NEW YORK CHICAGO

COMPOSITION, ELECTROTYPING, PRESSWORK, BINDING
BY
J. B. LYON COMPANY, ALBANY, NEW YORK

PARTIAL LIST OF CONTRIBUTORS TO VOLUME XII

ANGELL, JAMES ROWLAND, Litt.D.
Dean of University Faculties, University of Chicago
FUNCTIONALISM

AYRES, SAMUEL G., B.D.
Librarian, Garrett Biblical Institute
GENERAL CONFERENCE OF THE METHODIST EPISCOPAL CHURCH

ASHE, SYDNEY W.
Educational Department, General Electric Company, Pittsfield, Mass.
GENERATORS

BENNETT, CHARLES E., Litt.D.
Professor of Latin, Cornell University
GALLIC WAR, CÆSAR'S COMMENTARIES ON THE
GERMANIA

BERTLING, K. O., Ph.D.
Amerika Institut, Berlin, Department of Education
GERMANY — GERMAN SCHOOLS

BESSEY, ERNEST A., Ph.D.
Professor of Botany, Michigan Agricultural College
FUNGI

BIGELOW, JOHN, LL.D.
Author of "The Complete Works of Benjamin Franklin," etc.
FRANKLIN, BENJAMIN

BOTHNE, GISLE, A.B.
Professor of Scandinavian Languages and Literature, University of Minnesota
FRITHJOF'S SAGA

CALLAHAN, JAMES M., Ph.D.
Professor of History and Political Science, West Virginia University
GERMANY — DIPLOMATIC RELATIONS OF THE UNITED STATES WITH

CANFIELD, ARTHUR G., Ph.D.
Professor of Romance Languages, University of Michigan
FROISSART'S CHRONICLES

CARLTON, WILLIAM N. C., M.A., L.H.D.
Librarian, Newberry Library, Chicago
GARFIELD, JAMES ABRAM

CARROLL, HENRY K., LL.D.
Author of "Religious Forces in the United States," etc.
GERMAN BAPTIST BRETHREN

CASTLE, WILLIAM ERNEST, Ph.D.
Professor of Biology, Harvard University
GENETICS

CHAMBERLAIN, CHARLES J., Ph.D.
Professor of Morphology and Cytology, University of Chicago
GAMETOPHYTE

CHANDLER, FRANK W., Ph.D.
Professor of English and Comparative Literature, University of Cincinnati
GIL BLAS

CORNYN, JOHN HUBERT, B.A., LL.B.
Editorial Staff of The Americana
FRENCH REVOLUTION, THE

COUMBE, CLEMENT W.
Technical Art Expert
FRESCO PAINTING
FURNITURE, HISTORY OF ANCIENT
FURNITURE, MEDIÆVAL
GAUNTLETS

CROSS, WILBUR L., Ph.D.
Professor of English, Yale University
FRANKENSTEIN

DAKE, CHARLES LAURENCE, A.M.
Professor of Geology, School of Mines and Metallurgy, Univesity of Missouri
GEOLOGY

DARTON, NELSON H.
United States Geological Survey
GASES IN MINES AND COAL
GEOMORPHOLOGY

DERRY, JOSEPH T.
Author of "History of Georgia"
GEORGIA, STATE OF

DOLE, NATHAN HASKELL, A.B.
Author, Editor and Translator
FRUITS OF CULTURE
GANGHOFER

DOUGLAS, D. S.
Editorial Staff of The Americana
GEORGE, DAVID LLOYD
GLADSTONE, WILLIAM EWART

EGGER, CARL E., Ph.D.
Assistant Professor of German, University of Michigan
GEORGE, STEFAN

EISELEN, FREDERICK CARL, Ph.D., D.D.
Professor of Old Testament Interpretation, Garrett Biblical Institute
GENESIS, BOOK OF

ELROD, MORTON J., Ph.D.
Director of Biological Station, University of Montana
GLACIER NATIONAL PARK

EMERSON, OLIVER FARRAR, Ph.D., Litt.D.
Professor of English, Western Reserve University
GIBBON, EDWARD

Contributors to Volume XII — Continued

EMERTON, EPHRAIM, Ph.D.
Winn Professor of Ecclesiastical History, Harvard University

GERMANY — HISTORY OF GERMAN RELIGION

FERRIS, RICHARD, C.E., Sc.D.
Editorial Staff of The Americana

GAS
GLUCOSE

GAY, WILLIAM H.
President of Berkey & Gay Furniture Co., Grand Rapids

FURNITURE INDUSTRY IN AMERICA, THE

GENTHE, KARL WILHELM, Ph.D.
Formerly Assistant Professor of Natural History, Trinity College

GENTHE, MARTHA KRUG, Ph.D.

GERMANY — PHYSIOGRAPHY

GLASSON, EDWIN J.
United States Department of Agriculture

FRUIT GROWING

GOEBEL, JULIUS, Ph.D.
Professor of Germanic Languages in the University of Illinois

GERMANY — HISTORY OF LITERATURE

HAMLIN, A. D. F., A.M., L.H.D.
Professor of Architecture, Columbia University

FRENCH ARCHITECTURE

HAUHART, WILLIAM F., Ph.D.
Assistant Professor of German, University of Michigan

FRENSSEN, GUSTAV
FREYTAG, GUSTAV
FULDA

HENDERSON, ERNEST F., Ph.D.
Author of "Short History of Germany"; "Blücher and the Uprising of Prussia against Napoleon," etc.

GERMANY — POLITICAL HISTORY TO 1871

INGERSOLL, ERNEST
Zoologist, Editor and Author

FUR-BEARING ANIMALS
FUR TRADE
FURS
GAME BREEDING
GLYPTODONT

ISAACS, LEWIS M., Ph.B., LL.B.
Music Critic and Composer

FREISCHÜTZ, DER

JAGEMANN, HANS CARL G. VON, Ph.D.
Professor of German Philology, Harvard University

GERMANY — HISTORY OF THE GERMAN LANGUAGE

JELLIFFE, SMITH ELY, M.D., Ph.D.
Formerly Professor of Pharmacognosy, Columbia University

FREUDIANISM, MEDICAL ASPECTS OF
GENERAL PARESIS

KAINS, M. G., B.S., B.S.A., M.S.A.
Lecturer on Horticulture, Columbia University

FRUIT
FRUIT INDUSTRY

KALLEN, HORACE M., Ph.D.
Instructor in Philosophy, University of Wisconsin

FREUDIANISM

KASNER, EDWARD, Ph.D.
Professor of Mathematics, Columbia University

GEOMETRY, ELEMENTARY

KEYSER, CASSIUS J., Ph.D.
Adrian Professor of Mathematics, Columbia University

GEOMETRY, CARTESIAN
GEOMETRY, LINE-, AND ALLIED THEORIES
GEOMETRY, MODERN ANALYTICAL

KLEIN, HENRI F.
Editorial Staff of The Americana

v	of, very
y	(consonantal) yes, young
z	pleasant, rose
zh	azure, pleasure
′(prime), ″ (secondary)	accents, to indicate syllabic stress

THE ENCYCLOPEDIA AMERICANA

F

FRANCO, frän'kō, **Giovanni Battista**, Italian painter and etcher, called Il Semolei: b. Udine, 1510; d. Venice, 1580. He visited Rome, where his Venetian manner was much influenced by that of Michelangelo. His best work was done in decorative lines. Upon the victorious entry of Charles V of Spain into Rome in 1536 he embellished the triumphal arch with scenes descriptive of the city's history. His principal canvas is a 'Baptism of Christ' in the Venetian Church of San Francesco della Vigna. His etchings, including such plates as 'The Adoration of the Shepherds' and 'The Scourging of Christ' (after Titian), are by many preferred to his paintings, which are criticized for defects of color.

FRANCO-GERMAN or FRANCO-PRUSSIAN WAR, the stupendous conflict between France and Germany in 1870–71, which resulted in the total defeat of the French, the overthrow of the Napoleonic dynasty, the establishment of the Third Republic in France and the consolidation of Germany into an empire under the leadership of Prussia.

The remote causes of this war are to be sought in the jealousy which had long existed between France and Prussia, and which was strengthened on the side of France by the Prussian defeat of Austria in 1866, which secured to her rival the unquestioned leadership in Germany. The immediate occasion of the war occurred in June 1870, when General Prim, commanding in Spain after the deposition and abdication of Queen Isabella, offered the crown of that country to Leopold of Hohenzollern, a prince belonging to the reigning house of Prussia. It was thought in France that the acceptance of this offer would endanger the balance of power in Europe, and more particularly would threaten the safety of France, by putting Prussia in a position to attack it both in the east and in the south. Accordingly, the government of Napoleon III demanded of the King of Prussia that he should forbid the candidature of the prince. The prince voluntarily retired from his candidature, but the French ambassador offensively insisted that this renunciation should be formally made by the king and a guarantee given that the candidature would not be revived. This demand was refused and a formal declaration of war by France against Prussia was received by Count Bismarck, the chancellor of the North German Confederation, on the 19th of July. The war was welcomed by both sides with equal enthusiasm. While the French were the first in getting their troops to the frontier it soon became manifest that instead of being in a complete state of readiness, as the Minister of War had declared, the army was defective in almost everything essential to its equipment.

In contrast to this the arrangements for mobilizing the German army, which had previously been tested in Prussia in 1864 and 1866, were again found to work admirably. Each section of the army was completely organized in the headquarters of the district which it occupied in time of peace and was only sent to the frontiers after being furnished with everything it required. In addition to this, Prussia, against which country alone the war had been declared, was not only joined according to treaty by all the states of the North German Confederation but also by those of the south, upon whose neutrality, perhaps even upon whose alliance, Napoleon and the French had counted. The whole of Germany north and south was thus in arms and was able to muster forces far outnumbering those of the French. While the whole French army brought into the field at the commencement of the war numbered no more than 310,000 men, the troops of the Germans in the field amounted in all to 477,000, to which must be added strong reserves ready, with the exception of such as were necessary to protect the interior and to resist a threatened landing on the north coast by the French fleet, to be brought to the scene of war at any time, giving a total strength on the side of the Germans of more than 1,000,000 men.

The German forces were divided into three armies; the First Army had its headquarters at Trèves under General Steinmetz; the Second Army occupied the Bavarian Palatinate under Prince Frederick Charles; while the Third Army, under the crown prince of Prussia, was stationed in northern Baden. The cavalry of each army, instead of being attached in separate divisions to each of the corps d'armée composing the army, were in this way massed together into one body, and in this formation rendered very important services during the war. The commander-in-chief of the whole forces was King William of Prussia, who was supported by a staff of general officers, with Von Moltke at their head. The French army, under Napoleon himself, had its headquarters at Metz, and two advanced divisions were stationed on the borders of France and Germany, the one in the north on the Saar, under General Frossard, the other farther south at Weissenburg, under General Douay. The first overt act of war took place on 2 August, in which a part of the northern division of the French army, in the presence of Napoleon and the prince imperial, compelled a few Prussian troops belonging to the First Army, after some hours' firing, to evacuate Saarbrücken. After this Von Moltke assumed the offensive. His plan was to unite the three armies in the line of the Moselle in order to attack the enemy's centre with the view of obtaining the shortest line of operations in the direction of Paris, and in this he was completely successful. On 4 August the army under the crown prince defeated the advanced southern division of the French army at Weissenburg, and on 6 August MacMahon's army at Wörth; on the latter date also the first and second German armies had routed the northern division of the French army at Forbach, with terrible loss on both sides. In two separate armies, commanded respectively by Marshal Bazaine and Marshal MacMahon, the French retreated. To prevent their union Steinmetz and Frederick Charles pursued Bazaine, defeated him at Courcelles on 14 August, at Mars-la-Tour on the 16th, at Gravelotte with awful slaughter on the 18th, and shut him up in Metz. The crown prince and his army following MacMahon advanced to Nancy; there reinforced by a newly formed army under the crown price of Saxony, they advanced on Châlons, where MacMahon's army had been reorganized and strengthened, and was expected to retreat on Paris. Following instructions, however, MacMahon moved northward to make a descent upon Metz and relieve Bazaine. He was overtaken near Beaumont, and on 27 August and on the days immediately succeeding a number of engagements and strategic movements resulted in MacMahon's army being surrounded at Sedan on 1 September by a force of overwhelming numbers. On the following day both army and fortress were forced to capitulate. Forty generals, 4,000 officers of all grades and 84,000 soldiers became prisoners of war. Among the prisoners was Napoleon III, who was unexpectedly found to have been present with the army of MacMahon. On the day after the battle he had a personal interview with King William of Prussia, who assigned to him Wilhelmshöhe, near Cassel, as a place of residence during his captivity.

At the news of this disastrous defeat the Parisians in an outburst of rage demanded the dethronement of the Napoleon dynasty, and on 4 September a republic was proclaimed. A government of national defense presided over by General Trochu, military governor of Paris, was formed, but before any effective measures could be adopted Paris was invested by the Germans on 19 September. A day or two before a delegation from the central government had escaped from Paris and established themselves at Tours, where they were joined on 9 October by Gambetta, who escaped from Paris by balloon. It was some time before the French were able to organize a new army, and in the meantime, 27 September, Strassburg fell into German hands, and on 28 October Metz, which had been invested by the second German army under Prince Frederick Charles, capitulated. By the beginning of November war in the open field had been resumed at various points: in the north, in the southeast and on the Loire in the neighborhood of Orleans. The army of the Loire, under Gen. Aurelle de Paladines, compelled the Germans to evacuate Orleans on 7 November, but was unable to follow up this temporary success, and on 4 December and on 12 January was severely defeated by Prince Frederick Charles. The army of the north, under General Faidherbe, which had been hastily formed to attempt the relief of Paris, after many gallant attempts which were checked by the first German army under General Manteuffel, was finally defeated at Saint Quentin on 19 January. In the east and southeast the results were equally disastrous to the French. General Werder defeated the French troops under Cambriels in the Vosges, the irregular forces under Garibaldi in Burgundy, and at Héricourt on the Lisaine on 15, 16 and 17 January kept in check the army of Bourbaki until the approach of Manteuffel compelled Bourbaki and 84,000 troops to escape into Switzerland, where they were disarmed and remained till the conclusion of the war.

Meanwhile Paris had held out for a much longer period than even the most sanguine on the side of the French had expected. Desperate sallies were frequently made, but not in sufficient strength to have any decisive effect. On the failure of the last sally, on 19 January, General Trochu resigned and was succeeded by Lefló as head of the government of defense, and by General Vinoy as commander of the troops of Paris. But by this time the city was at the point of starvation, and after a three weeks' bombardment was in such a desperate condition that the government could no longer help seeing that a capitulation was inevitable. The terms were settled on 28 January, the chief being that all the forts around Paris should be immediately handed over to the Germans, and that the city should pay a contribution of 200,000,000 francs ($40,000,000). An armistice of three weeks was at the same time concluded, to allow of the election and assembling of a National assembly to decide upon war and peace. This armistice, however, was not to extend to the scene of war in the southeast until a separate arrangement had been made regarding it. Here the fortress of Belfort still held out, but at last, on 16 February, it agreed to capitulate. The garrison, on account of its gallant defense, was allowed to march out with full military honors. On the same day the armistice became general. The fortress of Bitsch in the department of Moselle, did not surrender till after the conclusion of the preliminaries of peace.

The elections for the assembly had taken place on the 8th; it met at Bordeaux, and on the 17th appointed M. Thiers head of the executive; and on the 21st he arrived at Versailles with a diplomatic commission to negotiate for peace. After the armistice had been thrice prolonged the preliminaries of peace were signed at Versailles on 26 February and accepted by the assembly at Bordeaux on 1 March. On the same day the German troops entered Paris; on 18 January King William, who had taken up his residence at Versailles, had by acclamation been proclaimed Emperor of Germany. The principal terms of peace were: (1) That France should cede to Germany one-fifth part of Lorraine, including Metz, together with the whole of Alsace except Belfort and the surrounding district. (2) That France should pay to Germany a war indemnity of 5,000,000,000 francs ($1,000,-000,000). (3) That certain departments of France should remain in the occupation of the Germans and should not be fully evacuated until after the payment of the whole indemnity. The definite treaty of peace, which was signed at Frankfort on 10 May and ratified on the 21st, confirmed in all essential particulars the preliminaries of Versailles. The last instalment of the war indemnity was paid on 5 Sept. 1873, and France was completely evacuated by the Germans on the 13th of the same month.

Bibliography.— Consult the French official account, 'La Guerre de 1870–71' (Paris 1902); the German official account, 'Der Deutsch-französische Krieg, 1870–71' (Berlin 1874–81); Von Moltke, 'The Franco-Prussian War, 1870–71,' translated by Forbes (London 1893); Chuquet, 'La Guerre de 1870–71' (Paris 1895); Herstlet, 'The Map of Europe by Treaty' (Vol. III, London 1891); F. B. Maurice's contribution in Vol. XI of the 'Cambridge Modern History,' with its exhaustive bibliography; Sohel, 'Histoire Diplomatique de la guerre Franco-allemande' (Paris 1875); Valfrey, 'Histoire du traite de Francfort' (Paris 1874–75); and the work of the United States ambassador, 'Recollections of a Minister to France' (New York 1887).

FRANÇOIS, frăṅ-swä, **Kurt von,** German explorer: b. Luxemburg, 1852. After active service in the Franco-Prussian War, he joined, with the rank of lieutenant, the Wissmann expedition to explore the river Kassai, a tributary of the Kongo, and subsequently published 'In the Interior of Africa, the Exploration of the Kassai.' He then explored with Grenfell two southern tributaries of the Kongo and published his 'Exploration of the Tschuapa and Lulongo' (1888). He was on his return promoted to be leader of an expedition which the government despatched to the colony of Togo, and accompanied the military expedition into South Africa. His maps of regions visited and historical accounts of colonization there are of value to the student of African affairs.

FRANÇOIS, Louise von, German novelist: b. Herzburg, Saxony, 27 June 1817; d. Weissenfels, 24 Sept. 1893. Her first important story, 'The Last Reckenburgerin' (1871), was very warmly praised by the critics for its power in character delineation; it was followed by 'Frau Erdmuthen's Twin Boys' (1872); 'Climacteric Years of a Lucky Fellow' (1877); 'Judith the Housekeeper' (1878), a peasant counterpart to 'The Last Reckenburgerin,' and next after that her best story. She wrote a 'Popular History of the Prussian War of Liberation, 1813–15'; and a comedy, 'Woman's Station' (1882).

FRANÇOIS DE NEUFCHATEAU, nĕf'-chă-tō', **Nicolas Louis François,** COUNT; French poet and statesman: b. Lorraine, 1750; d. Paris, 1828. He was educated at the Jesuit College of Neufchâteau, and received this name in 1765 when a volume of poetry published by him attained considerable vogue. In 1770 he was appointed professor of rhetoric at Toul, and in 1783–88 he was procureur général in San Domingo. Later he was deputy to the National assembly and to the legislative assembly, of which he became secretary and was for a time its president. He published, in 1793, a comedy entitled 'Paméla, ou la vertu recompensée' which led to his imprisonment. In 1797 under the Directory he was Minister of the Interior, and during his tenure did much for inland navigation and for industrial exhibitions. He was president of the Senate in 1804–06, and after 1815 retired from politics. Other volumes by him are 'Fables et contes en vers' (1814); and 'Les trois nuits d'un goutteux' (1819). He wrote also many articles on agriculture and miscellaneous subjects and translations. Consult Lamoureux, 'Nicolas Louis François de Neufchâteau' (Paris 1843), and Simian, 'François de Neufchâteau et les expositions' (ib. 1889).

FRANCOLIN, a kind of small partridge belonging to the genus Francolinus of the family Phasianidæ of Africa and southern Asia, much resembling the American bobwhite in behavior. One species (*Francolinus vulgaris*) used to be common in the south of Europe, but has been exterminated.

FRANCONIA, Germany, a district lying to the east of the Rhine, and traversed by the Main. After the dismemberment of the Carlovingian empire this district became attached to the German division, and ultimately formed one of the grand-duchies of Germany. Between 1024 and 1125 it furnished a series of emperors to Germany. (See GERMANY, *History*). It was one of the 10 circles into which the empire was divided by Maximilian I in 1512. Its capital was Nuremberg. In 1806 it was partitioned among Würtemberg, Baden, Hesse-Cassel, the Saxon duchies and Bavaria. The last received the largest share, and still retains the name in the three circles of Upper, Middle and Lower Franconia. (1) Upper Franconia has an area of 2,702 square miles and pop. 661,126. Bayreuth is the capital. (2) Middle Franconia has an area of 2,925 square miles and pop. 929,985. The capital is Anspach. (3) Lower Franconia has an area of 3,243 square miles and pop. 709,832, Würzburg is the capital. The name of Franconia has been rendered familiar to the traveler and the geologist by its picturesque scenery, which has procured for part of it the name of Franconian Switzerland, and by its caverns, filled with fossil bones, among the most remarkable of which is König Ludwig's Höhle (King Louis' Cave), between Bayreuth and Muggendorf.

FRANCONIA MOUNTAINS. See WHITE MOUNTAINS.

FRANCS-TIREURS, frăṅ'-tē'rėr' (Fr., free shooters; «snipers»), name given to bands of French soldiers whose exploits came into general notice during the Franco-German War of 1870–71. They originated in 1867–70 when military societies sprang up in northern France. They were not well organized at first, and waged an irregular warfare against small enemy detachments, lines of communication, etc. The Germans refused to recognize them as belligerents of military standing, and when captured they were summarily executed.

In November 1870, they were incorporated with the regular army, became better organized, and co-operated in the movements of the regular army. They continued to wage a guerilla warfare for some time after the main bodies of French troops had been defeated and captured. The most spectacular exploit of this corps was the destruction of the Moselle Railway Bridge on 21 Jan. 1871. Consult Saint Etienne, 'Les Chasseurs des Vosges' (Toul 1906). See FRANCE; ARMY.

FRANCUCCI, frăn-koo'-chē, **Innocenzo.** See IMOLA, INNOCENZA DA.

FRANEKER, fră'ne-kėr, a town in Friesland, Netherlands, once the residence of the Frisian nobles, whose castles were numerous. Here lived and died the Belgian mystic Antoinette Bourignon: b. 13 Jan. 1616; d. 30 Oct. 1680, whose writings excited theologians in Europe for over a century, and with whom William Penn was in correspondence. She was a follower of Jean de Labadie. The plantarium, in the town hall, made by Eise Elsinga (1774–1881) shows the movements of the heavenly bodies. Here are the botanical specimens, from the famous university founded in 1585, which was suppressed by Napoleon in 1811, for its ultra-democratic proclivities. The same building contains portraits of several British scholars who came later to America, one of them being that of Amesius (Prof. William Ames, 1576–1633), whose 'Marrow of Theology' is still read in Holland and Scotland. "Few Englishmen have exercised so formative and controlling an influence on European thought as Ames." He died in Rotterdam, but his wife, son and daughter and his valuable library reached New England. At Franeker University, before 1780, the agitation began which led to the recognition of the United States as a nation, expressed in writing, oratory and a great torchlight procession in honor of the young republic beyond the Atlantic. Consult Boeles, 'Friesland's Hooge School' (1878); and Griffis, 'The American in Holland' (1899).

FRANGIPANI, frän'jė-pä'nē, (1) illustrious Roman family, founded in 1014 by Leo Frangipani and which reached the zenith of its power in the 11th and 12th centuries. Its castles and fortresses were in the neighborhood of the Arch of Titus and the Coliseum. The family was a rival of the powerful house of the Pierleoni, and their differences caused repeated troubles to both the State and the Church. The Frangipani were for long partisans of the emperor but later espoused the papal cause. (2) A noble family of Croatia, distinguished for its services in the struggle against the Turks. The most celebrated members of this family were John Frangipani, who in 1390 was Ban of Croatia, Dalmatia and Slavonia, and Christopher Frangipani who fought at Mohács in 1526. Francis Frangipani joined in a conspiracy against Leopold I in 1670 with the object of restricting Germanic influence in Hungary and of spreading that of the Magyar. The conspiracy being detected Francis paid the penalty with his life in 1671. Consult Gregorovius, 'Rome in the Middle Ages' (London 1896–97).

FRANGULA, the bark of *Rhamnus Frangula,* used in medicine as a purgative.

FRANGULIN ($C_{21}H_{20}O_9$), a dyestuff extracted from the root, bark, fruit and seed of the alder buckthorn (*Rhamnus frangula*). It is a bright yellow silky, crystalline mass, without taste or smell, which fuses on heating, and can be sublimed in golden needles. It is not soluble in water, and though soluble in hot alcohol separates very completely on cooling. It dissolves in alkalies with a purple color, and is decomposed by sulphuric acid with a succession of colors. It forms lakes with metallic hydrates, and dyes silk, wool and cotton. In its chemical constitution it is a glucoside, and it is probably the same as *cascara sagrada.*

FRANK, fränk, **Jacob** (properly **Lebowicz**), Jewish pseudo-Messiah: b. Galicia, 1720; d. 10 Dec. 1791. The name Frank was obtained during travel in the east from the Turks, who employed the word as a generic term for an European. Originally a distiller, he settled, after his eastern journey, in Podolia, where he professed himself a second Messiah, basing his teachings, in opposition to the Talmud, on the Sohar, the source of the Cabbala. An outcome of the Messianic mysticism of Sabbetai Zebi, in the middle of the 18th century, he started the movement, in behalf of spiritual freedom, so he claimed, but the moral laxity which followed alarmed the rabbinical authorities, who were unable to suppress the agitation. He was imprisoned by the Poles for a number of years, but was set free by the Russians after their invasion of Poland. He then removed to Offenbach, a small city near Frankfort-on-Main, where he lived regally on the gifts of adherents and finally became a Roman Catholic. His death by apoplexy broke down popular belief in his immortality, but for a number of years his daughter succeeded in continuing the existence of the Frankist beliefs. The sect of Frankists persisted for some time in Poland, Turkey and Moldavia, its tenets being a Judaized form of the Roman Catholic faith. Consult Grätz, H., 'Frank und die Frankisten' (Breslau 1868); id., 'History of the Jews' (Vol. V, Philadelphia 1895); Kraushaar, A., 'Frank i Frankisci Polsky' (2 vols., Cracow 1895); Morfill, W. R., 'Frank and the Polish Frankists' (in *Academy,* Vol. XLIX, p. 73, London 1895); Przyborowski, W., 'Historya Franka i Frankistow' (Cracow 1893).

FRANK, Johann Peter, German physician: b. Rothalben, Bavaria, 1745; d. 1821. He studied medicine at the universities of Heidelberg and Strassburg, was professor at Pavia 1785–95, when he was made director of the Vienna General Hospital, where he remained until 1804. Afterward he was for a short time professor of medicine at Vilna, Russia, and was physician in ordinary to Tsar Alexander I. He returned to Vienna in 1808. He exerted a wide influence upon the development of medical practice in Lombardy, Austria and Russia. He made great improvements in public sanitation methods, wrote much on this subject and has been called the founder of modern sanitation. A good deal of the legislation on this subject is based on his recommendations. His principal works are 'System einer vollständigen medizinschen Polizeri (6 vols., 1779–1819; supplement, 3 vols., 1812–27; trans. into Italian 1808–30); 'De Curandis Hominum Morbis

Epitome' (6 vols., 1792–1821; German trans., 3d ed., 1840–41); 'System der landwirschaftlichen Polizei' (1789–91); 'Selbstbiographie' (1802). Consult Seiler, 'Peter Frank' (Dresden 1895).

FRANKALMOIGNE, frank'ăl-moin', form of feudal tenure whereby lands were held by religious houses or persons for charitable purposes. By the ancient common law of England, a man could not alien lands which came to him by descent without the consent of his heir, but he might give a part to God in free alms. It was an old Saxon tenure and was continued under Norman rule. This is the tenure by which almost all the ancient monasteries and religious houses held their lands, and by which the parochial clergy and very many ecclesiastical foundations hold them at this day in England. See FEUDALISM; TENURE.

FRANKAU, fränk'ow, **Mrs. Julia.** See DANBY, FRANK.

FRANKEL, Zacharias, German Jewish theologian: b. Prague, 1 Oct. 1801; d. Breslau, 13 Feb. 1875. He was eminent for his work in rabbinical jurisprudence; as magazine editor (1844–46, 1851–68) promoting the study of Jewish history and Semitic lore, and as director of the Breslau Seminary (1854–74), which he made the most famous in his day. He was the leader of what was termed the positive historical school, and exerted a powerful influence against obscurantism and radicalism. His works include 'The Jewish Oath, in its Theological and Historical Relations' (1840–47); 'Studies on the Septuagint' (1841); 'Introduction to the Mishnah' (in Hebrew, 1860), and 'Introduction to the Palestinian Talmud' (1870).

FRANKENBERG, Germany, town of Saxony, 32 miles southwest of Dresden, an important industrial centre. It manufactures cottons, woolens, carpets, silks, dyes, furniture, castings, machinery, cigars and draperies, and has the largest calico-printing works in Saxony. It contains a gymnasium, trade school, textile school and a teachers' seminary. In the neighborhood are many ruined castles and churches, at one of which is a memorial iron cross to the poet Körner. Pop. 13,576.

FRANKENHAUSEN, fränk'en-how'sen, Germany, town of the principality of Schwarzburg-Rudolstadt, 27 miles northwest of Weimar, on the Wipper. There is a gymnasium, a technical institute, and a teachers' seminary. It manufactures cigars, sugar and articles of mother-of-pearl and contains productive salt springs. Its baths are famed for curing scrofula. There are mines of lignite, and sandstone quarries in the neighborhood. Nearby also is the Barbarossa cave, discovered in 1865. Here on 15 May 1525 the Brunswick, Hessian and Saxon forces defeated the insurrection of the peasants led by Münzer. Pop. 6,600.

FRANKENSTEIN, frănk'en-stīn. The famous romance of 'Frankenstein' was begun by Mrs. Shelley in the summer of 1816, while she was staying with her husband the poet, Lord Byron and another friend in Switzerland by Lake Geneva; it was completed at Marlow, in England, the next year and published in 1818. On wet evenings the little Swiss party of four used to read German ghost stories; and at the suggestion of Byron, they entered into a half-serious compact that each should write one for the amusement of the company. Only Mrs. Shelley quite fulfilled the engagement. The outline of her story came to her in a dream — that is, in a horrible nightmare — one night after she had been greatly excited by a conversation between Byron and her husband over the possibility of creating and endowing a being with life. This problem Frankenstein, a young student in chemistry and anatomy, succeeds in solving. But the creature whom he builds up in his laboratory and infuses with life turns out to be a huge male monster eight feet in height, with long ragged hair, and rolling, blood-shot eyes, and yellow features so distorted and loathsome that no one can look upon them an instant without a scream of terror. Cut off from all association with mankind, the hideous giant resolves upon war against the whole human species and above all others against the man who had formed him and sent him forth to unsupportable misery. One by one he slays, or brings to death from grief, all the members of Frankenstein's family and all his dearest friends including his bride. At last, Frankenstein, unable to overtake and kill the being fashioned by his hands, dies of exhaustion and remorse; and the monster, repentant for his crimes, disappears in the darkness of the northern seas.

In this romance, Mrs. Shelley reached the goal for which she set out — which was to write as horrible a tale as she had ever read. In her own words: "One which would speak to the mysterious fears of our nature, and awaken thrilling horror — one to make the reader dread to look round, to curdle the blood, and quicken the beatings of the heart." She also lived to know that she had added a new word to the English language. Frankenstein is now a synonym for a man whose own works bring him to disaster or destruction. And as the monster of the romance bears no name, the name of his creator has been often transferred to him so that "a Frankenstein" has come also to signify, in popular usage, a being of the most appalling ugliness and brutality, having no trace of the moral sense whatever.

WILBUR L. CROSS.

FRANKENTHAL, fränk'en-täl, Germany, a manufacturing city of the Bavarian Palatinate, 10 miles northwest of Mannheim near the Rhine. It has machine shops, iron foundries and sugar refineries, manufactories of dynamos, machinery, boilers, cooperage works, corks, toys, soap, bells and cement works. A canal connects it with the Rhine. The town dates from the 8th century. Its abbey church, dating from 1119, is the chief object of interest. The town erected a monument to those who took part in the war against Napoleon I. Pop. 18,779.

FRANKFORT, Ind., city and county-seat of Clinton County; on the Chicago, Indianapolis and Louisville (Monon), Lake Erie and Western, Toledo, Saint Louis and Western (Clover Leaf), and the Pennsylvania railroads (including a new double-track road, Indianapolis to Frankfort), and the Terre Haute, Indianapolis and Eastern and Kokomo, Marion and Western traction lines; 47 miles northwest of Indianapolis and 91 miles southwest of Fort Wayne. It is situated in an agricultural section and its chief manufactures are flour, butter, canned goods, lumber, cigars, plumbers' brass goods, tool handles, kitchen cabinets, stoves and furnaces. The trade is chiefly in the manufactured articles and grain, fruits and vegetables. The city has a fine public library and a well organized system of public schools. There are five grain elevators (22 in the county). The electric light plant is owned by the city. Pop. 9,596.

FRANKFORT, Ky., city, capital of the State of Kentucky, county-seat of Franklin County; on the Kentucky River, the Chesapeake and Ohio, Frankfort and Cincinnati and the Louisville and Nashville railroads; 55 miles by rail east of Louisville and 65 miles southwest of Cincinnati. The city was founded by Gen. James Wilkinson (q.v.) in 1786, and for a time it was made the seat of his intrigues when he was trying to detach Kentucky from the Union and affiliate it with Spain. When Kentucky was admitted as a State in 1792 Frankfort was made the capital. During the Civil War it was for a time the headquarters of the Confederate forces under Braxton Bragg (q.v.). On 4 Oct. 1862 Richard Hawes was inaugurated here as the Confederate governor of Kentucky. In 1900 there was great excitement in Frankfort as to who was elected governor of the State. It was decided that William Goebel was the governor-elect. In the midst of the agitation Goebel was assassinated. Frankfort owes much of its present prosperity to its location in the «Blue Grass» section of the State. Its chief manufactures are flour, whisky, lumber, carriages, twine, shoes and furniture. The United States census of manufactures for 1914 showed within the city limits 31 industrial establishments of factory grade, employing 878 persons; 546 being wage-earners receiving annually a total of $271,000 in wages. The capital invested aggregated $4,094,000 and the year's output was valued at $4,755,000: of this, $1,996,000 was the value added by manufacture. The city is the trade centre for an extensive region; the river is navigable and by artificial means it is made to furnish a large amount of water power. The city contains the State arsenal, a State home for feeble-minded children, a State penitentiary, the State Normal School for colored pupils and Saint Joseph's Academy. The State government buildings and the State library with over 100,000 volumes add to the interests of the city. Franklin cemetery contains the grave of Daniel Boone (q.v.) and other noted men connected with the history of Kentucky. Pop. 11,080.

FRANKFORT, N. Y., village in Herkimer County, 10 miles from Utica, on the West Shore Railroad and on the Erie Canal. Its industrial establishments include agricultural implement works, and road-making machinery factories, and the Gates match factory, one of the first in the country. The village has a public library. The village owns its waterworks and electric-lighting plant. Pop. 4,213.

FRANKFORT, Council of, the assembly convened at Frankfort-on-the-Main by Charles the Great in 794. It was attended by all the bishops of the Frankish kingdom, together with many ecclesiastics, and also by the bishops of Italy and Aquitania and by some ecclesiastics from England. It condemned the doctrine of Adoptianism as propounded by Elipandus and Felix. It also condemned the rendering of Latreia (worship due to God alone) to images. Its canons also touch upon many matters of discipline and doctrine. Consult Hefele, 'Conciliengeschichte' (Freiburg 1874); Migne, 'Patrologia Latina,' xcvii; and Mombert, 'Charles the Great' (New York 1888).

FRANKFORT LAND COMPANY, 1686. Francis Daniel Pastorius (q.v.), an able young German lawyer, had joined the sect of Pietists (q.v.), and to escape from the atmosphere of Lutheranism concerted with his coreligionists an emigration to America. A number of wealthy and distinguished Germans and Dutchmen were induced to join; but they soon gave up the idea of emigrating themselves, and wished Pastorius instead to head a colony of German and Dutch Mennonites and Quakers to a land where they need not be harried. Pastorius had made Penn's acquaintance in England, had become a Quaker, and wished to be near Penn; some Frankfort and Crefeld merchants bought from Penn 15,000 acres near Philadelphia, and had formed a land company, calling it the German Society. They were all friends of Pastorius, who himself was one of the original purchasers. He was appointed factor of the company and in 1683 conducted a colony thither, and at once laid out Germantown (q.v.). In 1686 the land company was reorganized as the Frankfort Land Company, after its holdings had been increased to 25,000 acres. Consult Learned, M. D., 'Francis Daniel Pastorius' (in *German American Annals,* Vols. IX and X [U. S. Vols. V and VI], Philadelphia 1907–08).

FRANKFORT-ON-THE-MAIN, mān, Prussia, the capital of a district of same name, on both banks of the navigable river Main, 24 miles above its confluence with the Rhine. It is divided by the river into two unequal parts; the one on the north bank, called Frankfort proper, being considerably larger than the other, which is called Sachsenhausen; and the two communicate by several bridges. Frankfort was formerly fortified; but most of its outworks are now converted into gardens and promenades, and it is entered by nine gates. The principal streets are wide; there are also many squares and a number of large buildings, among which may be named the Rœmerberg, or old palace, in which the emperors of Germany were elected, and place of the assembling of the Diet; the Taxis palace, a place of residence of the emperors; the Sallhof, a modern imperial palace; an academy of painting, and the Senkenberg Museum. Its manufactures include carpets, table-covers, oilcloths, cotton and silk fabrics, woolen stuffs, jewelry, tobacco and printer's black. It has also large printing, lithographic and stereotyping establishments. Charlemagne, who had a palace in this city, summoned a council in 794, and it was surrounded with walls by Louis I in 838. It was the capital of the Eastern Franks from 843 to 889, when Ratisbon was selected. Frederick I was elected at Frankfort in 1152. From that time it became the place of election of the German kings and emperors. Frankfort was made a free city in 1245. Frederick of Prussia signed a treaty known as the Union of Frankfort, with the empire, France and Sweden, at this city, 13 May 1744. The French captured it 2 Jan. 1750, and again in sembly of Pennsylvania a delegate to the Continental Congress which consolidated the armies of the colonies, placed Gen. George Washington in command of them, issued the first Continental currency, and assumed the responsibility of resisting the imperial government; his last hope of maintaining the integrity of the empire having been dissipated by recent collisions between the people and the royalist troops at Concord and Lexington. Franklin served on 10 committees in this Congress. He was one of the five who drew up the Declaration of Independence in July 1776, and in September following was chosen unanimously as one of the three commissioners to be sent out to solicit for the infant republic the aid of France and the sympathies of continental Europe. In this mission, the importance of which to his country can hardly be exaggerated, he was greatly favored by the reputation which had preceded him as a man of science. While yet a journalist he had made some experiments in electricity, which established its identity with lightning. The publication by an English correspondent of the letters in which he gave an account of these experiments secured his election as an honorary member of the Royal Society of London and undisputed rank among the most eminent natural philosophers of his time. When he arrived in Paris, therefore, he was already a member of every important learned society in Europe, one of the managers of the Royal Society of London, and one of the eight foreign members of the Royal Academy in Paris, where three editions of his scientific writings had already been printed. To these advantages must be added another of even greater weight: his errand there was to assist in dismembering the British Empire, than which nothing of a political nature was at this time much nearer every Frenchman's heart. See GREAT SEAL OF THE UNITED STATES.

The history of this mission, and how Franklin succeeded in procuring from the French king financial aid to the amount of 26,000,000 francs, at times when the very existence of the republic depended upon them, and finally a treaty of peace more favorable to his country than either England or France wished to concede, has been often told; and there is no chapter in the chronicles of this republic with which the world is more familiar.

Franklin's reputation grew with his success. «It was,» wrote his colleague John Adams, «more universal than that of Leibnitz or Newton, Frederick the Great or Voltaire, and his character more beloved and esteemed than all of them. . . . If a collection could be made of all the gazettes of Europe of the latter half of the 18th century, a greater number of panegyrical paragraphs upon *le grand Franklin* would appear, it is believed, than upon any other man that ever lived.»

A few weeks after signing the definite treaty of peace in 1783, Franklin renewed an application which he had previously made just after signing the preliminary treaty, to be relieved of his mission, but it was not until 7 March 1785 that Congress adopted a resolution permitting «the Honorable Benjamin Franklin to return to America as soon as convenient.» Three days later, Thomas Jefferson was appointed to succeed him. On 13 Sept. 1785, and after a sojourn of nearly nine years in the French capital, first in the capacity of commissioner and subsequently of minister plenipotentiary, Franklin once more landed in Philadelphia, on the same wharf on which, 62 years before, he had stepped, a friendless and practically penniless runaway apprentice of 17. Though now in his 79th year, and a prey to infirmities not the necessary incidents of old age, he had scarcely unpacked his trunks after his return when he was chosen a member of the municipal council of Philadelphia, and its chairman. Shortly after, he was elected president of Pennsylvania, his own vote only lacking to make the vote unanimous. «I have not firmness,» he wrote to a friend, «to resist the unanimous desire of my country folks; I find myself harnessed again into their service another year. They engrossed the prime of my life; they have eaten my flesh, and seem resolved now to pick my bones.»

He was unanimously re-elected to this dignity for the two succeeding years, and while holding that office was chosen a member of the convention which met in May 1787 to frame the Constitution under which the people of the United States are still living. With the adoption of that instrument, to which he probably contributed as much as any other individual, he retired from official life; though not from the service of the public, to which for the remaining years of his stay on earth his genius and his talents were faithfully consecrated. Among the fruits of that unfamiliar leisure, always to be remembered among the noblest achievements of his illustrious career, was the part he had in organizing the first anti-slavery society in the world; and as its president, writing and signing the first remonstrance against slavery ever addressed to the Congress of the United States.

In surveying the life of Dr. Franklin as a whole, the thing that most impresses one is his constant study and singleness of purpose to promote the welfare of human society. It was his daily theme as a journalist, and his yearly theme as an almanac-maker. It is that which first occurs to us when we recall his career as a member of the Colonial assembly; as an agent of the provinces in England; as a diplomatist in France; and as a member of the conventions which crowned the consistent labors of his long life. Nor are there any now so bold as to affirm that there was any other person who could have been depended upon to accomplish for his country or the world what Franklin did in any of the several stages of his versatile career.

Though holding office for more than half of his life, the office always sought Franklin, not Franklin the office. When sent to England as the agent of the colony, he withdrew from business with a modest competence judiciously invested mostly in real estate. He never seems to have given a thought to its increase. Frugal in his habits, simple in his tastes, wise in his indulgences, he died with a fortune neither too large nor too small for his fame as a citizen or a patriot. For teaching frugality and economy to the colonists, when frugality and economy were indispensable to the conservation of their independence and manhood, he has been sneered at as the teacher of a «candle-end-saving philosophy,» and his 'Poor Richard' as a «collection of receipts for laying up treasures on earth rather than in heaven." Franklin never taught, either by precept or example, to lay up treasures on earth. He taught the virtues of industry, thrift and economy as the virtues supremely important in his time, to keep people out of debt and to provide the means of educating and dignifying society. He never countenanced the accumulation of wealth for its own sake, but for its uses,— its prompt convertibility into social comforts and refinements. It would be difficult to name another man of any age to whom an ambition to accumulate wealth as an end could be imputed with less propriety. Though probably the most inventive genius of his age, and thus indirectly the founder of many fortunes, he never asked a patent for any of his inventions or discoveries. Though one of the best writers of the English language that his country has yet produced, he never wrote a line for money after he withdrew from the calling by which he made a modest provision for his family.

For the remaining half of his life both at home and abroad, though constantly operating upon public opinion by his pen, he never availed himself of a copyright or received a penny from any publisher or patron for any of these labors. In none of the public positions which he held, even when minister plenipotentiary, did his pay equal his expenditures. He was three years president of Pennsylvania after his return from France, and for his services declined to appropriate to his own use anything beyond his necessary expenditures for stationery, postage and transportation. It is not by such methods that men justly incur the implied reproach of "laying up treasures on earth," or of teaching a candle-end-saving philosophy.

Franklin courted fame no more than fortune. The best of his writings, after his retirement from journalism, he never gave to the press at all; not even his incomparable autobiography, which is still republished more frequently than any of the writings of Dickens or of Thackeray. He always wrote for a larger purpose than mere personal gratification of any kind. Even his bagatelles and *jeux d'esprit* read in the salons of Paris, though apparently intended for the eyes of a small circle, were inspired by a desire to make friends and create respect for the struggling people and the great cause he represented. Few if any of them got into print until many years after his decease. Franklin was from his youth up a leader, a lion in whatever circle he entered, whether in the printing-house, the provincial assemblies, as agent in England, or as a courtier in France. There was no one too eminent in science or literature, on either side of the Atlantic, not to esteem his acquaintance a privilege. He was an honorary member of every important scientific association in the world, and in friendly correspondence with most of those who conferred upon those bodies any distinction; and all this by force of a personal, not to say planetary, attraction that no one brought within his sphere could long resist.

Pretty much all of importance that we know of Franklin we gather from his private correspondence. His contemporaries wrote or at least printed very little about him; scarcely one of the multitude whose names he embalmed in his 'Autobiography' ever printed a line about him. All that we know of the later half of his life not covered by his autobiography, we owe almost exclusively to his private and official correspondence. Though reckoning among his warm friends and correspondents such men as David Hume, Dr. Joseph Priestly, Dr. Price, Lord Kames, Lord Chatham, Dr. Fothergill, Peter Collinson, Edmund Burke, the bishop of Saint Asaph and his gifted daughters, Voltaire, the habitués of the Helvétius salon, the Marquis de Ségus, the Count de Vergennes, his near neighbors De Chaumont and Le Veillard the *maire* of Passy,— all that we learn of his achievements, of his conversation, of his daily life, from these or many other associates of only less prominence in the Old World, might be written on a single foolscap sheet. Nor are we under much greater obligations to his American friends. It is to his own letters (and except his 'Autobiography,' he can hardly be said to have written anything in any other than the epistolary form; and that was written in the form of a letter to his son William, and most of it only began to be published a quarter of a century after his death), that we must turn to learn how full of interest and importance to mankind was this last half-century of his life. Beyond keeping copies of his correspondence, which his official character made a duty as well as a necessity, he appears to have taken no precautions to insure the posthumous fame to which his correspondence during that period was destined to contribute so much. Hence, all the biographies — and they are numberless — owe almost their entire interest and value to his own pen. All, so far as they are biographies, are autobiographies; and for that reason it may be fairly said that all of them are interesting.

It is also quite remarkable that though Franklin's life was a continuous warfare, he had no personal enemies. His extraordinary and even intimate experience of every phase of human life, from the very lowest to the very highest, had made him so tolerant that he regarded differences of opinions and of habits much as he regarded the changes of the weather,— as good or bad for his purposes, but which, though he might sometimes deplore, he had no right to quarrel with or assume personal responsibility for. Hence he never said or did things personally offensive. The causes that he represented had enemies, for he was all his life a reformer. All men who are good for anything have such enemies. "I have, as you observe," wrote Franklin to John Jay the year that he retired from the French mission, "some enemies in England, but they are my enemies as an American; I have also two or three in America who are my enemies as a minister; but I thank God there are not in the whole world any who are my enemies as a man; for by His grace, through a long life I have been enabled so to conduct myself that there does not exist a human being who can justly say, 'Ben Franklin has wronged me.' This, my friend, is in old age a comfortable reflection. You, too, have or may have your enemies; but let not that render you unhappy. If you make a right use of them, they will do you more good than harm. They point out to us our faults; they put us upon our guard and help us to live more correctly."

Franklin's place in literature as a writer has not been generally appreciated, probably because with him writing was only a means, never an end, and his ends always dwarfed his means, however effective. He wrote to persuade others, never to parade his literary skill. He never wrote a dull line, and was never nimious. The longest production of his pen was his autobiography, written during the closing years of his life. Nearly all that he wrote besides was in the form of letters, which would hardly average three octavo pages in length. And yet whatever the subject he touched upon, he never left the impression of incompleteness or of inconclusiveness. Of him may be said, perhaps with as much propriety as of any other man, that he never said a word too soon, nor a word too late, nor a word too much.

The Doric simplicity of his style; his incomparable facility of condensing a great principle into an apologue or an anecdote, many of which, as he applied them, have become the folk-lore of all nations; his habitual moderation of statement, his aversion to exaggeration, his inflexible logic, and his perfect truthfulness,— made him one of the most persuasive men of his time, and his writings a model which no one can study without profit. A judicious selection from Franklin's writings should constitute a part of the curriculum of every college and high school that aspires to cultivate in its pupils a pure style and correct literary taste.

There was one incident in Franklin's life, which though more frequently referred to in terms of reproach than any other, will probably count for more in his favor in the Great Assize than any other of his whole life. While yet in his teens he became a father before he was a husband. He never did what men of the loftiest moral pretensions not unfrequently do,— shirk as far as possible any personal responsibility for his indiscretion. On the contrary, he took the fruit of it to his home; gave him the best education the schools of the country then afforded. When he went abroad, this son accompanied him, was presented as his son wherever he went, was presented in all the great houses in which he himself was received; he entered him at the Inns of Court, and in due time had him admitted to the English bar; made him his private secretary, and at an early age caused him to be appointed by the Crown governor of New Jersey. The father not only did everything to repair the wrong he had done his son, but at a time when he was at the zenith of his fame and official importance, publicly proclaimed it as one of the great errors of his life. The world has always abounded with bastards, but with the exception of crowned heads claiming to hold their sceptres by divine right, and therefore beyond the reach of popular criticism or reproach, it would be difficult to name another parent of his generation of anything like corresponding eminence with Franklin, who had the courage and the magnanimity to expiate such a wrong to his offspring so fully and effectively.

Franklin was not a member of the visible church, nor did he ever become the adherent of any sect. With the Unitarian creed Dr. Franklin had more in common than with any other, though he was much too wise a man to suppose that there was but one gate of admission to the Holy City.

Franklin made a somewhat more definite statement of his views on the subject of religion, in reply to an inquiry from President Styles of Yale College, who expressed a desire to know his opinion of Jesus of Nazareth. Franklin's reply was written the last year of his life, and in the 84th of his age:

«You desire to know something of my religion. It is the first time I have been questioned upon it. But I cannot take your curiosity amiss, and shall endeavor in a few words to gratify it. Here is my creed. I believe in one God, the creator of the universe. That He governs it by His providence. That He ought to be worshipped. That the most acceptable service we render to Him is doing good to His other children. That the soul of man is immortal and will be treated with justice in another life respecting its conduct in this. These I take to be the fundamental points in all sound religion, and I regard them as you do in whatever sect I meet with them.

«As to Jesus of Nazareth, my opinion of whom you particularly desire, I think His system of morals and His religion, as He left them to us, the best the world ever saw or is like to see; but I apprehend it has received various corrupting changes, and I have, with most of the present Dissenters in England, some doubts as to His divinity; though it is a question I do not dogmatize upon, having never studied it, and think it needless to busy myself with it now, when I expect soon an opportunity of knowing the truth with less trouble. I see no harm, however, in its being believed, if that belief has the good consequence, as probably it has, of making His doctrines more respected and more observed; especially as I do not perceive that the Supreme takes it amiss, by distinguishing the unbelievers in His government of the world with any peculiar marks of His displeasure.

«I shall only add, respecting myself, that, having experienced the goodness of that Being in conducting me prosperously through a long life, I have no doubt of its continuance in the next, though without the smallest conceit of meriting such goodness. My sentiments on this head you will see in the copy of an old letter enclosed, which I wrote in answer to one from an old religionist whom I had relieved in a paralytic case by electricity, and who, being afraid I should grow proud upon it, sent me his serious though rather impertinent caution.» See FRANKLIN'S AUTOBIOGRAPHY.

Bibliography.—A list of works by or relating to Benjamin Franklin appeared in the *Bulletin* of the New York Public Library for January 1906; Ford, W. C., 'List of the Benjamin Franklin Papers in the Library of Congress' (Washington 1905); Ford, P. L., 'Franklin Bibliography: a List of Books written by or relating to Benjamin Franklin' (Brooklyn 1889); 'Autobiography' (edited by John Bigelow, Philadelphia 1868); 'Life of Benjamin Franklin, written by Himself' (edited by Bigelow, rev. ed., ib., 1888); 'Complete works' (10 vols., edited by Bigelow, New York 1887–88); Mignet, F. E., Jr., 'Franklin in France' (ib. 1887–88); Morse, J. T., 'Benjamin Franklin' (ib. 1889); Ford, P. L. (edited), 'Sayings of Poor Richard' (New York 1890); Ford, P. L., 'The

Many-Sided Franklin' (ib. 1899); Fisher, S. G., 'The True Benjamin Franklin' (Philadelphia 1899); More, P. E., 'Benjamin Franklin' (Boston 1900); Oswald, S. C., 'Benjamin Franklin, Printer' (1918).

JOHN BIGELOW.

FRANKLIN, Christine Ladd, American scientist: b. Windsor, Conn., 1 Dec. 1847. She was graduated at Vassar College in 1869; studied at the University of Johns Hopkins 1878–82 under Sylvester and others and later at Göttingen and Berlin. In 1882 she was married to Fabian Franklin. Her theory of color-vision, which she published in 1892, attracted wide attention in America and Europe. Until 1909 she had charge of the department of physiological optics in the *Psychological Review.* In 1901–02 she was an associate editor of Baldwin's 'Dictionary of Philosophy and Psychology' and lectured in logic and psychology at Johns Hopkins during 1904–09, and since 1910 at Columbia University. From her pen have come many contributions to mathematical, philosophical and psychological journals, and editorials and other articles to the *Nation,* etc. In 1887 Vassar College conferred upon her the degree of LL.D.

FRANKLIN, Edward Curtis, American chemist: b. Geary City, Kan., 1 March 1862. He was graduated at the University of Kansas in 1888, and also studied at the University of Berlin and at Johns Hopkins. He was assistant in chemistry 1888–93, associate professor 1893–99, and professor of physical chemistry 1899–1903 at the University of Kansas. In 1903 he was appointed associate and in 1906 professor of organic chemistry at Leland Stanford Junior University. From 1911 to 1913 he was connected with the United States Public Health Service as professor of chemistry and chief of its department of chemistry. He was a member of the United States Assay Commission in 1906. He is Fellow of the American Association for the Advancement of Science, and has published papers on the electrolytic action of ammonia, and various salts and solvents.

FRANKLIN, Fabian, American mathematician and editor: b. Eger, Hungary, 18 Jan. 1853. After his graduation from Columbian (now the George Washington) University, Washington, in 1869, he engaged in civil engineering and surveying. In 1877 he became a Fellow at Johns Hopkins University, and his advance to the associate and then full professorship of mathematics quickly followed. During his connection with Johns Hopkins, which lasted until 1895, he was a frequent contributor to mathematical and other journals. In 1895 he became editor of the Baltimore *News;* and on 1 Oct. 1909 associate editor of the New York *Evening Post.* Among his works are 'People and Problems' (1908); 'Cost of Living' (1915), and contributions to mathematical publications and *The Nation.*

FRANKLIN, SIR **John,** English navigator: b. Spilsby, Lincolnshire, 16 April 1786; d. Lancaster Sound, 11 June 1847. When only a boy he went to sea, and later entered the English navy. In 1806 he was present at the battle of Trafalgar, in 1814 at that of New Orleans, and in 1819 was appointed to head an overland expedition from Hudson Bay to the Arctic Ocean. After suffering many hardships and being frequently on the verge of death from hunger and fatigue, he reached home in 1822. In the following year he married a Miss Purden (died 1825), the daughter of an architect, and the author of several poetical effusions. In 1825 he submitted to Lord Bathurst a plan "for an expedition overland to the mouth of the Mackenzie River, and thence by sea to the northwest extremity of America, with the combined object also of surveying the coast between the Mackenzie and Coppermine rivers." This proposition was accepted, and six days after he left Liverpool, in the same year, his wife died. In 1827 Captain Franklin arrived at Liverpool, where he married as his second wife, Miss Griffen. In 1829 the honor of knighthood was conferred upon him. He commanded the *Rainbow* frigate in the Mediterranean 1830–33; and was lieutenant-governor of Van Diemen's Land 1837–43. In 1845 Sir John set out on a third expedition with two ships, called the *Erebus* and *Terror,* and his ships were last seen by a Scottish whaler on 26th July of that year. He spent his first winter in a cove between Cape Riley and Beechey Island. After that period many expeditions were dispatched, both from England and America, in search of Sir John, of whom there were no tidings, and not till 1854 did the intelligence reach England that the navigator and his companions had, in all probability, perished in the winter of 1850–51. This intelligence, however, wanted confirmation, and Lady Franklin, who deserves all praise for the intelligent persistency of her efforts, resolved to have the mystery cleared up. Accordingly a last expedition was fitted out, and the news was, in 1859, at length confirmed by the return of Captain McClintock, in the yacht *Fox,* after a persevering search for the lost adventurers. This officer brought with him indisputable proofs of the death of Sir John and the loss of his crew. Several articles belonging to the unfortunate explorers were found at Ross Cairn and Point Victory. At the latter place a record was discovered, wherein it was stated that Sir John Franklin had died 11 June 1847. Other traces were found on the west coast of King William's Island, as the various survivors of the expedition had strayed from each other, perhaps in search of food, or the means of escaping from their dreary and desolate situations. C. F. Hall, the eminent Arctic explorer, returned in September 1869 from a five-years' search for the remains of Sir John Franklin's companions, and brought back about 150 relics of the expedition, purchased from the natives of King William's Land. It remained, however, for Lieutenant Schwatka to find the bodies of the Franklin party in his expedition of 1879–80. Franklin was the author of 'Narrative of a Journey to the Shores of the Polar Sea in the Years 1819–22' (1823); 'Narrative of a Second Expedition to the Shores of the Polar Sea in 1825–27' (1828). Consult McClintock, 'Narrative of the Fate of Sir John Franklin' (1860); Osborn, 'Career, Last Voyage and Fate of Sir John Franklin' (1860); Beesly, 'Sir John Franklin' (1881); Markham, 'Life of Sir John Franklin and the Northwest Passage' (1891); Traill, 'Life of Sir John Franklin' (1896).

FRANKLIN, William, American colonial governor: b. Philadelphia, 1729 or 1730; d. England, 17 Nov. 1813. He was a natural son of Benjamin Franklin (q.v.), in whose household he was brought up. He served with the Pennsylvania forces on the Canada frontier, obtained a captain's commission before 1750, in 1754–56 was comptroller of the general post-office during part of his father's administration as Postmaster-General, and during a portion of that time clerk of the provincial assembly. In 1757 he went to England with his father, studied law in London and was admitted to the English bar in 1758. In 1762 he was appointed governor of New Jersey. During the Revolution he was a Loyalist, and kept under guard by the patriots from January 1776. In June 1776 he called a meeting of the Colonial Assembly, then abrogated, for which he was kept prisoner in Connecticut till 1778, when he was exchanged, and later went to England. It was for this son of his that Benjamin Franklin wrote his autobiography. As a result of his stand against the Revolution, an estrangement arose between father and son, which, however, disappeared before the latter's death. Consult Bigelow, J., ed., 'The Life of Benjamin Franklin, etc.' (3 vols., Philadelphia 1879); Bruce, W. C., 'Benjamin Franklin, etc.' (New York 1917); Fischer, E. J., 'New Jersey as a Royal Province, 1738–76' (in Columbia University, 'Studies in History, Economics and Public Law,' Vol. XLI, New York 1911); Hart, C. H., 'Who was the Mother of Franklin's Son' (in *Pennsylvania Magazine of History and Biography*, Vol. XXXV, p. 308, Philadelphia 1911); Ford, P. L., 'Who Was the Mother of Franklin's Son' (Brooklyn 1889); Franklin, W., 'Letters from W. Franklin to W. Strahan' (Philadelphia 1911); Lee, F. B., 'New Jersey as a Colony and a State' (4 vols., New York 1902); 'Minutes of the Provincial Congress and the Council of Safety of the State of New Jersey' (Trenton 1879); Parton, J., 'Life and Times of Benjamin Franklin' (2 vols., New York 1865); Ricord, F. W., ed., 'Archives of the State of New Jersey' (Series I, Vols. IX, X, XVII, XVIII, XXV–XXIX; Series II, Vols. I–V; Trenton 1885–1917); Sabine, L., 'Biographical Sketches of Loyalists of the American Revolution' (2 vols., Boston 1864); Whitehead, W. A., 'Contributions to the Early History of Perth Amboy, etc.' (New York 1856).

FRANKLIN, William Buel, American military officer: b. York, Pa., 27 Feb. 1823; d. Hartford, Conn., 8 March 1903. He was graduated at the United States Military Academy in 1843 at the head of his class, one of his classmates being U. S. Grant. In the Mexican War he served on the staff of General Taylor as a topographical engineer, and carried Taylor's orders at the battle of Buena Vista. After the Mexican War he served in the Engineer Corps of the army and gradually reached the rank of colonel. At the outbreak of the Civil War he was assigned to the command of a brigade in Heintzelman's division. He took part in the battle of Bull Run, served with distinction in the Peninsular campaign and was promoted major-general of volunteers in 1862. Subsequently he served under McClellan in Maryland and under Burnside at Fredericksburg (q.v.) where he commanded the left wing, was adversely criticized for his part in this battle and resigned his command. However, he returned to the army in July 1863 and was assigned to the department of the Gulf under Banks. A severe wound received in the battle of Sabine Cross Roads, 8 April 1864, incapacitated him for almost a year. In July 1864 he was captured by the Confederates, but escaped the same night. In March 1865 he was brevetted major-general in the regular army, but resigned a year later to engage in manufacturing, becoming vice-president of Colt's Automatic Firearms Manufacturing Company. He represented Connecticut as State Commissioner at the Centennial Exposition (1876), was adjutant-general of his State 1877–78, and for many years president of the board of managers of the National Home for Disabled Soldiers. He was appointed United States Commissioner-General to the Paris Exposition in 1899 and was made a grand officer of the Legion of Honor. His various reports covering his commands and operations during the Civil War may be found in United States War Department, 'War of the Rebellion. Official Records' (Series I, II and III, Washington). Consult Franklin, W. B., 'A Reply to the Report of the Joint Committee of Congress on the Conduct of the War' (New York 1863); Greene, J. L., 'General W. B. Franklin and the Operations of the Left Wing at the Battle of Fredericksburg' (Hartford 1900); Johnson, R. U., and Buel, C. C., editors, 'Battles and Leaders of the Civil War' (4 vols., New York 1884–88).

FRANKLIN, William Suddards, American educator, physicist and electrical engineer: b. Geary City, Kan., 27 Oct. 1863. He was graduated from the University of Kansas in 1887, and the same year was appointed assistant professor of physics there. After studying at Harvard and Cornell and the University of Berlin, Germany, he was appointed in 1892 to the chair of physics and electrical engineering in Iowa State College, remaining there till 1897, when he received his appointment to the same chair in Lehigh University. He is author and joint author of about 80 scientific papers and of 22 books on mathematics, physics and electrical engineering. In 1912 he published a volume of essays entitled 'Bill's School and Mine.'

FRANKLIN, a title bestowed upon the English landholders previous to the Norman conquest, who held their lands of the Crown free from any feudal servitude. In later years they lost their power and dignity, which was usurped by the Normans and became simply wealthy yeomen.

FRANKLIN, Canada, former district, and since 1905 merged into the Northwest Territories. It was formed in 1895, and comprised several islands to the north of the main land mass. The principal islands are Banks, Prince Albert, King William, Baffin Land, Prince of Wales, Melville, North Devon and Bathurst. The area is about 500,000 square miles. Being mostly within the Arctic circle it is nearly destitute of animal and vegetable life. A few Eskimos dwell on Baffin Land.

FRANKLIN, Ind., city, county-seat of Johnson County; on the Pennsylvania Railroad, Louisville Division, about 75 miles east of Terre Haute, and 20 miles south of Indianapolis. It is in an agricultural section and its chief manufactures are agricultural implements, flour and lumber. The value of taxable property is given as $2,000,000; industries, besides those mentioned, canning and light and power; resources of the four banks approximately $1,721,000. It is the seat of Franklin College, founded in 1834 by the Baptist Church, and has also one high and two graded schools. Pop. 4,502.

FRANKLIN, Ky., city, county-seat of Simpson County; on the Louisville and Nashville Railroad; about 145 miles southwest of Lexington, and five miles from the boundary line between Kentucky and Tennessee. The manufactures are woolen goods, flour, bricks and lumber. The trade is in the agricultural products of the surrounding country, and the manufactures of the town. It is the seat of the Southern Kentucky Sanatorium and the Franklin Female College. Pop. 3,063.

FRANKLIN, La., a town and parish-seat of Saint Mary Parish, 101 miles by rail southwest of New Orleans and 30 miles west of Morgan City, on Teche Bayou, and on the Southern Pacific Railroad. It is the centre of a very fertile district, and as the bayou is navigable for steamers, the town has a considerable trade in cotton, sugar, fruits, etc. There are also several saw-mills and sugar refineries located in the town. Pop. 3,857.

FRANKLIN, Mass., town in Norfolk County, 28 miles southwest of Boston, on the New York, New Haven and Hartford Railroad. The town also includes the village of Unionville. Dean Academy, an endowed co-educational school, is located here, and the town also has an almshouse, a public library and six churches. There are manufactories of pianos, straw, woolen, felt and cotton goods, printing presses, etc. It was originally a part of Wrentham, but in 1778 was separated and incorporated as a separate township. The affairs of the community are administered by town meetings. Pop. 6,440.

FRANKLIN, N. H., a city in Merrimac County, situated at the junction of the Pemigewasset and Winnepesauke rivers, which here unite to form the Merrimac, and on the Boston and Maine Railroad, 95 miles northwest of Boston. Owing to the abundant water power, numerous mills have located here, among which are paper and pulp mills, machine shops, woodworking shops, hosiery and knitting machine mills, woolen mills and one of the largest needle factories in the world. It is famous as the birthplace of Daniel Webster, and on the farm once owned by him now stands the New Hampshire Orphans' Home. The city owns and operates its waterworks. It was incorporated as a town in 1828 and as a city in 1895. A mayor and council administer public affairs. Pop. 6,132.

FRANKLIN, Ohio, village in Warren County, on the Cincinnati Northern Railroad; Cleveland, Cincinnati, Chicago and Saint Louis; Ohio Electric; the Big Miami River, and the Miami and Erie Canal, 40 miles northeast of Cincinnati. There are several churches, schools, paper mills, wood pulp mills and large tobacco warehouses. It was founded by Gen. William Schenck in 1796. Pop. 2,659.

FRANKLIN, Pa., a city and county-seat of Venango County, 123 miles north of Pittsburgh, on the Alleghany River, at the mouth of French Creek, and on the Erie, the Pennsylvania, the New York Central and the Franklin and Clarion railroads. The chief business is in oil, as the city is in the heart of a great oil region. There are large oil refineries, oilwell supplies and railway equipment shops and manufactures of asbestos goods, air compressors, boring machines and drills, carbon papers and office blanks and books, etc. The United States census of manufacturers for 1914 showed within the city limits 45 industrial establishments of factory grade, employing 2,002 persons; 1,479 being wage-earners receiving annually a total of $955,000 in wages. The capital invested aggregated $13,516,000, and the year's output was valued at $10,608,000: of this, $4,999,000 was the value added by manufacture. The city has beautiful parks and a public library, four banks, one high school, one union and five ward schools, one Catholic school; a State armory, city hall, courthouse, etc; the streets are provided with sewers and paved with brick. Franklin was first settled in 1753, and was incorporated in 1795. The government is of the commission form, the mayor and commissioners being elected annually. The value of the taxable property is given as $5,650,000 at about 60 per cent assessment. Pop. 10,250.

FRANKLIN, Tenn., town and county-seat of Williamson County, 20 miles south of Nashville, on the Harpeth River, and on the Louisville and Nashville and Middle Tennessee railroads. The Tennessee Female College, which was established in 1856, and the Battleground Academy are located here, and there are also several public schools and a Masonic Temple. It has flour mills, a furniture factory and a planing mill, several steam cotton gins and carriage manufactories. It was the scene of two battles during the Civil War, the first on 10 April 1863, between the Federal forces under General Granger and the Confederate forces under General Van Dorn, the latter being defeated; the second on 30 Nov. 1864, between the forces of General Hood and those of General Schofield, and which is famous as the Battle of Franklin (q.v.). Pop. 2,924.

FRANKLIN, Battle of. On 12 Nov. 1864 General Sherman turned back from his pursuit of Hood to begin his march from Atlanta to the sea, leaving General Thomas to act on the defensive in Tennessee or to take the offensive in Alabama. Hood was at Florence and Tuscumbia, on the Tennessee River, threatening Nashville, with an army of 44,000 men. Thomas' command, much smaller, was widely distributed from Chattanooga to Nashville. General Schofield was at Pulaski, Tenn., 80 miles south of Nashville. With the Fourth corps under General Stanley, a part of the 23d corps, under General Cox, and a division of cavalry, Thomas instructed Schofield to delay Hood, should he advance, until the army could be concentrated and Nashville reinforced. On the 21st Hood moved on Schofield's right. Schofield withdrew from Pulaski on the 22d, reached Columbia on the 24th, and remained there until the 27th,

when Hood forced him to withdraw to the north bank of the river. On the 28th Schofield learned that Forrest's Confederate cavalry threatened his line of withdrawal through Spring Hill, 11 miles in his rear, and early on the morning of the 29th all his trains and three divisions of infantry were put in motion for Spring Hill. Stanley led, and arrived at Spring Hill just as Forrest reached it. Stanley checked Forrest and took defensive positions. Hood followed Forrest, and during the night Schofield's entire army passed through Spring Hill, in sight of Hood's bivouac fires, for Franklin, 12 miles distant, which the advance reached before daylight of the 30th. Being unable at once to cross to the north bank of the Harpeth River, Schofield, who was closely followed by Hood, had to fight to save his trains, with a river at his back. He threw up a line of entrenchments, and a division of the Fourth corps under Stanley crossed to the north bank of the river, all those remaining in the works south of it being under command of General Cox. By noon the trains were in, and most of them crossed to the north bank. Not anticipating a general attack, Schofield gave orders for the withdrawal of the troops at sunset. He was mistaken as to the intention of Hood, who had closely followed his rear with Forrest's cavalry, and when Wagner's division, acting as Schofield's rear-guard, had halted and thrown up barricades about 280 yards beyond the main line, Hood rapidly advanced his infantry and ordered a desperate assault to drive the Union forces into the river. Two of Wagner's brigades were on either side of the Columbia road; Opdycke's brigade had come into the main line and was massed 200 yards in rear of the entrenchments. Wagner's orders were «to develop the enemy, but not to attempt to fight if threatened by too strong a force.» Hood formed his lines with celerity on either side of the Columbia pike, Cleburne's and Brown's divisions of Cheatham's corps on the east and west sides of the road respectively, in two lines of battle. When within 400 yards of Wagner's line, at 3.30 P.M., the charge was ordered and, with a wild shout, they rushed forward. Wagner was enveloped on both flanks and fiercely attacked in front, the Confederates rushed over his barricades and his men gave way in the greatest disorder, closely pursued by the exultant enemy. When within 100 yards of the main line the Union artillery and infantry opened fire. Cleburne, who was leading his division, was shot dead, great gaps were made in the ranks, but the line pressed on, carried the centre of the 23d corps' line for the length of a brigade, went over the works, captured two batteries and many prisoners, reached an inner line of entrenchments, 68 yards in rear of the main line, and here they were checked. Colonel Opdycke, who had massed his brigade in rear, when he saw Wagner's men falling back in disorder, and that the works in front had been captured, ordered his men forward. Deploying as they advanced, they rushed upon the Confederates, and a desperate hand-to-hand encounter took place, resulting in the retreat of the enemy to the outer line of works, the capture by Opdycke of nearly 400 prisoners and nine battle-flags, and the recovery of the captured batteries. General Thomas says Opdycke's prompt action «saved the day.» Meanwhile the battle had extended to the right and left, involving all of the 23d corps and the left brigade of Kimball's division. The Confederates reached the works in many places, but were unable to carry them. On both sides the fighting was most gallant. At midnight the Union army crossed to the north bank of the river and marched to Nashville.

The Union army engaged at Franklin, not including cavalry, numbered about 23,000 men, of whom 189 were killed, 1,033 wounded and 1,104 missing. Of this loss 1,241 were in Wagner's division. The Confederates engaged numbered about 22,000. There are no complete official reports of Hood's losses; as far as figures are available it appears that the Confederates lost 534 in killed, 1,744 wounded and 417 in missing; but Schofield reports that 1,750 were buried on the field, 3,800 were disabled and placed in hospitals and 702 captured, an aggregate of 6,252, to which must be added the slightly wounded, probably 2,000. A controversy arose regarding the responsibility for the heavy losses of the Union forces which was followed by an investigation, resulting in the censure of General Wagner's actions and in his removal from his command at his own request. On the Confederate side General Hood was blamed by many for his severe losses, and, although his superiors held him blameless, he too was relieved at his own request. Franklin, Tenn., was also the scene of various other actions, engagements and skirmishes fought on 9, 12, 26, 27 Dec. 1862; 1 Feb.; 4, 31 March; 9, 10 April; 4 June 1863; 17 Dec. 1864. E. A. CARMAN.

FRANKLIN, State of, now Tennessee (q.v.). Twelve years after the Watauga Association was formed (1772), and when four counties west of the present North Carolina had been organized, with some 10,000 people, that State on request of Congress ceded the district to the United States, giving it two years to accept. The inhabitants, already aggrieved at having no Supreme Court or militia protection, and being left to fight the Indians and keep public order without help, and now, feeling abandoned to at least two years' anarchy, decided to revolt, set up a State, and ask Congress for admission. On 23 Aug. 1784 deputies from three counties met at Jonesboro, resolved on measures and issued an address to the people. Each county chose five representatives, which met in convention at Jonesboro in November, but were unable to agree, and adjourned to 14 December. Meantime the alarmed North Carolina legislature established a Supreme Court and proper officers, and formed the Watauga militia into a brigade, commanded by the leader of the revolt, John Sevier. He advised the convention to accept this redress of their grievances; they refused and made him president of their meeting, drew up a constitution to be ratified by another convention the following November, and named the new State perhaps at first Frankland; if so, they soon changed it to Franklin, after the philosopher. A governor — Sevier — and a legislature were elected; courts established, sheriffs and justices appointed, etc. For the next three years there were two conflicting governments, each levying taxes, disallowing each other's official acts and making war on each other. The North Carolina militia invaded the Franklin courthouse at Jonesboro, seized the papers and turned the judge and counsel outdoors; a Franklin mob did the same service to a North Carolina court; the North Carolina commander took the papers by force from Sevier's house, and Sevier gathered a force and recaptured them from his opponent's house. At last, in 1788, the North Carolina party prevailed and put an end to Franklin; Sevier was carried off to Morganton, N. C., put into jail and later tried for high treason. While his trial was going on about a dozen of his followers entered the courtroom. Remaining unrecognized they succeeded in attracting Sevier's attention and, while one of them interrupted the proceedings by addressing the presiding judge, Sevier made good his escape. Finally the North Carolina legislature sensibly passed an act of oblivion and made Sevier a senator, and in 1790 the lands were ceded to the United States. From 1790–96 they were known as the Territory South of the Ohio. In 1796 they became the State of Tennessee with John Sevier as the first governor. (See UNITED STATES — WESTWARD MOVEMENT). Consult Fitch, W. E., 'The Origin, Rise and Downfall of the State of Franklin, etc.' (in *Order of the Founders and Patriots of America, New York Society*, Publication No. 25, New York 1910); Gilmore, J. R., 'The Rear-Guard of the Revolution' (New York 1886); id., 'John Sevier as a Commonwealth-Builder' (New York 1887); Turner, F. M., 'Life of General John Sevier' (New York 1910).

FRANKLIN COLLEGE, a non-sectarian institution founded in 1834 at Franklin, Ind., by the Baptist Church. Its faculty numbers 18; the average annual attendance of students is 260. The tuition fees are $175; living expenses $225; productive funds $333,000; income, including tuition and incidental charges, $53,100. The library contains over 30,000 volumes; the college colors are gold and blue. The number of graduates since organization is 748.

FRANKLIN INSTITUTE, The, of the State of Pennsylvania for the Promotion of the Mechanic Arts, institution founded in Philadelphia in 1824 for the dissemination of knowledge of the arts and sciences. The work of the society is carried on by means of lectures and reports, exhibitions, class instruction, a journal and a reference library. At first the lectures gave systematic courses of instruction, but are now limited to a presentation of the latest discoveries in the arts and sciences. The lectures may be divided into two classes — popular lectures and strictly technical discussions confined to the special divisions of the institute. A committee was formed in 1834 to report on new inventions and discoveries; it consists of 60 members, and its work has greatly enhanced the standing of the institute. The founding of a journal in 1826, by opening the way to the establishment of exchange relations with other societies, proved an invaluable help in promoting its growth. It is issued monthly, gives a record of the institute's work and publishes articles on the advance of science. The institute maintains a library of scientific literature, in some branches unique, and embracing the publications of the principal scientific and technical societies of the world, and the leading periodicals devoted to science and the arts. At the present time the collection consists of about 68,492 volumes and 29,716 pamphlets. Several of the foreign governments have deposited with the library complete sets of their patent-office publications. It contains records of the patent office of Great Britain since 1617, of France since 1791, of Switzerland since 1888, of the United States since 1790. Abstracts of the patents granted by Germany, Russia, Hungary and Austria can also be consulted. The institute has held 29 exhibitions of American manufactures, the most notable being that of 1884, which was the first exhibition in America devoted exclusively to the electrical arts. Medals and premiums are awarded for notable inventions. It maintains a school of architectural and mechanical drawing and night schools of machine designs and naval architecture. Any one interested in the purposes and objects of the institute and expressing a willingness to further the same may become a member when proposed by a member in good standing and elected by the board of managers. The institute fills the need felt by inventors and discoverers of some competent, trustworthy and impartial body, to whom they may safely appeal for advice, and on whose judgment they may confidently rely for an opinion as to the usefulness of their inventions and discoveries. Consult Wahl, W. H., 'Franklin Institute: A Sketch of Its Organization and History' (Philadelphia 1895).

FRANKLIN AND MARSHALL COLLEGE, located at Lancaster, Pa., was formed in 1852 by the consolidation of Franklin College, founded at Lancaster in 1787, and Marshall College, founded at Mercersburg, Pa., in 1836. Franklin College was organized with a view to meet the needs of higher education in the interior of the State, especially among the Germans, who formed so large a part of the population. Dr. Benjamin Franklin, after whom the college was named, took a deep interest in its welfare, contributed liberally to its endowment and in his old age made the journey from Philadelphia to Lancaster to be present at its formal opening. Although the college had in its faculty men like Henry E. Muhlenberg, the distinguished botanist, and Frederick V. Melsheimer, the entomologist, and on its board of trustees some of the most prominent men of the Commonwealth, its work was that of a first class high school.

Marshall College was founded by the Reformed Church in the United States, when its theological seminary was removed from New York to Mercersburg, to meet the educational requirements of her own communion, and with limited resources accomplished a wonderful work. Among the eminent men in its faculty were its first presidents, Drs. Frederick Augustus Rauch and John Williamson Nevin, and later on Dr. Philip Schaff, all of whom took high rank as philosophers and theologians. The college had a brilliant career, but declined for lack of endowment and pecuniary resources.

When the two colleges were united, James Buchanan became president of the new board of trustees, and the institution entered upon a prosperous career, although it had to make its way in the face of many obstacles and limitations. Its growth was checked by the Civil War, from the effects of which it but slowly recovered. During the last 15 or 20 years, however, its growth has been rapid, and it now compares favorably in point of equipment, grade of scholarship and number of students with its sister colleges in the State of Pennsylvania.

Franklin and Marshall College makes no pretense to be a university. It lays stress upon the college course as a means of liberal education, with sufficient elasticity in the way of electives to make first class preparation for technical or professional study. It confers the degrees of A.B. and B.S. for undergraduate work, and A.M. and M.S. for graduate work, after the completion of the prescribed courses and satisfactory examinations.

The site of the college is exceptionally fine. The prncipal buildings are the main building, the halls of the literary societies, the Daniel Scholl Observatory, the gymnasium, two Academy buildings, the De Peyster Library and the new Science building, with admirable equipment for physics, chemistry and biology. The libraries contain altogether about 48,000 volumes. The students in the college proper and the academy number 510, and the faculty 27. This account does not include the Theological Seminary of the Reformed Church, which, although in close proximity to the college, is a separate institution.

FRANKLINISM. See ELECTRICITY.

FRANKLINITE, a native oxide of zinc, manganese and iron, containing these metals in rather widely varying proportions. It crystallizes in the isometric system with octahedral habit, and also occurs in massive and granular forms. It is opaque, slightly magnetic and iron-black in color, commonly with a metallic lustre. Its hardness varies from 5.5 to 6.5, and its specific gravity from 5.07 to 5.22. In the United States its occurs in considerable quantity in the neighborhood of Franklin Furnace, N. J., taking its name from the locality, where it is mined as an ore of zinc, its manganese and iron being melted into «spiegeleisen,» an alloy used in the manufacture of Bessemer steel.

FRANKLIN'S AUTOBIOGRAPHY. Franklin began his autobiography while he was visiting the bishop of Saint Asaph at Twyford in 1771. This first instalment carried the account from 1706, the date of Franklin's birth, to 1731. It was intended solely for his own posterity, and contains what he called «several little family anecdotes of no importance to others,» but the manuscript proved so interesting to some of his friends that he was persuaded, when the Revolution had ended and he again found a little leisure, to continue his task for the sake of the public. At Passy in 1784 he wrote the engaging pages which tell of his early religious speculations and his pursuit of moral perfection. In 1788, once more at home in Philadelphia, he brought his history from 1731 to 1757, and the next year, the year of his death, added a brief section which breaks off, however, without going beyond his initial trials as agent of the Pennsylvania assembly. Part I was issued in French in 1791; Part II, in French in 1798; Part III, in English in 1817 (with I and II); Part IV, in French in 1828. The whole book, as Franklin wrote it, was first published in 1868 by John Bigelow, whose text and notes are indispensable.

Franklin was already a cosmopolite, a great diplomat and statesman, and an honored citizen of the world, when he thus related his small beginnings, but he assumed no posture in presenting himself as he had been when he was only a printer and provincial politician. Nothing can exceed the candor with which he tells of his struggles for a livelihood unless it be the lack of modesty with which he recounts his successes. He is, though he makes no claim to be heroic, actually the hero, in the 'Autobiography,' of one of the few universally interesting plots — that in which a man wins his way unaided. There is something essentially dramatic in Franklin's steady progress to wealth and influence; he had the golden touch which turns every material thing to some human advantage. And yet the book has no romantic coloring. The «family anecdotes» of Part I are neither intimate nor sentimental; the later comments upon style, politics, morals and religion take no higher tone than that of good sense; his noble achievements as scientist and philanthropist are narrated as quietly as the purchase of his first silver spoon. In part, of course, this classic simplicity is due to the fact that he wrote as a richly experienced man, incomparably bland, smooth-tempered, prudent and just; but it is due even more largely to the fact that Franklin was above all the citizen, that he lived most truly when his particular life was most involved in civil affairs. His language is the plain speech of the man who has no private eccentricities of thought or feeling; he instinctively chooses to tell about himself what he knows from his wide knowledge of the world that the world will want to know. The 'Autobiography' is not only one of the greatest of autobiographies; it is one of the most truly republican books ever written.

CARL VAN DOREN.

FRANKMARRIAGE, a species of estate entail once obtaining in England under the common law, but now obsolete. It existed when a man gave land, which he held in fee simple, to his daughter on her marriage, upon which the married couple become donees in frankmarriage, and the land could pass only to their issue of the fourth generation. This estate came into use under Henry II and was a favorite form of dowry until the reign of Elizabeth.

FRANKPLEDGE, the old English custom by which 10 inhabitants of a district made themselves responsible for any crime or injury committed by one of their number. At first only freemen could undertake the frankpledge, but later *villains* were admitted. When a crime was committed by a member the other nine compelled his appearance or held him to reparation. In case he absconded, they themselves were held to make reparation by the sheriff, who held court for this purpose. See CRIMINAL LAW.

FRANKS, SIR **Augustus Wollaston,** English archæologist: b. Geneva, Switzerland, 1826; d. London, 22 May 1897. He was graduated at Cambridge University in 1849; became an assistant in the British Museum in 1851; and served as keeper of the Department of British and Mediæval Antiquities for many years. He was knighted in 1888; and was president of the Society of Antiquities from 1892 till his death. His publications include 'Recent Excavations and Discoveries on the Site of Ancient Carthage' (1860); 'Guide to the Christy Collection of Prehistoric Antiquities and Ethnography' (1868); 'Catalogue of a Collection of Oriental Porcelain and Pottery' (1876), etc.

FRANKS («Spearmen»), **The.** In the 3d century A.D. (the name first appears in 240, under the Emperor Gordian) the scattered Teutonic tribes north and east of the middle and lower Rhine, in the present Westphalia, Hesse, Gelderland, etc., united in a loose confederacy; very probably compacted by the ancestor of the Meroving family, to whom the Franks clung so loyally and even stupidly for centuries. The tribes themselves were known from the early empire: Ampsivarii, Attuarii, Batavi, Bructeri, Chamavii or Gambrivii, Chatti, Cherusci, Sali, Sigambri, Usipetes, etc. In 253 under Valerian they raided Belgic Gaul, and half a century later had permanently settled south of the lower Meuse in Brabant. They are early distinguished as Salian and Ripuarian Franks: the former (from their chief tribe, perhaps originally on the Isala or Yssel) on the lower Rhine; the latter (*ripa*, bank) on both banks of the middle Rhine. The Salians, after heavy defeats by the Romans, became their allies and wardens of the marches; but when the pretender Constantine withdrew the Roman garrisons in 406 for his attempt on Italy, they overran central Belgium, and Colonia Agrippina (Cologne) shortly fell into their hands. By 450 they had reached the Moselle and the Somme, or Luxemburg and northwest France; but still acknowledged Roman sovereignty. They sent forces to help the Romans against Attila at Châlons; but when the Huns had retreated from the fortresses whence they had expelled the Romans,— Trier, Mainz, Metz, etc.— the Franks occupied them and the lands on the Rhine and Moselle instead of the Romans. The Salians now held the territory from the Scheldt to the Somme and Meuse, or most of Belgium and a little of France; the Ripuarians from the Meuse to the Rhine, and the lands along that river from the Lippe to the Lahn. They were still pagans; backward in the arts of war; had no political union or common head, though their chiefs all claimed Meroving descent; and were accused of being treacherous and perfidious even beyond barbarian wont, which their history makes probable.

When the Western Empire fell, the Rhone and Saône valleys were occupied by a Burgundian kingdom; central and northern France by a Roman province in a condition of anarchy; below which was the great Visigothic kingdom of Enric, taking in South France and nearly all the Spanish Peninsula. Five years later (481) a Salian prince of the upper Scheldt named Chlodovech (Latinized Clovis) acceded, and in 485 fell on the Roman province in alliance with other princelings. In three years he had conquered it, making Gaul to the Loire and Brittany a Frankish possession; refusing to share the spoil with his allies, he attacked and subjugated all the Ripuarians, slaying every Merovingian prince he could seize, in order to exterminate all rivals. In 492 he married Clotilda, the Catholic niece of the Burgundian king. In 496 he subdued the Alemanni, and Frankish settlers founded Franconia. On returning from his campaign he was baptized a Christian and subscribed to the Athanasian creed; and in a single generation the entire Frankish body, now consolidated into one, renounced paganism. He then conquered nearly all Visigothic Gaul. But Burgundy was too strong for him. He died in 511. The chance of Chlodovech becoming an Athanasian instead of an Arian had the most important consequences: alone of all the barbarian conquerors of Rome, his subjects were in religious sympathy with him, and his work endured, while the Arian kingdoms crumbled to pieces. This also began the career of the Frankish monarchy, which for centuries, as the champion of the Church, helped it and was helped by it.

Chlodovech began the practice of dividing the kingdom among his sons, which his successors followed; again and again death or the strong hand united the realms, again a legacy would divide them; and the records of the ferocious, half decrepit, perfidious Merovingians are the blackest in all European history for unredeemed wickedness and anarchy. Scarce one of them for a century lived to be 40, and scarce one showed any gleam of statesmanship to justify his atrocities or his even worse weakness. At last in 613 the dominions — which had generally followed the fourfold divisions of Austrasia, Neustria, Burgundy and Aquitaine — were united apparently finally, but the Merovingian kings ceased to have any but a nominal sovereignty. The great provincial governors, in the period of anarchy, had made their offices hereditary; the officers of state likewise — chamberlain, keeper of the seal, etc. Of these the mayors of the palace became the *de facto* rulers; keeping the kings as puppets, but making them live as country gentlemen, only attending court functions annually, in a farm-cart and with long hair. This mayoralty in Austrasia fell into the hands of one of the most wonderful families of the world, the Karlings or Carlovingians, who held possession of it for a century, till one of them became king; and later the mightiest of them, Charlemagne, became emperor of the Romans in a revived empire. Pepin, or Pippin of Landen, «the Elder,» was the first, dying 639; then his son Grimwald, murdered 656; the latter's sister married the son of Arnulf, bishop of Metz; and their son was Pepin the Younger or Pepin of Heristal, who, after 30 years of anarchy and partition and reunion following Grimwald's death, finally and forever reunited the Frankish realms by a crushing defeat of the allied forces of Neustria and Burgundy at the battle of Testry, 687. His son, Charles Martel (Hammer), who held power 717–41, carried civilization at the sword's point among the Germans, and in 732 routed a great Saracen army at Poitiers, saving France from the Mussulman. His son Pepin the Short, after 10 years of mayoralty, deposed the last driveling Meroving and ascended the throne. Pepin's son Charles (Carolus Magnus, Charlemagne, perhaps with a confusion of the title with the name Carloman), acceded in 768. As warrior, statesman and lawgiver, he stands among the foremost of all time. The Frankish realm as such attained by far its greatest extension under him — though it is incorrect to say, as is usual, that his work perished with him, for the territorial divisions of his realm never went back to their old anarchy. He ruled a vast congeries of races, from North Spain to North Germany, and from the Hungarian plains to the English Channel; and he brought them all under the reign of law and Christianity, inheritors of the memories and civilization of Rome. In 800 he crowned the career of the Franks begun by Clovis, becoming secular head of a Holy Roman Empire, of which the Pope was the spiritual head. Whether it was well judged or beneficial to the world, historians are still divided. The history of Charlemagne's successors is not the history of the Franks: after this they became merged in a wider aggregation.

The Frankish dominion was the conduit through which the treasures of Rome, political, social and ecclesiastical, were given to the world. Roman law, Roman literature and the Christian religion were forced on the barbarians through the Franks: their impress, deep and strong, was laid in the foundations of European civilization. The best modern compendium is Oman's 'History of the Dark Ages' (London 1901). Consult also Emerton, 'Introduction to the Study of the Middle Ages' (Boston 1895); Hodgkin, 'Italy and Her Invaders' (8 vols., Oxford 1890–99); Sergeant, 'The Franks' (New York 1898).

FRANSECKY, frăns'kē, **Eduard Friedrich von,** German general: b. Gedern, Hesse, 1807; d. 1890. In 1825 he entered the Prussian army and became a member of the general staff in 1843. He distinguished himself in the war with Denmark in 1848, and by his resistance against seemingly overwhelming odds won a decisive engagement at Münchengratz in the Austro-Prussian War of 1866. He was also prominent in the battle of Sadowa. In 1870–71 in the war against France he commanded the Second Army Corps, and by a forced march reached the battlefield of Gravelotte where he threw the First army against the Pont-du-Jour Heights. Late in the year while commanding the army between the Marne and the Seine he repulsed the great effort of Ducrot's forces to break this line. He was transferred to the East and assisted in the operations which obliged Bourbaki's army to retreat and be interned in Switzerland. He was decorated with the Order of the Black Eagle and received $450,000 marks in recognition of his distinguished services. In 1879 he became governor of Berlin. He resigned this post in 1882. Consult Von Bremen, 'Memoirs of Friedrich von Fransecky' (Bielefeld 1901).

FRANTZ, Konstantin, German publicist: b. Halberstadt, 1817; d. 1891. He was educated at the universities of Halle and Berlin. For some time he studied and wrote on mathematics and philosophy, and also acted as private secretary in the Berlin Foreign Office. He entered the consular service and spent the years 1853–56 in this service in Spain. His work is interesting in view of subsequent events. Russia he believed to be the greatest menace to his country and Europe and after Russia the United States, with its free institutions, and its utter disregard for rockbound political theories. The central idea in his works, therefore, is the necessity of establishing a confederation of central European powers directed against the United States and Russia this confederation to be built around Austria and Germany. His chief works are 'Der Föderelismus als das leitende Princip für die soziale, staatliche und internationale Organization' (1879); 'Die Weltpolitik' (1882–83); and part of Schuchardt's 'Die deutsche Politik der Zukunft' (1899). Consult Schuchardt, 'Frantz, Deutschlands wahrer Realpolitiker' (Melsungen 1896).

FRANZ, Robert, German composer: b. Halle, 28 June 1815; d. Berlin, 24 Oct. 1892. The family name originally Knauth, was legally changed to Franz in 1847. He began the study of music at an early age and in opposition to his parents. At the age of 20 he went to Dessau where he studied under Schneider 1835–37. Upon his return to Halle he studied the great masters, paying special attention to Bach, Handel and Schubert, and in 1843 published his first set of 12 songs, which won the warm praises of Schumann, Mendelssohn, Liszt and other masters. From then till 1868 he held various appointments at Halle. In that year owing to ill health and deafness, he was obliged to give up his positions, and was soon reduced to poverty. A series of benefits were organized by his friends in America and Germany and alleviated his dependency. His arrangements of some of Bach's and Handel's works are standard, but it is as a song writer that he is best known and his fame assured. He published over 250 songs with pianoforte accompaniments, a Kyrie and several chorales and four-part songs, besides arrangements of the vocal masterpieces of Bach and Handel. Franz's best songs rank with those of Schubert and Schumann. Consult Prochaska, 'Robert Franz' (Leipzig 1894).

FRANZ, Shepherd Ivory, American psychologist: b. Jersey City, N. J., 27 May 1874. He was graduated at Columbia University in 1894, and later studied at the University of Leipzig. In 1897–99 he was assistant in psychology at Columbia, was assistant in physiology at Harvard 1899–1901, instructor in physiology at Dartmouth Medical School 1901–04, pathological psychologist at the McLean Hospital, Waverley, Mass., 1904–06. In 1906 he became professor of experimental psychology and physiology at George Washington University, in 1907 psychologist and in 1910 scientific director in the same institution. He is a Fellow of the American Association for the Advancement of Science and member of many other learned bodies. He is author of about 70 monographs and articles on psychology, neurology and psychopathology, including the volume 'Handbook of Mental Examination Methods' (1912).

FRANZ-DREBER, frănts' drā'bĕr. See Dreber, Heinrich Franz.

FRANZ-JOSEF LAND, frănts'-yō'zĕf-länt, an Arctic archipelago, north of Nova Zembla, extending, so far as it has yet been explored, between latitude 80° and 83° N. It consists of about 100 small islands divided by fjords, channels and sounds. The chief islands are Alexander in the west, Graham Bell in the east, Wilezek, Prince George, Prince Rudolph in the north, Cape Fligely and Northbrook. The whole archipelago, which rises into isolated flat-topped or dome-shaped mountains of basalt, 5,000 feet high, is sheeted with ice. The islands are of volcanic origin and are composed mostly of Juranic basalt. Fossil strata are numerous. The winter sun is absent four months, and the climate is in consequence distinctly polar. Auroral displays are on a magnificent scale. The average temperature in winter is about — 19° F., and in summer 35° F. There are dense fogs and violent gales often continued for days. The chief plants are lichens, and grasses, and yellow and white poppy, and cresses. The mosses form thick carpets in places with a brilliant coloring. There is a comparative abundance of animal life — bears, walruses and foxes occurring, also ringed seals. Of birds are found the snow bunting, eider duck, purple sandpiper, various gulls, guillenots, the little auk, brant goose, snowy owl and Arctic tern. Of insects there are only six species. The archipelago was discovered and partly explored by Payer and Weyprecht in 1873–74; its southern shores were explored by Leigh Smith in 1880–82, and much of it by the Jackson-Harmsworth expedition in 1895–96; also by Nansen in his retreat 1896; Wellman in 1898 and 1900; by the Duke of the Abruzzi 1899–1900, in which Cagni made the then world's record of 86° 33'; by Baldwin-Zeigler in 1901–02; and by the Fiala-Ziegler Expedition in 1903–05. (See Polar Research). Consult Duke of the Abruzzi, 'On the Polar Star in the Arctic Sea' (2 vols., New York 1903); Greely, 'Handbook of Polar Discoveries' (Boston 1911); Jackson, 'A Thousand Days in the Arctic' (New York 1899); Payer, 'New Lands Within the Arctic Circle' (Eng. trans., London 1876); Peters, 'Ziegler Polar Expedition, Scientific Results' (Washington 1907); Weyprecht, 'Sulla spedizione polare austro-ungarica' (Trieste 1875).

FRANZEN, August, American portrait and genre painter: b. Norrköping, Sweden, 1863. He came to America while still a boy, and went to Paris where he studied under Dagnan-Bouveret. There he carefully prepared himself for the careful and conscientious work as a portraitist which has filled so great a part of his artistic career. He settled in New York and became a member of the Society of Amercan Artists in 1894, and an associate of the National Academy in 1906. He has painted many celebrities and his exhibitions are largely attended. He was awarded a medal at the Chicago Exposition of 1893, and a bronze medal at the Paris Exposition of 1900. His 'Yellow Jessamine' hangs in the Brooklyn Institute Museum.

FRANZENSBAD, frănt'sĕns-bät, **EGER-BRUNNEN,** ā'gĕrbroon-nĕn, or **KAISER-FRANZENSBAD,** Bohemia, a celebrated Austrian watering-place, about four miles northwest of Eger, with which it is connected by a fine avenue. It is situated amid low, bare hills, and consists of four rectangular streets lined with trees. The mineral springs here were known in the 16th century, and even at that time the waters were bottled and sent to a distance. It was selected as a watering-place in 1793 by the Emperor Frances II (of Germany — Francis I of Austria), from whom it received its present name. The bathing establishment consists of an irregular building erected over the springs with a long colonnade extending to the Kurhaus, where the visitors assemble, and the balls and concerts are given. The springs, 12 in number, are alkaline, saline, chalybeate, and are very efficacious in cases of anæmia, dyspepsia, etc. The mud baths of Franzensbad are much used by those suffering from gout, rheumatism, skin diseases, etc.

FRANZENSKANAL, frănts'ens-kä-näl', or **BÁCSER CANAL,** canal of Hungary, constructed in 1801, connecting the Danube from a point about 20 miles south of Mohacs with the Theiss at a point about the same distance south of Zenta, and passing through Zombor and Kula. About midway between these cities a branch canal leaves it and goes southeast to the Danube at Veusatz. The main canal is 65 miles long, 65 feet wide and 6½ feet deep. The branch line is 35 miles long and of equal depth and width.

FRANZOS, frăn-tsōs', **Karl Emil,** Austrian author: b. Russian government of Podolia, 1848; d. 1904. His early days were spent in the place described in his stories. After passing state examination in law, he became a journalist and traveled, 1872–76, through Europe, Russia, the Danubian lands, Turkey and Egypt, settling in 1876 in Vienna where he wrote three famous books that have been translated into many languages: 'Halb Asien,' 'Vom Dom zu Donau' and 'Aus der Grossen Ebene.' From 1882–85 he edited the *Neue Illustrirte Zeitung*, and in 1880 founded and edited the *Deutsche Dichtung*, moving to Berlin in 1887. Stressing rather the tragic sides of Jewish life among the Galician Jews, he wrote 'Die Juden von Barnow' (1877); 'Moschko von Parmo' (1880); 'Judith Trachtenberg' (1881), which have appeared in numerous editions and languages. His 'Ein Kampf ums Recht' (1887) is broader in vein, dealing with farmer's rights in Bukowina. He was the author of many other works in fiction and biography, and his books have been widely translated. His wife, Ottilie Benedict (b. Vienna, 24 Sept. 1856), wrote 'Das Adoptiv Kind und Andere Novellen' (1890), and 'Schweigen' (1902).

FRAPAN (fră'pän) **ILSE,** the pseudonym of the German novelist and poet Ilse Levien (q.v.).

FRAPOLLI, fră'pōl-lē, **Lodovico,** Italian diplomat and patriot: b. Milan, 1815; d. 1878.

He was forced to join the Austrian army in 1831, but left it in 1836. He went to Paris in 1840 to study at the School of Mines. His works deal principally with the origin of the earth, its formation, etc., the geological formation of Germany, Scandinavia, etc., in which countries he traveled extensively in 1843–47. He was for some time secretary of the French Geological Society. During the revolutionary year of 1848 he fought at Paris and subsequently was made War Minister of the Lombardy government. He returned to France as Ambassador of Lombardy, and later of Tuscany and the Roman republic. After the capture of Rome, he lived in succession in Switzerland, Sardinia and France. In 1860 he joined Garibaldi's forces in Sicily and entered Naples with him. He was an Italian deputy from 1860 to 1874, and was an extreme member of the Republican party. He was prominent in Masonic circles. In 1870 he fought with Garibaldi in France. He died in a sanitarium, after a lingering illness.

FRAS, or FRAZ, Jacob. See VRAZ, STANKO.

FRASCATI, fras-kä'tē, Italy, summer resort in the province of Rome, on the north side of the Alban Mountains, 15 miles southeast of Rome. It is the see of a cardinal bishop and contains two churches over 11 centuries old. There is a memorial tablet in the church of San Pietro, to Charles Edward Stuart, the Young Pretender, whose body was buried here in 1788, but is now in Saint Peter's, Rome. Frascati contains many famous estates or villas, the more notable of which are the Villa Torlonia, formerly Conti; the Villa Lancelotti, formerly Piccolomini, where Cardinal Baronius composed his 'Church History' in the 16th century; the Villa Aldobrandini, in which are paintings by the Cavaliere d'Arpino; the Villa Ruffinella, once owned by Lucien Bonaparte and later by Victor Emmanuel II. For the robbery of Lucien Bonaparte at this villa see Irving's 'Adventure of an Artist.' In the neighborhood are the ruins of an amphitheatre, the villa of Cicero, a Roman theatre and reservoir. The city is famous for its wine. Pop. 10,577. Consult Ashby, T., 'Papers of the British School at Rome' (Vol. IV, London 1907).

FRASCH, fräsh, **Herman,** American chemist and inventor: b. Gaildorf, Wurttemberg, Germany, 1852; d. 1914. He began the practice of pharmacy in 1868, and after his arrival in the United States entered the laboratory of Professor Maisch at the Philadelphia College of Pharmacy. In 1874 he established his own laboratory. Many of his earlier inventions were connected with the production of oil, salt, wax and white lead. In 1885 he entered the petroleum refining business on his own account in London, Ontario; here he devoted himself so successfully to the refining and purification of Canadian oils that his product, the highest grade of pure oil, became a serious competitor to Pennsylvania oil. The patents and works were purchased in 1888 by the Standard Oil Company and the processes were put into practice at the various plants of this company throughout the United States. Further patents for the treatment of petroleum and petroleum products were issued to Mr. Frasch. In 1890 he took a patent on an apparatus that is regarded as an epoch-making improvement in the sulphur industry. He erected a plant at the deposits of native sulphur in Louisiana and by sending down superheated water through a boring of 1,000 feet he melted the sulphur, which then ascended to the surface through an inner tube in the boring. The melted sulphur is then pumped into bins several feet high, in which it solidifies, and the blocks are later broken up and loaded directly on cars. The result of this invention has been a reduction of the importation of sulphur into the United States to less than one-tenth of its former proportions, and a corresponding increase in home production. Frasch was awarded the Perkin medal in 1912.

FRASER, Alexander, Canadian Gaelic scholar and author: b. Inverness-shire, Scotland, 1860. He was educated at Perth and at Glasgow University. He came to Canada in 1886, entered journalism, became city editor of the Toronto *Mail* and later of the Toronto *Mail and Empire*. He also edited successively the *Scottish-Canadian*, the *Presbyterian Review* and *Fraser's Scottish Annual*. He was lecturer in Gaelic at Knox College, Toronto, for many years and delivered the annual Gaelic address before the Gaelic Society at Inverness, Scotland, in 1895. He was elected president of the Gaelic Society of Canada and of the Canadian Folklore Society, and in 1906 became archivist of the province of Ontario. His works include 'Short Scottish-Canadian Biographies'; 'Essays on Celtic Literature'; 'Practical Lessons in Gaelic Grammar'; 'The Mission of the Scot in Canada'; 'The Last Laird of MacNab' (1899); 'The 48th Highlanders of Toronto' (1900); 'The History of Ontario' (1907); 'The Brock Centenary 1812–1912' (1913).

FRASER, Alexander Campbell, Scottish philosophical writer: b. Ardchattan, Argyleshire, 3 Sept. 1819; d. 2 Dec. 1914. He was a lecturer on mental philosophy in the New College, Edinburgh, 1846–56, editor of the *North British Review*, 1850–57; and professor of logic in Edinburgh University, 1856–91. His principal productions are 'Essays in Philosophy' (1856); 'Rational Philosophy' (1858); a memoir of Bishop Berkeley, with a collected edition of his works (1871–90); an annoted edition of Locke's 'Essay on the Human Understanding' (1894); 'Philosophy of Theism' (1898); a valuable personal retrospect entitled 'Biographia Philosophica' (1904); 'Berkeley and Spiritual Realism,' (1909), etc.

FRASER, Charles, American painter: b. Charleston, S. C., 20 Aug. 1782; d. there, 5 Oct. 1860. He studied law, was admitted to the bar in 1807, but withdrew from practice in 1818, and acquired, particularly in the South, a considerable reputation as a miniature-painter. His sitters included Lafayette (1825) and most prominent South Carolinians for 50 years. He also painted interiors, landscapes, genre and still-life scenes, and historic subjects. An exhibition of his works at Charleston in 1857 comprised 313 miniatures and 139 other canvases in oils. Publication 'Reminiscences of Charleston' (1854).

FRASER, Mrs. Hugh. See FRASER, MARY.

FRASER, James, English prelate: b. Prestbury, Gloucestershire, 18 Aug. 1818; d. Manchester, 22 Oct. 1885. He was educated at Lincoln College, Oxford, took orders in the English Church and was rector at Cholderton, Wiltshire, 1847–60; and of Upton Nervet, Berkshire, 1860–70. He was made assistant commissioner of education in 1858 and in the following year rendered a memorable report on his division. In 1870, soon after his refusal of the bishopric of Calcutta, he became bishop of Manchester, in which position he gained the approbation of churchmen and non-conformists alike, as also other religious denominations, which earned him the sobriquet of "bishop of all denominations." Under his administration the diocese made a most remarkable advance. He opposed the Tractarian movement and belonged to the old High Church school of theology. Bishop Fraser was greatly interested in educational matters and visited the United States and Canada in 1865 as a commissioner of education, subsequently publishing a 'Report on the Common School System of the United States and of Upper and Lower Canada' (1866). A bronze statue of Bishop Fraser stands in the square before the town hall of Manchester, and in the Fraser Chapel of the cathedral of Manchester is a recumbent statue in marble of the much-beloved prelate. He published some addresses and sermons and various reports as commissioner of education. Consult Bryce, 'Studies in Contemporary Biography' (New York 1903); Diggle, 'The Lancashire Life of Bishop Fraser' (3d ed., London 1889); id., 'Sermons of Bishop Fraser' (1887–88); and 'Memoir of Bishop Fraser' (1887).

FRASER, Mary (Mrs. Hugh Fraser), English novelist: b. Rome. She is a sister of F. M. Crawford (q.v.), the novelist, and was married to Hugh Fraser, English Minister to Japan, who died in 1894. She traveled with her husband in America and the Orient and in 1884 embraced the Roman Catholic faith. In her works she seeks to interpret the spirit of the new Japan. She is the author of 'The Brown Ambassador' (1895); 'Palladia' (1896); 'A Chapter of Accidents' (1897); 'The Looms of Time' (1898); 'A Diplomatist's Wife in Japan' (1899; new ed., 1911); 'The Custom of the Country; or Tales of New Japan' (1899); 'The Splendid Porsenna' (1899), a story of modern Roman society. She published also 'Letters from Japan' (1904); 'A Diplomat's Wife in Many Lands' (1910); 'Further Reminiscences' (1912); 'The Honor of the House,' with J. J. Stahlman (1913); 'Italian Yesterdays' (1914); 'The Bale Fire' (1914); 'Captain Corbeau's Adventure' (1914); 'Seven Years on the Pacific Slope' (1915).

FRASER, Simon. See Lovat, Twelfth Lord.

FRASER, Sir Thomas Richard, English physician: b. Calcutta, 5 Feb. 1841. He was educated at Edinburgh University in 1862 and was assistant physician to the Royal Infirmary 1869–74. He became examiner in materia medica 1870–75, and in public health 1876–79 in the University of London. In 1877 he was a member of the Admiralty committee on Sir George Nares' Arctic Expedition 1877, in which year he became professor of materia medica at Edinburgh and of clinical medicine in the following year. He was dean of medicine at Edinburgh from 1880 to 1900, was president of the Indian Plague Commission 1898–1901, president of the Royal College of Physicians of Edinburgh 1900–02. In 1902 he was knighted. He is well known as an authority on poisons and has published 'An Investigation into Some Previously Undescribed Tetanic Symptoms Produced in Cold-blooded Animals' (1867–68); 'An Experimental Research on the Antagonism between the Action of Physostigma and Atropia' (1870); 'The Character, Action, and Therapeutic Uses of Physostigma' (1883), and 'Duspnœa of Bronchitis and Asthma' (1887).

FRASER, William Alexander, Canadian author: b. Picton County, N. S., 24 March 1859. He traveled widely and became a mining engineer, but subsequently turned his attention to writing. He has contributed much to English and American magazines and has achieved distinction as a writer of short stories. 'The Eye of a God and Other Stories' first attracted attention (1892); and he published in 1900 an interesting collection of animal stories, 'Mooswa and Others of the Boundaries.' Other works are 'The Outcasts' (1901); 'Thoroughbreds' (1902); 'Brave Hearts' (1904); 'Sa'zada Tales' (1906); 'The Lone Furrow' (1907).

FRASER RIVER, the principal river in British Columbia. The larger fork of the Fraser rises in lakes in lat. 55° N. and long. 124° W. After flowing southeast for about 160 miles it joins the lesser fork, which has a length of 200 miles from its source in the Rockies to the junction. The main stream flows through the province from north to south for 725 miles and enters the Gulf of Georgia a little north of the United States boundary line. The Fraser receives the waters of the Stuart, Quesnelle, Blackwater, Thomson, Chilcotin and of many lesser streams. It is navigable for 100 miles in its lower course and in a part of the upper course between Fort George Cañon and Soda Creek vessels of light draft navigate the stream. It is subject to floods from April to August, often rising 60 feet above normal high water in the narrow reaches and covering about 200,000 acres in the valleys lower down. Gold was discovered in its bed in 1857 and for some years the rush thither rivalled those of California and Australia. Its lower watershed is densely forested. Great quantities of timber are floated down the river and its tributaries. The salmon, of which there are five species, are world famous, and the fishing and canning industries are of some importance. The river was named after Simon Fraser, who explored it in 1808.

FRASER RIVER SALMON and others of the genus *Oncorhynchus nerka,* the blueback, redfish, which are common in the Fraser River and other streams of British Columbia.

FRASERBURGH, Scotland, seaport in Aberdeenshire, 42 miles north of Aberdeen. It contains a handsome cross, town hall, large custom-house; the streets are wide and clean. In the neighborhood to the north is the Promontorium Tœxalium of Ptolemy, now Kinnaird Head, on which stands Fraser's ancient castle, utilized as a lighthouse, with its mysterious wine tower and cave. Fraserburgh is the chief centre of the Scottish herring fishery, and in addition to cured herrings and cod, exports barley, meal, oats and potatoes. It has three tidal harbors, and its shipping includes 14 sailing vessels, 8 steam vessels and a fleet of 700 fishing boats. The herring trade is valued at $1,000,000 annually. Pop. 11,151. There is a large increase in the number of inhabitants during the fishing season (July and August).

FRASERVILLE, or **RIVIÈRE DU LOUP,** rē-vyār' dü loo, Canada, a town and county-seat of Temiscouata County, Quebec, on the south shore of the Saint Lawrence at the confluence of the Rivière du Loup, 116 miles below Quebec. It is on the Intercolonial Railway and is the terminus of the Temiscouata Railway. Its permanent population is almost entirely French Canadian. It has railway workshops, and manufactories of pulp, leather, lumber, furniture, iron products, butter and flour. It is a popular summer resort. Pop. 6,774.

FRATERNAL INSURANCE. See INSURANCE, FRATERNAL.

FRATERNAL SOCIETIES IN AMERICA. A fraternal society is defined as a corporation or voluntary association organized and carried on for the sole benefit of its members and their beneficiaries. It has no capital stock and is not operated for profit. Every such society must have a representative form of government, and is supposed to operate on the lodge system, with a ritualistic form of work for the meetings of the lodges or other designated subordinate bodies. It has power to adopt its own constitution, by-laws, rules and regulations for the orderly conduct of its affairs, and in general terms may manage its internal interests as it may deem best. Although the American fraternities have the same basis as the friendly societies (q.v.) of England and Scotland, they are a purely American institution, organized without reference to, and at the outset of their career, in entire ignorance of the fact that the same system was in successful operation elsewhere. At the present time the laws governing the fraternal system are in a state of transition, and as the fraternal societies are the creatures of, and governed by the laws of, the different States, any change in those laws will necessarily change or modify the system as at present operated.

There are two representative bodies, claiming to act for, and represent a large constituency among the fraternal associations. The National Fraternal Congress, organized in 1886, represents the larger number of leading societies. From its official reports it appears to aim at eventually securing the adoption of a uniform law throughout the United States and Canada, defining as fraternal society, as above expressed, with the addition, that every society shall pay a death benefit on the death of a member, and may pay disability payments, resulting from accident, disease or old age. During the years 1900 and 1901 the Congress made a vigorous effort to secure the passage of a uniform bill in the legislatures in all the leading States, restricting the benefits, coupled with a provision requiring all the newer organizations to charge adequate rates, but allowing the older societies to continue their low rate assessment system. This action was bitterly opposed by the minority of the Congress and by a still larger number of other associations that were not affiliated with the Congress. The result of this opposition was the defeat of the proposed law in every State where a contest was made.

The outside societies that participated in this contest, feeling the need of a union for mutual protection thereafter, immediately after the contest was ended met together and in March 1901 organized the Associated Fraternities of America, with the avowed object of opposing any further changes in the laws of the different States until public sentiment was ripe for the adoption of a uniform law on the basis of the largest liberty to each society in the matter of benefits, provided adequate rates are charged therefor. This dissension among the fraternal societies induced the convention of the insurance commissioners of the different States to formulate a proposed law for the government of fraternal societies, containing many new and startling features.

All the early fraternal associations collected their contributions from their members by means of assessments, the rate of which, except in two instances, was graded according to age at entry, and each member was required to pay such a number of assessments each month as might be needed to meet the death losses. As these older organizations advanced in years, their death losses necessarily increased in number, and with increased death losses the number of assessments each month also increased. During this period many new societies were organized on the same system and while young naturally had a low death rate and a low mortality cost per member. Being much cheaper they naturally attracted members from their predecessors until they were displaced in popular favor by other new creations on the same plan. Whatever differences of opinion may now exist among fraternalists as to the need of the systems at the present time, they all agree that the old assessment system has been a failure, and should be superseded by rates based on the recognized mortality tables. The newer organizations profited by the experience of the older societies, and generally started with higher rates, and this fact has made it much easier for them to provide for their deficiencies. A large number of the younger organizations are, and for some years have been, charging adequate rates, and the protection they furnish is as safe as the insurance supplied by any insurance company.

The real basis of the fraternal system in America is the fraternal bond of union, uniting the members together in a common cause for mutual beneficial and protective purposes. The lodge system requires meetings of the members at least once a month, and therefore directly tends to draw the members closer together. Every member thus participates in the work of the organization and the emulations aroused among the different lodges naturally produces the best results at the least outlay. Bread cast upon the waters will return, and it is the act of casting that produces that wonderful change in the human heart, which constitutes the return. A mother is fonder of her offspring than the father, and both parents love a crippled child more than the sturdy members of the flock, and the reason is the same. The mother suffers more and bears more than the father, and both do more for the cripple than for the healthy child. No one ever did a good deed, or thought to do a good act without feeling the better for it, and thus no person ever did or can participate in the good work that the various lodges of the fraternities are engaged in without growing to love the work and the organization which does the work. This ennobling influence upon the membership is not by any means the least of the many blessings conferred upon the American people by the fraternal system. This same influence naturally impels the members to labor without compensation for the growth and prosperity of the organization and thus at a low cost produce results beyond the dreams of avarice to the insurance companies.

Every society is required to have a representative form of government and is governed by its constitution and laws, as enacted, or from time to time amended by the constituted authorities. Its constitution and laws therefore constitute the contract between the members in their relations to the society. The protection furnished by such societies is not insurance in the ordinary sense in which that word is understood and used. No society can issue a certificate in favor of a creditor of the member and the benefits furnished under the certificate cannot be attached for the debt of the member. The beneficiaries are limited to husband or wife, affianced husband, or affianced wife, or some heir, blood relative or dependent of the member. In insurance anyone having an insurable interest in the life of the policy holder may be named as beneficiary while under a fraternal certificate the beneficiary is limited by the bonds of affection and duty. In the one case a beneficiary has a vested interest in the policy and it cannot be changed without her consent, while in the other the beneficiary has no vested rights whatever until the claim matures; and the member may have his certificate changed in favor of another beneficiary without her knowledge or consent.

There are numerous other societies conducted on the same principle. According to the reports of the supreme bodies of these organizations for 1916 the membership of the principal fraternal organizations in the United States and Canada was as follows, beginning with the largest:

Freemasons	1,760,277
Odd Fellows	1,622,100
Modern Woodmen of America	921,899
Eastern Star, Order of	800,000
Woodmen of the World	732,385
Knight of Pythias	729,053
Rechabites, Independent Order of	701,040
Good Templars, International Order	620,000
Loyal Order of Moose	620,000
Improved Order of Redmen	479,033
Benevolent and Protective Order of Elks	442,658
Royal Arch Masons	422,359
Order of Eagles	400,000
Ancient Order of United Workmen	350,000
Knights of Columbus	346,560
Order of Owls	346,754
The Maccabees	331,756
Ancient Order of Hibernians	250,000
Royal Arcanum	244,722
Knights Templar	237,368
Independent Order of Foresters	218,074
Junior Order of United American Mechanics	230,000
Nobles of the Mystic Shrine	220,000
Foresters of America	205,756
B'rith Abraham Order	194,490
Brotherhood of American Yeomen	196,478
Woman's Benefit Association of the Maccabees	179,176
Knights and Ladies of Security	155,399
Ladies' Catholic Benevolent Association	155,080
Loyal Orange Institution	150,000
Tribe of Ben Hur	101,011
Orioles, Order of	98,781
Sons and Daughters of Liberty	90,265
Protected Home Circle	88,252
Fraternal Aid Union	80,000
Mystic Workers of the World	83,538
Knights of the Golden Eagle	78,112
Court of Honor	75,786
United Commercial Travelers of America	72,964
Order of Gleaners	71,070
Daughters of America	68,000
Improved Order of Heptasophs	65,604
Knights and Ladies of Honor	65,855
Catholic Mutual Benefit Association	64,615
National Union	62,028
New England Order of Protection	53,619
Hermann's Sons	42,000
Ladies of the Modern Maccabees	50,088
Independent Order of B'nai B'rith	40,083
Knights of Malta	40,000
United Order of American Mechanics	36,316
Patriotic and Protective Order of Stags	34,827
Veiled Prophets of the Enchanted Realm	34,000
Fraternal Brotherhood	26,495
Royal League	32,756
Sons of Saint George	32,000
Order of United Ancient Druids	30,968
Smaller organizations	236,841
Total	16,118,931

All the older associations operate on what is known as grand jurisdictions consisting of representatives elected by the subordinate lodges within the limits of the grand jurisdiction. It in turn sends delegates to the supreme body, which is the highest authority in the organization. As a general rule the supreme body assumes all liability for death or disability payments that are permanent in their nature, and the subordinate lodges assume and pay the sick or other temporary disability benefits. Each member pays his share of all benefits through the local lodge, of which he is a member, the dues going to the supreme office, being remitted direct, and not through the grand jurisdiction. As a rule the grand jurisdiction covers a State, and has supervision over the growth and general management of all the lodges within its territory. Of late years the tendency has been to do away with the plan of grand jurisdictions and have the supreme body composed of delegates elected either directly by the lodges or by districts composed of a number of lodges. The officers are usually elected by the supreme body, but in some cases are elected by a direct vote of the members.

To sum up in a word: a fraternal society is a brotherhood of members, bound together by its fraternal bond of union. It is organized and carried on for the sole benefit of its members and their beneficiaries. It operates on the lodge system, and uses a ritual in the meetings of its lodges and the initiation of its new members. It has a representative form of government, in which the management is responsible to the members for the faithful performance of their duties. It is governed by a constitution and laws enacted by the representatives of its members, and it furnishes its members, in all the States, with protection in case of death, and in many of the States with protection in case of disability resulting from illness, accident and old age after the expectancy of life, and in some of the States with still more liberal benefits. See INSURANCE, FRATERNAL, and the articles on the different fraternal organizations.

FRATERNITIES, religious societies for pious practices and benevolent objects. They were often formed during the Middle Ages, from a desire of imitating the holy orders. From the 12th to the 15th century nothing was considered more meritorious than to form and belong to such orders. The laity, who did not wish to pronounce the monastic vows, entered into associations in order to gain some of the advantages of the religious even in their worldly life. These societies were at first formed without any ecclesiastical interference, and on this account many of them, which did not obtain or did not seek the acknowledgment of the Church, had the appearance of separatists, which subjected them to the charge of heresy. The pious fraternities which were formed under the direction of the Church or were acknowledged by it were either required by their rules to afford assistance to travelers, to the unfortunate, the distressed, the sick and the deserted, on account of the inefficiency of the police, and the want of institutions for the poor, or to perform certain acts of penitence and devotion. Of this description were the Fratres Pontifices, a brotherhood that originated in Tuscany in the 12th century, where they maintained establishments on the banks of the Arno, to enable travelers to cross the river and to succor them in case of distress. A similar society was afterward formed in France, where they built bridges and hospitals, maintained ferries, kept the roads in repair, and provided for the security of the highways. A bridge of 18 arches over the Rhône at Avignon, built by Saint Bénézet in 1177 and another of 22 arches over the same river at Pont Saint Esprit, built between 1265 and 1309, were among their greatest achievement in bridge-building. They gradually amassed great wealth by alms and gifts. In 1519 they were secularized on account of the abuses that had crept into the order.

Similar to these were the Knights and Companions of the Santa Hermandad in Spain; the Familiars and Cross-bearers in the service of the Spanish Inquisition; the Calendar Brothers in Germany; the Alexians in Germany, Poland and the Netherlands, etc. The professed object of the Alexians was to visit the sick and imprisoned; to collect alms for distribution; to console criminals, and accompany them to the place of execution; to bury the dead, and to cause masses to be said for those who had been executed, or for persons found dead. They derived their names from Alexius, their patron saint, and were at first principally composed of persons from the lower classes of the people in the Netherlands. They were afterward increased by the addition of the female branch, the Black Sisters. Although lay brothers they had houses, and formed their order into two provinces under an ecclesiastical government. They still exist, in the societies for burying dead bodies, in Antwerp, Utrecht and Cologne. The Brothers of Death, of the order of Saint Paul, were dressed in black, like the Alexians, and were distinguished by a death's head on their scapulary. They were suppressed by Pope Urban VIII.

There were also Gray Penitents (an old fraternity of an order existing as early as 1264 in Rome, and introduced into France under Henry III), the black fraternities of Mercy and of Death; the Red, the Blue, the Green and the Violet Penitents, so called from the color of their cowl; the divisions of each were known by the colors of the girdle or mantle. The fraternity of the Holy Trinity was founded at Rome in 1548 by Philip de' Neri for the relief of pilgrims and the cured dismissed from the hospitals. The Brothers of the Christian Schools are a fraternity founded near the end of the 17th century, the statutes of which were approved by Benedict XIII. Their labors have been of great service in the cause of elementary and secondary education in France, though their work is not confined to France but extends over a large part of the world, including Belgium, North and South America and England. They take religious vows, wear a suit of clerical dress and always work in pairs. In Ireland there is a body of Christian Brothers modeled on the French one, the first of its schools having been opened at Waterford in 1804. Their schools have spread over Ireland, and their system of education has received the approval of various royal commissions.

The Brothers of Common Life, founded at Deventer in Holland by the celebrated theologian, Gerald Groot, toward the end of the 14th century, and formally approved by Gregory XI in 1376, were a fraternity which performed great services to learning, especially theological learning. From Holland they spread rapidly over Germany, and increased so greatly in numbers that 500 houses belonged to the order in 1460. The Roman Catholic Church is indebted to it for a text of the Latin version of the Bible by Saint Jerome, most carefully prepared by a collation of the most ancient manuscripts. This text was consulted as an authority by the editors of the Bible prepared at the command of Sixtus V. The same order prepared some texts of the Christian fathers.

The Brothers of Charity are another fraternity whose hospitals are found in the principal cities. It was founded by Saint John de Dieu in Spain in 1540. Much better known in Great Britain are the Sisters of Charity (called also Gray Sisters, Daughters of Charity, Sisters of Saint Vincent de Paul), a Roman Catholic order founded in 1634 at Paris by Saint Vincent de Paul for the purpose of nursing the sick in hospitals. The sisters take vows of poverty, chastity and obedience, besides a vow binding themselves to serve the sick. Besides conducting hospitals and nursing, they sometimes undertake the management of poor schools. They attend the sick of every nation and religion. There is also a body of Irish Sisters of Charity, separate from the one just mentioned. See GREEK-LETTER SOCIETIES or COLLEGE FRATERNITIES and ORDERS, RELIGIOUS.

FRATERNITIES, College. See GREEK-LETTER SOCIETIES.

FRATICELLI, frăt-ĭ-sĕl-ĭ or chĕl'ē, a name applied to several heretic sects in the Middle Ages, more especially to those members of the order of Saint Francis who, in an endeavor to live up to the strict rule of their founder, created a split between the Spirituals and the Conventuals of the Franciscans (q.v.). They were generally opposed to existing ecclesiastical and social order and were similar to the Brethren of the Free Spirit, Beghards and other sects. They had no fixed place of residence. In the 14th and 15th centuries the Fraticelli made considerable progress and attracted more or less attention in northern Italy, from where they spread to a certain extent to southern France, Flanders and South Germany. They declared the existing Church as in a state of apostasy and looked upon poverty as an absolutely essential condition. Some of the popes persecuted them with great severity as heretics and many of them suffered greatly from the Inquisition. Consult Döllinger, J. J. I. von, 'Beiträge zur Sektengeschichte' (Munich 1890); Ehrle, F., in *Archiv für Litteratur und Kirchengeschichte des Mittelalters* (Vols. I–IV, Berlin 1885–88); Lea, H. C., 'History of the Inquisition of the Middle Ages' (3 vols., New York 1888).

FRATICELLANS. See FRATICELLI.

FRATRES ARVALES. See ARVAL BROTHERS.

FRATTAMAGGIORE, frä'ta-mä-jō'ra, Italy, city in the province of Naples, eight miles north of the city of Naples. It contains a fine church and has manufactories of silk and ropes. There are also many country homes of wealthy Neapolitans. Pop. 13,720.

FRAUD, *in law,* all deceitful practices in defrauding or endeavoring to defraud another of his known right, by means of some artful device, contrary to the plain rules of common honesty. It is condemned by the common law, and punishable according to the offense. All frauds and deceits for which there is no remedy by the ordinary course of law are properly cognizable in equity. Where a fraud can be clearly established, courts of law exercise a concurrent jurisdiction with courts of equity. Wherever fraud or surprise can be imputed to, or collected from, the circumstances, equity will interpose and grant relief against it. Where a person is party to a fraud, all that followed by reason of that fraud shall be said to be done by him. A party prejudiced by a fraud may file a bill in equity for a discovery of all its circumstances. Mere inadequacy of price alone is not a ground for a court to annul an agreement; but if there be such inadequacy as to show that the person did not understand the bargain he made, or was so oppressed that he was glad to make it, knowing its inadequacy, it will show a command over him which may amount to a fraud. If a person be fraudulently prevented from doing an act, equity will consider the act as done; and equity also relieves against bargains made under misconception of rights. In treaties, concealment of a material fact by one of the parties, in order to keep the other in ignorance, whereby to profit, is a gross fraud, and the contract will be set aside in equity. Constructive or legal fraud is applied to such acts or contracts as, though not originating in an actual evil design or contrivance to perpetrate a positive fraud or injury upon other persons, yet by their tendency to deceive or mislead other persons, or to violate public or private confidence, or to impair or injure the public interest, are deemed equally reprehensible with actual fraud, and are prohibited by law, as within the same reason and mischief as acts and contracts done *malo animo.* Gross criminal frauds are punishable by way of indictment or information. Frauds are not indictable at common law unless they be such as affect the public — as vending unwholesome provisions, or using false weights or measures; or by the way of conspiracy; or unless they affect the crown or the administration of justice. (See FRAUD, STATUTE OF; FRAUDULENT CONVEYANCES). Consult Bigelow, 'The Law of Fraud on its Civil Side' (Boston 1888); Browne, 'Construction of the Statute of Frauds' (1895); Kerr, 'Treatise on the Law of Fraud and Mistake' (4th ed., London 1910).

FRAUD, Prevention of, an exercise of police power to stop deception, or to render its commission more difficult, or to facilitate its detection. The principal field for legislation for the prevention of fraud is found in the business of brokers, agents and depositories — warehouse and commission men, auctioneers, etc.,— and in the sale of commodities, especially of substitutes, imitations and adulterations, bankrupt and fire sales, and sales by peddlers or other itinerant dealers. Fraud is legally dealt with either criminally,— generally in cases specified by statute,— or civilly by granting or withholding remedies, or by preventive measures.

Congress can legislate for the prevention of fraud so far as interstate and foreign commerce is concerned. The Pure Food Law of 1906 serves partly for that purpose. A city ordinance will usually cover protection against fraudulent practices, particularly in the retail sale of merchandise and in the services of hotel-keepers, cab and taxicab-drivers, for which a stranger is likely to call. A State may exercise its power for the prevention of fraud, even though interstate commerce is thereby indirectly affected; as example the sale of oleomargarine colored in imitation of butter was largely prohibited, though imported from other States and sought to be sold in original packages. As a useful article of commerce, however, the policy of prohibition of oleomargarine has been abandoned in all the States, the legislation against it showing evidences of a desire to use the power of fraud prevention so as to suppress competition.

Governmental regulations to prevent fraud include the requirement of licenses, of reports, of notices, labels and marks indicating the character and quality or quantity of merchandise; the fixing of standards of weights and measures and sometimes of the form of packages, and inspection by public officials.

FRAUD ORDERS, Postal, powers conferred on the Postmaster-General by act of Congress 19 Sept. 1890, to prohibit the use of the mails by persons believed to be conducting a fraudulent business. The necessity for the act was demonstrated by the fact that as the work of investigation proceeded, schemes for swindling through the mails were disclosed much more numerous and extensive than had been supposed. Many of the fraudulent enterprises proved to be as far-reaching in their ramifications as the postal service itself. Not only were thousands of credulous people swindled out of money foolishly invested, but confidence in legitimate enterprises was undermined. It was estimated that in 80 important cases early brought under the operation of the act, the American public in less than a decade had been swindled to the extent of a hundred million dollars. The arrest, conviction and imprisonment of the swindlers has proved effective in abating the fraudulent abuse of the mails. The constitutional question raised as to the authority of Congress to delegate power to the Postmaster-General to act in specific cases was definitely affirmed by the Supreme Court of the United States. The action of the Postmaster-General was thus made conclusive, no provision being made for a judicial review.

FRAUDS, Electoral. See ELECTORAL FRAUDS AND SAFEGUARDS AGAINST; CORRUPT PRACTICES ACTS; ELECTORAL COMMISSION; UNITED STATES — DISPUTED PRESIDENTIAL ELECTIONS.

FRAUDS, Statute of. Perhaps one of the most important statutes ever enacted in England or the United States was the Statute of Frauds (29 Charles II, chap. 3). It was passed in the year 1673. Its object is stated to be the "prevention of frauds and perjuries," and its effect is to make writing essential to the validity of many contracts or transactions. The most important sections are those relating to contracts; namely, the 4th and the 17th, almost every word of which has been the subject of numerous decisions. It is provided by the 4th section that no action shall be brought on the contracts therein mentioned unless the agreement or some note or memorandum thereof shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized. The contracts referred to are the following: (1) Any special promise by an executor or administrator to answer damages out of his own estate; (2) any special promise to answer for the debt, default or miscarriage of another person; (3) any agreement made upon consideration of marriage; (4) any contract or sale of lands, tenements and hereditaments, or any interest in or concerning them; and (5) any agreement that is not to be performed within the space of one year from the making thereof. This section, however, does not make the contract null and void, but only unactionable. The 17th section has reference to sales of goods for the price (or value) of £10, and upward, which are "not allowed to be good" unless some memorandum of the bargain has been made in writing, or unless the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain, or in part payment. In the statutes of the American States the principal alteration made in these terms is by the specification of a different sum of money. The sum usually established is $50, but in some of the States it is $30 or $40. Generally the statute has been construed not to render compliance with its provisions essential to the validity of the enumerated contracts, but only necessary to the proof of such contracts against the party who sets up the statute as a defense. The importance of this statute has been so fully recognized in this country that it has been substantially re-enacted in every State in the Union, and in some of them its provisions have been made still more comprehensive and stringent. The 17th section, however, has been discarded in 16 of the States: Alabama, Arizona, Delaware, Illinois, Kansas, Kentucky, Louisiana, New Mexico, North Carolina, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Virginia and West Virginia. Consult 'Cyclopedia of the Laws of England,' (Vol. V); Browne, 'Treatise on the Construction of the Statute of Frauds' (5th ed., Boston 1895); Smith, 'Treatise on the Law of Frauds and the Statute of Frauds' (Indianapolis 1907). See CONTRACT; FRAUD; LEASE.

FRAUDULENT CONVEYANCES, in law, a fraudulent conveyance is a conveyance the object, tendency or effect of which is to defraud another not a party to such a conveyance, or the intent of which is to avoid some debt or duty due by or incumbent on the party making it. Conveyances of this character are declared invalid by two celebrated English statutes which have been substantially re-enacted throughout the United States with the same provisions. The first of these statutes was passed in the 13th year of the reign of Queen Elizabeth (1571), and commonly referred to as the statute 13 Eliz. chap. 5, and by it all fraudulent conveyances, gifts or alienations of lands or goods whereby creditors might be in anywise disturbed, hindered, delayed or defrauded of their just rights are rendered utterly void; but the statute does not extend to any estate or interest in lands on good consideration, and bona-fide conveyed to any person not having notice of such fraud. The second statute against fraudulent conveyances is the statute 27 Eliz. chap. 4, which was passed in 1585. It provides that the conveyance of any interest in lands for the intent and purpose to defraud and deceive subsequent bona-fide purchasers of the lands for a good and sufficient consideration shall be utterly void. This statute differs from the one first mentioned in applying solely to lands, and in protecting the interests of purchasers instead of creditors; but it contains similar provisions declaring the validity of any previous conveyance if it be upon valuable consideration and to a bona-fide purchaser. It has been held in England, in the interpretation of this statute, that if the previous conveyance be voluntary it is void as to a subsequent purchaser, even if he had notice before he received his deed that such a conveyance had been made. This doctrine has been generally rejected by the courts throughout the United States as unjust, and the principle adopted that the receipt of notice gives a person intending to purchase sufficient opportunity to protect his own interests, and if he is guilty of imprudence in accepting the conveyance he should receive no assistance from the courts. This appears to be the more unobjectionable doctrine. Voluntary conveyances are never set aside under either statute, as between the immediate parties, but only in favor of purchasers or creditors. Consult Bigelow, 'The Law of Fraudulent Conveyances' (Boston 1911); Hunt, 'The Law Relating to Fraudulent Conveyances' (London 1897); Moore, 'Treatise on Fraudulent Conveyances' (2 vols., Albany 1908). See FRAUD.

FRAUENBURG, frow'en-boorH, Germany, town in the district of Königsberg, Prussia, on the Frische Hoff, 41 miles southwest of Königsberg. The chief products are garden truck, flour and cereals. A forest school is situated here. Copernicus was canon of the cathedral and died here in 1543. His tomb is in the Gothic cathedral erected in 1329. Pop. 2,522.

FRAUENFELD, frow'en-felt. Switzerland, capital of the canton of Thurgau, 25 miles northeast of Zürich, on the Murg. It is situated in a beautiful and fertile district, and is of importance as the centre of trade for the fruit, wine and agricultural products of the district. It is a well-built town and contains a church which was built in 1286 and an ancient castle, the government building, which contains the archives of the canton and a library, the town hall and military barracks. It is the seat of a technical school with historical and scientific collections, and has manufactories of gloves, cotton and iron goods, machinery, leather and guns. Pop. 8,105.

FRAUENLOB, frow'en-lōb, the assumed name of Heinrich von Meissen, German minnesinger: b. 1250; d. 1318. For several years he wandered as a minstrel and then established the first school of the meistersingers at Mainz. The ladies of Mainz are said to have carried his bier to the cathedral in appreciation of his life-long chivalrous devotion to their sex. His tomb was restored in 1783 by ladies during the Werther period of German literature, and the ladies of Mainz erected a beautiful monument to his memory near his tomb in 1842. Ettmüller published an edition of his poems in 1843. They are bombastic and artificial in style. One of his works, the 'Cantica Canticorum,' has appeared in English.

FRAUNCES' TAVERN, an ancient building at the southeast corner of Broad and Pearl streets, New York. It was originally built by the Delancey family and long occupied as a mansion. Afterward it was transformed into a tavern. After the British evacuation of New York it was for a time the headquarters of Gen. George Washington, who here on 4 Dec. 1783 delivered his farewell address to his officers. In 1768 the New York Chamber of Commerce was founded here, and in 1902 it was purchased and restored by the Sons of the Revolution, who have thus preserved for posterity one of the famous landmarks of Revolutionary days. The tavern is still maintained.

FRAUNHOFER, frown'hō-fĕr, **Joseph von,** German mathematician: b. Straubing, Bavaria, 6 March 1787; d. Munich, 7 June 1826. In 1799 he was placed with a looking-glass maker and glass-grinder at Munich. After various vicissitudes he received an appointment as optician in the mathematical and mechanical institute of Reichenbach and Utzschneider at Benedictbeuren, and in 1809 the mechanical part of the optical institute was chiefly under his direction. In the same year he became one of the members of the firm under which the business was conducted, and in 1818 its director. In 1823, after it was moved to Munich, Fraunhofer became a member of the Academy of Science, its conservator of physics and was made a member of the nobility in 1824. One of the most difficult operations of practical optics was to polish the spherical surfaces of large object-glasses accurately. Fraunhofer invented a machine which obviated this difficulty, and rendered the surface more accurate than it was left by the grinding. He invented also other grinding and polishing machines, and introduced many improvements into the manufacture of the different kinds of glass used for optical instruments, and which he found to be always injured by flaws and irregularities of various sorts. In 1811 he constructed a new kind of furnace, and on the second occasion when he melted a large quantity found that he could produce flint-glass, which, taken from the bottom of a vessel containing two hundredweight of glass, had the same refractive power as glass taken from the surface. He found that the English crown-glass and the German table-glass both contained defects occasioning irregular refraction. In the thicker and larger glasses there would be more of such defects, so that in larger telescopes this kind of glass would not be fit for object-glasses. Fraunhofer therefore made his own crown-glass. The cause which had hitherto prevented the accurate determination of the power of a given medium to refract the rays of light and separate the different colors which they contain was chiefly the circumstance that the colors of the spectrum have no precise limits, and that the transition from one to another is gradual and not immediate; hence, the angle of refraction cannot in the case of large spectra be measured within 10 feet or 15 feet. To obviate this, Fraunhofer made a series of experiments for the purpose of producing homogeneous light artificially, and unable to effect his object in a direct way, he did so by means of lamps and prisms. In the course of these experiments he discovered that bright fixed line which appears in the orange color of the spectrum when it is produced by the light of fire. This line enabled him afterward to determine the absolute power of refraction in different substances. Experiments to ascertain whether the solar spectrum contains the same bright line in the orange as that produced by the light of fire led him to the discovery of the innumerable dark fixed lines in the solar spectrum, consisting of perfectly homogeneous colors and now bearing his name. The importance of this discovery can scarcely be overestimated. It led to the invention and use of the spectroscope (q.v.), to the science of spectroscopy (q.v.), and to all our present knowledge of solar and stellar chemistry. Fraunhofer also made a variety of other important discoveries and inventions. He made the great refracting telescope for Dorpat. His writings were edited by Lommel as 'Gesammelte Schriften' (Munich 1888). Some of his writings were translated into English by J. S. Ames and published as the second volume of 'Harper's Scientific Memoirs' under the title 'Prismatic and Diffraction Spectra' (New York 1898). Consult Anon., 'Life of Fraunhofer' (in *American Journal of Science and Art,* Vol. XVI, p. 304, New Haven 1829); Voit, 'Joseph Fraunhofer' (Munich 1887).

FRAUNHOFER LINES. See SPECTROSCOPY.

FRAU SORGE, frow'sôr'ge (DAME CARE). 'Frau Sorge,' the first of Herman Sudermann's complete novels (1887) and the work which brought him his fame as a writer of fiction, as 'Die Ehre,' his first play, placed him in the front rank among contemporary dramatists, stands out in the long list of his novels and plays in two ways; as an art-work it is the most perfect, and it is the one which shows least the wear and tear of a generation of social change. Those may be merely two ways of saying the same thing; namely, that in a writer who combines, as Sudermann does, the qualities of a poet and a realist, the more highly imaginative works have a more permanent value than the controversial ones. Into this grim tale of East Prussian peasant life, with its hint of autobiography in the spirit and the scene, if not in the story, Sudermann has infused something of the spirit of the epic, the narrative of the toiler battling against the forces of nature. The legend of Frau Sorge (Dame Care) with which the story ends and around which it is conceived is a fine bit of imaginative writing. It is the story of a mother so poor and lonely that she had no one to act as godmother for her son except Dame Care, who offers to see that the boy grows up to be a good man who shall never go hungry if his mother will give the boy's soul, with his youth and his hope of happiness, as a hostage to Dame Care. The rending of the charm by the power of a woman's love and the solemn, but never tragic, quality of the story, are distinguishing characteristics of Sudermann's work.

FRAYSSINOUS, frā'sē-noos', **Denis Antoine Luc, Count de,** French prelate and statesman: b. Curières, Aveyron, 1765; d. 1841. He entered the ministry and attained fame by his conferences at l'Eglise de Saint Sulpice in 1803–09. In the latter year they were prohibited by Napoleon. In 1816 he was made court preacher and almoner of Louis XVIII, and became Minister of Public Worship in 1824–28. He was made a peer of France and the Jesuits were readmitted to France during his term as minister. In 1822 he was elected to the Academy. The Revolution compelled him to leave France and he sojourned for a time at Rome and at Prague. His 'Défense du christianisme' (3 vols., 1825) had a great vogue in his day and went through several editions. Consult his life by Henrion (2 vols., Paris 1844).

FRAZER, SIR **James George,** English anthropologist: b. Glasgow, Scotland, 1854. He became a Fellow of Trinity College, Cambridge, and was appointed professor of social anthropology at the University of Liverpool in 1907. His works are of the greatest importance in the study of anthropology, and particularly of religion and myth. He is a Fellow of the British Academy, honorary Fellow of the Royal Society of Edinburgh and corresponding member of the Royal Prussian Academy of Science. He has published a revised edition of 'Long's Sallust' (1884); 'Totemism' (1887); 'The Golden Bough' (1890; 2d ed., 1900); 'Passages of the Bible chosen for their Literary Beauty and Interest' (1895; 2d ed., 1909); 'Pausanias's Description of Greece,' translated with a commentary (1898; 2d ed., 1913); 'Pausanias and Other Greek Sketches' (1900); 'Lectures on the Early History of the Kingship' (1905); 'Adonis, Attis, Osiris, Studies in the History of Oriental Religion' (1906; 2d ed., 1907; 3d ed., 1914); 'Questions on the Customs, Beliefs, and Languages of Savages' (1907); 'The Scope of Social Anthropology' (1908); 'Psyche's Task, a Discourse concerning the Influence of Superstition on the Growth of Institutions' (1909; 2d ed. 1913); 'Totemism and Exogamy' (1910); 'The Magic Art and the Evolution of Kings' (1911); 'Taboo and the Perils of the Soul' (1911); 'The Dying God' (1911); 'Letters of William Cowper,' chosen and edited with a memoir and a few notes (1912); 'Spirits of the Corn and of the Wild' (1912); 'The Belief in Immortality and the Worship of the Dead' (Vol. I, 1913); 'The Scapegoat' (1913); 'Balder the Beautiful' (1913); 'Essays of Joseph Addison,' chosen and edited with a preface and a few notes (1915); 'The Golden Bough' (Vol. XII, Bibliography and Index, 1915).

FRAZER, John Fries, American scientist: b. Philadelphia, 8 July 1812; d. there, 12 Oct. 1872. He was a grandson of Lieut-Col. Persifor Frazer of the Revolution. Graduated with highest honors at the University of Pennsylvania in 1829, he afterward completed a course in law, was admitted to the bar, but soon gave up the practice of this profession in favor of the natural sciences. With Prof. A. D. Bache he made the first researches on magnetics in the United States. In 1836 he became one of the two assistants on the First Geological Survey of Pennsylvania. After filling for some time a professorship in the Philadelphia High School, in 1844 he succeeded Professor Bache as professor of natural philosophy and chemistry in the University of Pennsylvania, serving until his death; and from 1855–68 also as vice-provost. In 1857 he received the degree of LL.D. from Harvard. He was an active member of the American Philosophical Society (its vice-president in 1855), the Academy of Natural Sciences, and the Franklin Institute (the editor of its journal from 1850 to 1866), and one of the charter members of the National Academy of Sciences. Consult Le Conte, T. L., 'Memoir of J. F. Frazer' (in National Academy of Sciences, *Biographical Memoirs,* Vol. I, p. 245, Washington 1877).

FRAZER, Persifor, American geologist, son of preceding: b. Philadelphia, 24 July 1844; d. 1909. After graduation (1862) from the University of Pennsylvania, served during Civil War in the Mississippi squadron (1863–65); was mineralogist and metallurgist to the United States Geological Survey (1869–70), professor of chemistry in the University of Pennsylvania (1870–74), assistant geologist Second Geological Survey of Pennsylvania (1874–82). He was the first foreigner to receive the degree of Docteur-ès-Sciences Naturelles from France, which also gave him the decoration of the golden palms of the Academy. He served as vice-president, representing the United States in the International Geological Congress of 1888 (London), and of 1897 (Saint Petersburg). The John Scott medal was awarded to him in 1905. He wrote extensively for scientific periodicals, published five volumes of Reports of the Geological Survey of Pennsylvania; 'Tables for the Determination of Minerals' (1874); and 'Bibliotics or the Study of Documents' (1894).

FRAZIERS FARM, Battle of. See GLENDALE, BATTLE OF.

FREAR Walter Francis, American jurist: b. Grass Valley, Cal., 29 Oct. 1863. He was graduated at Yale University in 1885, and at the Yale Law School in 1890; and received the degree of LL.D. from Yale University in 1910;

was made second judge of the First Circuit Court of Hawaii, in January 1893, associate justice of the Supreme Court of Hawaii in March 1893. He was a member of the commission to recommend to Congress legislation for Hawaii, in August 1898; was appointed chairman of the Hawaiian Code Commission in 1903; became chief justice of the Supreme Court of Hawaii in July 1900 and governor 1907–13. He was chairman of the Hawaiian delegation to the National Republican Convention in 1912. He is the author of 'Evolution of the Hawaiian Judiciary,' etc.

FREAR, William, American agricultural chemist: b. Reading, Pa., 24 March 1860. He was graduated at Lewisburg (now Bucknell) University in 1881, and was assistant in sciences there in 1881–83, when he became assistant chemist of the United States Department of Agriculture. In 1885–1907 he was professor of agricultural chemistry, and after 1907 of experimental agricultural chemistry at the Pennsylvania State College of Agriculture. Meanwhile he held various important posts in State agricultural work. Since 1900 he has been special agent of the United States Department of Agriculture and is also chief chemist of the Pennsylvania Dairy and Food Bureau. He edited *Agricultural Science* in 1892–94 and is a member of many scientific societies. His writing is confined exclusively to communications to scientific periodicals and experiment station and State reports.

FRECHETTE, frā-shĕt, **Louis Honoré,** French-Canadian poet; b. Levis, Quebec, 16 Nov. 1839; d. 31 May 1908. He edited several French-Canadian journals and in 1889 became clerk of the legislative council of Quebec. His lyrics were much admired both for their form and sincerity of passion. He published 'Mes Loisirs' (1863); 'La Voix d'un Exilé' (1869); 'Pêle Mele' (1877); 'Les Fleurs Boreales,' crowned by the French Academy (1879); 'Les Oiseaux de Niège' (1879); 'La Legende d'un Peuple' (1887); 'Les Feuilles Volonte' (1891); 'Veronica,' a drama; and in prose 'Letters à Bastile' (1872); 'Histoire Critique des Rois de France' (1881); 'Originaux et Detraques' (1892); 'Letters sur l'Education' (1893); 'La Noël au Canada' (1900).

FRECKLES, brownish-yellow spots of a circular form on the human skin. They are due to excess of pigmentary matter in the cells of the cuticle, immediately above the true skin, and only appear on those exposed surfaces, as the neck, face, hands and arms. They are sometimes congregated in thick clusters which give to the features an unsightly appearance. Sometimes freckles are hereditary, appearing soon after birth and continuing through life, or subsiding or vanishing altogether. This affection is most common as well as most persistent in persons of fair complexion and hair, and especially so in those with red hair. There can be no doubt that exposure to the sun increases the disfigurement. One of the milder treatments for removing freckles is a solution of 15 to 30 grains of hyposulphite of soda, or of chloride of ammonium, 15 grains to one ounce of water. A beneficial remedy, to be used as a wash at night and in the morning, is a mixture of bichloride of mercury, dilute acetic acid, borax and rose water.

FREDEGAR, or **FREDEGARIUS SCHOLASTICUS,** chronicler of the Franks, who flourished in the 7th century and was one of the three compilers of the celebrated 'Historia Francorum,' a history of the Franks down to 642 A.D. It is invaluable as a source book for the history of France during the first half of the 7th century. It is written in corrupt Latin, and was continued in the 8th century in the work known as 'Gesta Francorum.' Fredegar traced the Franks in direct line from the Trojans. Consult Krusch, 'Fredegarii et Aliorum Chronica' (Hanover 1888).

FREDERIC, Harold, American novelist: b. Utica, N. Y., 19 Aug. 1856; d. Hornby, England, 19 Oct. 1898. After receiving an education in the schools of his native city, he entered the profession of journalism there, working later on papers in Albany and New York. In 1884 he was appointed London correspondent of the New York *Times*, retaining this position until his death. His best works were his novels, of which the two greatest are 'In the Valley' (1890), a historical novel of upper New York, and 'The Damnation of Theron Ware' (1896), a searching analysis of the life of the American bourgeoisie. Among his other novels are: 'Seth's Brother's Wife' (1887); 'The Lawton Girl' (1890); 'The Return of O'Mahoney' (1892); 'The New Exodus,' a story of Jewish life, written after his visit to Russia (1892); 'The Copperhead' (1894), a Civil War story, dramatized and produced with considerable success in 1917; 'Marsena' (1895), humorous tales; 'March Hares' (1896); 'Gloria Mundi' (1898); 'In the Market Place' (1899). See IN THE VALLEY.

FREDERICIA, frĕd-ĕ-rĭsh'ē-ā, Denmark, seaport, on the coast of Jutland. It was at one time well fortified, but the forts have not been kept in repair. The chief exports are eggs, meat, fish, cheese and butter; the chief imports are cotton and woolen goods, fruit, salt and petroleum. Pop. 14,228.

FREDERICK (Friedrich Maria Albrécht Wilhelm Karl), Archduke of Austria: b. Gross-Seelowitz, near Brünn, 1856. His training was almost exclusively military. In 1905 he was made general of infantry and army inspector, and in 1907 commander of the Landwehr. Upon the death of Prince Francis Ferdinand in 1914 he became practically chief commander of the Austro-Hungarian army. The Albertina collection of engravings and drawings is housed in his palace at Vienna.

FREDERICK I, First Elector of Brandenburg, of the house of Hohenzollern: b. 1371; d. 1440. In 1398 he succeeded his father, Frederick V, Burgrave of Nuremberg. He served in the army of Hungary, and at the battle of Nicopolis in 1396 effected the rescue of King Sigismund. He supported the candidacy of Sigismund for the imperial crown and in recognition of his services was made Elector of Brandenburg in 1417, after he had been administrator for seven years. He thus became the founder of the royal Prussian dynasty. He quarreled with Sigismund in 1423 and in 1427 sold his rights as Burgrave of Nuremberg to the city. He was a candidate for the throne of Germany in 1438. Consult Brandenburg, 'König Sigmund und Kurfürst Friedrich I' (Berlin 1891).

FREDERICK III, Elector of Brandenburg. See FREDERICK I OF PRUSSIA.

FREDERICK I, king of Denmark and Norway: b. 3 Sept. 1471; d. 10 April 1533. While joint ruler of Schleswig-Holstein, he succeeded his nephew Christiern (or Christian) II, on the deposition of the latter, in 1523, and entered into an alliance with Gustavus I, king of Sweden. After taking Copenhagen, he gained over all the nobility, to whom he granted privileges at the expense of the throne, and introduced Lutheranism into his dominions.

FREDERICK II, king of Denmark and Norway, the son and successor of Christian III: b. 1534; d. 1588. He ascended the throne in 1559. He subdued the Ditmarshers of West Holstein in 1559, suppressed piracy in the Baltic and North Sea, founded the fortress of Kronborg, and waged a successful war against Sweden (1563–70). He was a friend of learning, was served well by his counselors and was beloved by his people.

FREDERICK III, king of Denmark and Norway: b. Hadersleben, Schleswig, 18 March 1609; d. Copenhagen, 6 Feb. 1670. He succeeded his father Christian IV, in 1648. The most remarkable event of his reign was his changing of the constitution from an elective to an hereditary monarchy.

FREDERICK IV, king of Denmark: b. Copenhagen, 11 Oct. 1671; d. there, 12 Oct. 1730. He ascended the throne on the death of Christian V in 1699. He leagued against Charles XII of Sweden, who forced him to make peace; but when Charles fled to Turkey, Frederick drove the Swedes out of Norway, and concluded a favorable peace, retaining possession of the duchy of Schleswig.

FREDERICK V, king of Denmark and Norway: b. Copenhagen, 31 March 1723; d. 14 Jan. 1766. He came to the throne in 1746. The character of his reign may be inferred from the following remark, which, on his deathbed, he made to his successor, Christian VII: «It is a great consolation to me, my son, that I have not injured any person and that my hands are not stained with one drop of blood.»

FREDERICK VI, king of Denmark and Norway: b. Copenhagen, 28 Jan. 1768; d. there, 3 Dec. 1839. He became regent in 1784, following on the mental eclipse of his father. Having joined the Armed Neutrality of the North against England in 1800, all Danish ships in English harbors were seized and the Danish fleet destroyed at Copenhagen (21 April 1801). The regent thereupon withdrew from the alliance. Having again allied himself with Napoleon, Copenhagen was bombarded by the British (25 Sept. 1807). On his accession in 1808, he had waged a war with the Swedes, who attempted to possess themselves of Norway. He succeeded in defeating them and peace was signed in 1809. Norway was taken by the Allies in 1814 and handed over to Sweden; Pomerania and the isle of Rügen falling to Denmark. His country emerged from the Napoleonic wars in a bankrupt and prostrate condition; but under the able guidance of the chief minister, Bernstorff, great progressive measures were carried through, among them peasant emancipation, freedom of the press, prison reform and Jewish emancipation; savings banks were established, education encouraged and a representative system of government set up.

FREDERICK VII, king of Denmark: b. Copenhagen, 6 Oct. 1808; d. Glücksburg, 15 Nov. 1863. He ascended the throne in 1848. The principal events of his reign were the revolution in Schleswig and Holstein, and the dispute over the succession to Denmark and the duchies, the king himself and his uncle, the heir-presumptive, being childless.

FREDERICK VIII, king of Denmark: b. 1843; d. Hamburg, 14 May 1912. He was the eldest son of Christian IX and of Queen Louisa of Hesse-Cassel. He received his education at a grammar school and fought against Germany in 1864. He also studied at Oxford and traveled abroad. In 1869 he married Princess Louisa of Sweden, niece of Oscar II. He succeeded his father on 29 Jan. 1906. In 1905 his second son, Charles, became king of Norway, under the title of Haakon VII. He was a brother of Queen Alexandra of England and of King George I of Greece. He died suddenly at Hamburg, and for several hours his body was not identified.

FREDERICK III («The Fair»), German king and Duke of Austria: b. 1286; d. Gutenstein, 13 Jan. 1330. On the death of his father, Albert I, he failed to gain the throne, which went to Henry VII. On the death of the latter a few of the electors favored Frederick, chose him as king, and he was crowned by the Archbishop of Cologne in 1314. The majority of the electors, however, chose his cousin, Louis IV, Duke of Upper Bavaria, and war was carried on until the capture of Frederick at Mühldorf in 1322. Frederick was imprisoned for three years, when he was released for a short time, returning to captivity in accordance with an agreement between him and Louis, and remaining in captivity until his death.

FREDERICK I, surnamed BARBAROSSA or RED BEARD, emperor of the Holy Roman Empire, son of Frederick, Duke of Suabia: b. 1123; d. June 1190. He was chosen to succeed his uncle, Conrad III, in 1152. He was crowned at Aix-la-Chapelle a few days after his election. His great ambition was to secure the independence of the empire and, above all, to be master of Italy. His first expedition to Italy was made in 1154, when, after subduing several towns in Lombardy, he went to Rome, and after some delays, had himself crowned emperor by Adrian IV (18 June 1155). He marched again into Italy in 1158, took Brescia and Milan, and at the celebrated Diet at Roncaglia assumed the sovereignty of the towns and received the homage of the lords. On his return to Germany he triumphed over Bohemia, and made Poland tributary to the empire. After the death of Pope Adrian, Frederick had three anti-popes in succession elected in opposition to Alexander III, who excommunicated him and his pope, Victor. The same year, 1160, he besieged and took Crema, after a most courageous defense. In 1162 he conquered Milan, and had many of the public buildings destroyed, as well as parts of the fortifications; after which the other towns of Lombardy submitted to him. In 1166, he traversed the Romagna, levied contributions on the towns, besieged Ancona and had himself crowned a second time at Rome by the anti-pope, Pascal, but pestilence broke out in his army and he was forced to return to Germany. In 1174 he besieged unsuccessfully the newly founded town of Alessandria, and in 1176 was totally defeated by the Milanese at Como. This reverse was not lost on him, for it changed his policy of repression. In 1183 he made peace with the Pope and the towns of Lombardy. In 1188 he assumed the cross, set out in the following year on the third crusade, was opposed on the march by the Greek emperor and the sultan, arrived in Asia, and was drowned while crossing a river.

Frederick was great, not only as a soldier, but as a ruler. His administration was marked by justice, his subordinate officers were chosen for their capacity and probity, he was himself an educated man and promoted education and literature. His politic measures held in check the power of the nobles of Germany by the granting of municipal privileges to the cities. His memory is still cherished among the peasants of Germany, who dream of the return of Fritz Redbeard, as the Welsh did of King Arthur. Consult Prutz, 'Kaiser Friedrich I' (1871–73); Fischer, 'Kreuzzug Friedrich I' (1870).

FREDERICK II, emperor of the Holy Roman Empire: b. Jesi, near Ancona, Italy, 26 Dec. 1194; d. Fiorentino, 13 Dec. 1250. He was elected king of the Romans in 1196, again after the death of his father, Henry VI, and a third time on the excommunication of Otho IV, in 1211. He was already king of Sicily and duke of Suabia, under the joint regency of his mother and Pope Innocent II. He made a league with Philip Augustus, king of France, and after the defeat of Otho by the latter at the battle of Bouvines, was crowned at Aix-la-Chapelle in 1215. He received the imperial crown at Rome in 1220, on which occasion he had to renew a vow previously extorted from him to take the cross. In 1225 he married as his second wife, Yolande, daughter of John of Brienne, king of Jerusalem, and in 1227 embarked for the Holy Land. Illness compelled him in a few days to abandon the enterprise, and for this he was excommunicated by Pope Gregory IX. He set out again in 1228, and the Pope exciting opposition to him and invading his hereditary states, he at once concluded a truce with Kameel, the sultan of Egypt, by which he became master of Jerusalem. He entered the city, crowned himself (no priest daring to do it), and returned to Europe. He recovered his states, made peace with the Pope and suppressed the revolt of his son Henry, who was then imprisoned for life. In 1235 Frederick began the war with the cities of Lombardy, having for his ally Eccelino, tyrant of Verona. After his victory of Cortenuova, he took Ravenna, Faenza and Benevento; and in 1241 his fleet defeated that of the Genoese, and captured the cardinals and bishops who were on their way to attend a council against him. Frederick promoted the election of Innocent IV, who had been his friend and made a treaty with him, but soon found Innocent a most determined enemy. A new anathema and sentence of deposition and release of his subjects from their allegiance to him was published in 1245. The mediation of Saint Louis utterly failed to bend the Pope to reconciliation. Rival emperors were set up, the war in Italy continued, Parma was lost in 1248, his, Frederick's, son, Enzio, was defeated and made prisoner in the following year. Frederick was the most accomplished sovereign of the Middle Ages; but his strong sympathies with his Italian motherland and his unremitting endeavors to establish a compact and all-supreme empire in Italy, were the causes not only of his own misfortune but of the miseries which he brought on the German empire by embroiling it in costly wars abroad and leading him to neglect the welfare and to sacrifice the interests of his German subjects.

FREDERICK III («The Pacific»), emperor of the Holy Roman Empire: b. Innsbruck, 21 Sept. 1415; d. Linz, 19 Aug. 1493. He was elected emperor in 1440, and reigned for 53 years, the longest German reign. He was of a slow, phlegmatic temper and in his hands the imperial authority declined. The Concordat of Vienna in 1448 put an end to the nationalization of the Church in Germany which had been attained at the Council of Constance. Frederick failed in his claim to the crown of Hungary, but in his reign the Hungarians were expelled from Vienna. He showed foresight in his alliances: the Swabian League, formed in 1487 to maintain the authority of the empire, led to the peaceful annexation of the Tyrol. He effected a stroke of diplomancy by the marriage of his son, Maximilian, to Mary, daughter and heir of Charles the Bold of Burgundy, to whom he surrendered the kingdom of the Romans in 1486.

FREDERICK I («the Victorious»), elector-palatine: b. 1425; d. 1476. In 1439 he received a portion of the Palatinate on the death of his father. This he ceded some time later to his brother, Louis. After the latter's death he became guardian of his infant nephew, Philip, and administered the government. He was made elector for life in 1451 owing to the external troubles which threatened the Palatinate, but renounced the succession of his children in favor of his nephew. He opposed Frederick III, and had to defend himself against the defection of his allies. In 1462 he won the brilliant victory of Seckenheim, and thereby increased the territory of the Palatinate and secured undisturbed possession of the electorship for his lifetime. Consult Feeser, 'Friedrich der Siegreiche' (Neuburg 1880), and the biography by Menzel (Munich 1861).

FREDERICK II («the Wise»), elector-palatine: b. 1482; d. 1556. He ascended the throne in 1544, succeeding his brother, Louis. He was in command of the imperial army in 1529 when the Sultan Solyman appeared before Vienna. He came under the influence of Melanchthon, and joined the Schmalkald League. Consult Rott, 'Friedrich II von der Pfalz und die Reformation' (Heidelberg 1904).

FREDERICK III («the Pious»), elector-palatine: b. 1515; d. 1576. He became elector-palatine in 1559 upon the extinction of the elder Palatine line. He had become a Lutheran in 1546, and by his embracing the Calvinistic faith in 1561 alienated the Lutheran princes. He aided the French reformers and also those of the Netherlands. His supervision of the drawing up of the Heidelberg catechism in 1563 placed Calvinism on a systematic foundation. Consult Kluckhohn, A., 'Friedrich der Fromme' (Nordlingen 1877–79).

FREDERICK IV ("the Upright"), elector-palatine: b. 1574; d. 1710. Son of elector Louis VI. His father died during his infancy, and his uncle, John Casimir, was his guardian until he assumed the crown in 1592. The Protestant Union was formed in 1608, chiefly through his influence, and his whole reign is noted for his firm adherence to the Protestant cause. Consult Haüsser, L., 'Geschichte der rheinischen Pfalz' (Heidelberg 1856).

FREDERICK V, elector-palatine and king of Bohemia: b. Amberg, 1596; d. Mainz, Germany, 29 Nov. 1632. He succeeded his father, Frederick IV, in 1610. In 1613 he married the Princess Elizabeth, daughter of James I, of England. In 1619, on the death of the Emperor Matthias, he accepted the crown of Bohemia in opposition to the Hapsburg claimant. He made a triumphal entry into Prague, which was followed in 1620 by his total defeat by the Imperial forces at the battle of Prague, and the loss of his kingdom and hereditary states. He then took refuge in Holland. He was succeeded by his cousin, Maximilian of Bavaria, the head of the Catholic League. Two of his sons, Prince Rupert and Prince Maurice, were celebrated in the Civil Wars in England. His daughter, Sophia, who was married to Ernest Augustus, afterward Elector of Hanover, became the mother of George I of England.

FREDERICK I, first king of Prussia (FREDERICK III, as elector of Brandenburg): b. Königsberg, 11 July 1657; d. Berlin, 25 Feb. 1713. He succeeded his father in 1688, entered into the alliance against France, supported William of Orange in his English expedition, and seized Bonn and other towns, sent auxiliaries to the emperor against the Turks, and, after a dispute of some years, sold to the emperor the circle Schwiebus, which the Great Elector had acquired in exchange for the principalities of Liegnitz, Brieg and Wohlau. He supported the emperor in the war of the Spanish Succession, and in 1701 obtained from him the title of king, which he had long coveted. Frederick gratified his love of pomp in the ceremony of his coronation at Königsberg, the cost of which exhausted his treasury for a time. He placed the crown on his head with his own hands. In 1694 he founded the University of Halle; two years later the Berlin Academy of Painting; and, in 1707, he established the Academy of Sciences, Berlin, and made Leibnitz first president.

FREDERICK II, best known as **FREDERICK THE GREAT**, king of Prussia: b. 24 Jan. 1712; d. Sans Souci, 17 Aug. 1786. He was the son of Frederick William I and the Princess Sophia Dorothea of Hanover. Though by the direction of his father, he was instructed only in the details of military exercises and service, his taste for poetry and music was early developed by the influence of his first instructress, Madame de Rocoules, and his early teacher, Duhan, who, countenanced by the queen, formed a secret opposition to his father's system of education. The prince's inclination led him to adopt entirely the views of his mother. This gave rise to a coolness between him and his father. Indignant at the oppression and hatred which he experienced from his father, Frederick determined to flee to the court of George II, king of England, his mother's brother. His sister Frederica and his friends, Lieutenants Katt and Keith, were the only persons entrusted with the secret of his flight. He was, however, overtaken, was barbarously treated by his father, and obliged to be an eye-witness of the execution of his friend Katt.

While the prince remained in the closest confinement in Küstrin, the king sent him a proposal to renounce the succession in favor of his younger brother Augustus William, on condition that he should have the liberty of pursuing his own inclinations in regard to his studies, traveling, etc. "I accept the proposal," said the prince, "if my father declares that I am not really his son." On this answer the king, who looked on conjugal fidelity with religious respect, relinquished his design. That the king was inclined to sentence his son to death is certain. But the provosts Reinbeck and Seckendorf, who had before intrigued against the prince, now saved his life; the latter, in particular, by availing himself of the interference of the emperor.

The prince was not admitted to court till on the occasion of the nuptials of his sister Frederica, and was obliged by his father in 1733 to marry the Princess Elizabeth Christina, daughter of Ferdinand Albert, Duke of Brunswick-Bevern. Frederick William gave the castle of Schönhausen to her, and to the prince the county of Ruppin, and in 1734 the town of Rheinsberg, where he lived devoted to study till he ascended the throne. Among his daily visitors were literati, musicians and painters. He corresponded with foreign scholars, particularly with Voltaire, whom he greatly admired. Several of his writings, in particular his 'Anti-Machiavel,' had their origin in the rural tranquillity of Rheinsberg.

The death of his father raised him to the throne 31 May 1740. Frederick on his succession found in his states a population of only 2,240,000. At his decease the number had risen to 6,000,000. He raised Prussia to a pitch of greatness by his talents as a legislator and general, assisted in the field and in the cabinet during a reign of 46 years by many distinguished men. Frederick, who had already excited great expectations, retained for the most part the institutions and laws of his father, but gave to the latter more extent and vigor. The death of the Emperor Charles VI was a favorable moment, of which Frederick II took advantage, to revive the claims of the house of Brandenburg with regard to the Silesian principalities, so far as to ask from the queen, Maria Theresa, the duchies of Glogau and Sagan, in return for which he promised her assistance against all her enemies, his vote for the election of her husband as emperor, and 2,000,000 Prussian dollars. These proposals being rejected, he occupied Lower Silesia in December 1740, and defeated the Austrians 10 April 1741, near Molwitz. This victory, which was almost decisive of the fate of Silesia, raised new enemies against Austria. France and Bavaria united with Prussia, and the war of the Austrian Succession commenced. The only ally of the queen of Hungary and Bohemia, George II of England, advised her to make peace with Prussia because Frederick II was her most active and formidable enemy. After the victory of Czaslau (Chotusitz), gained by Frederick, 17 May 1742, the first Silesian War was terminated by preliminaries signed at Breslau under British mediation (11 June), and by the peace signed at Berlin, 28 July 1742. Frederick obtained Lower and Upper Silesia, and the larger part of the county of Glatz, with full sovereignty. On the other hand he renounced all claims to the other Austrian territories, assumed a debt of 1,700,000 Prussian dollars charged on Silesia, and promised to respect the rights of the Catholics in Silesia. Saxony acceded to this peace, of which England and Russia were the guarantors.

Frederick II seized the opportunity of a peace to introduce useful institutions into the conquered territories, and to render his army more formidable. In 1743, on the death of the last count of East Friesland, he took possession of that county, the reversion of which had been granted to his family in 1644 by the emperor. The war of the Austrian Succession continued; the Emperor Charles VII was driven from his hereditary estates of Bavaria, and the Austrians were everywhere victorious. Frederick, apprehensive that an attempt would be made to recover Silesia, entered into a secret alliance with France (April 1744), and with the emperor, the palatinate, and Hesse-Cassel, in Frankfort (22 May 1744). He promised to support the cause of the emperor by the invasion of Bohemia, on condition that he should receive the circle of Königgrätz. He entered Bohemia suddenly, 10 Aug. 1744, and captured Prague; but the Austrians and Saxons compelled him to evacuate Bohemia before the close of the year. The death of the emperor (18 Jan. 1745), and the defeat of the Bavarians at Pfaffenhofen, obliged Maximilian Joseph, the young elector of Bavaria, to conclude the Peace of Fuessen with Maria Theresa, and occasioned the dissolution of the Alliance of Frankfort, after Hesse-Cassel had already declared itself neutral. The victory of the Prussians over the Saxons at Kesselsdorf, 15 Dec. 1745, led to the Peace of Dresden (25 December). Frederick retained Silesia, acknowledged the husband of Maria Theresa, Francis I, as emperor, and Saxony promised to pay 1,000,000 Saxon dollars to Prussia.

During the 11 following years of peace Frederick devoted himself with the greatest activity to the domestic administration, to the improvement of the army, and at the same time to the Muses. It was at this time that he wrote his 'Mémoires pour servir à l'Histoire de Brandenbourg,' his poem, 'L'Art de la Guerre,' and other works in prose and verse. He encouraged agriculture, the arts, manufactures, and commerce, reformed the laws, increased the revenues of the state, perfected the organization of his army which was increased to 160,000 men, and thus improved the condition of the state.

Secret information of an alliance between Austria, Russia and Saxony gave him reason to fear an attack and the loss of Silesia. He hastened to anticipate his enemies by the invasion of Saxony, with which the Seven Years' War, or third Silesian War, commenced. The Peace of Hubertsuburg (15 Feb. 1763), terminated this war without foreign interference, on the principle that the contracting parties should remain in *statu quo*. Frederick came out of the Seven Years' War with a reputation which promised him in the future a decisive influence in the affairs of Germany and Europe. His next care was the relief of his kingdom, drained and exhausted by the contests. He opened his magazines to furnish his subjects corn for food and for sowing. To the peasants he distributed horses for plowing, rebuilt at his own expense the houses destroyed by fire, established new settlements, built manufactories, and laid out canals. In 1764 Frederick founded the Bank of Berlin, with a capital of 8,000,000 Prussian dollars.

A treaty was concluded with Russia (31 March 1764), in consequence of which Frederick supported the election of the new king of Poland, Stanislaus Poniatowski, and the cause of the oppressed Dissidents in Poland. For the purpose of connecting Prussia with Pomerania and the Mark, and of enlarging and consolidating his territories, Frederick consented to the first partition of Poland proposed at Saint Petersburg and concluded 5 Aug. 1772. Frederick received the whole of Polish Prussia (which had been ceded to Poland by the Teutonic Order in 1466), with the part of Great Poland to the river Netz, excepting Dantzic and Thorn. From this time the kingdom of Prussia was divided into East and West Prussia. He declared against the possession of a large part of Bavaria by Austria in 1778, after the death of Maximilian Joseph, elector of Bavaria, without issue, but Austria was not to be diverted from her designs by negotiations. Saxony, therefore, formed an alliance with Prussia, and Frederick invaded Bohemia with two armies (July 1778). The Emperor Joseph, in a strongly fortified camp behind the Elbe, could not be induced to give battle. The aged Empress Maria Theresa wished for peace. But Catherine II having declared her intention of assisting Prussia with 60,000 men, this war of the Bavarian Succession was terminated without a battle by the Peace of Teschen (13 May 1779). Austria consented to the union of the principalities of Franconia with Prussia, and renounced the feudal claims of Bohemia to those countries. In the evening of his active life Frederick concluded, in connection with Saxony and Hanover, the confederation of the German princes, 23 July 1785.

Frederick left to his nephew, Frederick William II, a kingdom increased by 29,000 square miles, more than 70,000,000 Prussian dollars in the treasury, an army of 200,000 men, great credit with all the European powers, and a state distinguished for population, industry, wealth and science. Tested and strengthened by severe experience before he ascended the throne, and possessed of rare talents, Frederick shook the prevailing political system of Europe when he conceived and established, in accordance with the wants of his time, the confederation of princes, the master-work of his policy. One of his great merits is that in the most difficult circumstances he contracted no public debts, but on the contrary, though he distributed a considerable part of his revenues in different ways among his subjects, he had a richer treasury than any monarch in Europe ever possessed. His contempt for ecclesiastical establishments, which was considered by his contemporaries as a contempt of religion, has been censured, and his writings show that his heart was a stranger to the highest sentiments of piety. Entirely unacquainted with the literature and mental cultivation of Germany, which began in his later years, he underrated it and contributed nothing to its improvement, and was even prejudiced against the use of the language.

Some of Frederick's writings were published during his lifetime, but most of them appeared first in the 'Œuvres Posthumes' (1788–89). In 1846–57 the Berlin Academy published a critical edition of the whole, together with his literary and private correspondence, under the title 'Œuvres de Frédéric le Grand' (31 vols.). See FREDERICK THE GREAT.

FREDERICK III, king of Prussia, second emperor of modern Germany: b. Potsdam, 18 Oct. 1831; d. 15 June 1888. He married in 1858 the Princess Royal of England, the eldest daughter of Queen Victoria. When Prussia declared war against Austria in 1866 the crown prince, as he was called, became commander of the army of the Oder. By a series of rapid marches from Silesia through the Sudetic mountain passes into Bohemia his army arrived just in time to aid Prince Frederick Charles and snatched the decisive victory of Sadowa. At the outbreak of the Franco-German War he commanded the third German army, which numbered 200,000 men, and with these he advanced to attack the French under MacMahon. The first assault was made at Weissenburg (4 August), and two days later he successfully turned the French defense at Woerth, causing the disorderly retreat of MacMahon's army. He pressed northward closely after MacMahon, and the passage of the Meuse by the Germans under his command greatly contributed to the successful turning of the French advance and the final surrender at Sedan. This accomplished, he pushed on to Paris, and after surrounding the city established his headquarters at Versailles, where he remained until the capitulation in January 1871. In 1887 he was attacked by cancer, and while undergoing treatment for this his father died, and he became emperor in March 1888. The announcement of his own death three months later was received with wide regret, for his renown as a military commander, his liberal views, his large-heartedness and his resignation under suffering, had touched his personality with the rarest heroic qualities.

FREDERICK I («the Warlike»), elector and Duke of Saxony: b. 1369; d. 1428. His father was Frederick the Stern of Meissen. In 1381 on the death of his father he with his two brothers and two uncles succeeded to the inheritance. He became a distinguished soldier in the campaigns against the Hussites, and in recognition of his services was made elector and Duke of Saxe-Wittenberg in 1423 by the Emperor Sigismund. The Hussites inflicted a defeat upon him at Aussig in 1426. With his brother he founded the University of Leipzig. The House of Guelph, once rulers of England, were his direct descendants. Consult Böttiger and Flatte, 'Geschichte des Kurstaates und Königreichs Sachsen' (3 vols., Hamburg 1830–73).

FREDERICK I, elector and first king of Saxony: b. 1750; d. 1827. He was the son of Elector Frederick Christian and succeeded his father in 1763 as elector with the title of Frederick Augustus III. During his minority his uncle Prince Xavier was his guardian. With Frederick the Great he fought against Austria in 1778–79 and joined the League of German Princes. He declined the crown of Poland which was offered him in 1791. He kept his state neutral during the Franco-Austrian war of 1805, but in 1806 joined Prussia against France. The rout at Jena obliged him to form a treaty of alliance with Napoleon in the same year, and by it he was permitted to assume the title of royalty. He obtained the duchy of Warsaw in 1807 from Napoleon, and during the remainder of the latter's career remained his faithful ally. He was made a prisoner by the allies at Leipzig 19 Oct. 1813, and at the Congress of Vienna was obliged to cede about one-half of his kingdom to Prussia. He devoted his remaining years to perfecting the internal administration of his kingdom and developing its agricultural and commercial resources. Consult, Bonnefois, A., 'Un Allié de Napoléon, Frédéric Auguste premier roi de Saxe' (Paris 1902).

FREDERICK II («the Mild»), elector and Duke of Saxony: b. 1411; d. 1464. Son of Frederick I, he shared the family lands with his three brothers, defended Saxony from the Hussites, and became Burgrave of Meissen. His brother William disputed his partition of the lands of Frederick the Peaceful and the struggle went on from 1446 to 1450. An attempt to abduct his two sons was made in 1455; this is the event known to German history as the «Prinzenraub.»

FREDERICK III («the Wise»), elector of Saxony: b. Torgau, 17 Jan. 1463; d. 5 May 1525. He succeeded his father, Ernest, and is known chiefly as founder of the University of Wittenberg (1502), and as the friend and protector of Luther, one of the first professors of the new university. He refused to put into execution the papal bull which ordered Luther's writings to be burnt, and declined to put the reformer under restraint or be sent to Rome. It was by his arrangement that Luther, after the Diet of Worms, was seized and carried off to Wartburg. He did not, however, establish the reformed faith in his dominions. He became administrator of the empire in 1519, and was offered the imperial crown, but declined it.

FREDERICK III, king of Sicily: b. 1272; d. 1337. He was a son of King Peter of Sicily and Aragon. When his elder brother James succeeded as king of Aragon, Frederick became regent of Sicily. Soon afterward James surrendered Sicily to the Church in trust for Charles II of Aragon which caused a revolt of the Sicilians who chose Frederick as their king in 1296. Frederick was compelled to fight to hold his throne and in 1302 made a treaty with Charles II. With Henry VII he made war again on the House of Anjou in 1313 and the struggle was continued with short intervals to the end of his reign. During his reign the Sicilians became a united people, and were thenceforth to be reckoned with in the affairs of the peninsula.

FREDERICK I, William Charles, duke (1797–1803), elector (1803–06), and king (1806–16) of Würtemberg: b. Treptow, Pomerania, 6 Nov. 1754; d. 30 Oct. 1816. He was a son of Sophia Dorothea, niece of Frederick the Great. In 1797 he became duke. His title of king, with a large accession of territory, he gained through an alliance with Napoleon. In 1806 he joined the Confederation of the Rhine; in 1809, 1812 and 1813 fought for Napoleon, but in 1813 took side with the allies.

FREDERICK, Christian August, duke of Schleswig - Holstein - Sonderburg - Augustenburg: b. Castle Augustenburg, island of Alsen, 6 July 1829; d. Wiesbaden, 14 Jan. 1880. He was banished from Denmark in 1851, after having, while an officer of the general staff, taken part in the insurrection. Upon the conclusion of the war between Denmark and Germany in 1864, however, he was proclaimed duke by a popular assembly at Elmshorn and received allegiance at Kiel. But he was not destined to rule. The duchy by the terms of the Treaty of Vienna, fell to Austria and Prussia for disposal, and Prussia, through Bismarck, imposed upon Frederick conditions which he rejected. After the war with Austria, his domains were incorporated with Prussia. He took part in the Franco-German war as a Bavarian general on the general staff of the Prussian crown prince. His daughter, Augusta Victoria, was married to Prince William of Prussia, later William II, emperor of Germany.

FREDERICK AUGUSTUS II, king of Saxony: b. 1797; d. Tyrol, 9 Aug. 1854. He was the eldest son of Prince Maximilian of Saxony. He was made joint regent of Saxony with King Anthony in 1830 and succeeded the latter in 1836. With the aid of Prussian troops he quelled an insurrection which broke out in Dresden in 1849 in alarming proportions. The remainder of his reign was tranquil. His death resulted from a fall while traveling in the Tyrol. Consult Förster, F., 'Friedrich August II' (Leipzig 1910).

FREDERICK AUGUSTUS III, king of Saxony: b. 25 May 1865. He was educated at Leipzig and Strassburg, entered the army in 1883. He was made general of infantry in the Prussian army in 1902, and succeeded his father on 15 Oct. 1904. In 1902 the Princess Louise of Tuscany, whom he had married in 1891, eloped with André Giron, a tutor in his palace. She was divorced by him in 1903.

FREDERICK CHARLES, Prince of Prussia, popularly known as the «Red Prince»: b. Berlin, 20 March 1828; d. Castle of Klein-Glienicke, near Potsdam, 15 June 1885. He was a son of Frederick Charles Alexander and nephew of William I. He was in command of the first Prussian army which made so vigorous a resistance, and, aided by the second army, which arrived opportunely, finally defeated the Austrians at the battle of Sadowa (Königgrätz). In the Franco-German War he commanded the second army, fought at Vionville and Saint Privet, directed the siege-operations against Metz, and 28 Nov. 1870 defeated the army of the Loire. He married Marie Anna of Anhalt. One of his daughters, Louise Margareta (1860–1917) was married to Arthur, Duke of Connaught.

FREDERICK FRANCIS II, grand duke of Mecklenburg-Schwerin: b. 1823; d. 1883. He was the son of grand duke Paul Frederick and received his education at the University of Bonn. He succeeded to the grand duchy in 1842 and became a general in the Prussian army, distinguishing himself in the war with Austria in 1866. In 1870 he commanded the 13th army corps and laid siege to Toul, which he took 23 Sept. 1870, and later in the campaign he was prominent in the operations on the Loire and at the siege of Paris. There is a fine monument to him at Schwerin erected in 1893. Consult Von Hirschfeld, 'Friedrich Franz I' (Leipzig 1891).

FREDERICK HENRY, Prince of Orange: b. Delft, 1584; d. 1647. He was a son of William the Silent and succeeded his brother Maurice in 1625. The latter had given him his military training. He attained fame as a military leader by the capture of several cities including Hertogenbosch in 1629, Maastricht in 1632, Breda in 1637, and Sas van Ghent in 1644. He made a successful treaty with Spain securing for the Dutch every point for which they had long struggled. In his time the Dutch Republic reached its greatest power and influence. Consult 'Memoires de Frédéric Henri' (Amsterdam 1743).

FREDERICK LOUIS, Prince of Wales: b. Hanover, Germany, 20 Jan. 1707; d. Leicester House, London, 20 March 1751. He was the eldest son of George II, with whom he was on terms of enmity. He became the leader of the Opposition, which was strongly against Walpole and styled itself the Patriot party. In the contest between Handel and Buononcini he was a partisan of the latter. At the outbreak of the rebellion of 1745 he sought, but did not obtain, the command of the army. He married Augusta, daughter of Frederick II, duke of Saxe-Gotha, and his eldest son became King George III.

FREDERICK WILLIAM, elector of Brandenburg, called the Great Elector: b. 16 Feb. 1620; d. Potsdam, 9 May 1688. He succeeded his father when the unhappy Thirty Years' War was still raging in Germany, and his conduct toward the contestants was marked by great prudence. In 1641 he concluded a treaty of neutrality with Sweden, notwithstanding the earnest remonstrances of Austria. In 1644 he concluded an armistice with Hesse-Cassel, by which Cleves and the county of Mark were restored to him, and by the peace of Westphalia in 1648 received Magdeburg, Halberstadt and Kammin In the war between Poland and Sweden (in 1655) he supported both parties in turn and obtained an acknowledgment of the independence of the duchy of Prussia from Poland, upon whom it was formerly dependent. In 1672 he concluded a treaty with the Dutch Republic when his state was threatened by Louis XIV. On 6 June 1673, he concluded a treaty with France at Vossem, by which France promised to evacuate Westphalia and to pay 800,000 livres to the elector, who in return broke off his treaty with Holland

and promised not to render any aid to the enemies of France. In 1674 the German states declared war against France. In the following December a Swedish army, at the instigation of France, entered Pomerania and the Mark. The elector defeated them, 18 June 1675, at Fehrbellin. In 1678 he concluded a separate peace with France, at Nimwegen, as did also Holland and Spain. France demanded the restoration of all the conquered territories to Sweden. The elector, having refused compliance, formed an alliance with Denmark and waged a new war against Sweden, but was obliged to submit, by the Peace of Saint Germain-en-Laye, 29 June 1679. Louis XIV having occupied several circles of Alsace by his famous *chambres de réunion*, Frederick William effected (1684) an armistice of 20 years between France and Germany. But when he renewed (1685) his treaty with Holland and received into his dominions about 14,000 Protestant refugees from France, driven forth by the revocation of the edict of Nantes, new difficulties arose between him and France, which brought him into a closer connection with Austria. He received the circle of Schwiebus in 1686, and in the same year sent 8,000 men to assist the Austrians against Turkey. A wise and tolerant ruler, equally skilful in the fields of diplomacy and administration, Frederick William set himself to repair the ravages wrought by the Thirty Years' War. He paid great attention to agriculture, promoted canal works, was a discriminating patron of education, founded the University of Dinsburg and reorganized those of Frankfort on the Oder and Königsberg, and also established the Royal Library of Berlin. A colossal statue of Frederick William in bronze was cast by Jacobi in 1700 and is still one of the greatest ornaments of the city of Berlin. Consult Hitl, 'Der grosse Kurfürst und seine Zeit' (1893); Philippson, 'Der grosse Kurfürst' (1897–1902), and W. Ward's contribution in Vol. V of the 'Cambridge Modern History' (1908).

FREDERICK WILLIAM, duke of Brunswick: b. Brunswick, 9 Oct. 1771; d. at Quatre-Bras, 16 June 1815. He entered the Prussian military service in 1788, and in 1800 was commissioned major-general. With a Bohemian volunteer corps he invaded Saxony, and with Austrian reinforcements took Dresden and Leipzig. After the armistice of Znaim, he defeated Reubel's corps, 6,000 strong, at Oelger, near Brunswick, finally arrived at Elsfleth and Brake, seized all available shipping and embarked for England, where he was received with demonstrations of enthusiasm. He participated in the Peninsular War, and returned only after the battle of Leipzig (1813). He fell while leading an attack at Quatre-Bras.

FREDERICK WILLIAM I, last elector of Hesse: b. Philippsruhe, 20 Aug. 1802; d. Prague, 6 Jan. 1875. He succeeded to the throne in 1847. His reign was disturbed by conflicts with his people due to his efforts to disregard the constitution of 1831 and to limit popular liberties. In 1866 he took sides with Austria in the war with Prussia, was deposed, and for a time imprisoned. In the same year Hesse was annexed to Prussia, the larger portion of it now being incorporated with the province of Hesse-Nassau.

FREDERICK WILLIAM I, king of Prussia: b. Berlin, 15 Aug. 1688; d. Potsdam, 31 May 1740. He married the daughter of the elector of Hanover, afterward George I of England, and began to reign in 1713. In 1715 he declared war against Charles XII of Sweden, and in conjunction with Denmark took Stralsund; but on the death of Charles, in 1718, he made peace. Thereafter he introduced internal reforms in his kingdom and worked out an admirable system of financial administration. His habits were entirely military and he labored unweariedly to promote the discipline of his troops. One of his strongest peculiarities was an extraordinary love for tall soldiers; and in order to procure them had agents employed in all parts of Europe, who even went the length of kidnapping men for his service. He held science and literature in profound contempt; but money he worshipped; he was frugal in expenditures; and men of a military character after his own ideal he respected and encouraged. The consequence was that he left an abundant treasury and a well-appointed army of 83,000 men. He was succeeded by his son, Frederick the Great. Consult Carlyle's picturesque account of this sovereign in his 'Frederick the Great'; and Tuttle's 'History of Prussia' (Boston 1884).

FREDERICK WILLIAM II, king of Prussia: b. 25 Sept. 1744; d. 16 Nov. 1797. He was the eldest son of Prince August William, brother of Frederick the Great, and ruled from 1786 to 1797. Of an easy, pleasure-loving disposition in his youth, much under the control of his mistress, the Countess Lichtenau, and devoted to a blind obscurantism and Rosicrucian mysteries in his riper years, in his feeble hands the army declined and the power of Prussia waned. As the result of an interview at Pilnitz in 1791, he arranged with the emperor of Austria to interfere in aid of Louis XVI of France. The ensuing campaign was an inglorious one, concluded by a retreat to the Rhine in the autumn of 1792. The war was ended in 1795, and Frederick William ceded to France Prussian territory west of the Rhine. From the second (1793) and third (1795) partitions of Poland his kingdom obtained large accessions of territory. Consult Stanhope, 'A Mystic on the Prussian Throne' (London 1912).

FREDERICK WILLIAM III, king of Prussia: b. 3 Aug. 1770; d. 7 June 1840. He commenced his reign in 1797 by maintaining a strict neutrality in the various alliances with and against France which resulted from the ambitions designs of Napoleon I. In 1805, however, he yielded to the solicitations of Russia, and allied himself with the tsar against the French emperor. The rapid campaign of 1806, and the defeat of the Prussians at Jena, opened the gates of Berlin to the enemy, in whose hands it remained till 1809. In 1807 the battle of Friedland led to the humiliating peace of Tilsit. Restored to his capital, the king diligently endeavored to repair the evils of war; but new disasters overtook him, and his kingdom suffered greatly during the struggle from 1812 to 1814. He subsequently joined his troops with those of Russia. The allies having triumphed over the French at Leipzig, Frederick William in 1814 entered Paris with

Tsar Alexander. On the return of Napoleon from Elba, he once more joined the allies. After the victory of Waterloo, in which the Prussians, under Blücher (q.v.), played an important part, Prussia, once more at peace, gradually recovered from the losses she had sustained, under the wise and paternal sway of Frederick, whose moderation contributed greatly to the maintenance of peace. Throughout his life, he was a warm defender of the Protestant religion, and a patron of education. He never redeemed his promise, however, to bestow a representative constitution on his people, and the Revolution of 1830 only strengthened his determination to withhold it. The establishment of the provincial estates only affected his slightly absolute power. It may finally be said of him, that, a waverer between the Absolutist party and the Liberal party, he secured, as is the lot of most undecided men, the respect and adherence of neither.

FREDERICK WILLIAM IV, king of Prussia: b. 15 Oct. 1795; d. near Potsdam, 2 Jan. 1861. On the death of his father, Frederick William III, he succeeded to the throne in 1840. He evinced, at an early period, a love for the arts, which he preserved throughout his career. During the first years of his reign his subjects anxiously demanded the reform of the government, requiring the liberal constitution which had been promised them in 1815 in return for the great sacrifices they had made during the continental war. In 1847, at a general diet of the Prussian states, some of these reforms were granted. In March 1848, however, the king was obliged to change the ministry, to issue a general amnesty and commence a war in favor of Schleswig against Denmark. In the war between the western powers and Russia, the king preserved a strict neutrality, though earnestly solicited by each party to espouse its side in the conflict. In the complication relative to the Danubian principalities, Prussia followed the lead of France and Russia as opposed to England and Austria. Toward the end of 1857, a severe illness, resulting in the loss of some of his faculties, caused his brother William to be nominated regent, who succeeded him as king.

FREDERICK, Md., city and county-seat of Frederick County, one of the richest agricultural counties in the United States. Situated near the Monocacy River, on the Baltimore and Ohio and the Pennsylvania railroads; also the centre of the Hagerstown and Frederick Railroad, an extensive trolley system, 60 miles northwest of Baltimore and 58 miles north of Washington, D. C. Here are Hood College and Hood Seminary for Women and the Maryland School for the Deaf, a State institution. Frederick's manufacturing interests embrace leather, hosiery, brick, fibre brushes, flour, iron specialties, corn canning and lime products. The city has an assessed property valuation of $6,500,000, pure mountain water and good State roads. During the Civil War it was twice occupied by the Confederates, the second time in 1864 by Gen. Jubal Early, who compelled the citizens to pay a ransom of $200,000. Federal troops under General McClellan occupied the city in 1862. Frederick has monuments to Francis Scott Key, the author of the 'Star Spangled Banner,' and to Barbara Frietchie, the heroine of Whittier's famous war-time poem, which bears her name. Both were residents of Frederick and their remains are buried there. It was also the birthplace of Admiral Winfield Scott Schley, the hero of Santiago. Pop. about 10,411.

FREDERICK, Okla., city and county-seat of Tillman County, 150 miles southeast of Oklahoma City, on the Saint Louis and San Francisco and the Wichita Falls and Northwestern railroads. Owing to its position as the centre of a productive agricultural region, it has extensive interests in cotton, cottonseed oil and cake, alfalfa, wheat and poultry. The city owns its waterworks. Pop. 3,027.

FREDERICK THE GREAT. «A tyrant of extraordinary military and political talents, of industry more extraordinary still, without fear, without faith, without mercy» is Macaulay's estimate of the greatest of all the Hohenzollerns. In the light of the Great War, Macaulay's essay reads like prophecy, while Carlyle's glorification of unscrupulous force as embodied in Frederick seems like courting the destruction which burst upon the world in August 1914. All that Macaulay wrote about Frederick's great crime of violating his plighted faith, of robbing the ally whom he was bound to defend, and of plunging all Europe into «a long, bloody and desolating war» applies to Frederick's descendant; but Carlyle admired Old Fritz because he was the only man in the 18th century who managed *not* to be a hypocrite. Carlyle was a romantic historian, and his history of Frederick was his *magum opus.* That he should select this subject was almost the inevitable result of his German studies. Having acquired the language as a key to mineralogy, he translated various German works, wrote, in a series of essays, what is practically a history of German literature, and found in Goethe a working theory of life. With this vivid interest in everything German, it was only natural that Carlyle should be attracted by the military genius who made his little German kingdom great and formidable, and set it on its career of ever-growing power. To tell Frederick's story, Carlyle found it necessary to trace the history of his house from the earliest times. This was the greatest task of his life, and it set the pinnacle upon the edifice of his fame. It rounded out his literary life. Upon its completion, he received the honor he valued most, election as Lord Rector of his old university of Edinburgh, whither he had come a poor country boy of 13, more than 50 years before. In the hour of his greatest triumph came his greatest loss, the sudden death of his brilliant wife. He did no more work. His remaining years were a gradual declension to the grave.

Carlyle himself called his greatest work, his 'Thirteen Years War' with Frederick. In 1852 he made his first trip to Germany to gather material, visiting the scenes of his hero's battles and noting their topography with unerring accuracy. The first two volumes appeared in 1858 and the last two in 1865.

Emerson considered it «Infinitely the wittiest book that was ever written.» Lowell criticized it with discrimination. While pointing out its obvious faults, he wrote: «The figures of most historians seem like dolls stuffed with bran, whose whole substance runs out through any hole that criticism may tear in them; but Carlyle's are so real in comparison, that, if you prick them, they bleed.»

So true are Carlyle's narratives of Frederick's battles, that his work was studied as a textbook in the military academies of Germany.

ARCHIBALD MACMEACHAN.

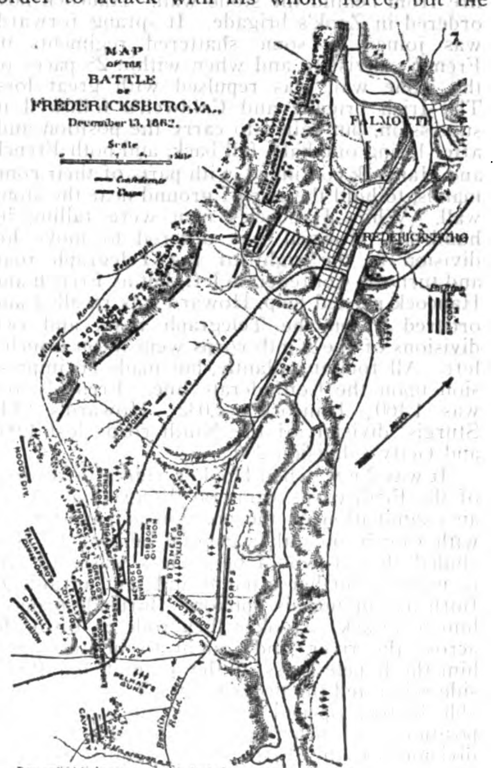
FREDERICKSBURG, Tex., town, county-seat of Gillespie County; on the San Antonio and Arkansas Pass Railroad; 80 miles west of Austin. It was founded by a German colony in 1846. Chief industries, farming and stock-raising. Number of inhabitants in 1917 somewhat more than 3,000.

FREDERICKSBURG, Va., city in Spottsylvania County; on the Rappahannock River, and the Richmond, Fredericksburg and Piedmont, and the Potomac, Fredericksburg and Potomac railroads; 61 miles north of Richmond. It has good water power and manufactures silk, woolen goods, flour, shoes, carriages, tanned leather, excelsior, etc., and an assessed property valuation of more than $2,000,000. It was the scene of several battles during the Civil War. (See FREDERICKSBURG, BATTLE OF). Noteworthy are the Stonewall and National cemeteries, Fredericksburg College, State Normal School, public libraries, an attractive park, etc. Pop. 5,874.

FREDERICKSBURG, Battle of. At the beginning of December 1862 the Army of the Potomac, under command of General Burnside, held the north bank of the Rappahannock River at Falmouth, Va., while the Confederate Army, under General Lee, held the south bank at and below Fredericksburg. The Army of the Potomac «present and equipped for duty» numbered 120,281 men, with 312 guns. General Lee's army, strongly entrenched on a broken range of hills back of Fredericksburg, numbered (10 December) «present for duty» 78,513 men, with 270 guns.

The Army of the Potomac was organized into three grand divisions: The right, under General Sumner, consisted of the Second corps, General Couch, the Ninth corps, General Willcox, and Pleasonton's cavalry division; the centre, under General Hooker, of the Third corps, General Stoneman, Fifth corps, General Butterfield and General Averell's cavalry division; the left, under General Franklin, of the First corps, General Reynolds, Sixth corps, General Smith, and General Bayard's cavalry brigade. General Lee's army was divided into two wings, General Longstreet commanding the left and General Jackson the right.

Burnside concluded to cross the river at and below Fredericksburg by pontoon-bridges. Under great difficulties, with annoyance from the enemy, the bridges were completed 11 December, troops rushed over, and by night of the 12th Sumner and Franklin had crossed and taken position. Franklin, who was to open the battle by an attack upon the Confederate right, reinforced by Birney's and Sickles' divisions of the Third corps, and Burns' of the Ninth, had about 60,000 men. At 7:30 A.M. on the 13th, Burnside gave him orders to seize the heights at Hamilton's crossing. One of Franklin's smallest divisions, Meade's, led the attack, moving out at 9 o'clock; but owing to flank attacks and lack of immediate support, it was 1:15 P.M. before Meade drove the Confederates from the Richmond Railroad and, crossing it, charged up a ridge and into the woods, piercing the centre of A. P. Hill's first line; but when he had crossed the road that ran in rear of the crest he was attacked, front and flank, by Hill's second line and the reserves, and was driven back with a loss of over 40 per cent in killed, wounded and captured. Gibbon, who had been thrown forward to support Meade's right, shared the same fate, being forced back, with a loss of 1,267 men. The Confederates then advanced beyond the railroad but were checked. Franklin made no further attempt to carry the ridge, but directed his attention to protecting his left, which he thought was seriously threatened. At 2:30 P.M., when Sumner was heavily engaged in front of Marye's Heights, Franklin received Burnside's order to attack with his whole force, but the



From original in the possession of the Southern Historical Society. SERIES I VOL. XXI.

order was not carried out. Franklin put but a small part of his command into the fight.

Sumner was held in position until after 11 A.M. in the expectation that Franklin would make such an impression upon Lee's right as would enable him to carry the line near the Telegraph and Plank roads. Feeling the importance of haste, Burnside now directed Sumner to begin his movement. In rear of the town, and between it and the heights that Sumner was to carry, was a broken plain, traversed about midway by a canal or ditch, running from right to left. Two roads cut the plain nearly at right angles with the canal; the Plank road on the right, the Telegraph road on the left, leading to Richmond. The advance was to be made on and between these two roads, over ground completely covered by artillery on the heights. McLaws' division held the heights to be assaulted, Cobb's and Kershaw's brigades being placed in the sunken Telegraph road, that ran at the base of the hill. On the side of the road next to the town was a stone wall, shoulder high, behind which Cobb's and Kershaw's men were well protected. The Second corps led in the attack. French's division moved out of the town by parallel streets, and at noon, under a severe artillerv and musketry fire, had driven in the Confederate skirmishers and gained a rise of ground, within about 120 yards of the stone wall, from which and the top of the hill it received a most deadly fire. Hancock's division followed in support. At 1 P.M. Couch ordered French and Hancock to carry Marye's Heights. French sent in his three brigades in succession, but they were bloodily repulsed by the deadly fire from behind the stone wall. Hancock now ordered in Zook's brigade. It sprang forward, was joined by some shattered regiments of French's division, and when within 25 paces of the stone wall was repulsed with great loss. The Irish brigade and Caldwell's followed in succession, but failed to carry the position and, after losing one-half, fell back, and both French and Hancock continued, with parts of their commands, to hold the rise of ground near the stone wall. While Hancock's men were falling by hundreds, Howard was ordered to move his division to the right of the Telegraph road and turn the Confederate left, but as French and Hancock needed help, Howard was recalled and ordered in on the Telegraph road, and two divisions of the Ninth corps went in on Couch's left. All fought gallantly, but made no impression upon the Confederate line. French's loss was 1,160; Hancock's 2,032; Howard's 914; Sturgis' division of the Ninth corps lost 1,007 and Getty's division 296.

It was 2 P.M. when Hooker, riding in advance of the Fifth corps, came on the ground. After an examination of the position and conference with Couch and other general officers, he concluded that it would be useless waste of life to make a further attempt and sent an aide to Burnside, giving his opinion. Burnside ordered him to attack. Hooker then rode to Burnside, across the river, and sought to impress upon him the hopelessness of the attempt, but Burnside reiterated the order to attack. Every available battery opened fire upon the Confederate position, and near sunset Humphreys led his division of the Fifth corps against Marye's Heights, Sykes' division moving on his right. Twice Humphreys led his men forward; some of them were killed within 20 yards of the stone wall; but he was repulsed with a loss of 1,000 men. Sykes, on his right, lost over 200, while Griffin's division, on the left, supporting the Ninth corps, lost over 800 men. Night came with the Union army everywhere repulsed. Burnside directed preparations for a renewal of the battle on the morning of the 14th, when he proposed to lead the Ninth corps, his old command, in an assault where the 2d and 5th corps had failed, but he was dissuaded from the attempt. From the night of the 13th until the night of the 15th the two armies confronted each other, engaged in artillery-firing and angry skirmishing. On the night of the 15th the Army of the Potomac recrossed the river, after one of its most bloody and humiliating defeats. Its loss was 1,284 killed, 9,600 wounded, and 1,769 missing, an aggregate of 12,653. The Confederate loss was 595 killed, 4,061 wounded, and 653 missing, an aggregate of 5,309. The loss of the Confederate troops defending Marye's Heights was less than 1,000; that of the attacking and supporting Union troops was over 7,300. As a result of the large Federal losses both General Franklin and General Burnside were much criticized especially after the Joint Committee of Congress on the Conduct of the War had made a report unfavorable to both. General Franklin resigned, though he maintained that the fault was not his, but the result of Burnside's inadequate orders. A considerable controversy arose regarding this question, but the preponderance of evidence seems to place the blame on Burnside's shoulders. General Burnside soon after the battle of Fredericksburg was relieved by General Hooker. A number of other engagements and military operations of varying extent took place at or near Fredericksburg on April 17–19, 1862, Aug. 4–8, 1862; Nov. 9, 1862; April 29–May 4, 1863; March 5–8, 1865; by some authorities the fighting on May 3–4, 1863, is called the second battle of Fredericksburg, but it is usually known as the battle of Marye's Heights, being part of the Chancellorsville campaign (q.v.). Consult

FREDERICKTOWN, Mo., city and county-seat of Madison County, 104 miles south of Saint Louis, on the Saint Louis, Iron Mountain and Southern Railroad. Marvin College is situated here. There is a lead mine known as La Motte located nearby. It has been worked continuously for over 200 years. Cobalt, lead, nickel and copper mining are carried on and railroad ties are manufactured. The city owns its electric-lighting plant. Pop. 2,632.

FREDERICTON, Canada, county-seat of York County and capital of New Brunswick, is beautifully situated on the west side of the river Saint John, 60 miles north-northwest of Saint John. It is on the Canadian Pacific and Intercolonial railways, and is the terminus of the Fredericton Railway. It is a port of entry and the seat of a United States consular agent. It has handsome public buildings and is the seat of parliament buildings, New Brunswick University and of the provincial normal school. It is the seat of an Anglican bishopric. Fredericton has manufactories of iron castings, machinery, leather, boots and shoes, but its chief trade is in lumber and timber products. The city was first called Saint Ann's, and on its being selected as the site of the provincial capital by Col. Thomas Carleton, the first lieutenant-governor, the name was changed (1785) to Fredericton, in honor of the Duke of York. Pop. 7,208.

FREDERIKSBERG, Denmark, formerly a suburban municipality of Copenhagen, situated to the west of the latter. It is a handsome residential section and contains several beautiful parks and a zoological garden and art museum. It contains also a palace built by Frederick IV in the 18th century. It is in the Italian style and is now used as a military training college. The Royal Porcelain Works, a faïence factory and several breweries are located also in this section. Since 1910 it forms a part of Greater Copenhagen. Pop. 97,237.

FREDERIKSBORG, frād'ĕr-ĭks-bôrg, celebrated castle of Denmark, situated on islands in Frederiksborg Lake in Zealand, 22 miles northwest of Copenhagen. It was constructed in 1600–20 by Christian IV and is in the style of the Danish Renaissance. The kings of Denmark were fomerly crowned in its chapel, which contains a king's oratory and several religious paintings executed by Bloch. The mural decorations of the castle are by Ovens, and De Vries and Sweis executed most of the sculpture. The castle was partly destroyed by fire in 1859 and has since been made into a national historical museum.

FREDERIKSHALD, frād'ĕr-ĭks-häl', Norway, fortified seaport, on the Idefjord, at the embouchure of the Tistedalselo, 85 miles southeast of Christiania. It has a good harbor which is protected by the fortresses of Frederiksten and Glydenlöve. There is a monument to Charles XII who fell while besieging the town in 1718. It was besieged by the Swedes for two years in 1658–60. It is of importance as a centre for the lumber trade of East Norway and exports large quantities of woodenware. Pop. 11,992.

FREDERIKSHAVN, frā'dĕr-ĭks-hä'v'n, Denmark, seaport town of Jutland, on the Cattegat, 52 miles north of Aalborg. The harbor is excellent, admits vessels of 20-feet draught and is free from ice throughout the year. There is regular steamer communication with Copenhagen and with several points in England and Sweden. It exports large quantities of dairy products, beef, fish, oysters, pork and eggs, and imports coal, iron, cotton goods, grain, yarn and wood. It was incorporated as a town in 1818. Pop. 7,916.

FREDERIKSTAD, frā'dĕr-ĭks-stät, Norway, seaport town at the mouth of the Glommen, 58 miles southeast of Christiania. It dates from 1570 and was for a long time very strongly fortified. Its industries are important, consisting of manufactories of bricks, boilers, engines, chemicals, cotton and woolen goods, lumber and ships. The lumber trade with France, Germany and Holland is extensive. In the neighborhood is Hankö, one of Norway's most popular bathing resorts. Pop. 15,597.

FREDMAN, The. See Bellman, Karl Mikael.

FREDONIA, Kan., city and county-seat of Wilson County, on the Atchison, Topeka and Santa Fé and the Missouri Pacific railroads, on the Fall River, 90 miles southeast of Wichita. It is situated in an agricultural and stock-raising district and natural gas and oil are found nearby. The chief industries are manufactories of brick and cement, window-glass and ice, linseed-oil and founding. The waterworks are owned municipally. The commission form of government obtains here. Pop. 3,473.

FREDONIA, N. Y., village in Chautauqua County, on the Dunkirk, Allegheny Valley and Pittsburgh railroad, about four miles south of Dunkirk and about 45 miles southwest of Buffalo. It was settled in 1803 and incorporated as a village in 1829. It was early noted for its good schools, including its free academy. It is a residential village situated in an agricultural region, in the Lake Erie grape section, and has large wine cellars, nurseries, canning establishments, etc. Some of the industrial products are grape baskets and boxes, dried fruits, patent medicines and grape juice. Natural gas was discovered here in the early part of the 19th century and was in use for lighting the village in 1821. The trade is chiefly in fruits, wine and patent medicines. It has the D. R. Barker free library and one of the State Normal schools. It was for some years the home of William Barker Cushing (q.v.). The village owns and operates the waterworks and electric-light plant. Pop. 5,328.

FREDRO, frā'drō, Count **Alexander**, Polish dramatist, called «the Molière of Poland»: b. Suchorow, Galicia 1793; d. Lemberg, 15 July 1876. He served in the army for many years and came to Paris in 1814 to study French drama. He was the founder of Polish comedy, those who preceded him having worked over French plays. He produced 18 comedies, which had considerable success. He is praised for his presentation of comic types and for the national spirit which pervades his work. His plays appeared in a collected edition in 1877. 'Mr. Moneybags' (his first piece, 1821); 'Ladies and Hussars'; 'Man and Wife'; and

'Revenge', are his principal titles. The scenes are taken from real life.

FREE BANKING SYSTEM, the predecessor of and essentially the same as our present national banking system, and on the same principles as the general railroad and corporation laws. Up to 1838 all banks required special charters, with the attendant evils of collusive «blanket» powers, corruption, and an insecurity which was not only a private evil, but seriously affected the State credit and finance. In that year New York State passed a «free» or open banking law, under which anyone could start a bank by depositing with the State an amount of securities equal to its circulating notes. The other States soon followed the precedent.

FREE CHURCH, the term applied by British non-conformists to the Christian denominations throughout the British Empire, free from state patronage and control.

FREE CHURCH ASSOCIATION, founded in 1866, in English ecclesiology, is a society which has for its main object the abolishment in the Established Church of pew rents and pew ownership, maintaining the equal right of all parishioners to the free and unrestricted use of seats in churches. See INSTITUTIONAL CHURCH.

FREE CHURCH OF ENGLAND, a distinct evangelical Protestant denomination which originated in the creation of «free churches» in the west of England as a protest against the Tractarian (q.v.) movement of 1832. The Shore controversy (1843–49), and the Gorham case (1849–50), accentuated the movement. The Church had in 1916 two bishops, 24 ministers and 1,352 members. This Church may be regarded as the English counterpart of the Reformed Episcopal Church in the United States (q.v.).

FREE CHURCH OF SCOTLAND. This was the name assumed by the large body of ministers and their adherents who gave up their livings and separated from the Established Church of Scotland at the Disruption (q.v.) on 18 May 1843. They seceded in vindication of the «Headship of Christ,» that is, to gain liberty to obey what they deemed the will of their Divine Lord in all church arrangements (including the election of ministers to charges) free from the control or interference of the civil power. No new article of faith was adopted, all the forms and rights of the national Church being retained in their integrity. The Church prospered in the face of formidable financial difficulties which were largely overcome by the institution of a sustenation fund, and by the excellent arrangements made for its distribution and employment. After 1867 there was a movement for an incorporating union with the United Presbyterian Church, which represented the voluntary principle in Scottish non-conformity. That union was formally compelled by the constitution at Edinburgh, on 31 Oct. 1900, of the first general assembly of the United Free Church of Scotland, which represented 1,149 ministers and 296,089 communicants belonging to the Free Church, and 637 ministers and 199,089 belonging to the United Presbyterian Church. A protesting minority, consisting of 27 ministers and 500 elders, who claimed to represent a total strength of 50,000 members and adherents, refused to join the union. The union of the Free Church with a voluntary body appeared to them to be a surrender of the principle of national religion and of the Confession of Faith, subscription to which had been already qualified by two declaratory acts. They were also opposed to the toleration in the Church of the higher criticism, and to the use of organs and human hymns. They were extruded from the use of the buildings and funds of the Church; the parties went to law; and after the protesting minority had been nonsuited in the Scottish courts, the case was taken on appeal to the House of Lords, which by a majority judgment, given in August 1904, reversed the decision of the Scottish courts. The effect of the judgment was that the whole of the funds and property of the Free Church became vested in the non-uniting minority, or «Wee Frees,» as they were popularly called. Lord Halsburg, who gave the leading judgment, decided that the Free Church had «lost its identity» in its incorporation with the United Presbyterian Church, a voluntary body. The decision was received with dismay and indignation in Scotland. It was at once perceived that the «legal» Free Church, whose stronghold was in the Gaelic-speaking Highlands and Islands, and was almost totally unrepresented alike in the rural districts throughout the country and in the great urban centres, was in no position to administer the trust that had been imposed upon it. Relief had to be sought in legislation; a royal commission was appointed and following on its report an act of Parliament was passed in 1905, under which an executive commission was set up to allocate the property as between the two churches. The Free Church had in 1916 5 synods, 12 presbyteries, 97 ministers and 178 congregations. See PRESBYTERIANISM, *United Free Church*.

FREE CITIES, the name applied to various cities of Germany which in the 12th century assisted the emperors in repressing the arrogance of the nobles, and, in return for their services or contributions, received various privileges and immunities and became imperial cities. Free cities existed in Germany from the time of the Romans; they had little in common with the free cities of later times, and in the beginning of the 16th century lost their most essential privileges, and even the name of free cities, through the ignorance and carelessness of their magistrates. The most important of those privileges, as shown in the case of Ratisbon, were that they should enjoy an independent government; should never swear allegiance to any emperor or king, nor be obliged either to engage in any expedition against the Romans, or to pay for the privilege of exemption; nor to pay any contributions whatsoever to the empire; nor be in any way reckoned among the cities of the empire. Virtually they were independent republics. Commerce and manufactures gradually increased the importance of the imperial cities and they often ventured to resist their masters, the emperors, and could not be reduced to obedience without great difficulty. In the middle of the 13th century two important confederacies were established for common objects — the Hanseatic League (q.v.) (1241), comprising the cities of Frankfort-on-the-Main, Hamburg, Bremen and Lübeck, and the league of the

Rhenish cities (1246), comprising Cologne, Worms, Mainz, Strassburg, Basel and Spires, which are now incorporated in their respective political divisions. The powerful Hanseatic League lasted nearly four centuries, until its dissolution was effected by several causes in 1630. The remnant of this league and of the former *collegium* of cities, which had its representatives in the German Diet — namely the free cities of Hamburg, Bremen and Lübeck — was incorporated with the French Empire in 1810. As these cities co-operated vigorously in the recovery of German independence, they were acknowledged, together with Frankfort-on-the-Main, as free cities by the Congress of Vienna (1814–15). They joined the German Confederacy and obtained the right of a vote each in the Diet, and one among the four in the narrower council. In conformity with the 12th article of the constitution of the German Confederacy, they established a common Supreme Court of Appeal in 1830. Frankfort in 1866 was annexed to Prussia. The only free cities now existing are Hamburg, Lübeck and Bremen, each sending a member to the Bundesrath, and Hamburg three deputies to the Reichstag, the others one each.

FREE CONGREGATIONS (Ger. *Freie Gemeinden*), sometimes called "Protestant Friends," a sect of German Rationalists, who at first professed to be Christians, but now reject the doctrines of miraculous revelation and a personal deity. They possessed considerable influence between 1840–50. From 1855 on, they had a difficult time as a result of determined oppression on the part of the governmental authorities of most of the German states. In more recent times they again increased their influence, gained official acknowledgment in a number of states, and gradually extended the number of their adherents. In 1859 a national society of free congregation was formed. A number of weekly and monthly journals are published, representing their views. There are upwards of 120 congregations of them in Germany, and a few in the United States. Consult Kampe, F., 'Geschichte der Religiösen Bewegung der Neueren Zeit' (4 vols., Leipzig 1852–60); Nippold, F., 'Handbuch der Neuesten Kirchengeschichte' (Heidelberg 1867); Tschirm, G., 'Zur 60 jährigen Geschichte der Freireligiösen Bewegung' (Bamberg 1904).

FREE ENQUIRERS, a body of reformers interested in the improvement of labor conditions and associated with the establishment of New Harmony, Ind., in 1825. The originator of the movement was Robert Owen (q.v.), and among others associated with him was Robert Dale Owen (q.v.) who with Fanny Wright at New York in 1827, established *The Free Enquirer*, a socialistic and agnostic publication. See NEW HARMONY; HARMONISTS; D'ARUSMONT, MADAME FRANCES (FANNY WRIGHT); RAPP, JOHANN GEORGE.

FREE NEGROES, in the United States. At the formation of the Union these numbered about 60,000, nearly half of them in the South; but while there were few slaves in New England, and those dwindling, and less than 50 per cent more than the free colored population north of Maryland, the South had more than 20 times as many slaves as freedmen, and the system was extending. Hence this section began early to dread the free negroes, as an element always making their slaves discontented, and possibly stirring them to revolt; a sentiment deepened into terror after the Santo Domingo massacres. State laws and constitutions were framed or amended to drive them from the States or re-enslave them; one method being to forbid emancipation by will, and provide that free negroes must choose masters or leave the State; and another to punish all penitentiary offenses of negroes with reduction to slavery. The Colonization Society derived its first impetus from this feeling, till it was seen to be a mere reinforcement of slavery. The laws for refusing to allow negro merchant sailors to land, or even imprisoning them if they did, also caused much bad blood with the North. The "Black Laws" reached their acme just before the War, as did the personal-liberty laws in the free States. When the United States Constitution was formed free negroes could become voters in every one of the original 13 states except South Carolina and Georgia. By 1860 they had lost this privilege in all but five New England States and New York. This remained so until the passing of the 13th, 14th and 15th amendments to the Constitution. At the beginning of the Civil War there were 487,970 free negroes to 3,953,760 slaves. (See NEGRO). Consult Alexander, W. T., 'History of the Colored Race in America' (New Orleans 1887); Brawley, B. G., 'A Short History of the American Negro' (New York 1913); Russell, J. H., 'The Free Negro in Virginia, 1619–1865' (in Johns Hopkins University 'Studies in Historical and Political Science,' Series XXXI, No. 3, Baltimore 1913); Williams, G. W., 'History of the Negro Race in America' (New York 1883).

FREE PORT, a harbor where ships of all nations may enter and load or unload on payment of harbor dues or charges for accommodation. Goods may be stored at free ports, and may then be either reshipped for export, or they may be admitted for home consumption on payment of the usual full customs of the country. The bonded warehouse system effects the same end as free ports. It is gradually spreading. England never had any free ports. There are none to-day in the United States and France. Only Hamburg and Bremen in Germany and Copenhagen in Denmark are still partially free ports. There were, however, many free ports in earlier times when the large number of small states with differing custom regulations made them of importance. Consult Bellet, D., 'La Question des Zones et Ports Francs' (in *Revue d'Économie Politique*, Vol. XXXI, p. 197, Paris 1917); Howe, F. C., 'The Free Port an Agency for the Development of American Commerce' (in *American Academy of Political and Social Science*, Vol. LIX, p. 236, Philadelphia 1915).

FREE PRESS. See PRESS, FREEDOM OF THE.

FREE SHIPS, FREE GOODS. That is, that in time of war, belligerents shall have no right to inquire into anything regarding a vessel and her cargo but whether the former belongs to a neutral, and if so, her cargo must be as free as herself; unless the cargo is agreed contraband of war. This is the doctrine of international law which the countries of predominantly industrial interests have always struggled to have accepted; while those by nature constantly or frequently at war have refused to admit it. In the great wars of France with England, in the Revolutionary and Napoleonic era, the United States was the great champion of this doctrine, while England refused to admit it, claiming the right to confiscate her enemy's goods wherever she found them, and search every neutral for them. The War of 1812 arose partly from this, and did nothing toward settling it; but the close of the war period left it of little practical importance for many years. The Declaration of Paris (q.v.) went farther than this, and proclaimed neutral goods safe even in an enemy's vessels.

FREE AND SLAVE LABOR. See LABOR.

FREE-SOIL PARTY (1848–55). This was the old Liberty party (q.v.) of direct abolition (Birney, Chase, etc.), plus the «Conscience Whigs» of Massachusetts (Sumner, C. F. Adams, etc.), who supported the Wilmot Proviso (q.v.), and the «Barnburners,» or Van Buren section of the New York Democrats. The latter as a body adopted their principle of restricting the extension of slavery into the Territories, to punish the Polk administration, ultra-southern, for attempting to build up its own «machine» in New York at the expense of the Albany Regency (q.v.); but a small element of it was really in sympathy with their less extreme purposes. Van Buren had lost the nomination in 1844 by refusing to approve the annexation of Texas; and his co-operation was more than a mere party move. The Liberty party in 1847 nominated John P. Hale of New Hampshire and Leicester King of Ohio for President and Vice-President; but seeing a chance of larger success through the promising split in the Democracy, dropped them and waited. The Barnburners offered only an even share of the State vote with their rivals the Hunkers in the Baltimore Democratic convention of 1848, withdrew, and after nominating Van Buren at a bolting convention to keep the party together, agreed to join in a fusion «Free-Soil» party. A convention of this at Buffalo in August nominated Van Buren and Adams. The platform declared for «Free Soil, Free Speech, Free Labor and Free Men»; and that slavery in the States was beyond the control of Congress, but that as Congress could not make slaves it was bound to refuse it admission to the Territories. (See WILMOT PROVISO). The party cast 291,263 votes, turned Maine and six western States over to the Democrats (Cass), and would have defeated the Whigs (Taylor) but that the New York defection (120,510) was mainly from the Democrats and gave that State to the Whigs. The New York Democratic delegation to Congress was annihilated all but one; and the two factions at once struck a bargain which left Van Buren permanently out of public life. The Free-Soilers in the 31st Congress (1849–51) had 2 United States senators (Chase and Hale), and 14 representatives, including J. R. Giddings, George W. Julian and Horace Mann. Sumner in the Senate and 3 more representatives reinforced them in 1851, and in the 33d Congress (1853–55) they had 5 senators and 17 representatives. Having been abandoned by their casual allies, in 1852 they nominated Hale and Julian; with a platform denouncing the Compromise of 1850 (q.v.), both the great parties for accepting it, and slavery as «a sin against God and a crime against man,» and demanding the repeal of the fugitive-slave law. They polled 156,149 votes, of which 25,329 were in New York. They maintained their organization in Congress till the Kansas-Nebraska Bill (q.v.) had created the Republican party, which adopted its policy, and into which they were at once fused. It had served as a school of experience for some of the most distinguished Republican leaders, and played a part out of all proportion to its voting strength. Consult Wilson, H., 'Fall of the Slave Power' (New York 1874); and Smith, T. C., 'Liberty and Free-soil Parties in the Northwest' (New York 1897).

FREE SONS OF ISRAEL, Independent Order of, a Jewish fraternal and benevolent society founded 10 Jan. 1849. It has 3 grand lodges and 89 subordinate lodges in the United States. In 1914 it had a total membership of 8,745, and up to that time had paid $6,559,355 to its beneficiaries.

FREE SPIRIT, Brethren of the, a sect of heretics with strong leanings toward quietistic and pantheistic mysticism, which originated in Alsace in the 13th and 14th centuries, and quickly became disseminated over Italy, France and Germany. They claimed «freedom of spirit,» and based their claims on Rom. viii, 2–14. Thence they deduced that they could not sin. Consult Döllinger, J. J. I. von, 'Beiträge zur Sektengeschichte' (Munich 1890); Hahn, C. U., 'Geschichte der Ketzer' (Stuttgart 1847); Lea, H. C., 'History of the Inquisition of the Middle Ages' (3 vols., New York 1888); Preger, W., 'Geschichte der Deutschen Mystik' (3 vols., Leipzig 1874–93).

FREE STONE, the name applied to building stones, especially sandstones, that can be most conveniently worked on account of their freedom from stratification planes, layers of heterogeneous material or different structure, etc. Limestones that can be freely cut in all directions, owing to exceptional homogeneity of structure, may also be called free stone. See BUILDING MATERIAL.

FREE TRADE, in current use restricted to mean the interchange of commodities between countries politically independent, without obstacles specifically intended to restrict the trade. All taxes on imports, which form a large part of the revenue of most civilized governments to that extent impede the freedom of trade; but the essence of the free-trade system is, that they shall not be arranged to «protect» the correspondent home production, or, as free-traders would put it, to divert capital into otherwise unprofitable channels at the expense of the consumer. This is accomplished by selecting articles not possible to produce at home (as tropical products in a temperate country); by forbidding their production at home (as tobacco in England), foregoing certain new home industries for the sake of sparing existent ones; or by laying corresponding internal taxes.

That free trade was never even formulated as a theory till a few generations ago, nor adopted as a policy till within two generations, that it is even now practised in its fulness by only one country, and nearly so by only two more, and that the former, its chief exponent, is at this moment rent by a fierce struggle to resume its old protective system, indicates something more back of this question than the mere state of economic enlightenment. The truth is, free trade is a matter of business, and all states have prior interests which business only subserves, and to which it is sometimes partially antagonistic. National existence always comes first, national prestige usually, national rivalry and jealousy frequently. In the Middle Ages war was the normal condition of most countries and the constant liability of the rest; hence everything had to be subordinated to diversified resources in war, whence a nation's supplies might be suddenly shut off. As the age of neutrality and the localization of wars has supervened, this danger has practically passed; but masses of capital and of labor in each country, which its rulers cannot politically disregard, can still be injured by the hostile tariffs which are the modern substitutes for fleets and armies of conquest. The problem at issue is, whether these injure the target as much as the marksman; free-traders have one answer, protectionists another. But the protectionist interest is always much more concentrated and effective than the free-trade: it is that of masses of capital embarked in certain enterprises and fighting for life, with all the masses of people behind it whom it maintains, and who would be temporarily injured by a readjustment. Protection is led by those who are interested in terms of millions, free trade mostly by those who are interested relatively in terms of pennies. The contest is so unequal that it is only wonderful that any circumstances have ever given the latter even a temporary victory.

In Europe till the 17th century, and in most parts of that till the 18th, the only way the bounds of free trade were extended was by conquest; and even that did not always effect it, old provinces and feudalities retaining their rights to separate custom-houses — primarily an octroi, but used for "protection." Most countries were cut up by dozens of these vexatious boundary lines, crippling all internal trade, and making each little district a special and self-subsistent world. Under Louis XIV Colbert (1665–83) swept away many of these old provincial barriers, to the enormous development of French industry and trade, and consequently revenue; but he could not touch the chief portion. Already in 1623 De la Croix had propounded the theory of free trade; and in England it was urged in 1696 by Nicholas Barbon, one of the founders of the life-insurance system. But about the middle of the 18th century it sprung into life at once in two quarters, the lesser influence at the time having been vastly more potent in the end: with the French "Physiocrats" and Adam Smith. The theory of the former — whose founder was Cantillon and the chief heads Quesnay and De Gournay — was enthusiastically taken up by a group of able thinkers and men of affairs, and in 1774 put partially in practice by Turgot, in free trade for grain throughout France. Their method of approach was curious: they held that as commerce does nothing but transfer from hand to hand wealth already existing, without creating new, the gains of the trading class are at the expense of the only real wealth, the products of the earth; it is therefore to the community's interest that they should be as small as possible, and to this end commerce should take the shortest and most natural channels, as this leaves the "net product" of society the highest. Meantime in 1752–63, Adam Smith, a professor of moral philosophy at the University of Glasgow, had been working out a theory of the social progress of nations; and, as one branch of it, he investigated the causes of their material well-being. He was anything but a man of business, but he had a Scotch intellect which reasoned truly, and his society included many keen and able merchants and importers of the day. From them and his own mind he produced and fortified the theory that dams in a stream could never create water, but only force it into other channels. He visited France and met the Physiocrat leaders, and received doubtless new arguments and fresh facts. In 1775 he published his 'Wealth of Nations,' perhaps the most epoch-making single book of all time; for it created political economy as a science and free trade as a practical system. He took separately each kind of protective duty in use or advocated, and proved that each did harm in the very line it was supposed to do good. But he saw no hope of free trade ever coming about in England, so dominating was the influence of invested capital and of "furious and disappointed monopolists." But a curious change in industrial affairs inverted the position of his friends and enemies. His views had been favored by the landed interest and disfavored by the manufacturers; but the course of business made the agriculturists eager to keep up the duties on grain, which gave them immense profits; while the manufacturers began to be irked by the duties on raw material, which checked their coming dominance of the textile market under the splendid English inventions. The ablest statesmen were on the same side: Shelburne and the younger Pitt were convinced free-traders, and the latter tried to put Irish free trade into the act of Union in 1800. Two decades later the adherents were numerous: Ricardo's 'Political Economy' had reinforced Smith's, with greater weight because he was a successful Jewish banker; and London merchants were petitioning to have the shackles taken off trade. The first great success was making William Huskisson president of the board of trade in 1823; he was ignominiously driven from the Cabinet by the Duke of Wellington, but had induced Parliament to free some articles and lighten the duty on others. Thrust aside by more pressing politics, the reform stood still till 1836, when a failure of crops made it once more a burning question. Never was an issue so sharply marked out: the people were sacking the towns for bread while grain was taxed to enrich the landlords. Meantime manufacturers, increasingly the chief reliance of the national revenues, were kept out of foreign markets by having to pay higher for raw materials and more for wages. Local Anti-Corn-Law Associations from 1837 on were fused into the National Anti-Corn League in 1839; at its head were Richard Cobden and John Bright, both partners in Manchester calico-printing works; whence the term "Manchester School" for supposed believers in various doctrines mistakenly attributed to Cobden. The struggle convulsed

England, and almost broke the bonds of social order; but the final blow to the old system was the Irish potato famine in 1845. This shortage made food still higher; and Sir Robert Peel, who had taken office expressly to resist the repeal of the Corn Laws, remained in it to repeal them himself, 26 June 1846 — most of the duty at once, the rest by a sliding scale within three years.

The full free-trade policy was not introduced for many years, however: it was Mr. Gladstone in 1869 who framed the present system of absolute freedom from protection, though as Palmerston's chancellor of the exchequer in 1861 he had taken a long step toward it. In 1841 more than 1,000 articles were on the customs list, over half of them large staples; in 1849 they were reduced to 515, and in 1855 to 414, but still 153 main articles of consumption; while in 1861 they were reduced at a blow to 142, of which only 19 were of great importance, and in 1876 to 42, of which 10 were important. They have since been reduced to 12 altogether, in as few classes as possible — seven kinds of drinks, three of sweets, one narcotic and one food; namely, spirits, wine and beer; tea, coffee, chicory, and cocoa; sugar, molasses, and glucose; tobacco; and dried fruits.

It may be said here that in the last 30 years of protection, the total increase of British imports and exports was $340,000,000; in the first 30 of free trade it was $2,400,000,000, between seven and eight times as much. In 1816-40 the total increase in British shipping was 80,000 tons; from 1848 to 1858 it was 1,257,000, and thence to 1880 1,917,000 more. The experience of Belgium was even more striking. Under Napoleon prohibitory duties were imposed, and the country became largely depopulated; with the return of the Dutch and low duties, great manufactures at once sprang up; with their expulsion in 1830 high protective duties were again imposed, and in 1851 the prime minister declared that if they were not removed all domestic industry would be ruined; the whole system was swept away in 1855, and Belgium rapidly became, size for size, the foremost industrial and commercial state of the world, the richest per capita, and the manufactory of Europe. Only a few per cent of its revenue is from imports, the rest being from internal duties.

The arguments for free trade cannot be stated without those against protection, being the same. They are not alone industrial, but political and social. Broadly, it is asserted that protection cannot increase the total industrial product to be divided up, and can only enable one class of the community to force the remainder to buy one costly article instead of two cheap ones, thus lessening the volume of trade and production; that its claim, to redistribute the amount in wages is false, as but for the system the same capital would have been employed in other industries and paid as much wages, with lower prices to the consumers; that its claim to ultimately reduce prices is false, because as soon as that object has been achieved, it applies to the government on that very ground to save it from ruin by increasing the duty; that its claim to found industries is false by demonstration; and that it narrows instead of diversifying them; that it extorts high prices from home consumers by squeezing the market of which it is given a monopoly, and then sells its surplus to foreigners at a low price — which Adam Smith sets down as inevitable with a protective system; that it produces trusts, to prevent competition through which the public might secure its alleged benefits; that it produces alternate "feast or famine," inflation and panic, instead of equable business; that it makes orderly public finance impossible, by creating huge random revenues to be spent at random, in place of a calculable budget; that it corrupts politics deeply and hopelessly, by making masses of capital dependent on legislation for its profit, and consequently influencing that legislation for its own ends, stripping the treasury to prevent repeal of duties, inventing extravagant schemes to spend an unnecessary revenue, and buying votes in its favor by enormous permanent burdens on the people, through pensions, etc., is mainly due to this money power created by legislation. For the opposite side, see PROTECTION. See also ECONOMICS; TARIFF.

Y., 1912); Higginson, 'Tariffs at Work' (London 1913); Matthews, 'Taxation and the Distribution of Wealth' (New York 1914).

FREE WILL. This question is properly divided into two sections, that of the metaphysical basis and the doctrinal application; but the latter has so deeply affected the reasonings on the former, that it is almost impossible to separate them.

The metaphysical problem is unique, from its presenting at the outset an irreconcilable contradiction between the phenomena of consciousness and the operations of reason. In this respect it is different from the insoluble problems of time and space, where the conflict is between opposing conclusions of the reason with regard to the materials furnished by consciousness; here there is a denial, by reason, of the validity of those materials. Consciousness appears to show us at every moment that we can dictate our actions mostly and our thoughts very largely; reason tells us that each follows on other phenomena, from whose invariable relation of precedence we characterize them as cause and the former as effect. Consciousness tells us that our will is the active agent in producing the phenomena which immediately succeed it; reason tells us that this fancied agency is an illusion and itself a part of the chain of sequences, and that the apparent relation is because, as Hobbes says, the so-called will is the last wish of the mind before determining. But what causes the determination? This involves the problem of the nature of the will as before, as well as of the "coupling-pin" by which, if a reality, it acts on matter; if not a reality, the reason why a mental resolve is invariably followed by a physical movement or mental conception. Of the coupling-pin no acceptable theory has ever been framed; the best explanation of the association of will and act, supposing the former an illusion, is still Spinoza's, that they are twin phases of the same ultimate reality, and of necessity change coincidently. But this leaves it still unexplained why our consciousness makes the will not coincident with the act, but invariably its predecessor: we do not will and act simultaneously, but in succession. The overwhelming weight of reason, however, for 2,500 years, from the Greek predecessors of Aristotle to Jonathan Edwards, has won reluctant acceptance to the doctrine of universal determinism, or in theological phrase, of necessitarianism: a chain of causation extending to all things and back to infinity, since no uncaused first act or idea can be fancied except as part of the First Cause of the universe. It is of course never claimed that all acts are volitional or all volitions deliberate, but only that the mind at will can interject uncaused determinations among the caused. It is evident, however, that to assume the possibility of uncaused acts is to consign the universe to chaos and abolish the reign of law; that only on the theory of strict and unbroken causation (or "invariable sequence") can we reason at all concerning phenomena; that the mind must follow the same law as other entities, and has no power, nor could even be endowed with such by omnipotence, of willing without motive — that is, without a cause itself the resultant of an endless series of other causes. Indeed, as Professor Huxley puts it, for the mind to cause itself implies that it has anteceded itself, which is absurd; the first mental action must have been part of the chain of causation, which surrenders the whole case, as there is no spot where it can be imagined that it was able to throw down the ladder by which it had climbed, and cut loose from causes into a region of caprice.

To avoid this conclusion, a curious dilemma — usually known as "Buridan's Ass," though Buridan did not devise it — was invented by the mediæval schoolmen. Suppose an ass between two bundles of hay, exactly alike, and with no motive for choosing which to bite first: it is absurd to suppose he would starve in the midst of food, and he must therefore act from free will. To this, however, it was answered that if motiveless he would so starve; and the question remained as before.

Involved with this is the question of God's foreknowledge. It is obvious that this involves his pre-determination of events, as otherwise he would foreknow what was never to happen, or was to happen outside his will; and there can be no change in the predestined order, since any change in a sequence must itself be part of the predestination and foreknowledge.

Alone of all metaphysical questions not incident to the claims of religious founders, this has always been a fierce battle-ground, the dividing line of great religious sects. The reason is that the possibility of sanctions for moral law, and consequently of a decent basis for human society, is believed to depend upon it. Determinism seems to cut the roots of moral obligation, by removing the possibility of obedience to it. If we are without will except as a consciousness of preference resulting from causes outside our control, we are automata; and preaching obligation of any sort to us seems as irrational as preaching it to a doll, for our action will not be influenced by it, nor are we responsible for disobedience. In this extreme form, the fallacy is easily apparent. The will, as Edwards has put it, always follows the greatest seeming good: but its estimate of good is not an unvarying thing, but constantly changing with experience and reason. Now moral rules, apprehended and accepted by the mind, form a part of this good, and therefore become new causes which determine the will: and whatever may have been the causation which has determined the evolving and enforcing of the moral law, it is nevertheless a portion of the environment which acts on the mind. As to responsibility, the question is irrelevant. An automaton which runs into a fire or the sea perishes none the less than if the act were a conscious volition. Punishment waits not on responsibility, but on violation of the laws of its being, and blame and excuse are alike impertinent to the result. We do not blame a child who burns its fingers, but the fingers are in the same condition as if we did.

Back of this, however, lies a contradiction of fact. So far from determinism making moral law impossible, free will makes it impossible. If volition can perpetually nullify the action of motive, there is a fatal breach in the continuity of cause and effect; there can be no calculable sequence of action and therefore no law. The most perverse defiance of natural order is no more independent of cause than the steadiest obedience, for that perversity is itself due to causes precedent. Whence then come the invariable consciousness of freedom to act, its universal recognition, its embodiment into the framework of society, the obvious fact that there can be no society except on this basis? Why, here again, do consciousness and practice oppose themselves unalterably to invincible argument? Edwards explains that though we have not liberty of willing, we have liberty of action; which taken literally would imply that the will has no necessary connection with the act, and that we may voluntarily do a thing we have involuntarily willed not to do. Of course Edwards does not in fact maintain this, but only that God has given a choice of action by furnishing experience and reason and illumination by which to frame correct determinations. Waiving discussion of the difference between these determinations and will, the real explanation probably lies in the confusion between the abstract and concrete will, between its dependence on causes and, as above said, our own power to determine or change those causes. Instruction, example, appeals to self-interest or fear, or vanity, or affection, or honor, etc., produce an environment and modify the view taken by each of the supreme immediate good, calculably enough to base coherent society upon; where their effect is grossly miscalculated the society goes to pieces. Metaphysics and the general consciousness are both right, each in its own sphere: the will must have motives, but those motives are furnished in great measure externally. Furthermore, subject to the inexorable limitation, it can furnish by its own action motives to change itself; and constantly does so, attributing to its independent action what is really due to the influence of the new causes it has made to operate in altering its estimate of relative good. For the purposes of human life, volition is absolute and there is no injustice in enforcing responsibility.

E., 'The Rational Education of the Mind' (Boston 1914); Martineau, J., 'A Study of Religion' (2 vols., Oxford, 1888); Mill, J. S., 'Logic' (London 1856); Rashdall, H., 'Theories of Good and Evil' (Oxford 1907); Stewart, D., 'Moral Philosophy' (Edinburgh 1854); Ward, J., 'The Realm of Ends' (Cambridge 1911).

FREEDEN, frā'dĕn, **Wilhelm Ihno Adolf,** German mathematician and navigation expert: b. Norden, Hanover, 1822; d. 1894. He received his education at the universities of Bonn and Göttingen. For a number of years he was head of the school of navigation at Elsfleth, and in 1867 founded the German Naval Observatory at Hamburg, of which he was in charge until 1875. This observatory was designed to facilitate maritime intercourse, and consists of the departments of marine meteorology, of coast meteorology, of signal service, chronometer testing and bureaus of nautical, meteorological and magnetic instruments. He was in the Reichstag in 1871–76 and until 1891 was editor of the *Hansa, Zeitschrift für Seewesen,* which he had founded together with H. Tecklenborg-Bremen.

FREEDMAN. See FREEMAN.

FREEDMEN'S BUREAU, 1865–69. The supervision, temporary maintenance and employment of the mass of homeless, penniless and untaught freedmen created by emancipation was an obvious duty of the government, urged upon it at once after the proclamation of 1 Jan. 1863; and in 1863–64 officials were appointed to lease abandoned lands to them for terms not exceeding a year. The military officers left much of the care and provision for freedmen in their hands; but a more comprehensive plan was needed, and after various abortive efforts at an acceptable measure, a «Bureau of Refugees, Freedmen and Abandoned Lands» was established in the War Department, 3 March 1865, to continue for a year after the war. It was to be headed by a commissioner, with assistant commissioners in all the seceded States; to issue supplies to destitute freedmen, have charge of abandoned lands to lease and ultimately sell in 40-acre plots, and have «control of all subjects relating to refugees and freedmen» — an elastic provision construed in the most elastic way. Its commissioners — the head being Gen. O. O. Howard (q.v.), a noble-minded and laborious philanthropist — acted as courts of law where there were none, or where negroes were not recognized as free; established the institution of marriage, and kept records; assured the freedmen the right to choose employers, and made fair contracts for them. The «abandoned lands» disappeared under the amnesty acts; but the bureau did excellent work by inaugurating free schools on a large scale. On 6 Feb. 1866 Congress passed a bill to enlarge its powers and make it permanent; Johnson successfully vetoed it, but on 16 July another was passed over his veto, extending the bureau to July 1868, later extended a year in unreconstructed States. Under this its sweeping powers made it largely the government of the South under Reconstruction, especially as the department military commanders were usually made assistant commissioners; and the demoralizing and disastrous struggle of the North to secure negro independence and of the South to reassert white mastery, is a history of part of the bureau's action — through executive and legislative powers scarcely pretended to be constitutional, and to transfer which to the regular courts the Fifteenth Amendment was passed. The bureau was regarded with detestation in the South; a large number of its officers secured office through negro support; and its influence was exercised in organizing the blacks politically against the whites. Better features of its work were the foundation of the free public schools in the South, and of Fisk, Howard and Atlantic universities, and Hampton Institute; of the system of negro peasant proprietorship; and the winning of equal rights for all men in the courts. That it failed in its larger hopes, and that its harmful results were so great that many hold them far in excess of its benefits, are facts attributed by the fairest judges to the inevitable conditions of the problem. (See a very lucid and singularly just summary by W. E. B. DuBois — colored — in the *Atlantic Monthly,* Vol. LXXXVII, p. 354). The bureau ended its main work in 1869; its educational work continued till 1872, and bounty payments some years longer. It had about 900 agents in 1868; and expended in all some $20,000,000, over $10,000,000 on objects unconnected with soldiers' bounties. General Howard published a report of its work in the House Executive Documents, 41st Congress, 2d session. Consult Pierce, 'The Freedmen's Bureau' (Iowa City 1904).

FREEDMEN'S SAVINGS AND TRUST CO., usually called **FREEDMAN'S BANK,** a savings bank chartered by Congress in the District of Columbia by an act approved 3 March 1865, at the special instance of Charles Sumner and Charles R. Buckalew, as a means of encouraging thrift among the newly emanicipated negroes. It was in fact intended as part of the Freedmen's Bureau work, and had among its corporators General Howard, the chief commissioner, and a host of the most eminent and upright public men and philanthropists; and its investments were restricted to government securities. It started branches in some 30 Southern cities, with doubtful legality, but covered by the elastic ægis of the bureau's power and everyone's good will, the South's most of all; and did a large business. But the corporators appointed successors much less disinterested; the restriction on investments was removed in 1870, ostensibly to benefit depositors by a higher rate of interest, against the protest of Simon Cameron in the Senate; the securities were rapidly replaced by «wildcat» stocks, all speculative and mostly worthless, and by mortgages on valueless property; and in 1874 the bank was pronounced insolvent, with practically no assets. At that time there were 61,131 depositors with a total of $2,939,925 deposits. As a result of bankruptcy proceedings about 62 per cent or $1,822,753 of this indebtedness has been paid off. The blow to incipient negro thrift was very great; and the scandal discredited the entire system of which the bank was an outcome, and was one cause of the political overturn in 1874. Consult Anon., 'The Story of the Freedman's Bank' (in *Nation*, Vol. XX, p. 253, New York 1875); United States; Banking and Currency Committee, 'Freedman's Savings and Trust Co.' (Washington 1910); United States, 'Acts and Resolutions' (38th Congress, 2d Session, Washington 1865).

FREEDOM, Pa., borough in Beaver County, 25 miles northwest of Pittsburgh, on the Pittsburgh, Fort Wayne and Chicago Railroad, and on the Ohio River. There are manufactures of caskets, monuments and oil. Pop. 3,060.

FREEDOM, Personal, the liberty of the individual to determine the course of his own actions, subject only to restrictions the same for all and as few and liberal as the public safety permits. It is characteristic of a social condition where the individual is the fundamental unit, rather than subordinate communities such as the family or the clan. Accordingly, the gradual eclipse of the family by the individual characteristic of European social history has led to the removal of such obstructions to personal liberty as the Roman right of the father. The disappearance of slavery and of serfdom is likewise a natural consequence of the supersession in their rôle of political units of the household and the estate by the individual. In the modern democratic state, personal liberty exists as a recognition of the right of each individual, within limits, to do what he pleases without the constraint of his fellows to go where he pleases, to work at whatever trade he pleases and to own whatever property he can purchase. All these rights are strictly limited in the case of minors, and even among adults, the welfare of the State has necessitated such restrictions as punishments, quarantines, special professional qualifications and taxes. In times of emergency the right of the State to dispose of even the lives of its constituent individuals for the common good is universally recognized. That the restriction on the individual by the State shall not be more oppressive than necessity demands is secured by various clauses in the constitutions of the several nations of the world. In English-speaking countries, one of the most trusted weapons against the abuse of the powers of the State is a constitutional provision concerning writs of *habeas corpus* (q.v.).

FREEDOM OF CITY. The custom of granting to a distinguished visitor the "privileges connected with municipal citizenship," which is known as conferring "the freedom of the city" obtains in both American and European cities. The practice is to enter the names of such "honorary citizens" upon the register of municipal electors, but they are not actually entitled to exercise the franchise or to become members of the city's governing bodies. The custom amounts nowadays to little more than a public expression of esteem, but its history goes back to the mediæval days when it was a notable and valuable gift. When the custom originated there was no general recognition of the right of freedom of domicile, and cities were more like private corporations with restricted membership than our modern cities. Such membership — municipal citizenship — was usually obtained only after a long period of apprenticeship to one of the recognized guilds, followed by examination, and enrolment as a "master workman." In such circumstances, the immediate and unencumbered gift of "the freedom of the city" by the vote of the magistrates was a considerable favor, and it was only granted to persons whose wealth or renown made their citizenship substantially desirable to the other burghers.

FREEDOM OF THE SEAS. See INTERNATIONAL LAW.

FREEDOM OF SPEECH AND OF THE PRESS. By this is understood the essential right embodied in liberty of speaking and publishing the truth with good motives and for justifiable ends, in regard to the actions of the government, of officials, or individuals. The different bills of rights in State constitutions contain provisions along the same lines as those contained in the First Amendment of the Federal Constitution that no law shall be made "abridging the freedom of speech or of the press." This preserves an important feature of personal liberty long recognized in the constitution of England and maintained in the United States where in fact liberty in speaking and publishing one's opinions is subject to even fewer restrictions than in England. These constitutional provisions, however, do not imply that liberty of speech and publication shall be free from responsibility and not subject to regulation. Improper speech and publication can incur both civil and criminal liability as determined by general law in the protection of property, person and reputation. These regulations and restrictions comprise: (1) Civil liability to damages for injuries caused by slander, that is, the speaking of false and malicious words concerning another resulting in injury to his business or reputation; (2) both civil and criminal liability for libel, which is the publication by writing or printing of matter calculated to injure the business of another or his character by bringing him into ridicule, hatred or contempt, under circumstances rendering such publication unjustifiable and without lawful excuse; (3) criminal punishment for the speaking or publishing of blasphemous, obscene, indecent or scandalous matter. Damages may be recovered in a civil suit for libelous statements made maliciously or without proper occasion to the injury of another. The truth of the statements may be pleaded as justification for a complete defense; but unless their truth is established, defamatory words spoken or written are presumed to be false, and they are also presumed to be malicious unless the occasion of their being spoken or published is such as to render them privileged.

FREEDOM OF THE WILL, a work by Jonathan Edwards. It is an amazing fact that this treatise, undoubtedly the greatest contribution of America to metaphysical thought, was written within a period of four months, while the author was a missionary to the Indians in a frontier settlement. But the work is amazing for other reasons also. Its power of close argumentation was reckoned by so able a critic as Sir James Mackintosh as «perhaps unmatched, certainly unsurpassed.» The reputation of its awful audacity still haunts the minds of men who know no metaphysics and recite no creeds. Properly to understand the book, however, it is necessary to go back to Edwards' youth, and to read his romantic outpourings on the beauty of holiness, the serene delights of the gardens of faith, and the fragrance of the love of God. These things still underlie the terrible logic of the later treatise, though concealed from superficial gaze by the unfortunate results of his reforming zeal and by his long-developed habit of controversy. To Edwards the Arminian theology of the day — which held that man is free to choose between good and evil and owes his salvation to his own choice as well as to the grace of God — was a manner of trifling with the tremendous issues of sin and of slighting the supreme prerogative of Deity. It is to make a mockery of sin, he argued, to suppose that men would deliberately and knowingly choose evil and pain in place of good and happiness; man's freedom is confined to his ability to carry out his inclinations, but his so-called will is nothing more than his inevitable inclination toward that which at the moment of action seems to him best. In the same way it is to derogate from God's majesty to look for any cause in the world outside of His omnipotent will. Hence the inclinations of men, as they must have a cause, are traced back to their source in God, whom Edwards does not hesitate to call «the author of sin,» though, as he insists, «for wise, holy and most excellent ends.» It is of course a manifest injustice to reduce Edwards' vast argument, a veritable megalotherium of metaphysics, to so puny a compass. More than that, any prospective reader should be warned that the spirit and intention of Edwards cannot be judged from this treatise alone, but must be gathered from the whole range of his works.

Paul Elmer More.

FREEHAND PERSPECTIVE. See Art Drawing.

FREEHOLD, N. J., town, county-seat of Monmouth County, on the Central Railroad of New Jersey, and the Pennsylvania Railroad; about 32 miles southwest of Jersey City. It was settled in 1734, and for some time it was called Monmouth Court House, because the county court was held in the village. In 1869 it was incorporated, and the commission form of government has been adopted. It is the trade centre for a large agricultural section. Its chief manufactures are bicycles, foundry and machine-shop products, underwear and shirts. There is also a large canning factory. One of the attractions of the town is the granite monument in memory of the battle of Monmouth (q.v.) which took place here 28 June 1778. Pop. 3,622.

FREEHOLD, in English and American law, an estate or real property held in fee simple in America, or in England either in fee simple or fee tail; the tenure by which such an estate is held. (See Fee.) Anciently it was one of the two chief tenures known as tenure in free socage, and was the only free method for laymen to hold property. A freehold estate must possess immobility, in other words, must consist either of land or of some interest arising out of land annexed to it. Secondly, it must be of indeterminate duration. Consult Digby, K. E., 'An Introduction to the History of the Law of Real Property' (Oxford 1875); Pollock, Sir F., and Maitland, F. W., 'History of English Law Before the Time of Edward I' (2 vols., Cambridge 1895).

FREELAND, Pa., borough in Luzerne County, on the Lehigh Valley and Central Railroad of New Jersey, about 30 miles southwest of Scranton. It is situated in the anthracite coal region, but is surrounded by a large section of good farming land. The chief industrial establishments are two silk mills, an overall factory, two coal mining companies, etc. There are two banks with aggregate resources of about $1,150,000. The value of taxable property (1916) was given as $2,028,273. Educational institutions are the Mining and Mechanical Institute, public and parochial schools. Receipts of government (council of 12 members) $21,629 and expenses $20,465, as reported in 1916. Pop. 8,000.

FREEMAN, Alice Elvira. See Palmer, Alice Freeman.

FREEMAN, Edward Augustus, English historian: b. Harborne, near Birmingham, 1823; d. Alicante, Spain, 16 March 1892. He was educated at Trinity College, Oxford, where he obtained a scholarship in 1841, and after his marriage in 1847 he retired to a small estate at Somerleaze, in Somerset, where he devoted himself to literature. His first publication (1849) was a 'History of Architecture,' a subject in which he maintained interest throughout his life. This work was more especially devoted to Gothic architecture. His architectural researches helped to turn his attention to history, but his earliest historical works were the product of his interest in contemporary burning questions. His 'History and Conquests of the Saracens' (1856) was partly due to the Crimean War; and the American Civil War brought forth his 'History of Federal Government' (1863), which, however, remained a fragment in one volume. Between 1867 and 1879 appeared his *magnum opus*, the 'History of the Norman Conquest of England,' in six volumes, followed in 1882 by two supplementary volumes dealing with 'The Reign of William Rufus and the Accession of Henry I.' In 1884 he was appointed regius professor of modern history at Oxford, and this post he occupied till his death. His last great work was a 'History of Sicily,' which he left unfinished, though three volumes of the work were published. He died in Spain, where he was traveling for the purposes of recreation and research. Other works of his beside those mentioned were 'Essay on Window Tracery'; 'The Architecture of Landaff Cathedral'; 'History of Wells Cathedral' (1870); 'Old English History for Children' (1869); 'Growth of the English Constitution' (1872); 'Historical Essays' (three series, 1871–79); 'The Ottoman Power in Europe' (1877); 'Historical Geography of Europe' (1881); 'Subject and Neighbor Lands of Venice' (1881); 'Lectures to American Audiences' (1882); 'English Towns and Districts' (1883); 'Some Impressions of the United States' (1883); 'Exeter'

(1887); ‘Methods of Historical Study’ (1886); ‘The Chief Periods of European History’ (1887); ‘William the Conqueror’ (1888); ‘Studies of Travel’ (edited by Miss F. Freeman, 3 vols., 1893, 1897). He was a man of strong partisan feeling, which sometimes interfered with a judicial weighing of evidence. But he took great pains to verify his facts, indeed was devoted to truth, and had a wide and deep knowledge of history. The charge of prolixity made against him is not without foundation, but when in the mood he displayed remarkable powers of compression. He had a marked preference for the use of words of purely English origin. In spite of his pugnacity and the obstinacy with which he maintained his side in a controversy he was a man of generous and kindly nature. Consult ‘Life and Letters,’ by Stephens (1895).

FREEMAN, James, American Unitarian clergyman, the first in the United States to assume the name Unitarian: b. Charlestown, Mass., 22 April 1759; d. Newton, Mass., 14 Nov. 1835. He was graduated at Harvard College in 1777, in 1782 became lay-reader in King's Chapel, Boston, later proclaimed himself a Unitarian, and, supported by his congregation, secured corresponding changes in the prayer-book. In 1787, his bishop having refused him ordination, he was ordained by his wardens and congregation. Until his death he was sole minister of the chapel. He received the degree of D.D. from Harvard in 1811; he was a liberal and accomplished scholar. He published ‘Sermons and Charges’ (1832).

FREEMAN, James Midwinter, American Methodist clergyman: b. New York, 29 Jan. 1827; d. Morristown, N. J., 27 Feb. 1900. He was educated at Wesleyan University, ordained in the Methodist Episcopal Church in 1850 and held pastorates of various prominent New Jersey churches for 22 years. From 1872 until his death he was assistant editor and corresponding secretary of the Sunday School Union and of the Tract Society of the Methodist Episcopal Church. He also acted as secretary of the board of trustees of the Centenary Collegiate Institute and of that of Drew Theological Seminary, as well as secretary of the Methodist Historical Society of New York City.

FREEMAN, Mary Eleanor Wilkins, American novelist: b. Randolph, Mass., 1862. She was educated at Mount Holyoke Seminary and after some years spent in Brattleboro, Vt., returned in 1883 to Randolph, which remained her home till her marriage to Charles Freeman in January 1902, when she removed to his home in Metuchen, N. J. She came first into notice about 1886 by her extremely faithful delineations of certain phases of New England life in her short stories contributed to the magazines; then attempted more sustained work, and published several novels, displaying the same characteristics. Her work steadily gained in popularity and has been admired by English as well as American critics. A fondness for very short sentences gives it almost a staccato character at times, and while the accuracy of her studies of New England village existence cannot be called into question, her insistence upon the bareness of the life to the exclusion, or almost entire subordination of its happier phases, conveys a not wholly correct impression of the life in its entirety. Her published works include ‘The Adventures of Ann’ (1886); ‘A Humble Romance and Other Stories’ (1887); ‘A New England Nun, and Other Stories’ (1891); ‘Young Lucretia’ (1892); ‘Giles Corey, Yeoman,’ a drama (1893); ‘Jane Field,’ her first novel (1893); ‘Pembroke’ (1894); ‘The Long Arm,’ with J. E. Chamberlin (1895); ‘Jerome, a Poor Man’; ‘Silence and Other Stories’; ‘The People of Our Neighborhood’; ‘Understudies’; ‘Madelon’; ‘The Love of Parson Lord’; ‘Evelina's Garden’; ‘The Wind in the Rose-Bush’; ‘The Givers’ (1904); ‘Doc Gordon’ (1906); ‘By the Light of the Soul’ (1907); ‘Shoulders of Atlas’ (1908); ‘Winning Lady’ (1909); ‘Green Door’ (1910); ‘Butterfly House’ and ‘Yates Pride’ (1912); ‘Copy Cat and Other Stories’ (1914); ‘The Jamesons, and People of Our Neighborhood’ (serially, 1914).

FREEMAN, Nathaniel, American jurist: b. Dennis, Mass., 8 April 1741; d. Sandwich, Mass., 20 Sept. 1827. After studying law and medicine he moved to Sandwich in 1763. He fought in the Revolution, and was brigadier-general of militia forces in 1781–91. In 1795–99 he was a member of the United States Congress, sat in the Massachusetts legislature, and was for many years judge of probate and of the court of common pleas. He was also a medical practitioner, and an orator of some distinction.

FREEMAN, or FREEDMAN, is one who has inherited the full privileges and immunities of citizenship; one who has been delivered from the restraints of bondage, but who, usually, is not placed in a position of full social or even political equality with him who was born free. In old Rome, the equivalent for freeman comprehended all classes of those who were not slaves. As the organization of Roman society survived the convulsions of the Middle Ages to a far greater extent in the towns than in the landward districts, where the institutions of feudalism (q.v.) almost entirely superseded it, it is in the borough and other municipal corporations of Europe that we still find freemen, or persons inheriting or acquiring by adoption, purchase or apprenticeship the rights of citizenship. In the United States the term freemen was used of the colored people emancipated by the Civil War. The duty of caring for those people, finding them work, and preparing them for the privileges of freedom was thrown on the War Department; and in 1865 an act of Congress created in that department the bureau commonly known as the «Freedmen's Bureau» (q.v.) whose duties practically ceased in 1870. The founding of several institutions for colored persons, such as Howard University and Fisk University (q.v.), was a permanent result of its work, out of which have grown other educational achievements of great importance in the advancement of the colored people. Consult Green, ‘The Making of England’ (London, 1883).

FREEMAN'S FARM or STILLWATER, Battle of. See SARATOGA, BATTLES OF.

FREEMASONRY. See MASONIC FRATERNITY.

FREEMASONS. See MASONIC FRATERNITY.

FREEPORT, Ill., city and county-seat of Stephenson County, on the Pecatonica River, the Illinois Central, the Chicago and Northern, and the Chicago, Milwaukee and Saint Paul railroads, about 113 miles northwest of Chicago, and 55 miles southeast of Dubuque. Freeport's chief manufactures are wind-mills, automobiles, organs, gas engines, hardware, pianos, agricultural implements, drugs and chemicals, garments and toys. The United States census of manufactures for 1914 showed within the city limits 63 industrial establishments of factory grade, employing 3,013 persons; 2,566 being wage-earners receiving annually a total of $1,661,000 in wages. The capital invested aggregated $11,227,000, and the year's output was valued at $7,447,000: of this, $3,537,000 was the value added by manufacture. It has a free library, three hospitals, a good system of public and parish schools, and several fine public buildings and public parks. Freeport was settled in 1835 and received its charter in 1855. The «Freeport heresy,» a political doctrine much discussed before the Civil War, was that, regardless of the Dred Scott Case (q.v.), any territory had the right to reject the slave system by the means of police laws which would be «unfriendly,» and would in time stamp out the existence of slavery. This «doctrine» or «heresy» was advanced by Douglas in the famous debate with Lincoln which took place in Freeport in 1858. Pop. 20,000.

FREEPORT, N. Y., village of Nassau County, on Long Island, on the Long Island Railroad, 20 miles east of New York. It is mainly a residential town, contains a high school and two clubhouses. Fishing is the only local industry. It owns the electric-lighting and water plants. Pop. 7,463.

FREER, Charles Lang, American capitalist: b. Kingston, N. Y., 1856. He was educated in the public schools of Ulster County, N. Y., and for many years was engaged in railway service and manufacturing in Detroit. He is now retired. He is well known as a connoisseur in art. He presented his own art collection to the Smithsonian Institution at Washington, and donated $1,000,000 to the building fund of this institution. He received the honorary degree of A.M. from the University of Michigan.

FREESIA, a genus of plants of the iris family, including two or three species, natives of southern Africa. They have narrow, grass-like leaves and showy clusters of fragrant white or pale yellow flowers terminating the slender stems. They are popular with florists and for window gardens, and are of very easy culture.

FREETHINKER, a name assumed by those who, disbelieving in revelation, feel themselves free to adopt any opinion in religious or other matters which may result from their own independent thinking. The name was specially claimed by those who in the 17th century took part on the anti-Christian side in the deistic controversy. Voltaire (q.v.) was a well-known French freethinker.

FREETOWN, Africa, a seaport of West Africa, capital of the British colony of Sierra Leone (q.v.) on the south side of the river of Sierra Leone, in 80° 29′ N., 13° 10′ W. Its principal streets are broad and straight, and have, more especially in the part occupied by Europeans, a very attractive appearance, the houses being generally detached and surrounded by trees. Freetown is a strongly fortified imperial coaling-station. A railway runs from Freetown some distance into the interior. Its climate is very unhealthy, although in recent years sanitary conditions have been improved considerably and the death rate has gradually been reduced. A new residential suburb has been developed on one of the nearby hills (900 feet high) and has been connected with the town proper by a light railway. Freetown was made a municipality in 1893 with a mayor and 12 elected and 3 appointed councillors, being the first city in West Africa to enjoy this privilege. It is a port of call for all West African steamers and of ever-growing commercial importance. There are the usual official buildings of a small colonial capital; governor's palace, barracks, courts, schools, churches, including a cathedral, botanic gardens, etc., show the result of many years' labor. There are no horses, manual labor taking their place. In 1916 the total revenue was $48,452 and the expenditures $57,175. The net debt slightly more than $130,000. The town was founded in 1792. In September 1794 it was practically destroyed by a French squadron, but recovered in a short time. According to the census of 1911 there is a population of 34,090 of which 558 are Europeans, 169 Asiatics and 33,363 Africans of more than 15 different tribes. Consult 'The Freetown Municipality Consolidation Ordinance, 1908' (London 1908); 'Handbook of Sierra Leone' (Sierra Leone 1916); Burton, Sir R., 'Wanderings in West Africa, etc.' (Vol. I, chapter V, p. 193, London 1863); Crooks, J. O., 'Life and Letters of Lord Macaulay' (Vol. I, p. 29, London 1909); Villelume, Baron de, 'Au Cœur de l'Afrique' (Paris 1910).

FREEZING, CONGELATION, or SOLIDIFICATION, the transformation of a liquid into a solid under the influence of cold. Each pure liquid always solidifies at the same temperature, which is called its freezing point (q.v.), and the solid also melts again at the same temperature. Thus the freezing point and the melting point, or point of fusion, are the same, and the point is always the same for the same substance. The freezing point of water, or the melting point of ice (32° F.), is taken for one of the fixed points in thermometry. The freezing point of mercury is 39° below zero, of sulphuric ether 46° below zero, of alcohol 203° below zero F. It has been shown that the increase of pressure on water, and on all substances which expand in freezing, will lower the freezing point; and that such substances as wax, spermaceti, sulphur and paraffin, which contract in freezing, have the freezing point raised by pressure. See MELTING-POINT.

FREEZING-MIXTURE, a mixture for the production of artificial cold by absorption of heat. For this purpose two substances are mixed, of which one is usually solid, and which tend to form a liquid mixture. In liquefying any solid a certain amount of heat is made latent, and owing to this the temperature of the mixture at the end of the liquefaction is often very low. Thus on mixing snow and salt together the salt converts the snow into water, or rather tends to form brine; but snow cannot melt without withdrawing from something a quantity of heat. It may withdraw this heat from the salt, or partly from surroundings. Hence the temperature of the brine which is the result of the mixture is very much below that of either the salt or snow. The fact is that salt and water mixed cannot be in the solid condition, except at a temperature very much below that of ordinary snow. The table gives a list of freezing-mixtures, and of the lowering temperature obtained by means of them. See ICE, ARTIFICIAL; REFRIGERATION AND REFRIGERATING MACHINES.

Substances and parts by weight	Reduction of temperature, F.		Total temperature reduction, F.
	From	To	
Snow 2, sodium chloride 1	+32	—5	37
" 2, calcium chloride 2½	+32	—40	72
" 2, calcium chloride crystals 3	+32	—50	82
" 12, sodium chloride 5, ammonium nitrate 4	+32	—25	57
" 3, dilute sulphuric acid 2	+32	—23	55
" 3, hydrochloric acid 5	+32	—27	59
" 3, potassium 4	+32	—51	83
Sodium nitrate 3, dilute nitric acid 2	+50	—3	53
" phosphate 9, dilute nitric acid 4	+50	—12	62
" sulphate 6, ammonium nitrate 5, dilute nitric acid 3	+50	—40	90

FREEZING POINT, the degree of cold at which a liquid freezes. It may be stated as accurately as the degree of heat at which a liquid congeals, since everything above absolute zero represents some degree of heat. In the case of water the freezing point is 32° F. or 0° C. The fusing or melting point of a metal is also its freezing point, the point where it changes from the liquid to the solid condition if the temperature is going down, or from solid to liquid if it is going up. But as the melting points of metals are regarded as hot, we use the word fuse, except in the case of mercury or quicksilver. The freezing or fusing points of familiar substances are:

Hydrogen	—328° F.	Sulphur	235° F.
Mercury	—38	Tin	551
Bromine	—20	Bismuth	517
Water	0	Zinc	811
Olive oil	50	Lead	850
Phosphorus	112	Gold	1913
Potassium	144.5	Iron	2912
Sodium	204		

Sea water freezes at a lower point than fresh water, owing to the solution of salt and other minerals. Changes of pressure affect the freezing point as well as the boiling point. This is illustrated by the melting of glaciers from the bottom, which is the cause of their movement of flow. This melting at the bottom is due to the great weight of ice, creating pressure, which brings about melting though the temperature may be many degrees below 32° F.

To determine the molecular weights of substances, it is important to know the freezing point. To ascertain this the common method is to make a solution of the substance. The freezing point of the solution is usually lower than that of the solvent, the difference being proportional to the amounts not only of volume but of weight. The curves obtained appear to be similar to those found by tests of the boiling point to determine molecular weight. Beckman's apparatus for determining the freezing point of solutions consists of a jar containing a liquid, which can be maintained at a temperature slightly below that of the solution, and a glass tube made double, that is, with inner and outer tube, the inner tube for the solvent and the outer for air space. A thermometer scale is marked on the inner test tube. With this apparatus the freezing point of the pure solvent can be found with a close approach to accuracy. Next a definite proportion of the substance to be dissolved is added to the solvent, through a side aperture provided in the tube, and the temperature of the solution is observed. The difference between the freezing point of the solvent and the solution is then apparent. Because of different results obtained by different experimenters with different apparatus it was learned that several conditions minutely affected the final temperature recorded. The size and shape of the vessel containing the cold mixture that accomplished the freezing, and the regular or irregular stirring of the contents, and the diameter of the test tube were all found to affect the ultimate temperature, as well as the temperature of the outside of the jar, due to the temperature of the room. To check such experiment therefore a boiling test and sometimes other tests are made for molecular weight, the average result being accepted. See MELTING POINT; SOLUTIONS.

FREIBERG, frī'bĕrg, Saxony, a mining town 25 miles southwest of Dresden. It is the capital of the mining district of Saxony, and contains a mining academy founded in 1765, with 13 professors, fine scientific collections, among which is the celebrated collection of precious stones amassed by Werner, and a large library. There is a fine relic called the Golden Portal belonging to an ancient Church that stood on the site of the Gothic cathedral. It is an ancient imperial city, and is still surrounded by the old walls and ditch. The town owes its origin to the discovery of silver mines in its vicinity in the 12th century. Here, on 29 Oct. 1762, Prince Henry of Prussia defeated the allied Austrian and Saxon army. Pop. 36,237.

FREIBURG, frī-boorg, or **FREYBURG,** or **FREIBURG IM BREISGAU,** Baden, a town in the circle of the upper Rhine, in the valley of the Dreisam, and on the railway from Carlsruhe, in one of the most beautiful and fertile districts of south Germany, at the west foot of the Black Forest. It consists of the town proper, the fortifications of which have been converted into pleasure-grounds, and of two suburbs, and is the seat of a superior civil and criminal court, and of several public offices. The buildings most deserving of notice are the münster or cathedral, a large and beautiful Gothic structure built of red sandstone, admired for its delicate symmetry, with a magnificent portal richly sculptured, and surmounted by a tower, partly of exquisite open work, 380 feet high; the university, founded in 1457, the merchant house, now the chief tax office, a quaint Gothic structure, resting on pointed arches, and decorated externally with fresco portraits of the Emperor Maximilian, his son Philip I, Charles V and Ferdinand I; and the grand-ducal palace and government buildings. Freiburg is the see of an archbishop, and the seat of the courts and offices for the circle of the upper Rhine. Pop. 83,324; pop. of the entire District of Freiburg being 564,580 and area 1,830 square miles. Its university had, in the winter semester 1914–15: professors and teachers, 151; students, 2,237 (theology 250, jurisprudence 469, medicine 960, philosophy 301, and the remainder students of the faculties of mathematics and natural science). The faculty of theology in the University of Freiburg, as in the universities of Munich, Münster and Würzburg, is Roman Catholic.

FREIBURG. See Fribourg.

FREIFELD, George, American judge: b. New York city, 1856; d. 17 Nov. 1917. Of German extraction, his father served in the Civil War. Freifeld was elected a municipal court justice in 1909, and was re-elected to the second district municipal court of Brooklyn in 1917 for a term of 10 years. For over a quarter of a century Freifeld was a prominent figure in Freemasonry; he was district deputy of the third district in 1906, and in 1914–15 was grand master of the Grand Lodge of Masons in the State of New York. He served 12 years as a member of the board of education, was a life member of the Brooklyn Institute of Arts and Sciences, and vice-president of the Manufacturers' Trust Company.

FREIGHT. This term was originally synonymous with cargo, being applied to miscellaneous articles shipped for transportation by water. When the railways began to do a general transportation business in America the word freight was extended in meaning to cover all miscellaneous merchandise transported by train, other than baggage, mail and express matter paying a higher rate for quick transporation. In Great Britain, however, the word freight was not so extended in general meaning, the word «goods» being employed for miscellaneous shipments by railway, so that in England they say goods-van and goods-train with a meaning similar to freight-car and freight-train in the Western hemisphere.

The tremendous development of the United States railways, and the enormous freights they handle, have overshadowed the much smaller volume of ocean freight shipped in and out of this country, hence freight is largely considered from the railway point of view. The freedom of trade between the States, and the unprecedented development of railways has evolved a freight traffic in this country which is the marvel of modern civilization. Manufacturers no longer confine their trade to a neighborhood, but seek trade hundreds and thousands of miles away, because low freight charges enable them to compete.

Early in the history of American railways there was developed the policy of charging for freight «what the traffic would bear.» Obviously a carload of shoes, worth several hundred times as much as a carload of brick, could afford to pay a cent a pound or $20 a ton more without any danger of driving away the traffic, whereas the brick would not be shipped at all if it was assessed a rate of $20 a ton, being more than its intrinsic value. So the railroads stiffened the prices on valuable goods and took other articles at cost or less than cost, arguing that as they had to run trains both ways, they might be hauling empties if they did not accept cheap «fillers.» They were further urged on by the continual threat of competition by canal, river or coast vessels. The railway interests thought it good policy to keep these out of existence, because water transportation is cheaper than railway, although slower. So they underbid for freight on stone, brick, lumber, coal, grain, etc., to hold the trade and keep down canal and river competition, believing that if these got a good start they would make a bid for the higher class freight that could pay a profitable price. Under such conditions the railways of America have built up a freight traffic that far excels the passenger and express traffic. There are more than 40 times as many freight cars in use on American railways as there are passenger, mail and express cars combined.

Freight rates, originally based on market conditions, next had to meet competitive conditions, to points where other railways led, or where there was water communication. For many years the railways competed for freight, and cut-rate wars between the roads were common in the last century. Then it developed that very large shippers who could dictate to railways demanded and secured rebates, thus getting an advantage over small competitors; also that certain cities had been discriminated against, and that the railways actually carried freight to some centres, say 500 miles for less than they charged intervening cities at a distance of 300 or 400 miles. Under such conditions freight rates had become so much mixed and complicated as to be unintelligible to the mass of people, seemingly senseless, and often grossly unfair to those who considered the charges from the basis of equity. Complaints were so numerous and so well founded that the Interstate Commerce Commission (q.v.) was established to secure equitable rates and rulings, and the famous regulation was established that a railway must not charge more for a short haul than for a long haul.

Conditions tended toward centralization of and consolidation of railway interests, and for years promoters and capitalists were kept busy consolidating competing lines of railway until the present great trunk lines were established, and 88 railway systems virtually control the transportation of the country, while 13 of them, each doing an annual freight business of from $50,000,000 to $150,000,000, control more than half the lines and dominate the situation. Competition has given way to consultation, and through interlocking directorates the great railway systems move largely in unison, with common interests, the protection of the shipping public lying in the dictation of the Interstate Commerce Commission.

The average haul for freight in the United States is about 140 miles, and it follows that much of the freight has to be transferred to some other railway system, and sometimes to several systems before reaching its destination. Where shipments are large, shippers hire entire cars, and the goods are loaded and go in that car to the destination, no matter how many lines it travels over. The railways charge each other for the use of such cars when detained under certain conditions. The smaller freight is subject to transfer and handling when going to other systems.

Freight Handling.— Shipments of freight may be divided into four classes: (1) Bulk articles, which subdivide into (a) free-flowing articles, as oil, grain, sand, coal, ore and broken stone, that can be run through a chute or pipe, or handled by dumping; and (b) articles requiring mechanical handling, as coke, brick, pig iron, lumber, steel beams, etc. (2) Live stock, requiring special cars, food and attendance. (3) Package freight, including boxes, barrels, crates, wrapped goods and machinery. (4) Perishable freight, as meats, vegetables, fruit, etc., much of which requires refrigeration. These classes of freight require for economical handling different methods and different cars for transportation. For handling grain, the elevator, with spout delivering right into the cars or vessel, has been highly developed. For oil transportation by rail the tank-car was devised and proves both safe and cheap. For sand, coal, ore, etc., the gondola and various types of dump-cars have been developed, handling this class of freight by the simple process of having it slid on by gravity and dumped out by the same force.

At terminals or points where railway and water traffic meet, a variety of freight-handling machinery is always to be found, suited to the local conditions. Great steel bridges, for conveying overhead cars and lifting heavy freight bodily back and forth between the cars on the railway tracks and the vessels at the docks, are common. In many of them a man rides with the car and conducts its operations. Others are operated on the principle of cableways, and still others are essentially cranes or gantries. The Hulett unloaders have achieved great popularity at terminals on the Great Lakes. The old method of handling a lot of freight between car and vessel by crews of men with wheelbarrows is abandoned wherever possible. Machinery has caused a vast reduction in freight-handling costs. Figuring roughly, it used to cost $2 to $3 a ton to shift a miscellaneous cargo; now it is usually accomplished at a cost of less than 25 cents a ton. A record of costs at a large freight terminal, where all sorts of freight are continually transferred from cars to steamships and from ships to cars, showed these figures: Hand trucking 200 feet, 8 cents a ton; loading on box cars, 12 cents a ton; unloading from box cars, 11 cents a ton; loading off-shore ships with package freight, 23 cents a ton; unloading or discharging same, 20 cents a ton. In a modern terminal the vessels run into slips alongside great piers that parallel the entire length, giving close access to every hatchway. There are cranes on the ship and on the pier for hoisting and shifting the cargo. On the piers are lines of bins for separating the freight or for brief storage, while nearby are large storage warehouses for freight that has to wait. Every up-to-date mechanism that makes for easy transshipment is at hand. Portable conveyors are supplied for running bags and packages aboard or off board with a minimum of handling. Electric trucks are becoming as common as hand trucks. The heaviest articles are handled with ease, large machines being shipped all put together in one crate. Every sort of mechanical assistance for freight handling seems to have been thought of and provided, just as in a modern factory.

Statistics.— There are 2,400,000 freight cars employed on United States railways, double the number in 1894, and of three times the total capacity; in other words the cars are one-half larger than they used to be. The average haul of a consignment of freight is 140 miles — less in the Eastern but more in the Western States. The annual mileage of these freight cars is 20,000,000,000, or the equivalent of more than a hundred round trips to the sun, or 40,000 tours around the earth. The ton mileage, that is the number of tons carried one mile, is 264,000,000,000, or the equivalent of 1,400 trips to the sun and back. The average receipts per ton-mile are three-fourths of a cent. A horse will draw a ton a mile in 15 minutes, at a cost of 50 cents for hauling and another 50 cents for loading and unloading; a man can carry a ton in 50-pound parcels a mile in 20 working hours, or two and a half days, yet the railway handles this freight for three-fourths of a cent. As the railway's average haul is about 140 miles, it is apparent that its average charge for a ton of freight is $1. Valuable freight, however, commands much higher figures.

The Interstate Commerce Commission reports the freight movement for the year ending 30 June 1914, in tons, as: Products of agriculture, 98,825,133; animal products, 26,352,289; products of mines, 574,000,013; forest products, 91,093,595; manufacturing products, 142,015,332; merchandise, 40,239,497; miscellaneous freight, 35,934,471; total of United States freight movement in one year, 1,008,460,330 tons. More than half this total is mine products and more than a fourth is soft coal; bituminous and anthracite coal and coke constitute 38 per cent of the total; ores, 9 per cent; stone, sand, etc., 8.5 per cent; lumber, 6.2 per cent; grain, 4.5 per cent; and cement, brick and lime together, 3.8 per cent. No other class of freight is over 2 per cent of the total.

The last census reports the railways as spending $95,000,000 annually for new cars and $437,000,000 for repairing cars. At least 95 per cent of this must be for freight cars, and the great excess of the repair item is evidence that very many cars are rebuilt so much that they might better be classed as new, and that from this point of view it requires about 200,000 new freight cars annually to handle the freight — 100,000 to replace those that wear out and 100,000 to take care of increased freight movement. Since the railway mileage of the United States is about 35 per cent of the entire world mileage, it is reasonable to infer that the above statistics represent about a third of the world's freight movement by rail.

Ocean Freight.—This was originally carried by sailing vessels, and while such transportation is very cheap, it has given way to steam navigation, nearly all the carrying trade being in the hands of regular lines plying between the important ports of the world. The tonnage going out of New York, which is now the world's greatest port, is about 15,000,000 tons annually. In time of peace London and Hamburg each clear about 14,000,000 tons, Liverpool and Rotterdam 12,000,000 each, Hongkong 11,000,000, Shanghai 9,000,000, Rio Janiero 8,500,000, and Marseilles, Singapore, Colombo and Cardiff each 7,000,000 to 8,000,000 tons. The steamship lines follow the same practice as the railways in making rates, putting the price on the valuable freight, and carrying bulk cargo, which is sometimes needed as ballast, at low rates. There are a considerable number of coasters that do a freight business all along the Atlantic seaboard and handle cargoes at rates much less than the railways charge, but railway interests have sought to discourage such traffic by refusing such vessels terminal facilities at the docks. There seems to be an economic loss here, for it is well known that a schooner with a gasoline engine can tow a half dozen large barges between ports on the coast and make money at rates away below what the railways charge; but there is risk in the business and occasionally a string of barges is wrecked by a sudden storm.

The total ocean freight of the world is approximated by the commerce reports. The imports of 31 leading countries in 1912, the best year for comparison, were of $19,000,000,000 value, and the cost of transportation was about $350,000,000. The tonnage is believed to be about 1,000,000,000, of which about 20 per cent now originates in the United States. It thus appears that America is far ahead of all other countries in freight movement, the internal movement here by rail being equal to the entire water movement of the world, and one-fifth of the ocean freight being American though little of it is carried under the American flag.

CHARLES H. COCHRANE,
Author of 'Modern Industrial Progress.'

FREILIGRATH, frī'lig-rät, **Ferdinand**, German poet: b. Detmold, 17 June 1810; d. Cannstadt, Würtemberg, 17 March 1876. His father was a teacher. Though apprenticed to a grocer at 15, he continued his studies and published verses in local journals. In 1831–36 he was a banker's clerk in Amsterdam. In 1836–38 he published a literary journal *Rheinisches Odeon*, became a bookkeper at Berman, but continued writing lyrics, one volume of which he published at Mainz in 1838, and as it proved successful he determined to devote himself entirely to literature. In 1842 he received a small pension from the King of Prussia; but this he retained for only two years, for having embraced views in politics of an advanced liberal stamp which placed him in opposition to the government, he felt bound to resign the benefits of royal favor. At the same time (1844) he published a poem entitled a 'Confession of Faith' (Glaubensbekenntnis), in which he became the champion of the political creed he had adopted. In 1848 three other political poems by him: 'Die Revolution'; 'Februarklänge'; and 'Die Todten an die Lebenden,' saw the light; and the last of these led to his being put on trial for treason. This trial, in which he was acquitted, is memorable for another reason, being the first jury trial ever held in Prussia. From 1851 till 1867 Freiligrath resided in England as manager of the London branch of a Swiss banking establishment. On the failure of the bank a national subscription was got up in his behalf in Germany, and the proceeds of it enabled him to return to private life. The general amnesty of 1868 brought him back to Germany and he celebrated the triumph of 1870 with the very popular 'Hurrah Germania' and 'Die Trompete von Vionville.' The early poems of Freiligrath are distinguished by a wealth of glowing and highly-colored imagery, and by the prevalence of Oriental scenes and subjects. His political poems are too full of the tones of party warfare to live as poetry; but many of his lyrics seem destined to hold an abiding place in German literature. Germany is also indebted to him for many admirable translations from foreign languages, as from Burns, Tannahill, Moore, Hemans, Shakespeare, Longfellow and Victor Hugo. His works were collected in eight volumes and published at Stuttgart (1870–71). There is a volume of English translations of his select poems edited by his daughter, Mrs. Kroeker (Leipzig 1871). Consult Buchner, 'Ferdinand Freiligrath, Ein Dichterleben in Briefen' (Lahr 1881–82); Richter, 'Freiligrath als Uebersetzer' (Berlin 1899); Rodenberg, 'Jugenderinnerungen' (ib. 1899).

FREIRE, frā'rĕ, **Ramon**, Chilean general: b. Santiago, 29 Nov. 1787; d. there, 9 Dec. 1851. He was a grandson of Freire de Andrada (q.v.). He fought in the patriot army in the war for independence (1811–20), and defeated Benevides at Concepcion, 27 Nov. 1820. He became the leader of the Liberals, and upon the deposition of O'Higgins in 1823, supreme director, with dictatorial powers. In 1826 he ended Spanish rule in Chile by expelling the remaining Spanish forces from Chiloé. He was re-elected supreme director in 1827, but resigned not long after. The Conservatives having gained control, he led an insurrection against them, was defeated at Lircai (1830), and banished to Peru. In 1836, he attempted to invade Chile with two ships, but had to surrender, was again exiled to Peru and was not permitted to return until 1842. After his death a bronze statue was erected to his memory by public subscription in Santiago de Chile. Consult Elliot, G. F. S., 'Chile' (London 1907); Mehegan, J. J., 'O'Higgins of Chile, etc.' (London 1913); Torrente, M., 'Historia de la Revolucion de Chile, 1810–28 (in *Collecion de historiadores i de documentos Relativos a la Independencia de Chile,* Vol. III, Santiago de Chile 1900).

FREIRE DE ANDRADA, frā'rĕ dā ändrä'dä, **Gomes**, Portuguese colonial administrator: b. Coimbrà 1684; d. Rio de Janeiro, 3 Jan. 1763. He served in the Portuguese army, and became governor and captain-general of Rio de Janeiro in 1733, his authority extending over most of southern Brazil. His administration of almost 30 years was the most successful and prosperous, as well as the longest, in the colonial annals of Brazil. The gold mines were effectively worked, and colonization was greatly furthered. The war over the boundaries of Brazil and Paraguay was fought during his administration (1754–56). Freire de Andrada was made Count of Bobadilla in 1758. His exploits form the subject of the epic poem entitled 'picos Brasileiros' or 'O Uraguay' (1811), by José Basilio da Gama.

FREISCHÜTZ, frī'shüts, (in German «free shooter») a legendary marksman who makes a covenant with the devil that six balls from his gun shall follow his own will, while the seventh is directed by the devil. The idea was universal about the 15th century, and may be found in the literature of the time and even later. Consult Apel, 'Gespensterbuch' (1810–15) and the opera by Weber, 'Def Frieschütz' (1821).

FREISCHÜTZ, Der, romantic opera in three acts by Carl Maria von Weber (libretto by Friedrich Kind) first produced at Berlin, 18 June 1821. Founded upon a popular fairy story, the plot has an atmosphere of mediæval romanticism heightened many degrees by its musical investiture. Max, a skilful marksman, is betrothed to Agatha, daughter of the head ranger of the Prince of Bohemia. Caspar, who has sold himself to the demon Zamiel, is also in love with Agatha and plots to ruin Max and deliver him over to the Evil One in substitution for himself. He persuades Max to accept his aid to procure magic bullets to win him success in the coming trial upon which his future rests. At the Wolf's Glen, Max joins Caspar and receives from Zamiel seven silver bullets, six for himself and one to be at the demon's disposal. On the eventful day, Max fires his six successful shots. At the Prince's command, he fires the seventh, Zamiel's bullet, at a passing dove. It appears to him as Agatha; but her bridal wreath protects her and Zamiel directs the bullet to Caspar's heart. No opera has a history of greater popular success and none is nearer to the German heart than 'Der Frieschütz' with its folk-spirit and thoroughly national emotional expression. It was the foundation stone of a new school of opera that has vitally influenced the trend of the art even to the present day. The suggestive and descriptive power of the music, the intimate connection between the orchestra and the stage, the rich hues of the instrumental color and the telling and novel orchestral effects, notably in the melodramatic scene of the casting of the magic bullets, form a landmark in the history of the development of music. Wagner's debt to Weber, readily acknowledged by him, was immense. Berlioz, too, learned much from his use of the orchestral instruments. The opera is full of ingratiating melody of a popular nature, much of it pure folk-music (for example, the «Peasants' March» and the «Waltz» in the first act) and all of it expressive of what has come to be known as German romanticism in music. The overture is a model of orchestral scoring, rich, effective and spontaneous. Agatha's great scene and aria «Wie nahte mir der Schlummer» is the musical high-water mark of the opera and in its great variety of moods and rhythms, closely welded, is a clear presage of the continuous music of a later day. The chorus of bridesmaids and the huntsman's chorus in the third act are sung at least wherever German is spoken; and there are many other numbers scarcely less close to the hearts of the people.

LEWIS M. ISAACS.

FREISING, Otho of. See OTHO OF FREISING.

FREISING, frī'zing, Bavaria, town 22 miles northeast of Munich, on the Isar. It contains a cathedral, dating from the 12th century, and a former episcopal palace now transformed into a seminary. There are also a gymnasium, a preparatory school and teacher's training school, and a number of orphanages, homes and other benevolent institutions. Agricultural machinery, stained glass and pottery are the chief articles here manufactured. Freising is of Roman origin and from 724 was the see of a bishop. In 1803 the see was merged with that of Munich. Pop. 14,946.

FREJES, frā'hēs, **Francisco,** Mexican historian: b. Guadalajara, Mexico; d. 1845. He was trained for priestly and monastic life, became known as a Franciscan of remarkable eloquence, but retired from publicity in 1838, and eventually became superior of the monastery of Guadaloupe, near Zacatecas, Mexico. His object in his retirement was the prosecution of historical study, and his works, especially the 'Historia Breve de la Conquista de los Estados Independientes del Imperio Mejicana,' have both value and interest.

FREJUS, frę-zhü', France, town in the department of Var, 15 miles southeast of Draguignan. It was founded by Roman colonists from Massilia (Marseilles), and was again colonized by Julius Cæsar, after whom it was named Forum Julii. Its Roman remains are interesting; there is a pharos, a circus, a viaduct and walls. In the time of Augustus the harbor became the principal naval station in Gaul, but is now entirely silted up. It was the birthplace of Agricola, Roscius and Gallus, and at a later day of l'Abbé Sieyès. Pop. 4,022.

FREKI. See GERI AND FREKI.

FRELINGHUYSEN, frē'ling-hī-zěn, **Frederick,** American lawyer: b. Somerset County, N. J., 13 April 1753; d. 13 April 1804. He was graduated at the College of New Jersey (now Princeton) in 1770; studied law, and was admitted to the bar in 1773. Two years later he was chosen a member of the Provincial Congress of New Jersey. He was a member of the Continental Congress much of the time during the Revolutionary War; served as a captain in the army; participated in the battle of Trenton, in 1777 he became colonel of the New York militia and took part in all the military operations of Washington's army in that year and in the battle of Monmouth in 1778. From 1783 to 1793 he practised his profession, and attained great eminence; in 1793 he became United States senator serving until 1796. He led an expedition against the Western Indians in 1790.

FRELINGHUYSEN, Frederick Theodore, American statesman: b. Millstone, N. J., 4 Aug. 1817; d. Newark, N. J., 20 May 1885. He was a nephew and adopted son of T. Frelinghuysen (q.v.). He was graduated at Rutgers College in 1836, and studied law in the office of his uncle and adopted father and succeeded to the latter's large practice in 1839. He was city attorney for Newark in 1849, and was widely known as counsel of many large corporations, among them the Central Railroad of New Jersey and the Morris and Essex Canal Company. He was one of the founders of the Republican party in New Jersey. He became attorney-general of New Jersey in 1861, serving until 1866, when he was appointed United States senator. He remained in the Senate till 1869, and was regarded as an able debater. In 1870 he was appointed Minister to Germany, but declined the appointment. He returned to the Senate in 1871. He was a member of the Electoral Commission of 1876–77. He succeeded James G. Blaine as Secretary of State under President Arthur in 1881. He was president of the American Bible Society and a trustee of Rutgers College.

FRELINGHUYSEN, Theodore, American lawyer: b. Millstone, N. J., 28 March 1787; d. New Brunswick, N. J., 12 April 1862. He was a son of F. Frelinghuysen (q.v.). He was graduated at the College of New Jersey (now Princeton) in 1804; and admitted to the bar in 1808. In the War of 1812 he commanded a company of volunteers, and in 1817 became attorney-general of New Jersey, which office he held till 1829 when elected United States Senator. In the Senate he was prominent on the Whig side, and was active in the discussions relating to the rechartering of the United States Bank and the withdrawing of the government deposits therefrom, and relating to the tariff. He failed of re-election in 1835 and resumed his practice at Newark, of which city he was mayor in 1837–38. He was chosen chancellor of the University of New York in 1838; was nominated for Vice-President of the United States in 1844 on the ticket with Henry Clay; and in 1850 became president of Rutgers College where he remained until his death.

FREMANTLE, William Henry, English clergyman: b. Swansboro, Buckinghamshire, 12 Dec. 1831; graduated at Balliol College, Oxford, 1853; Fellow of All Souls, Oxford, 1854–63; Fellow and tutor of Balliol College, 1888–94; curate of Middle Claydon, 1855–57; vicar of Lawknor, Oxfordshire, 1857–65; rector of Saint Mary's, Bryanston Square, London, 1865–83; canon of Canterbury, 1882–95. Since then dean of Ripon. He has occupied prominent lectureships and a chaplaincy. He was the author of fully a dozen volumes and editor and translator of the work of others. His most important works are 'The World as the Subject of Redemption' (1885); 'Christian Ordinances and Social Progress' (1901); 'Natural Christianity' (1911). He translated the works of Jerome and Rufinus.

FREMANTLE, Australia, the chief seaport of Western Australia, at the mouth of the Swan River, 12 miles from Perth. The manufactures include aërated waters, boots, soap, furniture, confectionery, etc. In 1914–15 the vessels entering the port of Fremantle showed aggregate tonnage surpassed only, among Australian ports, by that of Sydney, Melbourne, Brisbane and Adelaide, its total being 1,659,697 tons. Pop. of town and suburbs about 22,200.

FREMIET, frā'mĭ-ā, **Emmanuel,** French sculptor: b. Paris, 1824; d. 1910. His early artistic education was received from his uncle Rude. He became lithographer in the Museum of Natural History and official painter of the Morgue. His 'Gazelle' brought him considerable fame in 1843 and he was awarded medals for his animal groups 'The Mother Cat' and 'A Hunting Dog.' 'The Wounded Hound' (1850) created a furore, and is now in the Luxembourg. In 1855 he was commissioned by the emperor to model a series of military statuettes; many of these are now in the Frémiet Barbedienne collection. He was appointed professor of drawing and modeling at the Jardin des Plantes in 1875, and in 1887 received the medal of honor for the celebrated 'Gorilla Carrying off a Woman', which had been rejected at the Salon in 1859. Among other notable groups and statutes by him are the 'Jeanne d'Arc' in the Place des Pyramides, Paris; with copies at Nancy and in Fairmount Park, Philadelphia; 'The Faun' in the Luxembourg; his statues of Napoleon I at Grenoble, the Duke of Orleans at Pierrefonds, the Prince de Condé, the elephant of the Trocadero Fountain, Paris; statues of De Lesseps at Suez, of Colonel Howard in Baltimore. He was awarded the Grand Prix at the Paris Exposition of 1900. At the Saint Louis Exposition of 1904 he exhibited a statue of Saint George, the 'Gorilla of Gabun,' and 'Race Horses.' He was a grand officer of the Legion of Honor, a member of many art societies and of the Institut de France.

FRÉMONT, Jessie Benton, American author: b. near Lexington, Va., 31 May 1824; d. Los Angeles, Cal., 27 Dec. 1902. She was a daughter of Thomas H. Benton (q.v.), and married John C. Frémont (q.v.) in 1841. She published 'Story of the Guard: a Chronicle of the War,' with a German translation (Boston 1863); 'A Year of American Travel' (New York 1878); 'Far West Sketches' (Boston 1890); a sketch of her father prefixed to her husband's memoirs (Chicago 1886); 'Souvenirs of My Time' (Boston 1887); 'The Will and the Way Stories' (Boston 1890). Consult Frémont, J. C., 'Memoirs of My Life' (Chicago 1886); Peacock, V. T., 'Famous American Belles of the 19th Century' (Philadelphia 1901).

FRÉMONT, John Charles, American explorer and soldier: b. Savannah, Ga., 31 Jan. 1813; d. New York, 13 July 1890. His father was a Frenchman and his mother came of the distinguished Virginia family of the Whitings. He attended Charleston College, but was expelled from there for insubordination before completing his course. In 1833 he was appointed teacher of mathematics on board the United States sloop of war *Natchez*, with which he proceeded on a cruise to South America. On his return he gave his attention to civil engineering and in 1836 was one of a company sent out to survey a railway route. He was still engaged in railway surveying in 1837, and at the end of that year was engaged in the survey of the Cherokee lands in Georgia, North Carolina and Tennessee. In 1838–39 he undertook the exploration of the country between the Missouri River and the British frontier in the present States of Iowa, Minnesota, the Dakotas and Nebraska. In 1838 he became a second lieutenant in the United States Topographical Corps. In 1841, in Washington, he eloped with Jessie Benton, daughter of Senator Benton. About this time Frémont proposed to the government to undertake the exploration of the Rocky Mountains — at that day a terra incognita. His plan being approved through the influence of his father-in-law, Senator Benton, he, in 1842, started with a handful of picked men on the first of a series of explorations of what is now the western part of continental United States. Great Britain at that time laid claim to Oregon, and the Southwest was under the domain of Mexico. Frémont reached and explored the South Pass. Not only did he fix the locality of that great defile, but he defined the astronomy, geography, botany, geology and meteorology of that region, described the route since followed, and designated the points upon which a line of United States forts were subsequently erected. He proceeded on a second expedition in 1843 intending to extend his previous work to the westward and join it with the survey done on the Pacific Coast by Captain Wilkes, of the United States navy. He had just reached Westport (Kansas City), from Saint Louis, when an order commanding his return reached the latter city. The assigned reason for the order was that he was taking with him a 12-pounder howitzer without authority. His wife received the order and, instead of forwarding it, sent him a message telling him to get away to the wilds as soon as possible and ask no questions. This time he reached South Pass by another route and from there journeyed to Great Salt Lake, reaching the island now known by his name. He pushed investigations right and left of his entire course, went up the Snake River and journeyed along the Columbia, finally reaching Fort Vancouver where he connected his survey with that of Wilkes' exploring expedition. Later in the winter, without adequate supplies, or a guide, he traversed the wilderness to the Rocky Mountains. In this daring expedition he crossed 3,500 miles of country in sight of eternal snows, discovering the grand features of Alta California, its great basin, the Sierra Nevada, the valleys of San Joaquin and Sacramento and determined the geographical position of the west portion of the North American continent. He came east via Utah Lake, the Uinta River and Brown's Park, reached the North Platte, turned south through Colorado, reached the Arkansas River, which he followed eastward, and arrived in Saint Louis, 6 Aug. 1844. His report created a sensation and 10,000 copies were printed and distributed by Congress and many thousands of copies were issued and sold by private publishers. He was made captain in 1844. His third expedition was quickly organized in 1845 and directed to California in the acquisition of which by the United States it played a prominent part. On this trip he had a force of 60 expert marksmen; he proceeded from Bent's Fort along the Arkansas, the Grand and the Uinta to the Wasatch Mountains, across these to Utah and Salt Lake, thence down to the Sierra Nevada, crossed by the Donner Pass, to Sutter's Fort. The Mexican War was now looming up; Frémont had secured permission of the Mexican officials at Monterey to explore California and New Mexico. This permission was withdrawn within a short time and he was ordered to leave Mexican territory. This order, however, he did not obey but, on 5 March 1846, fortified himself on Gavilan Peak, thus opening the first phase of the war in California. Without being attacked he retreated toward Oregon. In May while on this journey through Lieutenant Gillespie he received special instructions from Washington and returned at once to the Sacramento Valley country. Frémont here found the American settlers in open revolt against Mexico. They had proclaimed the «Republic of California» at Sonoma, and had adopted a white flag with one red stripe at bottom and bearing a star and bear for emblems, hence this is often called «the Bear Flag Revolt.» Frémont took command, and this move created an American military occupation. The naval forces under Stockton and Sloat now entered the fray, raising the flag at Monterey. The United States flag was raised soon after in San Francisco, Sutter's Fort and Sonoma. Stockton made Frémont major of the land forces.

General Kearny arrived soon after the capture of Los Angeles, and co-operated with Frémont and Stockton. Frémont sided with Stockton in the latter's differences with Kearny on the question of senior authority. At this time Frémont was commissioned lieutenant-colonel and soon after was promoted by Stockton military commandant and civil governor of the Territory of California, and in this capacity in 1847 concluded the articles of capitulation by which Mexico ceded exclusive possession of that territory to the United States. In the autumn of 1847 Frémont was tried by court-martial in Washington on several charges arising out of the conflict of authority between him and General Kearny. Frémont was found guilty and sentenced to dismissal from the service. President Polk did not confirm all the charges, and remitted the sentence. Smarting under a sense of having been greatly wronged, Frémont quit the service on 15 March 1848. Later in this same year he organized another expedition to survey a railway route to the Pacific. After enduring terrible hardships and losing 11 of his party he finally arrived in California. He had purchased a large tract of land in 1847 and gold having been discovered on his tract, on his return to California proceeded to develop it. Considerable litigation followed over the title and Frémont finally lost the lands altogether. In 1850 he was one of the first senators sent from California to Washington. In 1853 he undertook his last expedition across the continent, made new discoveries and after many hardships reached California. In 1856 he was the first candidate of the new Republican party for the presidency.

His opposition to slavery cost him the votes of the South and he received but 114 electoral votes while Buchanan received 174. On the outbreak of the Civil War in 1861, Frémont was appointed a major-general of volunteers. He then, as commander of the Western Federal Army, marched into Missouri seeking an encounter with General Price's Confederate force. An unfortunate dispute with a subordinate officer caused the War Department to relieve him of his command. A few months later he was placed in charge of the Mountain Department of Virginia, Tennessee and Kentucky. His division was finally consolidated under Pope, who was Frémont's junior, and the latter declined to serve under him and resigned in 1864. He became involved in the railroad building boom of the late 60's and early 70's and met financial disaster in the panic of 1873. He was governor of Arizona in 1878–81, and in 1890 by act of Congress was made a major-general and placed on the retired list. In July of the same year he died in New York of ptomaine poisoning. In 1906 the State of New York erected a monument at his grave in Rockland Cemetery, Piermont, N. Y. He wrote 'Report of the Exploring Expedition to the Rocky Mountains in the Year 1842, and to Oregon and North California in 1843–44' (Washington 1845); 'Memoirs of My Life' (Chicago 1887); id., 'Souvenirs of My Time' (Boston 1887); id., 'A Year of American Travel' (New York 1878); id., 'The Story of the Guard' (1863). Consult Bigelow, John, 'Memoir of the Life and Public Services of John Charles Frémont' (New York 1856); Carvalho, S. N., 'Incidents of Travel and Adventure in the Far West with Colonel Frémont's Last Expedition' (ib. 1857); Curtis, 'The Republican Party' (ib. 1904); Dellenbaugh, F. S., 'Frémont and '49' (New York 1914); Frémont, E. B., 'Recollections' (ib. 1912); Richman, I. B., 'California under Spain and Mexico' (ib. 1911); Royce, 'California' (Boston 1888); Upham, 'Life of Frémont' (Boston 1856).

FREMONT, Neb., a city and county-seat of Dodge County, in the central eastern part of the State, on the Chicago and Northwestern, the Union Pacific and the Chicago, Burlington and Quincy railroads, 37 miles northwest of Omaha. The town was settled in 1857 and was incorporated in 1871; it has a telephone system, gas works and a municipal water supply and electric-lighting plant. It is an important market for horses, cattle, sheep and swine and has pork-packing establishments, flouring mills, planing mills, machine shops, etc. The educational institutions include a normal school and a business college. There is a Carnegie library; noteworthy also are the courthouse, Lutheran Orphan's Home and high school buildings. Pop. 9,345.

FREMONT, Ohio, city and county-seat of Sandusky County, on the Sandusky River, at the head of navigation, 30 miles southeast of Toledo. In a productive farming, oil and natural gas region, its transit facilities include the Lake Erie and Western, the Lake Shore and Michigan Southern, the Wheeling and Lake Erie railroads, and the Fremont and Fostoria and the Lake Shore electric routes. It is a busy manufacturing centre with extensive water power and produces boilers, engines, cutlery, farming implements, stoves, ranges, electro-carbons, flour, beet sugar, paper, underwear, furniture, etc. The United States census of manufactures for 1914 showed within the city limits 65 industrial establishments of factory grade, employing 2,402 persons, 2,065 being wage earners receiving annually a total of $1,097,000 in wages. The capital invested aggregated $4,086,000 and the year's output was valued at $4,780,000: of this, $2,484,000 was the value added by manufacture. The principal civic features are the State Historical building, the Birchland public library (1873) and parks, chiefly gifts of Sardis Birchard, uncle of ex-President Hayes, the Hayes Memorial Hospital, Y. M. C. A. building, the armory, technical school, the Hayes Memorial Library and Museum in Spiegel Grove State Park, presented to the Ohio Archæological and Historical Society by Col. Webb C. Hayes; the Soldiers' monument, the tomb of Major Croghan in Fort Stephenson Park and the monument on Cemetery Knoll over the graves of President and Mrs. Rutherford B. Hayes. The site of a former Indian village and of a trading post from 1785, Fort Stevenson was built here early in 1812 and was the scene of Maj. George Croghan's defeat of the English and Indian forces 2 Aug. 1813. Known as Lower Sandusky until 1849, the name was then changed in honor of J. C. Frémont; it received a city charter in 1867. Pop. 12,000.

FREMONT PEAK, Wyo., mountain in the granite centre of Wind River Mountains in the west central part of the State, with an elevation of 13,730 feet above sea-level. It was named from General Frémont and was supposed to be the highest peak in the State until Gannett Peak, six miles north-northwest, was found to be 55 feet higher and the remeasurement of Grand Teton gave 13,747 feet for that summit in Teton Range. There is another Fremont Peak in San Benito County, Cal.

FREMSTAD, Olive, American operatic soprano: b. Stockholm, Sweden. At the age of 10 she came with her parents to America and settled in Minneapolis. She taught music in Minneapolis, Duluth, Chicago and New York and went to Germany in 1892 where she studied under Lilli Lehmann. In 1898 she made her début as Azucena in 'Il Trovatore' at the Cologne Opera House. She was subsequently engaged at the Royal Opera House, Munich; sang two seasons at Covent Garden, London; and in 1903 was engaged for the Metropolitan Opera Company of New York. Her success was immediate and overwhelming. She sings in all the principal Wagnerian rôles and also many in French and Italian. She created the part of Salome in Strauss' opera both in New York and Paris. Her best-known rôles are Isolde in 'Tristan and Isolde'; Brünnhilde in 'The Ring'; Kundry in 'Parsifal'; Venus, Tosca, Armide and Salome. She also ranks as one of the world's greatest lieder singers. She has received two decorations from the French government in appreciation of her remarkable achievements.

FREMYOT, frĕm'yō, **J. F., Baroness de.** See CHANTAL.

FRENCH, Alice, American novelist, better known as OCTAVE THANET: b. Andover, Mass., 19 March 1850. In 1878 she began writing on economics and sociology and similar themes but in a short time chose the short story as her special literary vehicle. Her residence in Iowa and Arkansas gave her practically a new field of experience of which she availed herself to the utmost. Her principal works are 'The Bishop's Vagabond' (1884); 'Knitters in the Sun' (1887); 'Otto the Knight' (1893); 'A Book of True Lovers' (1898); 'The Man of the Hour' (1905); 'Stories that End Well' (1911); 'A Step on the Stair' (1913). Her novel 'Expiation' (1890) won high praise. She also edited 'The Best Letters of Mary Wortley Montague.'

FRENCH, Anne Warner. See WARNER.

FRENCH, Daniel Chester, sculptor: b. Exeter, N. H., 20 April 1850. He was the son of the Hon. Henry Flagg French, judge and ex-assistant Secretary of the United States Treasury, who in 1867 moved to Concord, Mass., whence his son attended the Massachusetts Institute of Technology and Dr. Rummer's lectures on anatomy in Boston and received some slight tuition in sculpture from John Q. A. Ward. After a year spent in Florence, Italy, with Thomas Ball, he completed a commission from the town of Concord for the well-known statue of 'The Minute Man,' which was unveiled on the centenary of the battle of Concord, 19 April 1875. From 1876–78 his studio was located in Washington; from 1878–87 in Boston and Concord and after 1887 in New York. His principal works besides 'The Minute Man' of Concord are statues of General Cass, Rufus Choate, John Harvard and Thomas Starr King; 'Dr. Gallaudet and His First Deaf Mute Pupil'; Statue of the Republic; and the Milmore Memorial. Also 'Bust of Phillips Brooks,' Trinity Church, Boston; 'Gen. Wm. F. Bartlett,' Boston; Public Library bronze doors, Boston; 'Francis Parkman Memorial,' Boston; four Custom House groups, New York; statue of Senator Hoar, Worcester; Melvin Memorial and Emerson statue, Concord, Mass.; 'Alice Freeman Palmer Memorial,' Wellesley; 'Governor Oglethorpe,' Savannah, Ga.; 'Marshall Field Memorial,' Chicago, Ill.; statue of Lincoln in Lincoln, Neb.; equestrian statue, 'General Draper,' Milford, Mass.; 'Longfellow Memorial,' Cambridge, Mass.; 'Spencer Trask Memorial,' Saratoga, N. Y.; in collaboration with E. C. Potter, equestrian statue of Washington in Paris, France, and of General Grant, Philadelphia, Pa. He received numerous distinctions, being elected a member of the National Academy of Design, of the American Academy of Arts and Letters and of the Accademia di San Luca, Rome, and honorary president of the National Sculpture Society. Consult Caffin, 'American Masters of Sculpture' (New York 1903); Taft, 'History of American Sculpture' (ib. 1903).

FRENCH, Henry Willard, American journalist and author: b. Hartford, Conn., 1854. He is known as a war correspondent and lecturer and among his writings may be mentioned 'Nuna, The Brahmin Girl'; 'Desmonde, M.D.'; 'Art and Artists'; 'Our Boys in China'; 'Our Boys in India'; 'Our Boys in Ireland.'

FRENCH, SIR John Denton Pinkstone, 1ST VISCOUNT, English soldier: b. Ripple, Kent, England, 28 Sept. 1852. He served in the navy 1866–70, entered the army 1874 and fought in the Sudan campaign of 1884–85. In the Boer War in South Africa (1900) he commanded the cavalry division, directed the operations about Colesberg from 10 Nov. 1899 to 31 Jan. 1900, and commanded the cavalry in the movements that led to the relief of Kimberly in February 1900, and the capture of Bloemfontein and Pretoria. For his services he was appointed to be lieutenant-general. He was made a general in 1907 and field-marshal 1913; was inspector-general of the forces, 1907–11, 1914; and chief of the general staff, 1911–14. As he was one of the signatories to a memorandum to General Gough giving guarantees that army officers would not be called upon to fight the Ulster Unionists — which memorandum was repudiated by the Asquith government — he resigned in March 1914, but on the outbreak of the European War was appointed to command the British expeditionary forces in Belgium and France. After holding that post for a period of 16 months — during which the retreat from Mons took place, and the battles of the Marne, Ypres and Neuve Chapelle were fought — he resigned, was appointed as commander-in-chief of the forces in the United Kingdom, and for his services created a viscount (December 1915). He became Lord Lieutenant of Ireland in May 1918.

FRENCH, Mansfield, American educator: b. Manchester, Vt., 1810: d. 1876. He was educated at Kenyon College, Ohio, and from 1845 to 1848 was president of the Female College, Xenia, Ohio. He was active in the founding of Wilberforce University, the first college for the colored race, as he had been one of the founders of Marietta College. An ardent abolitionist he laid before President Lincoln his plans for the education of the negroes as preliminary to their emancipation. The National Freedman's Relief Association was the realization of his views, as he had stated them at a mass meeting held in Cooper Union, New York, February 1862. He became the agent of this association and did valuable work for the liberated negroes of the South at Port Royal, S. C.

FRENCH, William Henry, American soldier: b. Baltimore, Md., 13 Jan. 1815; d. there, 20 May 1881. He was graduated from West Point in 1837 and served with distinction in the Seminole and Mexican wars. In 1861 he was commissioned brigadier-general of volunteers. He fought in the battles of Fair Oaks, Gaines' Mills, Peach Orchard, Malvern Hill, Antietam, Fredericksburg and Chancellorsville. In 1862 he became major-general of volunteers, and was mustered out of the volunteer service in 1864 after having for a time commanded the Third Army corps. He commanded the Second Artillery 1865–76, first on the Pacific Coast and then at Fort McHenry, Md., and was retired with rank of colonel in 1880. He commanded the forces which suppressed the Baltimore and Ohio Railroad riots (1877).

FRENCH, William Merchant Richardson, American art director: b. Exeter, N. H., 1 Oct. 1843; d. Chicago, Ill., 3 June 1914. He was graduated at Harvard in 1864, and for over 10 years devoted himself to civil engineering and landscape gardening. In 1874, having become greatly interested in art, he was much sought after as a lecturer on art subjects and did some writing on art for various periodicals, and in 1877 began his connection with the School and Museum of Art in Chicago, becoming director in 1879 when it was renamed the Art Institute. He helped organize and build up this institution from small beginnings to its present size and prominence, and was connected with it until his death. He was president of the American Association of Museums.

FRENCH ALLIANCE, The, in American history, an alliance, offensive and defensive, between France and the American colonies, signed in 1778. Three American commissioners, Benjamin Franklin, Silas Deane and Arthur Lee, sent to the court of France at Versailles, obtained recognition of the independence of the United States, and effected an alliance between the greatest European rival of Great Britain and her revolting colonies in America. The treaty stipulated that should war ensue between France and England it should be made a common cause, that neither France nor America would make peace without the consent of the other, nor should either lay down its arms until the independence of the colonies should be established. The news of the alliance provoked great enthusiasm in the American colonies. See UNITED STATES — AMERICAN REVOLUTION.

FRENCH ARCHITECTURE. While in any extended discussion of the architecture of what is France to-day it would be necessary to divide the subject according to the various provinces which were later united under the French monarchy, it seems wiser in so brief an article as this must be to take a more comprehensive survey, referring to provincial differences only when necessary to make clear the more general view. Leaving aside, as not strictly architectural, the rude stone monuments of prehistoric France, especially numerous in Brittany (Carnac, Lochmariaker, etc.), we may best follow the customary division of the subject into the six periods called the Gallo-Roman, Carlovingian, Romanesque, Gothic, Renaissance and Modern periods, each marked by well-defined style characteristics.

I. **Gallo-Roman.**— With the conquest of Gaul by Cæsar (51 B.C.) the Romans began extensive works of public utility. These were especially numerous in Languedoc and Provence, where a large population of Greek colonists had long maintained a high civilization. Here the Romans built roads and bridges (e.g., the Pont du Gard near Nîmes and the bridge of Saint Chamas across the Touloubre), theatres and amphitheatres, city gates, baths, temples and triumphal arches, all of cut stone and admirably executed. Nîmes is especially rich in Roman monuments, including two gates, an amphitheatre, baths and one of the loveliest and best-preserved of all Roman temples, the so-called Maison Carrée (4 A.D.). Arles, with its amphitheatre; Orange, with its superb theatre; Cavaillon and Carpentras, with their triumphal arches; testify to the splendor of this Greco-Gallo-Roman civilization. Further north are other interesting Roman monuments: at Autun two well-preserved city gates, at Lillebonne, fine remains of a theatre; at Rheims, a splendid arch of triumph; at Paris, remains of the palace and baths of Julian (4th century) and of an amphitheatre (the *arènes de Lutèce*). Tombs and memorial columns at Saint Rémy, Cussy, Vienne, etc.; mosaic floors and foundations of villas, city walls, forts, gates, aqueducts and bridges, are widely scattered through France.

II. **Carlovingian.**— From the chaos of the Merovingian era which intervened between the Roman and the Carlovingian dominations, almost nothing remains of architectural work. Possibly the crypt of Jouarre and the much-restored baptistery of Saint Jean near Poitiers belong to this period. It was Charlemagne who began the restoration of civilization and art in France during the early part of the 9th century. Little, however, survives of this period in France: the oldest parts of the church of Saint Généroux in Poitou is of this time, but Charlemagne's greatest works were in the Rhine Valley. The octagonal church at Aix-la-Chapelle is his most important monument; built by Byzantine artificers in imitation of San Vitale at Ravenna, it has been much altered and restored in later centuries. Whatever else has survived is in fragments incorporated into later structures, as in the crypt of Saint Denis, the church of Saint Martin at Angers, in two churches at Vienne and the lower part of the tower of Saint Germain-des-Prés, Paris. The Norman invasions destroyed much of what was standing before 1000 A.D.

III. **Romanesque.**— With the establishment of the Normans in possession of western France (911 A.D.), and the accession of the Capetian dynasty to the French throne (987), there began a new era for France. Out of the social and political chaos were emerging the feudal system, an established monarchy, and the monastic orders (q.v.). It was these orders that revived architecture, for during the 10th and 11th centuries they were the chief refuge of the arts and the chief builders of churches, about which they grouped also many other buildings — cloisters, dormitories, refectories, hospitals, etc., in and upon which they developed the arts of carving, sculpture and painting. Lacking marble and antique columns, but retaining the traditional elements of the basilican church-plan, they were forced to build at first rudely, later with greater elegance, out of coarse stone vaulted churches with massive piers, heavy round arches, small windows and thick walls, in which decoration was reduced at first to its lowest terms. This general style, called the Romanesque, varied greatly in detail in different provinces. Thus in southern France the Roman remains strongly influenced the detail and execution of churches usually of moderate size but fine workmanship (Arles, Aix, Cavaillon, Thor, Vaison, etc.); in parts of south central France domical churches were built, showing Byzantine influence as at Périgueux, Fontévrault, Solignac, Cahors; in Normandy, where development was early and rapid, at first timber roofs, later scientific cross-vaulting appeared, and central towers or lanterns at the crossings (Vignory, Caen, Mont-Saint Michel); while in Burgundy and under Cluniac influence another development of vaulted architecture took place as at Vézelay; and in the Royal Domain and in Auvergne other variations of the general type. Lack of space forbids specifying these provincial variations; what is common in varying degree to all these «schools» is their solid, massive construction, controlled by a clear scientific logic, the absence of applied ornament, the richness of the deep portals with their shafted jambs and carving, the increasing use of symbolic sculpture and grotesques, the use of stepped arches, and in the later 11th and the 12th centuries, the great size of churches like Saint Sernin at Toulouse, Vézelay, the churches at Caen, etc., and their increasing loftiness, with ribbed cross-vaults and elementary buttresses.

IV. **Gothic.**— With the consolidation of the royal authority under Philip Augustus in the late 12th and Louis IX (Saint Louis) in the 13th century, and with the growth of the power of the bishops as opposed to the pretensions of the abbots, there began an activity in the building of cathedrals, — that is, of bishops' churches, — which endowed France with its most splendid monuments in that marvelous style called the Gothic. (See GOTHIC ARCHITECTURE). In this style, which was a logical outgrowth from the preceding Romanesque, a rigid structural logic blended with a vivid artistic imagination, clothing the structural elements of clustered piers, molded arches, ribbed vaults, flying buttresses, pinnacles and traceried windows, in forms of great decorative beauty, enhanced by figure-sculpture, carved foliage, stained glass and a limited amount of painting, and dignified by imposing dimensions and especially by great loftiness. The vault of Notre Dame, Paris, reaches a height of 108 feet; that of Amiens, 136 feet; that of Beauvais, 142 feet. Towers with or without spires,— in some cases it was planned to have seven — added to the majesty of the noble exteriors. The earliest completely Gothic cathedral was Notre Dame at Paris (1163–1235); but the abbey of Saint Denis as first erected (begun 1140), and the cathedrals of Senlis, Noyon, Auxerre and Laon show early and incomplete realizations of the style whose culmination is seen in the cathedrals of Chartres, Rheims and of Amiens, next to which may be named, among others, those of Bourges, Rouen and Tours. These were all practically completed in the 13th century and are all in the northern half of France. During the 14th century building was mostly confined to parish churches, chapels and partial rebuildings of earlier churches, the cathedral of Albi being the only large cathedral of this century. The style became more ornate, less majestic, passing in the 15th century into the highly ornate phase called the "Flamboyant" from its flame-like traceries, as in the exquisite churches of Saint Malou at Rouen and of Saint Pierre at Louviers and the façade of Rouen Cathedral. During this century civil and domestic architecture developed rapidly (Palais de Justice, Rouen; houses of Jacques Cœur at Bourges, of Cluny at Paris); and finally expired in a corruscation of brilliant, overwrought beauty in minor works, as the Renaissance came in.

V. Renaissance.— The Renaissance (q.v.) movement had been potent in Italian art for a hundred years before it strongly affected French architecture. Minor works by Italian artists during the closing decades of the 15th century had been executed in France, but it was not until the military expeditions of three successive kings into Italy — Charles VIII, in 1489, Louis XII in 1499, Francis I between 1515 and 1527 — that the new style began to make its way in France. Italy was at that time far in advance of France in the refinements of civilized life and art and Italian arists were imported as well as Italian works of art by all these three monarchs to domesticate the foreign style on French soil. Here began a long contest between the national French taste and the Italian, and fo. 400 years it has continued with oscillations between the Latin and the Gallic tendencies in design. Surviving fragments of the château de Gaillon (1499, demolished in 1793) and the east wing of the château of Blois built by Louis XII show a mixture of Gothic with Italian details; and while in the tremendous building activity of Francis I and his court in palaces, rural castles along the Loire Valley and churches a large number of Italian artists collaborated with French master-masons, composition and construction long followed Gothic traditions, though the decorative detail approximated Italian models. Thus the church of Saint Eustache (1532) at Paris is purely Gothic in conception but with not a Gothic detail; shafts, capitals, entablatures, arches all following Italian precedent. Even Fontainebleau, of which part (Cour Ovale) was built under Italian direction (Serlio, Primaticcio), and in more striking degree the châteaux of Chambord, Azay-le-Rideau and Chenonceaux, retain the high roofs, dormers, pinnacles and chimneys of the French feudal château, while the superb open staircase-tower of the north wing of Blois is a purely Gothic structure with exquisite Renaissance arabesques. The Renaissance forms are a superficial dress, and while under the Bourbon Henrys (II, III and IV) the Italian influence increased and architectural forms followed classic precedent more closely (châteaux of Ancy-le-Franc, Anet, Pailly, the Tuileries), and Gothic forms disappeared, the French were slow to abandon their preference for the older French ways. The earliest part of the Louvre (1546–59) by Lescot, did more than any other monument to fix the type of French Renaissance architecture for a long period.

Under Louis XIII and especially XIV, the Latin or classic ideals increasingly prevailed (1610–1710), and externally the great domed churches (Sorbonne, Val-de-Grace, Invalides) and palaces and châteaux like the completed Louvre with its magnificent east colonnade, the enlarged Tuileries and above all the colossal palace of Versailles, displayed a style of great stateliness and classical dignity, being admirably composed, but often frigid in their formal regularity. The picturesquely irregular massing of the times of the Henrys and of the earlier part of Louis XIII's reign disappeared entirely. Internally palaces were decorated in a style which, though increasingly capricious, was absolutely French and often displayed great refinement and originality. (See INTERIOR DECORATION). But this freedom degenerated into extravagance and a reaction set in during the second half of the 18th century, culminating under Louis XVI (1784–89), toward greater simplicity and purity within and without. The most notable monuments of this reaction are the colonnaded façades on the Place de la Concorde, the imposing façade of the church of Saint Sulpice and the coldly classical but impressive Panthéon, with its fine dome and very Roman exterior. To this period also belong the Grand Théatre at Bordeaux, the Palace of the Legion of Honor (Paris) and the Petit Trianon at Versailles. Under Napoleon this formal classicism developed into the Empire style and produced such monuments as the Madeleine, the Corps Législatif (Chamber of Deputies) and the Arch of the Carrousel, all in imitation of Roman types, and the superb Arc de l'Etoile, surpassing in grandeur all Roman arches of triumph but copying none.

VI. Modern.— The 19th century began amid both political and industrial revolutions and architecture sank to a low estate in Europe for a long period. In France, however, it maintained still some artistic life, thanks in part to the École des Beaux-Arts, in part to the vitality of the French taste. From 1830 to 1850 it was marked by a sincere effort after Greek refinement without copying of Greek models; the Library of Saint Geneviève, the Column of the Bastille and new wings of the Palais de Justice and École des Beaux-Arts exhibit this tendency, called by some the Néo-Grec. It was less a distinct style than a tendency which affected architecture beneficially long after its particular forms had been given up. When, under Louis Napoleon (the Second Empire) the completion of the union of the Louvre and Tuileries and the building of a new opera house were undertaken, French architecture rapidly advanced to a high degree of artistic excellence, drawing inspiration largely from the Louvre and the style of Henry II. Especially notable was the revival of French decorative sculpture applied to buildings, while the great international exhibitions of 1867, 1878, 1889 and 1900 and the building of new railway terminals greatly stimulated the development of the artistic use of iron and steel construction for roofing over very wide spans and introduced wholly novel types of architectural design. The eccentricities and the forced affectation of originality of the so-called «Art Nouveau» or secessionist movement, though it originated in France, never led to the extravagant monstrosities to which it gave birth in Germany, Austria and Belgium.

Ever since the time of Louis XIV the French have led the world in the creation and adornment of squares and monumental centres in cities, as in the Places Vendome and de la Concorde in Paris, the Grande Place of Bordeaux, the Place Stanislas at Nancy, the Longchamps at Marseilles, etc. In no other country in recent times have the arts of decorative sculpture and painting as auxiliary to architecture been carried to so high a development or practised with such success as in France. While tradition and the unifying influence of the national École des Beaux-Arts have to some extent hampered the free development of new ideas in architecture, on the other hand they have preserved it from anarchy and extravagance, while the sound good taste and artistic sense of the French people have been manifest through all periods of its history.

Bibliography.— The literature of French architecture, in French, is enormous; only a few titles can be given: Berty, A., 'La Renaissance monumentale en France' (Paris 1864); Blondel, 'Architecture française' (Paris 1756); Chateau, L., 'Histoire et caracterès de l'architecture en France' (Paris 1864); Du Cerceau, J. A., 'Les plus excellents bastiments de la France' (Paris 1868); Lechevallier-Chévignard, E., 'Les styles français' (Paris 1892); Palusire, L., 'La Renaissance en France' (Paris 1885); Révoil, H., 'Architecture romane du midi de la France' (Paris 1867); Ronyer and Darcel, 'L'Art architectural en France' (Paris 1869); Sauvageot, C., 'Choix de palais, châteaux, hôtels et maisons de France' (Paris 1867); Viollet-le-Duc, E., 'Dictionnaire raisonné de l'architecture française' (Paris 1876). In English: Adams, H., 'Mont Saint Michel and Chartres' (Washington 1914); Blomfield, R., 'History of French Architecture 1494 to 1661' (London 1911); Cram, R. A., 'The Substance of Gothic' (Boston 1917); Moore, C. H., 'Gothic Architecture' (New York 1899); Mathews, C. T., 'The Renaissance under the Valois Kings' (New York n. d.); Ward, W. H., 'French Renaissance Architecture' (London 1911).

Professor of Architecture, Columbia University.

FRENCH BROAD RIVER, a river of North Carolina and Tennessee, rising in Transylvania County, of the former State, near the foot of the Blue Ridge, flowing northwest into Tennessee, and discharging into Holston River, four miles above Knoxville. It is about 250 miles long. From Asheville to the Tennessee line it is remarkable for its beautiful scenery, flowing through deep mountain gorges, or overhung by high cliffs. In Buncombe County, N. C., are precipices known as the Chimneys and the Painted Rocks. The latter, which are between 200 and 300 feet high, derive their name from some Indian pictures still to be seen on them. Consult Kirke, E., 'On the French Broad' (in *Lippincott's Magazine,* Vol. XXXIV, pp. 425 and 529, Philadelphia 1884).

FRENCH CHALK, a variety of steatite or talc (q.v.) occurring in fine-granular or scaly masses of milky-white color and pearly lustre. It is extensively used by tailors as a crayon for marking cloth, also as an absorbent in removing grease spots and, in powdered form, inside of new gloves and shoes to produce a smooth surface and make it easier to slip them on.

FRENCH EQUATORIAL AFRICA. French Kongo — which in 1908 became the General Government of French Equatorial Africa — is a colony of a special nature. Its boundaries were fixed diplomatically before the country was penetrated, as the result of some brilliant exploring expeditions. The conquest was undertaken progressively and pacifically without France being called upon to support those heavy burdens and bloodshed which the establishment of other colonies have sometimes entailed.

We are indebted to those intrepid explorers who started out to unravel the equatorial mystery and who paid the price of their adventurous spirit in loss of health and life in order to add a new page to the colonial history of France. In turn, Commanders Bouet-Wuillaumez and Paul du Chaillu, Ensigns Bravouzec and Genoyer, Aymes, Marche and Compiègne, established from 1840 to 1872 the general lines of definite bases in the hinterland of Gaboon. Shortly afterward, Savorgnan de Brazza, by patience coupled with skill, transformed in the course of three successive missions from 1875 to 1885, the small possession of Gaboon into a very large colony, joining up in a pacific manner that Kongolese depression which constitutes the enormous basin of the Kongo to our Gaboonese possession. Possession had only just been taken when the diplomatic status of the Kongo was settled by an international conference, the outcome of which was the General Act of the Berlin Conference of 26 Feb. 1885, and a series of agreements fixing the frontier boundaries for Germany, established in the Cameroons, for Spain, mistress of the Rio Mouni region, for Portugal, installed in the enclosed territory of Cabinda, and for the Kongo Free State, which afterward became Belgian Kongo. However, a new field of activity was opened up for explorers consisting in the gigantic scheme of presenting France with an empire which would be linked up by way of the Tchad, the banks of the Oubangui River, to the Algerian oases, and by way of the upper Nile region and the ports of Gaboon to the Red Sea stations. In 1890 Crampel marched on Tchad, but the sly hostility of the Sultan Rabah prevented him from reaching it. Dybowski, Maistre and Clozel followed in his wake, and their repeated efforts gradually enlarged the sphere of France's activity in Kongoland. Shortly afterward as the result of a clever junction-movement carried out by the Foureau-Lamy mission coming from Algeria, Joalland-Meynier from Senegal and Gentil ascending the Kongo, France became definitely installed in Tchad in 1900 and Baguirmi, Kanem, Chari and Ouadai were not long before succumbing to its influence. These results were further completed by the Marchand mission, which crossed French Kongo from one to the other, making the junction between the basin of the Kongo and the Bahr-el-Ghazal, and which, following on the Fashoda incident, found its epilogue in the Declaration of 21 March 1899. The pacific conquest of the country was hereafter assured. At Tchad, however, where France encountered the hostility of the well-organized Senoussans and Ouadians and found herself in the presence of troops used to fighting in open country, trained by chiefs like the Sultan Rabah for long periods of warfare, the occupation could not be carried out under the same conditions and took the form of a veritable campaign, of which the battles of Abeché, Bir-Taouil and Doroté and the military operations of Massalit and Borkou were the most glorious episodes. In 1911 French Equatorial Africa allowed France to emerge from the situation wherein she found herself after the Agadir incident, and it was she who, by a mutilation accepted with dignity, finally supported the cost of the operations of 4 Nov. 1911 of which France was to reap honor and profit in Morocco. But although having to accept the inevitable in the scheme of world politics, Equatorial Africa was soon after to have her share of glory, and in the World War, thanks to the valor displayed by the Franco-Britannic troops under Generals Aymerich and Dobell, she has not only recovered the territories taken from her but she now exercises her administrative action in the old Cameroon territory.

French Equatorial Africa is an immense region which extends from the mouth of the Kongo to Tripolitana and from the Atlantic to Egypt, covering an area of 2,200,000 square kilometers (849,420 square miles) or almost four times that of France. Situated between lat. 19° N. and lat. 5° S., its climate is very varied, alternating with the dry and healthy climate of the Saharean countries to that encountered in the wooded forests of the equatorial zone. The inhabitants, numbering some 6,137,000, are no less diversified, from the nomads of the north to the savages living in the forests. Some have a pretense to civilization — at least Islamic — others are still barbarous and in the first stage of human evolution; the former are priests of tribes and turbulent, the latter still ferocious but more docile and more apt for agricultural work. This colony, so rich naturally as regards its soil, so well favored by the variety of its climate and its populations, possesses moreover the most magnificent navigable system imaginable, with the immense Kongo and its great tributaries, the smallest of which are large in comparison with our rivers in France, with the vast Tchad which receives the waters from the Chari and Logone, with the Ogooué increased by the Ivindo, the N'Gounie and the Fernan Vaz. Such a situation is unique in Africa and for Equatorial Africa it is indeed fortunate as not only does this system water and fertilize the greater part of its territory but it constitutes the most remarkable means of penetration, of communication and transport between the different regions.

From a physical point of view, the division of French Equatorial Africa into natural regions gives four large distinct zones: the mountainous zone of the coast basins; the large equatorial depressions of the African plateau; trans-equatorial Kongo of the upper country; and the basin of the Tchad.

The coastal basins each comprise four banks rising one above the other; beyond the maritime bank, the banks of the virgin forests at the top of the first falls, limited at the east by the N'Gounie, the Nyanga and the mid-Niari, then the banks of the grassy plateaux having an altitude of 400 to 700 metres (1,311 to 2,295 feet) and the bank of sandy prairies of the upper plateaux of a height varying from 700 to 800 metres (2,295 to 2,622 feet) and extending as far as the watershed of the Kongo Basin. The principal rivers are the Ogooué (1,200 km., 745 miles), the Kouilou, called the Niari in its upper course; a part of the Kongo (about 600 km., 373 miles, of its length of 4,000 km., 2,485 miles). The Kongo possesses in French territory a certain number of tributaries among which are the Alima, the Likouala, the Sangha (itself swelled by the N'Goko), the Oubangui forming the boundary between French Kongo and Belgian Kongo and itself swelled by the Ibenga, the Lobayem, the Kouango, the Kotto, etc. The Chari River has no outlet to the sea; it finishes in the lake Tchad after having received on its right bank the waters from Bahr Salamat, and on its left those of Bahr-Sara and Logone, of which the confluence is at Fort-Lamy. From an administrative point of view, the decree of 15 Feb. 1910 provided for the definite creation of the general government of French Equatorial Africa, as stipulated by the decree of 26 June 1908. The general government is constituted to govern the following groups of colonies: the Gaboon colony, capital Libreville; the Middle Kongo, capital Brazzaville; the Oubangui-Chari-Tchad colony, capital Bangui, including the military territory of Tchad.

At the head of the colony is a governor-general invested with mandatory powers from the

French Republic and residing at Brazzaville. The colonies composing the group have administrative and financial autonomy; they are administered, under the superior authority of the governor-general, by governors of colonies having the title of lieutenant-governors. The military territory of Tchad was administered by a commander of the territory of Tchad, acting under the direct orders of the lieutenant-governor of Oubangui-Chari-Tchad. The decree of 14 May 1915 specified that the military territory of Tchad should hereafter, under the name of "Tchad Territory," be administered either by a civil official or by the officer commanding the troops stationed there, such functionary to take the title of administrator or commander of the Tchad territory. Decree of 12 April 1916 specified that the chief of the Tchad territory would hereafter be under the orders of the governor-general of French West Africa. A decree of 7 April 1916 — modified by decree of 5 Sept. 1916 — fixed the conditions under which the Cameroon territories would be administered. The governor-general of French Equatorial Africa administers, as commissioner of the French Republic, the Cameroon territories which previously formed part of Equatorial Africa and which had been relinquished by virtue of the treaty of 4 Nov. 1911. Moreover, a governor of colonies is appointed as commissioner of the Republic in the old Cameroon territories.

From an economical point of view, French Equatorial Africa has, during the last 10 years, undergone an important evolution and its prospects are excellent.

The trade returns for the colony in 1892 were francs 5,500,000 ($1,100,000); it rose to a yearly average of about francs 11,450,000 ($2,290,000) for the following period of 10 years, and amounting in 1908, when the general government was formed, to francs 27,000,000 ($5,400,000) and reaching in 1913 francs 57,846,805 ($11,569,361). The trade for the year 1913 — taken as an average year — is divided up as follows: Francs 21,181,768 ($4,236,353) for importations and francs 36,865,038 ($7,373,007) for exportations. Foreign trade played a considerable part in exportations, in fact almost half. The French markets received in 1913 francs 14,389,717 ($2,877,943) of products from French West Africa, while the export figure for other countries was francs 5,728,194 ($1,145,638) for Belgium; francs 3,967,377 ($793,475) for England; francs 3,860,549 ($772,109) for Germany and francs 1,242,031 ($248,406) for Holland. These figures explain why the economical life of Equatorial Africa has slackened since the outbreak of hostilities. Trade fell in 1914 to 28,000,000 and to 22,000,000 in 1915, while there was a slight increase in 1916, the figure being francs 30,533,038 ($6,106,607). The products exported consist of minerals, animal and vegetable products, both of a superior quality. The mineral products of the colony which are found particularly in the Niari and Djoué basins are principally copper (of an exceptionally high grade), zinc and lead. For many years the natives have carried on the extraction of these products, and recently Europeans have systematically exploited same, the exportations amounting to 8 tons in 1910, 1,271 tons in 1913 and 1,451 tons in 1914.

French Equatorial Africa is rich in big game. Elephants are especially sought after on account of the value of their ivory. The exportation of the latter has remained stationary during recent years, varying between 130 and 150 tons, and eight-tenths of the ivory exported was sold before the war, on the Antwerp market. The exportation of whale oil represents a new and interesting factor, amounting to 10,603 tons in 1913, which, however, fell to 6,771 tons in 1914. Of all the French colonies, French Equatorial Africa is the richest from a forest point of view, possessing as it does a considerable choice of woods suitable for various uses. Mahogany is found in different grades, such as okoume which forms an excellent counter-veneer wood much used in Germany for the manufacture of cigar boxes; semi-hard wood such as kambala, walnut from Gaboon, billinga, hard woods like crail, moabi and mowingui, soft wood like fromager, gombo-gombo and tulip tree wood. The area of these compact forests is some 140,000 square kilometers (54,054 square miles). It should be noted, moreover, that three-quarters of the present forest production of Gaboon was consumed in Germany and Holland. During the year 1916 it was proposed to use wood from Gaboon for the needs of the army and for reconstruction work in the devastated regions of North and East France. Wood exports which scarcely amounted in 1898 to 2,886 tons reached 10 years later nearly 70,000 tons and in 1913 amounted to 150,688 tons, representing a value of francs 8,319,239 ($1,663,847). This result, obtained in so short a time, is most encouraging for the future of this industry.

Rubber is also found in French Equatorial Africa but the proper cultivation of this product has not yet been undertaken in these colonies. The recent world wide rubber boom was felt in French Kongo as elsewhere but this was only of temporary duration and should not interfere permanently with the normal development of this industry. The exportation for 1912 and 1913 was 1,901 tons and 1,600 tons respectively; in 1914 it dropped to 600 tons, increasing in 1915 to 1,413 tons. There is an abundance of palm oil in French Equatorial Africa but it is only exploited in a rudimentary way by the natives. Several large European establishments have been founded for the operation of this industry and its future would appear to be very promising. The exportation of palm oil only amounted to 76 tons in 1912 and 77 tons in 1913; there were 359 tons of palm almonds exported in 1912 as against 208 in 1896, 595 in 1913 and 971 in 1914, thus showing an upward tendency which reached, in 1915, 1,135 tons. Gum copal of various qualities is found in French Equatorial Africa but its exportation is insignificant (1,490 kg. [3,278 lbs.] in 1913). Raphia is also exported in small quantities, as well as fibres called "piassawa" which are used in the brush trade and the exportation of which amounted in 1915 to the interesting figure of 490 tons which is promising for the future of this industry. Among the principal cultures, the foremost are coffee and cocoa. The coffee tree grows in a wild state in many parts of Equatorial Africa, especially in the Kongo islands, the Sangha and the Oubangui; the local coffee is much appreciated by connoisseurs but no great traffic has yet been undertaken in this product. Its exportation merely amounted to 33,593 kg. (73,904 lbs.) in 1913. The climate and the soil of Gaboon, similar to that of the San Thome Island, are suited to the cultivation of cocoa and many experiments have been made in this direction within the last 20 years. The exportation of cocoa exceeded in 1913 158 tons; in 1914 it amounted to 142 tons and in 1915 actually reached 203 tons despite the difficulties of transportation. Finally, food producing plants are found in French Equatorial Africa such as the banana, tapioca, rice, etc., as well as medicinal plants (castor oil, kola, etc.); pepper, spice, etc., are also grown.

From the foregoing it will be seen that French Equatorial Africa is characterized by the variety and abundance of its products. Its great ivory reserves, its rubber trees, superior and more abundant to those of West Africa, the richness of its soil which is suited for all tropical cultures, its splendid palm forests and precious wood, the immense variety of its ordinary wood, its large herd of cattle in the north, the minerals found in its soil, its copper mines situated at less than 300 kilometers from the coast, all furnish a sure guarantee of the future prosperity of French Equatorial Africa which will quickly be on a par with French West Africa and Madagascar and from which France will derive great advantage. The colony must, however, be liberated from those impediments which at present hinder its full development. From a territorial point of view Equatorial Africa is the only one of the French colonies where the régime of granting large land concessions was put in practice in 1899 and which since 1910 has proved of much benefit to the colony. From a fiscal point of view the colony has suffered from a duality of the customs régime which is still further aggravated by the fact that a large part of the colony is subject to the international stipulations laid down in the Berlin Agreement by which it is deprived of the liberty of its tariffs.

FRENCH ESTABLISHMENTS IN INDIA, the five colonies of Pondichéry, Karikal, Chandernagar, Mahé and Yanaon. The total area is 196 square miles. These colonies are divided into five *dépendances* and 17 communes, having municipal institutions. There is also an elective general council. The governor of the colonies resides at Pondichéry. The colonies are represented in the Parliament at Paris by one senator and one deputy. The principal crops are paddy, ground nut and ragi. Pondichéry has five cotton mills and there is a jute mill at Chandernagar. The cotton mills employ 7,335 persons. There are also in operation two oil factories and a few oil presses for ground nuts, two ice factories and a cocoatine factory. Oil seeds form the chief export from Pondichéry. At the ports of Pondichéry, Karikal and Mahé in 1914 the imports amounted to $1,509,126 and the exports to $6,860,702; 292 vessels of 555,561 tons entered and 288 of 568,666 tons cleared from these three ports in the same year. Forty-three miles of railroad are in operation, Pondichéry to Villapuram, and Peralam to Karikal. Pondichéry, the chief French possession, was founded by the French in 1674, taken by the Dutch in 1693, and restored in 1699. The English took it in 1761, restored it in 1765, retook it in 1778, restored it a second time in 1785, retook it a third time in 1793, and restored it in 1814. The population in 1914 was estimated at 273,000.

FRENCH ESTABLISHMENTS IN OCEANIA, islands scattered over a wide area in the eastern Pacific. They are administered by a governor with an administrative council consisting of certain officials, the *maire* of Papeete, and the presidents of the chambers of commerce and agriculture. The establishments consist of the *Society Islands,* the most important of which are Tahiti and Moorea, the former with an area of 600 square miles and 11,691 inhabitants, the latter with an area of 50 square miles and 1,564 inhabitants. Other groups are the *Marquezas Islands,* with a total area of 480 square miles and 3,424 inhabitants, the two largest islands being Nukahiva and Hivaoa; the *Tuamotu group,* consisting of two parallel ranges of islands from King George's Island on the north to Gloucester Island in the south, their total population being 3,828; the *Leeward Islands* (Iles sous le Vent), of which the more important are Huahiné, with a population of 1,230, Raiatéa and Tohaa, population 3,347, and Bora-Bora-Maupiti, population 1,295; the *Gambier, Tubuai* and *Rapa* islands; the Gambier group, of which Mangareva is the principal, has six square miles of area and 1,533 inhabitants; the Tubuai (or southern) Islands, of which Rurutu is the largest, Raivavae, Rimatara and Rapa, have a combined area of 115 square miles and about 2,550 inhabitants. The total area of the establishments is estimated at 1,520 square miles, and their population in 1911 at 31,477, of whom 26,219 were natives and 975 Chinese. In 1903 it was decreed that separate islands or groups should no longer be regarded as distinct establishments, but that all should be united to form a homogeneous colony.

The most important of the islands is *Tahiti,* whose chief town is Papeete with 3,617 inhabitants, of whom 1,909 are French. Pearl and mother-o'-pearl are important products. The island is mountainous and picturesque with a fertile coastland bearing coconut, banana and orange trees, sugar-cane, vanilla and other tropical fruits, besides vegetables of temperate climes. Cotton, coffee and tobacco are now little cultivated. The chief industries are the preparation of copra, sugar and rum. The imports in 1913 were valued at $1,685,390 and the exports at $1,703,590. The chief imports are tissues, wheat, flour, metal work, and the chief exports are copra, mother-o'-pearl, vanilla, coconuts and oranges. There is a monthly steamer service connecting San Francisco, New Zealand and Australia with Papeete, the Tuamotu Islands, the Marquezas and the Leeward Islands. Shipping between the islands is carried on by sailing boats.

FRENCH GUIANA, French colony situated on the northeast coast of South America, in 4° 56′ 20″ N. lat. and 54° 41′ W. long.

French Guiana has an area about the third of France. Three chains of mountains run through the country parallel to the coast: the Tumuc-Humas ranges (1,250 to 2,500 feet), the central chain (650 to 1,300 feet) and the coastal chain (200 to 950 feet). A large number of water courses intersect the country. They flow from south to north, throwing their waters into the Atlantic Ocean after being swelled by several tributaries or creeks. The more important of these rivers are the Maroni, Mana, Sinnamary, Kourou, Cayenne, Conté, Mahury and Oyapoc.

Climate.— The temperature is not as hot as is generally supposed; it varies between 25° and 30° C., but it has a weakening and depressing effect on account of the humidity of the atmosphere, the hygrometric degree exceeding 90 per cent. The dry season lasts from June to November, the wet season during the other seven months of the year. The capital of the island is Cayenne, at the mouth of the river of that name, and the port can accommodate ships of 500 tons.

History.— Guiana was discovered by Christopher Columbus in 1498 but it was not until 1500 that Vincent Pinçon first explored the coasts. During the 17th century numerous European expeditions were carried out in Guiana. In 1604 Rivardière landed on the borders of the Mahury, in 1643 Poncet de Bretigny made an expedition to the Cap du Nord; in 1652 Equinoctial France was explored. In 1654 the Dutch took the budding colony and kept it for 10 years, but de la Barre expelled them in 1664 and took possession in the name of the Grande Compagnie des Indes Occidentales. In 1667 the English made a surprise attack on Cayenne, devastated the country, and withdrew. In 1676 it was again occupied by the Dutch who were, however, expelled by the fleet of Admiral d'Estrées.

Numerous attempts to colonize the place were unsuccessful on account of poor means of organization, the Kourou expedition being the most disastrous and ending in a veritable fiasco which contributed in gaining for Guiana an unmerited reputation which has seriously handicapped its development. However, thanks to the efforts displayed by men like Melouet, Guizan and Touat, better results were obtained and the country was in a flourishing condition for several years. When the Second Republic — to its eternal honor — abolished slavery on 27 April 1848, the negroes excited with their new liberty refused to work and the problem of labor became the crucial question in Guiana as in the West Indies for the development of the rich natural resources of the country. Since 1854 the discovery of gold mines resulted in a general exodus to the great forests where the «placers» are; the plantations which had survived so many vicissitudes were abandoned and serious efforts were necessary to place agricultural development on a proper basis again. Moreover, memories of the unfortunate Kourou expedition had a disastrous effect on the colony and was still further aggravated by the dispatch later on of exiles to Cayenne and Sinnamary as the outcome of the Fructidor incidents in September 1797. Since that time Guiana has been considered the dumping ground «par excellence» for deportations and in 1854 the colony was officially designated as a penal settlement.

Government.—At the head of the local administration is a governor, assisted by a privy council. Guiana is represented in the Chamber of Deputies but not in the Senate. From an administrative point of view, the colony is divided into communes each of which is administered by a mayor assisted by a municipal board.

Commerce, Trade, etc.— The trade of the colony for 1913 amounted to 24,717,302 francs, made up of 12,494,765 francs, imports, and 12,-222,537 francs, exports. Its business has not been much affected by the war, amounting to 20,989,045 francs in 1914 and 21,543,502 francs in 1915. (Franc = 19 cents United States currency; for general purposes of comparison, 5 francs=$1).

Gold mining is the principal industry of Guiana, the amount of gold dust exported representing a sum of 10,149,115 francs in 1913. The gold is exported almost exclusively to France and Switzerland — 2,388 kilograms of a total of 3,758 kilograms, Switzerland receiving 1,362 kilograms. Martinique received the remaining 9 kilograms of precious metal (kilogram=2.20 lbs.).

Agricultural products do not enter much into the commerce of Guiana. Cocoa in berries is exported to an amount of 15,241 kilograms (34,000 pounds), and coffee beans 720 kilograms (17,000 pounds), valued at 2,521 francs ($504.20). «Cayenne» pepper, which is now merely a trade term for this condiment, could be much more remuneratively exploited. Bananas, manioc, food producing plants, potatoes, yams and maize give good results nearly everywhere in the colony.

The forests, very rich in valuable wood, are as yet but little exploited. Rosewood was exported in 1913 to an amount of 44,676 kilograms of a value of 1,116,900 francs. Exotic woods were exported to an amount of 244 stères, representing a sum of 36,616 francs; most of the wood found in Guiana is superior to the European woods both as regards hardness and rupture resistance; the wacapou is used in the construction of railroad ties, the wapa is employed in France as props for the growing of vines. Apart from the wood other products are found in the forests, some of which are quite valuable, such as oily products, aromatic products, dye products, gum and resinous products, textiles and medical products. Balata gum is exported to an amount of 217,982 kilograms, representing a value of 653,946 francs. A fairly good trade is also done in raw hide, 35,040 francs, raw feathers, 2,760 francs, air bladders, 10,095 francs, and rich phosphates, 127,720 francs.

With the exception of gold prospecting, Guiana is only partially exploited, the extraction of gold having caused other industries to be almost entirely neglected, or at least relegating to a secondary place other rich minerals or vegetables which could be developed to the profit of the colony. It is, moreover, believed that silver exists in Guiana, as well as copper, lead, iron, tin, mercury and numerous precious stones such as topazes, chalcedones, grenats, amethysts, etc.

From every point of view, whether as regards mineral exploitation or rich forestral or agricultural products, Guiana is in a position to satisfy all demands made on it for colonization. The colony should accordingly show much improvement in a not too distant future, especially when the gold seekers will be joined by workers on the land. It should not indeed be forgotten that in a country so well endowed as Guiana, pasturage and tilling are the very essence of its existence and future prosperity.

FRENCH GUINEA, gin'ĭ, colony comprised in the government-general of French West Africa. It is situated on the coast between Portuguese Guinea and the British colony of Sierra Leone, and extends inland so as to include the territories of Dinguiray, Siguiri, Kouroussa, Kankan, Kissidugo and Beyla. The area is about 95,000 square miles and the population (1914) 1,810,059, including 1,166 Europeans. It is a rich colony, exporting not only cattle, peanuts, gum, hides, beeswax and rubber, but also palm kernels and palm oil. There is an experimental garden near Konakry, the capital, where the culture of bananas, pine apples, rubber trees and other plants is being tried. Futa Jallon contains cattle in abundance. Gold is found in the river Tinkisso and in the Bouré and Siecke districts. The French Guinea Railroad runs from Konakry to the Niger and thence to Kankan, a distance of 412 miles. At Konakry there is a new breakwater 1,066 feet long. In the colony there are 2,225 miles of telegraph and 48 miles of telephone line, with 6 miles of submarine line. The chief port is Konakry, where ocean-going vessels discharge their cargoes at the wharves. In 1915, 408 vessels, of 338,420 tons, entered the ports of the colony. Its imports in the same year were valued at $1,870,033, and its exports at $3,134,414. A regular system of government schools has been introduced here as in the rest of French West Africa. Konakry has regular communications with Europe through two French, one English, and one German line. The 1916 budget of the colony amounted to $1,365,480. Consult Aspe-Fleurimont, 'La Guinée Française' (Paris 1900).

FRENCH AND INDIAN WAR. See Colonial Wars in America.

FRENCH INDO-CHINA. History.— France lost India in the 18th century. In the 19th century she conquered eastern Indo-China. Although the territory is much smaller and less peopled than that of Hindustan, it is in no sense a compensation to be disdained. A colony which is half as large again as the area of France, with a population estimated at 16,000,000, of which 30,000 are French, which is situated at the very door of China — that incomparable market with a population of 400,000,000 — is a colony of very great value and justifies, despite its infancy, all the hopes which have been lavished on it. As has been quite rightly stated, it was not a war of 100 years but a slow penetration of Frenchmen into Indo-China extending over a century. However, the real conquest is of quite recent date. In 1870, Cochin-China and Cambodia alone belonged to France. Tonkin, Annam and Laos were acquired under the Republic. Here again a fortunate coincidence obliged France to take action: its ministers, with the exception of Jules Ferry, who had a clear insight into the future, followed not without uneasiness the rulings of fate. The real pioneer of the French in Indo-China was Pigneau de Behaine, a vicar in Cochin-China and bishop of Adran, who persuaded the emperor of Annam, Gialong, to have recourse to Louis XIV's aid against the Chinese. This premier intervention resulted in the signing of the Treaty of Versailles between Louis XIV and the son of Gialong in 1687, and by which France received the Bay of Tourane and the island of Paulo-Condore. The French officers, appointed to the court of Hué, formed a disciplined army which defended Annam against the English during the Revolution and the Empire. Chaigneau, the last survivor, died in 1822, having received the title of consul of Hué which was conferred on him by the Duke of Richelieu. Later on, however, a changed and hostile attitude was adopted toward the French and this spirit of persecution became extremely violent on the accession of Tu-Duc who deemed the French to be the implacable enemies of his country, describing them as "people who bark like dogs and run away like goats." Tu-Duc in fact became so menacing and defiant that the two European powers most directly concerned, France and Spain, decided to dispatch a small squadron, under Admiral Rigault de Genouilly, in 1847. A further intervention took place at Tourane in 1852, under the reign of Tu-Duc, as a result of the murder of several missionaries; this was followed in 1858 by the dispatch of a Franco-Spanish expeditionary force which took possession of Tourane, and later of Saigon, in 1859. But the wars in which the French Empire was engaged in Italy and China diverted momentarily the attention of France. Tourane was taken and Saigon blockaded. In 1861, Admiral Charner, at the head of a properly equipped expedition, which included but few Spaniards, conquered a part of Cochin-China. On 5 June 1862 Admiral Bonard signed at the "Camp des Lettrés" a treaty by the terms of which the three oriental provinces of the Mékong Delta, Saigon, Mytho and Bien Hoa, were ceded to France. A few years later (1867), Admiral Grandière completed the conquest of Cochin-China by seizing all the important places and the Emperor Tu-Duc surrendered at the Temple of Plumg-Tien, repenting and declaring himself guilty of "having neglected to perform my duties and having been incapable of preserving the patrimony of my forefathers intact." Thus the six provinces of the Mékong Delta were definitely occupied and Cochin-China became a French possession. Already, in April 1863, King Norodom, in order to be freed from the harsh vassalage of Sian and Annam — anxious to exploit the Cambodia country — had signed a protectorate treaty with Admiral Grandière. But larger schemes were conceived and at the time when the English were seeking a trade route to China via Irawaddy or the Salouen, the French wondered if the Mékong, by the very length of its course, would not open up a still easier way. The Doudard de Lagree mission soon found out, however, that this large river was not particularly practicable for penetrating into the Chinese Empire. It was a French merchant named Jean Dupuis who discovered a shorter route, the Red River, which led directly to the province of Yunnan, one of the richest and most densely populated of southern China. However, Jean Dupuis was molested by the Tonkin mandarins and Lieut. Francis Garnier was dispatched to Tonkin with 80 men to settle the incident, with the help of a high official of the Court of Hué. As a result of the bad faith of the mandarins he decided, despite the small forces at his disposal, to attack the citadel of Hanoi, which he took on 20 Nov. 1873 after a brilliant battle. In 20 days he was master of the whole of the Red River Delta; but the Annamites were not long in reacting, all the more so as they had the superiority in numbers; Francis Garnier was lured to his death on 21 Dec. 1873. Hostilities ceased at the beginning of 1874 on the arrival of Lieut. de Vaisseau Philastre who signed a disastrous treaty with the court of Hué by which France lost Tonkin, merely retaining a few commercial and diplomatic rights in Annam. The signing of this treaty assured relative tranquillity for a few years. But little by little the hostility of the Annamite mandarins to the French grew to alarming proportions and the emperor of China declared that he would not recognize the treaty of 1874. Commandant Rivière, who was appointed to bring them once more to reason, committed the same sublime stupidity of his predecessor, Francis Garnier, only to meet the latter's fate at Nam Dinh where he was endeavoring to repel the multitudes who were besieging it. The prestige of France had received a serious set-back. By unanimous decision the Chamber of Deputies decided «to avenge the glorious servitors of France» and the necessary credits were voted. But the campaign, carried out on the system of «small drafts,» was long and costly and the country understood but little the importance of colonial expansion. It required all the eloquence and civic courage of a Jules Ferry, backed by the dauntlessness of the army and navy, to secure this flourishing colonial empire for France.

Events succeeded each other in rapid succession; General Bouet installed himself at Hai-Duong, Admiral Courbet took the important town of Hué, and France's old enemy Tu-Duc recognized by the convention of 25 Aug. 1883 a French protectorate over Annam and Tonkin. However, Chinese pirates, or the «Black Flag,» were not alone in infesting Tonkin, for in addition there appeared the band of the «Yellow Flag» or Chinese regulars. It was against China itself that France was called upon to fight. General Millot, in charge of the Tonkin expeditionary forces, took Bac-Ninh, Hung-Hoa and Tuyen-Quang in 1884. Courbet conducting a campaign in the river passes of the Min, eventually took up quarters in Formosa and in the islands of Pescadores, and by a process of starvation forced China to treat for terms (1884-85) at the very time when General Briere de l'Isle delivered Tuyen-Quang and repulsed the Chinese to the north as far as the Kwang-Si district, after two months severe fighting. It is to be regretted that his right-hand man, General de Negrier, was wounded at Langsan and his successor, Colonel Herbinger, ordered a too hasty retreat which became a rout. This regretable incident although unimportant in itself supplied the long sought after excuse for the adversaries of Jules Ferry for demanding his resignation from office (30 March 1885). As a matter of fact the «Grand Tonkinois» could easily have revealed the terms of the forthcoming peace negotiations, but he preferred to lose his office rather than commit a diplomatic indiscretion. Negotiations, already begun by Commandant Fournier, were carried on by the representative of France, M. Patenôtre, resulting on 9 June 1885 in the signing of the final Treaty of Tien-Tsin by which China recognized the French protectorate over Tonkin, thereby opening up to French trade the rich Chinese provinces of the south: Yunnan and Kwang-Si. This treaty caused serious riots at Hué and necessitated the intervention of General de Courcy in Annam. The young rebel king was only subdued after a long campaign, being finally captured in 1888. Since that period France has had to assert its authority by undertaking numerous campaigns against the Annamite and Chinese rebels, who alone profited by a state of war. Operations were long and laborious, culminating in 1889 by the submission of the principal rebel chiefs. In 1904 the success of the Japanese in the Manchurian campaign naturally had its repercussion in the Asiatic world, although the immediate effect on Indo-China was not very great. Up to 1913 order reigned, with only slight local troubles, and at the end of 1913 the death of De Tham, who lived a secluded life in the mountains and forests of the Upper Tonkin regions, liable to fall at any moment into the hands of the militia, marked the close of the period of banditry with which France had had to contend ever since the conquest of this country. The adversaries of French domination in Indo-China from that time onward seem to have had recourse to the more scientific and violent weapons of modern revolutions. But the rapidity with which the plots were discovered and repressed, the manner in which justice was meted out by the «Criminal Commission» and the calm dignity displayed by the French population, made a profound and lasting impression upon the minds of the Annamites. In the last 12 years French Indo-China has become enriched by the inclusion of two more important territories, increasing its population by almost 1,000,000 inhabitants: the Kwang-Tchu-Wan territory, leased to France for a period of 99 years by the Franco-Chinese agreement of 10 April 1898, and the long disputed provinces of Battanbang, Siem-Reap and Sisophon, restored to Camboda by the Franco-Siamese agreement of 23 March 1907. In this manner was realized the progressive expansion of France in Indo-China, an exceptionally intricate and difficult enterprise if it is borne in mind that France was called upon to subdue and equitably govern a large and homogeneous population having a racial affinity with neighboring peoples not particularly well disposed toward France, i.e., Chinese, Siamese, etc. She had, moreover, to parry the great danger to its ideas of expansion arising from the contact of the people in the peninsula with an adjacent empire of several hundreds of million souls where the frontiers are not protected by any mountains of importance.

Area.— The total area of Indo-China exceeds 800,000 square kilometers (308,880 square miles); it is geographically bordered by the Annamite mountain chain, on its two sides, west and east, and by the lower valleys and deltas of the two rivers which form boundaries: The Red River and the Mékong River.

Topography.— Indo-China is crossed from south to north by a long range of mountains which join and form a cluster in the Tibet region, branching out fanwise from the north to the south, dividing the country into two large valleys which constitute the basins of the Mékong and the Red River. This mountain range entirely covers the Laos and spreads over the Tonkin as far as the Red River in high plateaux of an average height of 1,200 to 1,500 metres. From this block a long chain extends toward the south, the Annamite Cordilière, the spurs of which cut Annam up into a series of small valleys, the communications between which are difficult. Toward the southwest and the south, the Cordilière spreads into large plateaux a few of which extend to the boundaries of the Cambodia and Siam. The abundant rain from the monsoons in Indo-China has resulted in numerous water courses being formed which, except in the Annam centre, have their low and high seasons in winter and summer respectively. The rain is so frequent in this latter season that floods occur which are often of a disastrous character. The two large rivers of Indo-China, the Mékong and the Song-Coi or Red River, collect the waters and their alluvions form the deltas where the economical life of the colony is centred. The Mékong, an important river, has a length of 2,400 kilometers (1,460 miles) of which lake Tonlé-Sap, at the top of Pnom-Penh, forms a natural regulator. The Song-Coi is swelled by the Claire River and the Moire River whose vast delta encompasses the richest provinces of the colony.

The coasts of Indo-China have the form of an S and extend over a length of 2,500 kilometers (1,508 miles); they are rocky where the mountains are near the sea, low and flat by the side of the deltas. They afford good ports but the harbors are either too shallow or insufficiently sheltered.

Climate.— The climate of Indo-China is hot and damp; there are two seasons: summer, which is very rainy, and winter much less so. This difference is due to the monsoons or periodical winds which are prevalent during summer, blowing either from the southwest to the northeast (Cambodia, Cochin-China, Laos) or from the southeast to the northwest (coasts of Annam and Tonkin), and during winter from the northeast to the southwest. The climate, moreover, greatly varies according to the districts. In reality no Indo-Chinese, properly speaking, climate exists, but Indo-Chinese climates according to whether it is a question of Cochin-China, Cambodia, Annam or Tonkin.

Population.— The Indo-Chinese population is of great variety. Peopled during many centuries, Indo-China has witnessed numerous invasions or migrations resulting in a great cosmopolitan race having sprung up. The Annamites constitute at least five-sixths of the total population, being estimated at about 12,000,000. Then come the Cambodians, numbering about 1,300,000, or representing 7 to 8 per cent of the total population. The Thais or Lactians from Upper Tonkin form a total of 600,000 to 700,000 individuals, and the Khas district contains a large number of peoples spread over the Annamite mountain country. There also exist in Indo-China some other peoples who were probably the first to inhabit the country, but they were not strong enough to resist the Annamite invaders, the Cambodians or the Thais, and were obliged to seek refuge in the mountainous regions of the west and southwest. They are classed together under the general name of "the savage population" or Mois. The Chinese are very numerous in Indo-China and their importance is still more considerable than their number would appear to warrant. Finally, the number of Europeans taking up residence in Indo-China increases yearly.

Government.—At the present time the political organization of Indo-China is that of an adult colony. The decrees of October 1887 and 31 July 1898 created the Indo-Chinese union, centralising in the hands of a general governor the superior administration of the colony of Cochin-China and the protectorate of Cambodia, Annam and Tonkin. Nowadays the general government of Indo-China comprises five distinct regions: Cochin-China, capital Saigon, over which France exercises direct authority; Annam, capital Hué; Tonkin, capital Hanoi; Cambodia, capital Pnom-Penh; the three latter are protectorate countries where the rights of the sovereigns and the authority of the native officials appointed by them are respected; Laos, which can be considered as French territory despite the presence at Luang-Prabang and in other parts of this country of native princes or chiefs who continue to exercise over the population, with the consent of France and under its control, certain vestiges of suzerainty.

The territory of Kwang-Tchu-Wan possesses its own administration. The powers of the governor-general are set forth in the decree of 20 Oct. 1911; he holds mandatory authority from the French Republic for the whole of French Indo-China and is assisted by a general secretary and a government board. The various countries comprising the general government of Indo-China possess their administrative autonomy with certain reservations; they are each administered under the superior authority of the governor-general by a lieutenant-governor in Cochin-China, by superior residents in Tonkin, Annam, Cambodia and Laos, and by an administrator in the territory of Kouang-Tchu-Wan. Apart from privy and protectorate councils operating in Cochin-China, Tonkin, Annam, Cambodia and Laos, other deliberating or consultative assemblies exist in the various countries of Indo-China; such as the colonial board of Cochin-China (an emulation of the "Conseils Centraux" in the mother country), and the municipal boards of Saigon, Hanoi and Haiphong. The receipts and expenses of the general government and of the various countries composing French Indo-China are grouped in a general budget in which the common receipts and expenses are given, and in local budgets relative to each particular colony. The countries which constitute the Indo-Chinese Union are divided into provinces, at the head of which are placed administrators of the civil services who take the title of residents in the protectorate countries and government commissioners in Laos. It should be noted that besides the French administration there is always the native administration. The Tong-doc, the Tuan-phu, the Phu and the Huyen still govern respectively in Annam and Tonkin the provinces and circumscriptions; the consultative native chamber and the provincial councils of Tonkin have been given new powers by the local decree of 19 March 1913; Cambodia also possesses its native consultative assembly and in the Laos district the government commissioners have as assistants «Mandarins,» if not like the other countries of the union, native chiefs who by their situation and authority are most useful auxiliaries.

No French colony is more densely populated than Indo-China, none possesses a richer soil, so suitable for the most varied products or more abundant and intelligent labor. Its resources are immense. A European can, if he takes proper hygienic precautions, easily live in the country which is not too close to the swampy regions of the coast, or the forests of the interior. These conditions explain the rapid development made by Indo-China from an economical and commercial point of view since French occupation.

Live Stock.— The distance of Indo-China from France does not allow of the exportation of live stock and for the present the preparation of preserved meat is the only form in which Europe has benefited from its cattle breeding industry. According to the latest estimates drawn up in 1916, the Indo-Chinese livestock amounted to no less than 634,525 head of oxen, 523,553 cows, 289,939 calves, 618,939 buffaloes, 631,709 female buffaloes, 334,024 buffalo-calves, 2,662,534 pigs. The skins and horns of the oxen and buffaloes give rise to a certain amount of exportation (3,000 tons of raw hide in 1913). Silk is exported to an amount of about 100,000 kilos (220,000 lbs.), but a large quantity of the silk produced is employed for local uses. The «stock-laque,» an insect product, may later on give rise to a good business.

Fisheries.— Indo-China, with its 2,500 kilometers (9,650 miles) of coast, its large rivers, its numerous arroyos and especially the great lakes in the Cambodia region, is essentially a country suitable for the fishery industry on a large scale. Deep sea and river fishing permits of the exportation of a large quantity of dried and salted fish, of by-products and of fish oil. The government grants concessions of fishing rights from which it derived a revenue estimated at 500,000 piastres for 1915. The value of the fish exported from Indo-China gives 12,000,000 for Cambodia, 3,000,000 for Annam and 200,000 to 300,000 for Tonkin; the totality of fishing products exported for 1913 amounted to 18,000,000 francs ($3,600,000). Another local industry allied to the fishing trade is the preparation of different fish sauces, the most noted of which is the nuoc-mam.

Other Products.—Among the vegetable products, fatty matters hold a prominent place. The exportation of copra fluctuates between 6,000 and 8,000 tons. Arachide is cultivated in Annam where, however, it is mostly consumed locally. Castor oil, the exportation of which has increased from 42 tons to 600 tons, is principally shipped to China. Cotton oil is also cultivated locally. Rice is the principal crop of Indo-China and is consequently exported in large quantities. Indo-China is second only to Birmania as regards rice exports, being more important than Siam. Laons and Annam do not export rice and Cambodia only in small quantities (about 150,000 tons), but Tonkin exported in 1915 250,000 tons and the figures for Cochin-China — the principal exporter — were 1,295,000 tons in 1914 and 1,085,000 tons in 1915. Rice is treated at Cholon, the big Chinese town near Saigon. Maize was first exported in 1904 and from that time its cultivation has considerably increased, being classed at the present time third in the list of exportations, accounting for nearly 16,000,000 in 1913. Arrowroot, manioc and soja are cultivated for local consumption.

Sacchariferous plants, such as the sugar cane, are grown throughout Indo-China, and especially in Annam. The sugar palm is highly interesting, its sweet juices being estimated at 200,000 hectoliters (5,200,000 United States gallons) a year.

Textile raw materials are abundant. Cotton is cultivated nearly all over Indo-China for the local use of the inhabitants. The cotton from Cambodia is greatly valued by the spinners but practically the whole of the exportation — some 5,000 tons — is dispatched to Japan. Kapok is found in Cambodia in the proximity of the native habitations. Jute is not much cultivated in Indo-China; the local production is used by the natives for manufacturing mats. Ramia is not extensively cultivated and the Annamites use it for making fishing nets. Bambous are treated for paper pulp. Cane is abundant and Indo-China exports from 2,000 to 3,000 tons to Singapore. Mats from Tonkin — the manufacture of which is exclusively carried on by the Chinese — represents an exportation exceeding 800,000 tons.

Spices and condiments are found in Indo-China. The exportation of pepper for 1915 amounted to 4,007 tons, spices to 800,000 tons in 1913, while cinnamon amounted to 1,500,000 tons for the same year.

The rubber crop has fallen off during recent years, the natives having imprudently cut all the creepers. Hevea Bresiliensis has been much developed in Cochin-China; this is also found in southern Annam and in Cambodia, the area planted amounting to some 14,179 hectares (35,000 acres) representing 4,626,000 trees and the exportation reaching 914 tons in 1913, or a value of 962,708 francs ($192,541). The Indo-Chinese rubber plantations have a brilliant future before them. Coffee is principally exported from Tonkin, showing an average for the five years 1910 to 1914 of 1,815 hundred-weight. The average annual exportation of tea is 900 hundred-weight. Tobacco is cultivated all over Indo-China for local consumption, but the French Régie — which imports nearly 30,000,000 of tobacco from abroad — did not forget Indo-China which exported to France in 1913 tobacco, in various forms, amounting to 865,000 francs ($173,000). The principal commercial aromatic plant is the aniseed tree, the fruit of which is used mostly in the manufacture of the liquors known as «Anisette» and «Absinthe.» The exportation of this product amounted to 230 tons in 1913, of a value of 2,500,000 francs ($500,000). The general resources of the country in vegetation comprise medicinal plants, such as cocoa, dye-producing plants such as indigo, and fruits, such as bananas, pineapple, lemons, papaws, etc.

Forest Products.— The forest resources of Indo-China are of an infinite variety. Teak is abundant and is exploited in Luang-Prabang. The exportation of wood to Europe — which will certainly increase when Indo-China woods are better known, is already considerable for teak, «lim» and «chô.» The figure for 1913 was 3,875 tons, of a value of 798,000 francs.

The geological exploration of Indo-China has been begun methodically, but is far from being complete. The mines at present worked are the following: fuel in Tonquin and Annam, zinc in the Tuyen-Quan Lang-Hit Chodian region, tin in the Pia-Ouac district, antimony in Vinh and gold at Bong-Nieu. The value of the mineral output in 1915 was 15,980,000 francs ($3,196,000) and was exported to an amount of 12,632,000 francs ($2,526,000).

Since the war, Japan is the principal market for coal. The production, which was 371,000 tons in 1913, reached 540,000 tons in 1915. The output of the zinc mines for the same year amounted to 34,300 tons, exceeding the last five-yearly average, which was 29,000 tons. The production of tin amounted to 425 tons. Antimony from Vinh shows an exportation of 413 tons, representing a value of 95,000 francs ($19,000), and gold was exported from the mines of Bong-Nieu to an amount of 344,000 francs ($68,800) or 98 kilogrammes. Indo-China, which in the past relied on its agricultural industry for prosperity, possesses in its soil inexhaustible resources for a brilliant future.

Commerce and Trade.— The general trade returns for Indo-China for the year 1913 amounted to 651,697,321 francs ($130,339,464) or 306,238,068 francs ($61,247,613) for imports and 345,259,253 francs ($69,051,850) for exports. If the import statistics are analysed, i.e., those relating principally to cotton tissues, cotton threads, silk tissues, petrol, jute, beaten gold, porcelain, tea and flour, the figures show that France accounted for 107,086,468 francs ($21,417,293) and other countries for 194,931,643 francs ($38,986,328). Exportations to France amounted to 77,631,581 francs ($15,526,316) and 261,935,838 francs ($52,387,167) to other countries. The principal products exported are rice, tin, maize, cotton thread, dried fish, raw skin, pit-coal, leather, pepper and zinc. The trade movement in Indo-China showed a considerable upward tendency from 1904 to 1913, and despite the present conditions prevailing in Europe, Indo-China continues to prosper, as evidence of which we quote the figures for 1915–16: Imports, 334,955,000 francs ($66,991,000) and 390,981,000 francs ($78,196,200) exports, or a total of 725,936,000 francs ($145,187,200). After the war, therefore, great hopes may be founded on Indo-China, which, being a long way from the theatre of the war, has suffered somewhat in its imports — which is but natural — has nevertheless been able to continue to produce and satisfy her clients in the Extreme Orient, as well as those situated in other parts of the globe.

FRENCH POLISHING, a process, generally employed for giving a smooth surface-coating to furniture and cabinet-work. The surface of the wood being finished off with glass-paper and placed opposite the light, the rubber (a ball of wool covered with rag), dipped in the varnish (or polish), is passed quickly and lightly over the surface in the direction of the grain of the wood, and rubbed till dry. This operation must be repeated several times. The most common of the varnishes known under the name of French polish are prepared as follows: Pale shellac, 5½ ounces; finest wood-naphtha, 1 pint; dissolve. Before applying any of these varnishes the rubber must be first slightly moistened with raw linseed oil. See Varnish.

FRENCH PROPHETS, the English name for a group of Camisards, who arrived in England from France in 1706. Their leaders were Cavalier, Durand-Fage and Marion. The group laid claim to several extraordinary gifts, including that of prophecy, of tongues and of working miracles. They preached communistic doctrines, gained several converts for a time, and declined gradually. Consult Vesson, 'Les prophètes Camisards à Londrès' (Paris 1893).

FRENCH REVOLUTION, The. There are several revolutionary periods and events in French history which stand out prominently from the national records; but the Revolution of 1789 is, by common consent, known as The Revolution. This is because it marks, for the French people, the parting of the ways and forms the most prominent landmark along their pathway of progress. Behind the Revolution is autocratic France with its cynical abuses, profligacy, immorality and disregard for the rights of all but the governing class. On this side of the Revolution is modern France, forceful, imaginative, ever hopeful, working out her own political and social future along democratic lines which her far-seeing public and literary men laid down more or less clearly fully a century and a half ago, principles which served as a beacon light to the struggling American colonies in their fight for freedom, and unified the New World provinces of Spain against the incompetency and non-progressiveness of autocratic Spanish rule. Wherever democracy has made any true advances since 1789 it has been in the name of the principles of the French Revolution. This is why France is still to-day looked upon with peculiar affection by all the republics and democratic nations of the earth, why she was, from the beginning of the European War, the central figure in the immense drama played upon the stage of the world. France has been rightly called the mother of republics and of democracy, though the outbreak of the Revolution took place 13 years after the declaration of American independence. This is due to the fact that intellectually the Revolution had been going on in France for years before the fall of the Bastile, an event which symbolizes the high tide of public resentment against the autocratic and unjust acts of the irresponsible rulers of France during the pre-Revolutionary period. The growth of the principles announced by the Revolution is, in fact, the history of the rise and fall of the autocratic power of the French sovereigns; and it is the symbol of the revolt of the nation against the accumulated grievances of two centuries.

Pre-Revolution France.—After the breaking up of the Roman Empire, Europe became split up into many principalities and a few larger powers. All these political bodies were frequently at war with one another; and the country suffered from the unsettled condition of the age and the lack of anything like unity of aim. The whole of Europe was overrun with robbers and military, many of whom were not much better than robbers. Little by little the kings of France, whose power, in the beginning was very shadowy, succeeded in conquering the different principalities now included within modern France, and consolidating the government of the whole country under one royal head. But though this had been done the government of the sovereigns of France was still far from arbitrary; for the nobility retained very extensive power, and throughout the rural districts the communities practically governed themselves without the interference of the central authorities. The peasants had preserved the memory of their freedom and local autonomy under later Roman rule. This spirit was shown in 997 when the peasants of Normandy conspired against the oppression of their masters, proclaiming the equality of man. In 1224 the peasants of Brittany, under very similar conditions, revolted; and a most desperate and bloody war ensued before the nobility got the upper hand. Some cities had actually preserved their independence since the days of the Romans; others had purchased freedom from needy nobles; while others had boldly fought for and won independence in local government. This spirit of independence grew as the wealth of the country increased. But there was no unity in all these concessions or different forms of local government, each of which thought only of securing its own advantages and liberties. So when the French sovereigns had finally broken the power of the great barons and established the sovereignty and power of the Crown over all France, they turned their attention to the communes, as these local governments were called. Louis XIV consolidated all this power in his own person and became virtually autocratic ruler of France. The consolidation of the power of the nobles in that of the sovereign was beneficial for the country as it tended to make it a united nation, which it in no sense was previous to this extension of the sovereign power over the whole country. This concentration of power enabled the sovereign to do away with many abuses from which the peasantry and the middle classes suffered at the hands of the nobles. But all this was not done without a long and interesting battle. The independent princes and barons having been subdued by playing one off against another, the "king's peace" was established throughout the land for which universal laws were made instead of local observances. Francis I (1515–59) largely increased the royal power. He refrained from calling together the States-General; and he proceeded to divest them of power by taking each separate entity by itself; and he forbade the Parliament of Paris to "meddle in affairs of state or any other matters except those of justice." He set the fashion for the building of magnificent palaces and residences in imitation of those of Italy; and the nobles and the rich generally followed his example all over the land. Extravagance became fashionable at court. But the States-General were not dead. In 1576 they so seriously threatened the authority of Henry III that he was forced to side with them. Thus the struggle went on, sometimes quietly, sometimes openly, until Louis XIV proclaimed the doctrine of absolutism "I am the State," and succeeded in as nearly making good his boast in this direction as any other sovereign of Europe. . He not only believed in it himself, but he made France believe in it and he succeeded in getting the Church to teach it. During his long reign (1643–1715) the States-General were never called together. He did away with state and municipal liberties; and by an edict passed in 1683, the financial management of the cities of France was placed in the hands of the royal intendants. Under Louis XIV municipal life became a thing of the past. Thus every attempt was made, unfortunately for the royal family itself, to incapacitate the French people for democratic ideas or self-government. The king himself became the centre of all life, whether court or municipal. He destroyed the independence of everything but himself. To please his own vanity he patronized the brilliant literary men, philosophers and thinkers of his day, who all shone in his reflected glory. These very men, practically all of whom belonged to the middle classes, represented the rise of that class which Louis further encouraged by advancing them in industry and commerce as well as literature. Boileau, Racine, Molière, and the other brilliant thinkers of the age, were digging the grave for the autocracy that their royal master was so sedulously upbuilding. The middle class was also advanced in the Church. All these factors were with the sovereign; but the very fact that they were indicated a breaking away from the old policy of the value of blue blood and long ancestry. The king even raised illegitimate children of princes and nobles to power. Brilliancy, debauchery and profligacy distinguished the court, while the peasantry remained in ignorance, wretchedness and poverty. The long and costly wars of the reign of Louis XIV and the extravagance of the court, coupled with the vast scale on which royal palaces and other edifices were constructed, had already, toward the end of the reign of the king, placed the country deeply in debt. Monopolies, trade and commerce restrictions and the quartering of soldiers on the populace increased this misery of the peasantry and the middle classes; and the constant plundering of the unpaid military made life unbearable. In many districts the peasantry had become almost savages. But the king was set against all reform. Fènelon, exiled to Greece for suggesting the improvement of the condition of the masses, from there proclaimed that "governments are made for the governed," one of the first signs of the coming revolution. This excessively angered the king, who did not know that he was himself playing the principal part in the greatest tragedy of the age (though he thought it a royal drama) when he was fostering the brilliant lights of poetry, drama, history, art, philosophy and science; for they embodied the idea of liberty of thought which was destined to ultimately destroy the doctrine of autocracy and the divine right of kings.

The very power that the king was putting into the hands of the middle class to serve as a foil against the ambitions of the princes and nobles, while it served his day, built up a resistance on the part of the masses against which royal autocracy was pitiably powerless when the great test came in 1789; for the middle classes had got rich and ambitious and were strongly imbued with the idea of protecting themselves and their own interests and property from exactions on the part of the nobles and the sovereign. The sum of the national intelligence had risen enormously during the reign of Louis XIV and with it the power of national resistance had increased proportionately. The very organization that the king had given to literature, with Colbert as Minister, in order to control it, gave it a dignity and influence that it had never before possessed and enabled it to reach the great and growing middle class. The boldness of the writers and thinkers of the age presaged the coming revolution. Molière, Boileau, La Fontaine, Voltaire were names that were on every one's tongue. They attacked the vices and follies of their age and respected only what their royal patron wished respected. Thus, in the reign of the most absolute of all French monarchs, the leaven of democracy was industriously working; and the independence of thought shown by the great writers of the court was interpreted by each community and each separate interest in its own way and from its own point of view; so that, when the climax of the great drama came, the French intelligence had been quickened to a point perhaps greater than that of any other nation in Europe. This explains the sudden and ceaseless activity of the French people following the fall of the Bastile and the brilliant organization, innovations in government and sociology and masterly strategy in war with which they astonished the whole civilized world. All this was the legitimate result of that spirit of inquiry which began early in the reign of Louis XIV and continued with increasing impetus throughout the reigns of his successors. It was during this long period that was born the eager, earnest, venturesome, serious, witty, sympathetic France such as we know her to-day; for the autocratic sovereigns of the French people were working better than they knew or suspected.

The Struggle with Autocracy.— The death of Louis XIV left as heir to the French throne a boy of only five years of age, and the regencies and ministers of his minority worked together unconsciously to discredit the system of autocracy which the late sovereign had built up during his long reign. The dignity and regal splendor of the court gradually disappeared and cynicism, debauchery, frivolity and reckless extravagance took their place. Pleasure of the worst kind became the great god of the French court and of the nobility; and this evil permeated the body of the ever-increasing wealthy middle class. The debt of the court and the nation increased by bounds. The autocratic judicial system which Louis XIV had attempted to force upon the nation had worked as all artificial systems are apt to work; but in this case the effects were especially bad because the system was disorganized, disjointed and ineffective owing to a bewildering diversity of laws and customs which still held sway over France. In fact autocracy in the administration of the law was only a name in so far as any intelligent sovereign direction or administration was concerned. None of the officers of the law were paid by the sovereign and they were forced to help themselves as best they could. The French courts, as a result, became known as the «halls of robbery.» Over 300 different *customs* or series of local law codes were in use in France at this time. Hence the whole nation, with the exception of the sovereign and the nobility, groaned under this burden of legal injustice and oppression, which had made the securing of justice the most expensive thing in France. Corruption became so great in every branch of the royal and court service that only a comparatively small part of the money extorted from the public in the way of taxes, fees and fines ever reached the royal treasury, though the odium of the system rested upon the Crown which had farmed out the collection of its revenue. The revenue farmers got their concessions through favorite courtiers and powerful nobles. Thus courtiers, nobles and revenue farmers grew rich at the expense of the taxpayers, who consisted of the middle class, since the lower class was too poor to pay anything and the nobility and the clergy found means to avoid contributing to the purse of the nation and the court.

The Church itself was in a position which tended to divide it against itself; for the upper clergy alone profited by the exemption from taxes, the control of a large part of the land of the country and special privileges extended to the Church by the court. The lower clergy were miserably poor, all the lucrative and honorable offices in the Church being almost altogether in the hands of the nobility or sons of rich middle class families who had wealth enough to pay for special privileges and dignities. Thus, on the eve of the Revolution, France was in reality divided into two nations which had nothing in common with one another, the possessors and the dispossessed. So great had become the gulf dividing these two classes; so heavy the burden and so grievous the condition of the dispossessed, that it was only a question of time when the slumbering fires that burned in the subterranean depths of the nation should burst forth into volcanic passion. This discontent of the masses was increased on account of the burdens and interference under which industry and commerce groaned and the restrictions placed upon the right to work at whatever trade or occupation one wished to. The possession of nearly all the land of the country by the Crown, the nobles and the clergy and the excessive taxes on all rented land had led to the rapid decline of agriculture and to the consequently increased poverty of the agricultural population and the control of agricultural products by a few unprincipled jobbers working in the interests of a handful of nobles with special privileges from the court, ruined the peasant farmers and frequently brought on want in a land of plenty. This general misery of the masses and exploitation of the industrious middle classes soon began to have its influence upon the court and the government which were unable to obtain money enough to meet the growing expenses of the administration of the affairs of the nation and the increasing robbery of the public treasury. Finally, in 1787, the court, to avoid calling together the States-General, through which alone the national purse could be reached, finally compromised matters by calling an Assembly of the Notables, who were more inclined to look after their own interests than to help the court out of its financial troubles. Brienne, the Minister of the Crown, won over the Parliament to his ends by promising to call together the States-General (1788); and this was actually done the following year by his successor, Necker, because of the financial troubles of the government. But, in the meantime, the whole interest of the nation had become centred in the meeting of this the only representative body of the whole French people. The States-General met in 1789, under very different conditions from what it had assembled in the past; for now the Third Estate, as the representative body of the non-nobles was called, had become the representative of a rich and powerful section of the country which had been paying the bills of the nation for many years. The interest of the masses in their representatives, as the members of the Third Estate were called, increased from hour to hour. Clubs of many kinds were formed in Paris and all the more important towns of the country to further the interests of the middle classes. These were the forerunners of the democratic and revolutionary clubs that became so notable after the fall of the Bastile. The public unrest found a leader in Mirabeau, a brilliant orator and man of initiative, force of will and character, who was trusted by the people, notwithstanding his noble birth, because of the determined stand he had taken in their behalf. He went about the country stirring the people, by his fervid eloquence, to action in defense of their rights.

The States-General opened at Versailles on 5 May 1789; and they soon proved that they were in no mood to play the rôle the Crown had set apart for them. After considerable wrangling between the three orders which composed it, the clergy, the nobility and the Third Estate, the deputies of the latter declared themselves a «National Constituent Assembly» (17 June 1789). This was done in protest against the action of the other two orders in refusing to act with them in any measure or in any way, holding themselves above the representatives of the people. This action was equivalent to a declaration of war in the sense that it meant that the commons had decided to maintain their rights at all costs and against all opposition. Their attitude coupled with the evident joy with which it was welcomed by the populace of Paris and the surrounding cities and country aroused the court and the nobility to their own danger; and they met in secret session, locking the doors against the Third Estate. The latter at once met in a tennis court, where all the members solemnly swore not to disband until they had secured a constitution for France. This was the signal for the lower clergy, who formed the great majority of the priests, to join the commons and to throw open the church of Saint Louis to them. There the assembly, though warned by the king to disperse, declared the inviolability of its members and defied the sovereign. Louis XVI realizing the danger of the situation, persuaded the other two orders to yield to the Third Estate; and a truce was patched up. The commons had won out. But the contest was not over. The court threw troops around the city. The following day all Paris showed that it was with the Third Estate in no half-hearted way; and the electors of the city constituted themselves an administrative body (13 July). They formed a guard of the citizens which, in a few hours, reached 80,000 armed men. In fear, the king withdrew the troops. Again the commons had won out. The following morning the excitement of the populace, which already realized its power, reached fever heat. The mob attacked the Bastile, the emblem of autocratic power and oppression, and captured it; murdered the provost and several others, and putting their heads on pikes marched in parade about the city. The Revolution was in full swing; and the court and the nobility were powerless to withstand it, for arbitrary government had long ago deprived the upper classes of all organization and power of resistance.

The news of the fall of the Bastile spread rapidly over the whole country. In fear the nobles hastened to relinquish all their privileges, seigniorial, ecclesiastical and jurisdictional; and their ancient rights were restored to the municipalities. The day might have been saved for the royalists had they known how to handle the situation. But they thought only of regaining their lost privileges by force of arms; and to this end they plotted in secret. This came to the ears of the people and they hastened to Versailles and forced the king to accompany them to Paris, and with him went the queen and the assembly. All three found themselves in the hands of the revolutionists (6 October), who from this time on, with justice, continued suspicious of the good faith of the king and the court. On the anniversary of the taking of the Bastile an immense crowd assembled in the Champs de Mars took the oath of fidelity to the new Constitution; and among them were the king and Lafayette, commander of the National Guards of the kingdom. The excesses of the ultra-revolutionists increased from day to day and the plottings of the nobility and the court kept pace with it. Thus the two extremes of French society drew rapidly apart. The queen, Marie Antoinette, urged the king to assert his rights. The populace replied with the establishment of all kinds of clubs which became more revolutionary from hour to hour. Finally the royal pair decided to escape from France and to appeal to the sovereigns of Europe to help them restore the kingly power in France (20 June 1791). They had already had the promise of large bodies of troops from Austria, Spain, Prussia, Switzerland and Piedmont. The royal household were stopped in their flight, at Varenne, and sent back to Paris under guard. As a result of this attempted escape, the king was deprived of all power and placed under guard (17 July 1791); but on his accepting the new Constitution and solemnly swearing to strictly observe it, he was restored to power (14 Sept. 1791). There is no reason to believe that the king did not mean to keep his word. But he was not a strong enough character to force the nobles to keep faith with the Revolution.

The Terror.— The demands of the Constituent Assembly and the Constitution of 1791 were moderate and wise; France might have been saved the terrible days that followed had some strong leader arisen among the nobility; but the curse of absolutism long continued had rendered them powerless and inert and incapable of clear thinking and leadership. So all the activity and genius for leadership remained with the masses. This was unfortunate, for it assured the throwing to the winds eventually of all moderation. The new Constitution formed a basis upon which all parties might have easily agreed and worked for the restoration of order throughout the nation. It provided that there should be but one legislative assembly to hold office for two years, after a general election. In it were vested the sole right to make all laws and to carry on the war. The Constitution also provided for universal suffrage. These were very moderate provisions; but they were looked upon with great disfavor by the foreign governments of Europe which were still strongly royalistic. This gave encouragement to the plotting nobles at home and to the non-juring priests and emigrés abroad who stirred up the growing feeling against France in the foreign courts. A coalition of foreign kings was formed against France and their troops crossed the French frontier. In vain Louis appealed to them to withdraw the troops; they refused, and war began, a war that was to last 23 years, to engulf all Europe and to change the very nature of the French government and people. France, on her part, declared war against Austria on 20 April 1792. The king, while pretending to side with the French people, was secretly treating with the coalition. The Duke of Brunswick, commanding the Prussian army, issued a proclamation to the effect that he was coming to restore the king of France to his ancient power and dignity; and threatened dire punishment on all who dared oppose him (26 July 1792). The mob rose in Paris, and marching upon the Tuileries forced the deposition of the king and his imprisonment. This placed the ultra-revolutionary Commune of Paris, with Danton at its head, in control of the affairs of the nation. The report of the success of the Prussians in the north of France was the signal for the first outburst of ferocity on the part of the Commune, which proceeded to massacre wholesale prisoners of all classes, to the cry of "first get rid of the enemy at home" (2-6 September). This was followed by the proclamation of the republic by the Convention (20 September). Louis XVI was tried by the Convention for conspiracy against the nation, convicted and executed (21 Jan. 1793). This act brought England and the Netherlands into the coalition against France, and it created among the political parties in France itself an unlimited distrust of one another. This resulted in the most frightful atrocities perpetrated in the name of the safety of the republic. The guillotine became the best-known public office in France; untold victims were fed to it in all the cities, among them being Marie Antoinette, the queen (16 Oct. 1793). After the death of the king, the Convention became divided against itself; and the two dominant parties in it, the Girondists and the Montagnards, contended for supremacy and for different political aims, the former seeking to restrain the excesses of the Revolution, the latter seeking to push them to the extreme. The whole south of France rose against the Convention, which replied by suppressing liberty of trade, commerce and action and by throwing into prison over 300,000 suspects. The Girondists having gained the upper hand in Paris and the greater part of the country began to quarrel among themselves; one party wishing to make the Terror the government of all France and the other wishing to restrain the ferocity of their own followers. The Terrorists gained the upper hand, and Danton, Hérbet and their followers were arrested and executed at the instigation of Robespierre and his followers. The Terror became madness, and over 1,200 people were executed in one month. Robespierre became alarmed at the tempest he had himself stirred up and attempted to restrain it, with the result that the Commune ordered his arrest and execution together with that of many of his followers (27-28 July 1794). This final excess was followed by a reaction and the Convention supplanted the Commune. The prisons were opened; the Terror began appreciably to diminish; and the principal authors of the massacres were punished or exiled. The government of the Convention obtained notable military successes against the allies and the French rebels in the south everywhere except on sea. One of its first acts had been to abolish the Constitution of 1793 and to vest the executive power in the Council of the Ancients; and the Council of Five Hundred, the duty of the latter being to propose the new laws, and that of the former to pass upon them and to accept or reject them (1795). In the meantime, royalist plots were thickening and the result of one of these was to incite the National Guard to attack the Tuileries where the Convention was in session. Napoleon Bonaparte, then a lieutenant, defended the place, and put the Guard to rout. This feat and his previous services won him the command of the Army of the Interior and shortly afterward that of Italy. The government of the Directory continued to grow weaker and more incapable, and its incompetency had already plunged the country in debt. The emigrés who had in great numbers plotted almost openly for the overthrow of the revolutionary government returned in large numbers. The armies of the republic, which were republican to the core, had been almost universally successful. At this important moment Napoleon concluded a very advantageous peace, and thus became the hero of the hour (17 Oct. 1797).

Napoleon on the Scene.— The incompetency of the Directory resulted in another combination of European powers against it, including England, Russia, Austria, Germany, Turkey, Naples, Piedmont and the Barbary States; and the French government was forced to resort to conscription to obtain an army with which to meet the threatened danger. The wonderful successes of the comparatively weak forces of France against this strong coalition managed to keep alive the Directory but did not in any way help it to mend its ways, which had long ago become hopeless. The return of Napoleon to France in 1799 turned all eyes toward him as the coming savior of the nation. On 9 Nov. 1799, the Council of the Ancients ordered the removal of the two consuls, confiding the task to Bonaparte; and on the following day he cleared the Hall of the 500 who protested against his action; and from that moment he was dictator of France.

FRENCH REVOLUTION, The. Everyone knows the story how the manuscript of the first book of Carlyle's masterpiece, 'The French Revolution,' was lost. He lent it to his friend, John Stuart Mill, who in turn lent it to his Egeria, Mrs. Taylor; and Mrs. Taylor's housemaid used it to light the fires with. But everyone does not know how Carlyle took the loss. Mill and Mrs. Taylor went together to tell him the news. It was a long and painful interview, for Mill most injudiciously stayed talking for three hours. All through the ordeal, Carlyle's whole endeavor was to relieve Mill's distress at having caused such an irreparable loss. His own distress came later when the visitor was gone. The «ill-bred Scotch collie-dog,» as he had been called, played the part of a very chivalrous gentleman. No Chesterfield could have done more. Then, consoled by his admirable wife, he sat down and rewrote the whole book, a marvelous feat of memory and determination.

The completed work has been called drama rather than history; and the usual advice to the tiro is to read some plain forthright narrative of the events of the Revolution before attacking Carlyle's version; but a very bare outline will suffice. If the reader but surrender himself to the poet-historian's dramatic method and rouse his mind to co-operate, he will come to know this period as he can know no other; for Carlyle will make him live in the heart of it. This most artistic of all Carlyle's works is cast on the lines of a great tragedy with a definite beginning, middle and end. The curtain rises on the room where Louis the Well-beloved is dying of smallpox, and falls on the streets of Paris cleared of the Revolution by Napoleon's «whiff of grape-shot.» The central catastrophe is the violent death of the false, effete, bankrupt *ancien régime*. Carlyle realizes the events himself so strongly that he almost persuades the reader he is a living witness of the scenes portrayed. Urged by hunger, the women of Paris stream out in long procession to Versailles and bring the royal family back with them, «the baker, the baker's wife, and the baker's little boy,» as they call them; for the people still have faith in their king's power to relieve their distress. At the time, it seems no more than another bread-riot. The reader is not conscious of the implications or consequences of this act, just like any observant Parisian of the time. But events march swiftly on; the net of fate tightens around the luckless king and queen; they become prisoners; they must stand trial; they must set their heads under the axe of the guillotine. Equally vivid is his portraiture of the actors in the great drama, Mirabeau, Danton, Robespierre, Marat, for Carlyle possessed what his friend Emerson called «portrait-seeing, portrait-painting eyes,» which were as effective in dealing with the past as with the actually visible present.

Carlyle's own account of its composition is the best criticism. «It all stands pretty fair in my head, nor do I mean to investigate much more about it, but to splash down what I know in large masses of colours, that it may look like a smoke-and-flame conflagration in the distance, which it is.» When he had completed the manuscript in January 1837, he wrote to Sterling: «It is a wild savage book, itself a kind of French Revolution . . . it has come hot out of my own soul, born in blackness, whirlwind and sorrow.» These remarks are illuminating. All history is interpretation of events; and the interpretation is conditioned by the historian's training, outlook, opportunities, political and religious views, even when he does not try to make history fit a theory. Other histories of the Revolution, such as Taine's, are stronger in analysis of the origins and causes of this cataclysm; but Carlyle succeeds in giving back the actual impression the Revolution made upon the world at the time, the impression of storm and earthquake, volcano and eclipse. Nor must it be inferred that his work was superficial. It was based on "indefatigable investigations," pursued with a rare love of truth. Modern criticism may gnaw at slight defects, but it cannot impugn the solidity of this great book. Traill says that it has made this terrible drama of a foreign people as real to many English readers as any passage in English history delineated by Shakespeare or by Scott.

"This book gave Carlyle at a single step his unique position as a man of letters," says Carlyle's friend and biographer. It established his reputation as a man of extraordinary gifts among the greatest of the time. Dickens carried a copy of it with him wherever he went. From it he derived the inspiration for 'A Tale of Two Cities.' Southey read and reread it six different times. Thackeray welcomed it in an enthusiastic review. Even Jeffrey, an outspoken critic of the old school, admitted its success in the teeth of all the rules and precedents.

Dr. J. Holland Rose, the learned authority on Napoleon, has produced an annotated edition of 'The French Revolution'; but perhaps the most illuminating aid to the understanding of this masterpiece is Mr. Edmund J. Sullivan's graphic interpretation of the text in a remarkable series of symbolic designs for the two-volume edition of Chapman and Hall, 1910. The genius of Carlyle is matched by the art of this master of black and white.

FRENCH SOMALILAND. French Somaliland is situated on the east coast of Africa to the north and the south of the Bab-el-Mandeb straits; it is bounded at the north by the Ras-Doumeirah, which separates it from the Italian possessions, at the south by a line running from the Haadou wells to Gueldeissa, which separates it from British Somaliland, and on the west by Abyssinia. The French first settled in Obock in 1858, following a voyage undertaken by M. Henri Lambert, French consular agent at Aden, to Zeilah and the Bay of Tadjourah to purchase a port at the entrance to the Red Sea in anticipation of the opening of the Suez Canal. Ibrahim Abou-Becker, one of the principal chiefs of the country, whom he rescued from the Sultan Hodeidhah's prison during this voyage, offered, as a recompense for this service, to cede to France the territories of Obock. Unfortunately M. Henri Lambert was murdered near the Mushah Isles on 4 June 1859, and his work was only taken up again two years later by Capt. Fleuriot de Langle. This officer entered into negotiations with Ibrahim Abou Becker, punished the murderers of Henri Lambert, and drew up the treaty of 11 March 1862 which gave France the port of Obock and the territory situated between Ras Doumeirah and Res Ali in consideration for a sum of 10,000 thalers. The early stages of the colonies were extremely modest, comprising a police station, a few native huts and an improvised jetty — this was during the first year of occupation in 1883. But little by little, thanks to the merchants, shopkeepers, native traders and the inhabitants of Obock who all helped in the effort to develop the country, there sprang up on this hitherto uncultivated and desert plateau, a little city, peopled by 4,000 to 5,000 souls, active and enthusiastic, and this city was full of vitality in 1895. It soon became evident that Djibouti, on account of its port, was best suited for navigation and was capable of linking up business relations with Abyssinia. Djibouti was accordingly officially made the capital in 1896.

Topography.— The coast is flat, dry, monotonous, formed of hardened sand cliffs with waterless rivers. In the centre is the Bay of Tadjourah with the port of Obock which is merely a hamlet of a few hundred inhabitants; the small station of Tadjourah, the watering stations of Amabo and Sagallo to the north of the bay, and Djibouti at the south. In the interior, up to a line parallel to the coast and distant about 90 kilometers (61 miles), where the French hinterland finishes, small plateaux are found, and farther on is an undulating country with hills leading to the heights of Harrar and between which is the Aouache.

Climate.— The climate is of an extreme dryness (not however unhealthful); sunstroke only is to be feared, but it is easy to take precautions against it. Thanks to the railway, it is possible to go from Djibouti to Diré-Daoua in eight hours, thus enabling the inhabitants to get a breath of fresh air and take a few days rest at Diré-Daoua or Harrar, which really constitute for the inland a natural sanatorium.

The inhabitants belong to two distinct races: the red African race (Danakils or Somalis) and the white Ethiopian race (Gallas). Somaliland will never be an agricultural producing country as vegetation is practically nil with the exception of a few European vegetables, some date and coconut plantations and fruit trees; it is merely a trading centre and the natural route for transportation from southern Abyssinia. A few industries have been established in Djibouti, but it is trade alone which must make the fortune of this French colony on the Red Sea. The most important product is coffee which grows in a wild state in Abyssinia and Moka, these being but a short distance from the Arabian coast. After coffee there is the ivory trade, civet, sheepskin, goatskin, oxhide, raw animal wax and gold dust. Trade on the Somaliland coast, that is at Djibouti which has practically the monopoly, amounted in 1913 to 81,620,991 francs ($16,324,198), of which 33,916,843 francs ($6,783,368) were imports and 47,704,148 francs ($9,540,809) exports. The figures for 1916 were 80,864,011 francs ($16,172,802), being made up of 39,238,856 francs ($7,847,771) for imports and 41,625,155 francs ($8,325,031) exports. It is the trade done in Abyssinia which alone keeps business going in Somaliland. Products from abroad or destined for abroad account for three-fourths. Four-fifths of this trade is however carried on under the French flag, because on the one hand the large French ships alone touch at Djibouti and on the other hand coasting between Aden and Djibouti is carried on exclusively by the French.

The territory of Cheil-Said should also be mentioned. Here merchants from Marseilles established a coal depot in 1868. The position, which has an area of 150,000 hectares (446,000 acres), is a good one from a maritime point of view as it dominates the Strait of Bab-el-Mandeb.

FRENCH SPOLIATION CLAIMS. During the great European wars from 1793 on, French privateers assailed neutral commerce, of which the American was chief, under various pretexts or without any; one was that the United States had violated the treaty of 1778. In the virtual French-American war of 1798–99, their privateers about the West Indies and elsewhere made prize of a great quantity of American shipping, for which our commissioners vainly endeavored to obtain indemnification. Finally, in the treaty of 30 Sept. 1800, as there was no hope of getting the money from Napoleon, the United States for other considerations waived the claim. From then on, even though the cases were referred in 1885 to the Court of Claims, nearly every year saw a bill before Congress to pay these claims, and at various times a vote for it was obtained, which was vetoed by the President in each case — Polk, Pierce and Cleveland. The court finally adjudicated several thousand claims, and awarded some $4,800,000. Consult Carnegie Endowment for International Peace, Division of International Law, Pamphlet No. 25, 'Opinions of the Attorneys-General and Judgments of the Supreme Court and Court of Claims of the United States Relating to the Controversy Over Neutral Rights between the United States and France' (Washington 1917); id., Pamphlet No. 24, 'Documents Relating to the Controversy over Neutral Rights between the United States and France, 1797–1800' (Washington 1917); United States, Senate, Claims Committee, 'French Spoliations, etc.' (Washington 1912); United States, War Claims Committee (House), 'Veto Messages of J. K. Polk, F. Pierce and G. Cleveland of French Spoliation Claims' (Washington 1912).

FRENCH SUDAN, Africa, the name formerly given to a large tract of country in the western Sudan, including the upper basin of the Senegal and the countries watered by the Upper and Middle Niger; bounded on the west by Senegal, on the south partly by the French territory of Rivières du Sud, and on the east by independent tribes and by British territory. Officially it was divided into "annexed territories," mostly in the western part, and protectorates. The entire region now forms a part of the Government General of French West Africa.

FRENCH TAPESTRY. See TAPESTRIES.

FRENCH WEST AFRICA. A French government-general comprising the colonies of Senegal, French Guinea, the Ivory Coast, Dahomey, Upper Senegal-Niger. From the Rio de Oro to English Nigeria, the West African colonies are scattered over the west coast of Africa, separated from each other by various foreign colonies. For instance, Casamanca is separated from Senegal by English Gambia, and between Casamanca and French Guinea we find Portuguese Guinea. Then there is Sierra Leone and Liberia between French Guinea and the Ivory Coast which itself is separated from Dahomey by the Gold Coast and Togo. Yet although the French colonies from the Rio de Oro to Nigeria do not form an uninterrupted territory, they none the less possess an advantage over certain other foreign possessions which are completely enclosed, in that every one is within the loop formed by the Niger and has access to the common hinterland where all meet. It was at the commencement of the 14th century that the west coast of Africa began to be explored and colonized by the French. In 1365 some Dieppe sailors settled on the Senegal and Sierra Leone coasts; the first establishments, founded at great expense, soon disappeared with the exception of Senegal. Richelieu by forming colonization companies, gave a new development to these possessions and such companies administered Senegal, under different names, until 1758, when the colony fell into the hands of the English.

Retaken in 1779 by the Duke of Lauzun, Senegal was thereafter governed by agents appointed by the king. The capitulation of 14 July 1809 again placed the colony under English control, but it was restored to France in 1817. Up to 1855, however, France merely occupied different points on the coast. After the disastrous Franco-Prussian War of 1870–71, French public opinion was not properly informed as to the value of French West Africa, and, consequently, was not particularly imbued with the idea of expansion in these latitudes. Colonel Faidherbe's exploits and the progress made by French domination in the Saharean Oasis regions, gave food for reflection as to the advantages to be gained, from a political and commercial aspect, by reaching the Niger, despite the bad impression caused through the unfortunate expeditions of Mungo-Park and Lander. Faidherbe, moreover, was popular on account of the services he had rendered in the country's defense and his victories in Africa. But whilst the time was ripe for French explorations and conquests in Africa, the objective changed on several occasions. At first, the only desire was to extend beyond the Valley of Senegal into the Valley of the Niger; then came the feverish attraction of the wonderful Sudan which, conquered during the early campaigns in its northern part and henceforth illustrious with the names of Galliéni and Borgnis-Desbordes, excited no less public enthusiasm despite some crying disappointments. Then the view from the valley of the Niger and the more meridional regions, better watered, better cultivated and peopled, modified first impressions and took attention away from the tracts of land nearest to Upper Senegal. Finally the riches of Guinea, Fouta-Djallon, the Ivory Coast and Dahomey, became known, and the spirit of conquest and civilization could now speculate on these countries so varied and different in aspect.

Shortly afterward, Captain Binger showed up the empty hypotheses concerning the Kong Heights and, removing the prejudice which gave to the Ivory Coast colonies and Dahomey the petty importance of coaling stations without distant relations with the hinterland, proved in 1887–89 that there were as many «doors to the Sudan» as France possessed territory on the West African coast, from the mouths of the Senegal to those of the Niger; and the absolute necessity of joining up the whole of the Sudan, the Senegal and the Niger, the rivers at the south and the Guinea coast became obvious. From 1890 to 1901 (a period fertile in good results) a logical plan for colonial expansion was methodically carried out. In Senegal, Guinea, the Ivory Coast, and later in Dahomey, successful efforts were also made for territorial expansion, similar care being taken to draw the rich products of the hinterland toward the ports. Hereafter no doubt could remain concerning the economical future of the recently acquired colonies. The future of the Ivory Coast hinterland was no longer uncertain since the capture of Samory by Captain Gouraud on 29 Sept. 1898, following on the campaigns of Colonel Archinard. Since the two expeditions resulting in the defeat of Behanzin (1892–94) and since the settlement of the latent conflict between Great Britain and France regarding the borders of Lower Nigeria and Dahomey, the commercial future of the old kingdom of Dahomey could be unreservedly considered. The Brosselard-Faidherbe, Madrolle and Paroisse missions had proved as regards the Fouta-Djallon the importance of a commercial route terminating at Conakry. Certain missions excellently carried out across the Sahara resulted in the linking up of extreme South Algeria with the Kongo on the one side and French Sudan on the other.

While explorers traveled over the new regions, signing treaties with the native chiefs, and officers occupied (sometimes peaceably, sometimes by force of arms) territory which later on was to form French West Africa, French diplomacy did not remain passive, but turned these efforts to account to get the European Powers to recognize the countries placed under French influence. The Franco-English treaties of 10 Aug. 1889, 5 Aug. 1890, 25 Jan. 1895, 14 June 1898 and 8 April 1904, were completed by fixing frontier boundaries in agreement with Spain (27 June 1900), Germany (24 Dec. 1885 and 23 July 1897), Portugal (12 May 1886) and Liberia (8 Dec. 1892 and 18 Sept. 1907). Hereafter from the south of Morocco and Algeria to the Tchad «West Africa» was master of its own destinies. Very soon, however, the progress of French developments in Sudan obliged France to take steps to repress the troubles fomented by the Moors in the territory on the right bank of the Senegal. The progressive occupation, which it was desired to carry out in a spirit of pacificism, of the regions covered by the treaties of zones of influence was decided upon; the Moors, however, were hostile to the organization of Mauretania and numerous incidents took place such as the murder of Coppolani, the government's commissioner, in May 1905 and the Akjoucht fighting. But whatever might be the extent of these disturbances and however painful the unforeseen consequences sometimes are, regional troubles are always bound to arise, which, however, by their very nature are easy to localize, if not so easy to repress, and it is not necessary to have recourse to those punitive expeditions of which Continental France, moreover, has never had the monopoly. From a geographical point of view, the aspect of the coasts of French West Africa is very varied: the coasts are bordered with sand banks against which the waves break from Cape Blanc to the estuary of the Casamanca; rocky and much cut up in Guinea; bordered with lagoons on the Ivory Coast and at Dahomey. French West Africa is relatively flat; the mountainous region is situated in Guinea and extends from the Fouta-Djallon to the Kong country: this is the most salubrious part of the colony. West Africa is divided into two quite distinct river basins: the Senegal and the Niger, both of which have their source in the Fouta-Djallon and follow for some distance the same direction, the former toward Cape Vert where it flows into the sea after joining the Falémé and the Baoulé and watering Kayes, Bakel, Matam, Salde, Podor and Dagana,— the Niger flows toward the end of the Gulf of Guinea which it reaches after describing a wide curve on which are situated Toulimandio, Koulikoro, Segousikoro, Sansanding, Mopte and Kabara, one of the three ports of Timbuktoo.

The ethnography of West Africa is as yet difficult to determine in a scientific manner; the type of white man we find there comprise the Berbers, who live in the desert zone and are called Touareg in the Sahara; there is a red African type composed mostly of Feulhs or Foullenes from Senegambia, distant cousins of the Egyptian «fellahs,» which is a mixture of the African negro type and the Berbers; finally, there is the black type of infinite variety from the Ouolofs, from Lower Senegambia, which represent the negro type in all its purity, the Sonikès, nomads, the Mandingues, intelligent but warlike and given to pillage, to the Achantis of the Ivory Coast, Dahomenians and Haoussas of Upper Dahomey.

In organizing the immense territories which the valor of her explorers and the efforts of her politicians had assured for France, it seems evident that the fascination of empty words and the superstition of formulæ were not allowed to prevail; it would have been regrettable not to have resisted any such temptation when dealing with populations so greatly dissimilar as those of West Africa. When, in 1899, it was proposed to establish an embryonic organization in what was later to be known as The Guinea, The Ivory Coast and Dahomey, it appeared necessary to separate them administratively from The Senegal to which they had been hitherto connected under the name of «Southern Rivers and Dependencies.» But very shortly the mutual interests of the local governments became evident and a decree of 16 June 1895, which created the General Government of French West Africa, instituted a supreme authority which could, by reaching a decisive opinion on the spot, make the general interest override any particular tendencies of such and such a colony of the group. But the transformation was insufficient, as was also that effected later by decree of October 1902. It seemed an opportune moment to make a further step toward a more rational and profitable organization of the vast French West African possessions, and by a decree of 18 Oct. 1904, making the general government the instrument for the permanent direction and control of French West Africa by placing at its disposal, through the creation of a general budget, the necessary financial aid for its expenses in the common interest and to represent the civic dignity of West Africa, it was hoped that the general government would be able to develop the possessions in a normal manner.

The decree of 18 Oct. 1904 regulates the present organization of the general government. The immense territories to be controlled by the government have an extent of 3,913,250 square kilometers (1,510,795 square miles), comprising five colonies and a civil territory:—

1. Senegal, capital Saint Louis
2. Upper Senegal and Niger
3. Guinea, capital Koncary
4. Ivory Coast, capital Bingerville
5. Dahomey, capital Porto-Novo
6. Civil territory of Mauretania

The governor-general holds mandatory powers from the French Republic and his residence is at Dakar. He is assisted by a council. The colonies forming the group enjoy administrative and financial autonomy; each one is administered, under the superior authority of the governor-general, by a governor of the colonies whose title is lieutenant-governor and assisted by a secretary-general. The civil territory of Mauretania is administered by a commissioner of the governor-general of French West Africa. In the organization of West Africa, the question of improving the moral and general situation of the natives has received the constant attention of the administration. Evidence of this is found in the contracts passed between natives, in the improvement of the situation of natives, the organization of public education, the development of public hygiene and the medical aid rendered to the natives. West Africa is above all an agricultural country; it is therefore not surprising that agriculture has reached quite an advanced stage among these people so primitive in some respects. The produce of the land may be classed in two categories: agricultural products and food products, or in other words, those which are cultivated with more or less care; and the products of the forests. First among the agricultural products figure the arachide, or peanut, which has so enriched Senegal and the cultivation of which even extends to the Sudan. Practically the entire exportations of fruits and grains from Senegal to the Sudan consists of this product. If it is borne in mind that it was only about the year 1840 that this culture was started, its rapid development is seen by the export figures for the year 1913, which show, for Senegal, 229,961,605 kilogrammes (231,500 tons), for Upper Senegal and Niger, 8,577,135 kilogrammes (9,175 tons), and for Guinea 3,541,106 kilogrammes (3,714 tons).

The climate of French West Africa is suitable for producing cotton, the type of which has not yet been improved all-round, but which nevertheless can be used in the metropolitan workshops. From the results already obtained great hopes may be placed in the future of this cultivation. Upper Senegal and Niger, the Ivory Coast and Dahomey have, moreover, commenced to export a certain quantity of cotton. Dahomey exported in 1913, 171,173 kilogrammes (376,580 pounds) of cotton wool and 37,740 kilogrammes (83,028 pounds) of unseeded cotton; the Ivory Coast exported 18,221 kilogrammes (40,086 pounds) of cotton wool and Guinea 60,517 kilogrammes (133,137 pounds) of unseeded cotton. Kapok exported about 33,000 kilogrammes (72,600 pounds). The dâ grows wild in the Sudan and produces beautiful fibres. The growing of agave has several times been seriously attempted by the Europeans in Senegal.

Sorgho or large millet has been greatly cultivated in the West African colonies; it has been said, not without truth, that «millet is to Africa what rice is to Asia.» Another variety of millet is also found, the little millet or sania, or «mil chandelle» (wax millet). There is also a fairly considerable local trade in rice, cultivated more particularly in Upper Guinea, in Casamanca and in the inundated countries of the Middle Niger; there were 11,584 kilogrammes (25,485 pounds) of rice exported from Guinea in 1913. Manioc is more especially cultivated in Dahomey, the Ivory Coast and in Guinea; at the present time it is only used for local consumption, but when seriously taken up as a commercial proposition it will give considerable traffic to the railways. Sweet potatoes are found everywhere. Maize is cultivated particularly in Dahomey and locally serves as a food, but its cultivation for exportation is only carried on by the natives and therefore merits attention; the exports from Dahomey alone reached 13,256,193 kilogrammes (14,582 tons) in the year 1913.

Bananas form the principal food for the inhabitants of the Ivory Coast. Copra is exported from the Ivory Coast and Dahomey. Coffee is a product of Guinea where the «Rio Nunez,» with its rather small beans, of a dirty yellow with brilliant pellicles, is much appreciated on account of its special aroma, and on the Ivory Coast, where its export reached a figure of 10,637 kilogrammes (23,401 pounds) for 1913. The cultivation of cocoa, attempted with much success by the natives in the English colonies of the Gold Coast and Nigeria, has been developed in Dahomey and above all on the Ivory Coast which respectively exported in 1913, 10,651 kilogrammes (23,432 pounds), and 47,190 kilogrammes (103,818 pounds).

Among the principal products derived from the forests, rubber holds one of the foremost places, the territories producing it being Guinea, the Ivory Coast, the Sudan region and Casamanca. No definite choice has yet been reached as to which rubber trees should be cultivated but it would seem that the Funtumia will give good results, and accordingly the administration has taken steps, principally on the Ivory Coast, to protect this tree against a too extensive exploitation. The French markets of Bordeaux and Havre, new to this commerce, receive a fairly large quantity of African rubber, but Liverpool also receives an important supply. The exports for the year 1913 were the following: Guinea, 1,455,450 kilogrammes (3,210,990 pounds); Ivory Coast, 4,684,095 kilogrammes (10,305,009 pounds); Upper Senegal and Niger, 83,300 kilogrammes (183,260 pounds); Senegal, 90,421 kilogrammes (198,926 pounds); Dahomey, 5,105 kilogrammes (11,231 pounds).

The Ivory Coast and Dahomey are the colonies which export the greatest quantity of palmetto; this is abundant in the coastal region which is not dominated by the large forests. During the year 1913, Dahomey exported 7,971,220 kilogrammes (17,536,684 pounds) of palm oil, the Ivory Coast 6,014,460 kilogrammes (13,231,812 pounds), and Guinea 164,221 kilogrammes (361,286 pounds); for the same period Dahomey exported 26,371,438 kilogrammes (58,017,163 pounds) of palm almonds, the Ivory Coast 6,949,206 kilogrammes (15,288,253 pounds), Guinea 5,172,165 kilogrammes (11,378,763 pounds), Senegal 1,901,024 kilogrammes (4,182,252 pounds). Palm oil and palmetto are used principally in the manufacture of soap and stearine and are dispatched to Marseilles and England; a considerable quantity of these products was also sent to Germany. Ivory Coast is the richest as regards forest lands. The forests in this colony only have been most carefully explored by M. Auguste Chevalier, Directeur du Laboratoire d'Agromomie Colonial au Musée de Paris, who has made a thorough botanical classification of the different kinds of wood, and who estimates the wooded area at over 120,000 square kilometers (46,332 square miles). This area is very rich and valuable woods, the only ones which have been cultivated for many years, foremost among which is mahogany suitable for diagonal grained work and for decorative panels. Since then, many other samples have been experimented with and it now appears certain that commerce in general and the cabinet-making trade in particular will find on the Ivory Coast, the former, woods supplanting oak and teak which are lacking and of lengths and widths to which they have not been accustomed; the latter, new woods of beautiful shades which will enable satisfaction to be given to all customers' tastes. Wood exports from the Ivory Coast amounted in 1913 to 52,700 tons, representing a value of 5,000,000 francs ($1,000,000).

The kola business has been developed considerably by the natives and every day sees a more and more extensive use of it since the consumption of alcohol is no longer permitted on account of the growing prevalence of Islamitic beliefs. It is exported to Europe in ever-increasing quantities, as fresh fruit, to be consumed mostly in the form of extracts or wine tonics. In the year 1913 Dahomey exported 21,808 kilogrammes (47,977 pounds), and the Ivory Coast 24,090 kilogrammes (52,998 pounds).

Karité is found practically all over the West African possessions but principally in Upper Senegal and Niger, which, by the Kayes Railway and the river Senegal, makes large exportations of this fatty matter extracted on the spot by the natives. The exportation of kareté butter reached, in 1913, for Dahomey 169,841 kilogrammes (373,650 pounds), for Upper Senegal and Niger 27,565 kilogrammes (60,643 pounds), for the Ivory Coast 8,787 kilogrammes (19,331 pounds), and for Guinea 3,899 kilogrammes (19,331 pounds). The exportation of karité almonds from Upper Senegal and Niger, exclusively reached 474,624 kilogrammes (1,044,172 pounds).

Finally, gums, exuded by different trees of the acacia genus, are concentrated at, and dispatched from, one place, i.e., Saint Louis, from whence it is all shipped to France, the port of destination being Bordeaux. The exportation for 1913, for Senegal, amounted to 2,943,379 kilogrammes (3,238 tons), and for Upper Senegal and Niger 532,157 kilogrammes (585 tons).

Cattle breeding plays an important rôle, and is destined to play even a greater one, in the prosperity of the West African colonies. It is therefore necessary to encourage this industry in countries where labor is scarce, and with a view of procuring on the spot the necessary cattle for food for the European and the native. The principal centres are Senegal, the Sudan, Guinea and Dahomey, where horses, asses and bovidæ are found. The bovidæ are found more especially in Mauretania and Sudan Sahara. The raw skins of oxen, sheep and goat form an important exportation; in the year 1913 exports amounted to 1,010,743 kilogrammes (2,223,034 pounds) for Guinea, 802,931 kilogrammes (1,766,448 pounds) for Senegal, 211,405 kilogrammes (465,091 pounds) for Upper Senegal and Niger, and 50,333 kilogrammes (110,732 pounds) for the Ivory Coast. The trade in wool frôm Macina (Upper Senegal-Niger) is relatively recent, but it is beginning, however, to be put on a proper commercial basis, and its exportation amounts to 250,000 kilogrammes (550,000 pounds). Certain wild birds (ostriches, herons, marabouts) furnish valuable feathers. Wax is prepared in Gambia, Casamanca, Boubdou and the surroundings of Thiès and its exportation exceeded 180,000 kilogrammes (396,000 pounds) in 1913. The foregoing enumeration of the principal agricultural, forestral and animal products of French West Africa will give an idea of the variety of cultivation in the West African colonies, but although confidence can be placed in the future agricultural development of the colonies it must be recognized that no industry at present exists there in the real meaning of the word.

The West African colonies are fàr from being known from the point of view of geology and mineralogy, despite the highly scientific work of M. Hubert. The raw materials principally exploited are gold and salt. Gold is found in Upper Senegal where its production is estimated at approximately 800,000 francs ($160,000) yearly, and in Upper Guinea and the Bambouk region where gold from Falémé and Galam has been exploited since 1858 by the government. In 1913 the exportation of gold for this group of colonies amounted to 255,635 francs ($51,127). Salt is of two kinds: sea salt from the coast where the Gandiole salines constitute a fairly important output for Senegal; rock salt from the interior to the north of the town of Timbuktoo. Each year there enters into Upper Senegal-Niger, emanating from the Sahel and Sahara, an average of 80,000 bars of salt. The mining industries of this group of colonies have been the object of special legislation both as regards prospecting and operation of mines.

The fishing industry ranks next to the mineral industry. Fishing is at present practised over the entire west coast, but more particularly in Senegal and Dahomey. The coasts of Senegal and Mauretania have long ago been recognized for their ichthyological richness; the results of the efforts made to develop the fishing industry at the Lévrier Bay are now an accomplished fact; French fishermen are interested in fresh fish and the crustacea to send to France, and the dry fish for African consumption. The exportation of dry fish, salted or smoked, reached 575,354 kilogrammes (1,265,778 pounds) in 1913. But it is not merely sufficient for West Africa to be abundantly provided from an agricultural point of view and for its soil to be stocked with riches. If the commercial movement of the colony has made rapid progress and if the financial situation of French West Africa has constantly improved of late years, the cause should be looked for in the persevering efforts made by the local administration to furnish this group of colonies with the necessary economical equipment for their proper development. The ports have been improved, the railways from Daker to Saint Louis, from Thiès to Kayes, from Kayes to the Niger, have been constructed as well as the railways in Guinea, the Ivory Coast and Dahomey. It will therefore be seen that the dominating idea of the governor-general has been to open up lines of communication and to practise the policy of penetration by railways. The results have been excellent inasmuch as the general commerce, which in 1895, i.e., at the time the general government was created, amounted to 78,777,356 francs ($15,755,471), reached 10 years later 155,592,303 francs ($31,118,460). In 1913, the last normal year, the figure amounted to 277,718,152 francs ($55,543,636), made up as follows: 151,574,300 francs ($30,314,800), in importations and 126,143,852 francs ($25,228,770) exportations. The figure fell in 1914 to 233,928,780 francs ($46,785,756) and in 1915 to 225,484,917 francs ($45,096,983). For 1916 a total of 300,013,474 francs ($60,002,694) is estimated, made up as 172,137,615 francs ($34,427,523) for importations and 127,875,859 francs ($25,575,171) for exportations.

FRENCH WEST INDIES. The French West Indies form part of that stretch of volcanic islands which seem to connect North and South America. France possesses from the north to the south: the northern part of the island of Saint Martin, Saint Barthélemy, Guadeloupe and its dependencies, Désirade, Marie Galante, the Saintes Isles and Martinique. Martinique and Guadeloupe — the two sister islands — hold the foremost place among the French Antilles.

Guadeloupe.— Guadeloupe was discovered by Christopher Columbus who, while making a second exploring expedition in the Atlantic, perceived on 4 Nov. 1493 an island which he named after the monks of the convent of Notre Dame de Guadeloupe in Estremadura. The island remained Spanish until 1635 when Duplessis and Olive took possession of it in the name of «la Compagnie des Iles d'Amérique.» In March 1674 the colonization companies being in straightened circumstances the islands were made part of the royal domain, but the administration of the king was interrupted from 27 April 1759 to 4 July 1763 by a first occupation by the English under the command of Admiral Moore and General Barington. On 21 April 1794, during the Revolutionary period, the island was retaken by the English, only to be recovered on 2 June following by the delegates of the National Convention, Victor Hugues and Chrétien. A third and last British occupation took place during the Wars of the Empire lasting from 1810 to 1816 when Guadeloupe was definitely restored to France.

Area and Topography, etc.— Guadeloupe, which has an area of 1,780 kilometers (583 square miles), is divided into two islands independent of each other: Guadeloupe proper or Basse Terre and Grande Terre, separated by a stretch of sea about six miles in length and of a width varying from 90 to 300 feet. Basse Terre has the form of an irregular ellipse; it possesses many signs of its original volcanic state, there being still some active volcanoes, like the Soufrière. Grande Terre is in the form of a triangle and the principal ports of the colony are found there: Pointe à Pitre, Moule, Saint François, Sainte Anne and Port Louis. There are three districts in the island: Basse Terre, Pointe à Pitre and Marie Galante. During winter, Guadeloupe is subject to severe atmospheric perturbations and is frequently disturbed by cyclones in August and September.

Commerce.— In order to form a correct idea of the traffic movements in the principal products exported, we must take the figures for a normal year and not one which has suffered from the war (the 1914 and 1915 returns amounted to 43,728,540 francs ($8,745,708) and 46,323,164 francs ($9,264,632) respectively). Moreover, it is not fair to take a year like 1913 when atmospheric conditions were very unfavorable — 38,462,419 francs ($7,692,483). We will therefore take the year 1912 which may be considered as normal; the commercial movement amounted to 45,608,418 francs ($9,121,683), made up of 19,524,116 francs ($3,904,823) imports and 26,084,302 francs ($5,216,860) exports. Sugar-cane products hold the foremost place. The production of cane sugar has reached 39,000 tons, representing a value of 16,660,000 francs ($3,332,000 annually); the planters at present concentrate their efforts on better varieties and pay more attention to the extracting processes. The molasses exported in 1912 amounted to 714,000 litres (188,638 United States gallons) of a value of 103,000 francs ($20,600). Rum is exported to an amount of 9,697,000 litres (2,162,740 gallons) representing a value of 4,155,000 francs ($81,000). Coffee is grown more particularly in the middle region, having an altitude of over 600 feet; the kind cultivated is the Arabian coffee or «Le Liberia,» which at the best is used for grafting. The colony exported 1,108 tons of coffee of a value of 2,605,000 francs ($521,000) in 1912. The cultivation of cocoa has been continually on the increase during the last 20 years, the export figure for 1912 being 925 tons valued at 1,400,000 francs ($280,000). Vanilla and vanilla products, cultivated more especially in Basse Terre, varies from one year to another; in 1912, 25 tons valued at 396,000 francs ($79,200), in 1913, 20 tons, in 1914, 11 tons, representing a value of 220,000 francs ($44,000). The fruit trade is making progress, although this still leaves something to be desired; the principal fruits exported are bananas (12,800 kgs., 28,160 lbs.), pineapples (156,077 kgs., 343,369 lbs.), coconuts (26,000 kgs., 57,200 lbs.). Commerce in dye-producing plants is declining. Rocou is exported to an amount of 43 tons representing a value of 17,290 francs ($3,458) as against 88 tons in 1910 of a value of 63,000 francs ($12,600). Wood for cabinet making is exported to an amount of 24 tons valued at 5,500 francs ($1,100).

Bulky foods (yams, potatoes, carribee cabbages, etc.) are practically all used for local consumption. The administration has decided to encourage new cultures, principally the growth of coconuts and lemons, as much to provide against inconveniences caused by dependence on a single crop as to develop the resources of the colony. In normal times France receives nine-tenths of the production of the lands of the colony.

The dependencies of Guadeloupe include: Désirade, a rock of little productive capacity; Marie Galante with Grand Bourg, a fairly safe anchoring ground; the Saintes Archipelago, a mass of rocks which have been given the name of "The Gibraltar of the West Indies" on account of their high strategical importance; Saint Barthélemy and Saint Martin, of which France possesses two-thirds: Saint François, Sainte Anne and Port Louis.

Martinique.— Martinique was discovered by Christopher Columbus on Saint Martin's Day. The Spaniards did not settle there and the natives remained in possession of the island until 1625. At this time Pierre Belain of Esnambuc, while returning from a cruise in the Gulf of Mexico, obtained from Cardinal de Richelieu authority to constitute the "Compagnie des Iles d'Amérique; on his return to Saint Christopher he endeavored to colonize the neighboring islands and landed at Martinique on 1 Sept. 1635. In 1650 the Compagnie des Iles d'Amérique sold its islands for £60,000 to Duparquet who became their lord and master. On his death, war broke out between the French and the Caribs, which ended in the extermination of the latter. In 1664 the Crown purchased the islands from the heirs of Duparquet and ceded its rights to the Compagnie des Indes Occidentales. During the succeeding years, Martinique was attacked by the English and the Dutch, which resulted in the dissolution of the Compagnie and the return of the islands to the Crown. Cultivation was undertaken but very soon Martinique had other serious preoccupations and for more than a century was obliged to defend herself against the furious onslaughts of her enemies. In 1762 the island fell into the hands of the English who restored it to France one year later on the signing of the Treaty of Paris, but at the price of the loss of Canada. In 1793 the Royalist party surrendered the island to the English who kept it until the Peace of Amiens was signed. The English reoccupied it during the Empire Wars of 1808–14 and finally during the "Hundred Days." Since the treaty of 20 Nov. 1815 Martinique has always remained French and after the abolition of slavery in 1848, by a number of laws — not affecting however its colonial life — it has participated more and more in the public life of the mother country as one of her possessions.

Martinique which has an area of 987 square kilometers (385 square miles), the greatest length of which is 70 kilometers (44 miles) and the average width 31 kilometers (20 miles), is divided into two parts — two peninsulas united by the isthmus which is situated between the "cul de sac" of François and the "cul de sac" of Fort-de-France. Its mountain range really consists of two high peaks, one in the north and one in the south, connected by a small chain of mountains much less in height. All these mountains, which bear the name of "peaks" or "knolls" are of volcanic origin and we need scarcely recall here the awful calamity caused by the eruption of Mount Pelée in September 1907 which completely devastated the southern part of the island. Cyclones similar in character to those which play such havoc with the other West Indian islands do not spare Martinique and they are generally accompanied by a tidal-wave.

From a political point of view, Martinique is divided into two districts, the capitals of which were until 1902 Fort-de-France and Saint Pierre.

Commerce, Trade, etc.— Exportations amounted in 1913 to 28,896,814 francs ($5,779,362) out of a total trade of 51,041,129 francs ($10,208,225). In this total products from the land figure to an amount of 25,900,000 francs ($5,180,000). Sugar-cane is the principal crop of the island, the exportation for 1913 amounting to 40,000 tons, which is slightly higher than that of 1912. The exportation of rum, which occupies the second place in the trade of the island, amounted in value to about 7,000,000 francs ($1,400,000) in 1912, rising in 1913 to 12,000,000 francs ($2,400,000) for 18,823,000 litres (4,973,026 United States gallons). Next in importance is the cultivation of cocoa which is exported in berries to an amount of 524 tons of a value of 1,071,000 francs ($214,200). Coffee beans are exported to the amount of 9,587 kilogrammes (21,091 pounds), valued at 23,932 francs ($4,786). Vanilla figures for an exportation of 3,259 kilogrammes (7,169 pounds), representing 76,373 francs ($15,274); cinnamon 1,875 kilogrammes (4,125 pounds), valued at 1,234 francs ($246). The fresh-fruit trade has not yet attained that importance of which it is capable (40,675 francs, $8,135); the principal fruits exported being bananas (10,000 francs, $2,000); pineapples (15,000 francs, $3,000) and oranges (1,400 francs, $280). Oil from Indian wood is a fairly active industry, the results for 1913 being 2,649 kilos (5,827 pounds), representing a value of 23,495 francs ($4,699). In the category of farinaceous products, fecula and potatoes show exportations of 11 and 77 tons, respectively. The manufacture of citrate of lime is no longer in the experimental stage and the results obtained are highly satisfactory, the exportation amounting to 2,000 kilogrammes (4,400 pounds). All the citrate is shipped to England.

France accounted for 51.4 per cent of the trade movement in Martinique in importations, and 93 per cent in exportations; business with other countries amounts to 46.08 per cent and 3.78 per cent of the importations and of the exportations, respectively.

FRENCHMAN'S BAY, Maine, an ocean inlet in Hancock County, extending northward about 30 miles with a width of about five miles. It contains a number of islands, among them Mount Desert, whereon is situated Bar Harbor (q.v.).

FRENCHTOWN, Md., in the War of 1812. As part of the British operations on Chesapeake Bay in 1813, Sir George Cockburn was sent to close its head. Establishing himself first at the mouth of the Susquehanna, then on Elk River, on 28 April he sent 150 marines to destroy the stores at Frenchtown, a small village much used in the land transport between Baltimore and Philadelphia since the closure of the bay. They drove off the Americans and burned the stores and five vessels lying near.

FRENCHTOWN, Mich., Battle of, in the War of 1812. Hull's surrender of Detroit threw the American frontier back to the line of the Wabash and the Maumee. The Maumee was defended by Fort Wayne, about 20 miles from the Ohio border, and the Wabash by Fort Harrison, a block-house standing near the site of the present city of Terre Haute, near the Illinois border. In September 1812, after the departure of Sir Isaac Brock (q.v.) for Niagara, these forts were attacked simultaneously by the Indians, but Zachary Taylor saved Fort Stephenson and Fort Wayne held out until reinforcements arrived on 12 September under Gen. W. H. Harrison. The latter then divided his troops into three bodies to march by different routes to the Maumee Rapids, one of which forces, under Gen. James Winchester, after experiencing great hardships, reached the rapids 10 Jan. 1813, and there began to encamp. Two Frenchmen came to beg protection for Frenchtown, Mich., a little village on the Raisin River, about 30 miles to the north and 22 miles southwest of Detroit. Winchester sent half his troops who, on 18 January, with small loss, drove the British and Indians from the town, which success so elated the troops left behind at the Maumee that Winchester led them to the town, encamping there on 20 January but failing to take the usual military defensive measures. On the 21st the British commander, Gen. Henry Proctor, started toward the town with a force of 600 militia and 500 Indians under Round Head, making the assault on the American position the next day. Most of the American troops were in the open field and quickly succumbed, Winchester being among the captured. But a small body of Americans stoutly resisted behind a picket defense until Winchester, under Proctor's threat of burning the village and an Indian massacre, ordered them to surrender. The unwounded prisoners were sent to Malden but the wounded were left at Frenchtown under Proctor's promise of adequate protection. But Proctor failed to furnish protection and after his departure the Indians plundered the village, mutilated and scalped the dead, stripped the inhabitants of clothing and valuables and fired the houses, consuming the injured and the dead. The American loss was 934 killed, captured and massacred; the British loss was 24 killed and 158 wounded.

Had Proctor advanced to the Maumee Rapids he might have captured Harrison with his 900 troops and their artillery and stores. But Harrison burned the post and retreated to the Portage or Carrying River, about 18 miles to the rear, where on 1 Feb. 1813 he began the construction of Fort Meigs, before which on 28 April Proctor appeared with 983 regulars and militia and 1,200 Indians under Tecumseh (q.v.). On 1 May the British began the bombardment which lasted several days, but on 5 May were attacked on the north side of the river by a force under Brig.-Gen. Green Clay (q.v.) who had come to Harrison's relief. This force was almost annihilated by the British, but Harrison made a successful sortie on the south side. The siege was continued for several days but Proctor's army was weakened by death and sickness and by the desertion of the Indians, and on 9 May he retreated to Malden unmolested by Harrison. On 20 July Proctor again attacked the fort but after vainly trying to draw Clay into ambush decided to attack Harrison at Seneca on the Upper Sandusky, whither the latter had moved his magazine. Between Harrison's troops and the British was a stockade called Fort Stephenson, defended by one cannon and 160 troops under Maj. George Croghan (q.v.). Harrison ordered the evacuation of the fort but Croghan refused, and when the British attacked on 1–2 August not only repulsed them but inflicted such a decisive defeat that Proctor retreated to Malden. The British loss was 26 killed, 41 wounded and 30 missing, while Croghan lost only one killed and seven wounded. Soon afterward Tecumseh raised the siege of Fort Meigs and followed Proctor to Detroit. Harrison remained at Seneca until September, when he began the march that brought about the battle of the Thames (q.v.). Consult Wiley and Rines, 'The United States' (Vol. V, pp. 361–372, giving extensive bibliography); Adams, Henry, 'Administrations of Jefferson and Madison' (Vol. VII, pp. 72–115); histories of the war by Brackenridge, Lossing, Armstrong, McAfee, Richardson, Auchinleck, Perkins, etc.; Edwards, 'History of Illinois' and 'Life and Times of Ninian Edwards'; Montgomery, Henry, 'Life of Harrison'; Slocum, 'The Ohio Country'; Shaler, N. FREND, William, English reformer: b. Canterbury, 1757; d. 1841. He was educated at Saint Omer, France, and at Cambridge University. In 1781 he was chosen Fellow and became rector of Madingley in 1783. He was converted to Unitarianism in 1787, when he issued his 'Address to the Inhabitants of Cambridge to turn from the False Worship of Three Persons to the Worship of the One True God' (1788). About 1790 he traveled abroad and on his return published the radical pamphlet 'Peace and Union Recommended to the Associated Bodies of Republicans and Anti-Republicans,' which led to his trial and conviction for breaking the Statute *De Concionibus*. He was banished from Cambridge but remained a Fellow of the university until his marriage in 1808. From 1806 to 1826 he was connected with the Rock Life Assurance Company. He was active in every radical and popular movement of his time. He wrote, in addition to those mentioned above, 'Thoughts on Religious Texts' (1789); 'An Account of the Proceedings in the University of Cambridge against William Frend' (1793); 'Scarcity of Bread' (1795); 'A Letter to the Vice-Chancellor of Cambridge' (1798); 'Principles of Taxation' (1799); 'The Effect of

Paper Money on the Price of Provisions' (1801); 'Letter on the Slave Trade' (1817).

FRENEAU, frę'nō, **Philip**, American poet: b. New York, 2 Jan. 1752; d. near Freehold, N. J., 18 Dec. 1832. Graduated from Princeton in 1771, he was captured in 1780, during a voyage to the West Indies, by an English cruiser, and his experiences while under detention he later recorded in 'The British Prison-Ship.' Having regained his liberty, he wrote much for the *Freeman's Journal* of Philadelphia. In 1790 he became editor of the *Daily Advertiser* (New York), and in 1791 of the *National Gazette* (Philadelphia). After an interval at sea he permanently settled in New Jersey. Freneau was the first national poet of America and a lyrist of real though uneven gifts. His elegy, 'The Battle of Eutaw Springs,' was praised by Scott, who called it "as fine a thing of the kind as there is in the language." During the Revolution he was active in satirical verse. His work attests his extensive culture; and though it conforms in the main to the conventions of the 18th century, it does not lack distinction. He wrote also several volumes of prose, published under the pseudonym "Robert Slender" and of small merit. Until recently his poetry has been strangely neglected; but in 1901 appeared a biography by Austin, and in 1903 an edition of the poems, with a 'Life,' prepared by F. L. Pattee. During Freneau's life there were editions in 1786, 1788, 1809 and 1815. There were reprints of the 1786 edition in 1861 and 1865. Consult further, De Lancey, E. F., 'Philip Freneau; the Huguenot Patriot Poet of the Revolution' (New York 1891); Forman, S. E., 'Political Activities of Philip Freneau' (Baltimore 1902); More, P. E., 'Shelburne Essays' (New York 1908); Paltsits, 'Bibliography of the Works of Freneau' (ib. 1903); Tyler, 'Literary History of the American Revolution' (1897); and Wendell, 'Literary History of America' (1900).

FRENSSEN, Gustav, German novelist: b. in Barlt, in Ditmarschen, a district on the western coast of Holstein, 19 Oct. 1863. He received his early education in the volksschule at Barlt and later attended the gymnasium at Meldorf and Husum, not far from his birthplace. From 1886 to 1890 he studied theology at the universities of Tübingen, Berlin and Kiel. In 1890 he became pastor in the village of Hemme in Ditmarschen. In 1902, after the phenomenal success of 'Jörn Uhl,' he resigned his position as pastor in order to devote himself entirely to literary labors. For a time he then resided in Meldorf, but eventually he moved to Blankenese on the Elbe, a suburb of Hamburg, where he at present resides. Frenssen's power lies in his ability to describe nature and the life of his home community. The fate of the families and the individuals of his neighborhood had interested him from his boyhood days. He knows the seas, the forests and the moors of his native Ditmarschen and describes them in a realistic way. In reading his novels one soon finds himself deeply interested in the characters that are being portrayed. One lives and feels with them, sympathizes with their sorrows and grows with them in the development of their ideals.

His first novel, 'Die Sandgräfin' (1896), shows as yet no originality. Frenssen is still working in the ordinary novelist's fashion. An improvement may be seen in 'Die drei Getreuen' (1898). We find here an attractive picture of the author's home community and its people. The causes of the social disturbances and the large emigration to America are treated. 'Jörn Uhl,' the book which made Frenssen's reputation, appeared in 1901. It gives a vivid description of the struggles of a peasant in his attempts to lift himself above the drudgery and misery of his environment and to realize his higher, better self. In spite of his misfortunes the hero is not discouraged and eventually emerges into a happier existence as an engineer. The average reader feels that it would have been more appropriate if Jörn would have been permitted to work out his salvation as a peasant, but he is carried away by the descriptive power of the author and all his doubts vanish. More than 250,000 copies of this novel have been sold, a success almost without precedent on the German book market. In 'Hilligenlei' ('Holy Land,' 1905) Frenssen wishes to show why the people have been unable to grasp the teachings of the man of Galilee. The book attempts to bring about a rebirth of religion in spirit and in truth. It is doubtful, however, whether the literary field should be made the arena for agitation and reform. The artistic elements in literature are likely to suffer in this way and in 'Hilligenlei' the difficult problems are not solved, nor are they elevated into the field of the purely artistic. The characters are true to life and are sketched in an attractive fashion, but the conclusion to this novel is even more unsatisfactory than in 'Jörn Uhl.'

In 'Peter Moors Fahrt nach Südwest' (1907) Frenssen gives a patriotic appreciation of German valor in a far-distant African colony. The story, which is based upon the reports of a military campaign, is told in a simple and artistic way. The author has freed himself in this book from his tendency to interpose reflections on life and there are no episodes to detract from the unity of action. In 'Klaus Hinrich Baas' (1909) Frenssen describes the career of a country lad who left his home and worked out a commercial career in the city of Hamburg. Klaus is without culture but is practical and worldly-wise and fights his way against opposition until he is known as a successful business man. While Jörn Uhl was an idealist and stargazer, Klaus is a coolly calculating man who depends entirely upon himself in attaining his ends. 'Der Untergang der Anna Hollman' pictures the tragedy of lust for wealth. The hero, Jan Guldt, an ardent youth, is temporarily overcome but eventually emerges strengthened in character and insistently demands justice. Frenssen has also published three small volumes of 'Dorfpredigten' (1889), village sermons, and two dramas, 'Das Heimatsfest' and 'Sönke Erichson.' In 1915 he wrote a 'Bismarck-Epós' in hexameters which, however, after much discussion, was withdrawn from the bookmarket, as it apparently failed to meet the ideas of the great chancellor held by most Germans.

Frenssen's writings show the influence of Storm, Raabe and Dickens. His novels have been widely read, not only in Germany, but also in translations in England and America. At times his writings have episodes which detract somewhat from the main theme, but they fascinate the reader and he would be loath to have them omitted. Occasionally one feels the preacher transcending the artist in Frenssen's desire to reform society, but we cannot help but admire his moral earnestness. He feels it his duty to speak the truth about life as he understands it. One of the admirers of Frenssen says that *Ehrlichkeit* is at the foundation of his great success. See JÖRN UHL. Consult 'Gustav Frenssen,' by Hans Martin Elster (1910); Bierwirth, H. C., in 'German Classics,' (Vol. XVII, New York 1914). Also the histories of German literature by R. M. Meyer and Alfred Biese.

WILLIAM F. HAUHART,
Assistant Professor of German, University of Michigan.

FRENZEL, Karl Wilhelm, German journalist and novelist: b. Berlin, 1827; d. 1913. He received his education in his native city and after 1861 was dramatic and literary critic of the *National-Zeitung*. He wrote very many historical novels dealing with French and German life. Among his works are 'Charlotte Corday' (1864); 'Watteau' (1864); 'La Pucelle' (1871); 'Lucifer, Ein Roman aus der Napoleonischen Zeit' (1873); 'Frau Venus' (2 vols., 1880); 'Schönheit' (1887); 'Warheit' (1889); 'Berliner Dramaturgie' (1882), a valuable contribution to the history of modern German drama.

FRÉRE, frār, **Charles Théodore,** French painter: b. Paris, 24 June 1815; d. there, 25 March 1888. He was a pupil of Cogniet and Roquelan, and made his first exhibit in 1834. He was present at the fall of Constantine, Algeria, in 1837, and from that time chose scenes from Eastern life. His pictures illustrating Constantine (1840–48) are among the best he painted. In 1869 he accompanied the Empress Eugénie in her voyage up the Nile, and made a sketchbook of aquarelles at her request. He painted some military pieces but scenes of Eastern life formed most of his subjects. The Metropolitan Museum, New York, has three of his canvases, 'Cairo Evening,' 'View of Jerusalem' and 'Departure from Jerusalem for Jaffa.'

FRERE, frēr, SIR **Henry Bartle Edward,** English statesman and administrator: b. Clydach, Brecknockshire, Wales, 29 March 1815; d. Wimbledon, Surrey, 29 May 1884. He was educated at Haileybury College; entered the East India Company's civil service in 1834; introduced improvements into the system of tax collection, and distinguished himself as an administrator. At the outbreak of the mutiny in 1857 he promptly seized the fortress of Multan, retained command over his own province, and was enabled to assist the neighboring provinces. From 1862–67 he was governor of Bombay. In 1859 he was created K. C. B., and in 1867 G. C. S. I. In 1872, as British commissioner, he negotiated a treaty with the sultan of Zanzibar abolishing the traffic in slaves. In 1877 he was appointed governor of the Cape, and high commissioner in South Africa, but the war which he provoked with the Zulus gave so much dissatisfaction to the Conservative government then in office that he was censured, and on the accession of the Liberals to power in 1880 he was recalled. He was the author of the 'Life of Hookham Frere' (1871), and his own 'Life' by Martineau was published in 1895.

FRERE, John Hookham, English poet, translator and diplomatist: b. London, 21 May 1769; d. Malta, 7 Jan. 1846. After a career in the diplomatic service, he produced his original 'Prospectus and Specimen of an Intended National Work . . . Relating to King Arthur and His Round Table' (1817), better known as 'The Monks and the Giants'; a literary burlesque, full of charming verse and of excellent character-drawing. It naturalized in English the *ottava rima* afterward used by Byron in 'Beppo' and 'Don Juan.' A version of a large part of Aristophanes succeeded this effort, and this work, which admirably embodies the spirit of the original, gives him a high place as a translator. Consult 'Life' by Sir Bartle Frere (1871).

FRÉRE, Pierre Edouard, brother of Charles Théodore Frère (q.v.), French painter: b. Paris, 10 Jan. 1819; d. Econen, May 1886. He studied under Paul Delaroche, and chose sentimental genre as his specialty; many of his delineations of home- and child-life are full of true and simple feeling and have been frequently reproduced. In technique he was remarkable as a colorist, and his 'Little Gourmand'; 'Curiosity'; 'Repose'; 'The Little Cook'; 'First Steps'; 'Going to School' have long been favorites in the print-shop windows. He exhibited in the Salon from 1842 to 1886, received a number of medals and was made a chevalier of the Legion of Honor in 1855. He also exhibited 28 times at the Royal Academy, London, between 1868 and 1885. Pictures by him are in museums at Bernay, Chartres, Cardiff, Glasgow, Hamburg, Melbourne, Sheffield. Consult Bacon, H., 'Edouard Frère' (in *Art Journal,* Vol. XXXVIII, p. 321, London 1886).

FRÉRE-ORBAN, frār'ôr'băn', **Hubert Joseph Walther,** Belgian statesman: b. Liége, 1812; d. 1896. He was educated at Liége and at Paris, and entered on the practice of law in the former city. His early leanings toward the Liberal party led to his controversy with the Catholic clergy. He was an advocate of free trade and of the priority of state over church authority and of secular public instruction. He was elected to the Belgian Chamber in 1847, and became Minister of Public Works; in 1848–52 he was Minister of Finance. He founded the National Bank of Belgium, and reduced postal rates. In 1857 on the return to power of the Liberals he became again Minister of Finance, and was made Prime Minister in 1868. He retired with his party in 1870 but returned in 1878 and was again Prime Minister until 1884. For the succeeding 10 years he was leader of the opposition, and lost his seat in 1894. He published 'La mainmorte et la charité' (1854); and 'Le question monétaire' (1874).

FRERE'S TRANSLATION OF ARISTOPHANES. Born in 1769, graduate of Cambridge in 1792, occupying various positions connected with the Foreign Office from 1799 to 1808, intimate friend of Canning, John Hookham Frere is among England's many remarkable examples of public men in letters. In spite of interpretations and views sometimes at variance with recent exact scholarship; in spite of — perhaps because of — an old-fashioned freedom, his version of 'The Acharnians,' 'The Knights,' 'The Birds' and 'The Frogs' of Aristophanes, made at intervals beginning as early as 1820 for his own gratification and the diversion of his friends, and published in 1839 and 1840 (best read now in the 'World's Classics,' with introduction by W. W. Merry), remains the English rendering that most perfectly reflects the substance and spirit of the great Greek comedian.

Certain principles of translation formulated by Frere in a review of Mitchell's Aristophanes (*Quarterly Review*, July 1820) help to account for the qualities of his work. They may be restated briefly as follows: The language of translation should never attract attention to itself; expressions remarkable in themselves should as far as possible be avoided. The forms of language should be translated according to the intention with which they are employed. In his representation of the vast mass of feeling, passion, interest, action and habit always and everywhere common to mankind, the translator should make use of the phrase in his own language to which habit and custom have assigned a conventional import similar to that of the corresponding ancient phrases, taking care, however, to avoid those which, from their form or other circumstances, are connected with associations belonging exclusively to modern manners. The translator should omit all local peculiarities which, however interesting as matters of curiosity to the antiquary, would have no other effect than that of distracting the attention, or diverting it from the broad general expression of character and humor which is evidently the primary object of the poet. The *text* of the original is not necessarily *the original itself*. The tone and the intended impression of the original must first be ascertained, and the translator may then expand his own sentences to a dimension capable of bearing a distinct and intelligible impress of character. Or, he may contract; for example, the well-known coarseness of Aristophanes, which was a sop to the vulgar crowd, should be represented in the modern version, which is addressed to an audience of greater refinement, in greatly modified form. Again, just as Aristophanes compensated for extravagance of plot and situation with reality of speech, so the translator should employ truthfulness of language; remembering, however, to give intentional unrealities, such as burlesque, their corresponding form. Finally, the successful translation should be free from any of those peculiarities, unintelligible to an English reader, which belong to antiquity but are in no wise characteristic of it, and which would distract the attention without affording employment for the imagination; and yet should so perfectly maintain the tone and character of antiquity, and the general spirit of the original author, as to make it impossible for any one to feel sure, without special acquaintance with the text, that a deviation from the original had taken place.

The difficulties confronting the translator of Aristophanes, who, it must be kept in mind, represents the comedy of personal satire, and is therefore honeycombed with localisms, are enormous — in the words of George Cornewall Lewis, an exacting critic who wrote in 1844, there are "the endless variety of his style and metres, the exuberance of his witty imagination, the richness and flexibility of the Attic language in which he wrote, and the perpetual by-play of allusions (often intimated merely by a pun, a metaphor, or a strange new compound) to the statesmen, poets, political events and institutions, manners and domestic history of his times." Without claiming everything either as to ability or consistency, it may be said that Frere has met these difficulties with extraordinary success, and that his success has been due to more or less faithful observance of his own principles. He is not always literally accurate, and he sometimes admits the localisms and modernisms he condemns; but he reproduces with great vividness the spirit of audacious extravagance and droll absurdity, the rippling, sparkling variety, the dash and rapidity, the brilliant flights of poetic fancy, which are the essential traits of Aristophanes. Frere is a case of genius translating genius.

GRANT SHOWERMAN.

FRÉRON, frā'rŏṅ', **Elie Catherine**, French critic: b. Paris 1719; d. there, 10 March 1776. He was educated by the Jesuits and became professor at the Collègè Louis-le-Grand at the age of 20. In 1739 he became a contributor to literary periodicals and was a strenuous opponent of the encyclopædic movement and of Voltaire, one of its leading lights. His work called forth retorts from Voltaire, among which 'Le pauvre diable'; 'L'Écossaise' and 'L'Ave littéraire' are the most remarkable. Consult Nisard, 'Les ennemis de Voltaire' Paris (1853); Trévedy, J., 'Notes sur Fréron et ses cousins Royons' (ib. 1902).

FRESCO (Buono). See PAINTING, TECHNIQUE OF.

FRESCO PAINTING. The word "fresco" is Italian and means *fresh*. The term "fresco painting" means, technically, painting on a freshly laid wet surface of plaster. The method is employed in the decoration of spaces on walls and ceilings. The pigments used are water-colors. By extension the term has been used to include other systems of painting on plaster and has, at last, become, to some extent, accepted in popular parlance as synonymous with mural decoration in general. Some of the most noted paintings of the early great masters are in this medium.

Technique.—As an absorbent surface is needed on which to lay the plaster background, in cases where the wall structure is of hard, impervious stone, it becomes necessary to add a lining of brick. Over this is spread a three-quarter-inch layer of mortar consisting of lime (at least a year old), well-washed river sand and an admixture of ox-hair or other durable fibre. This coating is combed over coarsely to produce a roughened surface and is left to dry thoroughly (preferably a year) before further manipulation. Next comes the second coating (termed the *intonaco*), on which the painting is done. The aim here is to get this last plaster as absolutely homogeneously mixed as possible, as any imperfections or irregularities in the density of the plaster will cause lack of uniformity in the coating pigments when applied and unequally absorbed. To this end the finest quicklime is slaked and strained through a close-meshed sieve, then even-grained river sand is added till the mixture becomes, on cooling, a «lime putty» or paste. The next process is to saturate the brick surface with water and then lay on the plaster (*intonaco*), starting from the top and covering only as much as will suffice for the day's color work, say five hours, by which time the plaster gets too dry to absorb sufficient pigment, so that it would be likely to scale off later. When too dry the unpainted plaster must be cut away and fresh applied. After the freshly-laid plaster has had about 10 minutes to set it is best coated with a tint that will, when dry, afford a deep vellum surface tone (raw sienna and white lime of cream consistency). Next, the area of the day's color work is traced directly from a cartoon containing the pictured subject, or through a tracing paper copy, by a stylus (point), or by punctured indications of the outlines. The painting now proceeds according to the method and style desired by the artist — applying thin washes as in water-color painting or in thick brushwork (*impasto*), or both in combination. The bolder and larger surface of the brush can be shaded with additional pigment; or shading is frequently done by «hatched» lines. The process involves boldness and lightness of stroke as each application of color is permanent and allows no corrections and any hard pressure disturbs and ruins the soft wet surface. The pigments are limited to: White: lime white; yellow: raw sienna and cadmium yellow; red: vermilion, light red, Indian red; blue: cobalt blue and *genuine* ultramarine; green: oxide of chromium and emerald oxide of chromium or cobalt green; orange: burnt sienna; brown: raw umber, burnt umber; black: ivory black. The strict limitation of the permissible range of pigments is caused by the need of each being able to resist the caustic action of lime in the plaster. This restriction of the palette has caused other processes of painting on plaster to be practised (mentioned later) and, in order to distinguish this original method from others, it has been termed «fresco-buono» (good or *true* fresco). This fresco-buono, correctly carried out, is more permanent than any other painting process, except the silicious glaze decoration in ceramics. The chemical action creating this extraordinary durability is supposed to be caused by the formation of carbonates, and sometimes silicates, of lime on the surface of the plaster while drying; the eliminated carbonic acid of the kiln action being again absorbed from the air by the hydrate and producing, while drying, a hard skin which protects the surface against atmospheric action and becoming damp-proof. It is not, however, impervious to the action of sulphuretted hydrogen thrown off by coal-gas. Other processes of painting on plaster have been invented to avoid the inconveniences of the *wet* or *fresco* method. One is the «fresco-secco» or dry process. Among the old writers «secco» referred to distemper (*tempera*) work, using pigments ground in a binding medium, as egg, glue, size, gum, on a dry wall space. But the term *secco* in recent years refers to any dry processes, such as the German «stereochrome» or «water-glass» process, or the later innovation known as the Keims process. Among other schemes for increasing the usable range of pigments is «spirit fresco» done by grinding the colors in wax, then thinning with spirits of turpentine or oil of spike. The so-called «encaustic» fresco-painting is done by using wax as a medium and after its application it is heated and thereby becomes absorbed, to some extent, by the ground. The English «spirit» fresco, invented by Gambier Perry of Gloucester, was used in decorating Saint Andrew's Chapel in Gloucester Cathedral, etc., also was later employed by Lord Leighton on mural decorations in the Victoria and Albert Museum and other buildings. Time alone is the test as to their durability. As to the technique of the artist in the fresco medium, the fact that a fresco painting is a wall or ceiling decoration involves the consequence that the conceptions, in design and execution, shall be *architectural*. Quite distinct from oil color painting, with its multiplicity of tones and gradations unlimited, the fresco work has, correctly, to consist mainly of more or less flat background that conveys the idea of *surface* more than distance, while the subjects exist more in *outline* and *perspective* than in detail of merging light and shadow.

Historical.— The origin of mural painting on plaster reaches back into very primitive times. Without being hypercritical as to the exact processes used by the ancients, we know, from the excavations by Dr. Schliemann of the pre-Hellenic palaces of Mycenæ and Tiryns (1500 B.C), that the plastered walls and ceilings were decorated in colors. The ancient Egyptian tombs and mummy-cases were decorated with painting on stucco white ground in *tempera* (distemper). The Greeks would appear to have used the fresco process in the period of their prime, although it would seem that their most noted painter, Polygnotos, worked in *tempera* technique. But nothing is extant to afford visual proof. From the Roman period, however, we have fine examples of mural decoration in the ruins of Pompeii, Herculaneum, Stabia, Boscoreale, etc. Besides, Pliny and Vitruvius have left us descriptions of the Greco-Roman technique. Next we come to the fresco painting of the primitive Christians in the Catacombs of Rome and Naples. Then the art appears to have declined and we learn of only isolated examples till we come to the 13th and 14th centuries, when the process again began to flourish. And the art took on greatly advanced and talented execution in the persons of Cimabue, Giotto and other Italian artists. From Florence the pupils of these masters soon spread a knowledge and practice of the art of fresco painting throughout all Italy, some examples of which we will enumerate later. Mural decoration in fresco next became popular in Germany in this period and we find examples in Brunswick Cathedral, in Saint Gereon's, Saint Ursula and Saint Humbert's churches at Cologne. We find them numerous in the cloisters and castles; the «Dance of Death» (*Todtentanz*) is a favored subject. Even the façades of the buildings displayed fresco decorations (mostly allegorical and historical subjects). But with the 15th century we are in the Renaissance, resplendent with fresco paintings done for the church, royalty and the princely nobles. Wonderful genius in fresco work is displayed by Masaccio, Fra Lippi, Ghirlandajo and others. And their successes brought forth the enthusiasm of the 16th century that produced the schools of Florence, Milan and Rome, and created the highest work and most flourishing period in fresco painting. To this period belong the greatest of fresco painters: Perugino, del Sarto, Pinturicchio, Leonardo da Vinci, Luini, Correggio, Raphael, Michelangelo, etc., all great masters in this art. But too soon after the zenith of the fresco painting art followed the decadence with its baroque period of rapid execution running to fantastic perspectives and tours de force. Standing boldly out from such extravagances we have, however, such names as Annibale Carracci with his superlative work in the gallery of the Farnese Palace and Guido Reni has left us fine frescoes in the 'Dawn' or 'Aurora' on the ceiling of the Rospigliosi Villa and others, at Rome. Domenichino did fine fresco painting at Piacenza, Bologna and Rome (Villa Ludovici); Lanfranco achieved success in examples in Rome and Naples. South Germany produced its 16th century fresco painters; Holbein worked in Basle and London; his frescoes are, however, lost, the oils alone remaining. We must remember that the Catholic churches, in this period, did little decorating on their walls. With the increasing popularity in stained glass windows for ecclesiastical buildings, the colored light rays seriously interfered with polychrome effects in mural decoration. Little of importance was brought forth by the 18th century; Tiepolo did some decorating in Würzburg and some Tyrolese, as well as Italians, practised the art on minor works. In the 19th century Germany made an effort to revive the almost forgotten art and started an artists' colony in Rome. Clever workers resulted but their gaudy colors compare ill with the mellow tones of the old masterpieces. We have works in Munich by Cornelius, the Berlin Museum has decorations by Kaulbach. There were Veit and Schadow (seven pictures of 'History of Joseph' in the Berlin National Gallery), etc. Ludwig I of Bavaria, as art patron, aided by the guidance of Cornelius, had what are termed the best recent fresco decoration done in the Munich Glyptothek; Schnorr's 'Nibelungen' salon in the Imperial Palace is another noteworthy work.

Noted Frescoes.— Giotto's (1276-1336) 'Birth of the Virgin,' etc., are in the Bardi Chapel, his 'Scenes in the Life of Saint Francis of Assisi,' others in Santa Croce, Church of Santa Maria Novella ('Birth of the Virgin,' etc.) are best examples. By Beato Fra Angelico (1387-1455) the best extant works are 'Crucifixion,' 'Annunciation,' etc., in Saint Mark's monastery, where are also some of those of his less talented brother Fra Benedetto. Massaccio (1401-28) is well represented by his grand work in the Brancacci Chapel of Santa Maria del Carmine ('Tribute Money,' etc.). Benozzo Gozzoli (1420-97) creations are found in the Riccardi Palace, consisting of many portraits (the Medicis), the 'Journey of the Magi,' etc. All these are by Florentine artists and in Florence. The Gozollo series of paintings at Pisa in the Campo Santo are noted. Pietro Vannuchi, called «Perugino» (1446-1524), was teacher of Raphael and is represented by such work as the 'Crucifixion' in Santa Maria Maddalena de'Pazzi, Florence; the 'Baptism of Christ' in the Vatican, etc. Bernadino di Betti, called «Pinturicchio» (1454-1513), has left us 'Saint Catherine before Emperor Maximianus,' in the Vatican and scenes from the life of Saint Bernard of Siena in Santa Maria Araceli, Rome; others in the Sistine Chapel. Domenico Bigordi, called «Ghirlandajo» (1449-98), is represented by his 'Calling of Saints Peter and Andrew' in the Sistine Chapel and other works in Santa Maria Novella and Saint Trinita, in Florence. Andrea Vannuchi, called «del Sarto» (1488-1530), has extant his 'Death of Saint Filippo' and other works in Florence. The wonderful frescoes of Raphael (1483-1520), 'The School of Athens,' 'Jurisprudence,' 'Parnassus' and 'Theology' in the Vatican are peerless. Michelangelo Buonarroti's (1475-1564) great fresco 'The Last Judgment' is on a wall in the Sistine Chapel (Rome), together with his ceiling decoration 'Story of Genesis,' etc. Luini, pupil of da Vinci, did fine fresco work as is proven by his 'Virgin and Child' and 'Saint John' at Lugano. Da Vinci (1452-1519) did his world-renowned wall painting 'Last Supper,' in oil-colors and the great work is rapidly decaying by scaling off; no *fresco-bueno* work of his is known.

FRESCO-SECCO. See PAINTING, TECHNIQUE OF.

FRESCOBALDI, frĕs'kō-băl'dē, **Girolamo,** Italian organist and composer: b. Ferrara, 1583; d. 1644. He studied with Luzzaschi at Ferrara and later removed to Belgium. About 1614 he became organist of Saint Peter's, Rome, and remained in this position until his death, with the exception of an interval, 1628-33, when he was court organist at Florence. He is equally famous as a composer and organist. His compositions include canzones, motets, hymns and madrigals. Consult Haberl, F. X., 'Frescobaldi' (Leipzig 1887).

FRESCOS, Boscoreale. See ART, METROPOLITAN MUSEUM OF.

FRESH-AIR WORK, a form of benevolence or helpfulness; in this particular the taking of poor children from the tenements and slums of large cities to the country or seashore for recreation. It is said to have originated in 1849, when Rev. William A. Muhlenberg of New York sent a large number of poor children and invalids from his parish to the country for short vacations. In 1872 the New York *Times* inaugurated a system of free excursions and its example was followed in other parts of the country. The first general fresh-air societies were organized in 1874, and since then a number of newspapers have inaugurated fresh-air funds. There are now nearly 100 societies and 14 fresh-air organizations in New York. General agencies, church organizations and private funds provide for between 2,500,000 and 3,000,000 days' outing for poor children of the cities. The beneficiaries are for the most part children from 6 to 12 years old. A few adult women usually accompany them. They are sent away from the city for periods varying from a few hours to a fortnight spent in the so-called country homes, or as the guests or boarders of private families. In Europe, Switzerland was the first to take up the movement in 1876. In 1895 there were 73 fresh-air colonies in that country. Nearly all European countries and Argentina in South America have taken up the work. It is also common in Germany and Denmark for the artisan classes in the city and country to make a temporary exchange of children during a part of the summer. Consult 'Fresh Air Charity in the United States' (1897); Delpérier, 'Les colonies de vacances' (Paris 1908); Allen, 'Sea Air Treatment for New York's Bedridden Children' (in *Review of Reviews*, Vol. XXXII, New York 1905).

FRESH-WATER INSECTS. Insects are essentially creatures of the air and the land; yet a considerable number pass the whole or the greater part of their lives in rivers, lakes and ponds. Among insects aquatic in all stages we can distinguish between those which glide or skate over the surface of the water, diving not at all, or only exceptionally, and those which habitually dive and swim through the water after the manner of fishes. The most typical of the surface-dwellers are the bugs of the family Hydrometridæ. See POND-SKATERS.

Among the Coleoptera the whirligig beetles (*Gyrinidæ*) frequent the surface of ponds and brooks where they may be seen in small companies, performing a whirling, mazy dance over the surface-film. These insects, when they dive, carry down with them a small air-bubble enclosed in a film between the tip of the wing-covers to the hinder end of the abdomen. They are not, like the pond-skaters, completely enveloped in air while under water. The beetles of a nearly related family (*Dyticidæ*), well called «diving-beetles,» belong to the group of insects which live habitually submerged. Their contours are admirably adapted for motion through the water, but there is no dense hairy covering to ensure the formation of an air-bubble and the breathing is provided for in quite another way. The abdominal spiracles open on the upper surface of the segments, which are completely covered by the wing-cases when the wings are shut. The wing-cases being convex and the upper surface of the abdomen depressed, a considerable amount of air is enclosed, allowing the insect to remain submerged for some time.

Another mode of adaptation to life in the water is shown by the water-scorpions (*Nepidæ*). They are provided with a pair of long-grooved appendages at the tail-end of the body; these can be closely pressed together and form a tube, the tip of which pierces the surface-film and conveys a supply of air to the spiracles. These insects, like the allied «water-boatmen» (*Notonectidæ*), have well-developed wings, and make excursions by night to new watery dwelling-places.

Many insects lead an aquatic life only during their larval stage. Naturally enough, however, such insects when adult are to be found flying chiefly in the neighborhood of water in which they will lay their eggs — the May-flies and midges for example. The contrast between the conditions of the larval and the imaginal life in such cases is most striking, and can only have been brought about by slow degrees. A certain amount of moisture in the earth is necessary to the well-being of many burrowing larvæ, while some are found in semi-liquid mud, in decaying refuse, or in animal excrement. In such surroundings breathing through the lateral spiracles becomes impossible, and we find that access to the air-tubes takes place only by one or two pairs of spiracles near the head or tail-end of the body, sometimes opening through «respiratory trumpets» whose expanded mouths can be thrust out of the clogging surroundings of the mud or refuse into the fresh air, while the grub remains concealed and continues to feed. A similar suppression of most of the spiracles, with the development of a tubular process at the tail end of the body in connection with the tracheal system, is the adaptation by which many aquatic larvæ breathe — for example, the grub of the mosquito. The families of insects nearly related to these have larvæ which live in mud and damp earth, and this suggests that it was from the shores that the waters were invaded by these insect-hosts.

But there is another division of aquatic larvæ still more perfectly adapted to life in the water. The grub of the gnat or the drone-fly needs to rise to the surface at intervals and pierce the film with its air-tube in order to get a fresh supply of oxygen. But the pupa of the sand-midge, with its tubular gill-filaments, or the larva of a May-fly with its tracheal gill-plates, can remain in the water throughout its life, drawing, as do the fishes, sufficient oxygen from the dissolved air. It is interesting to notice that within the limits of a single and restricted order — the dragon-flies — we find some larvæ breathing by means of tracheal gill-plates, and others taking supplies of water into the hind-gut over whose walls run branching air-tubes; while in the final nymph stage the thoracic spiracles are open, and the insect raising the front part of its body above the surface, breathes through them after the manner of an imago. These various adaptations to an aquatic life within a single group indicate clearly that the habit of living in water is not primitive among insects, but that it has become acquired by different races at different times in the course of the development. It may be presumed that larvæ with the more perfect adaptations for breathing when submerged — leaf-like or thread-like gills — are older inhabitants of the water than those which have to rise periodically to the surface to take in a supply of air.

FRESH-WATER MUSSELS, bivalved mollusks that dwell in lakes and rivers; river-mussels, or river-clams. They belong to the family *Unionidæ,* allied to the cockles, which has a large and thick foot, no byssus, siphon short (when present), and a parasitic embryonic growth. The shells are equivalve, varying according from thin and smooth to very thick, rugose and knobbed; the hinge variable (in *Anodonta* having no hinge-teeth); and the interior always thickly nacreous, making it useful in the arts as «mother of pearl,» and often producing fine pearls. The family is world-wide in its distribution and includes about a dozen genera, two of which (*Unio* and *Anodonta*) occur in most parts of the world. These mollusks dwell in rivers and ponds, and vary greatly according to the character of their home, whereby a great number of supposed species have been named that are now known to be merely varieties of the same stock resulting from different environment. They stand upright in the sand on the blades of the shell, so that the heavy hinge margin receives any blow from drifting stones, or other harm; and slowly move about, sucking in the minute animal and vegetable organisms upon which they feed. (See PELECYPODA). The development of their young is most unusual. The eggs when ejected from the ovaries are caught in the gills of the mother and are sustained by a nutritive mucus-like secretion, until they reach a certain degree of age, when they become «glochidia.»

They then have a larval shell, provided with strong hooks, and possess a long filament. After a period they are expelled through the exhalent siphon into the water, and this ejection may be timed to the passing of a small fish, to whose body if they touch it the glochidia at once cling by means of the hooks. Should they miss striking against a fish when thrown out the embryos sink and lie upon the bottom with their shells gaping and the filament floating upward. There they remain until a «host» comes within reach; but this must soon happen or they will perish. The glochidia of *Unio* usually become attached to the gills; those of *Anodonta* to the skin or the fins. In this position they become overgrown by the skin or mucous membrane of their host, and are nourished by his juices. This goes on for about 10 weeks, during which time the glochidium has been metamorphosed into a young normal mussel, drops off and begins the ordinary course of life. Their life is probably long.

Mussels abound in all the rivers of the United States and were extremely numerous and varied in those of the Mississippi; and they entered very largely into the fare of the native red men, as is attested by the large refuse-heaps of their shells to be found in all the river courses. It was long ago discovered, however, that these shells yielded pearls of great beauty and price (see PEARL), while the mother-of-pearl of many species was marketable for the manufacture of buttons and similar articles. The result has been a serious depletion of the mussels of many parts of the Middle West, and nearly an extinction of some species. Consult Lefevre and Curtis, 'Studies in the Production and Artificial Propagation of Fresh-Water Mussels' in the United States Fisheries Bureau Bulletin (Vol. XXX, Washington 1912), and other publications of the department.

FRESNEL, frā'-nĕl, **Augustin Jean**, French physicist: b. Broglie, France, 10 May 1788; d. Ville d'Avray, near Paris, 14 July 1827. He was educated at the École Polytechnique and the École des Ponts et Chaussées, and early devoted himself to the practice of civil engineering. He served as government engineer in La Vendée and subsequently in Drôme. During the Hundred Days he was persona non grata to Napoleon, but after Waterloo he returned to Paris to his former occupation of engineer. In 1815 he became distinguished as the discoverer of the polarization of light, and in 1823 was elected a member of the Academy. He made important researches respecting the wave theory of light, and proved Newton's theory wrong so ably that Arago, long an opponent, was converted to the new hypothesis. The result of his great discovery is shown in the system of lens lighting apparatus, which has changed the mode of lighthouse illumination over the whole world and is universally known as the «Fresnel system.» In 1825 Fresnel was elected Fellow Royal Society of London, and in 1827 received the Rumford medal of the society. Consult Arago, D. F., 'Distinguished Scientific Men' (Boston 1859); Moon, R., 'Fresnel and His Followers' (Cambridge, England, 1849).

FRESNEL'S SURFACE. See LIGHT.

FRESNILLO, frĕs-nĕl'yō, Mexico, a city in the state of Zacatecas, on the Mexican Central Railway. It has a spacious square, with a fountain in the centre, and contains several large churches. In its vicinity are the celebrated mines of Fresnillo. Elevation nearly 6,900 feet above sea-lev l. Pop. about 6,500.

FRESNO, Cal., city and county-seat of Fresno County, situated on the San Francisco and San Joaquin Valley, the Southern Pacific and Atchison, Topeka and Santa Fe railroads. The city is an important fruit-growing centre, the raisin trade alone being valued at $5,000,000 annually. Other important industries are the cultivation and exporting of oranges, grapes and olives, besides a large livestock trade. The United States census of manufactures for 1914 showed within the city limits 117 industrial establishments of factory grade, employing 3,330 persons, 2,903 being wage earners receiving annually a total of $1,511,000 in wages. The capital invested aggregated $7,375,000, and the year's output was valued at $16,520,000: of this, $4,349,000 was the value added by manufacture. Fresno was settled in 1872, became the county-seat in 1874 and received a charter as a city in 1885. The government is controlled by a mayor, chosen every four years, a municipal council and other administrative officials. The assessed property valuation is about $22,000,000. Pop. (1916) 45,000.

FRETUM GALLICUM. See BONIFACIO.

FREUD, froid, **Sigmund**, Austrian psychiatrist: b. Freiburg, Moravia, 6 May 1856. He studied medicine at Vienna; was appointed demonstrator at the physiological institute, and subsequently assistant at the Vienna General Hospital, where he also lectured on diseases of the nerves. At Paris he studied for a year under Charcot in 1885–86 and in 1902 was appointed associate professor of neuropathology at Vienna. In 1909 he came to the United States. Freud's reputation is international owing to his psychoanalytical treatment of hysteria and especially to his theory of dreams. He published 'Zur Auffassung der Aphasie' (1891); 'Studien ueber Hysterie' (1895; English translation by Jelliffe and White 1913); 'Traumdeutung' (1900; 3d ed., 1911; trans. by Brill, 'Interpretation of Dreams,' 1913); 'Ueber den Traum' (1901; 2d ed., 1911); 'Psychopathologie des Alltagslebens' (1904; English trans. 1914); 'Der Witz und seine Beziehung zum Unbewussten' (1905; 2d ed., 1912); 'Drei Abhandlungen zur Sexualtheorie' (1905); 'Sammlung kleiner Schriften zur Neurosenlehre' (1906; 2d ed., 1911); 'Zweite Folge' (1909; 3d ed., 1913); 'Ueber Psychoanalyse' (1910; 2d ed., 1912); 'Totem und Tabu' (1913). He edited *Jahrbuch für psychoanalytische und psychopethologische Forschungen; Internationale Zeitschrift für ärztliche Psychoanalyse; Imago;* and *Schriften zur angwandten Seelenkunde.* See FREUDIANISM; DREAMS.

FREUDENTHAL, froid'en-tâl, **Jacob,** German philosopher: b. Bodenfelde, Prussia, 20 June 1839; d. Breslau, 1 June 1907. Twenty years teacher in the Rabbinical Seminary of Breslau (1864–88), he was successively lecturer, assistant professor and professor in philosophy at the University of Breslau (1875–88), dean of its philosophical faculty (1898–99). He was sent to England (1888) by the Prussian Academy of Science to study English philosophy, and to the Netherlands (1898) for research work on the life of Spinoza — the results being his 'Contribution to English Philosophy,' in the *Archio für Geschichte des Phil.* (IV, 400 et seq., V, 1 et seq.) and his 'Die Lebensgeschichte Spinoza's' (Leipzig 1899). In the field of Greek and Hellenistic studies, he wrote, besides various essays, 'Hellenistic Studies' (1875–79); 'On the Theology of Xenophánes' (1886); in addition to a treatise on Aristotle's conception of *Phantasia* (1863); and another on Josephs' assumed work on the rule of reason (1869). His son Berthold (1872) is professor of law at the Academy of Social and Industrial Sciences at Frankfort-on-the-Main.

FREUDIANISM. The name applied to the views of the most modern school of psychology and philosophy, of which Sigmund Freud (q.v.) is the central figure. The governing conceptions of contemporary scientific psychology fall into three classes. One class regards mind and body as coordinate and parallel functions of one another. It does not assume any causal connection between two mental states. In the laboratory it aims to check up introspection by the control of its conditions, and it is content to record the structure of these states as introspection, so controlled, reveals them. Another class regards consciousness or mental states as such as non-existent. What is normally called consciousness it describes as *behavior* (q.v.). In the laboratory it replaces introspection by rigidly controlled observations of the reaction of sentient beings to stimuli. This reaction, which is to its last detail physiological, is considered *with* its stimulus, as the mental unit of behavior. Hence, for the first group, consciousness runs parallel to the interaction of the body, or of a state of the body, with its environment. It is a third and later entity, which appears after the other two already exist, while for the second group consciousness *is* the response or behavior of the organism toward its environment. For the first group psychology is purely a descriptive science; for the second group psychology is an explanatory science which differs, however, from physiology in that it takes into account not the organism alone, but the organism together with the environment to which it responds. The third class falls between the other two. It believes in the reality of consciousness with the parallelists, and with the behaviorists it believes in its *functional* character. From the point of view of *functional psychology* consciousness modifies both the organism and its environment and is reciprocally modified by them.

All three of these conceptions are alike in that they have not succeeded in formulating any precise *law* of the rise, operation and subsidence of ideas. The so-called «law of association» is nearest to such a law; but that is rather a formulation of the conditions under which ideas appear together than a statement of their dynamic relationships and bases. It does not, nor does any other of the current hypotheses, unify the various processes of willing, feeling and thinking under a single causal concept.

Such a unification is, however, precisely what Freud effects. Psychologists have, on the whole, paid little and unflattering attention to Freud, but Freud has been the first to express the process of consciousness in a single causal pattern which can utter and coordinate in genetic terms *all* the phases of consciousness, in all degrees of normality and abnormality. The pattern may be designated as follows: Mind, like body, consists of distinct units of action, which Freud calls «complexes» or wishes. These are normally integrated and fused. The essential conditions of life are, however, such that not all can be realized or satisfied at one and the same time. Some can never be realized. Life, consequently, consists of constant choices between conflicting alternatives, of which many must be repressed if the course of life is to go on at all. The repression may be complete or partial. When it is effected, it does not destroy the wish; it renders the wish *subconscious.* The subconscious wish may then be completely dissociated from the conscious life and alternate with it, or it may *emerge* against the repressive factor, with a resultant in feeling, attitude and ideas that constitutes the overt state of consciousness and behavior. Every phase of a state of mind may be accounted for in these terms, which are ultimately reducible to the action of the primary instincts of self-preservation, sex, hunger and gregariousness.

Mind thus becomes an interplay and resultant of separate conational units, whose operation can be graphed as the physicist graphs the operation of lines of force. So stated, the view contains nothing novel. It is the same which Spinoza has worked out in detail in his 'Ethica' and which William James expressed in so many places in his 'Psychology.' Freud, however, adduces a wealth of empirical evidence, in which the *schema* of the causal process stands out clearly, and the movement from conflict to repression, dissociation, censure and emergence, in rationalization, symbol and fantasy is actually seen in the coming and going of states of mind. Freud's contributions fit in best with the concept of functional psychology. The behaviorists have, however, been the most hospitable to his ideas. In 'The Freudian Wish' Mr. Edwin Holt has very cleverly reduced the "complex" to the responsive mechanism of the reflex arc and its object. The whole of mind is there stated as the conflicts and integration of the varieties of this mechanism; "complex" "consciousness" and "subconsciousness" become superfluous and the Freudian system becomes one aspect of the larger system of behavior of living organisms.

Philosophy as such has as yet paid little or no attention to Freudianism. But Freudians and others have paid a good deal of attention to philosophy and philosophers. In this connection the analysis of systems and system-builders brings additional confirmation of William James' description of the non-logical motives in system-building. Hans Sachs and Otto Rank have divided philosophies into three types according to the instinctive motives in play: (1) that of the intuitive spectator or artistic metaphysician like Plato; (2) that of the synthetic thinkers like Comte, Spencer and Locke; (3) that of the analytical thinker like Kant, Spinoza, Hume. Their classification and examples are not convincing, but the line of investigation is promising.

To the persistent problems of philosophy the Freudian hypothesis contributes another confirmation of determinism in the controversy over the freedom of the will, and perhaps a mitigation and even an abolition of the problems by exhibiting the perennial wishes and conflicts that make persistent such difficulties as "the many and the one," "the immortality of the soul," "the existence of God," "the freedom of the will," "eternity and time." Whether it can add anything positive to metaphysics is extremely doubtful. Because of its conception of memory, forgetting and the subconscious, it has been claimed in confirmation of the Bergsonian philosophy (q.v.), but its treatment of these facts is diametrically opposed to that of Bergson. So far it has been most fruitful and original in the social sciences — in ethics and its derivatives. E. B. Holt's 'The Freudian Wish' is an essay in this field, in which a *rapprochement* is established between Freud and Aristotle. The ethical and social conclusions derive from the clear and distinct apprehension of the causal pattern of mental life, of the importance of conflict, of the constant oppositions of such fundamental instincts as that of sex and gregariousness, self-preservation and the groupings of individuals according to class, family, nation and so on. Once the detail of *causal pattern* of conscious life is fixed, it is bound to be a clarifying conception in education, ethics and religion rather more than in the purely technical philosophic disciplines like logic and metaphysics.

FREUDIANISM, Medical. The medical or therapeutical aspect of Freudianism claims priority in point of time over its distinctively psychological and philosophical application, since psychoanalysis developed out of therapeutic experience and primarily as a method of investigation and treatment of nervous disease. Still the very fact of its rapid development in these other spheres emphasizes its broader and its profoundly fundamental service in establishing a comprehensive genetic basis for therapeutic knowledge and practice. Under its conception neurotic disturbances together with the far-reaching physical phenomena dependent upon them are concerned with the patient's entire attitude toward reality, his attempt at self-expression in regard to it which involves his success or failure of adaptation toward it. Therefore it presupposes a psychological and philosophical attitude on the part of the physician in order to comprehend the patient's problem as well as to guide him to a normal adjustment to life as a whole.

Psychoanalytic investigation has thus of necessity led into a pragmatic psychology and philosophy whose scope is all-embracing and whose foundation is laid in the genetic development and dynamic potentiality of human life. The therapeutic side is inseparably bound with such implications of the psychoanalytic method for a new comprehension and control of both individual and general medical problems. In this way it has enlarged the conception of medicine and quickened it by this introduction and use of the dynamic genetic element.

It was while Freud was working as a pupil of Charcot in 1885–86 that he was led to his method of investigation of hysteria. Both Charcot and Janet discovered through hypnosis something of the hitherto unknown mechanisms of hysteria as the results of ideas which have temporarily gained mastery of the patient's mental apparatus. Freud followed up their observations together with Breuer, who had been able to demonstrate through hypnosis the psychic traumatic experience which was the cause of the hysteria and to discover the fact that the symptoms disappeared when the memory of the traumatic event was brought to clear consciousness and the emotion or effect originally accompanying it could be thus discharged. Freud then applied this cathartic method to a number of cases and with Breuer conceived of the hysterical symptoms as the manifestations of such mental traumas converted into bodily symptoms. This involved an elaboration and a much farther reaching extension of the original concept to account for the elaborate mechanisms which were gradually discovered at work. Freud carried this work forward into all forms of the psychoneuroses and discovered in all the same fundamental etiological factors as in hysteria.

Briefly considered his significant recasting of the etiological conception of neurotic disturbances includes the following features. Behind certain definite traumatic experiences first discovered in certain cases of hysteria there appeared to lie still earlier experiences reaching back into the forgotten infantile period. Meanwhile also the theory of a definite traumatic experience proved itself by no means always valid and this was gradually given up for a more comprehensive background of psychic predisposition in which infantile experiences phantasied as much as actual were stored up to contribute at a later period of psychic stress their accumulated effect toward a psychic disturbance. A working hypothesis was necessary to fit the facts revealed by psychoanalytic therapy which discovered these stored up memories and effects, and for this Freud adopted the concept of the unconscious, a mental sphere in which the past is conserved unrecognized but not inactive. Into this unconscious are relegated all those experiences and phantasies which belong to infantile years and to infantile modes of expression but which are not compatible with an adult position in a social, cultural environment. Nevertheless these experiences and phantasies represent the strongest instinctive forces and desires of mankind, his deepest wishes. Hence they can be banished only by the force of «repression.» These infantile instinctive desires are common to normal and neurotic alike, but in the former case the repression is successful as the effect associated with the infantile manifestation of the desire or the infantile experience is adequately discharged at the time or finds a sufficient substitution channel and is thus «sublimated.» In many cases, however, such a sublimation is not found and the effect undischarged is repressed together with the experience which it accompanies.

It is the special nature of these instinctive impulses which causes the strength of the repression, for they lie in the sexual sphere. It was here that Freud performed a striking service in opening up the nature of infantile sexuality. His investigations have proved the existence of the sexual impulse from the earliest years but in its «polymorphous,» undifferentiated manifestation, when it is not as yet converged into the central sexual aim but is diffused throughout the many forms which are essential as contributory in the course of normal development to the primary aim. They afford also, as in the history of the race, opportunities of desexualization and diversion of the primeval energy or libido from the strictly sexual into the various paths of sublimation which have built up civilization and are necessary for individual as for racial advance. They offer also in those constitutionally disposed to disturbance occasions for over emphasis of one or another of these polymorphous components. This causes fixation of infantile interest upon it with arrest in so far of normal psychic development, or according to Freud in conception later worked out by the Zurich school, pathways ready to receive a retrogression of the energy or libido when in later life some obstacle in its course drives it back to reanimate these pathways at the expense of the adult form of reaction.

Whether occupied with actual traumatic occurrences or with phantastic formations of childhood, primitive and infantile ways of thought and reaction fixed through life or revived through repression find themselves incompatible with cultural demands. The early content of experience or of phantasy is of a forbidden nature and therefore repressed but its affect continues to seek adequate expression. Hence arises an unbearable conflict. The only escape from this is through some form of compromise formation which will satisfy the unconscious wish and at the same time accord with the ethical demands of conscious life. The result, therefore, is the protean symbolism of hysteria, conversion into bodily symptoms, the compulsive idea, the compulsive act, the obsession, the whole train of phobias, and passing on to the realm of the actual psychoses or mental derangements, the whole range of symbolic acts which serve as nature's attempt to heal the breach between conscious and unconscious and substitute for the conflict this imperfect and a social but individually more bearable compromise.

The therapy of psychoanalysis consists then in the discovery of the hidden source of the conflict, bringing the original wish impulse to clear consciousness and thus discharging the affect bound with it. The ultimate goal always before the physician is the freeing of the regressed and diverted libido and directing it into paths of sublimation which will desexualize it for useful, active work and substitute such a form of satisfaction for the wasteful energy discharge of a futile round of self-perpetuating and distressing symptoms. For the libido as conceived by Freud and particularly defined and developed by Jung of the Zurich school, is the sum of creative energy originally designed for the reproduction and perpetuation of the race but in the course of development and expansion necessarily demanded along the countless pathways of sublimation. The force of the original impulse has not found even its biological reproductive outlet or has failed in satisfaction there probably because of the infantile fixations and the readiness of the regressive pathways to receive the libido at the first serious obstacle presented by external circumstances. The substitute symptom formations then take the place of the sublimations which naturally follow the normal healthful development of the love life. The aim and effort of clinical psychoanalysis is thus to release the libido from its regressive occupation with the ego wishes and direct it along the path of racial, that is social and cultural progress in order thus to attain also the satisfaction of the individual creative impulse.

This is the general principle of investigation into the sources of disturbance and of the method of treatment. It has been adapted to the understanding and treatment of the hysterias, compulsions and the like which distinctly have their origin in the infantile period, and also to those more acute forms of disturbance which Freud has called the true neurasthenias and anxiety neuroses, the origin of which lie in present conditions. The essential disturbance and treatment are the same in the latter forms of neurosis, and at the same time there is frequently a background of the same infantile condition and mode of reaction as in the former cases. Psychoanalysis has thrown much illumination upon the understanding of the psychotic or profound mental disturbances, particularly those of purely functional nature as well as upon the symptomatic manifestations of those of organic and toxic origin. Its therapeutical value has also been demonstrated here in so far as such patients are accessible to the co-operation with the work of the physician which is an indispensable part of the psychoanalytic procedure. The application of psychoanalysis to the psychoses, particularly dementia precox, has been largely the work of the Zurich school.

The method of psychoanalytic therapy requires a highly specialized technique in order to penetrate, correlate and readjust this wealth of plastic human material. This specialized technique was the result of Freud's careful and detailed research based upon his experience with hysteria and its subsequent development. His masterly insight and critique discovered and elaborated the «royal way» into the unconscious storehouse of affective experience and phantasy through the interpretation of the dream. This revealed not only the extensive symbolism under which the unconscious content concealed itself and obtained partial escape in a way acceptable to conscious thought, but also threw illumination upon the various mechanisms utilized in system formation as in dream work, technically known as condensation, substitution, distortion, manifestation through the opposite and the like, all of which have to be understood in order for the physician to guide the patient into the source of the disturbance and out through a revaluation and readjustment in an adequate discharge.

He discovered also the fundamental factor in the success of the treatment and with characteristic fearlessness and clarity of presentation has led his followers to an appreciation of its importance and a recognized utilization of it as an indispensable aid. This is that phenomenon to which Freud has given the name of the «transference.» It represents an essential element which enters into all human relationships but into none more conspicuously than into the success of medical treatment, mental or physiological. Yet it has been unrecognized in its real significance. Its share in the treatment has been either undervalued or because it was not properly understood it has sometimes interfered with treatment to a very serious extent. Its potentiality for service as its capacity for interference lies in its essentially dynamic character. Briefly defined it is that psychic ability on the part of the patient to bring over to the physician the whole burden of his psychic life and find in him the sense of power and security which the infantile neurotic character seeks in a heightened degree. It represents an aim of all human desire and thus enters into every relationship, particularly of the patient who feels his sense of weakness aggravated by any disease, but it plays a particularly large rôle in the infantile character of the mental and neurotic disturbances. On the basis of this Freud and his followers have shown it to be the psychoneurotic attempt to revive the infantile parent images and the supreme security which they afforded the infantile period. Through this then the physician gains the complete confidence necessary for the intimate and complex investigation of profound individual problems, while on the other hand he must utilize the confidence and affection gained to stimulate the patient to participate actively on his own part in the analysis and the accomplishment of the final aim, the freeing of the patient from a condition of infantile dependence, which without keen watchfulness would become intensified about this very factor so essential for successful treatment. The nature of the transference as Freud has understood it furnishes one of the clearest evidences of the nature of the unconscious mental conflict.

It is here that Freudianism shows its departure from the more partial therapy of hypnosis. The earliest psychoanalytic discoveries arose out of experience in hypnotic treatment and Freud at first employed this earlier method of approach to the unconscious. He soon, however, surpassed its inherent limitations and realized the advantage of the conscious co-operation of the patient in the detailed investigation of the unconscious and its minute analysis. Hypnotic success was recognized as a special example of the working of the transference phenomenon whereby the physician, by adopting a rôle which in reality represented the original parental attitude, created the condition of supreme dependence and received the unconscious revelations of the patient who through hypnosis had entered into the infantile world. In this condition of things there was a fruitful field for suggestion and its effect. Freud nevertheless soon discarded suggestion as he left hypnosis behind, for he perceived that a complete and permanent result was assured rather by the patient's co-operation and by the gradual realization on the part of the patient of the meaning of his conflict and the way out of it, than by the acceptance of suggestion which was conditioned by an infantile attitude of dependence.

Psychoanalytic therapy has hardly as yet passed beyond the stage of its infancy. But it arose out of experience and has been unfolded through its application to a large class of sufferers who were finding effective relief in no other manner. It is for this reason a method that deals with vital human problems and reveals a way of understanding them hitherto unknown. It claims to be only a pragmatic tool in the making, but one which carving into the pressing realities of modern existence must either evince its utter worthlessness or be perfected and enlarged in the process of application. Its results are already attested by signal success in many cases where a life condemned to a useless round of meaningless ceremonies, of profitless ineffectual effort, or of painful never solved struggle has given place to a clear self-understanding and a control of forces toward productive work and purposeful adjustments. It has moreover brought an illumination into the dark problems of mental disease suggestive of great promise for the future and likewise thrown much light in the direction of a clearer understanding of physical symptoms as avenues for psychical expression and thus of the relationship of mind and body. The clinical and therapeutic advance which this signifies has scarcely as yet made an entrance into general medical comprehension and appreciation, but through the results of their application psychoanalytic principles are steadily gaining ground.

SMITH ELY JELLIFFE.

FREUND, froint, **Herman Ernst,** Danish sculptor: b. Uthlede, Hanover, 15 Oct. 1786; d. Copenhagen, 30 June 1840. At first a blacksmith, he studied at the Copenhagen Academy of Fine Arts, won the academy's large gold medal with allowance for foreign study, and resided in Rome from 1817 to 1828, where he was greatly assisted in artistic progress by Thorwaldsen and executed his 'Mercury' and 'Luke.' His conspicuous successes were produced in the domain of Norse mythology, to which field belongs his Ragnarök frieze, not finished until after his death, when it was placed, in 1841, in the Christianborg Palace, where it was destroyed by fire in 1884. Other works by him are 'Eurydice,' 'Thor' and 'Mimer and Bolder Consulting the Norns,' and a monument of Hans Tousen at Viborg. After his return to Copenhagen he became teacher and director at the Kunstverein and later at the Academy of Fine Arts. Consult Freund, V., 'H. E. Freund' (1883); Solter, M., 'H. E. Freund, Danish Sculptor' (in *Scandinaira,* Vol. II, p. 148, Chicago 1885).

FREUND, Wilhelm, German classical scholar: b. Kempen, Posen, 1806; d. 1894. He was of Jewish parentage, was educated at Berlin, Breslau and Halle, was professor at Breslau 1828–29, Hirschberg 1848–51, at Gleiwitz 1855–70, and at Breslau after 1870. His greatest work is the 'Wörterbuch der lateinischen Sprache' (1834–45), based on Forcellini's lexicon. Other important works were the 'Gesamtwörterbuch der lateinischen Sprache' (1844–45); and 'Lateinisch-deutsches und deutsch lateinisch-griechisches Schulwörterbuch' (1855); 'Wie Studirt man Philologie?' (6th ed., Stuttgart 1903); 'Tafeln der Litteraturgeschichte' (1877); 'Triennium Philologicum' (3d ed., 1906 et seq.); the series of 'Präparationen zu den griechischen und römischen Klassikern' (1859 et seq.); 'Wanderungen auf Klassischem Boden' (1889–92). Andrews, Lewis and Short, Riddle and White, and Dr. Smith based their Latin-English dictionaries on Freund's work.

FREY, or **FREYR,** frār, the son of Njörd, of the dynasty of the Vanagods. He is the god of fruitfulness and peace, patron of marriage and had his chief temple at Upsala. He was greatly venerated in Sweden, Norway and Iceland. For a full account of his genealogy, his exploits and the worship rendered him, consult Paul, 'Grundriss der germanischen Philologie' (Vol. III, Strassburg 1900).

FREY, frī, **Emil,** Swiss statesman: b. Arlesheim, near Basel, 24 Oct. 1838. While in the United States in 1861 he enlisted as a sergeant in the Federal army, was taken captive at Gettysburg and confined in Libby Prison. He returned to Switzerland in 1865, there becoming prominent as a journalist, and was Minister from Switzerland to the United States 1882–87. In the Nationalrat he was a leader of the Left in 1872–82 and president in 1875–76. He was elected President of the Swiss Confederation 14 Dec. 1893. He is a noted advocate of educational progress and reform and has been prominent in the furtherance of public works and of army improvement. Frey was one of the most prominent supporters of the Saint Gotthard tunnel project and of other great enterprises to facilitate communication. Other projects dear to him were a greater and better army, an improved and extended system of frontier fortifications and a change in the forestry conservation system. He was appointed director of the International Telegraph Bureau at Bern in 1897, and 1906 presided at the first conference for the International Protection of Wage Earners.

FREY, Friedrich Hermann. See GREIF, MARTIN.

FREY, Heinrich, German anatomist and zoologist: b. Frankfort-on-the-Main, 15 June 1822; d. Zürich, 17 Jan. 1890. He began his studies at Bonn in 1840, and continued them up to 1845 at Berlin and Göttingen, when he took the degree of doctor in medicine and at the last-named university became assistant professor of physiology. In 1848 he was appointed professor of histology and comparative anatomy at Zürich, and professor of zoology at the Polytechnic Institute there. He wrote several volumes on histology and microscopy which are among the leaders in their special field. They include 'Histologie und Histochemie des Menschen' (5th ed., 1876; English trans. 1874); 'Das Mikroskop und die mikroskopische Technik' (8th ed., 1886; English trans. 1874); 'Grundzüge der Histologie' (3d ed., 1885). He was considered one of the first microlepidopterologists of Germany. He wrote a 'Text-Book of Zootomy' (1847); 'An Introduction to the Study of Invertebrates' (1847); and an elaborate account of the lepidoptera of Switzerland.

FREY, Joseph Samuel Christian Frederick, American clergyman: b. Mainstockheim, Bavaria, 1773; d. Pontiac, Mich., 1850. He was of Jewish parentage, and at an early age began the study of Hebrew theology, and became a reader in the synagogue in 1794. He was converted to Christianity in 1798, went to England and from 1800 to 1807 was a missionary of the London Missionary Society among the Jews of England. He came to America in 1816 and two years later became pastor of the Mulberry Street Congregational Church, New York. He established the American Society for Improving the Condition of the Jews in 1820. In 1827 he joined the Baptist ministry, and during the next 10 years held several pastorates in that Church. From 1837 to 1840 he labored in Europe for the American Society for the Conversion of the Jews, and met with little success. He returned to America in 1840 and settled at Pontiac, Mich., where he became instructor in Hebrew in the University of Michigan. He published 'My Life' (1809); 'Judah and Israel' (1837); 'Hebrew-English Dictionary' (1839); 'Hebrew Grammar' (1840); 'Joseph and Benjamin: A Series of Letters on the Controversy between Jews and Christians' (2 vols., 1842).

FREYBURG. See FREIBURG.

FREYCINET, frā-sē-nā, **Charles Louis de Saulces de,** French statesman: b. Foix (Ariège), 14 Nov. 1828. He was trained as an engineer, and held several important appointments, and rendered notable service when associated with Gambetta in the War Department in 1871. He was elected to the Senate in 1876, and became Minister of Public Works in the following year. He was Minister of Foreign Affairs and president of the Council 1879–80, and these posts he held on several subsequent occasions. In 1888 he became Minister for War, and continued to hold that office for five years, during two of which (1890–92) he was also Premier. In 1893 he had to resign owing to the Panama scandals. As head of the War Department he did much to strengthen and develop the French army. In 1898–99 he again held the post of Minister of War. He is the author of several important works on engineering and sanitation, and of 'La Guerre en Province pendant le Siège de Paris' (1872); 'Essais sur la philosophie des Sciences' (1895); 'La Question d'Egypte' (1905). In 1914 he published two volumes of memoirs. In 1890 he was elected to the French Academy.

FREYCINET, Louis Claude Desaulses de, French naval officer and navigator: b. Montélimart, Drôme, 7 Aug. 1779; d. 1842. He entered the navy in 1793, and saw service against the English and Spanish in 1795. With his brother Louis Henri he joined Baudin's expedition in 1800 for the exploration of the south and southwest coasts of Australia in the *Naturaliste* and *Géographe*. This expedition traversed much of the ground explored by Flinders. He returned to Paris in 1805 and received an appointment in the Department of Marine Maps and Charts, with the assignment to make maps of the territory he had covered with the Baudin expedition. He went to Rio de Janeiro in 1817 in command of the *Uranie* to take a series of pendulum measurements. He was accompanied by Arago, and his expedition was in reality part of a general plan of investigations in ethnology, geography, astronomy, meteorology, terrestrial magnetism and for collecting natural history specimens. On this voyage Freycinet visited Australia, Marianne, Hawaii, other Pacific islands, and South America. The *Uranie* was lost but nevertheless Freycinet returned to France with several splendid collections. He published 'Voyages de découverte aux terres australes pendant les années 1800–04' (2d ed., 1825); and 'Voyage autour du monde entrepris par ordre du roi' (13 vols., 1824–44). He also published some scientific memoirs and was one of the founders of the Geographical Society of Paris.

FREYLINGHAUSEN, frī'ling-how'zen, **Johann Anastasius,** German theologian and religious poet: b. Gandersheim, 1670; d. 1739. He was educated at Jena, where he studied theology. In 1695 he removed to Halle where he was assistant to Francke, and later became pastor and director of the Pedagogical Institute. He published several important works of theology, but his fame rests chiefly on the many hymns he composed and edited. His 'Compendium der christlichen Lehre' appeared in English in 1804 under the title 'Abstract of the Whole Doctrine of the Christian Religion.' The 'Grundlegung der Theologie' (14th ed., 1744) long remained a very popular work. Of his hymns the principal may be found in the collections 'Geistreiches Gesangbuch' (1714), containing 683 hymns, and 'Neues geistreiches Gesangbuch' (1718), containing 798 hymns. His hymns were very popular in Protestant Germany and have been republished many times.

FREYTAG, frī'täg, **Gustav,** German novelist, journalist and critic: b. Kreuzburg in Silesia, 13 July 1816; d. 30 April 1895. He was a son of the physician and burgomaster, Gottlob Ferdinand Freytag, a man of much dignity and reserve. His mother was cheerful, sympathetic and helpful. Seiler, one of his biographers, compares Freytag's home life with that of the young Goethe. It is certain that he never suffered any privations and had all possible assistance in obtaining a good education. At the age of 13 he entered the gymnasium at Oels. Here he developed a taste for wide reading. Of foreign authors he became interested chiefly in Walter Scott and James Fenimore Cooper. He himself has given testimony to the influence these writers had upon him during the formative period of his life.

In 1835 he left the gymnasium to enter the University of Breslau with the intention of devoting himself to the study of the classics. He came in touch here with Hoffman von Fallersleben who introduced him to the wonderland of Germanic antiquities. In the fall of 1836 he went to the University of Berlin where he attended the lectures of Karl Lachmann. According to Freytag's own account Lachmann was an inspiring teacher, and his lectures on the 'Nibelungenlied' and the history of the literature of the Middle Ages became the basis of Freytag's later studies in this field. In 1838 Freytag was granted the degree doctor of philosophy by the University of Berlin. In 1839 he established himself as lecturer (*Privatdozent*) in the German language and literature at the University of Breslau, but resigned the position after only a few years, to devote himself entirely to literary studies. In 1848 he moved to Leipzig, having purchased in company with Julian Schmidt, the literary historian, the political and literary journal known as the *Grenzboten*. They announced their editorial policy as liberal in politics and also in literature, but opposed to the strongly radical and revolutionary ideas of «Young Germany.» Freytag was connected with this journal almost during the entire period from 1848–70. All his important writings, except 'Die Ahnen' and 'Erinnerungen aus meinem Leben,' were published in this period. In 1870 he was summoned by the Crown Prince, later Emperor Frederick III, to his headquarters in the Franco-Prussian War as correspondent. The 10 years following he devoted to the writing of the series of historical novels, 'Die Ahnen.' The latter part of his life was spent in Wiesbaden and Siebeleben. After 1880 he took little interest in political and literary matters.

As a journalist he wrote many articles of more than passing value, but as a literary man his fame rests chiefly on four works: 'Die Journalisten' (1853), 'Soll und Haben' (1855), 'Bilder aus der Deutschen Vergangenheit' (5 vols., 1859–67) and 'Die Ahnen' (1872–80). 'Die Journalisten' is one of the most interesting of German comedies and is keenly enjoyed even to-day when it is well performed. The most successful character of the play is Konrad Bolz, a cheerful journalist, who feels the discords of his time, but whose genial nature makes the best of all situations. The acting qualities of the play are largely due to a brilliant dialogue. 'Soll und Haben' was an epochmaking novel in which Freytag ennobled the routine and toil of daily life. He conceived it to be the duty of writers in those trying times of political turmoil and social unrest to hold up before the people an example of their ability for efficient work. In its genial humor this novel shows the influence of Dickens. Its success was phenomenal, 64 editions having appeared up to 1906. The present-day reader, however, usually finds it somewhat tedious. 'Bilder aus der Deutschen Vergangenheit' is a series of descriptions of German life from its beginnings to recent times. In its clear style this work is a masterpiece of German prose. Freytag sketches the life in castle and cloister, the exploits of the knights of the Middle Ages, the intellectual ferment of the Reformation, the degradation of the Thirty Years' War, the rise of the Prussian state, and finally the wars of liberation of 1813–15. 'Die Ahnen' is a cycle of eight novels in which Freytag made a poetical transcription of his 'Bilder aus der Deutschen Vergangenheit.' The artistic value of these writings varies, but upon the whole the series is attractive and has the distinction with the 'Bilder' of setting forth the unity and continuity of German life. Another of his novels, 'Die Verlorene Handschrift' (1864), is not quite on the same plane as 'Soll und Haben.' The characters are somewhat artificial; they have not developed from life itself, but show the hand of the conscious imitator of real art. The humor, too, is at times forced and the language is not always spontaneous and free from mannerisms. Freytag's theoretical work, 'Die Technik des Dramas' (1863), indifferently translated by McEwan, Chicago 1894, is based upon the classical German drama. It is instructive and stimulating and states the fundamental dramatic laws clearly, but it should not be misused by trying to derive from it absolute rules that must invariably be followed. Other works of lesser importance are the dramas 'Die Brautfahrt, oder Kunz von der Rosen' (1841); 'Die Valentine' (1847); 'Graf Waldemar' (1850); and 'Die Fabier' (1859). 'Karl Mathy,' a biography, was published in 1870 and 'Lebenserinnerungen' in 1886.

At his death in 1895 Freytag was enjoying great popularity and his popularity has not waned up to the present day. He was not a genius, unless we define genius as «an infinite capacity for taking pains.» He himself early recognized that he lacked the divine spark, but undaunted he made the most of the talent he possessed. «German poetry, German scholarship and German patriotism,» as Erich Schmidt says, «were in Freytag fused into an indissoluble unity.» (See DEBIT AND CREDIT; JOURNALISTS, THE). Consult Collected Works, 22 vols., 1886–88; Lindau, Hans, 'Gustav Freytag' (Leipzig 1907); also Seiler, Friedrich, 'Gustav Freytag' (Leipzig 1898), and Schmidt, Erich, 'Dem Andenken Gustav Freytags' (in 'Deutsche Rundschau' (Vol. 83, pp. 453–464); republished in 'Charakteristiken,' 2d series, Berlin 1901).

WILLIAM F. HAUHART,
Assistant Professor of German, University of Michigan.

FRIAR, from the French *frère*, Latin *frater*, signifying brother, is a name common to the male members of any religious order. Thus the Capuchins were originally called Friars Hermits Minor, and the Observants, Friars Observants. The term, however, is more exclusively applied to those of the mendicant orders; of which the four chief were the Dominicans (Black Friars), Franciscans (Gray), Carmelites (White), and Augustinians. The most important lesser orders of friars are the Minims; the Third Order Regular of Saint Francis; the Capuchins; the Discalced Carmelites; the Discalced Trinitarians; the Order of Pennance or Scalzetti. Consult Creighton, M., 'Historical Lectures' (1904); Heimbucher, N., 'Die Orden und Kongregationen' (Paderborn 1907); Hélijot, P., 'Histoire des Orders Monastiques réligieux, etc.' (8 vols., Paris 1714–19); Monahan, W. B., 'Monks and Friars' (in *Associated Architectural Societies, Reports and Papers,* Vol. XXVII, p. 419, Lincoln 1904); Wietz, F. K., 'Abbildungen Sämtlicher Geistlicher Orden, etc.' (2 vols., Prague 1821).

FRIAR BACON, popular title of Roger Bacon. It is employed in a play of 1594 by Robert Greene under the title 'The Honorable History of Friar Bacon and Friar Bungay.' Thoms' 'Early English Prose Romances' (London 1828) contains the reprint of a prose work of 1627, entitled 'The History of Friar Bacon.'

FRIAR-BIRD, a familiar woodland bird of Australia, of moderate size, with brownish-drab plumage, head and neck bare of feathers and a cowl-like neck-ruff. They frequent tree-tops, possess considerable strength and boldness, and, when injured, have been known to inflict severe wounds with their strong claws and beaks. It is an aberrant form of honey-eater (*Meliphagidæ*); some 16 species, all of the Malayan and Australian regions, are grouped in the genus *Philemon*, of which the present species is named *P. corniculatus*, in reference to a horny excrescence upon the base of the culmen of the beak. Its loud cries and other peculiarities have given it many local names, such as «monk,» «leatherhead,» «poor soldier,» «pimlico» and «four o'clock.» Consult Gould, J., 'The Birds of Australia' (7 vols., London 1848); Le Souëf, W. H. D., 'Wild Life in Australia' (Christchurch 1907).

FRIAR'S BALSAM, popular term for the compound tincture of benzoin. It is often applied to a similar preparation, balsamum traumaticum. Friar's balsam is extensively used as a dressing for wounds and ulcers, having the properties both of a stimulant and of an antiseptic.

FRIAS, frē'äs, **Tomás**, distinguished Bolivian statesman: b. Potosí 1805; d. 1884. He was Secretary of State during several administrations, and in 1872, on the death of Morales, was chosen provisional President. He was elected to the vice-presidency in 1873 and in the following year succeeded to the presidency on the death of President Ballivian. His administration passed quietly, undisturbed by internal dissension, and was marked by many progressive measures. His term of office expired in 1877 and in 1879 he became Minister to France. Because of his progressiveness and integrity he is regarded as one of the greatest statesmen of South America.

FRIBOURG, fri'boorg, or **FREIBURG**, Switzerland, canton in the western portion of the country, bounded on the north and east by the canton of Bern, and on the south and west by Vaud, on the northwest by Lake Neuchatel. Its area is 646 square miles. The southern and eastern portions of the canton are elevated and the northwestern portion forms part of the basin of Lake Neuchatel. The Broye and the Saane are the principal rivers. Wood for export is obtained in the mountain forests, which yield also quantities of limestone, gypsum and pitch coal. Grain, potatoes, tobacco, fruit and grapes are the general crops grown on the productive area, which is 88 per cent of the total. Dairy products, black cattle and draft horses form considerable export items. The manufactures include watches, cigars, tobacco, paper, glass and woolens. Straw plaiting and tanning form the leading industries. French is the official language, but legislative measures are published in German also, since the canton is on the dividing line between the French and German-speaking populations of Switzerland. Roman Catholicism is the prevailing religion. Educational facilities are many, comprising the University of Fribourg, a seminary, college, industrial schools and many secondary and elementary schools. The ancient inhabitants were the Helvetii, who were in time displaced by the Alemanni and the Burgundians. The Franks took hold of the country in the 6th century, and in 1032 it became a part of the Holy Roman Empire. At the time of the Reformation Protestantism was not allowed to spread here. The French conquered the land in 1798 and held it until 1814. The canton is the most conservative in Switzerland, and popular rights are still rather restricted. The government is administered by a Grand Council, chosen by popular vote, and seven representatives are chosen for the National Council. Pop. 139,200. Consult Berchtold, 'Histoire du canton de Fribourg' (Fribourg 1841–45); and Marrot, 'Chronique du canton de Fribourg' (ib. 1878).

FRICK, Henry Clay, American manufacturer: b. West Overton, Pa., 19 Dec. 1849. He began business life as a clerk for his grandfather, a flour merchant and distiller, and later embarked in a small way in the coke business. He was president and since 1897 has served as chairman of the board of directors of the H. C. Frick Coke Company, now the largest producer of coke in the world, operating nearly 40,000 acres of coal and 12,000 coke ovens, with a daily capacity of 25,000 tons. He came into public notice by his vigorous management during the famous strike at Homestead, Pa., in 1892, when he was several times shot and stabbed by one of the strikers. In 1889–92 he was chairman of the board of the firm of Carnegie Brothers, and later chairman of the board of managers of the Carnegie Steel Company. He is a director of the Pennsylvania Railroad Company, the Atchison, Topeka and Sante Fe, the Chicago and Northwestern railways, the United States Steel Corporation, the Norfolk and Western Railroad Company, etc.

FRICTION, in mechanics, is the adhesion or degree of adhesion of contacting surfaces; the resistance which opposes the slipping or sliding of two bodies in contact. In an active sense, it is the rubbing together of things; in a passive sense, it is the tendency to adhere or stick, presented by bodies in contact, whether moving or at rest. Gritty substances and sticky substances between surfaces tend to increase friction; oils, fluids and gases interposed tend to reduce friction. The degree of friction between surfaces is determined by: (1) the weight or pressure with which they contact; (2) the extent or surface of area in contact; (3) the degree of roughness or smoothness of the contacting surfaces; (4) the speed at which the surfaces move; (5) the extent or kind of lubrication employed. The angle of friction is the maximum slope at which one body will rest on another without the upper one sliding off by gravity. Efforts have been made to tabularize the angle of friction of different contacting surfaces, but so many conditions are involved that in practice such tables are worthless. It is generally true, however, that at 45 degrees almost all straight surfaces will slip and smooth lubricated surfaces can be depended upon to slip at half that angle. A block placed on a flat, smooth surface can be moved by a force equaling two-fifths of its weight.

When friction is considered with reference to two bodies at rest, it is called static friction. Instances of static friction in machinery are noticeable in friction couplings or friction discs, consisting of two discs placed close together, just out of contact, one of which rotates while the other is stationary, but when both discs are tightly pressed together by the action of a lever, they rotate together, as if they were one. Friction between bodies in motion is called kinetic friction. This exists in the journal or bearing of an axle, on the working surface of cams, etc., in machinery; and machine designers as well as operators of machines should keep down such friction all they can, as it uses power to no good end.

Static friction is measured by the force that is required to just cause one body to move upon the other, when the two are pressed together by a certain definite pressure; and the ratio of this force to the pressure with which the bodies are held in contact is called the «coefficient of statical friction.» Kinetic friction is measured by the force that is required to maintain one of the bodies that are in contact, in a state of uniform motion with respect to the other one; and the ratio of this force to the force with which the bodies are pressed together is called the «coefficient of kinetic friction.» The coefficient of static friction between two given substances may be determined by causing a weight composed of one of the substances to rest upon a smooth plane composed of the other substance. If the plane is nearly horizontal, the weight will not slip upon it; but by increasing the angle of inclination, a position will be found for the plane, such that the weight is just on the point of sliding. The angle that the plane then makes with the horizontal is called the «angle of repose» of the pair of substances of which the plane and the weight are composed; and it may be shown by the elementary principles of mechanics that the coefficient of statical friction for these substances is numerically equal to the natural tangent of the angle of repose.

Rolling friction presents different characteristics from rubbing or static friction. It arises from the contact between a stationary surface and a rolling wheel, sphere or cylinder, or between two rotating surfaces. The tractive effort required to draw a cart on a smooth level road is about one-thirtieth of the weight of cart and load. A carriage wheel running on the ground is an instance of rolling friction, while the friction in the axle box is rubbing friction if the bearing be a plain one, or rolling friction if ball-bearings or roller-bearings are employed. Some have thought there was no friction between the steel balls and the raceway of a ball-bearing, but it is obvious that the weight or pressure produces static friction and that the imperfections of the surfaces, even though very minute, must always exist and there is almost sure to be some dust or grit in such bearings at some time, hence rolling friction has to be figured on by machine designers, even in the best bearings, though it may be trifling, as in the ball-bearings of a typewriter. Sliding friction is a term used as opposed to rolling friction and is identical with kinetic or rubbing friction, except that it suggests surfaces designed to slide easily.

To reduce friction in the moving parts of machinery, the parts contacting are made smooth, and their area or surface is kept small, as in roller-bearings and ball-bearings. (See BEARINGS). Provision is also made for some form of lubrication, the common plan being to bore small holes leading to the bearing or other point of friction and supply such holes with oil occasionally. In large bearings grooves are often cut diagonally in the surface of shafts to carry the oil to the entire surface. The principle of lubrication is the placing of a film of slippery substance between rubbing surfaces not so slippery. Oil is the most common lubricant and thin oil is used on light-running machinery and heavy, thick oil or grease on heavy machinery where the weight might tend to drive out or use up the light oil quickly. Water is sometimes employed, being cheaper. Graphite is an efficient lubricant, employed in cases where it is difficult to retain oil, as on a bicycle chain. In kinetic friction between surfaces that are smooth and well lubricated, the results depend far more upon the nature of the lubricant than they do upon the nature of the rubbing surfaces; and they are also greatly dependent upon the method by which the lubricant is applied. When a journal is lubricated by means of an oily pad placed underneath it, the friction may be more than six times as great as when the same journal is run in a bath of oil. Speed also has a great influence upon the amount of friction developed.

Early books on mechanics and engineering contained assumed laws of friction which were quite erroneous and are now disregarded. There is no method of determining in advance the actual friction in a mechanism, because all the conditions are never certainly known, and some of them are subject to change daily or hourly. In a cotton-spinning frame, for instance, the cotton bands that drive the spindles tighten up through shrinkage on a damp day, causing undue pressure on the bearings and often doubling the friction of the machine. The most nearly frictionless machine ever constructed is doubtless the Emery testing machine, which is employed for testing great bars of steel, as by pulling them apart. Large sizes of this machine will exert a pull of 500,000 pounds and, of course, this involves tremendous strain on the parts of the machine, and when the piece tested is pulled apart and broken and the strain is thus suddenly released, the reaction of the parts strained is equal to the breaking strain and would rack the machine terribly were not almost frictionless devices introduced. These are the «weighing-heads,» constructed on the principle of hydraulic weighing machines. The blow of reaction is received by a plunger bearing against a body of water, and the shock is absorbed by the water without injury to the machine. It would appear that nature makes frictionless machinery, for the earth and planets revolve in a medium in space so tenuous that no evidence of friction is observable. Were friction present, it would show itself in retardation of rotation as well as as orbital revolution. For the internal friction of liquids see VISCOSITY.

CHARLES H. COCHRANE.

FRIDA, frē'dä, **Emil Bohusch,** Czech poet and dramatist: b. Laun, Bohemia, 1853; d. 1912. He received his education at Prague, and in 1893 became professor of literary history at the Czech university of that city. He became a member of the Austrian House of Peers in 1901. He wrote comedies, tragedies, epics, several novels and made many translations from the best Continental writers. He has been likened by some to Victor Hugo. Much of his work has been translated into German, and in English his one-act play 'At the Chasm' appeared in *Poet Lore* (Vol. XXIV, 1913).

FRIDAY, a savage in Defoe's 'Robinson Crusoe.' Crusoe saved his life on a Friday, named him after the day and was faithfully served by him.

FRIDAY, the sixth day of the week, so named from the Anglo-Saxon *Frigedag*, the day of Friga, the wife of Odin and the Teutonic goddess of love. The Anglo-Saxon corresponds to the Lat. *Dies Veneris,* day of Venus, whence the French *Vendredi,* Friday. Its religious associations are varied. According to the Mohammedans it was the day when Adam was created, entered Paradise, was expelled therefrom, the day of his repentance, of his death and is to be the day of resurrection. It is the Moslem «day of assembly» or sabbath. As the day of Christ's crucifixion it is generally observed in the Greek, Latin and other Christian episcopal churches as a fast day, except when Christmas falls on a Friday, and is especially observed on Good Friday (q.v.). From the same cause, also, it is regarded among the superstitious as an unlucky day, and was long associated in the public mind with the execution of criminals sentenced to death, which usually took place on Friday and was commonly called hangman's day.

FRIDAY CLUB, The, a social club founded by Sir Walter Scott in 1803. Its rendezvous was at Fortune's Tavern. For list of its members see Lockhart's 'Life of Scott' (Vol. II, Edinburgh 1850).

FRIDOLIN, or **FRIDOLD, Saint,** Christian missionary of the 6th century, known as «The Apostle of Allemania.» Our knowledge of him is contained in the life by Balther, written in the 10th century. He labored in Ireland, where he was born, in Poitiers and in the island of Säckingen in the Rhine. He is the patron saint of Glarus, Switzerland, and is represented on its coat of arms. He is commemorated in the ecclesiastical calendar on 6 March. Consult the life by Balcher in Mone's 'Quellensammlung der badischen Landesgeschichte' (Vol. I, Carlsruhe 1845); Heber, 'Die vorkarolingischen Glaubenshelden' (Göttingen 1867); Heer, 'Sankt Fridolin, der Apostel Alemanniens' (Zürich 1888).

FRIED, frēd, **Alfred Hermann**, German peace advocate: b. Vienna 1864. He removed to Berlin in 1883, where he established a bookstore. After 1891 he devoted himself to the peace movement, founded the German Peace Society in 1892 and edited the *Friedenswarte*. He was joint-winner of the Nobel Peace prize in 1911. He has published 'Friedenskatechismus' (1895); 'Tagebuch eines zum Tode Verurteilter' (1898; Eng. trans., 1899); 'Lasten des bewaffneten Friedens und des Zukunftskrieg' (1902); 'Handbuch der Friedensbewegung' (1905; 2d ed., 1911); 'Die moderne Friedensbewegung' (1906); 'Pan-Amerika' (1910); 'Der kranke Krieg' (1910); 'Der Kaiser und der Weltfrieden' (1910; Eng. trans., 1912).

FRIED Oskar, German composer: b. Berlin, 10 Aug. 1871. His early musical education was scanty, and was obtained at intervals; he played meanwhile in obscure orchestras. Humperdinck noticed him at Frankfort and from him Fried received his first systematic instruction in composition. Later he studied counterpoint at Berlin under Scharwenka. His first success was 'Das trunkene Lied,' which appeared in 1904. From 1907 to 1910 he conducted the *Sternscher Gesangverein* of Berlin, and in the latter year established a symphony orchestra. He is famed as a successful choral and orchestral leader. He has written a prelude and double fugue for string orchestra, two choral works, andante and scherzo for wind instruments, and several songs. Consult Bekker, P., 'Oskar Fried: Sein Werden und Schaffen' (Berlin 1907); Leichentritt, H., 'Oskar Fried' (Leipzig 1906).

FRIEDEL, frē'děl, **Charles**, French chemist: b. Strassburg 1832; d. 1899. He studied under Pasteur in his native town and continued his scientific education at Paris, entering the laboratory of Wurtz. In 1869 he was graduated with two remarkable theses, one in organic chemistry and one in mineralogy which at once brought him to the notice of men of science. He was made instructor at the Ecole Normale in 1871, and in 1876 became professor of mineralogy in the Sorbonne. In 1878 he became member of the Institute in succession to Regnault. He eventually succeeded Wurtz (1884) as professor of organic chemistry and director of the research laboratory in the Sorbonne, a position he maintained till his death. The Ecole de Chemie, in connection with the University of Paris, was organized by Friedel in 1892. His contributions to synthetic mineralogy and to industrial chemistry have been of the greatest and most far-reaching importance. His researches are recorded by him in 254 original memoirs and entitle him to a place among the foremost scientific men of the 19th century. His name is especially connected in association with James Mason Crafts (q.v.) with the synthetic method known as the Friedel and Crafts reaction (q.v.). He published, in addition to textbooks on mineralogy and crystallography, 'Cours de chimie organique professé a la faculté des sciences de Paris' (1887).

FRIEDEL AND CRAFT'S REACTION, in chemistry, a synthetic method discovered by the French chemist, Charles Friedel, in conjunction with James Mason Craft. This discovery revealed the action of various chlorinated compounds on hydrocarbons in the presence of aluminum chloride. A vast number of varying organic compounds may thus be produced in any ordinary quantity, for example, triphenyl methane is a commercial compound, necessary to the production of valuable dyes; by Friedel and Craft's Reaction process it can be produced rapidly and cheaply in any quantity required.

FRIEDELITE ($H_7(MnCl)Mn_4Si_4O_{16}$), an acid silicate of manganese, containing some chlorine, and crystallizing in the rhombohedral system, but also occurring massive. It is rose-red in color, transparent or translucent and is found in a manganese mine at Adervielle, France. It was named after the French chemist and mineralogist Charles Friedel (q.v.).

FRIEDENTHAL, frēd'ĕn-täl, **Karl Rudolf**, German statesman: b. Breslau 1827; d. 1890. He received his education at Breslau, Berlin and Heidelberg. He was elected to the Reichstag in 1867 and aided in founding the Free Conservative party. He was present as a member at the Versailles conference during the Franco-Prussian War at which the constitution of the German Empire was framed. In 1875–80 he held the portfolio of Minister of Agriculture and afterward was elevated to the House of Lords. He laid the foundations for the economic development of modern Germany.

FRIEDENWALD, Herbert, American author and editor: b. Baltimore, Md., 20 Sept. 1870. He was educated at Johns Hopkins University where he was graduated in 1890, and at the University of Pennsylvania from which he received the degree of D.Ph. in 1894. He was chief of the division of manuscripts of the Library of Congress from 1897 to 1900; edited the *American Jewish Year Book* from 1908 to 1913; was secretary of the American Jewish Committee from 1906 to 1913, and is an officer of the American Jewish Historical Society. He has written 'The Continental Congress'; 'The Journal and Papers of the Continental Congress'; 'Material for the History of the Jews in the British West Indies'' (1897); 'Some Newspaper Advertisements of the Eighteenth Century' (1897); 'Historical Manuscripts in the Library of Congress' (1898); 'A Calendar of Washington Manuscripts in the Library of Congress' (1901); 'The Declaration of Independence' (1904); 'Preparedness,' a play (1915); 'Upheaval,' a play (1915).

FRIEDERICIA, frē-dā-rē'sē-ā, **Julius Albert**, Danish historian: b. Copenhagen 1849. He was appointed assistant librarian of the library of the University of Copenhagen in 1891. He is the author of 'Danmarks ydre politiske Historie i Tiden fra Freden i Lybek til Freden i Brömsebro' (1876–81); 'Adelsvoeldens sidste Dage Danmarks Historie fra Christians IV's

Dod til Enevoeldens Indforelse' (1894); 'Revolutionen og Napoleon I 1789–1815' (1903); and 'Christian IV's egenhændige Breve,' in collaboration with Bricka (1878–1901).

FRIEDHEIM, frēd'hīm, **Arthur,** German pianist: b. Petrograd 1859. At an early age he showed signs of musical ability. He received the ordinary education of a German youth of the upper classes in the gymnasium and university. He studied under Liszt at Rome in 1880–82, acted as conductor in various theatres for several years and again studied with Liszt at Weimar. He visited the United States in 1890 and there made his début as a pianist. He obtained recognition very slowly owing to his lack of moderation. His execution was so spirited that it rendered his playing colorless, and obscured many other excellent qualities. Through extensive tours in Europe he gradually came to be recognized as the greatest of the Liszt players, and on his return to the United States in 1910 his conquest was immediate. After 1908 he continued to live in Munich. He has written an opera, 'Die Tänzerin,' which was produced at Cologne in 1905, and a concerto in B flat for piano and orchestra.

FRIEDLAND, frēd'länt, **Valentin,** German educator: b. Trotzendorf, Upper Lusatia, 14 Feb. 1490; d. Goldberg, Silesia, 26 April 1556. He was educated at the University of Leipzig, was instructor at the Görlitz School for a time, but was obliged to resign in 1518 because of his sympathy with the doctrines of Luther and Melanchthon. He was appointed rector of the Goldberg gymnasium in 1523 but remained only for a short time; he returned in 1531 and rendered the school one of the most famous in Europe. Its organization was unique for the period, being modeled on that of the Roman Republic, the students having a voice in the administration. Latin became the official language of the school. The buildings were destroyed by fire in 1554 and the school was temporarily installed at Liegnitz pending the erection of a new school building at Goldberg. Friedland died while the building was under construction. Consult the lives by Löschke (Breslau 1856) and Pinzger (Hirschberg 1825).

FRIEDLAND, Prussia, small town 28 miles southeast of Königsberg, in East Prussia, on the river Alle. The Russians under Benningsen were here defeated on 14 June 1807 by the French under Napoleon (q.v.). Pop. 3,029.

FRIEDLAND, Sagan and Mecklenburg, DUKE OF. See WALLENSTEIN.

FRIEDLÄNDER, C. Gottfried Immanuel, German geologist: b. Berlin 1871. He was educated in Berlin, in the Kiel University and the Zürich School of Technology. He traveled extensively in North America, Hawaii and Samoa in 1893–94. In 1896 he visited the Canary Islands, in 1897 Madeira, in 1906 he came to Mexico, revisited Samoa in 1907, traveled in Japan in 1908–09 and in 1912 in the Cape Verde Islands. He made a special study of volcanoes and all his travels were for the purpose of gathering data in regard to this subject. After 1901 he resided in Naples in order to study Mount Vesuvius. He built a volcanological institute there in 1913 and founded the *Zeitschrift für Vulkanologie*. He has written many papers on the relation between the production of diamonds and other precious stones to volcanic action. In 1910 he was a member of the International Geological Congress at Stockholm, where he proposed the establishment of a volcanological institute at Naples.

FRIEDLÄNDER, Ludwig, German classical scholar: b. Königsberg, Prussia, 24 July 1824; d. 1909. He received his education at the Königsberg gymnasium and at Leipzig and Berlin. In 1847 he was appointed privatdozent at the University of Königsberg and in 1858 became full professor there. He retired in 1892 and removed to Strassburg. During his active life he paid considerable attention to Roman archæology and Homeric literature. His most representative work is 'Typical Studies in the History of Roman Manners and Morals' (8th ed., 1910), written in popular style. 'The Remains of Nicanor's Emendations of the Punctuations of the Iliad' (1850); 'Die homerische Kritik von Wolf bis Grote' (1853); 'Analecta Homerica' (1859), constitute him an authority in Homeric criticism. Other works are 'Ueber den Kunstsinn der Römer in der Kaiserzeit' (1852); 'Darstellungen aus der Sittengeschichte Roms, etc.' (8th ed., 1910); the works of Martial (1886); Petronius' 'Cena Trimalchionis' (2d ed., 1906); Juvenal's works (1895).

FRIEDLÄNDER, Max, German musical scholar: b. Brieg, Silesia, 1852. In early life he engaged in commercial pursuits, finally gave up this career, studied singing under Garcia in London and later under Stockhausen at Frankfort. He made his début as a singer at London in 1880, but did not continue long in this field, having become interested in the history of music. He settled in Berlin in 1883, where he came under the influence of Spitta, which led him to pursue original researches in the history of music. The University of Rostock conferred on him the degree of D.Ph. in 1887. He was appointed instructor in the science of music at Berlin University in 1894, becoming professor in 1903. He set about writing an exhaustive biography of Schubert and in pursuing this task discovered over 100 lost songs of the latter and many old folksongs. In 1912 he lectured in the United States. He has published 'Goethe's Gedichte in der Musik'; 'Gedichte von Goethe in den Kompositionen seiner Zeitgenossen,' and 'Das deutsche Lied im 18 Jahrhundert.'

FRIEDMAN, Isaac Kahn, American author: b. Chicago, Ill., 3 Nov. 1870. He was graduated at the University of Michigan 1893. Later he took part of post graduate course in philosophy and English in the University of Chicago. He spent three years in the florist business with his brother, since when he has been special writer on Chicago newspapers and for various magazines. In 1908 he traveled through Japan, China, Korea for the Chicago *Daily News*, contributing articles on sociological and economic topics. He has written 'The Lucky Number' (1896); 'Poor People' (1900); 'By Bread Alone' (1901); 'Autobiography of a Beggar' (1903); 'The Radical' (1907).

FRIEDMANN, Alfred, German poet and novelist: b. Frankfort-on-the-Main, Prussia, 26 Oct. 1845. He received his education at the universities of Heidelberg and Zürich. In 1886 he removed to Berlin and there devoted himself to literary work, producing many novels and works of verse. Among his poems are 'Merlin,' 'Orpheus' (1874); two ballads; 'Biblical Stars' (1875), comprising three idylls; 'Love's Fire Test, Angioletta'; 'Lays of the Heart' (1888). He is the author of many novels, including 'Two Marriages'; 'Suddenly Rich' (1891); 'The Wild Rose' (1893); 'Inez de Castro' (1898); 'Tantalus' (1901); 'Die letzte Hand' (1902); 'Vier Liebhaber der Marquise' (1905).

FRIEDRICH, frēd'rĭн, **Johannes,** German Old Catholic theologian: b. Poxdorf, Bavaria, 5 May 1836. After studying at the universities of Bamberg and Munich he entered the Roman Catholic priesthood in 1859. In 1865 he became professor of theology in the University of Munich. At the Vatican Council, 1869–70, he united with his colleague Döllinger (q.v.) in opposing the dogma of papal infallibility, and when acceptance of the dogma was demanded by the archbishop of Munich of the faculty of the Munich University, he with Döllinger declined and was excommunicated. In 1882, however, he was given another professorship, being transferred by request to the philosophical faculty. He opened in 1874 the Old-Catholic theological faculty at the University of Bern and lectured there for a year. He was one of the leaders in founding the Old Catholic Church, but withdrew from active leadership in 1878 when the Old Catholic Synod voted to allow its priests to marry. Among his many writings are 'Tagebuch während des vaticanishen Concils' (1871); 'Documenta ad Illustrandum Concilium Vaticanum' (1871); 'Zur Verteidigung meines Tagebuchs' (1872); 'Beiträge zur Geschichte des Jesuitenordens' (1881); 'Geschichte des Vaticanischen Concils' (1877–87), and 'Life of Döllinger' (1899–1901).

FRIEDRICH, John, American violin-maker: b. Cassel, Germany, 1858. Having studied violin making under Oswald Möckel, he came to the United States in 1883, and shortly took prominent rank in his calling. In 1893 he obtained the highest award for violins, violas and violon-cellos at the World's Columbian Exposition. He has also made bows of very excellent workmanship, and came to be recognized as an expert in identifying and appraising rare specimens. Four of the choicest specimens of his violins are in the possession of Dr. Frank Waldo of Cambridge, Mass.

FRIEDRICH, Kaspar David, German painter: b. Greifswald, 5 Sept. 1774; d. Dresden, 7 May 1840. He obtained his training under Ruistoop at Greifswald and under Eckersberg at the Copenhagen Acadamy of Fine Arts. In 1795 he settled at Dresden, where he became member and professor of the Academy. He drew his inspiration from scenes on the Baltic, at Rügen and in the mountains of Germany. Of the Romantic school he excelled in depicting nature as seen through the psychologic medium of transitory human moods. Favorite motifs are the gloom of the forest, night scenes with moonlight or storms at sea. Notable among his works are the following: 'Abbey in an Oak Forest on a Winter's Evening'; 'Pilgrim on the Shore,' both in the Castle of Berlin; 'View in the Hartz Mountains'; 'Moonrise by the Sea,' in the National Gallery, Berlin; 'Rest at Harvest Time,' in the Dresden Museum; 'Grave of Hermann (Arminius)' in Hamburg; and 'The Pine Forest,' at Rügen. In 1906 his works drew general attention at the German Centenary Celebration at Berlin.

FRIEDRICH, Woldemar, German painter: b. Gnadau, Saxony, 20 Aug. 1846; d. 1910. He studied in Berlin under Steffeck, and in Weimar under Plockhorst, Ramberg and Verlat. He accompanied the German troops in the Franco-German War, and thence gained material for his illustrations in Daheim and in Hiltl's 'Der französische Krieg von 1870–71' (6th ed., 1891). In 1881 he became professor in the art school at Weimar and in 1885 in the Berlin Academy. He executed decorative paintings in Castle Hummelshain, Weimar; the Weimar gymnasium. Among several other decorative works on a large scale are to be especially noticed 'The Diet of Worms' (1892) in the aula of the gymnasium at Wittenberg, and the two mural paintings, 'Art and Science' and 'Book-trade and Printing' in the Booksellers' Exchange at Leipzig. He also painted a series of aquarelles and numerous genre-works in oils.

FRIENDLY ISLANDS. See TONGA ISLANDS.

FRIENDLY SOCIETIES IN AMERICA. See FRATERNAL SOCIETIES IN AMERICA.

FRIENDLY SOCIETY, the general name for English benefit associations, usually founded by the working classes for purposes of self-help, which have become mostly mutual insurance societies. They originated with the mediæval guilds and for a long time maintained no benefit funds but made grants to numbers in distress. The benefits are generally for sickness and funeral expenses. Some maintain superannuation funds, others offer endowments, insurance for shipwrecks, loss of working appliances or tools, convalescent homes, widows' and orphans' funds, homes for the aged, and relief for the unemployed. The local societies with their social features are giving way to strongly centralized bodies, with no social union, on a purely business basis, the dues being paid through agents or by mail. The affiliated orders, including the temperance societies, constitute an important portion of the friendly societies; they are democratic social centres, many are of an educational character, and include the pick of the English working classes and many from the lower strata of the middle class. Of the societies for women the United Sisters' Friendly Society is perhaps the most important. Considerable reforms have been effected by legislation providing a legal status and supervision. In 1910 there were 31,469 societies registered under the Friendly Societies Act of 1896 (amended 1908) and of these 29,425 submitted reports giving a membership of 14,-507,000 and funds aggregating $314,330,000. The Hearts of Oak Benefit Society and the Rational Aid and Burial Association are the largest centralized societies. Among the leading affiliated are the Ancient Order of Foresters and the Independent Order of Foresters.

These societies have had a very beneficial effect on the English working man, but they did not reach the very poor and helpless, who have been provided for to a degree under the National Insurance Act. (See OLD-AGE PENSIONS). Consult Baernreither, 'English Associations of Working Men' (London 1893); Fuller, 'The Law Relating to Friendly Societies' (3d ed., ib. 1910); Wilkinson, 'The Friendly Society Movement' (ib. 1886); id., 'Mutual Thrift' (ib. 1891); the *Nineteenth Century,* No. 45,891.

FRIENDS, The Religious Society of. The Religious Society of Friends, commonly called Quakers, had its origin in England about the middle of the 17th century, and was largely the result of the ministry of George Fox, who is often called its founder.

Early History.— George Fox, the son of a weaver, was born at Drayton, in Leicestershire, 1624, and began his public preaching about the year 1648. His spiritual views and practical application of Christian doctrines met a ready response in many pious persons (both Churchmen and Dissenters), and bitter opposition from others whose practices they condemned. His followers increased rapidly, and were known as «Children of Light,» «Children of Truth,» and «Friends of Truth»; finally adopting the name «Religious Society of Friends.» Among them were many itinerant preachers; Fox in his journal (1654) says, above 60 in number. From the first imprisonment of Fox in 1649 to 1687 Friends were the objects of almost continuous persecution. In 1656 Fox computed there were seldom less than 1,000 in prison. Between the years 1661 and 1697, over 13,000 Friends were imprisoned in England, 198 were transported as slaves and 338 died in prison or of wounds received in assaults while attending meetings. These persecutions were upon various pretexts, as, the refusal to pay tithes, to swear or to remove the hat; for preaching in public places; as disturbers of public worship, for speaking in «churches» (a practice then not uncommon); and as Sabbath breakers, for traveling to their meetings on the day called the Sabbath. Many were apprehended for keeping an unlawful assembly under the Conventicle Act. Scotland, Ireland, the Continent and America were early visited by their ministers.

The first to arrive in New England were two women, Ann Austin and Mary Fisher, who came to Massachusetts from Barbados in 1656. After five weeks' imprisonment and much cruel treatment they were sent back. Stringent laws were promptly enacted by that colony to prevent others from coming and owners of vessels from bringing them. Regardless of the cruel penalties of these laws, the Quakers continued to arrive and suffer their infliction. In numerous instances delicate women were «stripped naked from the middle up, tied to a cart's tail and whipped through the town» and thence through other towns. Four — one a woman — were hanged on Boston Common. Nevertheless they increased in numbers and spread to adjoining colonies.

The first Friends in New Jersey settled along the Raritan River in 1663. In 1677 over 200 came to this province and founded Burlington. William Penn joined the society in 1667. In 1681 he and several other Friends purchased East New Jersey, and in the same year Penn obtained from the Crown the grant of Pennsylvania. A few Friends were in the province before Penn acquired it, and two shiploads came in the fall of 1681. The next year Penn himself came with others, and in less than three years the colony had a population of 7,000. For a period of 70 years, and so long as the influence of Friends predominated, there were no conflicts with the Indians. At an early date the society cleared itself of human slavery. Friends began to protest against it as early as 1688, and for nearly 100 years the agitation was continued, until «in the year 1787 there was not a slave in the possession of an acknowledged Quaker.» This was largely due to the labors of John Woolman, a minister in New Jersey, whose journal has a literary reputation.

Organization and Discipline.— Fox and his co-laborers did not have an outward organization as an object. The organization and discipline were progressively developed. The first disciplinary meetings established were held monthly and were in a sense congregational. Some were held as early as 1656, but the practice does not appear to have become general before 1666. The first yearly meeting appears to have been held in 1656, the first in London in 1668, but it was not held there regularly until 1672. The first yearly meeting in America was held in Rhode Island in 1661. Monthly, quarterly and yearly meetings have geographical boundaries; and monthly meetings are subordinate to quarterly, and these to the yearly meeting, which is the source of discipline, and final judge of all questions. At stated periods monthly meetings appoint a few of their number as «Overseers,» whose duty it is to have a loving oversight of the members. Men and women hold separate meetings for business, although some subjects are jointly considered. Of late years the practice of separate meetings has largely been discontinued. Elders are men and women chosen out of the body as «Friends of solid judgment, prudence and experience,» to sit with the ministers and to advise, encourage or caution them as seems needful. Persons — men or women — who speak and pray in public to the satisfaction of the members are, in due time, publicly acknowledged as ministers, or those in whom the body recognizes the «true gift.» Such recognition does not confer upon them any new powers or authority. All members are embraced in a set of «Queries» which are answered, some quarterly — others annually, by meetings for discipline. These have reference to love and unity; attendance upon meetings; consistency in speech, behavior and apparel; oaths, military service and fraudulent business; moderation in trade and living, and just payment of debts; encouragement of a stated or paid ministry; care of the poor and education of children; and keeping records of births, deaths and marriages. (The answering of «Queries» has been discontinued in many meetings). Meetings have no presiding officer. In those for business a clerk is appointed, whose duty is to gather and record the sense or judgment of the meeting as expressed. No question is settled by a majority and no vote is taken. Christ is recognized as «the head over all things to the church.»

Distinguishing Views.—In the essential doctrines of the Christian religion Friends were in accord with their fellow Christians. The principal points in which they differed were:

1. Immediate Divine Revelation. Barclay ('Apology') says: «Nothing is less minded and more rejected by all sorts of Christians

than immediate divine revelation; insomuch that once to lay claim to it is matter of reproach." Again, "He that affirms himself so led (by the spirit of God) is, by the pretended orthodox of this age, presently proclaimed an heretic." Fox (Journal) says: "I saw that Christ had died for all men, and had enlightened all men and women with his divine and saving light. I was commanded to turn people to that inward light, spirit and grace, by which all might know their salvation and their way to God." Friends believed that this inward saving light of Christ was universal and came to both heathen and Christian.

2. Worship and Ministry. Barclay ('Apology') says: "All true and acceptable worship to God is offered in the inward and immediate moving and drawing of his own spirit. All other worship, praises, prayers and preachings, which man sets about in his own will, at his own appointment, and can begin and end at his pleasure are but superstitious will-worship." Again, "As our worship consisteth not in words, so neither in silence as silence; but in an holy dependence of the mind upon God: from which dependence silence necessarily follows in the first place, until words can be brought forth which are from God's spirit." Hence silence is the basis of meetings for worship, which can be, and often are, held without a minister or any vocal service. Neither ministers, nor others, are supposed to break this silence without an immediate opening of a subject, and a sense that the Lord requires the delivery of the message revealed. No special training or educational qualifications are considered necessary for the ministry, and no consistent "Quaker" minister accepts pecuniary compensation for services in that capacity. Accepting literally the command of Christ to his apostles, "Freely ye have received, freely give." Friends refuse to pay tithes or in other way to contribute to the support of a paid ministry.

3. Sacraments. Sacraments require the services of a priest or minister. Friends denied this necessity, rejecting all types and outward ordinances. They taught that the only saving baptism was that of the Holy Spirit, and that the true communion was not partaking of bread and wine, but the spiritual "eating of the flesh and drinking of the blood" of Christ. They held that marriage was the Lord's joining of man and woman, and, therefore, was not performed by man — men were but witnesses.

4. War, Oaths, etc. Friends have always maintained that war and oaths were inconsistent with Christianity, being forbidden by Christ and his apostles in the New Testament. Consistent members refuse to perform military service or partake in war-like preparations. They refuse oaths in civil courts or elsewhere as forbidden by Christ's language, "Swear not at all." In their early history they suffered much on this account. They decline the use of complimentary titles and language, believing they proceed from pride and tend to foster it. They refuse the complimentary use of the plural pronoun to a single person, although the "thou" and "thee" to judges and magistrates has often resulted in suffering. They use the numerical language of Scripture instead of the names of months and days in honor of heathen deities. Their plainness of dress is a testimony against pride, and any uniformity the result of a refusal to change its style at the dictates of fashion.

Present Condition and Membership.— With some unimportant exceptions the society maintained a practical unity until the year 1827. At that time a separation occurred in Philadelphia Yearly Meeting and later in others. Since then two district bodies have claimed the title "Religious Society of Friends," commonly distinguished by the names "Hicksite" and "Orthodox," although not recognized or officially used by either body. The name "Hicksite" came from Elias Hicks, a talented and popular minister of Long Island, whose ministry was the immediate cause of the schism. The Orthodox party hold that unsound doctrines caused the separations. The followers of Hicks, admitting differences in doctrines, contend that the real cause was not so much these differences, as an arbitrary exercise of authority by the Orthodox party. Quotations from Hicks establish the contention that the divinity of Jesus Christ, the doctrine of atonement, and the inspiration and authority of the Bible were denied or questioned. There were probably some grounds for the charge of an arbitrary spirit on the part of the Orthodox. In the separations, two-thirds of Philadelphia and New York yearly Meetings were of the "Hicksite" party, and in Baltimore four-fifths; in Ohio they were about evenly divided, while in Indiana Hicks had comparatively few sympathizers. No separations occurred in New England or North Carolina meetings, they continuing to be identified with the Orthodox bodies, which were officially recognized by London Yearly Meeting.

There are seven yearly meetings of the "Hicksite" Friends: Philadelphia, Baltimore, New York, Genesee (Canada), Ohio, Indiana and Illinois, numbering about 17,800 members. They are connected by epistolary correspondence. Their principal schools are Swarthmore College, and the George School in Pennsylvania, Friends Central in Philadelphia and similar schools in New York and Baltimore. *The Friend's Intelligencer*, an ably conducted weekly paper, is published in Philadelphia.

Several of the Orthodox yearly meetings have experienced separations. Joseph John Gurney of England, a wealthy and educated minister and voluminous writer, expressed views which many in England and America regarded as subversive of some always held by the society. Prominent among those in America who opposed his views was John Wilbur, a minister in New England. This resulted in a division in that Yearly Meeting in 1845, which was followed by one in Ohio in 1854. These, and later separations in others, resulted in two distinct bodies of Orthodox Friends within the limits of six yearly meetings, including Canada. They have been distinguished by the respective names, "Gurney" and "Wilbur," and the terms "Progressive" and "Conservative." In Ohio the "Conservative" body was the larger, and in each of the others the smaller. London gave its official recognition to the "Progressive" bodies. There are now 13 of these, connected with each other and with London and Dublin Yearly Meetings by correspondence: New England, New York, Canada, Baltimore, North Carolina, Ohio, Wilmington (Ohio), Western, Indiana, Iowa, Kansas, Oregon and California. Total membership in America about 75,000.

The six "Conservative" yearly meetings are: New England, Ohio, Canada, Western (Ind.), Iowa and Kansas. These annually exchange epistles. Their membership is about 4,000.

Philadelphia occupies a unique position, not being connected with either of these groups of related yearly meetings. That its sympathies were with Wilbur against the views of Gurney was shown by the recognition of the "Wilbur" Friends in Ohio. Later, in the interest of peace, Philadelphia ceased correspondence with all yearly meetings, and has never regularly resumed it. The membership is about 4,000. Within most "Progressive" yearly meetings paid pastors, prescribed services, singing, instrumental music and revival methods have been introduced; until, in many localities, the so-called "Friends Churches" more nearly resemble "Methodists" than "Quakers." These yearly meetings have organized "The Five Years Meeting," held periodically as the name indicates, having advisory rather than legislative powers. Most of them have recently adopted a "Uniform Discipline." The principal schools of Orthodox Friends in America are: Haverford College, Pennsylvania; Earlham College, Ind. (Iowa) Guilford College, North Carolina; Pacific College, Oregon; Westtown Boarding School, Pennsylvania; Friends Select School, Philadelphia; Friends Boarding School, Providence, R. I.; Friends Boarding School, Barnesville, Ohio. Their principal periodicals are *The Friend,* Philadelphia (weekly) and *The American Friend,* Philadelphia (weekly), organ of the Progressive Yearly Meetings.

Statistics.— The total membership in 1918 was given as about 142,000, the distribution being as follows: "Orthodox" in America, 97,514; in Great Britain, Ireland and Australia, 22,350. The "Hicksite" membership was about 17,806; that of the "Wilburites" 4,000; that of the "Primitive" branch 171. The Continental membership (Norway, Denmark, Germany, France, Turkey) was given a few years ago as 247.

Edwin P. Sellew,
Publisher of The Friend, Philadelphia.

FRIENDS OF GOD, a body of religious reformers of the 14th century. They were mystics and labored for the reformation of society and the Church. The brotherhood included many members of religious orders, especially Dominicans. It appears to have flourished more especially in Basel, Cologne and Strassburg. Consult Jones, 'Studies in Mystical Religion' (New York 1909); Jundt, 'Les amis de Dieu au quatorzième siècle' (Paris 1879); Rieder, 'Der Gottesfreund vom Oberland' (Innsbruck 1905).

FRIENDS OF THE PEOPLE, society founded in 1792 by Sheridan and Grey with the object of bringing about parliamentary reform. Fox and Pitt were opponents of its program. Grey introduced reform bills in 1792, 1793 and in 1797, but the time was not ripe for such changes because the nation was engaged in a long struggle on the Continent. It was not until after the downfall of Napoleon that the nation could turn to home reforms. The movement finally achieved its triumph in the Reform Bill of 1832.

FRIENDS OF THE TEMPLE, a German sect, called also the Temple Society and Hoffmannites, founded by the Rev. Christopher Hoffman at Württemberg about 1850. The Scriptures are accepted in their entirety, all the biblical prophecies are to be fulfilled and the members are bound to labor to accomplish this end. In order to do so the people of God are to be gathered in Palestine. Temples are instituted in different countries in order to facilitate this object. The sect established a colony at Jaffa in 1868, and others subsequently at Haifa, Sarona, Jerusalem and other points in Palestine. Hoffman died in 1885 and the religious side of the movement has since declined; at present the movement is important on its economic side and because of its furtherance of German interests in the East. Outside of Palestine there are communities in Württemberg, Alexandria, Egypt and one of 350 members in the United States. The Eastern communities have a total membership of about 1,500. Consult Hoffmann, 'Occident und Orient' (Stuttgart 1875); id, 'Mein Weg nach Jerusalem' (ib. 1881-85); Kalb, 'Kirchen und Sekten der Gegenwart' (1907).

FRIENDS UNIVERSITY, an institution of higher learning founded at Wichita, Kansas, by the Society of Friends in 1898. The faculty numbers 20; the average annual attendance of students is 300. The tuition fees are $50; the total productive funds $210,000; total annual income $22,600. The library contains over 8,000 volumes. The total number of graduates since organization is 275.

FRIES, frēs, **Elias Magnus,** Swedish botanist: b. Smaland, Sweden, 15 Aug. 1794; d. Upsala, 8 Feb. 1878. He was educated at Lund and in 1828 was appointed demonstrator in botany there. In 1834 he was called to the chair of practical economics at Upsala, with which in 1851 that of botany was conjoined. His botanical investigations deal with the field of systematic botany, but his work is especially valuable in its additions to our knowledge of lichens, mosses, fungi, etc. Fries introduced into Sweden the morphological theory in his 'Systems of the Vegetable World' (1825). His work on 'Mycology' (1820-32) was long the standard work on the classification of fungi, of which he gave a relatively complete catalogue in 'Scandinavian Flora' (1846–49). He wrote a series of useful books on the *Hymenomycetæ,* on lichens, and on the flora of Scandinavia, more particularly of Sweden. Among his monographs is one on the 'Hieracieæ' (1848). In 1851 Fries was appointed director of the botanical museum and garden at Upsala, and in 1853 rector of the university.

FRIES, Jakob Friedrich, German philosopher: b. Barby, Saxony, 23 Aug. 1773; d. Wartburg, Germany, 10 Aug. 1843. He received his education at Leipzig and Jena and in 1801 was appointed lecturer in philosophy at the latter university. He was professor of philosophy and elementary mathematics at Heidelberg 1806–16, after which he held the chair of theoretical philosophy at Jena. He is a link between Kant's system and the so-called historical school. According to his theory philosophy is founded in the last analysis in subjective knowledge and it is propounded thoroughly only by means of psychological analysis. 'The New or Anthropological Critique of Reason' (1807) is his most important book. He wrote also 'Handbook to Psychical Anthropology' (1820); 'System of Metaphysics' (1824), etc.

FRIES, John, American insurgent: b. 1764; d. 1825. He had a varied career, becoming in succession a cooper, soldier and auctioneer. His career of soldier was undertaken in the so-called Whisky Insurrection. When in July 1798, Congress voted a direct tax of $2,000,000 the Federal officers who were sent to Pennsylvania to collect the State quota of $237,000, were resisted by a party of opposition which Fries had rallied from among the Germans of Montgomery, Lehigh, Bucks and Berks counties. At Bethlehem, 7 March 1799, the United States marshal was compelled by this party to release 30 prisoners who had been arrested for refusing to obey the law. The «rebellion» was at length put down by the militia which President Adams ordered out, and among those captured was Fries, who was subsequently twice tried and on each occasion sentenced to death. In April 1800 he was pardoned by President Adams, who at the same time proclaimed an amnesty to all concerned in the «rebellion.» Removing to Philadelphia he engaged in the tinware business in which he became comparatively wealthy. Consult Davis, 'The Fries Rebellion' (Doylestown, Pa., 1899); McMaster, 'History of the People of the United States' (Vol. II, New York 1907); and, for an account of the trials, 'Das erste und zweite Verhör von John Fries' (Allentown 1839).

FRIESE, frē'zė, **Richard,** German painter: b. Gumbinnen, East Prussia, 15 Dec. 1854. He studied at Berlin, and traveled in the East, as well as northward within the Arctic Circle. He is now considered one of the best of German animal painters, and is equally successful in depicting the lion in the desert and the deer in a German forest. In 1886 he was awarded a gold medal by the Berlin Academy, of which body he was elected a member in 1892. His most famous works are 'Lions Surprising a Sleeping Caravan' (1884), in the Dresden Gallery; 'On the Bredszell Moor' (1895), in the Königsberg Museum; 'Elks on Field of Battle' (1890), in the National Gallery, Berlin; 'A Twenty-pronged Stag under Way,' owned by Emperor William II.

FRIESEKE, Frederick Carl, American artist: b. Owosso, Mich., 7 April 1874. He received his art education at the Chicago Art Institute, the Art Students' League, New York, the Julien Academy and the Whistler School, Paris. After 1900 he lived mostly in France; he is of the Impressionist school, and his work shows the influence of Renoir. He has painted many beautiful female figures and has done considerable work in the nude. 'Before the Mirror' hangs in the Luxembourg Gallery; his 'The Toilet' in the Metropolitan Museum, New York; 'The Open Windows' in the Art Institute, Chicago. Mural decorations by him may be seen in the Hotel Shelbourne, Atlantic City, and in the Wanamaker Auditorium, New York. There are also pictures by him in the Gallerie-Modern, Venice; the Modern Gallery, Odessa, Russia; the Telfair Gallery, Savannah, Ga.; the Minneapolis Art Institute; and the Syracuse Museum of Art. He has received several awards, including gold medal, Munich in 1904, silver medal at Saint Louis 1904, prize at the Corcoran Exhibition, Washington 1908, and grand prize for painting at the Panama-Pacific Exposition 1915. He was elected to the National Academy in 1914, and is a member of the National Portrait Society, London; of the Société Nationale des Beaux-Arts, the International Society of Painters and Sculptors and the Society of American Painters, Paris.

FRIESIAN, or HOLSTEIN-FRIESIAN, CATTLE. See DAIRY BREEDS, under CATTLE.

FRIESIAN ISLANDS. See TERSCHELLING; TEXEL.

FRIESLAND, frēz'lănd, or **VRIESLAND,** frēs'länt, a province in the Netherlands, bounded by the provinces of Groningen, Overyssel and Drenthe, and by the North Sea and the Zuyder Zee. It is generally flat, and parts of it are below sea-level, being protected by dykes. Excellent horses, the best in Holland, cattle and sheep are reared, and cattle and other pastoral and agricultural produce are the principal exports. It is sometimes called West Friesland, to distinguish it from East Friesland, now the district of Aurich in Hanover. It is divided into three districts — Leeuwarden, containing the capital of same name, Sneek and Heerenveen. Area, 1,281 square miles. Pop. 366,305. See NETHERLANDS.

FRIETCHIE, Barbara. See BARBARA FRIETCHIE.

FRIEZE, Henry Simmons, American educator: b. Boston, 15 Sept. 1817; d. Ann Arbor, Mich., 7 Dec. 1889. He was graduated from Brown University in 1841, was instructor there from 1841–45, conducted the grammar-school connected with the university 1845–54, and from 1854 until his death was professor of the Latin language and literature in the University of Michigan, of which in 1869–71, 1880–82 and 1887–88 he was the acting president. He was a pioneer in the teaching of Latin on more advanced lines, laying more stress on the interpretation of Latin texts as literature than as illustrations of grammatical rules. He was also an advocate of the elective in place of the compulsory system, and the originator of the system by which graduates of preparatory schools approved by the university are admitted on the strength of their diploma without examination, a system which has been copied by almost all the important universities in this country. In every direction he did much to promote the interests of the university, being chiefly responsible for the establishment of its school of political science and its school and museum of art; also obtaining for it a State appropriation of $75,000 and an important library in political science. He published an edition (1860) of the 'Æneid,' and (1867) of the 'Ars Rhetorica'; and 'Giovanni Dupré' (London 1886). Consult Angell, J. B., 'A Memorial Discourse on the Life and Services of H. S. Frieze' (Ann Arbor 1890); Butterfield, C. W., 'H. S. Frieze' (in *Magazine of Western History*, Vol. V, p. 254, Cleveland 1886); Kelsey, F. W., 'H. S. Frieze' (in *Nation*, Vol. L, p. 8, New York 1890).

FRIEZE, (1) the architectural term for the central part of an entablature between architrave and cornice or any similar position, in a work of structural decoration. It is often enriched with figures of animals, etc., in relief, and in the Doric order (q.v.) of architecture is divided by triglyphs into metopes. One of the best-known examples is the Panathenaic frieze around the cella of the Parthenon, (q.v.) part of which is now in the British Museum. It was used especially in classic and neo-classic architecture. Consult Bone, H. A., 'Frieze and its Origin' (in *Art Journal*, Vol. LIII, p. 149, London 1901). See ARCHITECTURE. (2) The name of a thick woolen stuff or cloth with a nap on one side, in use since the 14th century for heavy outer garments. Frieze is largely made in Ireland, whence considerable quantities are exported.

FRIGATE, the designation in the days of wooden war vessels of a full-rigged ship with two decks, and so distinguished from a ship of the line which had three. In time frigates were designed to ensure speed and ease in working them, while they remained of moderate size. After 1600, the frigate type became more or less fixed although a rigid adherence to a single form was not demanded until about 1750, after which frigates were classified as forty-fours, thirty-eights, thirty-sixes, thirty-twos, twenty-eights and twenty-fours; this classification being made on the basis of the number of guns aboard. In the British navy the tonnage of frigates was from 500 to 1,200, while in the early days of the United States navy, vessels over 1,200 tons were at times classed as frigates. Frigates were usually fast sailers, mounted with 28 to 60 guns, and were employed as scouts and as cruisers, to convoy merchantmen, etc. With the introduction of armor-clad war vessels the term frigate has been superseded by that of cruiser, but a large full-rigged merchantman is still sometimes so called. The name originally was used in the Mediterranean to designate a long, swift vessel propelled by oars and sails. Consult Chatterton, E. K., 'Ships and Ways of Other Days' (Philadelphia 1913); Holmes, G. C. V., 'Ancient and Modern Ships' (2 vols., London 1906).

FRIGATE-BIRD, or **FRIGATE PELICAN.** See MAN-OF-WAR HAWK.

FRILL-LIZARD, a large Australian lizard (q.v.) (*Chlamydosaurus kingi*) of the family Agamidæ, so called in allusion to the erectile collar or ruff about its neck. This broad membrane is supported on each side of the neck by slender rods from the hyoid bone which extend to its margin like the sticks of a fan; and like a fan it may be folded close against the shoulders or spread until it stands up all around the back part of the head; but this erection can be accomplished only by opening the mouth widely, and always accompanies a stretching apart of the jaws. The exterior of the frill is of the general grayish-brown of the animal's body, but its interior or front is scarlet; and when it is suddenly spread in the face of an enemy behind the open hissing mouth, it is calculated to astonish and frighten the attacker in no small degree, as seems to be the purpose of the structure. These lizards are six to eight inches long plus a long, lashlike tail. They spend their time on trees and logs, searching for the beetles which constitute their principal food; and have an extraordinary manner, when in haste, of rising and running upon their hind legs alone. Consult Kent, W. Saville, 'The Naturalist in Australia' (London 1897).

FRIMAIRE, frē'măr' (Fr. sleety), the third month of the French Republican Calendar of 1793. It began on 21 November in years II–III, and V–VII; on 22 November in years IV, VIII–XI, XIII, XIV, and on 23 November in the year XII.

FRINGE-TREE (*Chionanthus virginica*), a beautiful tree of 10 or 20 feet in height, with oval, smooth, entire leaves, white narrow-petaled flowers in drooping racemes, and oval, purple drupes. Its blossoms are not only suggestive of its English name, but of the generic title of *Chionanthus*, «blossoms of the snow.» It is found in the United States from latitude 39° to the Gulf of Mexico, and forms an attractive feature in garden shrubbery. In the Southern States it is known as old-man's-beard.

FRINGES, (1) in optics, the bands of light and drak due to the interference of light waves, produced when a beam of light passes the sharp edge of a screen, or passes through a narrow slit or biprism. (See DIFFRACTION OF LIGHT; OPTICS; INTERFERENCE; LIGHT). (2) In the English Bible, the translation of the Hebrew *gedilim* in Deut. xxii, 12, and of *sisith* in Numbers xv, 38. Consult Benzinger, 'Hebräische Archäologie' (2d ed., Tübingen 1907); Nowack, 'Hebräische Archäologie' (Freiburg 1894); and Robertson-Smith, 'Religion of the Semites' (London 1894).

FRINGILLIDÆ, frĭn-jĭl'ĭ-dē, the finch and sparrow family, an extensive group of oscine birds, regarded as the most highly organized of all birds. The old name *Fringilla*, applied by Linnæus to the whole group, is retained only for the typical genus, represented by the chaffinch (q.v.). All the fringillines are small, compact and active, without eccentricity of form or plumage, and with organs adapted to an omnivorous diet, although seeds form the principal part of the fare. The bill is usually stout and cone-shaped, varying from a greatly swollen size in some of the grosbeaks to the slenderness of that of the goldfinch. The legs are short, and scutellate; the feet strong; and the wings and tail do not vary much from normal, but the wing has a minute outer primary. The plumage is varied, and in many genera the sexes are unlike. These birds mainly frequent fields, roadsides and woodlands; and build their nests (often elaborate structures) in trees, in bushes or on the ground — never in burrows, or tree-holes, or composed of mud. Their eggs are usually five in number, and usually are spotted. The family includes extremely good singers, and furnishes us not only the canary but many other of the most popular cage-birds; also many whose flesh is considered a delicacy. The group is divided into scores of genera and contains hundreds of species, which predominate in the northern latitudes of the Old World, where many are resident throughout the year; but they also abound in all other parts of the world except Australia. Consult Coues, E., 'Key to North American Birds' (5th ed., 2 vols., Boston 1903); Evans, A. H., 'Birds' (London 1899); Ridgway, R., 'Birds of North and Middle America' (Part I, Washington 1901); Sharpe, R. B., 'Catalogue of the Passeriformes or Perching Birds in the Collection of the British Museum' (London 1888). See BUNTING, FINCH, GROSBEAK, LINNET, REDPOLL, SPARROW, and names of various species.

FRISBY, Edgar, American astronomer: b. Great Easton, Leicestershire, England, 22 May 1837. He received his education at the University of Toronto where he was graduated in 1863. For the ensuing four years he taught in Canada, afterward becoming acting professor of mathematics at Northwestern University. Later he became assistant astronomer at the United States Naval Observatory, Washington, and professor of mathematics in the United States navy. He was retired on 22 May 1899, and now holds the relative rank of commander. For the government he observed several eclipses and made a noteworthy computation of the orbit of the comet of 1882. Until his retirement he was in charge of the government's 12-inch equatorial telescope.

FRISCHES HAFF (L.G., Fresh-water Bay), Germany, a lagoon on the north of Prussia, south of the Gulf of Danzig. It is about 57 miles long, with a breadth varying from 2 to 18 miles, and an area of 330 square miles. Its depth varies from 10 to 18 feet. Until 1510 it was entirely cut off from the Gulf of Danzig by the Frische Nehrung; in that year the waters broke over the Frische Nehrung at its northeastern extremity, forming the passage called the Gatt. This passage was originally from 10 to 15 feet in depth, but has been dredged to a depth of 22 feet. Vessels of greater draft than this load and unload at Pillan, which is located at the mouth of the Gatt. Cargoes are thence conveyed by lighters to and from the ports on the Frisches Haff. The Nogat, Frisching, Pregal, the Passage and part of all the waters of the Vistula flow into the Frisches Haff.

FRISCHMANN, David, Hebrew author: b. Lodz 1863. He removed to Warsaw in early life, began to write at 13, and came into public notice by his endeavor to overthrow the archaic traditions of Hebrew literature, which throughout his life he has earnestly sought to pattern after European models. He has translated Bernstein's 'Naturwissenschaftliche Volksbücher'; Byron's 'Cain'; Nietsche's 'Thus Spake Zarathustra' and other works. He has written much both in prose and verse. He works have been published in 17 volumes at Warsaw.

FRISCO, a popular abbreviation of the name San Francisco.

FRISIANS, a people of Teutonic stock, who at the beginning of the Christian era occupied the coast lands stretching from the mouth of the Scheldt to that of the Ems. They were closely related by speech and blood to the Angles and Saxons, and the other Low German tribes, who lived in Schleswig-Holstein and to the east of the Ems. The first notice of this people is found in the 'Annals' of Tacitus. They became tributaries of Rome under Drusus, and lived for some time on friendly terms with their conquerors, but were driven to hostilities by oppression. They submitted again in 47 A.D., and in 58 attempted to extend their territory between the Rhine and Yssel; in 70 they rebelled again with the Batavians in the campaign of Claudius Civilis. From this time on their history is obscure for several centuries. They appear to have been confused with their neighbors, the Saxons and Batavians. It is very probable that great numbers of Frisians joined with the Angles and Saxons in their sea-roving expeditions, and assisted them in their invasions and conquest of England and the Scottish lowlands. About the end of the 7th century, the Frisians in the southwest were subdued by the Franks under Pépin d'Héristal, who compelled them to accept Christianity. A century later the eastern branch of the tribe was conquered and christianized by Charlemagne. Their country was divided into three districts, two of which were annexed on the division of the Carlovingian Empire to the possessions of Louis the German, and the other to Charles the Bald. The latter part was called West Frisia (West Friesland), and the two former East Frisia (East Friesland). The distinctive national features were gradually lost by assimilation with their neighbors, and their modern history is chiefly connected with Holland and Hanover.

Bibliography.— 'Gesta regum Francorum'; Emmius, Ubbo, 'Rerum Frisicarum historia' (Leyden 1616); Winsemius, P., 'Chronique van Vriesland' (Franoker 1822); Klopp, O., 'Geschichte Ostfrieslands' (3 vols., 1854–58); Hooft van Iddekinge, 'Friesland en de Friezen in de Middeleeuwen' (Leyden 1881); Blok, P. J., 'Friesland im Mittelalter' (Leer 1891).

Language and Literature.—A Low German dialect, formerly spoken along the North Sea coast from the Scheldt to the Ems, where dwelt the Frisians, from whom it takes its name. It is now much more restricted in territory, and is confined almost entirely to the peasantry. It is closely akin to Anglo-Saxon, and has many points in common with Dutch, Danish and Icelandic. As now spoken it is divided into numerous dialects, some of which differ widely one from the other. The general dialectic divisions are East, West and North Frisian. The East Frisian is again divided into the Ems and Weser dialects. It has been supplanted by Plattdeutsch, and is now spoken by but a few hundred people in the Saterland of Oldenburg and on the island of Wangeroog. The name East Frisian, however, is popularly given to the dialect of Plattdeutsch which has supplanted the older tongue. The North Frisian is subdivided into about 10 dialects, many of which are but admixtures of Low German, Danish or West Saxon. Of the pure North Frisian there is scarcely any record. West Frisian has extensive literary remains, however, and modern West Frisian is the vehicle of all modern Frisian literature. It is subdivided into six dialects, which do not diverge greatly. The morphology of the language is essentially of the German type and its syntax is of the type of the older German dialects.

Old Frisian literature is very scanty, consisting mainly of collections of laws, a few epic poems and sagas. The Asegabuch (1200) was a series of laws valid for all Friesland. An almost complete collection of those laws is to be found in Richthofen's 'Friesische Rechtsquellen' (1840). Most of the poetry is a mixture of dialects which renders it useless for the study of the language; 'Thet freske Rijm,' a collection made in 1671, is a good example. The most important work in North Frisian is 'Di Gidtshals of di Söl'ring Pid'ersdei' of Hansen, a comedy published at Flensburg in 1809, and which appeared in a second edition together with 'Di leddelk Stjüürman,' a story and some poems at Sonderburg in 1833. In West Frisian has appeared nearly all modern Frisian literature of any consequence. Its period began in 1609 with the comic dialogue entitled 'Een tramensprekinghe van twee boersche Personem, Wouter en Lialle.' West Frisian poetry received considerable impetus from the work of Gijsbert Japiks and Jan Althuysen in the 17th and 18th centuries, respectively. Since then there has been no great name in Frisian poetry, and comedy portrayals of peasant life form alike the best and bulk of modern Frisian literature. The most famous of these comedies are Meindert's 'It libben fen Aagtje Ijsbrants, of dy frieske boerinne' (1779); 'De tankbre boerezoon' (1778); 'De reijs fen Maicke Jakkelis' (1778); and 'Het jonge lienes boosk.' Other names of more recent date are Eeltje (1797–1858), Salverda, Rinse. Van Blom, Van der Wey-Rutgers, van der Veen, W. Dijkstra and Pieter Troelstra.

FRIT. See Glass.

FRITH, John, English Protestant martyr: b. Westerham, Kent, 1503; d. Smithfield, 4 July 1533. He was educated at Eton and at Cambridge, where he was graduated in 1525, and in the same year on the advice of Wolsey removed to Cardinal (now Christ Church) College, Oxford. Here he assisted Tyndal in his translation of the New Testament. Because of his leanings toward the Reformers he was for a time imprisoned at Oxford but Wolsey procured his release and he went to the Continent, where he was associated with Tyndal at the Protestant University of Marburg. He returned to England in 1532 and warrants were issued for his arrest without delay. He evaded arrest for several months but was at last taken at Milton Shore, Essex, when about to depart to Flanders. After the manner of the time his imprisonment in the Tower was rigorous, mitigated a trifle under the chancellorship of Sir Thomas Audley. Just at a time when Cranmer and Cromwell were disposed to be lenient in his regard, Frith's enemies circulated a manuscript 'Lytle Treatise on the Sacraments,' which he had written for the information of a friend and with no view to publication. He was charged with denying the necessity as articles of faith of the doctrines of purgatory and transsubstantiation. He was found guilty, was turned over to the secular power 23 June 1533, and 11 days later was burned at Smithfield, London. Frith's works include a translation of Patrick Hamilton's 'Places'; 'A Pistle to the Christen Reader,' under the pseudonym of Richard Brightwell; 'Antithesis wherein are compared togeder Christes Actes and our Holye Father the Popes' (1529); 'Disputacyon of Purgatorye' (1531) directed against Rastell, Sir T. More and Fisher of Rochester. During his captivity he wrote several letters, a reply to More and some tracts. Frith is important in ecclesiastical history as having been the first to maintain the doctrine concerning the sacrament of Christ's body and blood, which ultimately was incorporated in the communion office of the Church of England. Later Cranmer, one of Frith's judges, was sent to the stake for the same belief and three years after the latter's death it became the professed faith of the English Church. Frith's works were published by Foxe (London 1573) and again in 1631. Consult Burnet, G., 'History of the Reformation of the

Church of England' (1865); Richmond, L., 'The Fathers of the English Church' (1807); 'Life and Martyrdom of John Frith' (London 1824); Alcock, Deborah, 'Six Heroic Men' (London 1906).

FRITH, William Powell, English painter: b. Studley, near Ripon, 9 Jan. 1819; d. 2 Nov. 1909. Since 1840, when he exhibited 'Malvolio before Olivia' at the Royal Academy, he produced a great number of scenes from Shakespeare, Molière, Dickens, Sterne, Goldsmith, etc., besides his immensely popular pictures, 'Coming of Age' (1849); 'Life at the Sea-Side' (1854); 'The Derby Day' (1858); 'The Railway Station' (1862); 'Before Dinner at Boswell's Lodgings' (1868 — sold in 1875 for £4,567); 'The Private View at the Royal Academy' (1881); 'Marriage of the Prince and Princess of Wales' (1865). Large engravings have been produced from a number of his pictures. In 1887–88 he published his autobiography.

FRITHJOF'S (frĭt'yōf) **SAGA.** This lyrical epic in 24 cantos by Esaias Tegnér was completed in 1825. This is the most famous literary work produced in Sweden, and for many years has been very popular throughout Europe. It is based on the romantic story, 'Frithjof's Saga,' written by an unknown author in Iceland about 1300. We find in the original saga, for the first time in the early Norwegian-Icelandic literature, resignation praised as a virtue of real manhood; also, for the first time, a love story with a happy ending. According to Tegnér's 'Explanatory Letter,' Œhlenschlæger's 'Helge' gave him the idea of Frithjof, but the treatment is different. The Swedish author has modified the original saga and made many additions, drawn from other Icelandic sagas and from the 'Edda.' "My object was to represent a poetical image of the old Northern hero age. The heroine Ingeborg says of Frithjof: How glad, how daring, how inspired with hope

"Against the breast of Norn [Fate] he sets the point
Of his good sword, commanding: 'Thou shalt yield.'"

These lines contain the key to Frithjof's character. All that may be offensive to the modern way of thinking in the conduct of a hero and warrior of old has been left out or smoothed over. The poem presents itself in conformity with the literary views and taste of the author's own age. As works of consummate art may be mentioned such cantos as 'Frithjof's Courtship,' 'Ingeborg's Lamentation,' 'The Viking Code,' 'The King's Election.' Each canto has its own peculiar form of stanza and metre. 'Frithjof's Saga' has been translated into English more than a score of times, also into almost all the languages of the Continent. It has been set to music by B. Crusell and others. In Germany it was for a long time customary to give boys and girls a beautifully bound copy of this work as a present at the time of their confirmation. In 1913 the Kaiser presented to the Norwegian people a colossal monument of Frithjof, which has been erected at Sogn, where he was supposed to have lived about 800 A.D.

Gisle Bothne.

FRITILLARY, *in botany,* a plant of the genus *Fritillaria,* of the lily family, found in the North Temperate and Arctic zones. The plants are herbaceous, the leaves simple, alternate, though sometimes appearing opposite or verticilate; the flowers terminal and pendent; the perianth campanulate, of six petals; the stamens six; the style trifid. About a dozen species are known, several of which are cultivated in gardens, being hardy and highly ornamental plants. The *F. imperialis,* or crown imperial, supposed to be a native of Persia, has large orange or yellow flowers nodding beneath a terminal tuft of leaves. The bulb is poisonous, as is that of *F. meleagris,* though in a less degree.

In entomology, a butterfly of the nymphaline genus Argynnis, containing some 50 species widely distributed in North America and others in the Old World. They are of medium or large size, usually red-brown with black markings in wavy transverse lines and rounded spots near the outer margin of the wings. Several species are among our most common and best-known butterflies. The name is also given to species of the related genera Dione, Euptoeta and Brenthis, the last of small size and darker hue.

FRITSCH, Gustav Theodor, German scientist: b. Kottbus, Brandenburg, 1838. He was educated at Berlin, Breslau and Heidelberg, went on a scientific expedition to South Africa in 1863–66 and was appointed an assistant in the Berlin Anatomical Institute in 1867. In the following year he journeyed with an expedition to Aden to observe a total eclipse of the sun and in 1874 he accompanied another expedition to Ispahan, Persia, to observe the transit of Venus. In 1874 also he was made professor of comparative anatomy at the University of Berlin, and later was appointed to the chair of physiology also. The Berlin Royal Academy of Sciences sent him to the Mediterranean countries in 1882 to study electric fishes. He has published 'Drei Jahre in Südafrika' (1868); 'Die Eingeborenen Südafrikas' (1873); 'Die elektrischen Fische' (2 vols., 1887–90); 'Die Gestalt des Menschen' (1899; 1905); Aegyptische Volkstypen' (1904); 'Das Haupthaar und seine Bildungsstätte bei den Rassen des Menschen' (1912).

FRITZ, Der alte, (Ger., Old Fritz), nickname given to Frederick the Great by his soldiers.

FRITZ, John, American iron and steel expert: b. Londonderry, Pa., 21 Aug. 1822; d. 13 Feb. 1913. He was at first a machinist in shops at Parkersburg and Norristown, and subsequently was a constructor of rolling-mills, acquiring in the latter capacity an authoritative knowledge of iron and steel manufacture. He equipped the Bethlehem iron and steel works, and was for many years manager of that well-known establishment. Many methods of manufacture now in general use were employed by Fritz among the first in this country, including the Bessemer process. Several manufacturers and scientists established in 1902 the award of the Fritz medal to be given for discovery in the fields of science. In 1910 the Franklin Institute awarded him the Elliott Cresson medal. He was president of the American Institute of Mining Engineers in 1894 and of the Society of Mechanical Engineers in 1896.

FRITZ, Samuel, German missionary: b. Bohemia 1656; d. Quito, South America, 1728. He joined the Jesuit Order in 1673, and in the following year was sent to Cartagena. He completed his studies at Quito and went as missionary to the upper Amazon region in 1686. His health failed and he removed to Pará at the mouth of the river, where he suffered imprisonment as a spy at the hands of the Portuguese governor of Pará. He was released in 1691, but returned to his former missionary field in 1693. Here he founded the Omaguas missions during his 42 years of labor among the aborigines, being since known to his brother Jesuits as "the Apostle of the Omaguas." He prepared a map of the upper Amazon region and published it in 1707 at Quito. It reappeared in the 'Lettres édifiantes' (Vol. XII, 1717). It was long the recognized authority on the upper river system.

FRITZ, Unser (Ger., Our Fritz), popular German name bestowed on Frederick William (1831–1888), Crown Prince of Prussia, afterward Emperior Frederick III, and father of the reigning Emperor William II.

FRITZNER, Johan, Norwegian clergyman and lexicographer: b. Askö 1812; d. 1893. He received his education at Christiania and for many years labored in several pastorates. He later devoted himself to literary work. His greatest work is his excellent dictionary of Old Norse, 'Ordbog over det gamle norske Sprog' (1861–67; 2d ed., 1883–96).

FRITZSCHE, Franz Volkmar, German classical scholar: b. Steinbach, Saxony, 1806; d. Rostock 1887. He was educated at the University of Leipzig, where he studied under Beck and Hermann. From 1828 until his death he held the chair of eloquence and poetry at Rostock. He wrote much on the Greek dramatists, especially Aristophanes. His best known works are 'Quæstiones Lucianeæ' (1826); an edition of Lucian's 'Dialogi Deorum' (1829); editions with commentary, of Aristophanes' 'Thesmophoriazusæ' (1838) and 'Frogs' (1845); a critical edition of Lucian's complete works (1860–74) and 'Recension des Buches Aeschylos Eumeniden von K. O. Müller' (1834), a defense of his former master, Hermann.

FRIULI, frē'oo-lē, Italy, formerly independent duchy, consisting, in its widest extent, of the modern Italian province of Udine, the Austrian County of Görz and Gradiska, and the circle of Idria. It derived its name from that of its chief town, Forum Julii, which was said to have been founded by Julius Cæsar. It was one of the most important duchies of the Longobard Kingdom, and after the overthrow of that monarchy by Charlemagne, and even up to the 15th century, when it was conquered by Venice and its territories dismembered, it retained a considerable degree of independence. The inhabitants, called Furlani, are Italian for the most part, but speak a peculiar dialect, into which a strong Celtic element has been introduced. The area of the district is about 3,300 square miles; its population about 700,000. Consult Manzano, 'Annali del Friuli' (Udine 1858–79); and Fracassetti, 'La Statistica etnografica del Friuli' (ib. 1903).

FRÖBEL, Julius, German editor and politician, nephew of Friedrich Froebel (q.v.): b. 1805; d. 1893. He pursued his studies at Munich, Weimar and Berlin, and in 1833 was appointed professor of mineralogy in the industrial schools of Zürich, Switzerland, and was also editor of *Der schweizerische Republikaner.* He gave up his professorship after 11 years and engaged in publishing scientific works and political tracts at Zürich. He removed to Dresden in 1846, and in 1848 was one of the Democratic leaders and a member of the Frankfort Main National Assembly. During this troubled year he visited Vienna in the company of Robert Blum. He was arrested and condemned to death, but because of his great talents he received a pardon from Windischgrätz. He came to the United States in 1849 and edited a German journal in New York until 1850, when he went to Nicaragua, and was later engaged in commercial expeditions in Mexico. In 1855 he was editor of a San Francisco paper and returned to Germany in 1857. In 1862–73 he was editor of newspapers in Munich and Vienna. In the latter year he was appointed German Consul at Smyrna, was transferred to Algiers in 1876 and retired in 1890. He published 'Aus Amerika' (1857), translated (1859) by himself and issued under the title 'Seven Years' Travel in Central America, Northern Mexico and the Far West'; 'Die Wirtschaft des Menschengeachlects' (1870–76); 'Ein Lebenslauf' (1890–91) an autobiography.

FROBEN, or **FROBENIUS, Joannes,** German scholar and printer: b. Hammelburg about 1460; d. 1527. He received his education at the University of Basel. In 1491 he set up a printing press at Basel, which became noted for its excellence. He published editions of Saint Jerome, Saint Cyprian, Tertullian, Hilary of Poitiers and Saint Ambrose. He also published the works of Erasmus, of whom he was an intimate friend. His Greek Testament, edited by Erasmus, was used by Luther for his translation. Froben projected an edition of the Greek Fathers, which was issued after his death by his son Jerome and his son-in-law, Nikolaus Episcopius. Many texts of Froben's were illuminated by Holbein.

FROBISHER, Sir Martin, English navigator: b. Altofts, Yorkshire, about 1530 or 1540; d. Plymouth, 22 Nov. 1594. He was sent to school in London and in 1544 was placed on board a ship sailing to Guinea. He was later in the public service at sea off the coast of Ireland. About 1560 he formed a resolution to undertake a voyage in search of a northwest passage to India, and by his efforts he gave the enterprise a national character. Finally he was put in charge of an expedition, consisting of two barks of 20 and 25 tons, and a pinnace of 10 tons, and an aggregate crew of 35. He set sail on 7 June 1576 by way of the Shetland Islands. Stormy weather resulted in the loss of the pinnace, and soon after one of the vessels, the *Michael,* deserted. Frobisher continued the voyage alone in the *Gabriel* and on 28 July sighted the coast of Labrador in latitude 62° 2' N. Some days afterward he reached the mouth of Frobisher Bay, which he deemed to be a strait. He explored the coast and Butcher's Island until 18 August, and then he returned homewards, reaching London by 9 October. He brought back with him some "black earth" and a rumor soon got abroad that this was really a lump of gold ore. The story aroused great enthusiasm and in the following year a much more important expedition was fitted out, with Frobisher in command. He sailed in May 1577, with three ships and 120 men and reached Hall's Island at the mouth of Frobisher Bay on 17 July. Several weeks were spent in prospecting for gold, but little was done in the way of discovery beyond going over the ground visited on the occasion of the first voyage. A third expedition of 15 vessels was sent out in 1578 and this time Frobisher sailed up a new strait, afterward explored by Henry Hudson (Hudson Strait). In 1580 he became a captain of one of the queen's ships and in 1585 was vice-admiral under Drake in his expedition to the West Indies. He was knighted for his distinguished services in the dispersal of the Spanish Armada in 1588. He continued to cruise in the Channel until 1590, when he was sent in command of a small fleet to Spain. In 1592 Sir Walter Raleigh sent him with a squadron against the Spanish coast, from which he returned with a rich prize. In 1594 he was engaged in the siege and relief of Brest, when he received the wound from which he died later at Plymouth. He was one of the ablest seamen of his time and ranks among the greatest of England's naval heroes. Consult Corbett, Julian, 'Drake and the Tudor Navy' (London 1898); Jones, F., 'Life of Frobisher' (ib. 1878); Hakluyt's 'Voyages,' and the Hakluyt Societies 'Three Voyages of Frobisher' (1867).

FROBISHER BAY, an Arctic inlet, located approximately between 62° and 64° N. and between 65° and 69° W., and opening westward near the mouth of Davis Strait, between Cumberland Sound and Hudson Strait, at the southern end of Baffin Land in the Northwest Territory of Canada. It is about 240 miles long by above 20 wide, with rugged mountainous shores. It was discovered by Sir Martin Frobisher (q.v.), the English navigator, in 1576 and named after him. It was till Hall's voyage called Frobisher Strait, being erroneously regarded as a passage into Hudson Bay. Consult Collinson, R., ed., 'The Three Voyages of Frobisher' (in *Hakluyt Society Publications,* Vol. XXXV, London 1867); Hall, C. F., 'Arctic Researches, etc., 1860–62' (New York 1865); Porter, R. W., 'Frobisher Bay Revisited' (in *American Geographical Society of New York, Journal,* Vol. XXX, p. 97, New York 1898).

FROEBEL, frö'běl, **Friedrich Wilhelm August,** German educationist: b. Oberweissbach, Thuringia, 21 April 1782; d. Marienthal, 21 June 1852. It was Froebel who said, «The clearer the thread that runs through our lives backward to our childhood, the clearer will be our onward glance to the goal»; and in the fragment of autobiography he has left us, he illustrates forcibly the truth of his own saying. The motherless baby who plays alone in the village pastor's quiet house; the dreamy child who wanders solitary in the high-walled garden; the thoughtful lad, neglected, misunderstood, who forgets the harsh realities of life in pondering the mysteries of the flowers, the contradictions of existence, and the dogmas of orthodox theology; who decides in early boyhood that the pleasures of the senses are without enduring influence and therefore on no account to be eagerly pursued;— these presentments of himself, which he summons up for us from the past, show the vividness of his early recollections and indicate the course which the stream of his life is to run.

The coldness and injustice of the new mother who assumed control of the household when he was four years old, his isolation from other children, the merely casual notice he received from the busy father absorbed in his parish work, all tended to turn inward the tide of his mental and spiritual life. He studied himself, not only because it was the bent of his nature, but because he lacked outside objects of interest; and to this early habit of introspection we owe many of the valuable features of his educational philosophy. Whoever has learned thoroughly to understand one child, has conquered a spot of firm ground on which to rest while he studies the world of children; and because the great teacher realized this truth, because he longed to give to others the means of development denied him, he turns for us the heart-leaves of his boyhood.

It would appear that Froebel's characteristics were strongly marked and unusual from the beginning. Called by every one «a moon-struck child» in Oberweissbach, the village of his birth, he was just as unanimously considered «an old fool,» when, crowned with the experience of 70 years, he played with the village children on the green hills of Thuringia. The intensity of his inward life, the white heat of his convictions, his absolute blindness to any selfish idea or aim, his enthusiasm, the exaltation of his spiritual nature, all furnish so many cogent reasons why the people of any day or of any community should have failed to understand him, and scorned what they could not comprehend. It is the old story of the seers and the prophets repeated as many times as they appear; for «these colossal souls,» as Emerson said, «require a long focal distance to be seen.»

At 10 years old the sensitive boy was fortunately removed from the uncongenial atmosphere of the parental household; and in his uncle's home at Ilm he spent five free and happy years, being apprenticed at the end of this time to a forester in his native Thuringian woods. Then followed a year's course in the University of Jena, and four years spent in the study of farming, in clerical work of various kinds, and in land-surveying. All these employments, however, Froebel himself felt to be merely provisional; for like the hazel wand in the diviner's hand, his instinct was blindly seeking through these many restless years the wellspring of his life.

In Frankfort, where he had gone intending to study architecture, Destiny touched him on the shoulder, and he turned and knew her. Through a curious combination of circumstances he gained employment in Herr Gruner's Model School, and it was found at once that he was what the Germans love to call «a teacher by the grace of God.» The first time he met his class of boys he tells us that he felt inexpressibly happy; the hazel wand had found the waters and was fixed at last. From this time on, all the events of his life were connected with his experience as a teacher. Impelled as soon as he had begun his work by a desire for more effective methods, he visited Yverdon, then the centre of educational thought, and studied with Pestalozzi. He went again in 1808, accompanied by three pupils, and spent two years there, alternately studying and teaching.

There was a year of lectures at Göttingen after this, and one at the University of Berlin, accompanied by unceasing study and research both in literary and scientific lines; but in the fateful year 1813 this quiet student life was broken in upon, for impelled by strong moral conviction, Froebel joined Baron von Lützow's famous volunteer corps, formed to harass the French by constant skirmishes and to encourage the smaller German States to rise against Napoleon.

No thirst for glory prompted this action, but a lofty conception of the office of the educator. How could any young man capable of bearing arms, Froebel says, become a teacher of children whose Fatherland he had refused to defend? how could he in after years incite his pupils to do something noble, something calling for sacrifice and unselfishness, without exposing himself to their derision and contempt? The reasoning was perfect and he made practice follow upon the heels of theory as closely as he had always done since he became master of his fate.

After the Peace of Paris he settled down for a time to a quiet life in the mineralogical museum at the University of Berlin, his duties being the care, arrangement and investigation of crystals. Surrounded thus by the exquisite formations whose development according to law is so perfect, whose obedience to the promptings of an inward ideal so complete, he could not but learn from their unconscious ethics to look into the depths of his own nature, and there recognize more clearly the purpose it was intended to work out.

In 1816 he quietly gave up his position, and taking as pupils five of his nephews, three of whom were fatherless, he entered upon his life work, the first step in which was the carrying out of his plan for a «Universal German Educational Institute.» He was without money, of course, as he had always been and always would be,— his hands were made for giving not for getting; he slept in a barn on a wisp of straw while arranging for his first school at Griesheim; but outward things were so little real to him in comparison with the life of the spirit, that bodily privations seemed scarcely worth considering. The school at Keilhau, to which he soon removed, the institutions later established in Wartensee and Willisau, the orphanage in Burgdorf, all were most successful educationally, but, it is hardly necessary to say, were never a source of profit to their head and founder.

Through the 20 succeeding years, busy as he was in teaching, in lecturing, in writing, he was constantly shadowed by dissatisfaction with the foundation upon which he was building. A nebulous idea for the betterment of things was floating before him; but it was not until 1836 that it appeared to his eyes as a «definite truth.» This definite truth, the discovery of his old age, was of course the kindergarten; and from this time until the end, all other work was laid aside, and his entire strength given to the consummate flower of his educational thought.

The first kindergarten was opened in 1837 at Blankenburg (where a memorial school is now conducted), and in 1850 the institution at Marienthal for the training of kindergartners was founded, Froebel remaining at its head until his death two years after.

With the exception of that remarkable book 'The Education of Man' (1826), his most important literary work was done after 1836; 'Pedagogics of the Kindergarten,' the first great European contribution to the subject of child-study, appearing from 1837 to 1840 in the form of separate essays, and the 'Mutter-und-Kose Lieder' (Mother-Play) in 1843. Many of his educational aphorisms and occasional speeches were preserved by his great disciple the Baroness von Marenholtz-Bülow in her 'Reminiscences of Froebel'; and though two most interesting volumes of his correspondence have been published, there remain a number of letters, as well as essays and educational sketches, not yet rendered into English.

Froebel's literary style is often stiff and involved, its phrases somewhat labored, and its substance exceedingly difficult to translate with spirit and fidelity; yet after all, his mannerisms are of a kind to which one easily becomes accustomed, and the kernel of his thought when reached is found well worth the trouble of removing a layer of husk. He had always an infinitude of things to say, and they were all things of purpose and of meaning; but in writing, as well as in formal speaking, the language to clothe the thought came to him slowly and with difficulty. Yet it appears that in friendly private intercourse he spoke fluently, and one of his students reports that in his classes he was often «overpowering and sublime, the stream of his words pouring forth like fiery rain.»

Froebel's educational creed cannot here be cited at length, but some of its fundamental articles are:

The education of the child should begin with its birth, and should be threefold, addressing the mental, spiritual and physical natures.

It should be continued as it has begun, by appealing to the heart and the emotions as the starting-point of the human soul.

There should be sequence, orderly progression, and one continuous purpose throughout the entire scheme of education, from kindergarten to university.

Education should be conducted according to nature, and should be a free, spontaneous growth,— a development from within, never a prescription from without.

The training of the child should be conducted by means of the activities, needs, desires and delights, which are the common heritage of childhood.

The child should be led from the beginning to feel that one life thrills through every manifestation of the universe, and that he is a part of all that is.

The object of education is the development of the human being in the totality of his powers as a child of nature, a child of man, and a child of God.

These principles of Froebel's, many of them the products of his own mind, others the pure gold of educational currency upon which he has but stamped his own image, are so true and so far-reaching that they have already begun to modify all education and are destined to work greater magic in the future. The great teacher's place in history may be determined, by-and-by, more by the wonderful uplift and impetus he gave to the whole educational world, than by the particular system of child-culture in connection with which he is best known to-day.

Judged by ordinary worldly standards, his life was an unsuccessful one, full of trials and privations, and empty of reward. His death-blow was doubtless struck by the prohibition of kindergartens in Prussia in 1851, an edict which remained nine years in force. His strength had been too sorely tried to resist this final crushing misfortune, and he passed away the following year. His body was borne to the grave through a heavy storm of wind and rain that seemed to symbolize the vicissitudes of his earthly days, while as a forecast of the future the sun shone out at the last moment, and the train of mourners looked back to see the low mound irradiated with glory.

In Thuringia, where the great child-lover was born, the kindergartens, his best memorials, cluster thickly now; and on the face of the cliffs that overhang the bridle-path across the Glockner Mountain may be seen in great letters the single word *Froebel,* hewn deep into the solid rock. Consult von Marenholtz-Bülow, 'Reminiscences of Friedrich Froebel' (translated by Mrs. Horace Mann, Boston 1887); Barnard, 'Papers on Froebel's Kindergarten' (1881); Fletcher and Welton, 'Froebel's Chief Writings on Education Rendered into English' (New York 1912); Hauschmann, 'Froebel's Kindergarten System' (1874); Bowen, 'Froebel' (1897); Quick, 'Educational Reformers' (New York 1896).

NORA ARCHIBALD SMITH.

FROG, Nicholas, or **Nic,** national nickname of the Hollanders, first appearing in 'Law is a Bottomless Pit,' by Arbuthnot (1712).

FROG. This familiar animal is the type of the anurous *Amphibia* (order *Anura*). The family *Ranidæ,* to which it belongs, is characterized by having the skin smooth, the hind legs long, and the feet usually completely webbed; teeth are present in the upper jaw and palate, seldom in the lower jaw. The tympanic membrane is situated behind the eyes, and is not concealed. The nostrils are placed at the extremity of the rounded muzzle just above its margin, and open directly into the mouth. When the mouth is filled with air the nostrils are closed, and the animal swallows the bolus of air into the sacculate lungs, there being, in the absence of ribs, no provision for such respiratory movements as take place in the chest of mammals. Frogs are thus air breathers, but they are capable of remaining for a considerable time under water. They swim with great vigor, and on land progress by a series of violent leaps, the long hind limbs being powerful levers. Their food is chiefly insects, which they capture by means of the tongue: this organ is covered with a viscid secretion and is attached in front, its free border being behind; it is rapidly projected from the mouth, the insect adheres to it, and is at once swallowed. The frog does not drink, but its soft skin absorbs fluids rapidly, and thus has a double function both of nutrition and as an aid to respiration. As the frog grows the old outer skin cracks from time to time, and is pulled off and swallowed. The animal retires in winter to the bottom of ponds, from which clusters of frogs may be drawn buried in mud. This hibernation, which is associated with low vital energy, ends in February; in March the spawn is deposited in gelatinous masses of many hundreds of eggs, the males riding for a long period at that season on the backs of the females, and fertilizing the eggs as fast as they are extruded. The eggs soon manifest change, and after a time the young escapes as a "tadpole," a larval animal with short body, circular suctorial mouth, and long tail, compressed from side to side. Gills project on either side of the head from a cleft which answers in position to the gill opening of fishes. The hind limbs first appear as buds, later the fore limbs project, the gills disappear, the lungs becoming more fully developed; the tail gradually shrinks and disappears, and the animal, which was at first fish-like, then closely resembled a newt (or urodele amphibian), finally assumes the adult or anurous form. This is a true process of metamorphosis as complete as that of the butterfly; since there is a change not merely of form and proportion, but also of internal organs. The frog is highest among *Amphibia,* and the successive stages of its development resemble each the adult form of a lower group in its line of ancestry.

Frogs, themselves useful in clearing gardens of slugs and insects, are in turn the prey of birds, especially herons and aquatic birds, of serpents, and fish, the latter destroying large quantities of the spawn. Though exposed to droughts, they can bury themselves in the moist soil and thus live after the ponds are dried up. Though thus tenacious of life, the stories of frogs being found in stone and in trees are for the most part founded on imperfectly noted facts, though it is possible that a frog may now and then get closed into a cavity for which, after entering, it had grown too large; but an aperture must always be present by which water can get access to them. Their fossil history goes back to the early Tertiary days, and probably will be found to extend farther, as Eocene examples differ little from modern forms.

It is by no means easy to define the word "frog" in classification, as distinguished from "toad" (q.v.), and the safest method here will be to deal only with the aquatic family *Ranidæ,* already defined, except as the most highly developed of amphibians. It contains about 280 species and is represented in every part of the world not too cold except southern South America and Australia, where all the so-called frogs belong to a related family, the *Cystignathidæ,* whose members, especially of the subfamily *Cystignathinæ,* may be said to represent the *Ranidæ* in Notogæa. "Some of them," says Gadow, "can be distinguished from the true, typical frogs solely by the arciferous type of the shoulder-girdle and sternum."

The type-genus *Rana* contains more than half the known species, and is scattered all over the northern hemisphere, but is absent from the southern. It is to this genus that the common frogs of Europe and the United States belong — the bull-frog, spring-frog, European grass-frog, etc. The American bull-frog (*R. catesbiana*) is the largest of the whole tribe, occasionally reaching a length of eight inches; and its muffled grunting cry may be heard a mile or more over the water. It is greenish bright upon the head and mottled elsewhere, while the legs are distinctly blotched. This species abounds in all sluggish waters from Kansas eastward, laying its eggs in long strings, and its tadpoles require two years to reach maturity. It is bold and voracious, catching fish, salamanders, other frogs and even ducklings. Its size and the chicken-like daintiness of the flesh in its hind legs, or «saddle,» make it the favorite frog for market, and great quantities are eaten in all parts of the country. In the springs, swamps and ditches lives the green frog (*R. clamata*), not half as big, but very similar in color except that it is yellowish or white below. Another green aquatic frog, still smaller, is the leopard frog (*R. virescens*), whose bright coat is marked with irregular blotches of black edged with whitish, in two rows along the back, and the legs are barred. This species is numerous everywhere as far west as the Sierra Nevada. Another checkered frog, confined to the Eastern States, is the pickerel frog (*R. palustris*), which is light-brown with two rows of large oblong square blotches of dark brown on the back, and one or two on the sides. The head is short, and a dark line extends from the nostril to the eye, while the upper jaw is white, spotted with black spots. Another well-known little kind is the wood-frog (*R. sylvatica*), which goes to the water to breed in early spring, but during most of the year lives in the dry woods. It is a variable reddish brown, with the side of the head marked with a dark-brown band. Several other less conspicuous species of frog inhabit North America, including a few representatives of another family (*Engystomidæ*), besides the tree-frogs, elsewhere described.

For frogs generally consult Gadow's 'Amphibia and Reptiles' (1901); for those of the United States the writings of Holbrook, C. C. Abbott, O. P. Hap, A. W. Butler, and especially 'North American Batrachia,' by E. D. Cope; Dickerson, 'The Frog Book' (New York 1906); Mivart, 'The Common Frog' (London 1874); Marshall, 'The Frog' (11th ed., New York 1912). See also AMPHIBIA; METACHROSIS.

FROG. See RAILWAY CONSTRUCTION, *Frogs and Switches.*

FROG, Flying. See FLYING FROG.

FROG-SHELL, a small mollusk of the *Triton* family (genus *Ranella*), so called because of its shape and mottled colors.

FROGBIT, *in botany,* the popular name for a small floating water plant belonging to the order *Hydrocharideæ*. See HYDROCHARIDEÆ; VALLISNERIA.

FROGFISH, any of several sea-fishes of low organization, toad-like forms and carnivorous habits, constituting the family *Antennariidæ,* and related to the goosefish (q.v.), itself sometimes called «fishing frog.»

FROGHOPPERS, or **FROTH-FLIES,** minute plant-feeding homopterous bugs of the family *Cercopidæ,* which dwell upon plants and may, when very numerous, seriously damage grass crops. The eggs are laid on the stems of plants in the autumn, and survive in the winter. When the embryos hatch (and these resemble the parents, but are wingless) they exude a viscid liquid which is whipped into froth, called in England «cuckoo-spit,» by the thrashing of the «tail,» an anal appendage, probably respiratory in function. The «spittle» is supposed to be a protective disguise, nevertheless the immature insects are preyed upon by wasps, etc. These bugs are called «froghoppers» in double allusion to the froth about their eggs and to their great leaping powers.

FROGMORE, a mansion within the royal demesne of Windsor, Berkshire, England. It was occupied by Charlotte, queen of George III, and later by the mother of Queen Victoria, who died here in 1861. In the grounds are the mausoleum of the Duchess of Kent and the royal mausoleum, a cruciform building with a central octagonal lantern, where lie the remains of the Prince Consort and Queen Victoria.

FROGMOUTH, one of a group of birds, the subfamily *Podarginæ* of the family Caprimulgidæ. They are indigenous to parts of India and to Australia. They have a very wide mouth, a soft plumage and are nocturnal. They have two large powder-down patches on each side of the rump, and have no oil gland.

FROGS, The (Aristophanes' 'Frogs'), is the wittiest comedy in the world and the best index of the intelligence of the audience that could appreciate it. It was produced in 405 B.C. in the brief interval of respite and hope between the victory of Arginusae and the fatal defeat of Ægospotami. The allusions to political conditions and the war are few. The main theme, the descent into hell, had a long history before Aristophanes, running back to the 11th book of the Odyssey; and from Aristophanes to Dante, and from Dante to 'The Houseboat on the Styx,' it has served as the vehicle of contemporary satire. It supplies Aristophanes with abundant motives of comic relief and farce. And the whole is enlivened by the grotesque costumes and the *brek-ke-ke-ke coax* refrain of the chorus of frogs, whose original habitat was the precinct of Dionysus in the marshes. But informing and transcending all this is the serious comedy of ideas — the criticism of the style, temper, thought and ethics of the new poetry. Sophocles and Euripides (as who should say Tennyson and Browning) are dead and there are none to fill their shoes, but very minor bards.

> "And idly tuneful, the loquacious throng
> Flutter and twitter, prodigal of time,
> And little masters make a toy of song,
> Till grave men weary of the sound of rhyme."

These words of William Watson are almost an echo of the complaints of Dionysus, god of drama, poetry and music. Since there are no good poets left on earth, he is resolved to fetch one from Hades. In this quixotic rôle he appears with a Sancho Panza, the slave Xanthias, who plays up to him in the funny business. He takes counsel of Heracles, who had made the journey and who vainly tries to daunt him. He crosses Charon's ferry to the chant of the frogs and is rejoined by Xanthias, who had to walk around the lake because Charon drew the color line on his boat. In the darkness they at first cannot see the malefactors and cutthroats there — but taking a good look at the audience, they discern them. After various comic alarms they fall in with a second chorus, composed of the blest initiates, to whose lovely songs they listen and from whom they inquire «where — in hell — they are." Knocking at Pluto's door, Dionysus, who wears the garb of Heracles, is received with an appalling outburst of Æschylean vituperation from the servant Æacus, who remembers Heracles' former thefts. Dionysus faints, and changes rôles with Xanthias, but insists on resuming his divinity when a message from Persephone invites them to a feast, and cajoles Xanthias into changing yet again upon the eruption of two furious housewives, who recall the misdeeds of Heracles. Æacus returns prepared to execute judgment on the supposed Heracles. But Xanthias, in that rôle, denies his guilt, and in accordance with Attic law, offers in evidence the testimony of his slave (Dionysus) to be taken under torture. Dionysus warns all and sundry that he is an immortal god. Xanthias proposes to test that by seeing which can stand the hardest buffets. The resulting farce is redeemed by the witty device of converting Dionysus' ejaculations of pain into unfinished familiar quotations. "O, mighty Cæsar," he yells — but instantly adds completing the verse, "dost thou lie so low?" A reference to the masters, Pluto and Persephone, clears up the misunderstanding, and after a choric song the two slaves are left outside talking servants' hall gossip. They hear a tremendous uproar within, and Aeacus explains to Xanthias that it is the contest between Aeschylus and Euripides for the tragic throne. Dionysus has been appointed judge, and the contest is transferred to the open stage, where it is accompanied by the comments of the chorus and the ribald interpolations of Dionysus. Beginning with a regular slanging match, the two rival poets analyze one another's dramatic construction and style, parody the blank verse and the lyrics, balance in the scales the weightiness of their meters and criticism of life, and censure the tendencies of their moral and political teaching. No literal version can convey any adequate idea of the wit and subtlety of this penetrating literary criticism. But 'The Rehearsal' and Sheridan's 'Critic' will give the English reader some notion of the kind of effects achieved. Dionysus adjudges the prize to Æschylus, and takes him back to the upper world. The protests of Euripides are met by a parody of his notorious line.

The tongue has sworn — the mind remains unsworn.
The tongue has sworn — but Æschylus's my man.

The justice of Aristophanes' travesty of Euripides "new poetry for a new age" is still under controversy. Recent criticism from Browning's 'Aristophanes' Apology' to the introduction of Professor Murray's translation leans to the side of Euripides. The best brief temperate summary of the older and saner view is to be found in Jebb's 'Lectures on Classical Greek Poetry' (p. 203 ff, 1892).

Paul Shorey,
Head of Greek Department, University of Chicago.

FRÖHLICH, frę̄'lih, **Abraham Emanuel**, Swiss poet: b. Brugg 1796; d. Aaran 1865. After 1835 until his death he held the pastorate of Aarau. He wrote many poems and fables which have become very popular, and have attained a high rank among their kind. His best known works are 'Fabeln' (1825); 'Das Evangelium Sankt Johannis in Liedern' (1830); 'Elegien an Wieg' und Sarg' (1835); 'Ulrich Zwingli' (1840); 'Ulrich von Hutten' (1845); and 'Johann Calvin' (1864).

FROHMAN, Charles, American theatrical manager: b. Sandusky, Ohio, 1858; d. at sea, 7 May 1915. Having managed several road companies, he took charge of the Empire Theatre, New York, in 1893, and in 1895–96 organized the syndicate which exercises so large a monopoly in American theatrical affairs. Maude Adams, Julia Marlowe, John Drew and other prominent performers were managed by him and he starred them in various rôles. He managed E. H. Sothern and Julia Marlowe in Shakespearean productions in the season of 1905–06. He opened playhouses in London and was one of the first managers to produce American successes on the London stage and English successes on the American stage. He lost his life on the *Lusitania*, when it was torpedoed by a German submarine.

FROHMAN, Daniel, American theatrical manager: b. Sandusky, Ohio, 1853. He became office boy in the New York *Tribune* office in 1866 and remained five years in the newspaper business. Subsequently he was manager of traveling theatrical companies and later manager of the Madison Square Theatre (1879–85). New York, the Fifth Avenue Theatre and the old Lyceum Theatre, New York. He was also manager of Daly's Theatre, New York, with the Daniel Frohman Stock Company. He also managed English and American stars and theatrical companies. He has allied himself closely with the so-called Theatrical Trust, formed by his brother Charles Frohman. At present he is proprietor of the (new) Lyceum Theatre, New York, and vice-president of the Famous Players' Film Company, and president of the Actors' Fund of America.

FROHSCHAMMER, Jakob, German theologian and philosopher: b. Illkofen, 6 Jan. 1821; d. Bad Kreuth, Bavaria, 14 June 1893. He studied theology at Munich, and was destined by his parents for the Roman Catholic priesthood, which he entered in 1847. From 1855 until his death he was professor of philosophy at the University of Munich. He was specially attracted to philosophy and the history of dogma. In 1850 he published his 'Beiträge zur Kirchengeschichte,' which was placed on the Index Expurgatorius, and led to his resignation as preacher at the university. His 'Über den Ursprung der menschlichen' (1854) and 'Menschenseele und Physiologie' (1855) gave great offense to his ecclesiastical superiors. In most of his writings he maintained the independence of science, whose goal was truth, against authority. He was denounced by the pope in an apostolic brief of 11 Dec. 1862, and students of theology were forbidden to attend his lectures. He refused to associate himself with the Old Catholic movement, and founded in 1862 the *Athenäum* as the organ of Liberal Catholicism. For this he wrote the first adequate account in German of Darwin's theory of natural selection, for which he was warmly commended by Darwin himself. He was excommunicated in 1871, and in reply wrote three pamphlets which were widely popular — 'Der Fels Petri in Rom' (1873); 'Der Primat Petri und des Papstes' (1875) and 'Das Christenthum Christi und das Christenthum des Papstes' (1876). He also vigorously opposed the materialism of Strauss and the doctrine of papal infallibility. In his later years he wrote several philosophical works, which include 'Die Phantasie als Grundprincip des Weltprocesses' (1877); 'Über die Genesis der Menschheit und deren geistige Entwicklung in Religion, Sittlichkeit und Sprache' (1883), and 'Ueber die Organization und Cultur der menschlichen Gesellschaft' (1885). Consult Attensperger, A., 'Jakob Frohschammer's philosophisches System im Grundriss' (1899); Friedrich, J., 'Jakob Frohschammer' (1896), id., 'Systematische und kritische Darstellung der Psychologie J. Frohschammers' (1899); Hinrichsen's, A., 'Deutsche Denker' (1888).

FROHSDORF, or **FROSCHDORF**, Austria, village situated 30 miles south of Vienna, on the Leitha. After 1844 it was the residence of the Duchess of Angoulême and later of the Count de Chambord. It subsequently became the headquarters of the elder Bourbons. Pop. about 700.

FROISSART, Jean, zhoṅ frwä-sär or froi'-särt, French chronicler: b. Valenciennes, Hainault, 1333 or 1338; d. Chimay about 1419. He was well educated with the view of entering the church, but he soon abandoned this object and took great delight in tales, adventures of chivalry and narratives of travel. His passion for travel brought him to Avignon and subsequently to England. In 1361 we find him in London, where he was appointed secretary of Queen Philippa. He visited Scotland in 1365 and in the following year left Britain with the Black Prince. Two years afterward he was in Italy. From 1370 to 1380 he lived more or less in seclusion, engaged on his Chronicles. About 1384 he was made chaplain to Guy de Châtillon, count of Blois. Thereafter for many years he made several journeys to examine the theatre of the events he was about to relate. In 1394 he was again in England and thereafter his movements became obscure. His 'Chronicle' (as the title is usually abbreviated) covering the years 1326–1400, is of capital importance for its period. To a collection of the verses of Wenceslaus of Brabant, Froissart added some of his own, and gave to the whole the title 'Meliador, or the Knight of the Golden Sun.' All of his extant poems were published at Brussels (1870–72). (See FROISSART'S CHRONICLES). Consult Darmesteter, 'Froissart' (1894); Molinier, 'Les sources de l'histoire de France' (Vol. IV, Paris 1904).

FROISSART'S CHRONICLES. The 'Chronicles' (*Chroniques*) of Froissart deserve in many respects to hold the first place among historical compositions of their kind. They purposed to be a record of all that was memorable in the long struggle between France and England that filled the last three-quarters of the 14th century, so far as it could be discovered by a man with a prodigious curiosity and thirst for information and very fortunately placed for securing it. For their author enjoyed the protection of Philippa of Hainaut, queen of Edward III, from his arrival in England in 1361 till her death, and later had successively as patrons, Duke Wenceslaus of Luxembourg and Count Guy of Blois; he lived in the company of great lords and ladies; he traveled much in England, Scotland, France and Italy; he followed the Black Prince to Aquitania in 1367 and the Duke of Clarence to Milan in 1368. Born in the 19th century Froissart would have been the prince of reporters and interviewers. He had a very keen scent for a "story," and a sharp eye for the color and movement of the life of camps and of courts, which he knew thoroughly and loved passionately. He shared unquestioningly the rather hollow ideals of knighthood of that troubled, post-chivalric age, bequeathed by the generations that had created the romances of chivalry but gone to seed and emptied of their first inspiration. The interest of life appears in the Chronicles, as in those romances, to centre in adventure. Personal exploits, feats of arms, jousts, tournaments, pageants, the glitter of armor and the clash of lance and sword and spear fill their pages and are reported with such spirit, zest and relish that they live again with vivid and colorful reality. And in equal measure the persons led in endless procession before us are made alive and real. The portraits, sketched in bold, firm, rapid, telling lines, distinct both in outward form and spiritual features, are almost the most solid and admirable part of the work. But the Chronicles are no true history. Froissart, though sincerely anxious to present the truth, was quite without critical sense, and we must not look in his pages for exact facts of date and place, which are not infrequently sadly distorted. He was equally without historical vision, and his narration wholly lacks perspective and illuminating glimpses into the meaning of the events of which he was the spectator. Chameleon-like, he takes on the color of the opinions that surround him, now English and Burgundian (in the first book of the Chronicles, inspired by Philippa of Hainaut and composed mainly in England), now French (in the three other books, and in a later redaction of the first, undertaken when his patron was French). Living in the society of the nobility he has their attitude and point of view; he has no more interest in the unprivileged people than if they did not exist, and the Chronicles have little or no information for us as to the life and condition of the great masses or the rôle they were playing more and more. But with all their shortcomings and omissions the Chronicles are a faithful mirror of the later 14th century and a most precious source of knowledge about it.

The manuscripts that we possess of the Chronicles represent several redactions, for Froissart was continually gathering new materials. For the first book he drew largely upon the Chronicles of Jean Lebel, even transcribing whole passages. For the expedition of the Black Prince in Aquitania he consulted the narrative of Chandos. The standard edition is that of Kervyn de Lettenhove (29 vols., Brussels, 1870–77). The Chronicles have long been accessible to English readers in translation.

ARTHUR G. CANFIELD,
Professor of Romance Languages, University of Michigan.

FROLIC, The. See WASP AND FROLIC.

FRÖLICH, Lorentz, Danish artist: b. Copenhagen, 1820; d. 1908. He studied in his native city under Eckersberg, in Dresden and in Paris under Coutoure. He spent much time in Rome and Paris and exhibited regularly at the salons. After 1877 he was professor at the Copenhagen Academy. His best known pictures are 'King Harold Blaatand' (1840); 'Cupid and the Water-Sprite' (1845; now in Leipzig); 'The Wood-God and his Family,' and decorations in several public buildings of Denmark and in the Court of Appeals at Flensburg, Prussia. He executed etchings for Fabicius, 'History of Denmark'; for Apuleius, 'Cupid and Psyche'; for 'Die Götter des Nordens' and other works. He is perhaps best known for his illustrations of old Danish ballads and of children's books.

FROLLO, Roman knight and governor of France, who was killed by King Arthur, according to an Arthurian legend of the 15th century.

FROME, England, town on the Frome, in Somersetshire, about 12 miles southeast of Bath. There are manufactures of woolen goods, broadcloth, silks, hats, dyestuffs, ales, cutlery and ironware. It is also an important central market for agricultural produce. Selwood Forest, a part of which is still in existence, was in the neighborhood. The town contains an art school and a museum and owns its water system. Pop. 10,901.

FROMENTIN, frō-mŏṅ-tăṅ, **Eugène,** French painter: b. La Rochelle, 24 Oct. 1820; d. Saint Maurice, near La Rochelle, 27 Aug. 1876. He began life as a law student, but early turned his attention to landscape painting, working in the studio of Louis Sabat. In 1842 he traveled in Algeria, and it was after this journey that under the guidance of Marilhat, the painter of Oriental scenes, he resolved to work a new vein in the same department by painting the North African deserts. In 1847 he exhibited at the Salon for the first time and visited Algeria twice (1848–52). The fruits of these wanderings were not only numerous pictures, but also two literary works descriptive of his travels. These were 'A Summer in the Sahara' (1856), and 'A Year in the Sahel' (1858), works distinguished by powerful and richly colored style and poetic imagination. As a painter his aim was to depict the light and atmosphere of the desert with truth and delicacy, yet imparting to it his own subjective interpretation, and he showed a marked taste for studies in gray and violet. The masterly analysis of ancient painting, which appears in his 'Masters of a Former Day' (1876), embodies the results of his travels in Holland and Belgium (1875), where he made a careful study of the Dutch and Flemish masters. His paintings are remarkable for their brightness and harmony of color, excellent draftsmanship and execution. The most noted are 'A La Rochelle Farm' (1847); 'The Gazelle Hunt' (1857); 'A Street in El-Aghouat' (1859); 'An Arab Bivouac'; 'The Falcon Hunt' (1863); and 'An Arab Camp,' his last picture, in the Louvre. He is represented in the Walters collection, Baltimore, and in the Vanderbilt collection and the Metropolitan Museum, New York. Consult Blanchon, 'Biography and Letters of Eugène Fromentin' (1909); Claretie, "Eugène Fromentin" (in 'Peintres et sculpteurs contemporains,' Paris 1882); Gouse, 'Eugène Fromentin, peintre et écrivain' (ib. 1881); Huthor, 'Modern Painting' (New York 1907); Jouin, "Fromentin" (in 'Maitres contemporains,' Paris 1887).

FROMMANN, Georg Karl, German philologist: b. Coburg 1814; d. 1887. He was editor of *Die deutsche Mundarten* and was also librarian of the Germanic Museum. In 1865 he was one of a Committee of Eleven theologians, which undertook the revision of Luther's translation of the New Testament. Later, at the request of the Protestant conference, the Old Testament was included and the revised edition of the whole Bible was published in 1892. Consult memoir by Vogt (Nuremberg 1888).

FROMMEL, frŏ'mĕl, **Emil,** German theologian and author: b. Karlsruhe, 5 Jan. 1828; d. 1896. He was educated at Halle, Erlangen and Heidelberg. He held several pastorates successively, was army chaplain during the struggle with France in 1870–71 and after the war became court preacher at Berlin and pastor of the garrison there. He wrote several volumes of theology including 'Die zehn Gebote Gottes in Predigten' (6th ed., 1898); 'In drei Stufen,' an anthology, (8th ed., 1890); 'Festflammen' (6th ed., 1896); 'Das Gebet des Herrn in Predigten' (4th ed., 1893). 'Tales For the People' (1873–86), and similar collections of humorous and realistic compositions, will more surely form his memorials in the future.

FROMMEL, Karl Ludwig, German painter and engraver: b. Birkenfeld, Oldenburg, 1789; d. 1863. He studied at Karlsruhe where his masters were F. J. Becker and Haldenwang. He afterward visited France and Italy. He returned to Germany in 1817, and became professor at Karlsruhe, where he founded the Society of Art and Industry. He visited London in 1824 with the object of studying the technique of steel engraving, and later he established a studio in this branch at Karlsruhe. He was director of the picture gallery from 1830 to 1858 and his able administration placed it in a flourishing condition. His most notable works (engravings) are 'Arricia near Rome'; 'View of Tivoli'; 'Mount Ætna'; and 'Mount Vesuvius.' Many of his landscapes are preserved in the Karlsruhe gallery.

FROMMEL-LINDEMANN, Karl August. See LINDEMANN-FROMMEL.

FROND, *in botany,* a term applied to a plant in which stem and leaves are not differentiated. It has been generally applied to fern leaves by older botanists who thought that ferns represented a combination of stem and leaf. The duckweed is the best illustration of the frond type.

FRONDE, frôṅd, the name of a political faction which played a conspicuous part in French history during the minority of Louis XIV, and gave rise to the insurrectionary movement known historically as the War of the Fronde. The members of this party obtained the contemptuous name of Frondeurs (slingers), being compared to boys throwing stones from slings, owing to the pertinacious lampoon warfare which they waged against the powerful minister of that day, Cardinal Mazarin, and the Queen Regent, Anne of Austria. Mazarin, as a foreigner and a parvenu, was detested by the French people — both patrician and proletarian — and especially had incurred the opposition of the Parliament of Paris to his measures. In 1648 Mazarin ventured on the bold step of arresting two of the most popular members of the latter body, and on the next day, 27 August (*la journée des barricades*) the Parisians rose in arms, dispersed some of the royal troops sent out against them, and barricaded the approaches to the Louvre, compelling the court party to retire to Saint Germain, thus leaving Paris in the hands of the insurgents. Upon the Prince de Condé advancing to besiege the capital, the parliament called the citizens to arms, when the Prince de Conti, the Duc de Beaufort («Le Roi des Halles,» and son of Henry IV), and numerous others of the great nobles of the kingdom came forward to head the insurrection. The famous Cardinal de Retz and the Duchesses de Longueville and de Montbazon also joined the popular cause. The Prince de Condé, too, changed sides and went over to the malcontents, with whom the court party shortly afterward patched up a treaty of peace of but brief duration. Fresh contentions arose, and Mazarin caused the arrest of Condé and Conti. This step excited a revolt in the provinces, and Marshal Turenne hastened to the rescue of the Frondeur princes, but was routed in the battle of Rethel (1650). The cardinal, however, enjoyed but a temporary supremacy; the parliament again agitated against him, and procured his banishment from France, leaving the Prince de Condé master of the situation. Subsequently, the contest degenerated into a war of intrigue and is regarded as one of the most useless conflicts ever waged. The court finally agreeing to dismiss Mazarin a general amnesty was proclaimed. Condé attempted to continue the struggle, but was proscribed, and entered the service of Spain, while Mazarin, after a time, returned to Paris, and again obtained the reins of government. It was not until 1653 that the last signs of revolt in the provinces were suppressed. The defeat of the movement helped to render the monarchy absolute. Consult Barante, ‹Le parlement de Paris et vie de M. Mole› (Paris 1859); Gordon, ‹The Fronde› (Oxford 1905); id., ‹Lettres du Cardinal Mazarin› (Paris 1878–1906); Pardoe, ‹Louis XIV and the Court of France, etc.› (London 1888); id., ‹Memoirs of Cardinal de Retz› (ib. 1896); Perkins, ‹France under Richelieu and Mazarin› (New York 1888).

FRONSPERG. See FRUNDSBERG, GEORG VON.

FRONSPERGER, Leonhard, German military writer: b. Ulm 1520; d. 1575. He applied himself to the study of military science at an early age. His most famous work is the ‹Kriegsbuch kaiserlicher Kriegsgerechte und Ordnungen vom Geschütz› (1573; new ed., by F. W. A. Böhm 1819), in which is displayed a remarkable knowledge of military science in all its ramifications. It stamped Fronsperger at once as the foremost German military writer of his century.

FRONT ROYAL, Engagement at. Front Royal, Va., is 12 miles east of Strasburg, and is the key to Luray Valley. On 23 May 1862 it was held by Colonel Kenly with nine companies of the 1st Maryland infantry, two companies of the 29th Pennsylvania, a company of the 28th New York, and a section of Knap's battery, under command of Lieutenant Atwell, in all about 900 men. Soon after noon of the 23d «Stonewall» Jackson, moving down the Luray Valley to cut off Banks' retreat from Strasburg to Winchester, pushed through the town, driving in Kenly's pickets and advance-guard. Kenly made a stand on a ridge about a mile north of the town, where he was joined by about 100 men of the 5th New York cavalry, but was soon flanked and pushed across both branches of the Shenandoah, and failed to burn the bridges behind him. When across the river he drew up on its north bank and, with artillery and musketry, resisted for some time all efforts to cross; but Jackson's cavalry forded the stream, both above and below the bridges, thus flanking his position, and Kenly fell back toward the cross-road leading to Middletown, closely followed by Confederate cavalry. He had gone four miles when his cavalry rear-guard was stampeded, and his infantry fiercely attacked, the resistance continuing until his force was cut to pieces and captured, with Atwell's two guns and the entire supply-train. Nearly all the New York cavalry escaped. The Union loss was 18 killed, 56 wounded and 718 captured; the Confederate loss was 11 killed and 15 wounded. Jackson pushed on after Banks, leaving Colonel Conner with the 12th Georgia and a battery at Front Royal. On the 30th the 1st Rhode Island cavalry, the advance of McDowell's corps, dashed into the town, surprised Conner, and captured 156 officers and men and one gun, the loss in the cavalry being 8 killed and 5 wounded.

FRONTAL BONE. See SKULL.

FRONTAL MORAINE. See MORAINE.

FRONTAURA, frōn-tă-oo'rä, **Vásquez Carlos,** Spanish dramatist and journalist: b. Madrid, Spain, 4 Sept. 1835. He was one of the most voluminous writers of Spain in the 19th century and contributed to practically all the well-known newspapers and magazines of Madrid. He founded the *Cascabel,* which he used in behalf of the restoration to the throne of Spain of Alfonso XII, in which he was finally successful. He became president of the Council of Ministers, and for six years he was governor of various provinces, editor-in-chief of the *Gaceta de Madrid* and finally head of the section of public charities in the Department of the Interior, a position he held for many years. He wrote many dramas and musical comedies, several of which were very popular and are still played wherever Spanish is spoken. Two of his zarzuelas, ‹Un caballero particular› and ‹En las astas del toro› have been presented almost countless numbers of times in Spain and the Spanish-American countries. Among his numerous comedies, ‹Pepe Carranza› and ‹Las tres rosas,› have also been extraordinarily popular. Among his other works which have been widely read are ‹Las tiendas,› ‹Los sermones de Doña Paquita,› ‹Tipos madrileños,› ‹La Galería de Matrimonios,› ‹Miedo al hombre,› ‹Brígida.› In all, his novels, stories and humorous works number little short of 100. He also published ‹Los Niños,› a magazine collection of stories for children (14 vols.), the best of its kind in Spain. His writings dealing with national customs contributed to *La Ilustración Española y Americana* show a real insight into the life of certain classes of Spain. He has also written several books for children which became very popular. Many of his works of all kinds have been translated into Portuguese, French, German and Italian.

FRONTENAC, Louis de Buade, loo-ē dė boo-äd frônt'näk, COMTE DE, French colonial officer: b. France, 1620; d. Quebec, 28 Nov. 1698. He entered the army in 1635 and at an early age became brigadier. In 1672 he was appointed governor of the French possessions in North America. Of an imperious nature, the new governor was nevertheless most energetic and aimed at an orderly, well-directed administration of the colony, which he believed would herald an era of great prosperity. To this end he inaugurated a city administration in Quebec and convened the clergy, nobles and commons. Frontenac's reforms met with little favor from his sovereign and he was shorn of much of his power. Quarrels with the Jesuits, the new intendant and the governor of Montreal divided the colony, and the news spreading to France Frontenac was recalled in 1682. In spite of his violent temper he gained the confidence of the settlers and the respect of the Indians, and in 1689, when to the horror of constant attacks from the Iroquois the misery of a war with England was added, he was again sent out by the king, as the only man who could rouse the colonists to hope and action. During the next nine years he loosed his savage allies on the defenseless villages of New England, repulsed a British attack on Quebec and so broke the power of the Iroquois that they were never again a terror to the colony. Consult Le Sueur, 'Count Frontenac' (Toronto 1906); Parkman, 'Frontenac and New France Under Louis XIV' (1877); Winsor, 'Cartier to Frontenac' (1894).

FRONTENAC, Kans., city of Crawford County, on the Atchison, Topeka and Santa Fe, the Kansas City Southern and other railroads, 100 miles south of Kansas City. It is the centre of an important coal mining region. The waterworks are the property of the municipality. Pop. 3,396.

FRONTERA, Mexico, a seaport in the State of Tabasco on the Gulf of Campeachy, 225 miles southeast of Vera Cruz. It has a good harbor and its annual exports exceed $2,000,000, consisting chiefly of coffee, cocoa, hides, rubber and dyewoods. Its imports consist chiefly of iron, steel, machinery and cotton goods and are valued at about $1,000,000 annually. It is the port of Juan Bautista, the capital of the State of Tabasco. A United States consul is stationed here. Pop. 5,760.

FRONTIER, Military, the outermost limits of the lines of national defense of a country. By agreement between countries with a common land frontier the military frontier is placed at some distance back of the actual dividing line between them. The term was formerly applied to a narrow strip along the Turkish frontier in Hungary, which had a special military government. Modern land frontiers are usually defended by a chain of forts.

FRONTINUS, frŏn-ti'nŭs, **Sextus Julius,** Roman writer of the latter part of the 1st century after Christ. He was thrice consul and commanded with reputation in Britain under Vespasian. He was appointed by Nerva to superintend the aqueducts of Rome and left an extant work on the subject, 'De Aquis Urbis Romæ,' as well as one dealing with the art of war, 'Stratagemata.' His death took place about the year 105 A.D. The 'De Aquis Urbis Romæ' is an important work in that it contains complete descriptions of the aqueducts and water supply of the city. Consult Herschel, 'Two Books on the Water Supply of the City of Rome,' which contains an edition of 'De Aquis,' with translations, notes and commentary (Boston 1899; 2d ed., London 1913) and 'Stratagemata,' edited by Gunderman (Leipzig 1888).

FRONTO, Marcus Cornelius, Roman orator and rhetorician: b. Cirta, a Roman colony in Numidia, about 100 A.D.; d. about 175. He went to Rome during the reign of Hadrian, soon acquired great fame as a speaker and teacher of rhetoric and was in consequence selected as tutor to M. Annius Verus and L. Commodus, afterward emperors under the names of Marcus Aurelius and Lucius Verus. He became a member of the senate and was a consul in 143 A.D. Till 1814 the only extant writings of Fronto were a worthless tract, 'De Differentiis Vocabulorum' and some fragments; but in that year Angelo Mai recovered many of Fronto's letters from a palimpsest in the Ambrosian library at Milan. These were part of the orator's correspondence with Antoninus Pius, Marcus Aurelius, Lucius Verus and other distinguished friends and were published under Mai's editorship in 1815. In 1823 Mai published a new edition of the letters, containing many others which he had discovered in the Vatican library. While not of great importance the letters show that the Emperor Marcus Aurelius was as highly esteemed by his contemporaries as by the moderns. Consult edition of the letters by Naber (Leipzig 1867); Brock, 'Studies in Fronto and his Age' (Cambridge 1911); Ellis, 'The Correspondence of Fronto and Marcus Aurelius' (Oxford 1904); Teuffel, 'Geschichte der römischen Litteratur' (6th ed., Leipzig 1913).

FROSCHDORF. See FROHSDORF.

FROSINONE, frŏ'sĭ-nō'nē, Italy (the ancient FRUSINO), city in the province of Rome, 53 miles southeast of Rome, on the Cosa River. Wine is produced in the neighborhood and marketed here. The ruins of the ancient Volscian town form its principal attraction. Pop. (commune) 11,646.

FROSSARD, Charles Auguste, French military officer: b. Versailles, 1807; d. Château-Villain, Haute Marne, 25 Aug. 1875. He was educated at the military school of Metz and gained distinction in the engineers' corps. He was present at the siege of Rome in 1849, was commander of the Second Corps of Engineers in the Crimea, and was made a brigadier-general in 1855. He served as chief of the engineering department in Italy in 1859 and in 1867 received the appointment of chief of the military household and governor to the prince imperial. He commanded the Second Corps of the Army of the Rhine in the Franco-Prussian War, driving the Prussians from Saarbrücken on 2 Aug. 1870. On 6 Aug. 1870 he was defeated at Forbach. He gave the order for the charge of the Imperial Guard cavalry in an effort to stem the retreat at Metz on 16 August, and was involved with his corps in the surrender of Bazaine's army, remaining a prisoner until the close of the war. General Frossard published a 'Rapport sur les operations du 2e corps de l'armée du Rhin dans la campagne de 1870' (Paris 1872).

FROST, Arthur Burdett, American illustrator and author: b. Philadelphia, 19 Jan. 1851. He studied under Thomas Eakins in the Academy of Fine Arts, Philadelphia, and coming to New York secured employment on the *Graphic,* and later entered the studio of Harper and Brothers, where his associates were Abbey, Reinhart and Alexander. In 1877 he went to England, and in 1900 he exhibited at the Paris Exposition. His early work was full of interest and attracted much attention and his later work showed the spirit of the true artist. His illustrations of 'Out of the Hurly-Burly' (1872), first attracted general attention. Good examples of his style are his illustrations of Stockton, 'Rudder Grange' (1879); Thanet, 'Stories of a Western Town' (1893); and Bunner, 'Story of a New York House' (1887). He has published 'Stuff and Nonsense' (1888); 'Bull Calf and Other Tales' (1892); 'Sports and Games in the Open' (1899); 'Golfers' Alphabet'; 'Book of Drawings' (1905); 'Carlo' (1913).

FROST, Edwin Brant, American astronomer: b. Brattleboro, Vt., 14 July 1866. He was graduated at Dartmouth in 1886 and afterward studied physics and astronomy at Princeton, Strassburg and at the Royal Astrophysical Observatory at Potsdam, Germany. In 1887-90 he was instructor in physics and astronomy, 1892-95, assistant professor and director of the observatory, 1895-98, professor of astronomy, and from 1898 to 1902 non-resident instructor at Dartmouth College. In 1898 he was appointed professor of astrophysics and in 1905 director at the Yerkes Observatory of the University of Chicago. From 1896 to 1902 he was assistant editor and after 1902, editor of the *Astrophysical Journal.* He has made an especial study of stellar velocities, stellar spectroscopy, sun spots and solar thermal radiation. He is a member of the National Academy of Sciences, the Royal Astronomical Society, the Societá degli Spettroscopisti Italiani and of many other learned bodies. He translated, revised and enlarged J. Scheiner's 'Treatise on Astronomical Spectroscopy' (1894), and has made many contributions to astronomical and other periodicals.

FROST, George Henry, American publisher: b. Ontario, Canada, 9 July 1838. He was educated at McGill University, Montreal, where he was graduated civil engineer in 1860. He was a land surveyor and railway engineer in Chicago before establishing himself in New York in 1878. In 1874 he established the *Engineering News* and published it until August 1911, when it was sold. He is president of the Courier-News Publishing Company of Plainfield, N. J., and is member of many engineering societies.

FROST, John, American educator and writer: b. Kennebunk, Me., 1800; d. 1859. He was educated at Bowdoin and at Harvard, being graduated at the latter in 1822. He taught in Boston and from 1828 to 1838 conducted a girls' school in Philadelphia. He was later connected with the Central High School until 1845. He compiled many school books and biographical and historical works, including his very popular 'Pictorial History of the United States' (2 vols., 1844); 'Pictorial History of the World'; 'Lives of American Generals'; 'American Naval Biography,' etc.

FROST, William Edward, English painter: b. Wandsworth, near London, September 1810; d. 4 June 1877. About 1825 he was sent to a drawing school in Bloomsbury where he studied for several years. He also studied in the British Museum and in 1829 was admitted as a student in the Royal Academy schools. He maintained himself all those years by portrait-painting, executing over 300 portraits. In 1839 he was awarded the gold medal of the Royal Academy for his 'Prometheus Bound.' In 1843 he was awarded a third-class prize for his cartoon 'Una alarmed by Fauns and Satyrs.' His best-known works are 'Christ crowned with Thorns' (1843); 'Nymphs dancing' (1844, now in the Dublin Museum); 'Sabrina' (1845); 'Diana and Actæon' (1846); 'Nymph disarming Cupid' (1847); 'Una and the Wood-Nymphs' (1847); 'Chastity' (1854); 'Il Penseroso' (1855); 'The Graces and Loves' (1863); 'Hylas and the Nymphs' (1867). In 1846 he was elected an associate of the Royal Academy, and to full membership in 1871. Frost was deficient in power of design and while many of his works have grace and charm they are entirely without mastery. Many of his pictures were frequently engraved.

FROST, William Goodell, American educator: b. Le Roy, N. Y., 2 July 1854. He was graduated at Oberlin College in 1876, and afterward studied at the universities of Wooster, Harvard and Göttingen, Germany. From 1877 to 1879 he was instructor in Greek, and from 1879 to 1892 professor of Greek at Oberlin, being chosen president of Berea College in the latter year. He has done much in the promotion of higher education in Kentucky and in adapting educational methods to conditions in the Southern mountains. He published 'Greek Primer' (1887); 'Inductive Studies in Oratory' (1890), and contributions to magazines.

FROST, the moisture in the atmosphere crystallized or congealed by the cold, upon the earth's surface, or upon various objects and surfaces situated or existing upon it, as grasses, shrubs, trees, window panes, etc. The various phenomena of hoar frost, window frost, etc., grouped under this head, occur over a large portion of the land surface of the earth. In the United States, hoar frosts often occur during the spring and autumn months, over the whole northern portion of the country, and more rarely also in the Southern States, sometimes causing much damage by freezing and injuring the young corn sprouts and early fruits and vegetables. Frosts occur only during calm, cold nights when the temperature falls below 32° F. In the United States the meteorological conditions usually preceding the formation of frosts are northerly winds, accompanied by high barometer, and especially the coincidence of these conditions with the near approach, or passing, of a storm from the west or southwest. The formation of hoar frost depends in some degree upon surface topography and local causes, oc-

WINDOW AND HOAR FROST

2 The same, cup-like
3, 4, 5, 7 Crystalline window frost
6 Branching hoar frost
8, 9 Membranous window frost, highly magnified

curring much more frequently within the deep valleys leading down from mountain heights, than in broader valleys or level regions. In the former, during calm cold nights, the cold air of the hill and mountain tops, by virtue of its greater specific gravity, flows down and mixes with, or flows underneath and replaces, the warmer, lighter air of the valleys, thus furnishing the conditions favorable to frost formation. The cooling of objects by radiation of heat, and by the evaporation of moisture from them, greatly facilitates the formation of frost. Frost crystallizations exhibit a wonderful variety, both of form and structure. The formation of each of the various types seems to depend upon a great number of meteorological and other conditions, some of them obscure. The temperature of the air, its electric condition, humidity, etc., and also the nature of the substances upon which they form, each seem to exert an influence in determining and modifying their form and structure. Two principal types of hoar frost occur,— the columnar and the tabular. Commonly, both varieties do not occur simultaneously, but on a given night one or the other type will greatly predominate and form the bulk of the crystals. Frost crystallizations in general greatly resemble those of snow, but because their development is usually restricted in one or more directions by the objects or surfaces upon which they form, the resemblance is segmentary, rather than complete. In general, columnar forms vary from similar snow crystallizations, by virtue of their hollow cylindrical, or cup-like character, and by often attaining to much greater dimensions. Sometimes, during extreme cold, such forms attain a length of many inches. Tabular forms rarely attain perfect symmetry, but exhibit within them air tubes and inclusions, assume crystal forms possessing both close and open structure, and develop upon the same extremely thin plane as do similar snow crystals. As commonly deposited in spring or autumn, they do not usually greatly exceed in size similar snow forms, but during intense and prolonged cold, as in winter, they attain much greater dimensions. A very beautiful effect is sometimes produced by the deposition upon the trees, shrubs, etc., of a heavy coat of hoar frost. Each limb and leaf and delicate twig is transformed and beautified, and presents a white appearance, as though frosted with silver. During zero weather, large and delicately formed branching tabular crystals, and long, icy needles, form in beautiful pendent clusters upon, and depend from, the rafters and timbers of barns, etc., close to where domestic animals are kept; and also upon ferns and similar plants overhanging icy terraces or ice-covered pools. Similar forms also form directly upon or project from icy surfaces. Even the clouds furnish their quota of frost crystallizations. When low-lying clouds enshroud mountain tops covered by forests, they often deposit a portion of their moisture upon the branches of the trees, commonly in the form of long, granular or fibrous needle-shaped crystals. Fogs, when they occur during hoar frost formation, usually deposit moisture upon the forming crystals in granular form. The most beautiful and varied frost crystallizations are those that form upon the window panes of dwelling houses, etc., in arctic or temperate zones. These fairy-like creations, seemingly in imitation of leaves, feathers, ferns, trees, starry firmaments, tropical forest effects, etc., occur as three distinct entities: the granular, the crystalline, and the membraneous. The latter variety forms only in heated rooms, upon window panes covered with an uncongealed film of water, as a dew-like condensation of moisture. It occurs most frequently in the form of long, curving, feather-like forms, or as an exceedingly delicate membranaceous-like network of diverging and coalescing lines. It is due to a process of crystallization that takes place during the conversion of a film of water into ice. The crystalline variety of window frost forms only upon window panes that are free from water in liquid form. Crystals of this class assume branching, star-like forms (often as four- or six-pointed branching stars), curving filaments, fibrous crystallizations, and those resembling sea-moss, long serrated lines, etc. Many of these are very beautiful and interesting. Some of them develop within minute striations in the surface of the glass and will reappear in the same identical positions upon a given pane, with each renewal. When identical meteorological and other conditions recur again and again, the types of frost coexistent with each will, in general, recur simultaneously with them. During zero weather, if conditions are favorable, the formation and growth of these beautiful frost creations takes place very rapidly. A beautiful and absorbingly interesting experiment consists in melting a heavy coat of window frost off a portion of a window pane (by placing an oil lamp close to it). Only the central portion of the pane should be cleared of all moisture; around this a film of water should be left upon the glass. Soon after the lamp is removed the feather-like membraneous frost will form around the outer edges of the film of water, and quickly radiate in beautiful curves toward the centre of the pane. They stop instantly when they reach the clear glass. Soon minute and delicate serrated crystal lines, or tiny crystal stars, appear upon the clear glass space, and slowly develop, and usually coexistent with them a thin film of granular texture will be laid down upon portions of the clear glass. The latter is not usually deposited in slow progressive order, but in intermittent order. Large spaces of the clear glass are often covered simultaneously, by a succession of auroral-like flashes; each flash, in the twinkling of an eye, spreading a thin granular film upon unoccupied portions of the glass. Singularly enough, the granular deposit does not form near where the true crystalline frost is; the latter repels the former and prevents its formation upon the spaces immediately surrounding it.

The phenomena included under the title frost, as commonly accepted, are understood to include both the processes of freezing and the mechanical effects produced thereby. Considered under this broad definition, frost plays an important part in the economy of nature, both beneficent and otherwise. It enters the crevices and minute cracks in the rocks and rends the rocks apart; and is thus an important agent in aiding and hastening their disintegration, and in converting them and the solid materials of the earth into soil. Its beneficent action in loosening and pulverizing the soil, by entering it and forcing the particles of compacted soil and clods apart through its expansive action upon the particles of moisture disseminated therein, is well known, and is of inestimable value to agriculture and to humanity. The damage sometimes done to vegetation, trees, etc., through the frosts entering them, and rending their fibres, cells, etc., apart, is often very great, and partial failures of crops such as corn, vegetables, fruits, etc., are due to this cause. As any considerable motion of air, the presence of clouds covering the sky, or the placing of a light covering, as of cloth or similar material, over the objects to be protected, greatly reduces or prevents the formation of frost upon them and of injury thereby, artificial preventives are often resorted to. Sometimes smoke-producing fires are built around or within enclosures or fields containing plants, fruits, or vegetables, and light, tent-like coverings are placed over small fruit trees, shrubs, etc., and other tender vegetable or plant growths, and thus the damage by frosts is prevented, or minimized. In France an instrument has been devised for the prediction of frost. It consists of a wet bulb and dry bulb thermometer, mounted on a board on which is also a scale of lines corresponding to the degrees of the dry bulb, and a pointer traversing a scale graduated according to degrees of the wet bulb. Observations are taken shortly before sunset. By means of the pointer and scale, the point may be found at which the line of the dry bulb reading meets the pointer set to the reading of the wet bulb. The scale is colored so that the point may fall in one of three zones, indicating certain frost, probable frost or no probability of frost. See also SNOW.

Air Drainage is a term generally applied to a type of air circulation which plays an important part in the distribution of frosts, more particularly in hill and valley districts. The cold heavy air of the higher slopes flows down and fills the valley, forcing upwards the warm and lighter air of the latter, and forming in the valley a lake of cold air. Thus there are heavy frost in the valleys while the higher slopes escape. The condition is understood by gardeners and others who use upper slopes for their gardens, orchards, etc.

B., 'Cold Waves and Frost in the United States' (Weather Bulletin P, Washington 1906); 'Canada's Fertile Northland' (Department of the Interior, Ottawa 1907); Hann, 'Zum Klima Manitoba' in *Meteorologische Zeitschrift* (Vienna 1894), and *Monthly Weather Review*.

FROST-BIRD, or FROST-SNIPE, a stilt sandpiper (q.v.).

FROST-BITE, form of mortification due to the action of cold in withdrawing the supply of blood from ears, fingers, nose, toes, cheeks, etc. In its milder forms it is known as «chaps» or «chilblains.» In frostbite the affected parts are always in danger of gangrene. The remedy is an immediate application of snow or a spray of ice-water to restore the circulation; this cold application is effective in all cases where the mortification is slight and not of long duration, but if it has gone too far the circulation cannot be restored, the part is lost and surgical treatment of the latter is necessary to prevent a spread of gangrene. See CHILBLAIN; COLD.

FROST-FISH, a name given to various fishes, because they appear at the time of early frost, as does the tomcod (q.v.) so called in New England. The frost-fish of New Zealand is one of the scabbard-fishes (q.v.).

FROSTBURG, Md., town in Allegany County, 80 miles southeast of Pittsburgh; on the Pennsylvania, the Western Maryland and the Cumberland railroads. Its situation is picturesque at an elevation of 2,200 feet above sea-level, and it has a reputation as a summer resort. A State normal school and a miners' hospital are located here. Coal mining is the chief industry, but there are also fire-brick and tile works, planing-mills, foundries and hosiery mills. It is governed by a mayor, elected for one year, and a council elected at large. The waterworks are the property of the municipality. Pop. 6,028.

FROTH-FLY, or FROTH-HOPPER. See FROGHOPPER.

FROTHINGHAM, Arthur Lincoln, American archæologist: b. Boston, Mass., 21 June 1859. He was educated in Rome, Italy, and at Leipzig; lectured on archæology at Johns Hopkins University in 1882–86; and became professor of archæology and the history of art at Princeton University in 1887, and in 1898–1906 was professor of archæology and ancient history. He founded the *American Journal of Archæology* in 1885; and was associate director of the American School of Classical Studies, Rome, in 1895–96. He is a member of many learned societies. His publications include 'A History of Sculpture'; 'Mediæval Art Inventories of the Vatican'; 'Stephen Bar Sudaili, the Syrian Mystic and the Book of Hierotheos' (1886); with Marquand, A., 'A Textbook of the History of Sculpture' (1896); 'Monuments of Christian Rome' (1908); 'Roman Cities in Italy and Dalmatia' (1910); 'A History of Architecture' (1911), and various monographs on Syria.

FROTHINGHAM, Nathaniel Langdon, American Unitarian clergyman and religious writer: b. Boston, Mass., 23 July 1793; d. there, 4 April 1870. He was graduated from Harvard in 1812 and entering the ministry was pastor of the First Church in Boston 1815–50. He was author of 'Deism or Christianity'; 'Sermons in the Order of a Twelvemonth' (1852); and 'Metrical Pieces' (1855–70). He was one of the earliest American students of German. His writings are marked by grace and refinement.

FROTHINGHAM, Octavius Brooks, American clergyman: b. Boston, Mass., 26 Nov. 1822; d. there, 27 Nov. 1895. He was a son of N. L. Frothingham (q.v.), and was graduated from Harvard in 1843, and from the Cambridge Divinity School in 1846. His radical views led to the resignation of his pastorate in the North Unitarian Church, Salem, Mass. He was pastor in Jersey City 1855–59; he then organized the Third Unitarian Church in New York, where he preached very radical and advanced views till his resignation in 1879. The remainder of his life was devoted to travel and literary pursuits, his home being in Boston. His works were 'Stories from the Lips of the Teacher'; 'Stories from the Old Testament'; 'The Religion of Humanity'; 'The Cradle of the Christ'; 'Memoir of W. H. Channing'; 'The Safest Creed'; 'Beliefs of the Unbelievers'; 'Creed and Conduct'; 'The Spirit of the New Faith'; 'The Rising and the Setting Faith'; 'Lives of Gerrit Smith, George Ripley, Theodore Parker'; 'Transcendentalism in New England'; 'Recollections and Impressions'; etc.

FROTHINGHAM, Richard, American journalist and historian: b. Charlestown, Mass., 31 Jan. 1812; d. 1880. He was at various times a member of the State legislature, was mayor of Charlestown 1851–53, and managing editor of the Boston *Post* 1852–65. He published 'History of Charlestown' (1848); 'History of the Siege of Boston' (1849); 'Life and Times of Gen. Joseph Warren' (1865); 'The Rise of the Republic of the United States' (1871).

FROUDE, frood, **James Anthony,** English historian: b. Dartington, Devonshire, England, 23 April 1818; d. Salcombe, Devonshire, 20 Oct. 1894. He was the youngest son of Archdeacon R. H. Froude, rector of Dartington, and was educated at Westminster and Oxford. His brother, Hurrell Froude, was one of the leaders in the "Oxford Movement" and both were influenced by Newman, the earliest work of the younger Froude being a contribution to the 'Lives of the Saints,' edited by Newman. He soon emerged from Tractarian influence, however, and for the rest of his life remained indifferent to the Church in which he had been reared. The first two volumes of his history of England appeared in 1856 and at once attracted marked attention, both favorable and adverse, on account of the brilliant style and the audacity of the writer's opinions. The book flatly reversed many historical judgments, and interpreted motives in a manner more common now than then, but very startling to readers in the middle of the 19th century. His attempted vindication of Henry VIII must be accounted a failure, brilliant and able as it is, and although it is a most striking portrait of Henry that he has painted, it cannot be called a faithful likeness. His treatment of Mary of Scotland is frankly hostile, and has been met with severe criticism. His judgment of Elizabeth, though far from impartial, is more nearly accurate than that of either of the other two personages. He excelled in vigorous, dramatic presentation of men and events, and in the judgment of sober critics appears to have cared much more for picturesque narrative than for absolute historical accuracy. As a historian, he will long continue to be read and admired, but his apparent indifference to historical truth at times will not permit of his inclusion in the first rank of historians. He visited the United States in 1872 on a lecture tour, his lectures being afterward published with the title of 'English Misrule in Ireland.' In 1874 he visited South Africa, his impressions being later given to the world in lectures at Edinburgh, and in 1882 made an extended tour through Australia, the West Indies and the United States, the literary outcome of which were 'Oceana' and 'The English in the West Indies.' He was the friend of Carlyle, whose literary executor he became, and his life of the Sage of Chelsea, his 'Reminiscences of Carlyle' and 'Letters and Memorials of Jane Carlyle' have excited a vast amount of controversy. In 1892 Froude succeeded the historian Freeman as regius professor of history at Oxford, his lectures in that capacity afterward constituting his volume on Erasmus. It may be said that Froude was more distinctly a man of letters than a historian. He is always readable even when one is forced to dissent from him most strongly, but he touched on too many themes to give to the writing of history the devotion toward it so characteristic of such men as the late Samuel Rawson Gardner, Professor Freeman or John Richard Green, and he was temperamentally indifferent to the claims of entire truthfulness. He may not have consciously distorted facts, but his selection of certain details and suppression of others for the apparent sake of making the particular hero in question brighter, or the particular villain darker, does not commend itself to the lover of truth for its own sake. His important works include 'Shadows of the Clouds,' published under the pseudonym "Zeta" (1847); 'The Nemesis of Faith' (1849); 'The Book of Job' (1851); 'The History of England from the Fall of Wolsey to the Death of Elizabeth' (1856–70); 'Short Studies on Great Subjects' (1867); 'Inaugural Address Delivered to the University of St. Andrews' (1869); 'The Cat's Pilgrimage' (1870); 'Short Studies: Second Series' (1871); Calvinism' (1871); 'The English in Ireland in the 18th Century' (1872–74); 'Short Studies: Third Series' (1877); 'Life and Times of Thomas Becket' (1878); 'Cæsar: a Sketch' (1879); 'Bunyan' (1880); 'Two Lectures on South Africa' (1880); 'Reminiscences of the High Church Revival' (1881); 'Short Studies: Fourth Series' (1882); 'Reminiscences of Thomas Carlyle' (edited 1881); 'Thomas Carlyle: History of the First Forty Years of His Life' (1882); 'Letters and Memorials of Jane Welsh Carlyle' (edited 1883); 'Thomas Carlyle; History of His Life in London 1831–81' (1884); 'Life of Lord Beaconsfield' (1890); 'The Divorce of Catharine of Aragon' (1891); 'Life and Letters of Erasmus' (1894). The first two volumes named above he attempted to suppress in later life, and succeeded with 'The Shadow of the Clouds.' Consult 'Life,' by Herbert Paul (1905).

FROUFROU, comedy in five acts, produced at the Gymnase in 1869 and the greatest work of Meilhac and Halévy.

FROZEN STRAIT, the passage which connects Repulse Bay and Fox Channel, and separates Melville Peninsula and Southampton Islands. It is from 10 to 20 miles wide and in lat. 65° N. This strait is frozen, as its name indicates, nearly all the year, although some bodies of water farther north are free from ice from two to five months each year.

FROZEN WELLS, wells occurring in which ice is found throughout the year. In most wells of this kind the temperature is seldom above 32° F. The low temperature is due to the entrance of cold air into the interior of the earth in cold winter months. Kimball studied conditions in some abandoned iron mines at Westport, N. Y., and thus obtained a clue to the method of ice formation in wells and caves. It was formerly believed that the presence of ice was due to the fact that the well pierced a stratum of glacier drift in which ice still survived. A famous frozen well is that at Brandon, Vt., which long showed ice at 14 feet below the surface in summer time.

FRUCTIDOR, frük'tē-dōr, the 12th month of the French Republican Calendar. From the year I to VII it ran from 18 August to 16 September, and in the years VIII–XIII from 19 August to 17 September. It was followed by five supplementary days — the sansculottides — which completed the year. The 18th Fructidor, year V (4 Sept. 1797) is memorable for the *coup d'etat* by Barras, Le Révellière and Rewbell in expelling Barthélemy and Carnot. See FRENCH REVOLUTION.

FRUGONI, Carlo Innocenzio Maria, Italian poet: b. Genoa, 21 Nov. 1692; d. Parma, 20 Dec. 1768. He was originally destined for the Church and was even induced to take monastic vows. He gained a great reputation as an elegant writer of Latin and Italian prose and verse and from 1716 to 1724 he was professor of rhetoric successively at Brescia, Rome, Genoa, Bologna and Modena, where he attracted a great number of students. He finally settled down at Parma, where the Duke Antonio Farnese appointed him poet laureate. After the duke's death he returned to Genoa. Later he returned to Parma and devoted his remaining years to poetical composition. As a poet, Frugoni is regarded as one of the best of the Arcadian school. Consult his 'Opere poetiche' (10 vols., Parma 1779); 'Poesie' (15 vols., Lucca 1780); Carducci, 'Poeti erotici del sec XVIII' (Florence 1878); 'Lettere inedite,' edited by Bertoldi (Forli 1891); the biography in 'Fabroni Vitae' (Vol. I, 1778–1805); Torelli, 'Paesaggi e profili' (Florence 1861); Bertana, E., 'Intorno al Frugoni' in *Giornale storico della letteratura italiana* (Vol. XXIV, Torino 1883 et seq.).

FRUIN, Robert, Dutch historian: b. Rotterdam 1823; d. 1899. He received his education at Leyden and after 1860 was professor of the history of the Netherlands there. He edited Nijhoff's 'Bijdragen voor Vaderlandsche Geschiedenis' and contributed frequently to *De Gids* and other periodicals. He was the greatest authority on Dutch history in his time. He published 'Tien jaren uit den tachtigjarigen oorlog' (4th ed., 1889); 'Reply to Sir Bartle Frere' and 'Appeal to the People of England' (1881), dealing with the Transvaal question caused considerable comment at the time; 'Geschiedenis der staatsinstellingen in Nederland tot den val der republick' (1901); 'Verspreide Geschriften' (8 vols., 1900–03),

FRUIT, that part of a plant in which the seed or other reproductive element is perfected; in ordinary plants the matured ovary with its pericarp and other parts. Strictly speaking the term is confined to the true seed plants (spermatophytes). This botanical definition is largely extended in popular usage to include the sporangia of mosses and the sori of ferns and still more loosely and erroneously to any plant part useful to man.

Within the limits of the definition fruit structures show exceedingly wide variation. Typically the fruit is a mature ovary which contains seeds, but in some cases, as in the strawberry, the seeds are practically outside the «fruit,» being embedded in the pulp. Because of the difficulty of making a satisfactory and all-inclusive general classification on any other than that of evolutionary development the following sketch is given.

Dry Fruits.— Starting with those simplest flowers in which all the carpels (simple pistils or one of the elements of a compound pistil) are separate, we find the stigma and style usually withering back as no longer of service, and the ovary enlarging, as the fertilized ovules grow up into seeds. But in many simple flowers more ovules are produced than are fertilized, and generally also more fertilized than can be developed up to maturity; hence the reduction of the ovules is exceedingly common, as is simply exemplified in the horse chestnut.

A second principle of fruit-making is reached through keeping in mind the origin of the ovary from one or more carpellary leaves, of which the individual development has been so greatly checked that they remain closed upon the ovules, and frequently even coalesce with each other from the base upward, so forming a many-celled ovary. Yet the tendency to their individual expansion is not lost; in many monstrosities, and normally in a few types, such as the common mignonette, the carpellary leaves early begin to expand, so opening the ovary and exposing the seeds long before ripeness. Far more frequently, however, this final development of the carpellary leaves is delayed until the growth-processes of the seed and fruit have ended, and it is, therefore, accompanied, or even preceded, by their death; the separation often indicating the lines at once of leaf-margin and leaf-fall.

In the best-developed carpellary leaves, such as those of the more floral *Ranunculaceæ,* we naturally find the ovary opening along the line of its united ovule-bearing margins. This is what is termed a follicle.

Since, however, the ovules are on the united margins, the midrib tends to interpose little or no resistance to a tendency to split or tear along its fold. Such «dehiscence by both dorsal and ventral suture» gives us the legume or pod. Another type is the *siliqua* (or when shortened and broadened the *silicula*) of *Cruciferæ.* Here the placental edges of two united carpels develop a transverse septum which divides the fruit; and this is left when the lobes split away, as so familiarly in honesty.

Among united ovaries which readily split open at the united margins (*septicidal*) is that of gentian (q.v.), while the more familiar three-

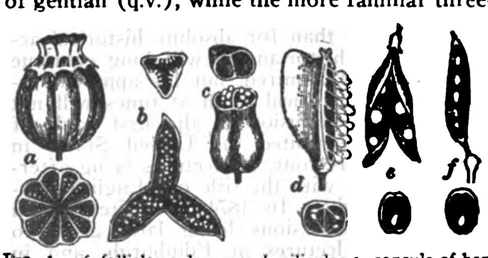

FIG. 1.—*f*, follicle; *e*, legume; *d*, silicula; *c*, capsule of henbane; *b*, of violet; *a*, of poppy.

celled ovary of violet, with its parietal placentation, gives a characteristic example of dehiscence along the midribs of the united carpels, so opening the loculi (*loculicidal*). In the five-celled capsule of the geranium (q.v.) the carpellary leaves separate not only at the sides but also at the base, so curling inwards and projecting the seed. Where, however, the placentæ remain more or less completely upon a

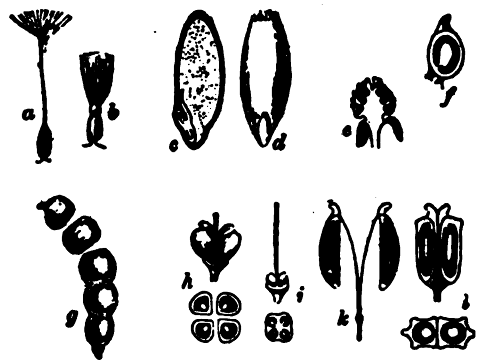

FIG. 2.—*e, f*, achenes of buttercup; *c, d*, caryopsis of oat; *a, b*, achenes with pappus; *g*, "lomentum"; *i, h*, nutlets and ovary of borage; *l, k*, umbelliferous type of schizocarp.

central column from which the valves are detached, the dehiscence is said to be septifragal.

In henbane (*Anagallis*), etc., the dehiscence is circular (*circumscissle*). Many-celled capsules are numerous in which the leaf-opening or dehiscence is greatly reduced from completeness; witness the valvular and porous dehiscence of the *Lychnis* and of the poppy respectively. Such cases clearly point us to those of carpels which do not open at all. Such indehiscent fruits, produced from carpels so persistently embryonic, are usually short, few or one-ovuled, and, for the most part, little specialized. Thus the follicle of the *Ranunculaceæ* of more specialized floral character becomes shortened into the one-seeded indehiscent *achene* of the anemone and the buttercup. In the achene of the grasses (which similarly represents the capsule of the ancestral lilies) the thin dry pericarp becomes inseparable from the seed-coat (hence the term caryopsis); in many trees (for example, hazel) it becomes hardened and thickened as a nut. In composites, too, the achene is practically a nutlet, although often (on account of its being inferior) superfluously termed a cypsela. Less extremely reduced representatives of the various multicellular ovaries to which such fruits correspond are afforded us by borages or mints in which the two-celled ovary of the primitive solanaceous type becomes, as in thorn-apple, etc., subsequently divided into four parts. In *Umbelliferæ* we have another characteristic form of schizocarp, as all such fruits are termed which split up without truly carpellary dehiscence, although the tendency to this can be seen still to have some influence. Here the separate portions (or mericarps), each resembling an achene or nut, are two in number, and when ripe swing off upon the ends of a forked carpophore.

Fleshy Fruits.— So far all our fruits have been dry; but a different physiological principle of fruit formation is necessary to comprehend those in which the pericarp is succulent. For, just as the effect of fertilization is seen in many animals to extend beyond the mere ovum to the parent organism, and also in many of the lowest plants, so it is in the case before us. Even in fruits which are dry on ripening we have seen that the ovaries or loculi, on which no demand is made for the growth of fertilized ovules, become reduced or disappear. Sometimes it may be merely the coats of the seed (as in the pomegranate) which undergo the complex histological and chemical changes which we sum up as those of succulence and ripening; at other times largely their placentas, as in gooseberry and currant. Yet, as in these, the innermost tissue of the ovary may become succulent as well. In the orange also the seeds are imbedded in the familiar succulent tissue of the enlarged loculi or "cells" of the endocarp; the grape, too, gives a characteristic example of soft endocarp. These may all be classed as berries or baccate fruits, for the distinction of the succulent product of an inferior ovary as a berry, from that of a superior one, as a uva or grape, need hardly be allowed to increase our nomenclature. A pepo is merely a berry in which the epicarp is thick and tough (for example, a melon, with which the orange and the pomegranate may be reckoned). Where the succulent change, instead of primarily affecting the deeper tissues of the fruit, and so producing a berry, leaves the endocarp hard, we have the drupaceous or stone-fruit. The endocarp here forms a more or less complete "stone" or "pit" around the kernel or seed, the difference from an ordinary nut being due to the succulence of an outer layer (mesocarp), with a more or less leathery outer skin, the epicarp. The plum, peach and cherry are the most obvious examples; but, since we may have many carpels thus transformed and more or less united as in the raspberry, we may have an aggregate fruit or syncarp of tiny drupes. The walnut and even the coconut are hence not true nuts. (See NUTS). The immature succulent mesocarp of the former is familiar in pickled walnuts, the ripe walnut we crack being merely the stony endocarp (which is exceptionally specialized in being set free by the bursting of the mesocarp on ripening). Coconut fibre is the fibro-vascular tissue of the mesocarp, the fruit being thus broadly comparable to a peach which has wizened while still young and stringy. But, as in the kindred grass, the coats of the ovule further unite to the endocarp.

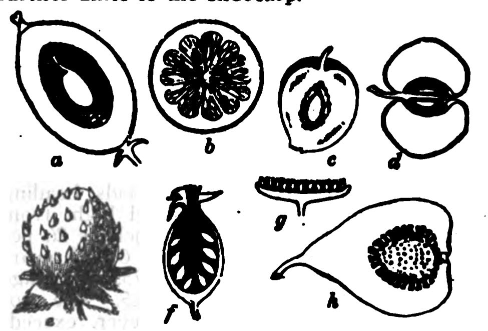

FIG. 3.—*a*, drupe; *b*, orange; *c*, a single drupelet of bramble; *d*, pome; *e*, strawberry; *f*, hip of rose; *g*, capitulum of Dorstenia; *h*, fig.

The numerous carpels of the strawberry, although, of course, corresponding to those of the allied raspberry, remain mere nuts; here, however, the subjacent portion of the floral axis or receptacle becomes succulent. In the perigynous and epigynous *Rosaceæ* the same change may take place; hence the rose-hip is a succulent axis, enclosing a multitude of nuts. The apple or "pome" is more akin to the drupe, since the carpels, here deeply sunk in the upgrown floral axis, develop a hard endocarp corresponding to the stone of a drupe.

Fertilization may even be followed by succulent or other thickening of the floral envelopes, or of the floral axis with subjacent bracts — the various cupules, as of acorn, beech, hazelnut, etc., being of this nature. Or we may have a spurious fruit developed at the expense of an entire inflorescence, as in the pineapple, Dorstenia and fig.

In the plantain and the banana the fruit is fleshy but when normally ripened it dehisces by the splitting of the pericarp into valves somewhat after the order of a bean pod. Another anomaly is the almond in which the construction is precisely the same as in the peach except that in the former the pericarp is fibrous, in the latter fleshy.

Chemical Composition of Fruits.— Our knowledge of the chemistry of fruit may be dated from the analyses of Fresenius (1857). But because of the innumerable varieties of almost every cultivated fruit, the effects of different soils and climates upon these, and still more of the fluctuation due to better or worse seasons, the results of any one chemical analysis would tend to convey an idea of undue precision. Thus — for example, while the ratio of sugar to free acid in certain grapes of an ordinary wine-year was found to be 16 to 1, in a very bad year it sank to 12, and in a very good year rose to 24. Hence a broad outline may be of more general use than the statistics of any one analysis.

The percentage of water may be taken as varying from 78 to 80 in the grape and cherry, as from 82 to 85 in plums, peaches, apples and pears, as 82 to 87 in brambles, currants, etc., and as much as 95 in the watermelon. The proportion of insoluble residue — skin and cellulose, stone and seed — obviously also varies greatly with succulence and ripeness, but may be taken, one fruit with another, at not less than from 4 to 6 per cent. Unripe fruits may contain a notable proportion of starch, but this is fermented on ripening into glucose and other sugars, fruit-sugar, grape-sugar, cane-sugar or (in *Sorbus*) sorbin. The only fruits which retain starch in important quantity are those of the banana, breadfruit-tree and baobab; hence the exceptional nutritive value of these. The olive alone yields a notable proportion of oil. The proportion of sugars varies exceedingly, dates, dry figs (48 per cent) and raisins (56 per cent), again very important foods, heading the list. Grapes, of course, stand high, from 12 to 18, indeed sometimes as much as 26 per cent, cherries from 8 to 13, apples 6 to 8, pears 7 to 8, plums 6, red currants 4.75, greengage plum 3.5, peach and apricot only 1.5. The proportion of pectin bodies is, however, exceedingly notable, especially in fruits such as the three last named. In unripe fruits (as also in roots) we find pectose, a body apparently related to cellulose, but easily transmuted by a natural ferment or by boiling with dilute acid into pectin, $C_4H_6O_4$, and its allies. These are all more or less soluble in water, with which they readily form a jelly (whence the peculiar consistency of our fruit-preserves). The proportion of soluble pectin and gum varies considerably and is of great importance to the blandness and agreeableness of fruit, the harder and more common apples having considerably less than 3 per cent and the best reinetts nearly 8. The red currant, indeed, like berries in general, has exceedingly little (0.25 per cent); while the apricot has as much as 9, the greengage plum 12 and the peach 16 — a circumstance which explains the peculiarly melting quality of these fruits, especially the last-named. The free acid also varies greatly, from 2.4 per cent in the red currant, 1.4 in the raspberry, and nearly as much in the sourest cherries, to 0.5 in sweet cherries and a minimum of 0.1 or less in the sweetest pears. That of apples and of grapes, of course, varies greatly, but both may generally be taken at from 0.75 to 1, while the apricot and peach stand at 0.3 or 0.4. The acid is primarily malic, but citric, acetic, oxalic, tannic and others may also be present.

The quantity of albuminoids is of course small, in fact, inadequate to render most fruits staple food. Yet it is by no means inappreciable, ranging from nearly .5 per cent in the majority of fruits to .7 or .8 in the grape (2.7 in raisins), and above 1 in the melon and the tomato. Hence to acquire albuminoids equal to those of one egg we must eat 1½ pounds of grapes, 2 pounds strawberries, 2½ pounds apples or 4 pounds pears. To replace 1 pound starch = 5½ pounds potatoes, we need 5.4 pounds grapes, 6.7 of cherries or apples, or 12.3 of strawberries.

The quality of fruits depends largely upon the proportion of sugar, gum and pectin to free acid, largely also upon the proportion of soluble to insoluble matters, but in very great measure also upon the aroma. This quality is due to the presence of characteristic ethers, often accompanied by essential oils, although not of course in ponderable percentage. Cultivation and selection operate strongly on all three factors.

Keeping of Fruit.— Many of the finest fruits undergo very speedy decomposition, which, as distinguished from the intrinsic processes of ripening, is due to the attacks of bacteria, molds or yeasts; so the problem of their preservation is therefore primarily one of preventing these. In damp and stagnant air, especially with considerable or frequent changes of temperature, these fungous pests multiply with special readiness; hence a fruit-room must be cool and shady, yet dry and airy, and the fruit carefully gathered rather before full ripeness, handled so as to avoid in any way bruising or tearing the skin, and laid out and occasionally looked over so that rottenness in one may not affect the rest. Under these conditions apples especially may be kept for many months; indeed many varieties of fruit — for example, winter-pears — require these conditions for satisfactory ripening. On antiseptic principles we see how it is that the dense-skinned and wax-coated grape can be so largely imported in sawdust, or how unripe gooseberries and even very perishable pears can be kept for months similarly packed in well-sealed jars in a cool place. The process of preserving with sugar in jars promptly covered up is similarly an antiseptic one; but in the systematic application of antiseptic princples we may still look for considerable progress in the preservation and transport of fresh fruit upon a large scale. The method of drying fruit has also been in use from remote times, especially with dates, figs and raisins. (See CIDER; FRUIT GROWING; FRUIT INDUSTRY; FRUITS, COLD STORAGE OF; GARDEN; and articles on the various fruits, as APPLE, CHERRY, PEACH, etc.). Consult works on fruit-culture by Bailey, Burbidge, Cheal, Downing, Du Breuil, Fish, Fuller, Hogg, Roe, Thomson, Wood, Paddock and Whipple, Sears, Barry, Warder, Thomas, Beach, Hedrick, Kains, Hume, Coit, Waugh, Wilkinson, Husman, Budd and Hansen, Card, Wickson, Webb, White, Popenoe, Munson, Chorlton, Fletcher, Maynard, Green and Meech.

M. G. KAINS.

FRUIT-BATS, the bats of the family *Pteropodidæ,* called also fox-bats or flying-foxes, because of their fox-like heads and faces. They compose one of the two grand subdivisions of bats, the *Megachiroptera* (see BAT), confined to the tropical parts of the Old World. These are the largest of all bats, and differ from the other bats in that they are entirely frugivorous. There are several genera, the most important being the genus *Pteropus.* The best-known species is the Indian fox-bat (*P. medius*), common in India, Ceylon and neighboring islands. As evening falls these bats fly out of the branches, where they have hung, like great black fruits, all day, and start on their nocturnal depredations, which they continue until dawn, when they return to their homes,— thousands sometimes forming a single colony, wrangling and jostling one another for the most desirable places on the limbs. Once settled they hang, head down, until day is over. They are so numerous and so destructive to crops in certain localities that they are hunted vigorously; but even when they are shot by thousands, the numbers do not seem to be materially decreased. There are certain species that sometimes feed on flowers as well as fruit; but this is not generally the case. The Indian fruit-bat, Lyddeker says, will greedily drink palm-juice from the pots hung on the trees to collect it, and at times, individuals have been found at the foot of the trees quite helpless from intoxication.

The spread of wing is from four to five feet in the Indian and Malay species; smaller than these are the ugly-faced *Harpyias,* so named because of the supposition that they were the «harpies» of the old mythology.

FRUIT-CROWS, the somewhat crow-like birds of that section of the South American family *Cotingidæ* called *Gymnoderinæ.* This section contains a number of most unusually ornamented birds, such as the bill-bird, and umbrella-bird, and most of them have bare spaces, or wattles, about the head. They are woodland birds whose habits are little known, but they feed mainly on seeds and berries, and make large nests in trees and bushes.

FRUIT-FLY, any of the flies of the family *Trypetidæ,* whose eggs are laid and maggots are bred in fruit, for example, the apple-maggot (q.v., under APPLE), or in plant stems. The Mexican orange-worm (see ORANGE INSECT-PESTS) is another well-known species, while the galls so frequently observable upon the golden-rod are the work of a third (*Trypeta solidaginis*). The maggots remain within the fruit or gall during the winter, then, if not already thrown down, creep out, drop to the ground and transform into pupa and imago. They vary in color from buff to brownish-black, and are frequently beautifully banded or spotted. See also POMACE-FLY.

FRUIT GROWING. Fruit growing is the art and practice of producing fruits for human consumption. Fruit growing is also highly developed as a profession; followed by many experts, teachers and investigators. In recent years there has been a tendency to develop the scientific aspects of fruit growing, and, although little progress has been made in the solution of fundamental laws, much knowledge of real value to the professional and practical fruit grower has been accumulated. The term pomology is frequently applied to the classified knowledge of fruit growing, but the two terms are really synonymous. The fruit grower's conception of the term fruit is much more restricted than that of the botanist's. In this country it is generally confined to the product of trees, bushes and woody vines, such as the apple, currant and grape. Important exceptions are the fruits of such herbaceous perennials as the strawberry and pineapple. The products of annual plants, such as watermelons, cantaloups, tomatoes, etc., are classed as vegetables. It is common practice to classify the fruits of North America into four general groups: (1) Orchard fruits, including the temperate zone tree fruits such as the apple, peach, apricot, plum, cherry, etc.; (2) grapes, the only important vine fruit; (3) small fruits, including the raspberry, blackberry, currant, gooseberry, blueberry, cranberry and strawberry; and (4) citrus fruits, including the orange, lemon, grapefruit and allied forms. To provide for such fruits as the pineapple, fig, olive and other fruits grown in milder regions of the country, the awkward but comprehensive heading tropical and subtropical fruits other than citrus, is frequently used.

A survey of the cultivated fruits of North America reveals the fact that native fruits have been of minor importance in developing the great fruit industries of the country. Of the more or less important fruits, the following are of foreign origin: the commercial apples, the pear, peach, apricot, quince, cherry, European plum, Japanese plum, Japanese persimmon, European grape, currant, certain gooseberries and most of the strawberries, all of the citrus fruits, pineapple, olive, fig and date. The native fruits have contributed several plums, a few apples, the grapes of eastern North America, the blackberry, dewberry, raspberry, loganberry, many gooseberries, some of the strawberries, cranberry and blueberry. The improvement of fruits, especially tree fruits, by breeding methods is a slow process and rather uncertain in its results. Practically all of the improved native fruits listed above are of chance origin. Many of the foreign introductions have been so altered in the course of time by the influence of environment, selection, and, to a small extent, by breeding, as to be now considered distinct American forms. Fruit growing in this country has been developed along amateur, local and commercial lines. There are varieties of fruit adapted for the home, the local market and the long distance market. The present-day improvement of varieties is largely with the commercial idea in view. Edible quality has been sacrificed to some extent; whereas appearance and shipping and keeping qualities have improved. Competition is becoming keener and the commercial fruit of the future must be of high quality in order to find a ready sale.

Commerce in fruits and fruit products during the early years of the 19th century was insignificant. It consisted in a small trade in fresh and dried apples, apple cider, apple brandy and vinegar, peach brandy, and in some localities, wine from native grapes. The increasing demand for cider led to the planting of many seedling apple orchards in the Northeast, and the culture of orchard and small fruits in general was gradually established in the vicinity of the larger towns. By the middle of the century the railroads began to penetrate the interior of the country, opening fertile regions adapted to fruit culture and broader commercial possibilities of fruit growing came to be more fully recognized. During the period from 1850 to about 1880 many large orchards, vineyards and small fruit plantations were established at long distance from their prospective markets, and plantings were increased in the vicinity of the large markets. The knowledge of fruit transportation and storage was limited. Nearby fruits frequently glutted the markets during the few days or weeks in which they were harvested and long-distance fruits could not reach these markets when local fruit was scarce. Such was the condition existing about 1890, when mechanical cold storage plants were adapted to storing apples over long periods and the more perishable fruits over temporary market gluts. Successful refrigerator car systems for conveying fruits long distances were developed about the same time. With the perfection of storage and transportation methods, fruit growing has become an important and highly specialized branch of North American agriculture. But few sections of the country are without some commercially important fruit industry.

Production.— The first attempt to obtain definite reports on the value of fruits produced in the United States was made by the 12th census in 1899. The total value of all classes of fruits produced in that year was $131,423,000. By 1909, the total value had increased to $218,000,000 which was equivalent to about one-third of the value of the wheat crop of 1909. The value of all deciduous tree fruits in 1909 amounted to $140,867,000; small fruits, $29,974,000; citrus fruits, $22,711,000; grapes, $22,027,000; subtropical and tropical fruits other than citrus, $1,995,000. Nearly four-fifths of the total value was contributed by apples, 38.3 per cent; peaches, 13.2 per cent; grapes, 10.1 per cent; strawberries, 8.2 per cent; and oranges, 8.1 per cent. Since 1909, the production of most fruits has gradually increased and competition has become keener. At the same time fruit values have conformed to the general upward trend in price of all commodities. As far as the commercial crop is concerned, the apple, the most important fruit grown in the United States, has been declining in production for the past 20 years. The bulk of the apple crop was formerly grown in the general farm orchards in the Northeast. Many of these orchards have passed the prime of life, produce inferior fruit and are dying. Thus far, the large crops they formerly bore have not been replaced by the many young orchards planted in other sections.

The principal orchard fruits of Canada are the apple, peach, plum, pear and cherry. The leading small fruits are the grape, strawberry, currant and gooseberry. As in the United States, the apple is the most important fruit grown. The production of all orchard fruits in Canada in 1910 amounted to 12,565,000 bushels of which 10,618,000 bushels were apples. Ontario is the leading province in the production of fruits, although apple orcharding has assumed some importance in Nova Scotia and British Columbia.

The geographical distribution of the important fruits is considered in articles dealing with these fruits (see APPLE, etc.). From the standpoint of commercial production the leading apple States are New York, Pennsylvania, Washington, Virginia, West Virginia, Missouri and Michigan; peaches, California, Georgia, Texas, New York, Alabama, Michigan and Pennsylvania; pears, California, New York and Michigan; plums, California, Oregon and Washington; cherries, New York, Washington, Wisconsin and Michigan; grapes, California, New York and Michigan; strawberries, Maryland, Delaware, Tennessee, Louisiana and Arkansas. Raspberries are widely grown throughout the northern half of the country. Limited commercial districts occur near large cities. New York and Michigan produce large quantities of raspberries for canning and drying. The loganberry, a blackberry-raspberry hybrid, originating in California, is now cultivated extensively in that State and Oregon for canning and drying. The principal citrus fruits grown in the United States are oranges, lemons and grapefruit. The cultivation of these fruits is largely confined to California and Florida. Limited quantities of oranges are grown in Arizona and in the Gulf Coast States. California produces about two-thirds of the oranges and practically all of the lemons. Florida produces about one-third of the oranges and most of the grapefruit. Of the smaller subtropical industries, pineapple growing is confined to Florida, and the production of dried figs and olives to California. It is practically impossible to secure complete and comparable statistics on the fruit industries of the country as a whole, but from data largely obtained from the United States Bureau of Markets, it is conservatively estimated that it required 200,000 cars to move all classes of fresh fruits in 1917. Nowhere in the United States are all branches of commercial fruit growing centered to such an intensive degree as in California. This great region has a multitude of local climates, much variety of soil and rainfall, and physical conditions which strongly differentiate it from the remainder of the United States. With one or two exceptions, such as the grapefruit and pineapple industries of Florida, every commercial fruit industry in the country as a whole has been duplicated in California and many industries, such as lemon, Smyrna fig, olive and European grape growing have been al-

FRUIT GROWING

1 Birdseye View of a Well-cultivated Peach Orchard

2 Strawberry Growing in Wisconsin

most localized there. If we except dried apples nearly all of the cured fruits are produced in California and about two-thirds of the canned fruits. In 1917, California shipped from the State 24,340 cars of fresh grapes, peaches, pears, plums, etc. The commercial citrus crop of California for the shipping season ended 1 Oct. 1917, was oranges, 46,447 carloads, and lemons, 7,914 carloads. The estimated production of dried fruits, including apples, apricots, figs, peaches, prunes, raisins and others was 341,100 tons, of which more than two-thirds were prunes and raisins. California packed over 7,000,000 cases of canned fruit in 1917. In recent years the citrus and pineapple industries in Porto Rico and the pineapple industry in Hawaii have developed rapidly. About $6,000,000 worth of canned pineapples were shipped from Hawaii to the United States in 1915. The same year Porto Rico shipped about $3,000,000 worth of pineapples, grapefruit and oranges to the United States.

Export Trade.— During the past 15 or 20 years the United States has developed a big business in fruits with other countries. The exports consist of dried and canned fruits as well as fresh apples, oranges and pears. Exports of all fruits during the year ended 30 June 1900, amounted to $11,486,000. By the year ended 30 June 1914, fruit exports had increased in value to $31,030,000 and for the year ended 30 June 1917, to $37,652,000. The fruit imports for the same years are: 1900, $16,284,000; 1914, $33,638,000; 1917, $25,315,000. Bananas and lemons comprise more than half of the imports. The balance is made up of dried currants, grapes, raisins, figs, olives, pineapples, dates and other fruits. The war has created an active demand for exports of canned and dried fruits, but has curtailed imports of fruits of all kinds. The principal fruit exported from Canada is apples. An average of 1,242,000 barrels annually, valued at $3,626,000, was exported during the five years ended 31 March 1913. During this same period, Canada's annual fruit imports amounted in value to about $10,000,000.

Cultural Practices.— In the early days when fruit had no financial standing as a crop, the farm orchard or plantation was given indifferent care at the best. With the rise of commercial fruit growing this condition has rapidly changed. Cultural practices, specially adapted to large area planting, have been evolved. The extent to which these practices are employed in certain regions varies largely with the relative importance of fruit growing and other agricultural pursuits. Men who make fruit growing their main pursuit have been quick to adopt methods that enhance the prospects of a good annual crop. Modern practice calls for just as thorough a preparation of the soil before planting fruit trees as is given other farm crops. The soil should be stirred deeper, because the main roots are to establish themselves some distance below the surface. The best planting conditions are secured when the land is occupied by a fertilized and cultivated crop the year before the trees are planted. As a rule solid plantings of the same kind of fruit are more easily managed and will be more successful than mixed plantings of different fruits. On the other hand it is safer to include several commercial varieties of the same fruit in a planting because most varieties yield better when pollinated by another variety than when self-pollinated. In most situations fruits will thrive best when tilled or cultivated than when grown in sod. There is rarely enough moisture for both trees and grass. For this reason grain crops should not be grown between the rows. In order to reduce the cost of developing an orchard, cultivated crops may be grown for a few years, provided they are well fertilized and neither the crop nor the necessary preparation of the land interferes with the ever-extending tree roots. Frequent light tillage from early spring until midseason conserves moisture and assists in making plant food available to the tree roots. Tillage prolonged throughout the whole season, however, will eventually destroy the physical texture of the soil, promote soil erosion and puddling; and may stimulate the trees into a late immature growth subject to winterkilling. To prevent this, the orchard is seeded down with a cover crop such as rye or clover as soon as the trees have ceased making rapid growth. This crop is turned under in the spring, thus supplying humus for loosening the soil. If clover or other legumes are used as cover crops, an important amount of nitrogen is added to the soil. In the West much of the fruit is grown under irrigation, and the tendency has been to till the land throughout the season in order to conserve as much moisture as possible. The detrimental effect of continued clean tillage on soil texture is so evident that the use of cover crops in that region is becoming more common. It is generally recognized that fruit crops exhaust the fertility of the land in much the same manner as other farm crops, and the best fruit growers use fertilizers in some form or other. Soils vary so much even over short distances that the fertilizer question must largely be solved by the individual grower. In lieu of more specific knowledge on the subject, the fertilizer practice of successful growers in any section is apt to give the best results.

Spraying fruits for the control of insects and diseases is a well established and generally necessary practice. Spraying equipment has been perfected for large and for small plantations and spraying formulas have been worked out to meet the needs of different sections of the country. Sprays are usually applied in liquid form. Quite recently some progress has been made in the perfection of dusting machines for orchard use. The fumigation of young fruit trees in nursery establishments for the control of scale insects is a common practice and is required by law in many sections. (See INSECTICIDES; FUNGICIDES). Most fruit growers practice pruning to some extent. The best practice calls for a light annual pruning rather than intermittent heavy pruning. Pruning is apt to be neglected over too long intervals because it requires more knowledge and experience than other orchard work and skilled labor is not always available. The subject is discussed under Pruning (q.v.). Fruit trees often set more fruit than can be matured to marketable size. An excessive crop usually means small and often poorly colored fruit. The overloading breaks down the limbs of the tree; thus favoring the development of disease, and, at the same time, reducing the chance for a good crop the succeeding year. These conditions can be corrected by thinning the fruit. Thinning is an established practice with peaches and other summer fruits. Such fruits show remarkable increase in size from thinning. When a market for high quality fruit is assured, it is often profitable to remove as much as two-thirds of the immature fruit. There is an increasing demand for high quality apples, and thinning is more common in the best commercial districts. Varieties that naturally grow large should not be thinned beyond the point of reducing excessive strain on the tree. In the citrus regions the fruits require several pickings and each of these pickings might be called a thinning operation. The usual time to thin is just after the so-called June drop, when the tree sheds much fruit that failed to pollinate and when growth is still active. The amount to thin varies with the kind of fruit and the variety. Rarely will it pay to thin unless the remaining fruits are well sprayed.

Very frequently young trees are attacked by rabbits, mice, woodchucks and the like and serious damage is done. If the trees are still vigorous and the wounds are not too extensive, the trees may be saved by bridge grafting. When young trees are set in districts where such rodents are numerous, it is a good plan to use some form of a tree protector. These protectors may be of wood veneer, wire netting, lath or tar paper. They should be set into the earth several inches and surround the trunk up to the base of the lower limbs. In milder sections of the South and West, heavy spring frosts sometimes do much damage to the young fruit buds and newly set fruits. In the West particularly, many large commercial orchards are equipped with fuel pots for burning crude oil, distillate and coal, while others use wood. Orchard heating devices are quite common in the citrus regions. The present orchard heating devices are far from perfect and much more must be learned about the range of effectiveness and the limitations of orchard heating before the practice becomes general. They have been more successful when employed over a large contiguous area and with fruits bringing high prices than when employed by individual growers and with fruits bringing low prices.

Generally speaking, cultural practices are more highly developed in those regions that are devoted almost entirely to fruit growing and are dependent on long distance markets. The same is true of methods of picking, grading, packing and marketing fruits. It has been thoroughly demonstrated that careful handling in preparing the fruit for market means a minimum of decay or deterioration in transit, on the market, or in storage. Also the prompt precooling of carefully handled fruits has a marked influence on their carrying and holding qualities. Competition in the fruit trade is keen; hence, fruit that is well grown and given every attention in getting it to the market in good shape must be put up in an attractive manner in order to secure remmunerative prices. The present practice is to put up choice fruits in packages small enough to induce customers to buy by the package. This has resulted in so many different sized packages that it has made marketing more or less difficult, both for the dealer and the consumer. Recent legislation by the Federal government and by several of the States provides for standard sizes in fruit packages, whether they be large or small. Fruit grades, especially for apples; have also been established in several States.

The country-wide development of fruit growing has been favored by climate, soil and economic conditions. This growth has also been fostered by governmental, State and provincial agencies. The Federal and Dominion Departments of Agriculture and the various State and provincial agricultural colleges and experiment stations have contributed largely to the knowledge underlying the principles of commercial fruit growing. Cultivated fruits have been introduced from foreign countries, varieties have been tested, and cultural problems worked out in experimental orchards. Successful practice has been studied in the field with the view of determining the reason for success and many investigations are conducted in commercial fruit districts in order that the results may have an immediate practical value. Until very recently, the cultural phases of fruit growing received most attention. The ever increasing competition between different sections of the country has caused the governmental agencies to take up many marketing problems, both technical and economic in nature. Many improved practices have resulted from studies in the handling, precooling, transportation and storage of fruits. The question of distribution is now receiving attention. The Bureau of Markets of the United States Department of Agriculture has an inspection service in most of the large markets for the purpose of investigating and certifying to shippers the condition and soundness of fruits when received at the market. Information on daily carload movements of fruit is now available to fruit growers in the commercial areas. See also the articles on the particular fruits.

Bibliography.— The Department of Agriculture of the United States and of Canada as well as the State agricultural colleges and experiment stations have issued numerous bulletins and reports on the practical, technical and scientific phases of fruit growing. The agricultural and general press and private writers have also contributed largely to the literature of fruit growing. Some of the general works on the subject are Bailey, L. H., 'The New Standard Cyclopedia of Horticulture' (6 vols., New York 1914-17); id., 'Principles of Fruit Growing' (New York 1915); id., 'The Pruning Manual' (New York 1916); Sears, F. C., 'Productive Orcharding' (Philadelphia 1914); Moore, S. W., 'Practical Orcharding on Rough Lands' (Akron, Ohio 1911); Paddock and Whipple, 'Fruit Growing in the Arid Regions' (New York 1910); Wickson, E. J., 'The California Fruits and How to Grow Them' (San Francisco 1914); Coit, J. E., 'Citrus Fruits' (New York 1915); Card, F. W., 'Bush Fruits' (New York 1917); Brown, B. S., 'Modern Fruit Marketing' (New York 1916).

EDWIN J. GLASSON,
United States Department of Agriculture.

FRUIT INDUSTRY. While fruits have been grown since earliest times to supply homes and comparatively local needs, fruit growing

FRUITS READY

Y FOR PLUCKING

has become worthy of the status of an industry only within the past century. Prior to this period commerce in fruits was limited almost wholly to dried fruits such as dates, figs, prunes, raisins and nuts, though oranges, lemons, coconuts, apples and a few other fresh fruits were successfully transported short distances and sold during the few weeks or months that they could be kept by the crude storage methods of those days. The main limiting factors of the fruit industry then were slow transportation, defective storage methods and the generally sufficient local supplies to meet the restricted demand.

These conditions applied not alone to America, where they, however, were most strikingly evident, but to the whole world. Not until sailing vessels gave place to steam and canals to railways did progress begin to be rapid. With the development of these improved methods of transportation came countless other improvements, not alone in speed but in storage and marketing, canning and drying. By their reaction these factors have stimulated production until the fruit industry now plays a highly important rôle in the world's commerce. Whereas in the United States half a century ago the area devoted to fruits and the value of the fruit products were small fractions of the total area and value of all crops grown, the increase has been such that in 1909 when the last census was taken they were about 2 and 4 per cent respectively of the gross totals and values of all farm crops. Development from that time forward continued to be rapid until the Great War placed a temporary check upon certain phases of planting, transportation and manufacture. Lest the percentages mentioned above should appear insignificant let it be noted that the area devoted to fruit growing in 1909 was upward of 10,000,000 acres and the value of the fresh fruits at point of production more than $215,000,000. Since that date millions of trees not then in bearing have added their quotas to the output, so both percentage and total value have been augmented.

Perhaps the most far-reaching effects of the improved transportation and storage have been the education of public taste and the consequent demand for fresh fruits in regions remote from points of production. Refrigerator cars, steamships and cold-storage warehouses have made it possible for growers a thousand to several thousand miles from market to grow fruits at living and often highly profitable prices, at the same time lengthening the season during which consumers may enjoy fruit. Steamship lines whose main business is the transportation of tropical fruits have been established between Mexican, Central American, West Indian and Mediterranean ports and those in the North, so the northern regions now secure abundance of these products. Similarly trainloads of fruits are shipped from the Pacific Coast States in refrigerator cars and forwarded on almost express schedule east of the Rocky Mountains. Still more striking is the instance of the strawberry which instead of being confined to the local period of production — about three weeks — may now be obtained in northern markets during six months, the earliest coming from Florida and Louisiana during January, the latest from northern New York during June. This period has recently been still further extended by the so-called "ever bearing" varieties which continue the local season in the North from July until October and even November. These varieties, however, have as yet scarcely attained commercial importance.

Again, thanks to the improved methods mentioned, the variety of products obtainable at any given season in the markets not only of the large cities but the small towns is no longer confined to the species locally produced before these methods came into play, but has been increased by countless kinds from distant points of production. It is nowadays no unusual thing to be able to choose among 25 or more fresh fruits offered for sale at one time in such large city markets as New York, Boston, Chicago or San Francisco. Dried, canned and preserved fruits and manufactured fruit products such as wine, cider, vinegar and juices have during the period in question become staple commercial commodities obtainable the year around. The net effect of these improved methods is such that the number of cultivated and even of the important wild fruits suited to human consumption not found in the world's markets in either the fresh or the manufactured state is steadily decreasing.

Among leading fruit producing countries of the world and the principal products the following may be taken as typical examples suggestive of the industry as a whole. The American tropics export enormous quantities of bananas, pineapples and coconuts to northern markets. The United States, Canada and Australia ship apples to Europe, where commercial plantings are too small to supply continental demand. Reciprocal shipments from Europe to America consist largely of dried fruits, such as figs, prunes, raisins, currants and oranges, lemons and grapes. The quantities of all these fruits imported are lessening as American growers gain knowledge of how to grow equally good supplies. In each continent there is similar reciprocal shipment, the tropical and subtropical fruits moving north and the temperate climate ones going south but to a less extent. In North America the movement of fruit is far more extensive than in any other continent. In addition to southern shipments northward and western ones eastward, there is a considerable movement from east to west and from north to south. California and Florida annually ship trainloads of oranges, lemons and grape fruit beyond their borders. The former also exports fresh, dried and canned plums, cherries, peaches, pears, grapes, apricots; the latter sends pineapples, strawberries, peaches and to a small extent subtropical fruits.

The opening years of the present century have seen a still more striking development of the fruit industry in the enormous and increasing plantations of cool climate fruits, notably apples, pears, plums and cherries in Oregon, Washington, Idaho and other northwestern States. These are being grown not merely for home consumption in those and adjacent districts, nor even for shipment to Atlantic and other eastern States, but to Europe and South America. Besides the factors of refrigerator car transportation and cold-storage warehousing the recently opened Panama Canal bids fair to have a marked influence; for by its means the cost of shipment to Europe may be lessened and markets on the eastern coast of South America reached more expeditiously and less expensively than when the route includes rail transportation from the orchards to Atlantic ports, transfer to steamer there, ocean voyage to Liverpool or other British port, a second transfer to other steamers and a second voyage to or through the tropics to some port in eastern South America. Developments were being made toward the more direct route suggested when brought to a halt by the Great War.

The principles upon which the fruit industry of these Northwestern States has been able to develop in spite of competition from older and more firmly established Eastern fruit-producing regions are so thoroughly sound in themselves that they are slowly but steadily revolutionizing the fruit business everywhere. First, by means of cultural methods adapted to the region the fruit is given a finish not usually found in the older producing districts where nearness to market permits the sale of all grades of fruit. Second, careful sizing and grading are insisted upon by organizations of growers who realize that in order to make sales at all and the more important repeat sales they must maintain a higher standard of product. Third, the adoption and perfection of the box rather than some other package in which to ship and sell fruit. Fourth, uniformity and attractiveness of packing in these boxes. Results have justified the care exercised; for buyers and final consumers have been taught through experience with these goods that they do not need to open the packages but can depend upon the statements printed on the labels as to the contents. Herein perhaps lies the answer to the question as to what factor is now destined to exercise most importance in the further development of the fruit industry.

As to what fruits are of relatively most economic importance, doubtless among fruits consumed in the fresh state the orange leads since it is grown in the warm parts of all the continents though it enters important commercial channels mainly from southern Europe, the West Indies and the semi-tropical parts of the United States. It is also of importance as a source of cider, juice, marmalade and peel. Probably the apple ranks next, with the mild parts of North America and Australasia in the lead. It finds the widest use of all fruits — fresh, evaporated, butter, marmalade, jelly, cider, vinegar, wine, champagne, brandy and countless culinary dishes. Then follows the grape which is grown on all continents from the tropics almost to the limits of agricultural endeavor, for consumption in the fresh state and as raisins, «currants,» wine, juice, vinegar, jelly and argols (a by-product of wine making used as a source of baking powder). The plum used fresh, preserved and as prunes comes next. Olives as a source of oil and a condiment; lemons candied and raw; bananas fresh and as flour; peaches fresh, canned and dried; pears, dates, figs, strawberries, pineapples and cherries take commercial rank in about the order named.

Judged by commercial standards, quantity and variety of products, prompt adaptation of scientific principles and business sagacity to fruit production and disposal, the United States and adjacent Canada rank first among the countries of the world. This is particularly evident in the development of many branches of the industry. While fruit growing in America has scarcely deserved the title «industry» for as long as a century, several branches have been developed from the original wild species in scarcely more than half that time. One notable instance is the American grape, the leading variety of which, the Concord, first bore fruit in 1849, yet in the 70 years since then it has extended to practically every State and province. It is now grown upon tens of thousands of acres and profitably employs thousands of people. Its latest development, the manufacture of juice, is a purely 20th century industry which now involves several million dollars in buildings and equipment. The European strawberry, like the European grape, having failed in America, native species were developed so that now trainloads of berries daily go to market from individual shipping stations. Similar remarks, though in less degrees, are true also of raspberries, blackberries and cranberries. All of these have been developed from strictly American species and all since the middle of the last century.

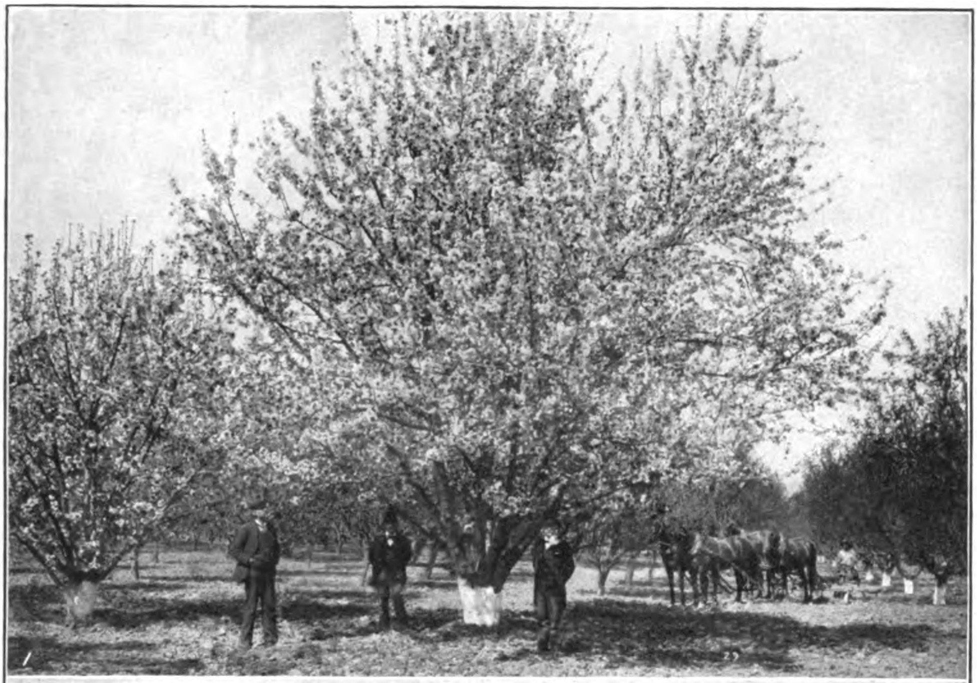
The fruit industry and its sponsors have not alone profited by its development. With it have been developed many other lines of business which directly or indirectly depend upon fruit growing. A partial list includes the following: The nursery business, the manufacture of pruning tools, spraying apparatus, insecticides, fungicides, fertilizers, tillage implements (many of these specially designed for work in fruit plantations), harvesting equipment, grading machinery, marketing receptacles and many others. Then there is the reflex action of fruit growing upon the development of cold-storage, refrigerator car building, railway freight traffic and commercial practices. Added to these are the subsidiary industries such as canning, evaporating, wine, juice and vinegar making, each in itself involving enormous capital and employing great numbers of workmen.

M. G. KAINS.

FRUIT-PIGEONS, a group (*Trevoninæ*) of pigeons of very brilliant and often curious plumage, and frequently of large size, which are scattered from India to the South Sea Islands. They spend their lives in the tops of the forest trees and feed wholly upon fruits, which are swallowed whole. There are about 180 species, chiefly of the genera *Carpophaga* and *Ptilopus*.

FRUITS, Cold-Storage of, the preservation of fruits, by keeping them in a refrigerator or ice-box of such a temperature as will neither freeze them nor permit the process of ripening to advance. The problem of cold-storage has at length been solved by experiments successfully made by the government expert, W. H. Ragan of the Department of Agriculture, at Washington. It had been generally supposed that cold-storage fruit quickly rotted, on exposure to the ordinary atmosphere of the dwelling-house in summer or winter. It has, however, been discovered that when fruit is put up in a proper condition and kept subject to a proper temperature, it remains uninjured by storage for some time. Thirty-two degrees is considered suitable temperature for the cold-storage of fruit.

FRUIT GROWING



1 Napoleon Cherry Trees in California **2 A West Virginia Peach Orchard**

1 Dewberry Field in Maryland

2 Gathering Peaches in Georgia

Peaches of good color, yet still hard, if fresh from the tree, have been kept in cold-storage for four weeks and found at the conclusion of that period in fairly marketable condition. They have maintained this condition for at least four days. It is only when they are in bad condition, imperfect and poorly colored, that they spoil on exposure, after resting in cold-storage.

In order to obtain good results the temperature of a cold-storage warehouse should be kept uniform throughout. Freshly plucked fruit is alone suitable for storage, for a delay of a few days, even of a few hours, will result in serious loss. While pears must be gathered as soon as they reach their full size on the tree, apples may best be stored when well matured and highly colored, though still hard. The storing should be made in small packages, certainly of not over 50 pounds; this is especially the case with regard to quickly fermenting fruits, such as pears and peaches. The careful ventilation of the cases, barrels or boxes, which enclose the fruit, is absolutelv indispensable. Nothing is more likely to prolong the preservation of fruit in cold-storage than wrapping them individually. Double-wrappings are even better than single. The inner paper should be porous, like blank newspaper tissue, the outer may be paraffin paper.

FRUITS, Tropical. Many tropical fruits are well known in the colder zones. Some of them are even cultivated in subtropical climates, in northern greenhouses, or as annuals whereever summer-heat is sufficiently torrid; as, for instance, okra, tomatoes, melons, egg-plants, peppers and peanuts. Others, like the pomegranate, lime, orange and related citrus fruits, banana, pineapple, fig, date, coconut, alligator-pear, litchi, coffee- and cocoa-beans and various familiar nuts, as Brazilnuts, are imported in a fresh or dried condition. Cooled ships are arranged for their transportation, especially for that of the fast-ripening banana. But most of the soft fruits of the tropics either will not survive long journeys, or will not pay for the trouble.

They form, however, an important part of the food of the natives in the Equatorial Zone who raise them in tiny scattered orchards or in their dooryards, or pluck them from wild groves. Many of these fruits, like the coconut and tamarind, have been carried from port to port and have been cultivated and even naturalized in so many tropical countries that their place of origin is a matter of dispute. Some of them are used as vegetables as in the case of the familiar tomato, egg-plant and okra. In the Philippines sequidillas (*Psophocarpus tetragonolobus*) are the tender angular pods of a leguminous vine, which are boiled, having an asparagus-like flavor. The pear-shaped fruits of a cucurbitous vine which is trained on arbors and is white or green, rugged of rind and single-stoned, is known as the chayote, or cho-cho (*Sechium edule*), and is boiled, stuffed and baked like squash, which it much resembles in taste and consistency. Africa contributes the akee (*Blighia sapida*), a brilliant vermilion-hued fruit, within which are shining black seeds perched on cream-colored fleshy arils which are cooked, generally with salt fish, and have the appearance and taste of scrambled egg-yolks. If eaten before the fruit has opened of itself, however, Jamaicans claim, the akee is a swift and deadly poison. The heavy, round compound breadfruit (*Artocarpus incisa*), too, is baked, or boiled, or even dried and converted into flour. It is an utterly tasteless vegetable, and for this reason can be used as frequently as a potato. Its seeds are also boiled for food. The sweeping from the trees of this dooryard fruit is one of the tragic results of a West Indian hurricane, since it destroys thus one of the food staples of the peasantry, having been brought to them from the Asiatic Archipelago. Its close relative, the jack-fruit (*Artocarpus integrifolia*), is larger, and so heavy that it is borne on trunk and limbs of the trees instead of at the tips of the branches. Green bananas, or plantains (*Musa sp.*), are also served as a vegetable, often being sliced and fried, and having a pleasant subacid taste.

Among the most prized tropical fruits are the thick-skinned mangosteen (*Garcinia Mangostana*); the little, round, brown sapodillas (*Achras Sapota*), in the West Indies called naseberries, evidently a contraction of an earlier title "Nispera." They are cut into hemispheres, so that the soft interior, not unlike a baked pear in flavor, may be scooped out. The East Indian durian (*Durio Zibethinus*), whose oval fruit is defended by spines which have been said to flay a man's face if struck by the falling fruit, and by a very offensive odor, is a favorite dessert with those who can forget the smell of the otherwise delicious pulp.

Other pulpy fruits are the little fragrant rose-apple good for jellies and dessert (*Eugenia Jambos*); and its relative, the Malay apple (*Eugenia malaccensis*); fruits borne on small anonaceous trees, which include the sweetsop (*Anona squamosa*) that remotely resembles a young pine-cone when ripe having greenish polygonal knobs rising from the ivory-tinted rind. It is readily torn apart in the hands disclosing slender black seeds enveloped in sugary pulp. The soursop (*Anona muricata*) is a curious shapeless green bag armed with weak prickles, enclosing crowded carpels, the seeds immersed in envelopes much like cotton wadding to the tongue, but filled with juicy pulp. Rather musky and tart in flavor, it is a favorite cool dessert served as a custard with cream, or as a sherbet. The cherimoyer (*Anona Cherimolia*) and custard apple, the latter also known as bullock's heart from its shape and size (*Anona reticulata*), belong to the same family and are not dissimilar.

The papaw (*Anona triloba*) of the Southern States is another member of this family, but the papaw of the tropics (*Carica Papaya*) is a different affair. It rises above the garden patches like a palm, but is really a sort of tall herbaceous plant, very slender, with a tuft of huge cut leaves at the top, beneath which hang dozens of canteloupe-like fruits that when cut disclose a hollow centre lined with small, black mucilaginous seeds. Its juice is said to render meat tender, it is the source of a drug and is itself prescribed for digestive troubles.

Avocados, or alligator pears (*Persea gratissima*), were at one time called "Midshipman's butter," the smooth rich flesh having been spread on bread, but they are now more generally used as a salad — or dessert — fruit.

They grow on a rather large tree. The star apple (*Chrysophyllum Cainito*) is also a large tree which changes color continually as the wind turns up either the green upper-surfaces or the satiny brown under-surfaces of the foliage. «You are just as deceitful as a star apple» is a West Indian comment supplemented by another, «he sticks like a star apple,» for this fruit, a little larger than an orange, smooth, purplish or green in color, hangs persistently on its long stem. When cut transversely, the severed tops of the seeds radiating from the centre form a star embedded in gelatinous flesh stained with color from the rind, from which gummy juices exude and cling to spoon and lips. The mammee apple (*Mammea Americana*) and the Otaheite apple (*Spondias dulcis*) are also grown for their fruit. Passion-flowers yield fruit rather like that of the «Maypop» of our Southern States. One of them, the golden apple (*Passiflora laurifolia*), clambers over shade trees and drops its oval fruits on the ground. The contents are mucilaginous and seedy and are sucked out. Others are the grenadilla used in ices and the sweet-cup (*P. quadrangularis, P. maliformis*).

It is said that a species of jujube was the «Lotus» of ancient history, but the small fruits of Jujube Zizyphus do not seem surpassingly tempting; they are generally dried and used as a refreshing acid dessert in winter, and formerly were an ingredient in «jujube paste.» A famous Mexican fruit is the «tuña,» produced by several varieties of cactus, especially by Opuntia Ficus-Indica and O. Tuña. An Opuntia plant appears on the coat-of-arms of Mexico. It is also called prickly pear from its shape and armament, or Indian fig on account of the many small seeds embedded in its somewhat acid pulp; it has been carried to the Mediterranean shores, thriving on their arid, hot sands and has become a veritable pest in Queensland. Some of the «tuñas» are prickly, and an old traveler says that Spanish dons played a trick on newcomers by rubbing several «tuñas» in a napkin, thus fastening the infinitesimal spines in the fabric «wherewith a man wiping his mouth to drink, those little prickles stick in his lips so that they seem to sew them up together, and make him for a while falter in his speech.» The cashew (*Anacardium occidentale*) has peculiar kidney-shaped fruits or nuts poised on the tips of swollen, pear-shaped, fleshy stalks that, although astringent, are eaten as «cashew apples» and furnish a wine. The shelled nuts are usually roasted and eaten with salt, and are said to be better than almonds. The tropical almond (*Terminalia Catappa*), a handsome street tree, also bears edible almond-like nuts. Tamarinds are the fruit of a huge leguminous timber-tree (*Tamarindus indica*), which is covered by the buffy pods, fragile-shelled, very like ripe bean-pods, but filled with a dark-brown acid pulp which is utilized for cooling drinks and also for tart preserves. There are also small fruits known as «plums» that are used for preserves, and the small, tough, puckery, pink-hearted yellow guava (*Psidium guava*) is famous for the sweet paste and jelly made from it.

Mangoes (*Mangifera indica*), however, are among the most valuable of tropical fruits. Unripe they are preserved and pickled and when ripe are eaten from the hand. The mango is so important a food that Jamaican bakers do not expect to sell as much bread as usual when this fruit is ripe. There are many which are cultivated in the tropical belt and have become naturalized therein; the inferior sorts are fibrous and have a turpentiny taste, but the better kinds are softer and more luscious. At the best the mango requires skill in manipulation; the tough fibres surrounding the husk of the seed radiating through the flesh. Golden loquats (*Eriobotrya Japonica*) and the fruits of many palms are among the minor fruits of tropical regions. Oily Sesame seeds (*Sesamuna orientale*) are cultivated for food and oil.

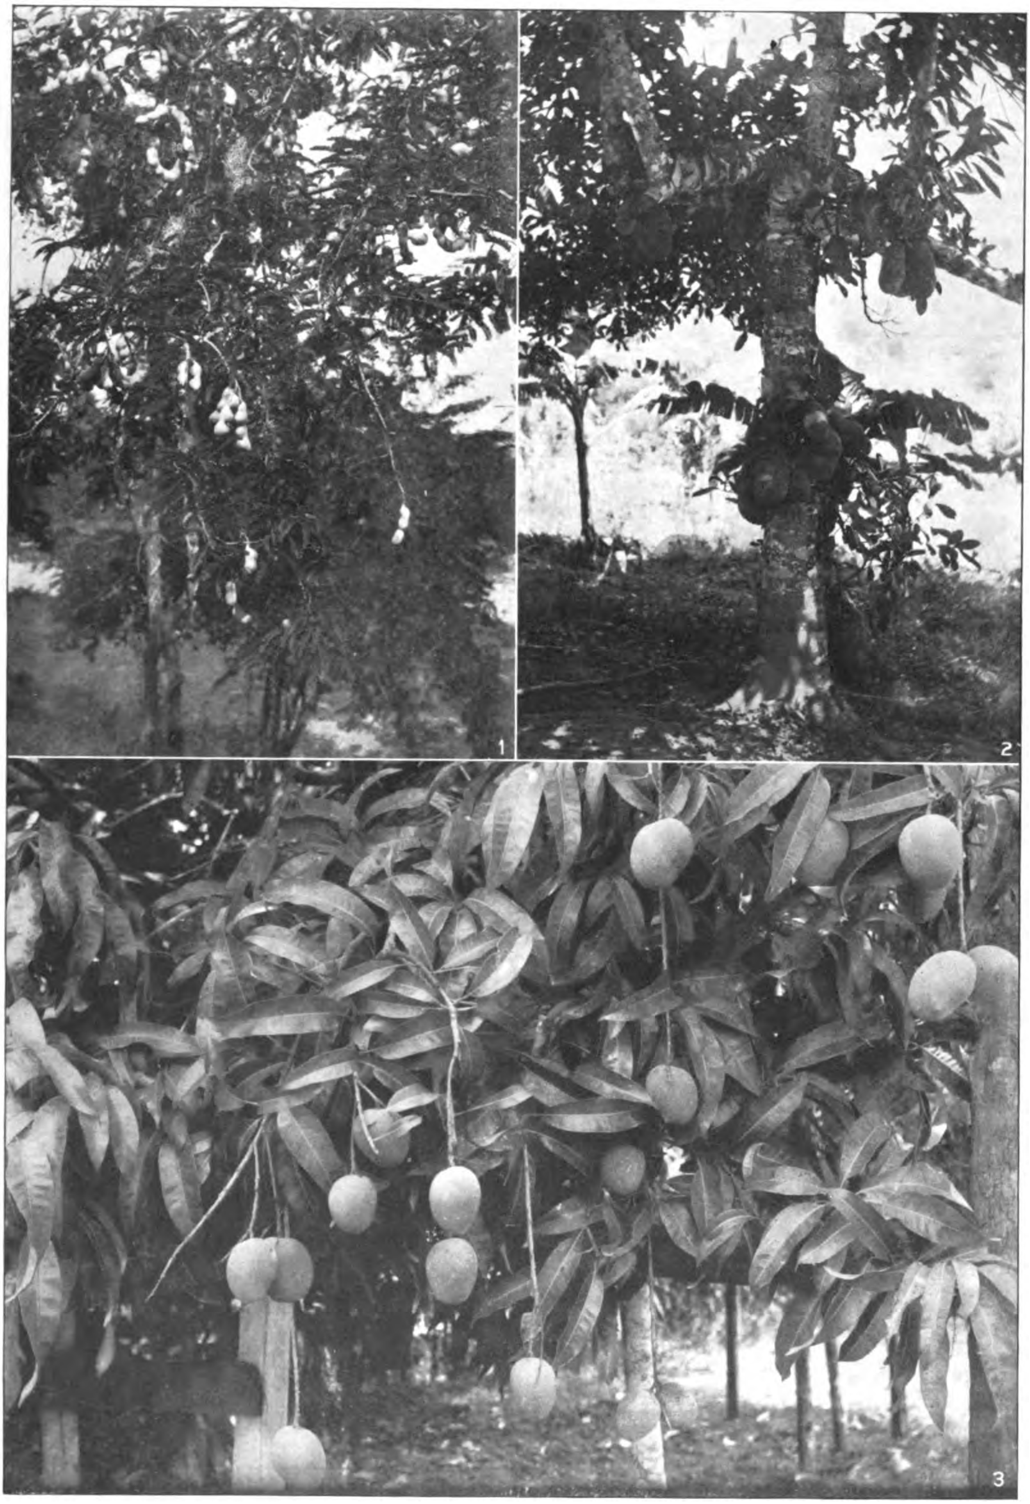
Although not eaten directly, the pencil-shaped pods of an orchid (*Vanilla officinalis*) are cured for flavoring purposes, becoming the vanilla of commerce. They are the fruits of a cultivated vine which creeps up tree-trunks. Annatto, or achiote seeds, are also gathered from the little tree, Bixa orellana, for the sake of their arils, which yield an orange-red dye applied to dairy products, and formerly used as a skin paint by South American aborigines. The dried fruit of pimento (*Pimenta officinalis*) becomes the allspice of commerce, while the seed and arils of Myristica fragrans are known as nutmeg and mace. Consult Candolle, Alphonse de, 'Origin of Cultivated Plants' (New York 1902); Cook, O. F., and Collins, G. N., 'Economic Plants of Porto Rico' (Contribution United States National Herbarium, Vol. VIII, pt. 2, Washington 1903); Philippine Commission, 'Report' (Part 3, United States War Department, Washington 1907).

HELEN INGERSOLL.

FRUITS OF CULTURE, The (PLODUI PROSIVYESHCHÉNIYA). Count Tolstoi recognized in the drama an immense power for driving home his ethical teachings. His second play, 'The Fruits of Culture' (or 'The Fruits of Enlightenment,' 1889), is a satirical comedy with a triple purpose — to show up the absurdity of superstition, whether manifested by people of culture or by simple-minded peasants; to discredit the medical profession; and to contrast the frivolity of the so-called educated and wealthy classes with the simplicity and dignity of the sons of the soil. Spiritualism is the principal target. The scene is laid in the Moscow mansion of Leónid Svedintsef, a landed proprietor and an ardent spiritualist. He is addressed by three peasants from the province of Kursk who are commissioned by their commune to buy land from him and to pay for it by instalments. Svedintsef insists that the whole amount be paid at once. The peasants have friends among the servants, and are promised that the master shall sign the paper that they desire. So Tanya the chambermaid and Semyon the kitchen-boy arrange a spiritualistic séance, in which the latter appears as a medium, and which the master attends with enthusiasm. His credulity rises to the occasion, and, when directed by the medium, he of course signs the paper granting the peasants their request.

Much of the fun of the play arises from frequent and unexpected encounters between the peasants and the lady of the house, who has a horror of disease germs and who is convinced that in the garments of these creatures lurk the

FRUITS, TROPICAL



1 Tamarind fruit

2 Jack fruit

3 Mangoes

germs of various dreadful diseases. The subplot concerns the fortunes of Tanya and Semyon, who are to be married, and who agree that the only real life is life in the country, where they propose to live. The list of characters include doctors, princes and other nobles, cooks and other servants, all of whom are differentiated with Tolstoi's masterly skill. It is all capital comedy and capital satire, has often been presented on the European stage, in Russian, in French and in German. It was first translated into English (from the French) by George S. Schumm in 1891, and is also included in the works of Tolstoi as translated by Nathan Haskell Dole, by Louise and Aylmer Maude, by Leo Wiener and by Mrs. Constance Garnett.

NATHAN HASKELL DOLE.

FRUMENTIUS, Saint, founder of the Abyssinian Church: b. about 300; d. about 360. He was a native of Phœnicia, and, according to Rufinus, when a young man set out for India with his brother Edesius and their uncle Meropius on a commercial voyage. The party fell into the hands of the Ethiopians on the shore of the Red Sea. All were put to death, with the exception of Frumentius and Edesius, who became slaves of the king. They were well treated, gained their freedom in time and rose to great influence in the land. After the death of the king, Frumentius became instructor to the young Prince Aizanes. He formed a Christian congregation with the help of visiting Christian merchants. Edesius returned to Tyre and became a presbyter. Frumentius went to Alexandria and was consecrated bishop of Axum in 328 by Athanasius, who in his 'Epistola ad Constantinum' mentions the consecration and gives some details of Frumentius' mission. Frumentius' day is celebrated on 27 October by the Latin, and on 18 December by the Abyssinian Church.

FRUNDSBERG, or **FRONSPERG, Georg von,** German soldier: b. Mindelheim, Swabia, 1473; d. 1528. In his youth he served in the campaign of the Hapsburgs against Switzerland and in Italy in the struggle between Cambria and Venice. In 1519 he became commander of the infantry of the Swabian League. He fought at Pavia in 1525. Through his services to Maximilian in organizing the pikemen he became known as "the Father of the German *Landsknechte*" (pikemen). Consult Barthold, 'Georg von Frundsberg' (Hamburg 1833), and the life in Latin by Adam Reissner (Frankfort 1568; German trans. 1572).

FRY, Sir Edward, English jurist: b. Bristol, 4 Nov. 1827; d. Failand House, near Bristol, 19 Oct. 1918. He was educated at Bristol College and at University College, London. He became a barrister in 1854, and Queen's counsellor and bencher of Lincoln's Inn 1869. He presided over the Royal Commission on the Irish Land Acts 1897–98; acted as conciliator in the South Wales colliery dispute 1898. He was legal assessor to the International Commission on the North Sea incident 1904–05; arbitrator between the United States and Mexico in the Pious Funds case 1902, and between France and Germany on the Casa Blanca incident 1909, and in many other local and international cases. From 1900 to 1912 he was a member of the Permanent Court of Arbitration at The Hague, and in 1907 was the first British plenipotentiary to The Hague Peace Conference. His published works include 'Essays on the Accordance of Christianity with the Nature of Man' (1857); 'The Doctrine of Election, an Essay' (1864); 'A Treatise on the Specific Performance of Contracts' (1858; 5th ed., 1911); 'British Mosses' (2d ed., 1908); 'James Hack Tuke' (1899); 'The Mycetozoa' (2d ed., 1915); 'Studies by the Way' (1900); 'The Liverworts' (1911).

FRY, Elizabeth Gurney, English philanthropist and prison reformer: b. Norwich, England, 21 May 1780; d. Ramsgate, Kent, 12 Oct. 1845. Brought up a Quaker by her family she did not adapt her mode of life to that prescribed by the more rigid and orthodox of the sect, till 1798, being then induced to do so by the preaching of William Savery, an American Friend traveling in England on a religious mission. This change was consummated by her marriage in 1800 with Joseph Fry, himself a "plain Friend." In 1810 Mrs. Fry became an occasional preacher and thenceforward devoted herself to offices of the purest benevolence and piety. Owing to her unwearied exertions, important reforms were effected in the prison systems, not only of Great Britain, but also in those of France and Germany. Consult 'Memoirs' by Thompson (1846); Corter (1853).

FRY, James Barnet, American military officer: b. Carrollton, Green County, Ill., 22 Feb. 1827; d. Newport, R. I., 11 July 1894. He was graduated at the United States Military Academy in 1847, and after serving as assistant instructor at West Point, he was assigned to the 3d Artillery, then in Mexico, where he remained till the close of the war. In 1863 he was appointed provost marshal-general of the United States, with headquarters at Washington, D. C.; and in 1864 was promoted brigadier-general. He was brevetted major-general in the regular army, 13 March 1865, for "faithful, meritorious, and distinguished services," and after the war served in the divisions of the Pacific, the South, the Missouri and the Atlantic, till 1881, when he was retired. He was the author of 'The History of Brevets'; 'The Army under Buell.'

FRY, William Henry, American composer and journalist: b. Philadelphia, August 1815; d. Santa Cruz, W. I., 21 Dec. 1864. He early showed a singular aptitude for music, and in 1835 produced four overtures which were performed by the Philharmonic Society of Philadelphia, who presented the composer with an honorary medal. He next wrote the operas of 'Aurelia' and the 'Bridal of Dunure.' In 1845 he brought out his opera of 'Leonora,' an Italian version of which was performed in 1858 in New York. In 1846 Fry visited Europe as the correspondent of several American newspapers, and after his return in 1852 gave his attention to music, producing several symphonies of merit. In 1855 appeared his next work, a 'Stabat Mater,' brought out at the New York Academy of Music. He subsequently became attached to the editorial staff of the New York *Tribune*, and attained much popularity as a public lecturer.

FRYATT CASE. On 20 March 1915 Capt. Charles Fryatt, commanding a British vessel, was attacked by the German submarine, U-33, off the coast of Holland and called upon to surrender. Instead, Fryatt turned his ship and attempted to ram the submarine, which escaped by quickly diving. Both Fryatt and his chief officer were each rewarded with a gold watch by the British Admiralty for bringing the vessel safely through. In the following year Fryatt was in command of the British steamer *Brussels* when he was captured by German torpedo boats on 27 July 1916. Taken to Antwerp, he was brought before a German court-martial at Ghent and charged with illegally — as a civilian — attacking a submarine. Fryatt confessed that he had acted under government instructions. He was found guilty and summarily shot as a *franc-tireur*. The execution aroused intense indignation in England and was regarded as on a level with that of Nurse Cavell (q.v.). The ensuing controversy between the British and German governments was carried on through the medium of the American Ambassador, Mr. Gerard.

FRYE, Alexis Everett, American educator: b. North Haven, Me., 2 Nov. 1859. He was graduated at the Cook County Normal School, Chicago, 1885, and from Harvard Law School in 1890. In 1883–86 he was teacher of methods and practice at the Chicago Normal School and from 1886 to 1890 lectured on educational topics. He was admitted to the Massachusetts bar in 1890 and in 1891–93 was superintendent of schools at San Bernardino, Cal. He was appointed superintendent of schools in Cuba by the Secretary of War in 1899. He organized the public-school system of the island in 1899–1901 and conducted the Cuban teachers' expedition, bringing 1,284 native teachers to the United States in 1900. He was captain in the Harvard University Battalion in the Spanish-American War. He has published 'Child and Nature' (1888); 'Brooks and Brook Basins' (1891); 'Mind Charts — Psychology' (1891) and a number of school geographies.

FRYE, William Pierce, American lawyer, legislator and statesman: b. Lewiston, Me., 2 Sept. 1831; d. Lewiston, 8 Aug. 1911; son of Col. John M. and Alice M. Frye. He was graduated at Bowdoin College in 1850 and after studying law in the office of William Pitt Fessenden, he began practice at Rockland, and later at Lewiston. He was elected to the State legislature from the latter city in 1861, 1862 and 1867. In 1864 he was a presidential elector on the Lincoln ticket. After serving a term as mayor of Lewiston, he was elected attorney-general of the State, on the Republican ticket, holding the office from 1868 to 1870. He was elected to Congress from his home district in 1871, and was re-elected no less than five times.

In 1881 he resigned his seat in the House of Representatives to accept the nomination to the United States Senate, filling the vacancy caused by the resignation of James G. Blaine, who entered Garfield's Cabinet as Secretary of State. Senator Frye was re-elected to the Senate in 1889, 1895, 1901 and 1907; was elected president pro tem. of the Senate in 1896, and has twice acted as permanent presiding officer of that body — after the death of Vice-President Hobart in 1899, and after the elevation of Vice-President Roosevelt to the Presidency in 1901. After the close of the Spanish-American War Senator Frye was a member of the Peace Commission in Paris. He was chairman of the Commerce Committee in the Senate and has exerted a great influence on national legislation. He was looked upon as one of the great leaders of the Republican party, and had much to do with framing legislation on the tariff and as regards American shipping. During the exciting days of the Spanish-American War he acted as chairman of the Senate Committee on Foreign Relations. Senator Frye was given the degree of LL.D. by Bowdoin College in 1889, and also by Bates College in 1881.

FRYER, John, American Orientalist: b. Hythe, Kent, England, 6 Aug. 1839. He was graduated at Highbury College, London, in 1860; (LL.D. Alfred University, N. Y.). He was principal of Saint Paul's College, Hongkong, 1861–63; and professor of English at Tung-Wen College, Peking, China, 1863–65; and head-master of the Anglo-Chinese School, Shanghai, China, 1865–67; head of department for translation into Chinese of foreign scientific books at Imperial Government Arsenal, Shanghai, 1867–96; general editor and other offices of Educational Association of China 1887 to 1896; founder and proprietor of Chinese Scientific Book Depot, Shanghai, 1874; Viceroy's Examiner at Imperial Naval College, Nanking, 1894–95; traveling secretary to Chinese Ambassador, Kwo-Sung-Tao, 1878. Editor of Chinese newspaper, *Shanghai Sinpao,* 1866-67. Honorary member Northern China Branch Royal Asiatic Society in 1867; Agassiz professor of Oriental languages and literature, 1895–1915; professor emeritus, 1915; president Oriental Institute of California since 1904. Founder of the Institution for the Chinese Blind, Shanghai, China, 1912; editor and proprietor of Chinese *Scientific and Industrial Magazine,* Shanghai, 1876–84; Third degree of Chinese brevet civil rank, 1872; First Rank of Third Degree, Imperial Order of the Double Dragon, 1878. He is author or translator of upwards of 100 books in the Chinese language published at Shanghai, as well as articles, essays, reports, etc., in English; and the first 'Educational Directory for China' (1896); various vocabularies of scientific terms in English and Chinese, etc.

FRYKEN, frĭ'kĕn, a series of small lakes north of Lake Wenern, Sweden. They are connected by narrow channels and drain southward into Lake Wenern. They are famed for their scenic attractions.

FRYXELL, Anders, Swedish historian: b. Hesselskog, Dalsland, 7 Feb. 1795; d. Stockholm, 21 March 1881. He was educated at Upsala, took holy orders in 1820, became instructor at the Djurgårdskole, Stockholm, in 1819, and at the Maria-Skole in 1822. He was rector of the latter in 1828–36. In 1823 he began his great work 'Stories from Swedish History'; the work occupied much of his time for 56 years and was issued in 46 volumes. His style is picturesque and his popularity among all classes is due to his faculty of awakening a national sense in his readers. He published a 'Swedish Grammar' in 1824, which long remained a standard. He was made pastor at Sunne in 1835 and was elected to the Swedish Academy in 1840. In 1847 he received permission to devote himself exclusively to historical research. His other works include 'Characteristics of Sweden between 1592 and 1600' (1830); 'Origins of the Inaccuracy with which the History of Sweden in Catholic Times has been Treated' (1847); 'Contributions to the Literary History of Sweden' (1862); 'The Rôle of the Aristocracy in Swedish History' (1850); 'Studies in Swedish History' (1843). In 1884 his daughter, Eva Fryxell, published from his manuscripts an autobiography, 'History of My History.' It is now recognized that Fryxell's labors were rather of a popular than of a scientific order and threaten to become obsolete despite their great popularity.

FTELEY, Alphonse, American civil engineer: b. Paris, France, April 1837; d. Yonkers, N. Y., 6 Aug. 1903. He was educated at the Ecole Polytechnique, Paris, and came to the United States in 1865. He was resident engineer of the waterworks bureau of Boston (1873–80); chief assistant city engineer of Boston (1880–84), and subsequently consulting engineer. He was also chief engineer of the New York Aqueduct Commission (1888–1900). In the last-named capacity he planned the Croton dam in 1891, and the Jerome Park reservoir in 1894. At various times he acted as consulting engineer on municipal waterworks and extensions in Brooklyn, Newark, Hoboken and on the Passaic Sewerage District, the Hoosac tunnel and the rapid transit systems of Boston and New York. He was a member of the American Society of Civil Engineers, its president in 1898 and a contributor to its 'Transactions.'

FU-HI, or FO-HI, Chinese legendary hero, whose reign began about 2852 B.C. He was the first of the Wu-Ti, or "Five Rulers," and is affectionately regarded as the founder of the Chinese nation. He is reputed to have brought the people from a barbarous state to a comparatively high degree of civilization. He was renowned as a law-giver, having instituted marriage and divided the people into 100 clans and forbidding intermarriage within the clan. Much of myth and legend surround his birth, his alleged discovery of writing, etc. He died in 2738 B.C. (See CHINA, *History*). Consult La Conperie, 'Western Origin of the Early Chinese Civilization' (London 1894); Hirth, 'Ancient History of China' (New York 1908); Mayers, 'Chinese Readers' Manual' (Shanghai 1875).

FU-SHAN, foo-shän', **FATSHAN** or **FACHAN,** China, a manufacturing town in the province of Kwang-Tung, 16 miles southwest of Canton, on one of the branches of the delta of the Si-Kiang. It has manufactures of silk, iron and steel, etc., is a busy commercial centre and is called the Chinese "Birmingham," doing an extensive import trade in scrap iron from Europe. Pop. about 500,000.

FUÀ-FUSINATO, foo-ä foo-sē-nä'tō, **Erminia,** Italian poet: b. Rovigo, 5 Oct. 1834; d. Rome, 27 Sept. 1876. She was married to the poet Arnaldo Fusinato (q.v.) in 1856. Her spirited appeals to national sentiment in 1848 brought her widely into notice. In 1852 was published her 'Verses and Flowers.' She wrote a series of 'Stornelli,' advocating Florence as the national capital instead of Rome. Her complete poetical works, 'Versi,' were published in 1879; her 'Literary Writings' in 1883.

FUAD PASHA, Turkish statesman: b. Constantinople, 1814; d. Nice, 1869. He was the son of the distinguished poet Kechéji-zadé Izzet Molla, was educated at Galata-Serai and was at first an army surgeon. In 1836 he forsook medicine and entered the civil service as an official of the foreign ministry. In 1840 he came to London as secretary of the embassy and later was employed on special missions in the principalities and to Petrograd. In 1851 he was sent to Egypt as special commissioner. Later in the same year he became Minister for Foreign Affairs, a post to which he was subsequently appointed four times and which he held at the time of his death. He was in command of the troops on the Greek frontier during the Crimean War and was distinguished for his bravery. He was Turkish delegate at the Paris conference of 1856; was on a mission to Syria in 1860; grand vizier in 1860–61 and later Minister of War. He accompanied the Sultan Abd-ul-Aziz to Europe and was presented with the freedom of the city of London. He was one of the original members of the Turkish Academy of Science and Belles-Lettres and published a Turkish grammar in 1852, which was held in great esteem by Turkish scholars. As Foreign Minister he rendered invaluable services to his government at more than one critical period.

FUCA, Juan de, hoo-än' dä foo'kä (originally APOSTOLOS VALERIANOS), Greek navigator: b. Cephalonia; d. Zante 1602. He was for many years in the Spanish naval service. In 1592, when he discovered the sea-passage separating Vancouver Island from Washington and connecting the Pacific Ocean with the Gulf of Georgia and with Admiralty Inlet and Puget Sound, he thought he had chanced upon a connection between the Atlantic and Pacific oceans. This strait has been called after his name. In 1596 he told an Englishman, Michael Lok, that he had made this discovery and the story found its way to 'Purchas, His Pilgrimes' (1625) and led to renewed efforts in search of a passage between the Atlantic and Pacific oceans. For a criticism of Juan de Fuca's claims consult Bancroft, 'History of the Northwest Coast' (Vol. I, 1884).

FUCA, Strait of. See JUAN DE FUCA, STRAIT OF.

FUCHOW. See FOOCHOW.

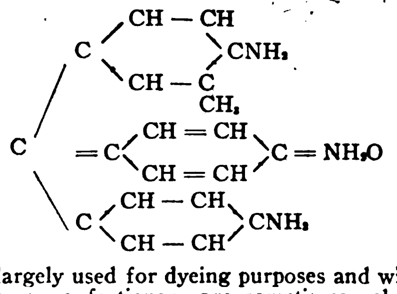
FUCHS, fooks, **Ernst,** German ophthalmologist: b. Vienna, 1851. He was educated in Vienna, was professor at the University of Liége in 1881–86 and in the latter year became professor of ophthalmology at the University of Vienna. He has written several important works, including 'Das Sarcom des Uvealtractus' (1882); 'Die Ursachen und die Verhütung der Blindheit' (1885); 'Lehrbuch der Augenheilkunde' (11th ed., 1907; Eng. trans. by Alexander Duane entitled 'Text-Book of Opthalmology,' 4th ed., 1911).

FUCHS, Immanuel Lazarus, German mathematician: b. Moschin, Posen, 1833; d. 1902. He was appointed professor extraordinary at Berlin in 1866 and became full professor of mathematics at Greifswald in 1869; removed to Göttingen in 1874, to Heidelberg the year following and to Berlin in 1884. He wrote considerable on the theory of functions and on linear differential equations. In 1891 he was made editor of the *Journal für die reine und angewandte Mathematik*. Consult 'Acta mathematica' (Stockholm).

FUCHS, or FUCHSIUS, Leonhard, German botanist: b. Membdingen, Bavaria, 17 Jan. 1501; d. Tübingen, 10 May 1566. He studied the classics under Reuchlin at Ingolstadt and was graduated doctor of medicine in 1524. He afterward turned his attention to botany, of which science he must be looked upon as one of the fathers. In his 'De Historia Stirpium Commentarii Insignes' (1542), he gave a clever description of domestic plants, alphabetically arranged, and laid the foundation of a permanent bontanical nomenclature. The fuchsia (q.v.) was named after him.

FUCHSIA, fū'shĭ-ą or fook'sĭ-ą, a genus of plants, the type of the tribe *Fuchsieæ,* family *Onagraceæ,* named after the botanist, Leonhard Fuchs. The genus contains more than 70 known species, chiefly natives of Mexico, Peru and Chile. Some have been found in New Zealand. The plants are shrubby or arborescent, sometimes climbing; the flowers are pendent, large and fine, with brilliant and delicate coloring — purple, rose and white; the calyx is four-cleft, the corolla four-petaled, the fruit four-celled. The leaves are opposite and verticillate. The flowers are both axillary and terminal, usually one flower springing from the axil, more rarely in racemes at the top of the branches. Fuchsias are much cultivated in conservatories, and are favorite house-plants throughout the United States. They are propagated with great facility from cuttings.

FUCHSINE, fook'sin, an aniline dye prepared by the action of arsenic acid, nitrobenzene or other oxidizing agents upon a mixture of aniline and its homologue toluidine, which yields a mass with a bronze or coppery lustre, called rosaniline. This dissolved in water, precipitated with common salt and the precipitate washed and crystallized from water, forms fuchsine, which in commerce receives various fancy names, as magenta, aniline or new red, roseine, rubine, etc. It is a derivative of triphenylmethane and has the formula



It is largely used for dyeing purposes and wines and even confectionery are sometimes colored with it. It was first prepared by Natanson in 1856, by heating aniline with ethylene chloride.

FUCHSIUS. See Fuchs.

FUCHS' SOLUBLE GLASS. See Water Glass.

FUDGE FAMILY IN PARIS. A satire written by Thomas Moore in 1818, the underbred English in foreign countries being the subject.

FUEGIAN. See Ona; Yahgan.

FUEGO (fwā'gō) **ISLAND.** See Fogo.

FUEL, Comparative Heating Values of. The effective and economical utilization of the inherent heat energy of fuel in the production of light and power is perhaps the most important industrial question of the times. It is one that plays such a necessary part of modern life and the cost of the fuel used oftentimes is so great a factor in the conduct of an industrial enterprise on an economical basis, that constant efforts are being directed to improve the present methods of fuel utilization and approach more nearly the possibilities of theoretical efficiency.

Kinds of Fuel.— Nature furnishes a great variety of fuel in three general forms — the *solid,* such as wood and coal; the *liquid,* such as petroleum; and the *gaseous,* such as natural gas. The solid forms of fuel are the most common; the liquid contain the largest proportion of heat energy; and the gaseous are the most convenient for use and economical of labor. The fact that any kind of gaseous fuel is the most convenient and, in a great many cases, the most effective for use, has been demonstrated principally through the utilization of natural gas; but as the supply of natural gas is gradually failing and the cost of oil-firing is much higher, the tendency of the times is to perfect methods for the conversion of solid and liquid fuel into gaseous form. These conditions render the methods of firing employed very important.

Methods of Firing.— In general, the economical and effective utilization of a fuel depends upon the completeness of the combustion thereof. In the combustion of solid facts by ordinary grate or "direct firing" methods the greater part of the heat liberated is lost in the form of gases which are not combustible at the temperatures attained in grate-fired furnaces. On the other hand, when solid fuel is first converted into gas and the gas thus obtained utilized by "gas firing" methods, the results accomplished more than compensate the 15 or 20 per cent loss of heat energy sustained by the process of conversion. As generally applied, gas firing results in more complete combustion and the attainment of higher combustion temperature and thereby make possible metallurgical operations which are impracticable with direct firing. There is also less loss of heat through the waste products of combustion and greater efficiency in transfer of heat. Furthermore, by suitable methods, the heat from the hot waste gases can be recovered and returned to the combustion chamber in preheated air, so that the gas and air supply, and therefore the combustion of the fuel, are placed under easy and complete control.

In practice, the theoretical amount of air necessary for complete combustion is always exceeded. Direct firing requires at least twice the theoretical amount to even approximate complete combustion, especially in the use of soft coals. With the progress of combustion, the fuel bed becomes more compact, so that with a given draught the amount of air penetrating into the bed decreases with the increase of the depth and compactness of the fuel. Under these conditions, a fresh charge of coal requires a greater amount of air to consume its volatile components and demands it at a time when its passage is most retarded and the combustion rendered more incomplete by the reduction of temperature accompanying volatilization. As the final result is an irregular air demand, the grates have to be arranged to admit the greater excess of air at all times, otherwise large heat losses will occur from the escape of unconsumed gases.

On the other hand, in gas firing, the air supply is always under control and therefore can be made to approximate closely the theoretical amount, thus reducing the bulk of the products of combustion and ensuring more complete combustion. The greater amount of heat then liberated is concentrated in smaller volume, and raises the temperature of combustion, so that the oxygen of the air combines more readily with the combustible constituents of the gas. Furthermore, the smaller the excess of air the less the dilution of the gaseous mixture by nitrogen and other inert gases which retard combustion.

The products of combustion being of a higher temperature transmit their heat more readily, and being smaller in quantity carry off less heat by way of the chimney. By suitable arrangements, these products may be intercepted and forced to impart a large amount of their heat to the air supply going to the combustion chamber, thus returning a certain amount of heat to the system, which represents a saving in fuel equivalent to the amount of heat so returned.

Therefore, in considering any fuel the primary question does not relate to the calorific value of the fuel so much as to what percentage of the heat energy represented by its calorific value is actually available for conversion into mechanical energy according to the manner of its utilization.

The latest experience shows, that in the case of a modern steam plant, burning coal by direct firing, the economy lies behind the stop valve, rather than in reducing the consumption of steam.

According to the best authorities, the mechanical arrangements and conditions most favorable for the most economical utilization of solid fuel are as follows: the height of the chimney should not be less than 120 feet, nor more than 180 feet, giving a natural draught ranging from 0.50 to 0.83 inches of water, with an average temperature of 300° F. For Lancashire boilers (full size) the chimney area should equal six square feet per boiler up to a total of four boilers and five square feet per boiler for every additional boiler. The area of the chimney entrance should be 10 per cent in excess of this amount and the flue should enter the chimney with a rising slope of not less than 45 degrees. The area through the economizer should be 20 per cent greater than the flue area and the economizer walls should be at least 14 inches thick and exceptionally well built and the combined area of the boiler side flues should not be less than twice that of the main flue.

As the price of fuel is influenced to a great extent by the convenience with which it can be burned, the general tendency is to use a higher priced fuel even though it may have a lower heating value than a cheaper grade. This tendency can be readily overcome and a large reduction made in the fuel bill by the use of high-class mechanical stokers which will burn coal almost impossible to fire by hand.

General Descriptions of Fuel.— For various reasons coal is the most important of all fuels and in many localities constitutes the only one available; but in some places wood, oil and gas are abundant and take the place of coal. In certain industrial and manufacturing plants, their waste products, such as straw, tanbark, sawdust and bagasse are used as fuel more economically than coal, owing to their availability. For general purposes, however, coal is the chief fuel and the available heating value of all other kinds of fuel are invariably expressed in terms of that of coal.

Solid Fuels.

Varieties of Coal.—The five most important varieties of coal are anthracite, dry bituminous, caking bituminous, cannel and lignite.

Anthracite coal is found principally in the Alleghany Mountains and in the Rocky Mountain region in Colorado. It is a hard, lustrous variety and breaks up easily at a high temperature. It consists of 93 to 95 per cent carbon and 2 to 4 per cent hydrogen and burns with very little flame and smoke, unless containing an excess of moisture and gives an intense heat. There is a variety known as semi-anthracite which contains 90 to 93 per cent carbon and 4 to 5 per cent hydrogen, but it is not as hard as true anthracite and burns with a short flame. Owing to its great brittleness, a large part of anthracite gets broken into small pieces; therefore, in order to obtain the best results it should be fired on grates having small air spaces. The various commercial names and sizes of anthacite coal used in industrial furnaces are as follows:

«Chestnut» coal passes over a round hole seven-eighths of an inch in diameter and falls through a hole one and one-half inches in diameter. «Pea» coal passes over a hole nine-sixteenths of an inch in diameter and falls through a hole seven-eighths of an inch in diameter. «Number One Buckwheat» passes over a hole three-eighths of an inch in diameter and falls through a hole nine-sixteenths of an inch in diameter. «Number Two Buckwheat» or «Rice» passes over a hole three-sixteenths of an inch in diameter and falls through a hole three-eighths of an inch in diameter. «Number Three Buckwheat» or «Barley» passes over a hole three-thirty-seconds of an inch in diameter and falls through a hole three-sixteenths of an inch in diameter. «Dust» includes all that falls through a hole three-thirty-seconds of an inch in diameter. The size of coal used has a considerable influence on the amount of heat produced, owing to its effect on the draft. With a poor draft, fine coal is consumed too slowly to be effective. Coal is most efficiently used in separate sizes, which afford regularity of draft, whereas mixed sizes have the effect of choking the fire.

Bituminous coal contains less carbon and more hydrogen than is found in anthracite. The dry variety is found in Maryland and Virginia and the caking variety chiefly in the Mississippi Valley. Dry bituminous coal contains 84 to 89 per cent carbon and 5 to 6 per cent hydrogen and burns freely, without caking and with very little smoke. The caking coals become pasty or swell and cake when burning. Caking bituminous coals contain from 80 to 85 per cent carbon and 5 to 6 per cent hydrogen and are largely used for making illuminating gas.

Cannel coal, also known as long-flaming bituminous, contains from 65 to 85 per cent carbon and 5 to 8 per cent hydrogen. It is found in Pennsylvania, Indiana and Missouri. All varieties of cannel coal have a strong tendency to smoke and some of them cake when heated.

Lignite, also known as brown coal, contains from 55 to 75 per cent carbon and 5 to 6 per cent hydrogen. It is found in the Dakotas, Colorado, Texas, Washington and Alaska. It is a substance intermediate between peat and coal and contains some moisture and mineral matter. The poorer varieties have a low fuel value.

Peat consists of decayed roots and foliage consolidated into earthy matter. It is cut out of bogs and swamps and then dried, usually by being stacked in the air. If it is sufficiently compact it is burned without being previously compressed; otherwise, it is pulverized and compressed into briquettes, and sold as an artificial fuel. The amount of ash varies from 5 to 12 per cent. Recent experiments in the carbonizing of peat have greatly increased its value as an effective fuel. It is transformed into peat charcoal by the process used in making wood charcoal and into peat coke or semi-coke in special apparatus. In powdered form peat has been used successively as a locomotive fuel on the Swedish national railways, the powder being blown into the fire with an air-blast. A small percentage of powdered bituminous coal is added to the peat powder. In the semi-coke process the peat is pulverized in water, carbonized and then pressed into briquettes. Peat charcoal has a calorific value of about 12,500 B. T. U. per pound and peat coke a calorific value of 14,500 B.T.U. per pound.

The value of a fuel is indicated by the number of heat units it contains. This heating value is expressed in British thermal units (generally abbreviated to B. T. U.). This unit is the amount of heat required to raise one pound of water one degree Fahrenheit from a starting point of 60°.

Coke is an artificial fuel obtained from bituminous or semi-bituminous coals by driving off their hydro-carbon constituents by means of heat. As the by-products of gas retorts, commercially known as gas-house coke, it has a low fuel value under direct firing methods; but it will make a very hot fire under forced draught. It contains about 60 per cent carbon and 1 to 2 per cent hydrogen.

Briquettes are made by pressing into blocks of varying shapes and sizes fine coal and coal dust mixed with tar, asphalt, pitch, molasses residues and similar materials as binders. At first prohibitory on account of manufacturing cost they have come more and more into favor as coal has advanced in price. In the United States alone, in 1917, there were 13 plants engaged in making briquettes. They used 402,336 tons of fuel material which otherwise would have been valueless, and turned out 406,856 tons of briquetted fuel, valued at $2,233,888 — an average value of $5.48 per ton. The calorific value of briquettes is from 13,700 to 14,600 British thermal units per pound.

Thermal Units.— The number of British thermal units (B.T.U.) per pound of fuel in some of the more common kinds of coal are as follows: Pennsylvania anthracite, 13,100 to 14,200; Pennsylvania Connellsville coal, 13,640; Pennsylvania semi-bituminous and cannel coal, 13,150; Pennsylvania brown coal or lignite, 12,300; Kentucky bituminous, 14,400; Kentucky cannel, 15,200; Kentucky lignite, 9,300; Indiana bituminous, 14,160; Indiana cannel, 13,100; Virginia bituminous, 13,100; Virginia Pocahontas, 14,800; West Virginia bituminous, 13,740; southwestern Illinois, 12,800; Missouri bituminous, 13,550; Ohio bituminous, 12,300; Maryland Cumberland, 12,200; Arkansas lignite, 9,200; Colorado lignite, 13,560; Texas lignite, 13,000; Washington lignite, 11,550; peat, air-dried, 7,400; peat, kiln-dried, 10,200 to 12,200; coke (average), 14,700. Many other examples are given in Bulletin 23 of the United States Bureau of Mines. Coals which have a high moisture content or a high percentage of ash develop their best fuel results when used in a gas producer. The calorific value of any sample of coal may be roughly determined by the formula $14{,}600\ C + 56{,}000\ (H - \frac{O}{8}) + 4{,}000\ S$. where the letters stand for the molecular weights of those elements — the result being in British thermal units per pound.

Wood, considered as fuel, is divided into two classes — hard wood and soft wood. The heating value of different kinds of wood for a given weight is practically the same; or, in other words, one pound of hickory is not worth any more as fuel than one pound of pine, as the chemical composition of different kinds of wood is nearly the same. Wood, however, is usually purchased by the cord, and the hard woods are very much heavier per cord than the soft woods. Hickory and hard maple weigh about 4,500 pounds per cord, equal to 1,800 pounds of coal; white oak weighs 3,850 pounds, equal to 1,540 pounds of coal; birch and the red and black oaks weigh 3,250 pounds, equal to 1,300 pounds of coal; poplar, chestnut and elm weigh about 2,350 pounds per cord, equal to 940 pounds of coal; pine weighs about 2,000 pounds per cord, equal to 800 pounds of coal. The average chemical composition of air-dried wood shows 37.5 per cent of carbon; 4.5 per cent of hydrogen; 30.75 per cent of oxygen; and 1.5 per cent of ash, with a moisture content ranging from 15 to 25 per cent. Its fuel value is about 5,800 British thermal units per pound. For some purposes wood is kiln-dried, increasing its fuel value to 7,800 British thermal units per pound; but such wood, if kept for any length of time, absorbs from the air the moisture driven out, and falls again into the class of ordinary air-dried wood. Selected resinous wood, such as pine knots, give as high a fuel value as 10,800 British thermal units per pound. In estimating relative fuel values it is customary to reckon one pound of coal as equivalent to two and one-half pounds of wood.

Spent tan-bark is commonly used in the furnaces of tanneries and yields about 4,500 British thermal units per pound. **Straw** is sometimes burned as fuel under boilers and yields about 5,500 British thermal units per pound.

Charcoal is made by evaporating the volatile constituents of wood, either by partial combustion or by heating in retorts. By partial combustion as in a common charcoal kiln, 100 pounds of wood will yield 20 pounds of charcoal, and by heating in a retort about 30 pounds. A cord of wood generally yields about 50 bushels of charcoal. Since the non-combustible constituents of the wood are driven off in the process of making charcoal, the latter has a high calorific value, ranging from 11,000 to 13,500 British thermal units per pound.

On account of the large per cent of moisture in peat, wood, sawdust and tan-bark, these substances as well as coke and charcoal, are rarely used for steaming or power-producing purposes, but all of them are available as fuel in gas producers, by the use of which the moisture is readily removed from the constituent gases, which can then be used for power-producing purposes by means of internal combustion engines, or be burned directly in furnaces where high temperatures are required, such as those of steel works, rolling mills, smelting furnaces, glass works and chemical works.

Liquid Fuels. Among liquid fuels the oils derived from petroleum occupy practically the whole division. In application they are used in two ways: in external combustion and much more extensively in internal combustion engines. While the so-called heavy oils are generally devoted to the external oil-firing and the lighter oils to the internal combustion type of motor, there is actually no distinct division as to availability, if there is a suitable adaptation of burners. Closely allied to the lighter petroleum oils is benzol, a by-product of the manufacture of coke. Tars derived from gas works, coke ovens and blast furnaces are much used in engines of the Diesel type. The only other liquid fuel which approaches industrial importance is alcohol.

Fuel Oils.— The various kinds of fuel oils are all derived from petroleum, varying in composition as follows: Carbon, 82 to 87 per cent; hydrogen, 11 to 15 per cent; oxygen, ½ to 6 per cent. The theoretical average calorific value is about 20,860 B. T. U. per pound, corresponding to a theoretical evaporation of 21 pounds of water from and at 212° Fahr.

American crude petroleum carries more of the lighter oils than the European, Mexican or Peruvian, from which a residuum or fuel oil, consisting largely of the heavy oils, is obtained by distillation. To be effective fuel oils must be vaporized and thoroughly mixed with the proper proportion of air. In this work steam atomizers give better results than the air spray, the steam required to atomize being about 4 per cent of the water evaporated.

«Astatki,» «Mazoot,» «distillate,» «petroleum refuse,» «reduced oil,» etc., are some of the commercial terms used to designate the various kinds of fuel oil.

Approximately, one pound of fuel oil is equal to 1.45 pounds of coal. A test at the Minneapolis waterworks showed that for the same duty 224 gallons of oil, weighing 6.875 pounds per gallon, equaled one ton (2,240 lbs.) of Youghiogheny coal.

Fuel oils have both advantages and disadvantages. The heating value of a fuel oil is nearly twice its weight of coal. Its use is not as injurious to the furnace as the use of coal, on account of the smaller percentage of sulphur. With oil, the fire can be controlled by means of a single valve and when once regulated to produce a certain heat, it can be maintained at that point with very little trouble. There is a much lower temperature in the fireroom, particularly noticeable on shipboard. The fire can be started easily and extinguished instantly. The combustion is complete and smokeless, thus making economy and cleanliness important advantages in its use. And there is a very considerable saving in labor, one man with oil taking the place of eight men with coal.

The most important disadvantages are the comparatively high price, danger from explosion, loss by evaporation and unpleasant odor.

The barrel of crude petroleum of commerce is 42 gallons, weighing six and one-half pounds per gallon, and it is customary to consider roughly that three and three-quarters barrels are equivalent to one ton of coal.

The requirements of a desirable fuel oil are: high calorific value — at least 18,000 B. T. U.; specific gravity within 0.85 to 0.97 at 60° F.; high flash point — not lower than 150°; and if for shipboard use, not lower than 175°, and 200° preferred; viscosity low enough to remain liquid at 32° and to flow freely with one foot head in a four-inch pipe; freedom from water (2 per cent highest exception); freedom from sulphur (1 per cent highest exception); freedom from dirt; and freedom from acid (one-twentieth of 1 per cent highest exception).

Tar Fuels.— Tar fuels are of two classes: the high temperature tars and the low temperature tars. The former are products of the horizonal gas retorts, are quite viscid and contain a high percentage of the objectionable naphthalene, and about 19 per cent of free carbon. Low temperature tars are the products of vertical gas retorts and blast furnaces manufacturing coalite and coke. The latter produce tars which are quite fluid, contain but small percentages of napthalene and anthracene and almost no free carbon. The tar from the vertical gas retorts is of the same general character, but has a larger proportion of naphthalene and about 3 per cent of free carbon. In some cases the tars are first distilled to secure their benzol content.

As fuel, tar is much less desirable than the oils because of its content of oxygen compounds (carbolic acid, cresylic acid, etc.), which not only reduce its calorific value but evolve noisome fumes. The average composition of tar is about as follows: carbon, 78 per cent; hydrogen, 6 per cent; sulphur, 1 per cent; nitrogen, 1 per cent; oxygen, 14 per cent. Its calorific value is about 15,800 B. T. U. per pound. The flash point of tar varies from 100° to 115° F. for vertical retort tar to 160° to 190° for horizontal retort tar.

Benzol.— Benzol appears upon the market in two grades — 90 per cent benzol and 50 per cent benzol; also in mixtures of the two. The 90 per cent grade is the only one used to any extent as a fuel and this use is confined almost wholly to internal combustion motors, where it very successfully takes the place of the higher priced gasoline and yields about 12 per cent more heat gallon for gallon — and without any change in the motor. The calorific value of benzol is 17,500 B. T. U. per pound (156,700 B. T. U. per gallon).

Alcohol.— It has been truly said of alcohol that, in the present state of the world's knowledge, it is the only fuel which man is able to manufacture in unlimited quantities and within a reasonable time, without drawing upon the reserves of natural fuels; and this is especially important as to those parts of the earth where there are no natural fuel deposits. Alcohol is easily produced from any form of vegetable growth containing sugar or fermentable starch and at a cost of about 21 cents per gallon from such relatively costly material as the sugar cane and the sugar beet — which may be grown in four months. The so-called gasoline motors run readily on 84 per cent alcohol (a higher degree has been found of no advantage) without material change in the mechanism. The only difficulties to be overcome are those of starting from the cold, and the necessity of a more abundant supply of fuel than with gasoline. The calorific value of fuel alcohol is about 11,500 B. T. U. per pound (91,100 B. T. U. per gallon). With alcohol, internal combustion motors show a somewhat higher efficiency than with gasoline and run with much less noise.

Gaseous Fuels.

The principal kinds of gaseous fuel which are in use at the present time for power-producing purposes are natural gas and producer gas. A certain kind of uncarburetted water gas, made by the decomposition of steam in the presence of incandescent-carbon, is also used to a limited extent, but this gas can never play a very important part as a power producer, on account of the large consumption of energy in its production.

The composition, weight and heat value of 1,000 cubic feet of the four types of gases used for power producing and illuminating purposes are as follows:

Natural Gas.— Marsh gas, 92.6 per cent; nitrogen, 3.61 per cent; hydrogen, 2.18 per cent; carbon monoxide, 0.50 per cent; oxygen, 0.34 per cent; olefiant gas, 0.31 per cent; carbon dioxide, 0.26 per cent. Natural gas weighs about 45.6 pounds per 1,000 cubic feet. Its calorific value is 1,100,000 B. T. U. per 1,000 cubic feet.

Coal Gas, or Illuminating Gas.— Hydrogen, 46.0 per cent; marsh gas, 40.0 per cent; carbon monoxide, 6.0 per cent; olefiant gas, 4.0 per cent; nitrogen, 1.5 per cent; oxygen, 0.5 per cent; carbon dioxide, 0.5 per cent. Coal gas weighs about 32 pounds per 1,000 cubic feet. Its calorific value is 735,000 B. T. U. per 1,000 cubic feet.

Water Gas.— Hydrogen, 45.0 per cent; carbon monoxide, 45.0 per cent; carbon dioxide, 4.0 per cent; marsh gas, 2.0 per cent; nitrogen, 2.0 per cent; oxygen, 0.5 per cent. Water gas weighs about 45.6 pounds per 1,000 cubic feet. Its calorific value is 322,000 B. T. U. per 1,000 cubic feet.

Producer Gas (from bituminous coal).— nitrogen, 55.3 per cent; carbon monoxide, 27.0 per cent; hydrogen, 12 per cent; marsh gas, 2.5 per cent; carbon dioxide, 2.5 per cent; olefiant gas, 0.4 per cent; oxygen, 0.3 per cent; Producer gas weighs about 65.9 pounds per 1,000 cubic feet. Its calorific value is 156,900 B. T. U. per 1,000 cubic feet.

This exhibit shows natural gas to be the highest in the order of heat energy, its calorific power being 50 per cent greater than that of coal gas. This is due to the high percentage of marsh gas given to natural gas by a natural process which cannot be duplicated artificially. Producer gas has the lowest heat value, yet it is the cheapest artificial fuel gas per unit of heat, as the oxygen for burning the carbon to carbon monoxide is derived principally from the air. It has only one-fifth the heat energy of good illuminating gas per cubic foot, and it is most successfully applied in operations where a considerable body of gas is burned rather than in small operations where illuminating gas can be used to superior advantage.

Comparison of Gases on a Coal Basis.— The theoretical heat value of average anthracite coal is about 14,200 B. T. U.'s per pound, or the power to evaporate about 14.7 pounds of water per pound of coal burned. This theoretical evaporation is never attained in practice, however, owing to heat losses sustained in various ways — by improper design of boilers, by radiation, by improper firing, etc., so that a boiler rarely gives an efficiency equivalent to the evaporation of 12 pounds of water per pound of coal, or the utilization of 80 per cent of the theoretical heat energy of the fuel. The efficiency usually attained is about 10 pounds of water, or about 67 per cent of the theoretical energy, so that only about 9,500 of the 14,200 heat units in a pound of coal are utilized by the average boiler.

As determined by satisfactory experiments, seven and one-half cubic feet of natural gas burned will evaporate 10 pounds of water; or in other words, about 8,000 heat units in the form of natural gas are equivalent to a pound of good coal burned. Other authorities give the heat value of 1,000 cubic feet of natural gas as equivalent to that of an amount of coal ranging from 80 to 130 pounds.

Comparison of Illuminating Gas and Producer Gas.— First-class coal gas, or carburetted water gas, made with four and one-half gallons of Lima oil per 1,000 feet of gas, contains between 730 and 735 heat units per cubic foot, which gives an equivalency of 19 cubic feet of gas to one pound of anthracite coal, or 1,000 cubic feet equal to 59 pounds of coal.

One pound of anthracite coal, composed of carbon 85 per cent, hydro-carbons 5 per cent, and ash 10 per cent, will make 90 cubic feet of producer gas of the following composition: hydrogen 12 per cent, carbon monoxide 27 per cent, marsh gas 1.2 per cent, carbon dioxide 2.5 per cent, and nitrogen 57 per cent, having a heat value of 137 heat units per cubic foot. This gives an equivalency of about 104 cubic feet of gas to one pound of anthracite coal, or 1,000 cubic feet to about 9.5 pounds of coal.

Comparison of Anthracite Gas and Bituminous Gas.— One hundred pounds of anthracite coal converted into gas in a gas producer yields 186.66 pounds of carbonic oxide, equivalent to 807,304 B. T. U.; 5 pounds of marsh gas, equivalent to 117,500 B. T. U.; and 3.75 pounds of hydrogen, equivalent to 232,500 B. T. U.;— a total of 1,157,304 B. T. U. The total energy per pound of gas is 2,248 B. T. U. Since the total energy in 100 pounds of anthracite is 1,349,000

B. T. U., its conversion into gas shows an efficiency of 86 per cent.

One hundred pounds of bituminous coal converted into gas in a gas producer yields 116.66 pounds of carbonic oxide, equivalent to 504,554 B. T. U.; 32 pounds of volatile hydrocarbons, equivalent to 640,000 B. T. U.; and 2.5 pounds of hydrogen, equivalent to 155,000 B. T. U.— a total of 1,299,554 B. T. U. The total energy per pound of gas is 3,484 B. T. U. As the total energy in 100 pounds of bituminous coal is 1,437,500 B. T. U., its conversion into gas shows an efficiency of 90 per cent.

In view of the facts that the supply of natural gas is gradually failing, and that the most satisfactory method of using the heat from other fuels is to first convert it into gas, it is interesting to note that in the gasification of fuels having a high percentage of moisture, high percentages of carbonic acid and hydrogen occur in the gas. This is probably due to the fact that at a temperature of about 1100° F., water vapor oxidizes carbonic oxide to carbonic acid. Therefore, coke and charcoal, which have a low value as a direct-firing fuel, work more favorably in a gas producer, and yield more gas per pound than any other material. The approximate yield of gas per pound of different materials is as follows: coke or charcoal, 104 cubic feet; anthracite, 85 cubic feet; bituminous coal, 75 cubic feet; lignite or brown coal, 55 cubic feet; peat, 45 cubic feet; wood 35 cubic feet.

Tests on Fuel.— The most important conclusions of the tests on fuel made by the government and by the laboratories of some of the principal universities are as follows:

1. Samples of coal from 17 States, tested in steam boiler plants, indicate that the high steaming quality of many of the American coals may be improved by washing.
2. Most of the American coals and lignites constitute an available source of power by utilization in gas producer plants.
3. Comparative tests made by the government on 14 bituminous coals from nine States, indicate that when these coals are used in a gas producer plant, their power efficiency is two and one-half times greater than when they are directly fired in a steam boiler plant.
4. Some of the lignites found in undeveloped but extensive deposits in the Dakotas and Texas, show very high power producing qualities when gasified in the gas producer and used in the gas engine.
5. Some of the American coals, and the stock produced in mining them can be briquetted on a commercial basis.
6. Under these conditions of attainable fuel economy, it is merely a question of time when the gas engine will supersede any possible type of steam motor.

FUELS. See INTERNAL COMBUSTION ENGINE.

FUELS FOR LOCOMOTIVES, Comparative Value of. See LOCOMOTIVE.

FUENTEOVEJUNA, foo-en"tā-ō-vē'hoo-na, Spain, town in the province of Cordóba, 45 miles northwest of the city of the same name. It is an important agricultural centre and has manufactures of bricks, flour, leather, soap, etc. Lead, calcite and building stone are obtained in the neighborhood. The town has a considerable trade, in wine, fruit and ordinary agricultural produce. It is famed for its honey and by many is believed to be the ancient Mellaria of the Romans. Pop. 13,470.

FUENTERRABIA, foo-en"-ter-rä'bē-ạ, Spain, town in the province of Guipúzcoa, on the French frontier and on the Bidassoa River. It has a mediæval aspect but in recent years a new town for summer visitors has sprung up without the walls of the old. The town has an ancient castle, a town hall, and is noted for its old gabled houses. Its principal industries are the manufacture of rope, nets, flour, lumber and paper. It had the usual fortune of a frontier town in the Middle Ages, being repeatedly attacked and sacked. Pop. 4,976.

FUENTES DE OÑORO, foo-en-tes dẹ ôn-yō'rō, Spain, village on the Portuguese border, 15 miles west of Ciudad Rodrigo. On 3 May 1811, it was the scene of a sharp engagement between the English forces of Wellington and the French under Masséna and Bessières. The French were debarred from their project of invading Portugal. Pop. 1,200.

FUERO, foo-ār'ō, **Joaquin**, Mexican soldier: b. Guadalupe Hidalgo, 1814; d. 1867. He received his education at the Military School of Segovia and became professor and vice-president of that institution. He suppressed the insurrection of 1840 and three years later was made chief of staff of the Tamaulipas army division. He fought against the Americans in 1846–47 and was seriously wounded in one engagement. He wrote 'Manual del militar, ò tratado completo de instrucción en la ordenanza' (1842), and a translation of McKenna, 'Military Tactics.'

FUERO (from the Latin *forum*), a Spanish word signifying jurisdiction, law, privilege. It is applied to the various written codes and characters of particular districts, towns, etc., and signifies generally those laws, privileges and immunities founded on usage and sanctioned by the suzerain or supreme authority. Fueros are both civil and ecclesiastical. The earliest, as well as the most universal, is the *fuero juzgo*. This name (a corruption of the Latin *forum judicum*) is given to a 13th century translation of a code of the 17th century. It contains the Gothic laws which, up till this time, gradually superseded the Roman. Each law receives the name of the Gothic sovereign by whom it was promulgated. This code has formed the foundation of Spanish law down even to modern times. The fueros of Leon, known by the name of *fueros bonos*, contain a complete constitution, civil and ecclesiastical, recognize the rights of self-taxation, and of the nobility of all subjects by birth. The constitution of free towns under these fueros is essentially republican, the king having only a right to name the corregidor, who must be confirmed by the junta of the province, an assembly elected by a very liberal suffrage. As the various monarchies became consolidated under a single head, the kings became anxious to evade or withdraw privileges which interfered with the organization of their kingdom, and after 1592 when Philip II entered Aragon with an army, hanged the grand-justiciary, whose office it was to administer the oath, and abolished the constitution, the fueros as a political institution ceased to exist, although some local and municipal privileges continued to be called by that name. In 1833 a civil war broke out in the Basque provinces, in assertion of the fueros, which were formally recognized in 1844. In 1876, however, the fueros of these northern provinces were superseded by the general laws of the kingdom. Consult Arias, M., 'Fueros observancias, actosde Cortes de Aragon' (Saragossa 1907); San Martin, ed. 'Los códigas españoles' (Madrid 1872–73).

FUERTE VENTURA, fwär'tä vĕn-too'rä, one of the Canary Islands, belonging to Spain. It is situated between the Grand Canary and Lanzarote. In general the soil is not productive and the rainfall is slight. Fishing and the raising of goats are the principal industries. Among the products of the island are figs, olives, almonds, gypsum and chalk. It has an area of 650 square miles and numerous extinct volcanoes. Its principal harbor is Cabras on the east coast. Pop. about 13,000. See CANARY ISLANDS.

FUERTES, Estevan Antonio, American civil engineer: b. San Juan, Porto Rico, 1838; d. 1903. He received his education at Salamanca, Spain, and at the Rensselaer Polytechnic Institute, Troy, N. Y. In 1861–63 he was assistant engineer in the Department of Public Works, Porto Rico, and subsequently served as director of public works for the western district of that island. Coming to the United States in 1864 he was successively assistant engineer and engineer to the Croton Aqueduct Board, and in 1870–71 was chief engineer of the American Isthmian Canal expeditions to Tehuantepec and Nicaragua to investigate and report on the practicability of a ship canal connecting the Caribbean and the Pacific. In 1873 he was appointed dean of the civil engineering department of Cornell, and in 1890–1902 directed the college of civil engineering there and brought the equipment of that department up to modern standard. In 1902 he became professor of astronomy at Cornell and supervised the construction of the Barnes Observatory. He planned a drainage system for Santos, Brazil. He was a member of many scientific societies, American and foreign.

FUERTES, foo-är'tęs, **James Hillhouse,** American civil and sanitary engineer: b. Ponce, Porto Rico, 10 Aug. 1863. He was graduated from Cornell University in 1883. He has constructed works for the sewerage, drainage and water supply of various cities in the United States, Canada and Brazil, and served as consulting engineer of various corporations and municipalities, and is a non-resident lecturer at Cornell. He has published 'Water and Public Health' (1897); 'Water Filtration Works' (1901); 'European Sanitary Engineering Series' in the *Engineering Record*, and numerous monographs on engineering and sanitary subjects, etc.

FUERTES, Louis Agassiz, American painter of birds: b. Ithaca, N. Y., 7 Feb. 1874. He was graduated from Cornell University in 1897. His habitat bird groups in the American Museum of Natural History are one of the most attractive features of the institution. He made 25 decorative panels for F. F. Brewster of New Haven, Conn. He has illustrated 'Birding on a Broncho' (1896); 'Citizen Bird' (1897); 'Song Birds and Water Fowl' (1897); 'Bird Craft' (1897); 'The Woodpeckers' (1901); 'Second Book of Birds' (1901); 'Birds of the Rockies' (1902); 'Handbook of Birds of Western North America' (1902); 'Coues' Key to North American Birds'; the plates for the 'Report' of the New York State Game, Forest and Fish Commission (1903); 'Upland Game Birds' (1902), and the companion volume, 'Waterfowl' (1903); New York State Museum, Eaton's 'Birds of New York' (1909–14); 'Handbook of Birds of Eastern North America' (1912), and much illustration for current magazines of ornithology, governmental reports, and many paintings privately owned. etc.

FUGA, Ferdinando, Italian architect: b. Florence 1699; d. 1784. He spent most of his active life in Rome, where there are many examples of his work, including the Corsini Palace, and the exterior of the Church of Santa Maria Maggiore. He removed to Palermo toward the end of his life and died there while employed in the reconstruction of the cathedral of that city.

FUGER, Heinrich, German artist: b. Heilbronn, Würtemberg, 1751; d. 1818. At Stuttgart he studied under Guibal and under Oeser at Leipzig. He toured Italy and studied brief periods at Rome and Naples. He was made court painter at Vienna, was appointed professor and assistant director at the Academy of that city, and became director of the Belvedere in 1806. His best works are the portraits of Joseph II, the Grand Duchess Elizabeth, Queen Caroline and Nelson (in the National Gallery, London), and the historical paintings 'Farewell of Coriolanus,' 'Allegory of Peace,' 'Bathsheba' and other examples in the Vienna collections.

FUGGER, fook'ĕr, or fug'ger, the name of a wealthy and illustrious German family of Suabia, descended from a weaver, who originally lived in the environs of Augsburg, about 1300. They were at first successful in selling clothes, but afterward extended their dealings and became merchants, accumulating an immense fortune. Reaching the height of their affluence at the commencement of the 16th century, they rendered considerable services to the Emperors Charles V and Maximilian, by making them large advances. These princes bestowed titles of nobility on the Fugger family, and they soon became connected with the best blood of Germany. Promoted to the highest dignities of the empire, they did not any the more neglect the pursuits of commerce. Their riches were always forthcoming for the improvement of their birthplace, Augsburg, where they erected some handsome monuments and founded philanthropical institutions. The best known of them are the three brothers, Ulric, James and George; and afterward Raymond and Antony, both sons of George. Ulric received for his loans to Maximilian the courtship of Kirchberg, and the seigniory of Weissenhorn, which afterward remained in the possession of his family. He was a great encourager of learning. Antony and Raymond bore, to a great extent, the expenses of the expedition of Charles V against Algeria, obtaining from him the permission to coin money. One day, at an interview with the emperor, Antony, as a mark of his regard and esteem, threw into the fire all the title-deeds and securities which Charles had deposited with him. Toward the close of the 18th century the family withdrew altogether from trade, confining themselves to the management of their landed estates. Count Anselm Maria of Babenhausen, of the Wellenberg line (b. 1776; d. 1821), was raised by the Emperor Francis II to the dignity of a prince of the empire. The principality of Babenhausen was annexed to Bavaria in 1806, and Leopold Fugger Babenhausen (1827–85), grandson of the first prince, was a hereditary Imperial councilor, and lord high-chancellor of Bavaria. He was succeeded by his brother Karl Ludwig Maria Fugger (b. 1829), who in 1891–93 was president of the Bavarian Reichsrat. Consult Jansen, 'Studien zur Fugger-geschichte' (Leipzig 1907), and Stauber, 'Das Haus Fugger von seinen Antängen bis zur Gegenwart' (Augsburg 1900).

FUGGERS Bank of the. The foundation of this great banking house was laid in Augsburg, Bavaria, about the middle of the 15th century. (Rabelais, 'Letters from Rome,' 1536). As its active career extended to the middle of the 17th century it embraced a period of some 200 years during which interval it was accounted the richest banking house in northern Europe, commercially the most extensive and politically the most important in its financial operations. The fortunes of the Fugger family grew originally out of the woolens trade, in which a great rivalry arose between the growers and merchants of wool in England, Germany and Spain, and the dyers and finishers of Italy. The political importance of the Fuggers coincided with the reign of Charles V, whose youth, 1500–1516, was passed in Ghent (Flanders), where he was born. The expenditures of the young prince exceeding his income, he had recourse for assistance to the Fuggers of Augsburg, one of whom (probably Antony), resided and conducted an agency of the house in Flanders. In 1548, after Charles had successively ascended the thrones of Spain and Germany, he reformed the government of Augsburg, marking the occasion by elevating the Fuggers to the dignity of senators and conferring the title of baron upon Raymond and Anthony. In the European wars which engaged the emperor, as well in the administration of his affairs in Spain and America, the Fuggers often shared his confidence and frequently responded to his demands for financial assistance. Among the minor, though now most interesting of the projects which were undertaken in the earlier portion of the great emperor's career one which was financed by the Fuggers, was a survey by Flemish engineers of the Isthmus of Darien, with a view to the construction of a Panama Canal, about 1526 (Rev. Peter Heylin's 'Microcosmos,' 1631, p. 788), a design whose grandeur had yet to await for its fulfilment another 400 years. The bank of the Fuggers, with agencies in the principal cities of Europe, was a depository for the funds of numerous commercial houses and trading companies, whose paper it discounted and whose plans it often promoted. It issued and cashed bills of exchange, bought coins and bullion, and advanced money upon bills of lading and consignments of merchandise; it even acquired the extraordinary privilege, in at least three places, of minting its own coins, some specimens of which are preserved in the great continental cabinets. Consult Hazlitt, 'European Coinage; mints of Augsburg, Fugger and Weissenhorn.' For the history of other ancient European banks see BARCELONA, BANK OF; BYZANTIUM, BANK OF; GENOA, BANK OF; MEDICI, BANK OF THE; TYRE, BANK OF; VENICE, BANK OF.

ALEXANDER DEL MAR.

FUGIO. See CENT.

FUGITIVE, *in law,* is a term applied to persons who having violated the laws of a State escape into a foreign territory. As one State cannot pursue criminals into the territories of another, the practice prevails among the more enlightened nations of mutually surrendering such fugitives to the justice of the injured State. This practice is founded on national comity and convenience, or on express compact. The United States recognize the obligation only when it is created by express agreements. (See EXTRADITION). As between the States of the American Union, extradition is made compulsory by the Federal Constitution, Article IV, Section 2, which provides that "a person charged in any State with treason, felony or other crime, who shall flee from justice and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime." In the several States there are statutory provisions or established usages regulating the procedure in such cases.

FUGITIVE-SLAVE LAWS. In the colonies and under the Confederation, fugitive slaves could be reclaimed only through intercolonial or interstate comity, and in framing the Constitution, one of the chief inducements for the South to join was a fugitive-slave clause. The mandate to deliver them up, however, was only to the States, which could not be punished for refusing to comply; and as the free States recognized no obligation of comity on this point, the general government passed the first fugitive-slave law, signed by Washington, 12 Feb. 1793. The oral testimony of the alleged owner was all the evidence required, and on this any magistrate, even a town justice, was ordered to surrender the alleged fugitive; $500 fine was imposed for rescue, concealment or obstruction of arrest. This made kidnapping free blacks a pastime, and it was extensively carried on in the Border States; motions to amend the law and require more evidence were voted down. On the other hand, the

Border States complained of increasing escapes, and Congress promptly passed an amendment (30 Jan. 1818), enabling a claimant to make his proof before a judge of his own State and abolishing the habeas corpus in such cases. The Northern magistrates, however, revolted against the obligation; Pennsylvania passed a law contravening the national act and providing its own methods of reclamation, and made them incumbent on her own magistrates; a Maryland slave-seeker thereupon carried off an alleged slave by force, and on his indictment the Supreme Court decided (Prigg v. Pennsylvania) that the execution of Federal laws could not be imposed on State officials. Taney dissented; and on this doubt the Northern States began to pass «personal-liberty laws» to prevent their officials being so employed or their buildings used as places of detention. With the spread of anti-slavery sentiment there also sprang up a method of assisting runaway slaves by sending them under cover of night from one sympathizer to another. This was called «the underground railway.» The South became roused to demand an effective fugitive-slave law as the price of remaining in the Union; and that of 1850 (see COMPROMISE OF 1850), the death-knell of the Northern-Southern Whig party, was passed, placing the whole course of reclamation in Federal hands. The entire machinery of the United States, from courts to army, was made part of a grand system for this one purpose, and new officials were appointed for it; marshals were liable to $1,000 fine, plus the value of the slave, if he escaped or even was forciblv rescued, and bystanders were held guilty of treason for refusing to assist; the owner's oath was full evidence, that of the alleged fugitive was not to be received, and the habeas corpus was rendered null; obstruction, rescue or concealment was punishable by six months' imprisonment and $2,000 damages and fine; if the claimant «apprehended» a rescue, the marshal was to take the fugitive to the claimant's State himself before surrendering him; lastly, an affidavit and general description made in the claimant's own State was to be valid for a reclamation in any other. This atrocious act was met by more stringent personal-liberty laws, which made it hard for the alleged owner or his United States agents to find any State soil to stand on in executing the writs or holding the fugitive; and in 1859 Wisconsin openly threatened to secede if the mandates were executed on her soil. Its political result was an undreamed-of boomerang, each seizure rousing a storm of indignation, often inflamed still more by the incidents — as riot and bloodshed, the murder of her child by a mother to save it from slavery (see GARNER CASE), the prosecution for treason of two Quakers who refused to join the hunt (see CHRISTIANA CASE), the seizure of long-time free black citizens of towns, etc. The Free-Soil party demanded its repeal; the Republican party inherited and pressed the claim; the success of the latter in 1860 was taken by the South as notice that the next administration would repeal it, and was a leading cause of the secession of 1861; and in the sequel the obnoxious law was repealed in 1864. Consult McDougall, M. G., 'Fugitive Slaves' (1891); Siebert, W. H., 'The Underground Railway' (1898); Smith, T. H., 'Parties and Slavery' (1906). See also UNITED STATES, SLAVERY IN THE; UNDERGROUND RAILWAY.

FUGIWARA, a noble family of Japan, eminent in civil affairs. It was founded by Kamatari, regent of the empire, in 645–49 A.D. It has given many statesmen, historians, scholars, poets, artists, etc., to Japan and was long the most powerful family in the empire. The empress of Japan is of this family, being of the 40th generation in descent from Kamatari. Consult Mentchikov, 'Empire du Japon' (Geneva 1881).

FUGUE, füg, a musical term derived from the Latin word *fuga*,— a flight, and signifying a polyphonic composition constructed on one or more short subjects or themes, which are harmonized according to the laws of counterpoint (q.v.), and introduced from time to time with various contrapuntal devices. The interest in these frequently heard themes is sustained by diminishing the interval of time at which they follow each other, and monotony is avoided by the occasional use of episodes, or passages open to free treatment. The chief elements of a fugue are: (1) the subject; (2) the counter-subject, or contrapuntal harmonization of the answer by the part which has finished the enunciation of the subject; (3) the answer; (4) episodes; (5) the stretto; and (6) the pedal point. There are three kinds of fugue, the simple, containing one subject; the double, consisting of two subjects, occasionally intermingled and moving together, and the counter fugue, in which the subjects move in a direction contrary to each other. In all fugues the parts *fly*, as it were, after each other, whence the name. The great masters of fugal form are Johann Sebastian Bach and Handel.

FUHCHOW. See FOOCHOW.

FÜHRICH, Joseph von, Austrian painter and engraver: b. Kratzau, Bohemia, 9 Feb. 1800; d. Vienna, 12 March 1876. He studied at Prague under Bergler and in 1824 designed plates for Tieck's 'Genovera.' In 1827 he removed to Rome, there joined the German Nazarenes, and collaborated in the fresco work of the Villa Massimi. He returned to Prague in 1829, went to Vienna five years later, and in 1841 received the appointment of professor at the Academy there. He painted a series of frescoes in the Church of Saint John Nepomucene in 1844–46, and a large fresco in the Altlerchenfeld in 1854–61. For the latter he was ennobled and made a member of the order of the Iron Crown. His paintings include 'The Mourning Jews' (Prague); 'Christ going to the Mount of Olives'; 'Peter's Draught of Fishes'; and 'Mary's Journey over the Mountain' (in the Vienna gallery). His best engravings are series illustrating the Psalter, the Imitation of Christ, and the Prodigal Son. Consult Muther, 'History of Modern Painting' (London 1907) and Wörndle, 'Joseph Führichs Werke' (Vienna 1914).

FUJI-NO-YAMA. See FUJIYAMA.

FUJI-SAN. See FUJIYAMA.

FUJITA, foo-zhē'tä, **Sadusake** (real name, HONDA TEIKEN), Japanese mathematician: b. 1734; d. 1807. He was a native of the Province of Mushashi and attained eminence in his chosen field, being the leading Japanese mathematician of his century. He wrote the celebrated 'Seiyo Sampo' (1779), mostly devoted to algebra, and many other works.

FUJIYAMA, FUJI-NO-YAMA, or FUJI-SAN, the sacred mountain of Japan, situated in the Province of Suruga, 60 miles west of Tokio, and having an elevation of 12,395 feet. It is a volcano, having a crater 2½ miles in circumference and 500 feet in depth. The last eruption took place in November 1707–January 1708. Many pilgrims visit it annually from all parts of the empire and on its sides are numerous shrines and temples. Consult Griffis, 'The Mikado's Empire' (11th ed., 2 vols., New York 1906) and Satow and Hawes 'Handbook for Travelers in Central and Northern Japan' (Yokohama 1881).

FUKIEN, or FOKIEN, China, a maritime province of the republic, bounded north by Chekiang, west and northwest by Kiangsi, south by Kuangtung and east by Formosa Channel. It has an area of 46,300 square miles and a population of 22,000,000. The surface is broken by low mountain ranges running from southwest to northeast and having densely wooded slopes. The soil is very fertile and is under intensive cultivation. Wheat, barley, rice, tea, sugar and indigo are produced in large quantities. Timber cutting is an important industry but manufacturing is at a low ebb. Porcelain of great value is produced and has long been unexcelled in quality. Foochow and Amay are the treaty ports of the province. See CHINA.

FUKUDA, Tokuso, Japanese educator: b. Tokio, 2 Dec. 1874. He was graduated at the Higher Commercial School of Tokio in 1894, afterward went abroad and studied economics and the history of political economy at Leipzig University. Subsequently he studied at the University of Munich and also at Paris and Genoa. Upon his return home in 1901 he was appointed professor at the Higher Commercial School, in 1906 he removed to the University of Tokio and subsequently was appointed professor at Keio University. He has published 'National Economy' and 'Labor and Economy.'

FUKUI, Japan, capital of the province of Echizen, on the Ashiwa River, five miles from its mouth. It is well built and is noted for its cleanliness. It has a long and honorable history and is a great Buddhist centre. There are also many Christian missions. The city manufactures annually about $10,000,000 worth of a white silk known as habutai. There are many smaller places of this name throughout the empire. Consult Griffin, 'The Japanese Nation in Evolution' (New York 1911). Pop. 53,000.

FUKUOKA, Japan, a prefectural town, 150 miles from Kokura, on the northern coast of Kiushiu. It contains an ancient castle, a public garden and has many splendid streets. There is also a permanent garrison stationed at the castle. Pop. 97,303.

FUKUSHIMA, Japan, town in the province of Iwashiro, 170 miles from Tokio and 50 from Sendai. It is the seat of a prefect and has a large trade in cocoons and raw silk. Pop. 33,500.

FUKUYAMA, Japan, seaport situated at the southern end of the Island of Yezo, 60 miles from Hakodate. Before the abolition of feudalism it was of great commercial importance, being the main outlet for the products of the entire island. In modern times Hakodate has usurped its place in the commercial world. The city has numerous temples and many remains of its former splendor. Pop. 15,000.

FUKUZAWA, Yukichi, foo-koo-zah-wah you-keé-chi, Japanese educator and author: b. Buzen, 1834; d. 1901. In the last generation, he was the intellectual father of one-half of the young men in civil government service in Japan, and the teacher of a large number of those who to-day direct the affairs of the empire. He mastered early the Dutch language and later the English. After traveling with the Japanese Embassy in America in 1860, on his return he refused all offers of honor or emolument under the government and devoted himself to education, authorship and journalism in championship of western civilization, especially in its American form. His books, 50 or more, treating of what were then novel themes, reached a sale of 4,000,000 copies. He founded the Keio University which has continued in wholesome rivalry with the Imperial University. No other individual did so much by pen and voice to mold the mind of the nation in favor of Occidental civilization. His two sons were educated at Yale University. Consult Chamberlain, 'Things Japanese' (1890); Morris, 'Makers of Japan' (1906).

FULAH, a Hamite-Negro people dwelling on the upper Senegal and from Senegambia to Darfur. They resemble the Berber peoples of North Africa, are negroid in speech and frizzled hair. Their color is light brown or copper and they are of good stature. They are divided into four great branches: The *Baa*, the *Jel*, the *Beri* and the *So*, these in turn are subdivided into many tribes. Consult Meyer, Hans, 'Das deutsche Kolonialreich' (Vol. I, Leipzig 1909).

FULBERT, French bishop and writer: b. about 960; d. 1028. At the Rheims school conducted by Gerbert, Fulbert was a charity student. Later he became connected with the diocese of Chartres. He became a teacher at Chartres and under his direction the academy there became renowned as a seat of learning. He was made bishop of Chartres in 1006, rebuilt the cathedral during his episcopate and took an active part in the political world of his day. He wrote letters, hymns and discourses; the first-named are useful as a history of his period. His literary remains are to be found in Migne, 'Patrologia Latina' (Vol. CXLI). Consult Pfister, 'De Fulberti Carnotensis Episcopi Vita et Operibus' (Nancy 1886).

FULDA, fol'da, **Ludwig,** German dramatist: b. Frankfort, 15 July 1862, of Jewish ancestry. After finishing the schools of his native city, he attended several German universities, finally taking the degree Doctor of Philosophy, from the University of Heidelberg in 1883. He had devoted himself largely to German literature and presented a thesis on Christian Weise, a German dramatist of the 17th century. From 1884 to 1888 he lived in Munich where he came in touch with Paul Heyse to whom he is indebted for help in striving for grace of form and perfection of finish. Since 1888 he has lived in Berlin. Here he came under the influence of the naturalistic movement. This affected him only temporarily, however, as he was not of a serious turn of mind and soon he gave most of his time to satire and light comedy. In 1906 and in 1913–14 he made lecture tours in the United States. Upon returning home from his first trip he published a volume entitled 'Amerikanische Eindrücke' which records in a rather easy superficial manner his impressions of America.

After beginning his literary career Fulda produced a succession of plays, most of which gained a fair degree of popularity upon the stage. He understands dramatic technique and his plays as a rule act well. They are bright, witty and sparkling in dialogue, though they lack originality and are not profound. They are amusing, but have no seriousness of purpose. It has been argued that his plays belong to the history of the theatre rather than to the history of literature. His dramas may be divided into three classes: Comedies, serious social plays and allegorical and symbolistic dramas. Examples under the first head are 'Unter vier Augen' (1886), and 'Der Dummkopf' (1907) which is perhaps his best stage play. Of his serious social plays 'Das Verlorene Paradies' (1890), 'Die Sklavin' (1891) and 'Maskerade' (1905) are the most important. Of his symbolistic dramas 'Der Talisman' (1893) and 'Der Sohn des Kalifen' (1896) are best known. The latter is by some considered his best play. But Fulda's enduring fame will probably rest upon his translations from the French of Molière, Beaumarchais and Rostand (Cyrano de Bergerac 1898). In recognition of the superior character of this work the French government bestowed on him the Legion of Honor in 1907. (See LOST PARADISE, THE). Consult Meyer, R. M., 'Die deutsche Literatur des Neunzehnten Jahrhunderts.'

WILLIAM F. HAUHART,
Assistant Professor of German, University of Michigan.

FULDA, Prussia, the capital of a district in the province of Hesse-Nassau, on the river Fulda, 70 miles northeast of Frankfort. Its cathedral is a replica on a lesser scale of Saint Peter's, Rome, and contains the remains of Saint Boniface. It contains also the 9th century church of Saint Michael, the old episcopal palace, a Benedictine convent, and large barracks, a Catholic gymnasium, with a library of 40,000 volumes, a teacher's training school and a school of military music. It has a large cattle market and manufactures textiles, leather, metal goods, agricultural implements, chemicals, soap, vinegar, etc. It was once the seat of a university and was ceded to Prussia in 1866. Pop. 22,500.

FULDA, Abbey of. A Benedictine abbey in Prussia, which is also the seat of a bishopric. The abbey was founded in 744 under the direction of Saint Boniface, who made it an episcopal see as a part of his plan for evangelizing Germany. The rule of the community was modeled on that of Monte Cassino, and absolute autonomy was secured to it by Pope Zachary in 751. The authenticity of the document granting this privilege has been questioned, but it is now generally accepted as genuine. The monks at Fulda devoted themselves particularly to the development of agriculture, and established many smaller monasteries in Thuringia, Saxony, Hesse, Bavaria, Lorraine, Swabia and other parts of Germany, these subordinate houses becoming centres of thriving agricultural communities. Art and literature were also assiduously cultivated at Fulda. A splendid church, erected in the 9th century on the site of the original structure, was famous throughout Europe, and exercised for centuries an influence on ecclesiastical architecture. The monastic school, established by Saint Sturmius, the first abbot, began to flourish during the time of Charlemagne, and became celebrated throughout Europe. Abbot Rabanus Maurus (822–42) assembled a great library, which was further enriched during the following centuries by the labors of the monks. By the end of the 10th century the abbey had achieved a very important position in the German Empire. From 968 the abbot was primate of all the Benedictine abbeys in Germany and Gaul, and from the 12th century, he was a prince of the empire. The abbey grew so rich in lands, tithes and other sources of revenue that the monastic discipline was much relaxed. The importance of the school declined perceptibly. At a comparatively early date the teachings of the Reformation affected the chapter, but late in the 16th century discipline was re-established and the Catholic faith restored. The foundation of a Jesuit college there in 1571 revived the scholastic spirit, which had almost ceased to exist. In 1584 a papal seminary was established and also placed under the direction of the Jesuits. During the Thirty Years' War the abbey suffered, but afterward it enjoyed a period of peace and prosperity, and in 1732 the Jesuit and the Benedictine schools were united and converted into a university. In 1802 the abbey, which then embraced a territory of about 40 square miles, with a population of 100,000, was secularized. In 1809, under Napoleon it was ceded to the Grand Duchy of Frankfort; in 1815 to Hesse-Cassel, with which it passed in 1866 to Prussia. The university was closed under the law of secularization, and the papal seminary was converted into an episcopal seminary.

THOMAS GAFFNEY TAAFFE.

FULFORD, Francis, Canadian bishop: b. Sidmouth, England, 30 June 1803; d. 9 Sept. 1868. He was a graduate of Exeter College, Oxford; was ordained to the priesthood in 1826; consecrated first Anglican bishop of Montreal, 25 July 1850 and elected metropolitan 1860.

FULGENTIUS, Fabius Planciades, African grammarian: b. about 480; d. about 550 A.D. Of his life we know nothing beyond what may be gleaned from internal evidence. He wrote 'Liber de Ficticiis Poetarum'; 'Liber Physiologus'; 'Mythologicon Libri III'; 'Expositio Vergilianæ Continentiæ'; 'Absque Literis, de Ætatibus Mundi' and 'Expositio Sermonum Antiquorum.' Consult the Teubner text 'Fulgentii Opera' (1898) and Zink, 'Der Mytholog Fulgentius' (Würzburg 1867).

FULGENTIUS, Saint, Bishop of Ruspe: b. Telepte, North Africa, 468; d. 533. He was of senatorial rank by birth, was well educated and became procurator of the province. The wars and troubles of the period caused him to seek refuge in a monastery near Telepte. Being persecuted by the Arian rulers, the monks were driven out and Fulgentius went to Rome in the year 500. He returned to Africa, founded a monastery and in 508 became bishop of Ruspe.

Two years later he was banished and again in 515. He suffered other indignities at the hands of the vandal king Thrasimund. On the latter's death in 523 Fulgentius returned to his see and spent his remaining years in peace. He was a rigorous ascetic and a champion of monasticism. He is honored on 1 January in the Catholic Church. Consult Migne, 'Patrologia Latina' (Vols. LXV and LXVII); Bordenhewer, 'Patrology' (Saint Louis 1908); and Mally, 'Das Leben des heiligen Fulgentius' (Vienna 1885).

FULGURITE. On mountain summits, it has been noticed occasionally that the surface of the rock shows in places a glassy film, and that fine depressions may be present, or small droplets of vitrified rock. It has been reasonably inferred that these are due to the fusion of the rock materials by lightning. On sand hills in many places curious natural tubes have been found projecting above the surface, and these, when examined under the microscope, are found to consist of a thin film of glass enclosing sand grains. They descend through the sand to depths of several feet, often branching in their course. These also are the product of lightning and are also known as fulgurites.

FULHAM, England, a metropolitan and parliamentary borough of London, six miles south of Saint Paul's opposite Putney. Area, 1,703 acres. It contains the residental districts of West Kensington and Walham Green. Here is the palace or manor house of the bishop of London, surrounded by a moat. The oldest part of the building dates from the beginning of the 16th century. The parish church of Saint Ann's contains some fine monuments preserved from the older building. The Queen's Club grounds are celebrated for their athletic meetings. The borough returns one member to Parliament. Pop. 153,284. Consult Feret, 'Fulham, Old and New' (1900).

FULKE, William, English Puritan: b. London 1538; d. 1589. He was educated at the University of Cambridge, began his studies for the bar, but soon abandoned this field for that of theology. In 1564 he was made a Fellow of Saint John's College and five years later rector of Warley and Dennington. In 1578 he became master of Pembroke Hall. He was an ardent Puritan of the extremist type and took an ungodly delight in the religious squabbles of his time. He wrote 'Defense of the Sincere and True Translation of the Holie Scriptures into the English Tong against the Cavils of Gregory Martin' (1583); 'Stapleton's Fortress Overthrown' (1580); 'Rejoinder to Marshall's Reply against the Answer of Martin Calfhill' (1580); 'Discovery of the Dangerous Rock of the Popish Church' (1582). An edition of these works appeared at Cambridge (1843–48).

FULLAM, William Freeland, American naval officer: b. Monroe County, N. Y., 20 Oct. 1855. In 1877 he was graduated at the United States Naval Academy at the head of his class; attained the rank of commander in 1905, and that of captain in 1909. In 1883–1904 he was engaged as instructor at the Naval Academy, in various departments, and lastly as chief of the department of ordnance. In the Spanish-American War he served on the *New Orleans*. In 1907–09 he was commandant of the training station at Newport, R. I., and commanded the *Mississippi* in 1910. Two years later he had charge of naval training on the Great Lakes, and in 1914 became superintendent of the United States Naval Academy. In 1915 he became commander of the Pacific Reserve fleet. He published 'Handbook of Infantry and Artillery, United States Navy' (1899); 'Textbook of Ordnance and Gunnery' (new ed., 1905); and 'The Recruits' Handy Book.'

FULLER, Andrew, an English Baptist clergyman and theologian: b. Wicken, Cambridgeshire, 6 Feb. 1754; d. Kettering, 7 May 1815. He was largely self-educated. He began preaching in 1774 and the next year became pastor at Soham. In 1782 he removed to Kettering where he labored for the rest of his life. Out of his «Monthly Concert,» a meeting for prayer for the conversion of the world, came the Baptist Missionary Society which sent forth William Carey. Mr. Fuller was secretary of the Society from its beginning until his death. He was the author of several theological works. The principal ones are 'The Catholic and Socinian Systems Compared' (1793); 'The Gospel: Its Own Witness' (1800); 'Strictures on Sandemanianism' (1809); 'Letters on Communion' (1815). His works were published in 5 vols., London 1831, and a more complete edition in 3 vols., Philadelphia.

FULLER, Arthur Buckminster, American Unitarian clergyman: b. Cambridgeport, Mass., 1822; d. at the battle of Fredericksburg, Va., 13 Dec. 1862. He was graduated from Harvard in 1843, studied in the Harvard Divinity School, and held pastorates in Manchester, N. H., and Boston and Watertown, Mass. In the Civil War he was chaplain to a Massachusetts regiment. He edited several works of his sister, Sarah Margaret Fuller (q.v.). Consult Fuller, R. F., 'Chaplain Fuller' (Boston 1863) and Higginson (in 'Harvard Memorial Biographies,' Vol. I, Cambridge, Mass., 1866).

FULLER, George, American artist: b. Deerfield, Mass., 1822; d. Brookline, Mass., 21 March 1884. He went to Illinois in 1836, and, having developed a taste for painting, studied in 1842 under Henry Kirke Brown, at Albany, N. Y. After working in Boston for a few years, he went to New York, where in 1857 his portrait of his former teacher, Mr. Brown, the first of his works to attract notice, gained him an election as associate of the National Academy. He spent eight months in European study and travel in 1859 and then retired to his farm at Deerfield, using his art only for recreation, till financial reverses in 1873 forced him to take it up again as a profession. About 1876 his pictures began to be noticed for their peculiar handling, richness of tone and a dreaminess of conception which, when admired at all, was admired very thoroughly. A memorial exhibition of his works was held at the Boston Museum of the Fine Arts in 1884. His contributions to the National Academy exhibitions include 'The Turkey-Pasture, Kentucky' (1878); 'The Dandelion Girl'; 'The Romany Girl' (1879); 'The Quadroon' (1880). To the exhibitions of the Society of American Artists he sent 'Priscilla Fauntleroy' (1882); 'Nydia' (1883). Other works of his are 'Cupid' (1854); 'Negro Nurse, with a Child' (1861); 'At the Bars' (1865); Shearing the Donkey' (1879); 'And She was a Witch'

(1879); 'The Gatherer of Simples' (1880); 'Winifred Dysart' (1881); 'Psyche' (1882); 'November' (1884); 'Fedalma' (1884); 'Arethusa' (1884) and numerous portraits. He left an unfinished picture representing a trial for witchcraft in the early days of New England. Consult Isham, 'History of American Painting' (New York 1905) and the biography by Millet (Boston 1886).

FULLER, Henry Blake, American author: b. Chicago, Ill., 9 Jan. 1857. He entered literature with 'The Chevalier of Pensieri-Vani' (1891), and 'The Châtelaine of La Trinité' (1892). He next wrote 'The Cliff-Dwellers' (1893), and 'With the Procession' (1895), novels of Chicago life; 'The Puppet-Booth' (1896), dramatic sketches; 'From the Other Side' (1898), short stories; 'The Last Refuge' (1900); 'Under the Skylights' (1901); 'Waldo Trench and Others' (1908).

FULLER, Lucia Fairchild, American artist: b. Boston, 6 Dec. 1872. She was educated at Shaw's Private School, the Cowles Art School under Dennis M. Bunker, and at the Art Students' League, New York, under William M. Chase and H. Siddons Mowbray. Since 1889 she has been engaged professionally as a painter, chiefly of miniatures. She was married in 1893 to Henry Brown Fuller. She was awarded a bronze medal at the Paris Exposition of 1900, a silver medal at Buffalo in 1901 and a gold medal at the Saint Louis Exposition of 1904. In 1906 she became associate of the National Academy and in 1913 was president of the Society of Miniature Painters. She is also a member of the New York Water Color Club.

FULLER, Melville Weston, eminent American jurist and one of the chief justices of the Supreme Court of the United States. He was borne in Augusta, Me., 11 Feb. 1833; d. Sorrento, Me., 4 July 1910. He was graduated at Bowdoin College (A.M.) in 1853, and attended a course of lectures at the Harvard Law School (LL.D.), and was admitted to the bar in his native city in 1855. He began the practice of law, meanwhile becoming the associate editor of the *Age,* a Democratic newspaper. In 1856 he was elected city attorney and president of the common council. He resigned these offices and removed to Chicago, where he established an extensive law practice.

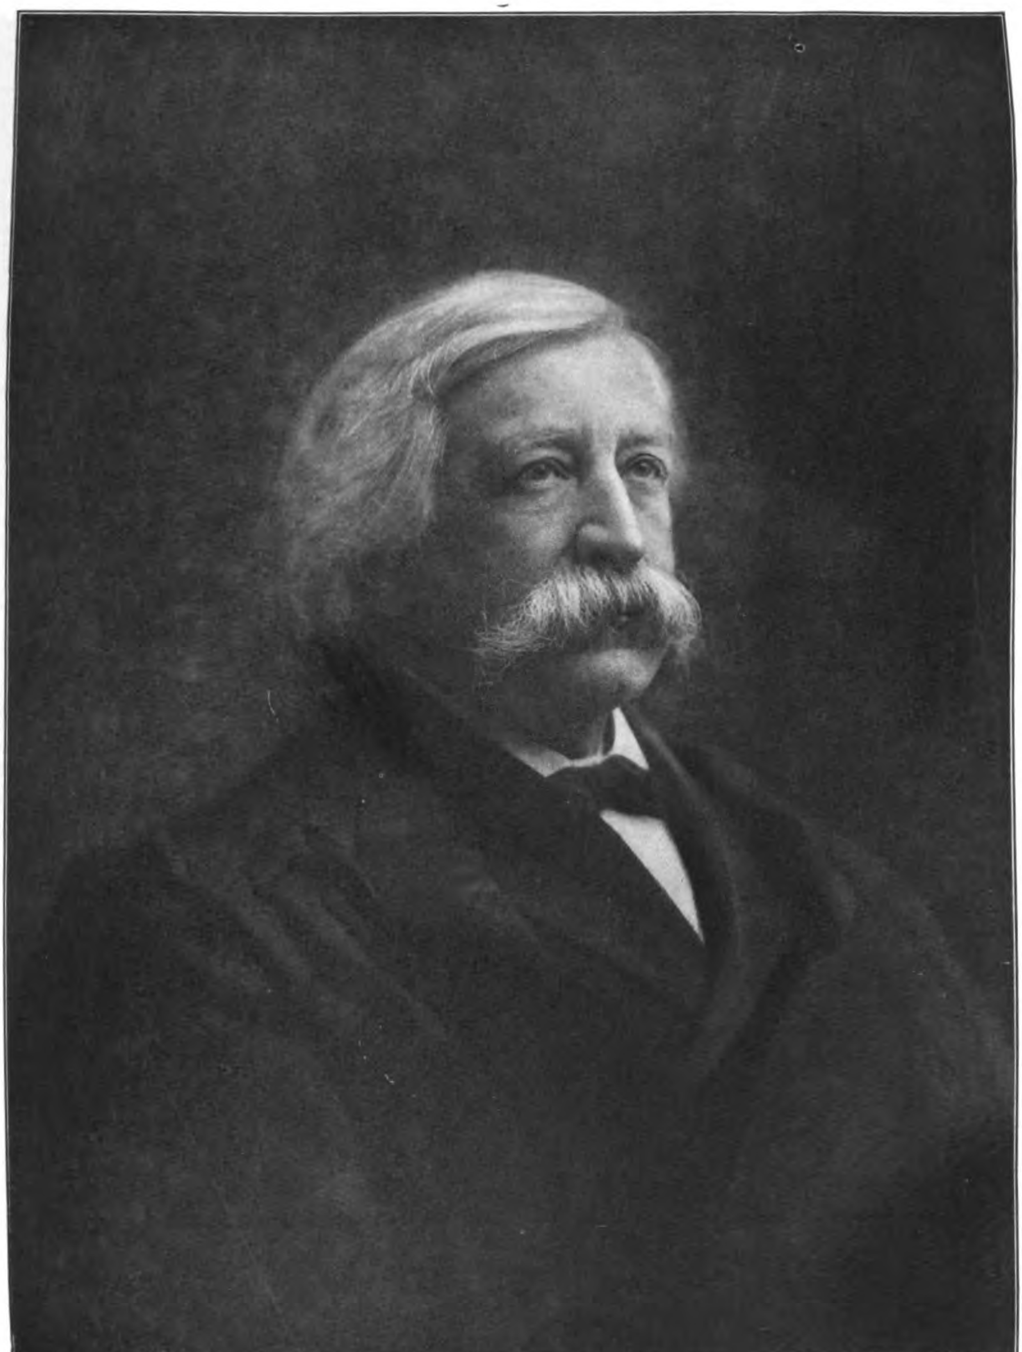
In 1862 he became a member of the Illinois State Constitutional Convention, and in the following year was elected from Cook County to the lower house of the State legislature. He rose rapidly in State and national politics, and from 1864 to 1880 was regularly a delegate from Illinois to the Democratic national conventions. In 1876 he placed Thomas A. Hendricks in nomination and was himself seriously considered as a candidate for presidential nomination in 1880. The same year he practically retired from politics, but gained additional fame as a lawyer during the next few years. In the famous lake-front case in Chicago he was counsel for the municipality, and in the Cheney ecclesiastical case, he defended Rev. C. E. Cheney, a Protestant Episcopal clergyman, rector of Christ Church, Chicago, against an action brought by an ecclesiastic council.

In April 1888 President Cleveland appointed him chief justice of the United States Supreme Court to succeed R. M. Waite (q.v.), deceased. He was confirmed 20 July 1888, taking the oath of office 8 October. About this time Bowdoin, Harvard College and the Northwestern University conferred degrees upon him. In the Supreme Court he soon became a prominent figure, and he was largely responsible for the expansion of Federal power, by means of the decision asserting the implied authority of the executive to protect the Federal judge on occasion when there is just reason to believe that, while in the exercise of official duties, he is exposed to personal danger. This was especially applicable to the case of one Nagle, an Arizona cowboy, who was made a United States marshal to protect the person of Chief Justice Field, and who while performing this duty shot and killed Judge Terry, of California. In December 1889, he delivered before the two Houses of Congress an address commemorating the inauguration of President Washington.

In 1899 Justice Fuller was a member of the Arbitration Commission convened at Paris for the adjustment of the Venezuela boundary question. In 1904–05 he was chosen by Great Britain as arbitrator at The Hague in the case of the French flag at Muscat. Consult an article by Reeder in *University of Pennsylvania Law Review* (October 1910), for a summary of his work in the Supreme Court.

FULLER, Richard, American Baptist clergyman: b. Beaufort, S. C., 22 April 1804; d. Baltimore, Md., 20 Oct. 1876. In 1820 he entered Harvard University, but was obliged, on account of feeble health, to leave during his junior year. He then studied law in Beaufort, was admitted to the bar and soon rose to eminence in his profession. During a period of great religious interest in Beaufort he felt it his duty to abandon the law and devote himself to the Christian ministry. At the same time he was constrained to leave the Protestant Episcopal Church in which he had been brought up. He was at once ordained, and called to the pastorate of the Baptist church at Beaufort. His reputation as a preacher soon became national and his services were widely sought in promoting religious revivals. During his residence in Beaufort he was engaged in two memorable controversies — one with Bishop England of Charleston, on the claims of the Roman Catholic Church, and the other with President Wayland, of Brown University on the subject of slavery. In 1836 he traveled in Europe for the benefit of his health and in 1846, became pastor of a Baptist church in Baltimore, Md., where he spent the remainder of his life. He was more than once president of the Southern Baptist convention. In addition to pamphlets and various sermons published separately, he was the author of volumes of 'Sermons' and 'Letters'; 'Argument on Baptist and Close Communion' (1849); 'Psalmist.' Consult the memoir by his nephew, James H. Cuthbert (New York 1879).

FULLER, Sarah Margaret (MARCHIONESS OSSOLI). American author: b. Cambridgeport, Mass., 23 May 1810; d. off Fire Island Beach, 16 July 1850. She derived her first teaching from her father, studied Latin at the age of six and injured her health by over-application. At 13 she was a pupil at the famous school of Dr. Park, in Boston, where she began the study



MELVILLE WESTON FULLER

of Greek. Thence she went to a school at Groton. On the sudden death of her father, she vowed that she would do her whole duty toward her brothers and sisters, and she faithfully kept the vow, teaching school in Boston and Providence, and afterward taking private pupils. During the transcendental period she knew intimately the leading minds of the time — Emerson, Hawthorne, Ripley, Channing, Clarke, Hedge — and in the company of such was very brilliant, meeting them as equals. She first met Emerson in 1835, and the next year visited him at Concord. She went occasionally to Brook Farm, though never fully believing in the success of that experiment, and never living there. She held conversations in Boston, conducted the *Dial,* translated from the German, projected works and wrote 'A Summer on the Lakes,' the record of a season spent in travel in 1843. In December 1844 she went to New York as literary critic of the *Tribune,* then under the management of Horace Greeley. While in New York she visited the prisons, penitentiaries, asylums, theatres, opera-houses, and lecture-rooms, writing about everything in the *Tribune* and doing much to move the level of thought on philanthropic, literary and artistic matters. She pursued this task unremittingly for about 20 months, after which, having saved a little money, she went to Europe in 1846. There she met the foremost people in the literary, social, political and reformatory world, spent the summer and autumn in travel, established herself for a time at Rome early in 1847, visited Switzerland and northern Italy and returned to Rome in the autumn. In December 1847 she was married to Giovanni Angelo, Marquis Ossoli, and entered with zeal into the Italian struggle for independence in 1849. Her conduct during the siege of the city by the French was of the most heroic, disinterested, humane and tender kind. She was a friend of Massini. On the capture of Rome in June 1849, she and her husband took refuge in Rieti, in the mountains of the Abruzzi, and after some months removed to Florence, which they later left for Leghorn, whence passage for America was taken on the *Elizabeth* that sailed 17 May 1850. The voyage ended in disaster; the vessel being driven ashore off Fire Island on 16 July 1850. The body of the child was borne ashore lifeless and neither father nor mother was heard of more. She wrote a good deal for magazines during her active literary period. Her collected works was edited by her brother, Rev. Arthur B. Fuller (Boston 1855). There are lives by Emerson, Clarke and Channing. There is also a memoir by Julia Ward Howe (in the 'Eminent Women Series,' Boston 1883) and one by Thomas W. Higginson (in 'American Men of Letters Series,' ib. 1884). Consult also Braun, F. A., 'Margaret Fuller and Goethe' (New York 1910); Dall, Mrs. C. H., (ed.) 'Margaret and Her Friends' (Boston 1895); Goddard, H. C., 'Studies in New England Transcendentalism' (New York 1908); Macphail, A., 'Essays in Puritanism' (Boston 1905).

FULLER, Thomas, Anglican churchman and historian: b. Aldwinkle, Northamptonshire, June 1608; d. London, 16 Aug. 1661. He was graduated from Queen's College, Cambridge. In 1630 took orders and was appointed perpetual curate of Saint Benet's parish, Cambridge, and became very popular as a preacher. In 1631 he became prebend in the cathedral of Salisbury. The same year he published a poem entitled 'David's hainous Sin, heartie Repentance, and heavie Punishment.' He gave up his Cambridge curacy in 1633, and next year became rector of Broadwindsor, Dorsetshire. His 'History of the Holy Warre' appeared 1639, soon after the publication of which he removed to London and was chosen lecturer at the Savoy church in the Strand. In 1642 he published his 'Holy and Profane State' (folio). In 1650 he published 'Pisgah Sight of Palestine and the Confines thereof, with the History of the Old and New Testament acted thereon' (folio), and in 1650 appeared his 'Abel Redivivus' consisting of lives of religious reformers, martyrs, divines, etc. In 1655 he published the 'Church History of Britain, from the Birth of Jesus Christ to the Year 1648'; to which was subjoined the 'History of the University of Cambridge since the Conquest,' and the 'History of Waltham Abbey.' The year after his death was published his principal literary work, the 'Worthies of England'— a production valuable alike for the solid information it affords relative to the provincial history of the country and for the profusion of biographical anecdote and acute observation on men and manners. Consult 'Life' by Bailey (1874).

FULLER, Thomas, Canadian architect: b. Bath, England, 1823; d. 1899. He studied at Bath and London; went to the West Indies, where he erected a cathedral at Antigua. In 1857 he went to Toronto, established his practice there and two years later, with his partner, Chilion Jones, was awarded first prize for designs for the Parliament buildings to be erected at Ottawa. He removed to Ottawa and remained there until 1867, in which year he entered the competition for the New York State Capitol at Albany, N. Y. His design was one of three to which were awarded equal premiums. In the second competition, with Laver, his design was adopted, and the capitol built from it. The same architects were also successful at this time in their design for a city hall and court buildings at San Francisco. Fuller resided in Albany until 1881, when he returned to Ottawa and was appointed chief architect of the Department of Public Works. He retired in 1897.

FULLER-MAITLAND, John Alexander, English musical critic: b. 1856. He graduated from Trinity College, Cambridge, in 1879, and in 1889 became musical critic of the London *Times.* He contributed to Grove's 'Dictionary of Music and Musicians,' the appendix to which he edited; translated (with C. Bell 1884) Spetta's 'Johann Sebastian Bach,' wrote a standard 'Life of Robert Schumann' (1884); 'Masters of German Music' (1894); 'The Musician's Pilgrimage' (1899); 'English Music in the Nineteenth Century'; and has in progress a new edition of 'Grove's Dictionary of Music.'

FULLERS' EARTH, a substance of indefinite composition, consisting essentially of clay, mixed with sufficient finely divided silicious matter to destroy its plasticity. Fuller's earth has a specific gravity varying from

1.8 to 2.5, and also varies in color. It is of very fine grain and received its name from the fact that for centuries its sole use was in cleansing («fulling») grease and oil from cloth and wool. In modern times its field of usefulness has been greatly extended. It is now an important agent in oil-refining, especially cottonseed and lubricating oils. The muddy oil is filtered through the earth and emerges clear. England was long the only large source of supply, the Cretaceous beds there furnishing great quantities. Cimolite, found in Greece is a variety of fuller's earth and has been used in similar fashion from the earliest times.

With the constantly rising prices for imported fullers' earth — due to the scarcity of ocean tonnage from 1914 on — the domestic production increased to the largest figure on record, reaching 67,822 short tons in 1916. The value of this output amounted to $706,951, an average of $10.42 per ton. The imports for the year amounted to only 16,801 short tons, of a value of $139,664, an average of $8.31 per ton. The relative ton price is informing as to the superior quality of the domestic product. Fully 80 per cent of the domestic product comes from the State of Florida. The other producing States are Georgia, Texas, California, Massachusetts and Arkansas. Large deposits have been located in Texas and California, but only one mine in each State was active commercially in 1916. The domestic product is nearly all used for clarifying and filtering fats, greases and oils, on which the earth exerts a bleaching effect. Only the imported earth is used for fulling cloth. (See MINERAL PRODUCTION OF THE UNITED STATES). Consult Ries, 'Clays, Occurence, Properties and Uses' (New York 1910) and Parsons, 'Bureau of Mines, Bulletin 71' (1913).

FULLERTON, George Stuart, American professor of philosophy: b. Fathegarh, India, 18 Aug. 1859. He was graduated from the University of Pennsylvania and in 1887 he was appointed professor of philosophy in the same institution. He was dean 1894–96, and vice-president 1894–98. Since 1904 he has been professor of philosophy in Columbia University. In 1913–14 he served as first American exchange professor to Vienna and other Austrian universities. In 1914 Emperor Francis Joseph appointed him honorary professor in the University of Vienna. He is the author of 'Preliminary Report of Seybert Commission on Spiritualism (1887); 'The Conception of the Infinite' (1887); 'A Plain Argument for God' (1889); 'The Philosophy of Spinoza' (1894); 'On Spinozistic Immortality' (1899); 'A System of Metaphysics' (1904); 'An Introduction to Philosophy' (1906); 'The World we Live In' (1912); 'The American Universities' (published in German 1914); 'Germany of To-day' (1915).

FULLERTON, Lady Georgiana Charlotte Gower, English novelist: b. Tixall Hall, Staffordshire, England, 23 Sept. 1812; d. Bournemouth, Hampshire, 19 Jan. 1885. She was married to Alexander George Fullerton in 1833 and followed him into the Roman Catholic Church in 1846. Her first novel, 'Ellen Middleton' (1884), was followed by 'Grantley Manor' (1847). Her later stories, after her conversion to the Catholic faith, are in a mild way «stories with a purpose,» the purpose being to develop the influence of religious belief on life and character; among them are 'Lady Bird' (1852); 'Too Strange Not to be True' (1864); 'Mrs. Gerald's Niece' (1869); 'A Will and a Way' (1881). She wrote also 'The Gold-Digger, and Other Verses' (1872). Consult Craven, 'Life of Lady Georgiana Fullerton,' translated from the French by H. J. Coleridge (1888).

FULLING, the act of cleansing, scouring and pressing woven woolen goods, etc., to render them stronger, firmer and closer; called also milling, because these cloths are usually scoured by a water-mill. The principal parts of a fulling-mill are the wheel, with its trundle, which gives motion to the tree or spindle, whose teeth communicate that motion to the pestles or stampers, which fall into troughs, wherein the cloth is put, with fullers' earth, to be scoured and thickened by this process of beating it. The operation takes from 48 to 65 hours, and results usually in considerable shrinkage in length and width; it obviates the tendency to unravel and renders the threads of the cloth so firm and close as to be almost imperceptible.

FULMAR, fŭl'mạr, a name applied to several species of petrels, of which the most common is the Arctic petrel (*Fulmarus glacialis*). This bird breeds on rocky coasts of the north Atlantic in enormous colonies, and goes southward in winter, some individuals as far south as New Jersey. It is about the size of a large duck. The head and neck are pure white; the back and long wings of a bluish or smoky gray; breast, belly and under surface white; bill large, strong and yellow or brownish; legs and toes brownish. The young are brownish gray. In the Hebrides, and especially in Saint Kilda, where these birds reside in incredible numbers, they are of great value to the people, not only for their eggs but also as a source of oil. The birds, when seized, vomit a quantity of clear amber-colored oil of a disagreeable odor which is one of the most valuable products of Saint Kilda. The old birds feed the very young with it. The fulmars breed on the faces of the highest precipices, on which every grassy shelf over a few inches in extent is covered with their nests, which are slightly excavated in the turf and lined with dry grass and withered tufts of sea-pink. One egg is deposited at a time, which the cliffmen obtain by descending with ropes from the summit of the cliffs. The fulmar feeds on animal substances, preferably fat. It flies buoyantly and swiftly, and withstands heavy gales, skimming the surface of the water. When a whale is caught, though few of the fulmars should be present, they assemble in thousands as soon as the cutting up is commenced; hence the whalers call them «whale-birds» or «mollymauks.» They follow in the greasy track of a whaling ship, coming within a few yards of the men engaged in cutting, and devour the morsels of fat voraciously and in great quantity, becoming quite tame. Other petrels which are classed as fulmars are the Giant Fulmar (*Ossifraga gigantea*), or «Cape Hen,» a bird 30 to 36 inches in length, and with a wing-spread of six to seven feet, common in the Indian and Antarctic oceans. This bird is exceedingly gluttonous, gorging itself until it can scarcely walk. Its favorite feast is carrion, and it has the filthy habit of vomiting its partly digested food when pursued. Rodgers' Fulmar (*Fulmar Rodgersii*) inhabits Bering Sea and adjacent waters as far south as the Bay of Monterey, California. The Pacific Fulmar (*F. g. glupischa*), is found along the north Pacific Coast as far south as Mexico. It is fearless of man, often disputing the catch with fishermen, and is easily captured.

FULMINATES, fŭl'mĭ-nāts, compounds of fulminic acid (C:NOH), all of which are violently explosive. The most important of these is mercuric fulminate, which is formed by dissolving 10 parts by weight of mercury in 120 parts of nitric acid of the specific gravity 1.34 and, when cooled, pouring this solution into 110 parts of 95 per cent grain alcohol. At the normal temperature a reaction sets in which becomes quite turbulent, dense white fumes being given off and then red fumes, and after this the mercuric fulminate separates out as a gray, crystalline powder. It has the formula of $HgO_2N_2C_2$, and belongs to the class of chemical substances known as oximes. Its specific gravity is 4.42. When moist it may be handled without danger, but when dry, mercuric fulminate explodes violently if struck or compressed or rubbed between hard surfaces; when heated to 367° F.; when touched with strong sulphuric or nitric acids; or when in contact with sparks from flint and steel or electric sparks. In all these cases the body undergoes a detonating explosion; and its principal use is to produce detonation in high explosives, though it is used also in percussion caps and primers to ignite gunpowder and other low explosives. Mercuric fulminate should be stored and transported only in the moist condition, yet even in this condition it can be exploded by the explosion of dry fulminate in contact with it. Certain amines like fulminating silver, gold, mercury and copper are frequently confounded with the fulminates because they also are explosive. The best known of these is Berthollet's fulminating silver, which was used in the bomb which killed Tzar Alexander II. This substance is produced only by the energetic oxidation of alcohol by nitric acid, in the presence of silver nitrate, the operation being performed in capacious vessels. It separates out as a black, crystalline mass, which explodes on the slightest concussion when dry and may even be exploded by rubbing between hard substances when moist, so that it requires the greatest caution in handling. It has been repeatedly formed accidentally in the ammoniacal silver solutions used in silvering mirrors and in the silver baths used in the wet processes of photography and has given rise to serious explosions. See EXPLOSIVES.

FULMINATION, a term used in chemistry to denote the violent decomposition of a substance, usually by heat or percussion, and accompanied by a flash of flame and a loud report, and differs therefore but little from detonation; except that the latter refers more to the sound, and the former to the flash. See DETONATION; EXPLOSIVES; FULMINATES.

FULMINIC ACID. See FULMINATES.

FULTON, Frederick John, Canadian statesman: b. Bedlington, England, 8 Dec. 1862. He received his education at Magdalene College, Cambridge, and after his arrival in Canada, began the practice of law at Victoria, B. C. He was elected to the British Columbia legislature as a Conservative in 1900 and three years later became president of the Council in the McBride Cabinet. Afterward he was successively Provincial Secretary, Minister of Education, Attorney-General and Commissioner of Lands. He was a member of the Irrigation Convention of 1907 and two years later served as chairman of the Timber and Forestry Commission. He did much for legislation on irrigation and forestry interests. He retired from public life in 1909.

FULTON, Robert, American inventor: b. Little Britain (now Fulton), Lancaster County, Pa., 1765; d. New York, 24 Feb. 1815. His father came from Kilkenny, Ireland, early in the 18th century, and settled in Little Britain. At the age of 13 Robert constructed paddle-wheels, which he applied with success to a fishing-boat. The years 1782–85 were spent in painting miniature portraits and landscapes, mechanical and architectural drawing, and whatever came in his way in the line of artistic work, at Philadelphia, where he numbered Benjamin Franklin among his friends. In 1786 Fulton went to London, and was received into the family of Benjamin West, under whose instruction he studied for several years. Afterward he practised his art in Devonshire, under the patronage of wealthy persons, among whom were the Duke of Bridgewater and Earl Stanhope. With his acquaintanceship with these persons begins his experiments in mechanics. Francis Egerton Bridgewater, last duke of that name, had become famous by the construction of a navigable canal from Worsley to Manchester, and Charles, Earl Stanhope, was the inventor of the Stanhope printing-press, and a student of mechanics and engineering. In 1793 Fulton actively engaged in a project for the improvement of canal navigation, and in the following year obtained from the British government a patent for a double-inclined plane for raising or lowering boats from one level to another on a system of small canals. In 1794 he patented a mill for sawing marble. Some time in 1796 he made plans for the construction of cast-iron aqueducts, and a great work of this kind was built for crossing the river Dee. A bridge built from his plans was erected at Wandsworth, and others at several points in Surrey. He also patented in England a machine for spinning flax, a dredging machine, a market or passage-boat, a dispatch boat, and a trader for use on canals. In 1796 he published his 'Treatise on the Improvement of Canal Navigation,' having previously published some articles on the subject in the London *Morning Star,* advocating small canals. Copies were sent by the author to the President of the United States and other officials, each accompanied by a letter emphasizing the advantages to be derived by the United States from canal navigation. In 1794 he became a member of the family of Joel Barlow, author of the 'Columbiad,' in Paris. Here he painted a panorama, the first ever shown in the French capital. In December 1797, Fulton made an experiment on the Seine with a boat for submarine navigation, to be used in torpedo warfare. In 1801 he conducted some experiments at Brest with his submarine or plunging boat, under the auspices of the French government, which, however, on Fulton's failure to blow up the British ships that sailed along the coast, became disaffected with the undertaking. At the instigation of Lord Stanhope, the government of England determined to secure Fulton's services for that country, and accordingly he went to London in May 1804, after a short sojourn in Holland. The submarine boat was finally reported by the British commission to be impracticable, but the torpedo they thought of some value, and Fulton was taken out with an expedition to try it against the French fleet at Boulogne, where the torpedoes burst harmlessly beside the French ships. An experiment in October 1805, with an improved apparatus, on a brig of 200 tons, provided for the purpose by the government, resulted in the destruction of the ship. In 1806 Fulton had returned to the United States, and renewed his experiments with torpedoes. His system was never adopted, though in 1810 Congress appropriated $5,000 for testing the torpedoes and submarine explosions. About this time Fulton invented a machine to cut the cables of ships at anchor. In 1813 he took out a patent for "Several Improvements in Maritime Warfare, and means for Injuring ships and vessels of war by Igniting Gunpowder under Water." Fulton began to turn his attention to the subject of steam navigation as early as 1793, as is shown in a letter to Lord Stanhope, written in that year. In 1803, having the financial assistance of Chancellor Livingston, Fulton launched a steamboat on the Seine, which, owing to faulty construction of the frame, immediately sank. Another boat was soon built, with the old machinery, and a trial trip was made but no great speed was attained. Encouraged with this partial success Fulton shortly afterward ordered an engine of Watt and Boulton to be sent to the United States. Early in the spring of 1807 the boat that was to navigate the Hudson and establish the system of steam navigation was completed at a ship-yard on the East River. The engine was put in later and on 11 Aug. 1807, the *Clermont* steamed up the Hudson to Albany, the voyage occupying 32 hours. During the autumn of 1807 the *Clermont* was run as a packet between New York and Albany. The success of Fulton's enterprise excited much jealousy and rivalry, and a number of persons disputed his claim to originality. Litigation and competition threatened to rob him of all profit from his invention. Fulton's first patent for improvements in navigation by steam was taken out 11 Feb. 1809, and another, with fuller provisions, on 9 Feb. 1811. Whatever may have been Fulton's honors as to the invention, he undoubtedly deserves the credit of first bringing into practical use the steamboat as a conveyance for passengers and freight, all earlier undertakings having been inefficient practically. The success of the *Clermont* was followed by the rapid multiplication of steamboats. A list of those built under Fulton's superintendence comprises the *Car of Neptune*, the *Paragon*, the *Fire-Fly*, the *Richmond*, the *Washington*, *Vesuvius*, *Olive Branch*, *Emperor of Russia*, the *Chancellor Livingston*, and many ferry-boats. He described his first ferry-boat in an article published in the *American Medical and Philosophical Register* for October 1812. In 1814, Fulton submitted to the coast and harbor defense committee plans for a steam warship to carry 44 guns, and in October of that year a boat of this description, called the *Demologos* (subsequently known as *Fulton the First*), was launched. The War of 1812 terminated before the effectiveness of the *Fulton* as a war vessel could be tested, and she afterward became a receiving ship. The last subject to which Fulton's energies were devoted was a modification of his submarine boat the *Nautilus*, but only the hull of the projected craft was completed before his death. Exposure in crossing the Hudson, after testifying in New Jersey in a steamboat case, laid the foundation of Fulton's last illness. He left a widow (daughter of Walter Livingston) and one son and three daughters. In 1909 the centennial anniversary of the *Clermont* was celebrated in conjunction with the tercentennial of the discovery of the Hudson by the navigator of that name. A replica of the *Clermont* was constructed and proceeded under its own steam up the river as its prototype had done exactly 100 years before. The literature of the steamboat controversy is extensive. The fullest list on the subject is afforded by Preble's 'History of Steam Navigation.' Fulton's published works are 'Treatise on the Improvement of Canal Navigation' (1796; French trans., 1799); 'Letters on Submarine Navigation' (1806); 'Torpedo War' (1810); 'Report on the Practicability of Navigating with Steamboats on the Southern Waters of the United States' (1813); 'Memorials of Robert Fulton and Edward P. Livingston in regard to Steamboats' (1814); 'Advantages of the Proposed Canal from Lake Erie to the Hudson River' (1814). Consult Colden, 'Life of Robert Fulton' (New York 1817); Dickinson, 'Robert Fulton, Engineer and Artist; His Life and Works' (ib. 1913); Knox, 'Fulton and Steam Navigation' (ib. 1886); Sutcliffe, 'Robert Fulton and the Clermont' (ib. 1909).

FULTON, Ill., city in Whiteside County, on the Mississippi River and Lincoln Highway, and on the Chicago, Milwaukee and Saint Paul, the Chicago, Burlington and Quincy, and the Chicago and Northwestern railroads, 36 miles northeast of Rock Island. The new high school building erected in 1914 at an expense of $40,000 and the Carnegie library are noteworthy. There are two banks, with resources aggregating over $1,000,000. The streets are paved, there is a good water system, and connection is made with Clinton, Iowa, by a high bridge over the Mississippi River. Pop. 2,174.

FULTON, Ky., city in Fulton County, 50 miles south of Paducah, on the Illinois Central. It is the seat of Tennessee College, a high school and Carr Institute and has machine shops, foundries, flouring mills, tobacco warehouses, lumber mills and harness works. The municipality owns the waterworks. Pop. 2,575.

FULTON, Mo., city and county-seat of Callaway County, on the Chicago and Alton Railroad, near the centre of the county, on Stenson Creek. Here are located the State School for the Deaf, Westminster College (Presbyterian), founded 1852; the Woods College, the Synodical College and State Hospital No. 1 for the Insane. Fulton is noted for its fire-brick and pottery works, and has a flouring mill, etc. The town was settled in 1821, and was incorporated as a city in 1859. There are three banks. The

ROBERT FULTON

value of taxable property in 1915 was $1,849,-437. The mayor and council are elected annually. The city owns and operates its electric-light and water plants. Pop. 6,000.

FULTON, N. Y., city in Oswego County, on the Oswego River and the Oswego Canal, and on the New York Central, New York, Ontario and Western and Delaware and Lackawanna railroads, 25 miles northwest of Syracuse. It has a public library, city hall, opera-house and other public buildings. It is the centre of the cheese trade of northern New York, and there are manufactures here of paper, woolen goods, flour, fire-arms, tools, water-motors, cutlery, paper-mill machinery, condensed milk, canned goods, knit goods, chocolate, infant's foods, macaroni, spark plugs, etc. The United States census of manufactures for 1914 showed within the city limits 51 industrial establishments of factory grade, employing 3,292 persons; 3,042 being wage earners receiving annually a total of $1,736,000 in wages. The capital invested aggregated $12,168,000, and the year's output was valued at $9,572,000: of this, $3,632,-000 was the value added by manufacture. Fulton was settled in 1791 and was originally incorporated as a village in 1835. The villages of Fulton and Oswego Falls, with an aggregate population of 8,206, were consolidated and chartered as a city in April 1902. A mayor and common council govern the city, being elected every two years by popular vote. The municipality owns and operates the waterworks. Pop. 11,138.

FULVIA, fŭl'vĭ-a, Roman matron: b. about 40 B.C. After being twice married she became the wife of Mark Antony. Antony divorced her to marry Cleopatra, upon which she attempted to persuade Augustus to take up arms against her husband. When this scheme did not succeed she retired into the East, where Antony received her with great coldness. This broke her heart and she soon after died.

FUMARIC ACID. See STEREOCHEMISTRY.

FUMAROLE, fū'mä-rōl, a volcanic vent, usually on the side of the main cone, from which gases issue. Due to the difficulty of approaching the main crater during an eruption, most of our information about volcanic gases is obtained from fumaroles. See VOLCANOES, and the section on *Volcanism* in the article on GEOLOGY.

FUMIGATION, an attempt at disinfection by gaseous agents. The term is also used to describe the application of the fumes of medicinal substances to the respiratory tract. Fumigation is probably, in its primary sense, a very unsatisfactory mode of bringing about disinfection. The agents that are used most effectively are chlorine gas, sulphur dioxide and formaldehyde. It has been distinctly demonstrated that chlorine gas as a disinfecting agent is untrustworthy, and that its application is attended with many disadvantages. Sulphur dioxide, in the absence of moisture, gives practically no results, and even when aqueous vapor is generated in a room previous to the use of the gas its bactericidal action is very slight. Moreover, sulphur dioxide in the presence of moisture in the air tarnishes brass and silver, gilt frames, etc., and corrodes fabrics and other stuffs. It is not a satisfactory disinfectant. Formaldehyde gas has been used since 1800 for fumigation. The vapor is extremely pungent, and it has a strong affinity for all organic substances. Its practical value as a disinfectant has been demonstrated to be above that of any other gaseous substance. It cannot, however, be said to give absolute results, and although its power of penetration is greater than in that of any of the others mentioned it is still only a surface disinfectant. The interior of a heap of clothing, for instance, if exposed to the gas, is not affected at all by it. Formaldehyde gas as a fumigant is not sufficiently strong to kill many household pests. This casts suspicion on its value as a room disinfectant. Moreover, it is very costly. In general it may be gathered that gaseous disinfection by fumigants is somewhat of a farce; and although formaldehyde gas approaches more closely the requirements of the ideal, it is far from being perfect. The best disinfectant for rooms is unquestionably sunlight. Short of this, thorough cleansing, rubbing down the walls, etc., should be carried out. As noted in the article on disinfection, it is the effort of hygienists to particularize on the type of disease agents which they desire to eradicate. The general modes of disinfection heretofore much in vogue were largely founded on a lack of knowledge of what the infecting agents have been. See BACTERICIDE; DISINFECTANTS.

FUMITORY («smoke of the earth»), a name commonly given to species of the genus *Fumaria.* It is a native European weed of delicate and beautiful appearance, which has been naturalized in America. The climbing fumitory or mountain-fringe of the United States grows well under cultivation. To the family *Fumariaceæ* belongs the genus *Corydalis,* found throughout most of the north temperate zone. Fumitory leaves have a bitter saline taste, and as a tonic and diaphoretic are used in provincial France as a blood-purifying remedy for scorbutic affections, chronic eruptions, etc.

FUNCHAL, fooṅ-shäl, Madeira, the capital and seaport of the island in the centre of a large bay on the south coast of Madeira. It is irregularly built; the streets are narrow, winding, ill-paved and dirty. An old castle, which commands the roads, stands on the top of a steep, black rock, called Loo Rock, surrounded by the sea at high water. The entire produce of the island, consisting mostly of wine and fruit, is exported from Funchal. Pop. about 19,600, among whom are many English, French, Portuguese and mulatto and negro freedmen. See MADEIRA.

FUNCK-BRENTANO, fuṅk brŏṅ-tä-nō, **Théophile,** French philosophical and critical writer: b. Luxemburg, 20 Aug. 1830; d. 1906. He became professor at the School of Political Sciences in Paris in 1873. His thorough studies in law and medicine have imparted to his philosophical writings an exactitude of thought and inspired a special stress on method, very apparent in such works of his as 'New Thoughts and Maxims' (1858); 'Exact Thought in Philosophy' (1869); 'Greek Sophists and Contemporary English Sophists' (1879); 'La civilization et ses lois' (1876); 'La politique' (1892); 'L'Homme et sa destinée' (1895); 'La science sociale, morale, politique' (1897); 'Les sophistes français' (1905), and others. As a critic he is esteemed for the happy presentation and careful elaboration of his thought.

FUNCTION. (1) *In biology,* the action proper to tissues, organs or groups of organs in plant and animal life. The function of respiration is the joint action of lungs and skin; digestion is a very compound function, to which organs and groups of organs contribute. The actions are capable of being grouped in subordination to three leading phenomena of every living thing — namely, sustentation, reproduction and relation. To the first belong digestion and all the other functions which contribute to the vegetative life; the processes of the second are, as examples of cell transformation, so far identical with those of the other two, but the results are different; the cell changes of the nervous system which regulates the relations of living things, are again identical with those of the other two sets of phenomena. Functional diseases are those due to organs perfect in structure but not performing their functions properly; as opposed to organic or structural diseases, due to defect of structure.

Organs often have more than one function — a *primary,* or that for which it is principally intended, and a *secondary,* some subsidiary purpose which it performs. It sometimes happens that important changes take place in the course of the evolution of a type, or the development of an individual, whereby the primary function disappears and some secondary use becomes pre-eminent or exclusive. Thus "a brilliant speculation," says Carpenter, "has indicated pairs of tracheal gills on the meso- and metathorax as the possible origin of insect wings. The primeval insects forsook, so it is thought, the water for the land; and the plates, becoming useless for breathing, were enlarged and finally changed into organs of flight." Another strong and familiar example is the case so often presented among crustaceans where the mouth parts are largely structures ("foot-jaws) originally ambulatory, but now entirely devoted to the seizing and mastication of food. Change of function results in change of structure. Consult Darwin, 'Origin of Species' (6th ed., London 1882); Dohrn, A., 'Der Ursprung der Wirbelthiere und das Princip des Functionwechsels' (Leipzig 1875); Marshall, A. M., 'Biological Lectures and Addresses' (London 1894); Saint George Mivart, 'Genesis of Species' (New York 1871). See also FUNCTIONALISM.

(2) *In mathematics,* one quantity is said to be a function of another, or of several others, when its value depends on those of the latter. Thus the area of a triangle is a function of its three sides, and $y=a+bx+cx^2$ is a function of a, b, c, and x. Functions receive distinctive names according to the nature of the dependence above referred to. Thus the function above written is said to be an algebraical function of x, since y is obtainable from x by the performance of a limited and definite number of algebraical operations. Log x, sin x, a^x, on the other hand, are said to be transcendental functions of x, and for obvious reasons receive the distinctive names of logarithmic, trigonometrical and exponential functions. The term function in its mathematical sense was due to Leibnitz (1692), but in its present sense was first defined by Johann Bernoulli (1718). Lagrange first used the term "theory of functions" in his 'Théorie des functions analytiques' (Paris 1797). The object of the theory is the study of functions of one or more variables, in which either the variables or the coefficients, or both, are complex numbers. Lagrange (1772, 1797, 1806) may be said to have been the real founder of this general theory but others before him — Newton, Leibnitz, Bernoulli, Clairaut (1734), D'Alembert (1747), and Euler (1753) — had already worked in its direction. Landen (1775) is usually credited with founding the theory of elliptic functions, though this theory had been suggested by Jakob Bernoulli (1691); Maclaurin (1742), and D'Alembert (1746). The real development of the theory, however, is due to Legendre, who after great labor produced his 'Traité des fonctions elliptiques et des intégrales Euleriennes' (1825–28). Abel, Jacobi and Cayley also contributed much to this theory. The present form of the general theory of functions is based largely on the works of Cauchy, Riemann and Weierstrass. For a list of the special functions consult Müller, 'Mathematische Terminologie,' in 'Bibliotheca Mathematica' (Leipzig 1901), a work in which are given about 200 functions. Brill and Noether, in 'Die Entwickelung der Theorie der algebraischen Functionen in älterer und neuerer Zeit,' in 'Jahresbericht der deutschen Mathematiker Vereingung' (Vol. II, Berlin 1894), gave a valuable history of the development of functions. Consult also Forsyth, 'Theory of Functions' (Cambridge 1893); Harkness and Morley, 'Theory of Functions' (New York 1893); and Merriman and Woodward, 'Higher Mathematics' (New York 1896), in all of which will be found the historical development, bibliography and full discussion of the theory of functions. See also articles in this encyclopedia: COMPLEX VARIABLE THEORY OF THE FUNCTIONS OF A; REAL VARIABLE, THEORY OF THE FUNCTIONS OF A; MATHEMATICS; TRIGONOMETRY; etc., to which extended bibliographies are appended.

FUNCTIONALISM (in psychology and philosophy). Functionalism is a term employed by modern writers both in philosophy and psychology. It occurs more commonly in psychological writers and it will be convenient to designate first the meaning which they assign to it. Functional psychology can be considered as dealing with three fairly distinct problems which we may discuss separately.

First: One of the fundamental problems which psychologists undertake to solve consists in the determination of the number and character of the various materials sensory, ideational, etc., which the mind employs, e.g., the varieties of color, tone, taste, etc. Their effort is directed to analyzing and describing both the elementary and the complex *contents* of consciousness. This field of endeavor is ordinarily entitled structural psychology. As contrasted with this, functional psychology undertakes to discern and portray the typical *operations* of the mind with especial reference to the *actual* life conditions under which consciousness occurs. In describing sensation, for example, it would find its sphere of interest in determining the character of the various sense activities like vision and hearing, as differing in their *modus operandi* from one another and from other mental processes such as thinking and willing.

This branch of functional psychology is found in all important psychological writers from Aristotle to the present day. It is not, however, until the present generation that any essential distinction has been recognized in this regard between structural and functional psychology. Indeed, as compared with the remaining forms of functional psychology, the distinction is relatively unimportant. It represents nevertheless a difference in emphasis which is significant. The functionalist is peculiarly resolute in his purpose to describe mental life as it is in the moment of experience. The analyses offered by the structuralist are perhaps apt to dwell too impartially upon details which may be evident to later introspective examination without having constituted noticeable features of the conscious state itself when it was in progress.

Substantially identical with this first conception of functional psychology, but phrasing itself somewhat differently, is the view which regards the functional problem as concerned with discovering *how* and *why* conscious processes are what they are. The structuralist is supposed to be occupied with the problem of determining *what* the conscious elements are and how they are combined. In general it will be seen that functionalism as thus described is roughly analogous to a physiology of mind, whereas structuralism is analogous to a mental anatomy.

Second: A broader conception of functional psychology and one more frequently characteristic of contemporary writers takes its rise from the prevailing interest in the larger formulæ of biology and particularly the evolutionary hypotheses within whose majestic sweep is nowadays included the history of the whole stellar universe. From this point of view functional psychology finds its peculiar problem in mental activity as part of a larger stream of biological forces. The psychologist of this stripe is wont to take his cue from the basal conception of the evolutionary movement, i.e., that for the most part organic life possesses its present characteristics by virtue of the efficiency with which they serve to meet the conditions laid down by the environment. With this conception before him he attempts to gain some understanding of the manner in which the psychical contributes to the furtherance of organic activities — not alone the psychical in its entirety, but much more the psychical in its particularities, mind as feeling, mind as judging, as willing, etc. He seeks to discover the exact nature of the accommodatory service represented by the various great modes of conscious expression.

Animal psychology affords a concrete example of the effort to discover these particularistic features of the adaptive service rendered by consciousness to organisms. Modern investigations in this field have thrown a flood of light upon such problems as the mechanism of instincts, the methods of animal topographical orientation, the scope and character of the several sense processes, etc. In a similar manner the studies of human genetic psychology, particularly that branch entitled child study, have contributed to our knowledge of the service rendered to the growing mind by its several different functions, such, for example, as the various sensations, the emotions, etc. Pathological psychology has also contributed in no small measure to our knowledge of the part played by particular portions of our consciousness in the development and organization of our mental life as a whole.

In this connection it is interesting to remark that not a few modern writers hold the view that every accommodation by an organism to a *novel* situation requires and involves consciousness. Such a view rests on the conviction that consciousness is not only of service from time to time in assisting organic adaptation to environment, but also that it is the absolute precondition of accommodation to situations which are new.

This broad biological ideal of functional psychology may be considered as issuing in the attempt to discover the fundamental utilities of consciousness. The problem from this point of view has not as yet been satisfactorily solved. It is possible to regard the three great familiar divisions of mental life, i.e., knowing, feeling, and willing, as constituting these basal utilities. There are, however, many subordinate categories which are equally significant; e.g., attending and judging. Moreover, from the strictly utilitarian standpoint it may be urged as practicable to reduce all these manifestations of utility to the basal one, selective accommodation; that is to say, it is because consciousness by its selective action leads to movements which result in the attaining of certain ends, that mind possesses value.

Third: It is sometimes asserted that functional psychology is in reality a form of psychophysics. This means that it finds its major interest in determining the relations to one another of the physical and mental portions of the organism. To be sure all psychology must necessarily entertain some doctrine regarding these relations, but functional psychology is occasionally identified with a peculiar attitude toward this problem which may be described as follows:

The distinction between the mind and the body is not regarded as founded primarily on a difference between two kinds of existence, one physical and the other mental. The two are rather thought of as different modes in which organic life expresses itself, now the one and now the other being more in evidence. Conscious processes are thought of as present whenever novel situations are to be dealt with and the fundamental business of consciousness is conceived to be that of building up efficient habits, or co-ordinations, to meet the necessities of these situations. The purely physical or physiological processes are on the other hand regarded as finding their peculiar sphere of action wherever old and well-formed habits are capable of meeting the requirements of the temporary environment. From this point of view mind and body are not so much two distinct entities as they are stages or aspects of the general process of vital accommodation to environment.

These three conceptions of functional psychology which have been described are obviously supplementary to one another. It is clearly impracticable to carry out a functional psychology which should deal with the problem of mind conceived as engaged in mediating between the environment and the needs of the organism without having some doctrine to offer concerning the connection of the mind and the body, for by common agreement consciousness makes itself effective through the muscular movements to which it leads. Some notion, therefore, of this connection must be involved. Moreover, it is equally certain that no effort to handle either of these problems can go far without some theory as to the basal character of the various mental operations themselves. The three positions must accordingly be regarded as complementary to one another. Their apparent divergence arises chiefly from emphasizing different aspects of a common problem.

The term functionalism, as has been already intimated, is less frequent in philosophy than in psychology. When used, however, it is generally employed as substantially identical with such terms as pragmatism and humanism. It does not represent a definite group of opinions and beliefs, but rather a certain attitude toward philosophical problems. This attitude may be illustrated by the comments in an earlier paragraph upon functional psychology conceived as concerned with the mind-body problem. In general, philosophical functionalism undertakes to discern the exact circumstances out of which the various problems of philosophy have grown, not only in the historical sense in which these problems are connected with the systems of particular movements or philosophers, but in the much more genetic sense in which they may be shown to come to light in the reflective processes of any human being. In a way, therefore, it might be designated a genetic philosophy.

In its purposes at least a philosophy of this kind is peculiarly vital, for it attempts to see the practical living significance of philosophical problems and it finds its solutions in the actual outcome in human life of the multifold factors with which metaphysical speculation finds itself confronted.

Dean of University Faculties, University of Chicago.

FUNDAMENTAL CONSTITUTIONS. See COLONIAL GOVERNMENT, PROPRIETARY.

FUNDAMENTAL NOTE, TONE, or BASS. (1) The lowest or deepest tone that a string or pipe sounds in generating a series of harmonics. The fundamental note of a stretched string is sounded when the string vibrates as a whole. The fundamental note of an open organ-pipe is sounded when there is one node at the middle of the pipe. In a closed organ-pipe the closed end or stopper acts as the node when sounding the fundamental note. (2) The fundamental note also signifies the root of a chord, irrespective of the inversions of the chord; thus in the common chord of C, C E G, C is the fundamental note and remains so in the inversions E G C, G C E, E and G being called the bass notes.

FUNDAMENTAL ORDERS OF CONNECTICUT, a body of laws based on the Foundation Principles of Thomas Hooker (q.v.) and adopted in 1639 for the government of the Connecticut Commonwealth, settled by seceders from Massachusetts, who were dissatisfied with the latter's autocratic government. Although the preamble presumed the union of church and State, a distinctive feature was the absence of a religious test for citizenship, while the authority and even the existence of a sovereign or proprietor were ignored. Otherwise there was no great divergence from the legislation controlling Massachusetts. The governing authority was vested in the presiding officer of a court of magistrates and town deputies, elected at a court session by the town freemen. There was no separation of the executive, legislative and judicial functions. The general court in 1659 imposed a property qualification of $150 for suffrage. Some authorities state that this was the first written constitution known to history that created a government, and it continued in existence without material alteration for nearly two centuries. Consult Fiske, J., 'Beginnings of New England' (pp. 127–128; Boston 1889); Rines, I. E., 'The United States' (Vol. I, pp. 263–269; New York 1916).

FUNDAMENTALS, or BODY OF LIBERTIES, a colonial collection of laws prepared in 1641 by a convention of New England freemen who resented the arbitrary, undefined powers and prerogatives of the magistrates. A preliminary draft prepared by the council was first submitted to the local magistrates and elders, and was then sent broadcast to the freemen for consideration, suggestion and improvement. After considerable revision, about 100 laws were formally adopted, with the provision that after three years' trial they were to be revised and then become finally established. Church members were vested with the supreme power, but the supreme council possessed the power of veto. Every citizen was granted a certain share in the business of any public meeting, although universal suffrage was not conceded. The liberties of women, children and servants were defined in a more benevolent spirit, in harmony with the Mosaic code. A certain degree of liberty was granted to private churches and assemblies of different Christians, but the council had power to suppress arbitrarily any proceedings which they deemed dangerous or heterodox and to punish or expel their authors. Strangers and refugees who professed the true Christian religion were to be received and sheltered. Injurious monopolies were not to be allowed. Slavery, villainage or captivity was abolished, except in the case of lawful captives taken in war, or any case where slaves might be sold by others or should sell themselves. All torture was abolished, except whipping, ear-cropping and the pillory which were retained as necessary and wholesome, but death was the punishment for idolatry, witchcraft and blasphemy, or for the wilful disturbing of the established order of the State. Consult Palfrey, J. G., 'History of New England' (Vol. I, pp. 229–282; 4 vols. 1873).

FUNDED DEBT. See DEBT, NATIONAL.

FUNDI, or FUNDUNGI, a kind of grain obtained from a grass, *Paspalum exile,* allied to the millets, which is cultivated to a considerable extent in the western part of Africa. It is wholesome and nutritious and is much used by the natives of western Africa as a food.

FUNDING, in finance, the conversion of floating debt into an interest-bearing obligation with a definite period, on which bonds can be issued. One such operation is of special interest in United States history, as part of the operations by which Hamilton, as leader of the Federalists (q.v), and then secretary of the treasury, succeeded in setting the government on a firm foundation. The Act of 4 Aug. 1790 founded not only the foreign and domestic debt in full, but the State debts incurred in carrying on the Revolutionary War; the bonds were at 6 per cent, but those for the domestic debt did not bear interest till 1800.

FUNDS, Public. See DEBTS, PUBLIC.

FUNDY, Bay of, a huge arm of the Atlantic Ocean extending into the land between New Brunswick and Nova Scotia, and the State of Maine, and terminating in two smaller bays, Chignecto Bay and the Basin of Minas. Its length up to Chignecto Bay is 140 miles, and its extreme breadth 45 miles. It is noted for its high tides, which are influenced by the Gulf Stream, and rise about 30 feet at Saint John and 60 feet at the head of Chignecto Bay, rushing into the latter with remarkable force. At Bay Verte, 14 miles distant, the tide rises little more than four or five feet. Along its northwest side the Bay of Fundy receives the Saint John, the largest river in New Brunswick, and also the Saint Croix. The tides in the Fundy are perilous to navigation and produce dangerous bores, especially in the upper reaches of the Bay. At low tide there is a long expanse of mud flats, at times over two miles in length, and the inreaching estuaries are completely drained. At the entrance to the Bay of Fundy are the Grand Manan and other islands. See TIDES.

FUNEN, Denmark, an island of the Danish archipelago, separated from Jutland by the strait called Little Belt; area 1,133 square miles; pop. about 252,288. Its shores are deeply indented; its interior is undulating, and there are numerous lakes, streams and marshes. The largest stream is the Odense, 36 miles long. The soil is extraordinarily fertile and well watered. Grain is produced and considerable amounts are exported. Stock farming is also extensively carried on. It trades principally with Sweden and Norway. It forms with other islands a province of Denmark (q.v.). Chief towns: Odense, Svendborg and Nyborg.

FUNERAL RITES, the last religious and ceremonial tribute of friendship and love paid to the remains of the dead. Funeral rites have developed from the belief that the dead are not really dead and the desire to propitiate or alleviate the departed spirit. Among the Hindus the corpse is perfumed and adorned with flowers; it is then burned; after many ceremonies the bones are deposited in a casket and buried, but afterward disinterred and thrown into the Ganges. A second series of obsequies commences after the period of mourning has expired, and this is followed by commemorative rites. The voluntary immolation (*suttee*) of the widow of the deceased, now abolished, was the most remarkable part of the ceremony. The Mohammedans bury their dead. The interment takes place as soon as possible, in obedience to the command of the prophet: «Make haste to bury the dead, that, if he have done well, he may go forthwith into blessedness; if evil, into hell-fire.» No signs of excessive grief, no tears nor lamentations, are allowed, as it is the duty of a good Mussulman to acquiesce without a murmur in the will of God. On arriving at the burial place the body is committed to the earth with the face turned toward Mecca. Monuments are forbidden by the law, but they are constantly erected. The Egyptians embalmed their dead. Among the Jews the next of kin closed the eyes of the deceased; the corpse was then washed, and, in the case of persons of some consequence at any rate, laid for a time in spices or anointed with spices, swathed in linen bandages, and deposited in the tomb. The mourning customs of the Jews may be collected from various passages of the Scriptures. They went bareheaded and barefoot, covered their mouths and kept silence, put on sackcloth, and sat in ashes; funeral songs were sung by persons hired for the purpose; splendid monuments were sometimes hewn out of the solid rock, with numerous niches; as each niche was filled, its entrance was stopped up by a large stone rolled against it. In the religious creed of the Greeks and Romans sepulture was an act of piety to the dead; without it the spirit had to wander 100 years on the banks of the gloomy Styx. The last breath was generally caught by a near relative, who opened his mouth to receive it; the body was washed and crowned with flowers, a cake of flour and honey placed in the hand, as a bribe for Cerberus, and an obolus in the mouth, as a fee for Charon. Interment and burning were practised indifferently. In interment the body was placed with the face upward and the head toward the west. In burning the pile varied in form and material; it was lighted by the nearest relative; perfumes and wine were poured on it, and the richest clothes of the dead were burned with him. The ashes were then collected and deposited in an urn. This description relates to both Greeks and Romans, whose rites were nearly identical.

In the Roman Catholic Church the body is washed immediately after death, a crucifix is placed in the hands, and a vessel of holy-water at the feet, with which the visitants sprinkle it. The Ritual prescribes that the corpse be borne in procession from the house in which it lies to the church, attended by the parish priest with acolytes and servitors all in cassock and surplice, and one of them bearing the processional cross in the van. Before the procession moves, the priest first sprinkles the coffin with holy-water and recites the *De profundis* and the *Miserere* while the procession is in movement. Taken into the church, the coffin is laid on trestles in the middle of the nave, the feet to the east or the sanctuary, if the deceased was a layman, the head to the sanctuary if he was a priest; lighted candles surround the coffin. Then follows the Office for the Dead, and after that the Mass for the Dead. After the Mass the priest, attended by the acolytes, pronounces the Absolution and certain prayers, meanwhile sprinkling the coffin with holy-water and fumigating it with frankincense. The procession is now re-formed and the body borne to the place of burial. There the *Benedictus* is sung or recited, followed by an Antiphon, *Ego sum resurrectio et vita* (I am the resurrection and the life); the corpse is again sprinkled, a final prayer is pronounced, and the body is laid in the grave or tomb. In the funerals of children, the vestments of the clergy are white instead of black, joyous psalms are chanted or recited, there are antiphons of praise and thanksgiving instead of petitions for mercy and forgiveness; and the church bell is not tolled.

In the Greek Church there are distinct services for laymen, monks and priests severally. The officiant holds a short service at the house of the defunct; service is held at the church, to which the body has been brought, and then at the grave, where the priest takes a shovel and sprinkles dust cross-wise on the body. Finally, before the grave is closed, he casts wax or ashes from his censer upon the coffin.

The English Church, followed very closely by the Protestant Episcopal Church in the United States, uses the order for the Burial of the Dead in the Book of Common Prayer. It is a stately and somewhat elaborate service, which is frequently used in part by other Protestant bodies. The first section of the service is recited in church, to which the body has been brought, or at the house of the defunct. It consists of anthem, psalms and a lesson. The second section, sometimes called the committal, is recited at the grave, where dust is scattered on the coffin as it has been lowered. Consult Yarrow, H. C., 'Introduction to the Study of Mortuary Customs among the North American Indians' (Washington 1880); Jevons, F. B., 'Introduction to the History of Religion' (London 1896); Frazer, J. G., 'The Golden Bough' (ib. 1900); Tylor, E. B., 'Primitive Culture' (ib. 1903).

FÜNFKIRCHEN, or **PÉCS,** Hungary, capital of the county of Baranya, 110 miles southwest of Budapest. The name is derived from five Turkish mosques, three of which are now in ruins and two in use as churches. There is a fine 12th century cathedral in Romanesque style. It contains a gymnasium, seminary, military school, vocational school, a library and museum. Church organs, leather, cloth and pottery are manufactured and there is a brisk trade in coal, wine, fruit and tobacco. From 1543 to 1686 the town was in the hands of the Turks. It is probably the Roman Colonia Serbinum. Pop. 50,000.

FUNG-HUANG, the Chinese phœnix, regarded as a harbinger of prosperity; also as an emblem of good luck. For the mythological lore concerning it, Consult Griffis, 'China's Story in Myth, Legend, Art and Annals' (New York 1911); Macgowan, 'Chinese Folk Lore Tales' (London 1910); Mayers, 'Chinese Reader's Manual' (Shanghai 1875).

FUNGI, fŭn'jī (singular *Fungus,* Latin name for mushroom), the general name applied to a multitude of lower plants of quite diverse structure, but which agree in not containing chlorophyll, the green coloring matter of the vegetable kingdom. Formerly the fungi were regarded as constituting a natural group (class or order), but are now recognized by modern botanists as belonging to many natural groups of plants.

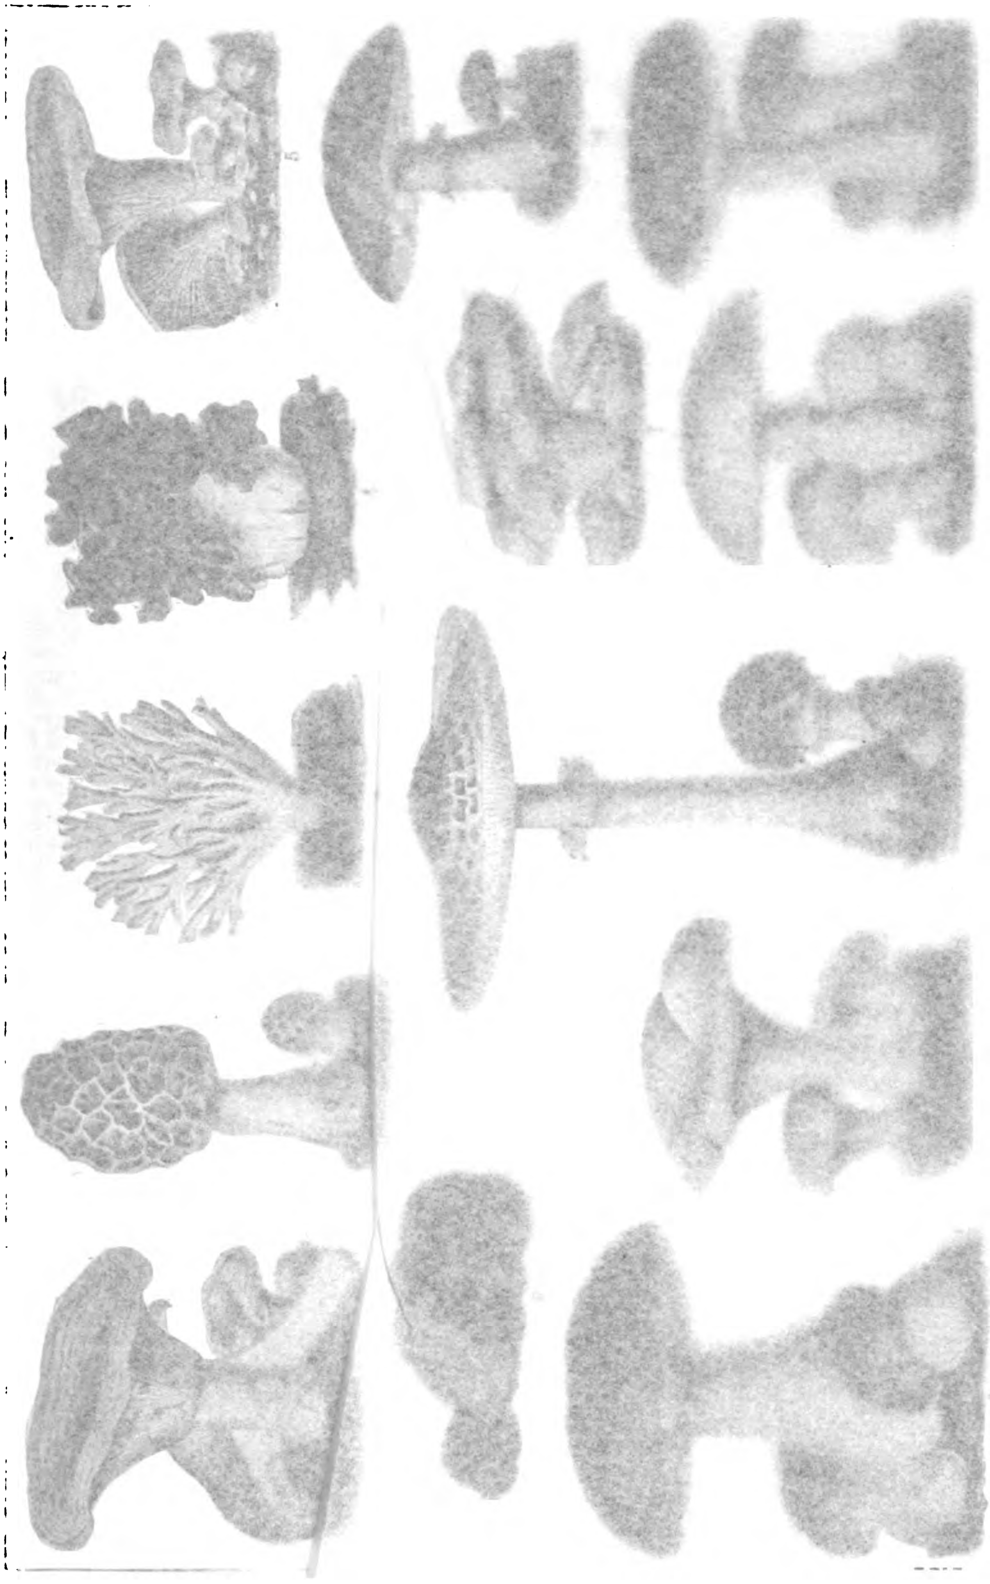
The peculiarities of fungi are physiological; they result from their food habits, and are not primarily structural and of profound significance. When we enumerate the physiological changes involved in the change of a plant from an independent life to one of parasitism or saprophytism, we have considered all of the essential differences between the fungi and the green plants from which they have been derived. We may say then, that a fungus is a lower plant which has suffered certain physiological changes on account of the fact that it has become parasitic or saprophytic.

Before going farther it is necessary to define certain terms which must be used in any discussion of the fungi. A plant is a *parasite* when it lives upon or in another living plant, absorbing food from it, and living at its expense. The mere fact of growing upon another plant does not make the first parasitic, for there are many small plants which merely find lodgment upon larger species, not, however, absorbing anything from the plants on which they are lodged. When it is necessary to distinguish such plants, they are called *epiphytes.* In the case of parasites the plant or animal upon which they live is spoken of as the host. When a plant lives upon an organism which is no longer living or upon its products it is called a *saprophyte.* Thus the toadstools which grow so freely on manure and other decaying vegetable matter are saprophytes. It is sometimes necessary to have a term to apply to plants which are neither parasitic nor saprophytic, and then we use the word *holophyte.* Thus all common green plants are holophytes. When it is desired to contrast holophytes with both parasites and saprophytes, we can use the term *hysterophyte* for the parasitic and saprophytic plants.

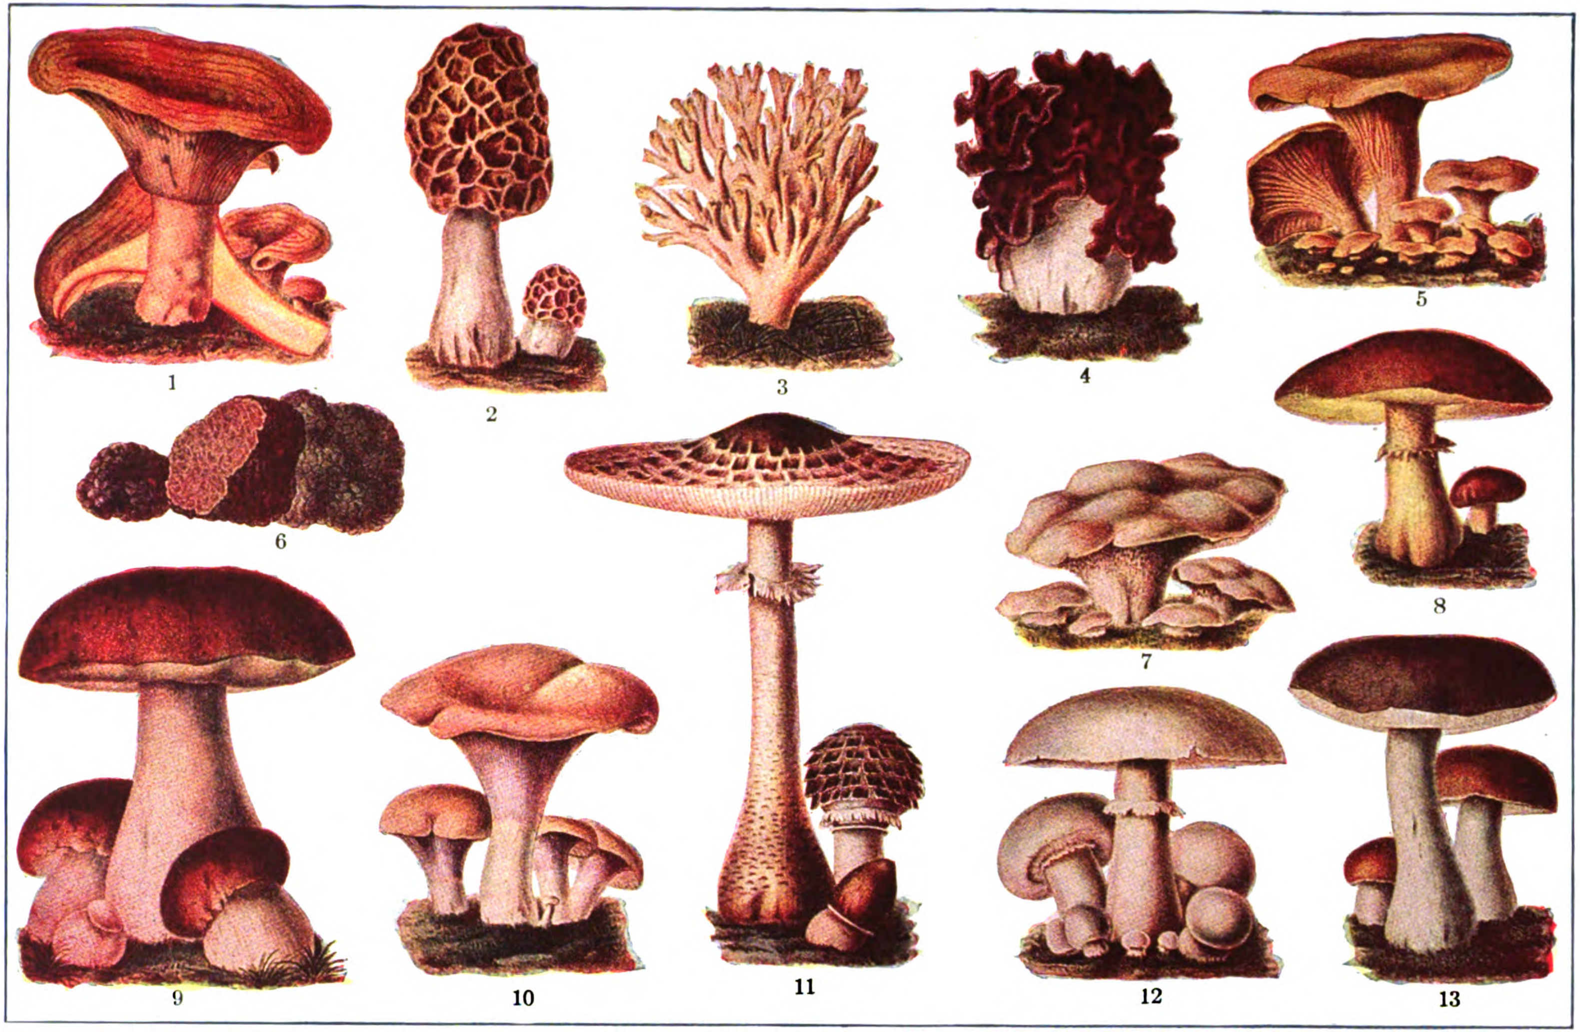
Applying the terms we have now defined, we may say that all fungi are hysterophytes, some living parasitically upon their hosts, others living saprophytically.

All holophytes are green in color, although in many this is concealed by other pigments and the significance of this is purely physiological. Green plants absorb the gas carbon dioxide, and in green cells this is combined with some of the elements in the ever-present moisture of the plant into a chemical compound allied to starch and sugar, and characterized by consisting of nearly equal amounts of carbon and oxygen, combined with nearly double the amount of hydrogen.

Such compounds are known as carbohydrates and they are made by all holophytes, and then used in the processes of assimilation and growth. It has been demonstrated that plants which are not green cannot make the carbohydrates, and since all plants need these compounds for building up their tissues, it follows that colorless plants must obtain them by taking them from living or dead green plants. Last, it should be borne in mind that even green plants cannot make the carbohydrates in darkness. For this work they need light and in fact the greatest importance of light to a plant is in connection with this process of making



EDIBLE FUNGI



1. Delicious Lactaria (Lactaria deliciosa)
2. Morel (Morchella esculenta)
3. Yellow Coral-fungus (Clavaria flava)
4. Saddle Fungus (Helvella esculenta)
5. Chanterel (Cantharellus cibarius)
6. Truffle (Tuber melanosporum)
7. Hedgehog Fungus (Hydnum repandum)
8. Ringed Boletus (Boletus luteus)
9. Stone-fungus (Boletus edulis)
10. Plum Mushroom (Clitopilus prunulus)
11. Parasol Mushroom (Lepiota procera)
12. Cultivated Mushroom or Champignon (Agaricus campestris)
13. Rough-stemmed Boletus (Boletus scaber)

carbohydrates. Accordingly plants which are not green, and which as a consequence do not make carbohydrates, often grow in darkness or in feeble light. This is quite characteristic of the fungi, great numbers of which grow as well in darkness as in light, or in some cases grow even much better in the darkness than they do in the light.

The fungi are very numerous, some recent estimates placing the number of species as high as 250,000, of which not more than one-third have as yet been described. They occur wherever there is organic matter of any kind upon which they can subsist. Wherever there are living plants or animals there are fungi which obtain food either from the living cells of their hosts, or the dead and cast-off cells and tissues. Some species occur in the lower layers of the air, in all exposed waters and in the soil. They are the most numerous of living things when we consider individuals alone. They range in size from extremely small to many centimeters in length. The smallest are far too minute to be seen by the naked eye, some being visible only by the aid of the most powerful microscopes. Of some of the smallest species it would require 25,000 to 30,000 placed side by side to measure one inch. On the other hand there are toadstools a foot or so in height and diameter, and puff-balls two to three feet in diameter have been recorded.

The fungi as thus described are found in four of the grand divisions (phyla) of the vegetable kingdom.

Phylum, Myxophyceæ. The Slime Algæ. — Here are gathered a thousand or so species of microscopic aquatic plants in which the cells have a very low organization. No distinct nucleus is present, and the coloring matter in the typical plants pervades the whole cell, and is of a bluish or brownish-green color instead of a bright green as in higher plants. They reproduce by simple fission, and by the production of spores. There is no hint of any sexual reproductive process. They occur in ponds, pools and streams, to which they give a greenish color by their great numbers. In decaying they usually give off a fetid odor.

While the typical Slime Algæ are greenish — and are known as green slimes — many have become parasitic or saprophytic, and have lost their green color. These colorless species are known as Bacteria, and are the lowest of the fungi.

Bacteria (Fig. 1) are then to be regarded as colorless green slimes, their lack of color

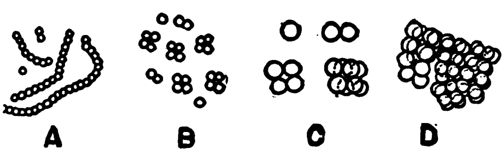


FIG. 1.— Bacteria. A, *Streptococcus pyogenes;* B, *Micrococcus tetragenus;* C D, *Sarcina lutea.* All highly magnified.

being due to their parasitic or saprophytic habits. Some species are minute rounded cells of remarkable minuteness. To these the generic name *Micrococcus* has been given, and many species have been recognized by botanists. Other genera with spherical cells are *Streptococcus, Staphylococcus, Sarcina,* etc. Other bacteria consist of cylindrical cells which tend to adhere end to end in filaments or rods. In the genera *Bacillus* and *Bacterium* the rods are straight or little curved, and short or of moderate length, while in *Vibrio* and *Spirillum* the rods are more or less spirally curved. In still other genera, as *Crenothrix, Leptothrix,* etc., the rods are elongated. The study of Bacteria

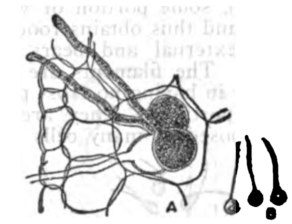

FIG. 2.— A, *Olpidium brassicæ,* one of the simplest of the fungi (*Synchytriaceæ*), parasitic in cells of a crucifer: B, three zoospores. Highly magnified.

in relation to diseases of man and other animals and of plants, and to soils, etc., has developed into the science of Bacteriology (q.v.). Many botanists now, on that account, do not include Bacteria among the Fungi. See BACTERIA.

Phylum Chlorophyceæ and Phylum Siphonophyceæ.— These plants, of which there are probably nearly 2,500 species, may very properly be called sea-weeds, since they are typically aquatic, living in the salt and fresh waters of the earth. Typically they are bright green, and the cells of which they are composed have well-formed nuclei. However, the chlorophyll is confined to definite portions of the protoplasm, and is not diffused throughout the cell. Some of the lower species are spherical, rounded cells, but for the most part they consist of filaments of cylindrical cells, or in some instances they are masses of cells constituting leafy-stemmed plants. They reproduce by fission as in the Slime Algæ, but in addition all, or nearly all, Slime Algæ reproduce sexually also. In the simplest cases of sexuality, two equal and similar cells detached from older plants fuse into a new and larger cell, and then this new cell grows into a new plant. Sometimes the new cell becomes covered with a thick wall, and for a time ceases activity as a "resting spore," before it develops into a new plant.

While most of the plants of these two phyla are green plants, several hundred species have become parasitic or saprophytic in habit (Figs. 2 to 10) and have therefore lost their color, and become fungi. Among these are the following families, namely:

Gall Fungi (*Synchytriaceæ*) are beyond reasonable doubt to be regarded as hysterophytic forms of the one-celled class (class *Protococcoideæ*) of the first of these two phyla. These fungi consist of single cells which enter the cells of their living host plants and there enlarge, feeding on the host cells and causing an irritation of the tissues which often causes swellings which may be minute or in some cases very large (e.g., wart disease of potato tubers caused by *Synchytrium endobioticum*). The fungus cell eventually breaks up internally into numerous minute zoospores which escape in various ways and infect new host cells. (Fig. 2). The family *Chytridiaceæ* (Fig. 3) which are mostly parasitic in aquatic algæ and fungi are probably closely related to these or to the next forms.

Water Molds (*Saprolegniaceæ*) which are minute filamentous, colorless plants living in the water on living and dead plants and animals. (Fig. 4). Each plant is a more or less branched thread, some portion of which penetrates the host and thus obtains food, while the other part is external and bears the reproductive organs. The filaments are cylindrical, and are peculiar in having no cross partitions in the vegetative portions. They are to be regarded as composed of many cells which have

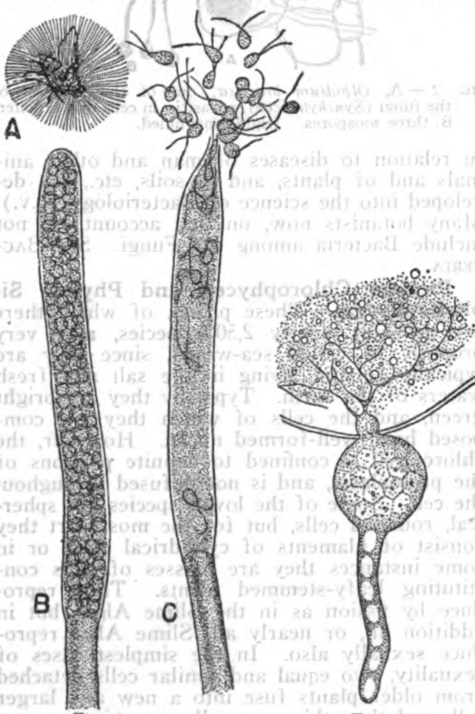

FIG. 4 FIG. 3

FIG. 3.—*Rhizidiomyces apophysatus*, another of the lower fungi (*Chytridiaceæ*); the root-like organs are parasitic in a cell of a water mold. Highly magnified.

not separated themselves by partitions. The nuclei are numerous, and very small.

The more common mode of reproduction is as follows: A terminal portion of a branch forms a partition at some distance from the extremity and the protoplasm in this segment becomes denser, and a little later divides into a great number of small cells, each of which remains naked (that is, no cell wall is formed around it), and soon escapes by a rupture of the end of the segment. (Fig. 4). These escaped cells are known as zoöspores, since they have a very active swimming motion, very like that of some of the lower microscopic animals. The similarity to the lower animals is shown still more by the identity in their locomotive organs, which consists of one or two slender protoplasmic whips (flagella) by whose rapid lashing the zoospores are propelled. After a short period of activity they come to rest, when they cover themselves with a cell wall, and begin to elongate into a filament like that of the

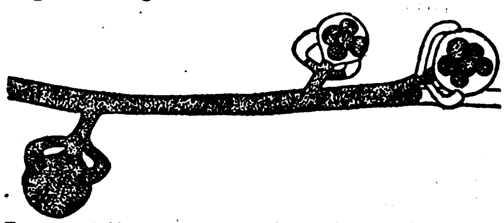

FIG. 5.—*Achlya racemosa*, showing antherids and oögones. Highly magnified.

plant from which they came. Reproduction by means of zoospores is very rapid, since they are formed in such great numbers when conditions are favorable.

The sexual organs, which are rather rarely formed, consist first of an enlarged and rounded end segment in which the protoplasm is quite dense. From the sides of the branch below the end segment (or from elsewhere on the body of the plant) slender branches grow up and in turn their ends become cut off by cross partitions. (Fig. 5). The first end segments (the rounded ones) are oögones, or in plainer words they are egg-organs, and in them one or more eggs are produced. The second segments (slender) are male organs called antherids, and the protoplasm they contain has the function of the spermatozoids of many plants (and animals). At the proper time the antherids puncture the egg-organs, and by the inflow of the contents of the former the eggs are fertilized. Later these eggs may germinate and produce new plants like those on which they were borne.

Downy Mildews (*Peronosporaceæ*) are much like the water molds, but instead of being aquatic, they live in the tissues of land plants. Like the water molds they are composed of branching, non-septate filaments. The main body of the plant usually grows in the intercellular spaces of the host, where there is nearly as much moisture as under aquatic conditions. In a few species, however, including the organism of the Late Blight of the potato (*Phytophthora infestans*), the filaments grow directly through the cells of the host, killing them in advance by a poisonous secretion sent out by the fungus. (Fig. 6). From this inter-

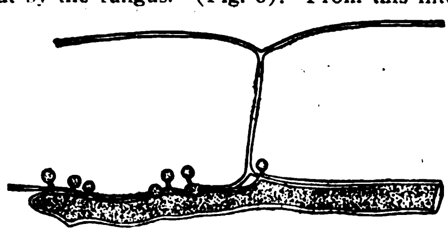

FIG. 6.—Portion of a filament of *Albugo candida*, with its haustoria penetrating host cells. Highly magnified.

nal part of the fungus short branches grow out into the air, and these become swollen terminally into rounded segments, which are in fact short zoosporangia. Instead of forming zoospores at once, they first fall off and then those that fall into water develop zoospores, much as in the water molds. As these structures are very minute, a droplet on a leaf is large enough for the germination of hundreds of the detached zoosporangia. Here again, the zoospores, after coming to rest, develop into new plants, which at once penetrate the host. In some species the zoosporangia grow at once into a filament, without forming zoospores.

The sexual organs of downy mildews are much like those of water molds, the differences being quite immaterial for the present discussion. (Fig. 7).

It is evident from a comparison of the structure and reproductive organs of water molds and downy mildews, that the latter are derived from the former. Just as the water molds have been derived from the green plants of the Green Felt family (*Vaucheriaceæ*) by the adoption of parasitic and saprophytic habits, so by the change from strictly aquatic conditions to those found in the intercellular spaces of land plants, water molds have been changed to downy mildews. Every difference between the two families may be accounted for by this difference in the environment of the plants.

Black Molds (*Mucoraceæ*) show an additional modification of the water mold type. They are non-aquatic, mostly saprophytes, a few only being parasites. They live for the most part on dead organic matter, animal or vegetable, which is still moist, and but few species can live in the water. The commonest species live on the starchy and sugary substances in pantries, cellars and other places where these substances are found in the presence of sufficient moisture. Organic substances which are dry are not attacked by black molds.

Each black mold plant is a branching tubular filament, which has few cross partitions. One part of the plant usually grows in the substance of the organic matter, and another grows

Fig. 7

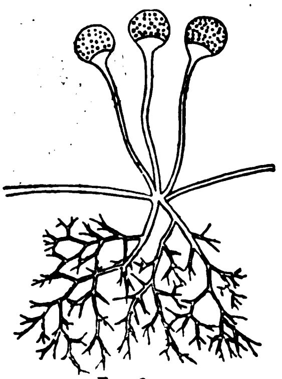

Fig. 8

Fig. 7.— *Peronospora alsinearum*, showing antherid penetrating the egg-cell. Highly magnified.
Fig. 8.— *Mucor stolonifer*. Highly magnified.

upward into the air. (Fig. 8). The former absorbs food matter, while the latter bears reproductive organs, as in the water molds. The ends of the aerial branches enlarge as in the two preceding families, but instead of forming zoospores, the protoplasm in the terminal segments forms many small spores, each covered with a cell wall. These spores are the homologues of the zoospores in previous families, but as the plants are not aquatic, these zoospores have ceased to be aquatic also. With a good cell wall to protect their protoplasm, they may be blown about in the air without drying up. It is in this way, in fact, that black molds are propagated, the air currents carrying the spores sometimes for long distances, and when they fall upon organic matter under

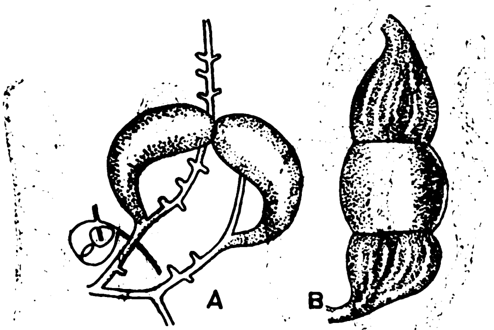

Fig. 9.— *Mucor fusiger;* A, young sexual organs; B, after fertilization. Highly magnified.

favorable conditions they quickly give rise to a new crop of mold plants. On the filaments which penetrate the nutrient substance, or grow over its surface, are to be found (rarely, however, in the common species) sexual organs somewhat resembling those of the two preceding families. (Fig. 9).

Insect Fungi (*Entomophthoraceæ*) are somewhat similar to black molds, but are parasitic in the body tissues of insects, and accordingly show considerable structural modifications. (Fig. 10).

Phylum Carpomyceteæ. The Higher Fungi.— This immense phylum, containing over 60,000 recognized species and probably twice as many, if not more, not yet studied, seems to have arisen from chlorophyll-bearing plants of the phylum Rhodophyceæ, the Red Seaweeds. These are mostly marine, although many fresh-water species are known. They reproduce sexually by the union of a non-motile sperm with the elongation of the oogone, termed trichogyne. The male nucleus passes down this to the egg nucleus with which it unites. The fusion nucleus thus produced divides very freely and the daughter nuclei pass out into many branching threads whose terminal cells (*carpospores*) are the reproductive cells of the plant. The whole structure of oogone, branching threads and carpospores is a "spore-fruit" and may or may not be surrounded by a protective structure of vegetative cells. In the Higher Fungi we find similarly a spore-fruit arising as a result of the sexual process. The ultimate cells are of three kinds, depending upon which one of the three classes is under consideration. (See Vegetable Kingdom and Plants, Morphological Evolution of). These classes are the Ascomyceteæ, Basidiomyceteæ and Teliosporeæ. Beside these there is a large group of fungi, certainly belonging to this phylum but which in the lack of knowledge as to their sexual reproduction cannot with certainty be assigned to any one of these classes. These are the Imperfect Fungi. All the plants of this phylum possess branching threads with numerous cross walls (septa) and usually one or two nuclei to a cell. Asexually they produce by conidia, cells cut off from the ends of unmodified or specially modified threads. The cells so produced possess walls and are distributed by the wind, rain, insects, etc.

Sac Fungi (class *Ascomycetea*).— The distinguishing mark of the plants of this class

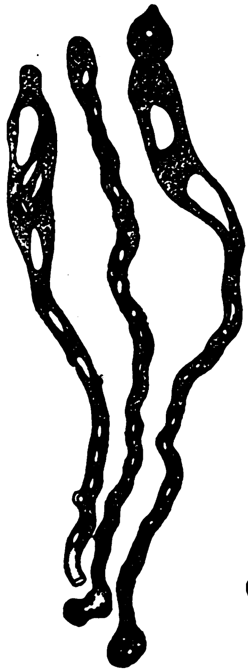

FIG. 10

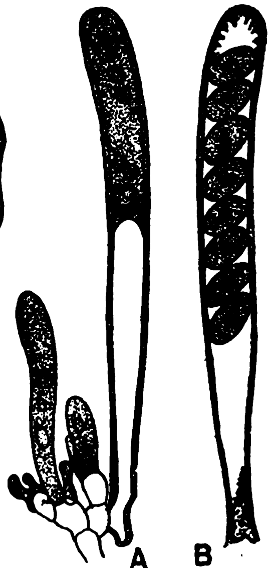

FIG. 11

FIG. 10.— *Empusa muscæ;* filaments from body of fly. Highly magnified.
FIG. 11.— A, several spore-sacs (*asci*) in different stages of development; B, a mature spore-sac. Highly magnified.

is that the spores which occur in their fruits develop in certain end cells and remain enclosed within the cell wall until matured. (Fig. 11). These spore-containing cells have been aptly likened to sacs (Latin *asci;* singular, *ascus*) and from this we derive the name of the class.

There are more species of sac fungi than of all other kinds. Their fruits range in size from very minute to many inches in extent. They include some of the most harmfully parasitic plants as well as many which live saprophytically upon refuse organic matter. Among the many families (more than 100) in this class, the following may be noticed:

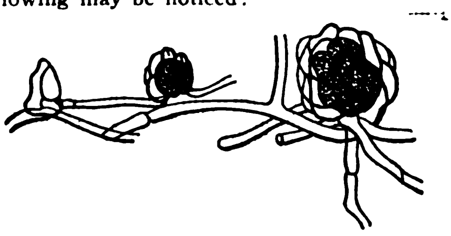

FIG. 12.— Sexual organs of *Erysiphe* and formation of fruit. Highly magnified.

Powdery Mildews (*Erysiphaceæ*) are the cause of many serious diseases of wild and cultivated plants; e.g., rose, apple, cherry, gooseberry, ash, etc. The plant body consists of branching filaments which creep over the surfaces of their hosts, from which they obtain food by means of root-like absorbing organs, which penetrate the host cells. Certain branches form spores by the simple process of separating their terminal cells in succession and this is done so abundantly that the spores form powdery masses on the surface of the hosts. These spores float away on wind currents, and those that germinate on similar hosts give rise to new plants.

The sexual organs (egg-cells and antherids) occur on the creeping filaments, and are short lateral branches, the former somewhat thicker than the slender antherids. (Fig. 12). The two come in contact with each other, and the protoplasmic contents of the antherid pass into the egg-cell fertilizing it. As a result the egg-cell sends out one or more branches, the end cells of which develop into *asci,* while from below the egg-cell there grows up a cellular, globular covering, constituting the outer wall of the fruit, and enclosing the *asci.* The spores in the *asci,* when set free by the rupture of fruit and *ascus* walls, germinate and on similar hosts give rise to new plants. These fruits are usually blackish and may be seen by the naked eye as minute globular bodies on the mass of filaments. (Fig. 13).

Truffles (*Tuberaceæ*) are eagerly sought for as table delicacies, their large subterranean fruits being highly favored by epicures. Their life history is not well known. They are saprophytic, living on the decaying organic matter in the soil in forests. Little is known as to their early life, and the formation of their non-sexual spores, but these are thought to be somewhat like those of the powdery mildews.

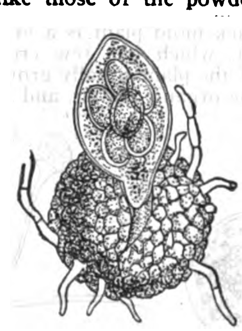

FIG. 13.— Mature fruit of powdery mildew, with escaping spore-sac. Highly magnified.

Their fruits are formed under ground. The sexual organs, which possibly precede the development of the fruits, have not yet been discovered. The fruits of the common truffles of Europe are from one to two inches in diameter, and warty and dark colored externally. (Fig. 14). Internally they consist of a soft, whitish tissue, in which are numerous cavities, each containing several *asci.* Practically nothing is known as to their propagation. A few little known species occur in America, but in Europe they are common. See TRUFFLE.

Black Fungi (*Sphæriaceæ* and numerous related families) are typically parasites which grow in the tissues of higher plants, and whose small black fruits are formed on the surface of the host. Here again we are evidently dealing with plants related to the powdery mildews, but with an increased parasitism. They are known to form non-sexual spores much as in the powdery mildews. Their fruits also resemble the fruits of the powdery mildews, and probably result from a fertilization, but thus far the sexual organs have evaded discovery.

Closely related to the foregoing and differing principally in possessing a bright color and fleshy or leathery structure are the members of the Family *Nectriaceæ*. Asexual and sexual

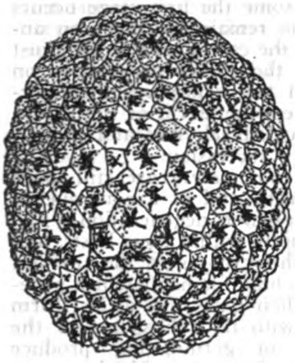

FIG. 14

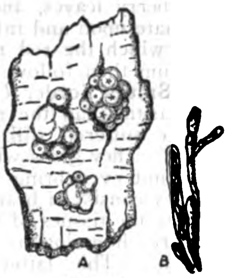

FIG. 15

FIG. 14.—Truffle; fruit, natural size.
FIG. 15.—*Nectria cinnabarina;* A, bark with enlarged fruits; B, spore-sacs. Highly magnified.

reproduction are similar to the same phenomena in the *Sphæriales*. Several species of *Nectria* (Fig. 15) cause serious cankers on apple twigs, etc. Ergot of grains (*Spermœdia* or *Claviceps*) also belongs in a closely related family.

Cup Fungi (*Pezizaceæ* and related families) are typically saprophytes (Figs. 16 and 17), growing in the tissues of decaying plants, as rotten logs, sticks, etc. In these fungi the plant is filamentous and grows through the decaying tissues as slender white, branching threads. Non-sexual spores resembling those of the powdery mildews are known for some species. Sexual organs, consisting of a globular egg-cell and a slender antherid are found on the creeping filaments. (Fig. 19). Fertilization takes

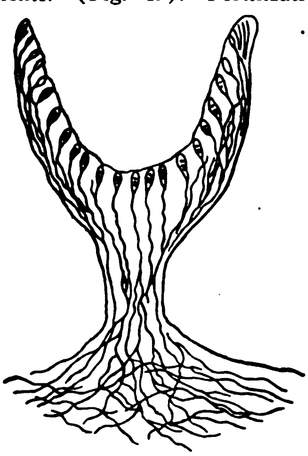

FIG. 16.—Diagrammatic vertical section of a cup fungus.

place as in powdery mildews, with a similar result, the fruits, however, being at length cup-shaped instead of globular. In many species the fruits (Fig. 17) are globular when young, but as they mature they open out into cup-shaped structures (Fig. 17), in the concave sur-

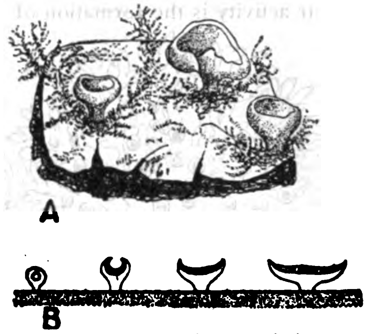

FIG. 17.—*Humaria rutilans;* A, three fruits, natural size; B, vertical sections of fruits of different ages.

face of which are found many *asci* (Fig. 18). It will readily be seen that were these cup-fruits to remain closed, their structure would be closely similar to that of the fruits of the powdery mildews or black fungi. However, the fruits of the cup fungi are often of considerable size, sometimes being as large as five or six inches in diameter.

Lichens (see article LICHENS) are now regarded as nearly related to the cup fungi and black fungi. (Fig. 20). In the essentials they agree with those fungi, but they are usually treated separately because their parasitism on various small algæ leads to the production of

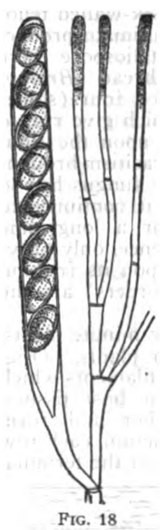

FIG. 18

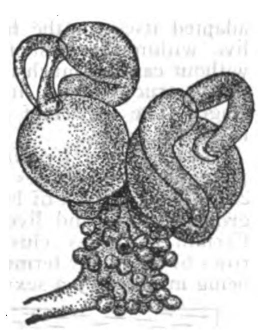

FIG. 19

FIG. 18.—*Humaria rutilans;* spore-sac, and three paraphyses. Highly magnified.
FIG. 19.—Egg-cells and antherids of a cup fungus. Highly magnified.

peculiar vegetative structures, the study of which for a long time led botanists to neglect their evident relationship to fungi which were not parasitic on algæ. There are several families of the lichen-forming fungi, aggregating between 2,500 and 3,000 species.

Yeasts (*Saccharomycetaceæ*) are here briefly referred to in order to call attention to the excessive degradation which they have suffered. Although they consist of single cells, or short chains, they are now regarded as greatly reduced sac fungi. They grow on sugars, starches and other carbohydrates, and one result of their activity is the formation of alcohol,

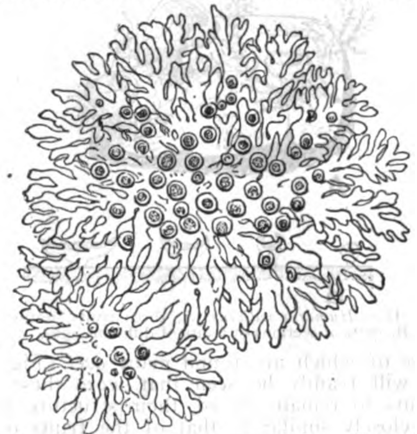

FIG. 20.—*Physcia stellaris*, a common lichen. Natural size.

while at the same time carbon dioxide is set free. It is for the alcohol that yeasts are used in breweries and distilleries, and it is for the escaping carbon dioxide gas that they are used in the making of bread. See YEAST.

Phylum Teliosporeæ.— The fungi of this phylum consist entirely of parasites upon higher plants. They are often exceedingly destructive. The characteristic distinction from the preceding phylum is the formation of a thick-walled teliospore. This is formed as the ultimate product of a sexual union. From this teliospore there arises sooner or later a short thread (*Bromycelium*) upon which are produced four (sometimes more) small "sporidia" which give rise to the new fungus when they fall upon the right host. In this phylum we find parasitism brought to its highest development. The fungus has so adapted itself to the host that it continues to live within the host tissues for a long time without causing much inconvenience, only proving destructive when it enters upon its fruiting stage. The two chief groups (orders) are the rusts and smuts.

Rusts (order *Uredinales*) are minute plants, parasitic in the tissues of higher plants. (Fig. 21). They consist of branching filaments which grow through and live upon the host tissues. Certain branches cluster together and form rows of spores by terminal abstriction, each row being initiated by a sexual union of the terminal

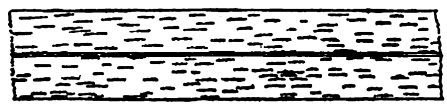

FIG. 21.— *Puccinia caricis*, a common rust on sedges.

or subterminal cells of two adjacent filaments. (*æciospores*) (Fig. 22 A). The fungus arising from the germination of these spores forms at first large numbers of red or orange colored single terminal spores (*urediniospores*) (Fig. 22 B), and still later, the one- to several-celled thick-walled, usually dark colored *teliospores*. (Fig. 22 B). These all begin within the host tissues, but they eventually break through the epidermis into the air. Lastly, when the teliospores germinate each produces a short filament (promycelium) on which four minute spores (*sporidia*) develop. There are thus four kinds of spores in a typical rust plant, and these have been taken to characterize as many stages in the plant's life history, namely: (1) Cluster-cup stage (*æciospores*); (2) Red Rust (*urediniospores*); (3) Black Rust (*teliospores*); (4) Promycelium (*sporidia*). In many rusts these stages occur on the same host in the order given, but in some the first stage occurs on one host, and the remaining stages on another. The latter is the case with the stem rust of wheat, in which the cluster-cups occur on barberry leaves, and the æciospores then germinate upon and infect the leaves of the wheat, on which the red rust, black rust and promycelium then follow in succession.

Smuts (order *Ustilaginales*) are still more parasitic than the rusts, and as a consequence have suffered still greater degeneration (Fig. 23). They grow wholly within their hosts, and do not even bring their spores to the surface. They consist of branching filaments which penetrate the tissues of their hosts, and at last form spores homologous with the teliospores of the rusts. The latter in germinating produce sporidia. Comparing the rusts with the smuts we note that while there are four stages in the

FIG. 23.— Portion of an ear of maize with eight of its kernels attacked by *Ustilago maydis*

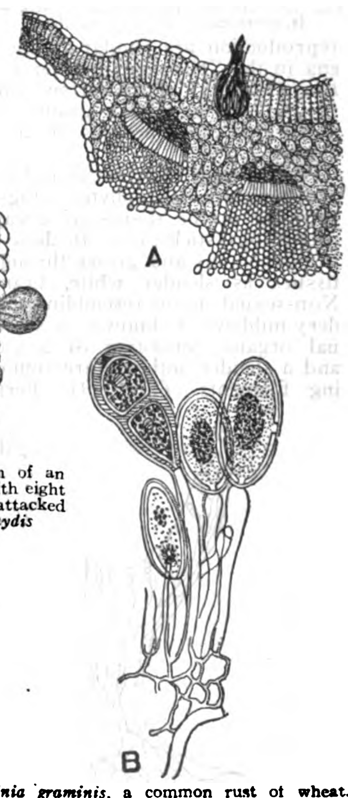

FIG. 22.— *Puccinia graminis*, a common rust of wheat. A, Cluster-cup stag on Barberry leaf; B, three urediniospores and one teliospore from a leaf of wheat. Magnified.

former, there are but two in the latter, the first and second having apparently disappeared

Imperfect Fungi.— At this point should be mentioned the so-called imperfect fungi, an immense aggregation of many thousand species (16,000 or more), of which we know but one stage (apparently the first) and so are unable to assign them to their proper place in the system. They are minute and mostly parasitic plants, occurring in the tissues of higher plants, and sending their spore-bearing branches out into the air. Some plants formerly placed here have been found to be early stages of certain sac fungi (black fungi, or their relatives) and it is suspected that most, if not all, of them will eventually be so disposed. At present they are grouped under three general kinds, as follows:

Spot Fungi (*Sphæropsidaceæ*), which produce whitish or discolored spots, and later develop closed, spheroidal cases, containing free spores. *Septoria* and *Phyllosticta* are common genera.

FIG. 24.— Basidia in different stages of development; A, when very young; B, with the spore-branches beginning to form at the summit; C, showing the spore-branches with nearly mature spores at their ends. All highly magnified.

Black-dot Fungi (*Melanconiaceæ*) are like the spot fungi, but there are no spore cases, the spores developing in masses beneath the epidermis which they eventually rupture. *Glœosporium* is a common genus.

Molds (*Moniliaceæ* and related families) produce their spores on branches which grow out through the stomata of the host. Here we find the parasitic species of *Ramularia Cercospora*, etc., and the mostly saprophytic species of *Monilia*. *Botrytis*, etc.

Basidium Fungi (class *Basidiomyceteæ*). — The distinguishing mark of this class is that the spores are produced externally upon club-shaped or rounded terminal cells. (Fig. 24). These club-shaped, spore-bearing cells are technically known as *basidia* (singular, *basidium*), whence the scientific name of the class. The basidia of this class are regarded in this discussion as the homologues of the spore-sacs (*asci*) of the preceding class.

About 14,000 species of fungi of this class are known. Many attain to considerable dimensions, especially their fruits. They are typically saprophytic, but it is now known that many of them are more or less parasitic, also, when the opportunity offers.

About 210 families are commonly recognized, four of which, only, will be noticed here.

Puff-balls (*Lycoperdaceæ*) are saprophytes whose branching filaments penetrate decaying

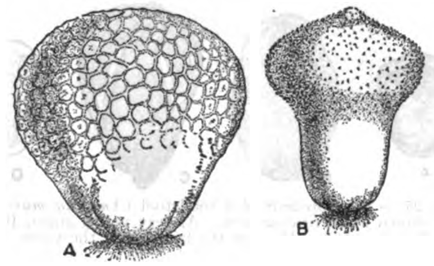

FIG. 25.— Two species of puff-balls; A, *Lycoperdon cœlatum*; B, *Lycoperdon gemmatum*.

wood or earth rich in organic matter, and finally produce globular fruits which rise above the surface. (Fig. 25), These fruits are filled with tortuous canals whose walls are studded with basidia on which the spores are produced. At maturity the interior tissues of the fruits deliquesce, setting free the spores, which escape into the air a little later as a dusty cloud, by the rupture of the fruit wall. From these spores new plants are produced, but we do not know the whole life history of these common fungi. Although the sexual organs should precede the formation of the fruits, they have not yet been observed.

Stink-horns (*Phallaceæ*) are closely related to the puff-balls, which they closely resemble in all stages excepting the last. Here the spore-bearing portion of the globular fruit is confined to a vertical, circular layer of tissue about midway between the centre and the circumference. At maturity the spore-bearing tissues deliquesce and at the same time the tissues below rapidly elongate, bursting the fruit-wall and carrying up the spores into the air. (Fig. 26). These fruits have very bad odors, which attract insects, and it is thought that these help to distribute the

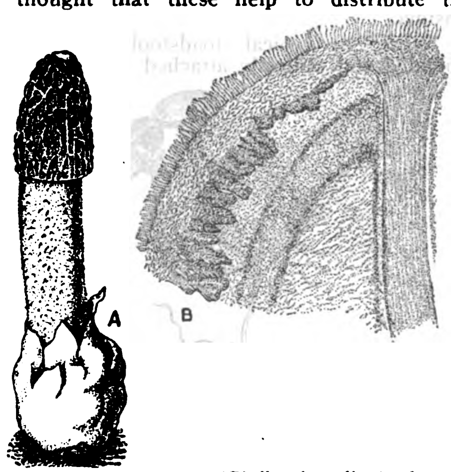

FIG. 26.— A, a stink-horn (*Phallus impudicus*) after the rupture of the volva; B, highly magnified section of the spore-bearing layer.

spores. Stink-horns are from an inch or two to six or more inches in height, and grow commonly in lawns and pastures, where their presence is indicated by their intolerable odor.

Toadstools, or **Mushrooms** (*Agaricaceæ*) are fungi of the puff-ball kind, consisting of white, branching filaments which creep through the nutriment substance or the host tissues.

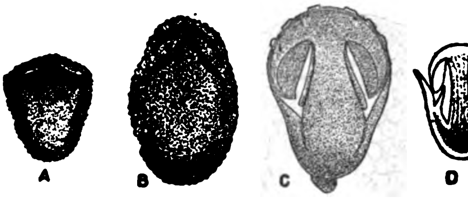

FIG. 27.— Development of a toadstool (*Amanita muscaria*) shown in vertical section. A, very young stage; B and C, later stages; D, after the bursting of the volva.

Most species are saprophytes, but some are parasites. When the fruits are young they resemble those of puff-balls, but as they grow older a circular layer of spore-bearing tissue develops, and this, by the rapid growth of lower lying tissues, is carried up on a stalk, very much as is done in the stink-horns. (Fig. 27). Here, however, the stalk is formed earlier, and the spores are usually developed after the rupture of the fruit-wall.

A typical toadstool fruit has the following structure: There is first at the bottom the cup-shaped remnant of the original fruit-wall (technically, the *volva*); from this rises the cylindrical stem (*stipe*), terminating in an expanded cap (*pileus*). The stem and cap together resemble an expanded umbrella, or a one-legged stool (Figs. 28 and 29), from which latter fact the common name "toadstool" was doubtless suggested. The lower surface of the cap is folded into many vertical radiating plates, called gills (*lamellæ*), and these are studded with the basidia, bearing the spores. This gill portion corresponds to the circular spore-bearing layer of the stink-horns, and the gills themselves are to be regarded as devices for increasing the number of spores, by an en-enlargement of the surface studded with basidia.

While in typical toadstools the cap is rounded and centrally attached to the stem, in

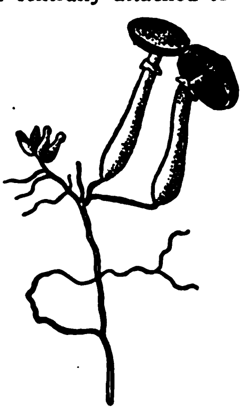

FIG. 28.— Two fruits of *Armillaria mellea* attached to the filamentous plant; several young fruits at the left. Considerably reduced.

some species its growth is not uniform, and the stalk is excentric, or even lateral. Lastly, let it be remembered that the toadstool which we see is not the plant itself (that is below the surface) but it is the fruit of the plant which develops in order that it may produce spores.

Pore Fungi (*Polyporaceæ*) are so named because the spore-bearing structure on the under side of the cap of the fruit consists of a mass of small vertical pores, instead of plates, and by this character they may be readily recognized. In typical pore fungi the general structure and development are similar to those of the toadstools, the change from gills to pores being the only important difference. Here, however, many of the species instead of growing into regular umbrella-shaped fruits have the stalk more or less laterally placed. In others, again, the lateral stalk is very short, and from this the step is a very short one to its complete suppression, when the cap is sessile marginally, as in the bracket fungi, which are

FIG. 29.— *Agaricus campestris*, the cultivated mushroom, showing several stages of development.

so common on decaying logs and other forms of timber.

Some pore fungi are fleshy, but for the most part they are hard and tough, often resisting decay for many years. Some of the species are perennial, adding successive layers of pore tissue to their fruits for some years.

ECONOMIC RELATIONS OF FUNGI.

The economic relations of the fungi are of great importance. Some are edible and furnish wholesome food to man and other animals, some are used in the arts, some yield medicines, some are the cause of disease in man and other animals, and some again attack and destroy other plants, including many of the cultivated plants of our farms and gardens.

Edible Fungi.— Here perhaps we should include those bacteria which have to do with the flavor of butter and cheese, and those molds whose presence in cheese adds to its edibility. Of far greater importance, however, are those species which are eaten for the nutriment which they contain. Truffles are collected in Europe, and sold in the markets. Dogs and pigs are trained to search for them, the attendant bagging the truffle when found by the keen scent of the animal. The Morels are sac fungi

3
5

POISONOUS FUNGI

1. Orange Chanterel (Cantharellus aurantiacus)
2. Hard-skinned Puffball (Scleroderma aurantium)
3. Green Russula (Russula furcata)
4. Emetic Russula (Russula emetica)
5. Poisonous Lactaria (Lactaria torminosa)
6. Death-cup (Amanita phalloides)
7. Thick-foot Boletus (Boletus pachypus)
8. Satan's Mushroom (Boletus satanas)
9. Antler Fungus (Calocera viscosa)
10. Fly Mushroom (Amanita muscaria)
11. Sulphur-tuft (Hypholoma fascicularа)
12. Lurid Boletus (Boletus luridus)

related closely to the cup fungi; each Morel (fruit) is a hollow-stalked body two to five inches high, with a crinkled and pitted conical cap in whose surface are embedded the spore-sacs. They grow in fields and in thickets, and when fresh are wholesome. Morels are often called mushrooms, although this name should be restricted to the next group.

Mushrooms (Fig. 29) are of the toadstool kind, and popularly but incorrectly any species which is edible is called a mushroom, while those which are poisonous are called toadstools. Many species are collected from the forests and fields by experts who have learned to distinguish them from the poisonous ones, but by far the most commonly used species is the common mushroom (*Agaricus compestris*) which is cultivated by gardeners for this purpose. See MUSHROOMS.

Poisonous Fungi.— Although the vast majority of the toadstools and other fleshy fruited fungi are edible or innocuous there are a number that are extremely poisonous and many others that, while not deadly, yet are likely to cause great discomfort or nausea. The most dangerous are the Death-cup (*Amanita phalloides*) and the Fly Mushroom (*Amanita muscaria*). The Emetic Russula (*Russula emetica*) is a common fungus that is poisonous, but its emetic nature prevents any serious injury. The occurrence of poisonous species of mushrooms makes great caution necessary on the part of those who otherwise would have in the great supply of mushrooms in the late summer and fall a source of food to be had for the picking. The only safe rule is to avoid any mushroom unless it is *known* to be harmless.

Medicinal Fungi.— The most important species is the Ergot (*Spermœdia clavus*), one of the sac fungi, which is parasitic in the heads of rye.

Pathogenic Fungi (on Animals).— Many bacteria are the direct cause of diseases of animals, including man. See BACTERIA.

Some of the water molds cause a serious disease of fishes, especially of young fishes in "hatcheries." Occasionally an epidemic, known as the "Salmon Disease," has been known to occur in the streams of Great Britain. Investigation has shown it to be due to a certain species of water mold.

The insect fungi (*Entomophthoraceæ*) annually destroy immense numbers of flies, locusts, caterpillar larvæ, etc. The common house fly is attacked by *Entomophthora muscæ* in summer and autumn. Every infected insect fastens itself by means of its tongue to some object, and soon perishes miserably, its body walls being pierced by innumerable spore-bearing branches. In the autumn myriads of locusts ("grasshoppers") are destroyed by *Entomophthora grylli*. When attacked by the fungus the locust climbs a grass or weed stem around which it finally clasps its legs and dies firmly attached. Many other insects, including mosquitoes, are destroyed by these beneficial fungi. Thus far all attempts to artificially apply these fungi in combating insects have been unsuccessful.

Several species of *Aspergillus* and other genera bring about a serious disease of the ear passages in man.

Pathogenic Fungi (on Plants). See PLANTS, DISEASES OF. See also VEGETABLE KINGDOM.

CHARLES E. BESSEY,
Late Professor of Botany, The University of Nebraska. Revised by ERNEST A. BESSEY, *Professor of Botany, Michigan Agricultural College.*

FUNGICIDES, fŭn'jĭ-sīd, any agent used to prevent the growth of fungi or their spores. The most important uses of fungicides are in agriculture and horticulture for controlling the fungi that attack crops. These may be divided into two general classes: (1) Fungi which burrow among the tissues of the host plants and expose little more than their fruiting organs to the air. (2) Fungi which expose almost all of their vegetative parts to the air, only the holdfast, absorbing organs (*haustoria*) entering the tissues of the host. From the nature of their growth it is easily seen that members of the second group may be attacked at any time, but that since the vegetative parts of members of the first group are protected by the tissues of the host they cannot be reached effectively by any fungicide without injuring the host. Controlling agencies in such cases must therefore be preventive.

For the control of the exposed fungi the chief agent is sulphur in out-door practice, applied as a powder, which is dusted upon the foliage, preferably with a powder gun. In the greenhouse it is more frequently evaporated, by strewing powdered sulphur upon the heating pipes or upon burlap suspended in warm parts of the greenhouse. This is a slow way, and is mainly preventive. When a considerable quantity must be evaporated in a short time the sulphur is gently heated over an oil stove. It is imperative that the sulphur be kept from igniting, because the fumes are destructive to host as well as fungus. For cleansing a greenhouse of objectionable fungi when the plants are out, the sulphur may be burned and all reachable parts sprayed liberally with Bordeaux mixture.

Various compounds of copper are used as preventives of the attacks of internal feeding fungi and as remedies for the exposed. Chief of these salts is copper sulphate, which may be applied in a pure solution only to dormant wood, walls, etc. It is used at the rate of one pound to the gallon, and will, at this strength, destroy lichens and algæ as well as fungi. For use upon foliage and other actively growing parts it must be mixed with some substance which will counteract its causticity. Lime is most frequently used, and the compound is called Bordeaux mixture from the French city where its usefulness was accidentally discovered about 1882. It is made as follows: A known number of pounds of copper sulphate are dissolved in an equal number of gallons of water, contained in a wooden tank or barrel, the salt being suspended at the surface of the water to ensure quick solution. In another receptacle a known number of pounds of lime, as free from magnesium as possible, are slaked with a little water, and when slaking is complete, enough more water is added to make the proportion one pound of lime to a gallon of water. When needed for use five gallons of the copper sulphate solution and five of the lime solution are separately diluted with enough water to make a combined total of 50 gallons.

The two diluted solutions are then thoroughly mixed, and afterward tested with ferrocyanide of potash to make sure that there is no uncombined copper sulphate. A brownish discoloration indicates that more lime must be added to neutralize the free copper salt. The mixture is then ready for general use, but for peaches, plums, cherries and some other plants, another 25 gallons of water must be added because of the susceptibility of the foliage to injury. The stock solution of copper may be kept for weeks, but the lime solution should stand for only a few days and the completed mixture for only a few hours, because the particles tend to flocculate and settle, a process which impairs the usefulness of the mixture.

Copper sulphate is often used as *eau celeste,* a solution of one pound of the salt to two gallons of water, plus three half-pints of standard ammonia, and then diluted with water to make 25 gallons. Since the strength of the ammonia varies, this solution often burns the foliage, there being insufficient ammonia to neutralize the free copper sulphate. This fungicide and ammoniacal solution of copper carbonate are used when a non-staining solution is needed, as in spraying ornamental plants and fruit which is nearing maturity. The latter solution is made by dissolving one ounce of copper carbonate in one pint of ammonia and mixing with 10 gallons of water.

The seeds of various cereals are often dipped in hot water formalin solution and copper sulphate solution to destroy fungous spores, and hot water is also used to some extent for destroying exposed fungi, spores, etc.

All solutions must be applied as a mist-like spray, to ensure which a nozzle with a small aperture is essential. The first application to fruit trees should be before the buds begin to swell. This may be a stronger solution than those used after growth starts. The second should be given when the buds begin to swell, the third when the blossoms have fallen. No spray should be given during the blossoming period. A favorite fungicide for ripening fruits is the ammoniacal copper carbonate solution, made by dissolving one ounce of copper carbonate in a pint of ammonia, to which are added 10 gallons of water. Lime-sulphur solution is also an efficient fungicide. It is made by boiling fresh lime and sulphur together, or by slaking lime in contact with sulphur. It is also used as an insecticide. Sulphur is a favorite remedy for various mildews. It is dusted in the foliage with a blower, but in greenhouses is evaporated. The usual apparatus for applying fungicides to plant foliage consists of a tank or container which can be made airtight, a hose with special nozzle which produces a mist-like spray and an air pump. By means of the pump air is forced into the tank containing the liquid, which then issues under pressure at the nozzle and is converted by the latter into a spray. All types of sprayer combine the above features in one form or another. (See FUNGI; BACTERIA). Consult Lodeman, 'The Spraying of Plants' (New York 1902); Prillieu, 'Maladie des plantes agricoles' (1895); Massee, 'Text-book of Plant Diseases' (New York 1899); Duggar, 'Fungous Diseases of Plants' (New York 1909); Stevens and Hall, 'Diseases of Economic Plants' (ib. 1910); various bulletins of the United States Department of Agriculture and of many of the State Agricultural Experiment Stations.

FUNGUS, fŭn'gŭs. See FUNGI.

FUNGUS-EATERS. The fungi enter largely into the food of the lower animals, and somewhat into the fare of the higher forms. The molds, slimes and various aquatic forms are devoured by echinoderms and mollusks, both bivalves and univalves, who take in the minute floating forms, or their spores, or eat the fixed growths from stones and other resting places, and by vegetable-eating fishes and crustacea. Pond-snails will keep the glass sides of an aquarium clean of vegetable growths, a large part of which is fungoid. Worms, slugs and insects in great variety feed upon the vast array of fungi not aquatic. Beetles are especially fond of the larger forms — the toadstools and tree-borne polypores. A large Javan beetle, known from its shape as the "fiddle-beetle" (*Mormolyce phylloides*), spends its life within and about certain fungi growing on tree-trunks. A whole family of small flies (*Mycetophilidæ*) breed in fungi, including the cultivated mushroom, beds of which are often largely damaged by the work of their maggots bred there; hence the group is termed "fungus-gnats." In the United States the woodland toadstools are eagerly fed upon when ripe in August and September, not only by great numbers of insects, slugs and snails, but by salamanders, tortoises (especially) and by all sorts of squirrels; but they seem to be rarely, if ever, eaten by birds. For the edibility of fungi by man, see MUSHROOM.

FUNGUS-GNAT. See FUNGUS-EATERS; GNATS.

FUNK, Franz Xaver von, German Catholic theologian: b. Abts-Gmünd, Württemberg, 1840; d. 1907. He received his education at Tübingen and at the Rottenburg Seminary, and also at Paris, where he paid special attention to economics. He became professor of theology at the University of Tübingen in 1870 and in 1876 became a member of the editorial staff of the *Theologische Quartalschrift* there. He published 'Opera Patrum Apostolicorum' (1878; 2d ed., 1901); 'Lehrbuch der kirchengeschichte' (1886; 4th ed., 1902); 'Die apostolischen Konstitutionen' (891); 'Kirchengeschichtliche Abhandlungen und Untersuchungen' (1899).

FUNK, fŭnk, **Isaac Kauffman,** American publisher: b. Clifton, Ohio, 10 Sept. 1839; d. 1912. He was graduated at Wittenberg College, Ohio, and after several pastorates, the last of which was in Brooklyn, N. Y., began a publishing business in 1872; founded and published the *Metropolitan Pulpit* (now the *Homiletic Review*) in 1876, and the *Literary Digest* in 1890. He has published also the 'Standard Dictionary' of which he was editor-in-chief (1890–94). He was an earnest Prohibitionist, and in 1884 founded the *Voice,* a prohibition journal, and was the Prohibition candidate for mayor of New York. In 1901 he began the publication of the important 'Jewish Encyclopedia.'

FUNK, Wilhelm Heinrich, American artist: b. Hanover, Germany, 14 Jan. 1866. He was educated in the public schools of his native land, and came to the United States after his father's death in 1885. He first attracted attention by a pen-portrait of Edwin Booth, the actor. He studied at the Art Students' League, New York, and was pen and ink artist on staff of the New York *Herald* 1891–96, also contributing to *Scribner's, Century, Harper's, Judge, Truth* and other magazines of the day. During this period he went to Europe every year and studied in the galleries of Holland, Spain, Germany, Italy and France, especially the masters of the 16th century. He now devotes attention to portrait painting, and has painted portraits of several members of the royal families of Germany and England, and many well-known men and women in the United States and in France. He is an especial member of the Munich Academy of Fine Arts.

FUNNEL-MARKS, painted designs on the funnels of ocean steamships to designate the ownership of the vessel. American line steamships are thus designated by a black funnel, white band, with black top; Cunard line, red funnel, with black rings and black top; French line, red funnel with black top; White Star line, buff funnel with black top; North German Lloyd line, cream funnel; Hamburg-American line, buff for express steamers, black for regular steamers; Holland-America line, green, white, and green.

FUNSTON, Frederick, American soldier: b. New Carlisle, Ohio, 9 Nov. 1865; d. San Antonio, Tex., 19 Feb. 1917. He was educated at the State University, Kansas, and was a commissioner of the Department of Agriculture to explore Alaska 1893–94. He served in the insurgent army in Cuba in 1896–97, and was made lieutenant-colonel. Suffering from wounds and illness he attempted to reach the United States, but was taken by the Spaniards and sentenced to death. At length he was liberated and on the outbreak of the war with Spain he was commissioned as colonel of the Twentieth Kansas Volunteers. He was sent to the Philippines and in 1899 became brigadier-general of volunteers. In March 1901, he commanded an expedition which succeeded in capturing the Filipino leader, Aguinaldo, and was appointed brigadier-general in the United States army in the same month. He became commander of the department of California in 1905 and, during the earthquake and fire of April 1906, placed the city under martial law and brought order out of chaos. From December 1907 to March 1908 he was in charge of troops at the Goldfield mining centre during the great strike of that year. In May 1914, Funston was sent with troops to Vera Cruz, Mexico; he brought sanitary and hygienic perfection out of disease-breeding uncleanliness and chaos, greatly improving the healthfulness of that tropical city. In November 1914 he was made a major-general. He was appointed commander-in-chief of the army mobilized on the Mexican border in March 1916, and also of movements of United States troops in Mexico, in pursuit of the bandit, Francisco («Pancho») Villa.

FUR-BEARING ANIMALS. Those animals whose pelts are utilized as fur garments or ornaments; specifically, animals of the carnivorous family *Mustelidæ*. See MUSTELIDÆ.

FUR-BEARING ANIMALS, Cultivation of, or **FUR FARMING,** is a new and promising industry in North America, which has been begun in view of the alarming decrease of these animals in their wild state. It will relieve the pressure on the wild stock, and will make it possible not only to supply the market with the pelts of captive stock, better on the average than wild skins, but also will enable the persons engaged to supply themselves with excellent furs at a comparatively small cost. As most of the animals to be utilized are natives of cold regions the industry can be successful, according to present information, only in the colder Northern States and in Canada, as in warmer regions good long fur will not be produced; but the beaver, skunk, muskrat and raccoon may be cultivated almost anywhere when local circumstances are favorable. Farmers are most advantageously situated to carry on this industry as a side-line, so that it has come to be called «fur-farming.» Much of the food required, which is mainly such as is fed to dogs and cats, involves little expense, and the labor of attendance is light, except, perhaps, in the case of black foxes. This special line requires a considerable investment and an expensive upkeep if entered upon systematically.

The earliest serious attempts were made in Oneida County, N. Y., where minks were reared in 1866 by H. Resseque, and by others later, with profitable returns; but were not long continued. Latterly mink culture has been resumed in Canada by many persons, one company in Quebec having embarked about $50,000 in the enterprise. Minks require access to water, and the yard in which they are confined should include a small space of pond or of a running stream. They are fed on bread, corn-meal mush and the like, with fish or meat twice a week. The results thus far are highly encouraging.

The Canadian pine-marten and the larger pekan (see MARTEN) have been bred in captivity, and several serious efforts are now in progress in Canada toward their cultivation; but the difficulties of success with these animals are great. The same is true of the otter, experiments with which are being made, with good promise of success. The fur of all three is very costly, and successful cultivation would be very profitable. The raccoon is far more easily reared, and this is now done in hundreds of farm-yards, where the space required and the food supply can be furnished with almost no expense, and the returns are gratifying; but wild stock is still too abundant to make the culture of this animal very important as yet. The same may be said of the skunk. Two kinds of skunks exist in North America — the common black-and-white northern skunk, and the smaller variegated or «striped» skunk of the southwestern border and Mexico. Both produce fur that is in constant demand at good prices, the pelts of the northern skunk being now worth about $3. The skunk breeders in this country now exceed in number that of all other animals combined. This animal tames quickly and is easily managed and cheaply fed; and it offers the great advantage that it remains asleep in its den during cold weather, when other animals need the most costly attention. Any farmer or villager may easily rear a few; and there is much inducement to engage in skunk-breeding as a regular business on a large scale. In undertaking to rear these or any other animals the principle of action must be to arrange food and a manner of life for the captives as nearly as possible like that to which they are accustomed when wild.

The cultivation for its fur of the fox in captivity is the most important and extensive venture in this direction yet made. American foxes, from the point of view of the furrier, are of four kinds: (1) The gray fox of the southern United States; (2) the small swift or kit fox of the western plains; (3) the red or «common» fox, and (4) the white arctic fox. The first two have not yet been cultivated, nor do their pelts enter largely into trade. The arctic fox is yet too abundant to attract capital to its culture; but a small proportion of the species, perhaps 10 per cent, are not white even in winter, but slate-blue in color all the year round, and are known as «blue» foxes. These have been held in captivity and reared for their fur for many years at places along the shores of Alaska, and on certain islands in Bering Sea; but in most places they are able to pick up their own food (largely fish), or need be fed only a part of the year, and are caught late in the fall by trapping. Several expensive experiments have been made in establishing breeding establishments for these blue foxes in eastern Canada, and they promise well, but definite results are not at hand.

Fox-farming.— The red fox, which, in its normal fulvous condition, contributes thousands of beautiful pelts to the furriers annually, has a strong tendency toward black in its pelage. When one shows a line of black along the spine and across the withers it is called a «cross-fox»; when the dark coloring is more irregular it is a «patch-fox»; when black all over, with the tips of the hairs white, it is a «silver fox.» This last is the most valuable variety, and one which varies from grizzly to almost pure black; finally, some may be pure black. To rear in captivity the ordinary red type would not be worth the cost; but to cultivate by selective breeding the high-priced silver and black furs promised wealth. Attempts to do this began in eastern Canada more than 50 years ago, but no considerable success was reached until two independent fox-breeders in Prince Edward Island united their knowledge and stock in 1894, and began to produce black and silver foxes the sale of which, as breeding pairs, brought them great wealth, and aroused a furor of excitement and an army of more or less speculative fox-farmers. The success of these originators was owing not only to the acquired knowledge and experience of many years, but to what is now known to be a most favorable situation, and to the availability of wire-mesh for fencing. To make a fox-proof fence had been, until the invention of woven wire, a practical impossibility.

Messrs. Oulton and Dalton, operating with great secrecy, continually bred from darker and darker animals until finally they achieved silver and black strains that bred true; but it was not until 1910 that they felt justified in appearing in the market. The first 25 silver skins sent to London sold at auction for an average of $1,386 apiece. This created a furor of speculation. «People who formerly had known something of the business,» says Osgood, «were now eager to engage in it. . . . How rapidly prices for breeding-stock advanced is well illustrated by the experiences of one ranchman who sold his first pair of cubs for $750, and other pairs successively for $3,000, $12,000, $13,000 and $14,000.» The maintenance of this prodigious inflation of prices was due mainly to stock companies which sprang up like mushrooms and were capitalized so recklessly that in May 1913, when the value of the foxes on Prince Edward Island was estimated officially at $15,000,000, the combined capitalization of 196 registered companies was $29,305,700, and in December 1914 was $31,500,000. In addition to this fox «ranches» were established all over Canada, and in almost every one of our northern tier of States. Then the monopoly was broken. Wild stock was searched for and found in increased amount, the war came on, and the inflation collapsed. Ranch-bred silver foxes could soon be bought for $1,500 to $2,000, or often much less, and pelts fell in price to the level of 10 years ago. «Now, with a comparatively large number of silver foxes in domestication, with a clearer understanding of their successful management, and with a return of moderate prices for breeders, a steady, healthy and general development of silver-fox farming may be expected.»

Karakul.— A very different kind of domestication of animals for the production of fur is that of the Central-Asian sheep, known as karakul (Black Lake), whose lambs at birth are clothed in a coat of closely curled black hair, formerly designated astrakan or Persian lamb. Some of these sheep (known as Arabi, Krimmer, broadtail, etc.) were imported, at great trouble and expense, in 1908 and their progeny, crossed with other breeds, is now producing these valuable lamb-skins here and in Canada. The industry is experimental as yet, but seems likely to prove a very valuable success. Consult Ingersoll, E., 'Animal Competitors' (New York 1911); Jones, J. W., 'Fur Farming in Canada' (Montreal 1913); Circular on Karakul Sheep (Department of Agriculture, Washington 1913); Dearborn, Ned, 'The Domesticated Silver Fox' (Department of Agriculture, Farmers' Bulletin 795, Washington 1917, which summarizes Farmers' Bulletins 301 and 328 previously issued).

ERNEST INGERSOLL.

FUR SEAL, the fur-bear or northern fur-seal (*Otaria ursina*), whose pelts form the seal-skins of commerce. (See FUR TRADE). There is also a southern fur-seal (*O. nigrescens*), dwelling along the southern coast of South America. See SEAL.

FUR TRADE, The. The history of the fur trade is so closely interwoven with the early history of America that it is extremely difficult to narrate one without reference to the other. Among all the industries that helped to make this country one of the great commercial nations of the world none exerted such an important influence upon the early prosperity of the colonies as that represented by those who took the pelts of animals and prepared them for manufacture into various articles for the use of mankind. The rich peltries of North America attracted hardy French and British adventurers to the shores of the New World, and to obtain furs they journeyed into the most distant and inaccessible parts of the land; and that

they might have havens of safety in which to store their pelts, and, incidentally, rest secure from the attack of a savage foe, they established small settlements, so many of which have since grown into prosperous communities. It was the fur trader, therefore, who was the real pioneer in North America. Always in advance of civilization, his labors in leading the way for the settlement of the country provided a means of advancement that would have been much delayed if it had not been for these preparatory efforts. The Canadian provinces, for example, owed practically all their primary prosperity to their fur trade, for in Canada, as throughout the English colonies farther south the native Indians were so ignorant of the value of the pelts which they gathered that they were willing to dispose of them upon terms that permitted an enormous profit to the successful trader.

Era of Great Fur Companies.— The conditions under which the fur trade with the natives was conducted soon became such a serious scandal that the licensing system was introduced, but this too soon became subject to abuse.

It was during these early days that the feuds between the British merchants of New York and the Canadian (French) traders became a serious factor in the industry. There can be little doubt that the former set out deliberately to encroach upon the fur interests of Canada, and the infringement of territorial rights had become serious when the Hudson's Bay Company was formed in 1670. This British company, which was chartered by Charles II, had the exclusive privilege of planting trading stations on the shores of Hudson Bay and all its tributaries, and when, about a century later, France lost possession of her Canadian colonies, the Britons assumed almost exclusive control over the great fur trade of America. Prior to the beginning of the 19th century this trade was chiefly monopolized by the powerful trading companies.

First in the field, of course, was the Dutch West India Company, with its prosperous trading-posts at New Amsterdam (now New York), Beaverwyck (now Albany), and at several points on the Delaware. Next came the extensive Hudson's Bay Company, which practically monopolized the trade in furs for 200 years, or until the Northwest Company entered the field and established a somewhat successful rivalry, although its efforts were confined almost entirely to the Pacific coast. This was an organization of French-Canadian merchants, and was formed in 1784 under the name «Compagnie du Nord-Ouest.»

It was in 1808 that John Jacob Astor formed the American Fur Company, establishing a line of trading-posts that extended across the continent, with a depot for furs at the mouth of the Columbia River, from which point he intended to ship direct to China and India. The name of the concern was afterward changed to the Pacific Fur Company and Mr. Astor saw his enterprise on the high road to success, when, in 1813, he was treacherously sold out to the Northwest Company by his resident partner, the latter claiming that, as the United States was then at war with Great Britain, the British soldiers would have taken the establishment by force if he had not made other disposition of it. After this incident, Mr. Astor confined his operations to the district east of the Rocky Mountains, where he, with his partner and successor, Ramsay Crooks, transacted a profitable business in furs for many years. The Russian-American Fur Company, which had its main trading-post at Sitka, Alaska, with many subordinate posts on the Yukon, carried on an immense traffic in such lines until 1867, when all its rights and properties were transferred to the United States with the purchase of Alaska.

Astor's Enterprises.— It was somewhat prior to 1809 that John Jacob Astor conceived his great project to make the American fur trade independent of the Hudson's Bay Company. As his scheme was partly based upon the fact that such an enterprise would have a strong tendency to spread the civilization of the East into the far western country, he asked the aid of Congress in carrying it into execution. Mr. Astor's idea was to establish a connected chain of trading-posts from the Great Lakes to the Pacific Ocean, with a central depot for packing and shipment at the mouth of the Columbia River; to acquire one of the Sandwich Islands as a provision station and to establish a line of vessels to sail from the west coast of North America to the most important ports in India and China. Washington Irving, in his 'Astoria,' presents a graphic description of this gigantic enterprise which met with such a strange disaster when Astoria, the town founded at the mouth of the Columbia River in 1811, was so unnecessarily abandoned during the War of 1812. The remainder of Mr. Astor's career, however, was quite as remarkable. Year after year his fur business was extended until its operations surpassed those of any house that had hitherto been established. In addition to its immense American business a gigantic export trade was carried on with many countries, and, when the founder of the company died, he left a fortune that was estimated at $20,000,000. William Backhouse Astor, his son, was interested with him in the fur trade, and when, in 1827, the house of John Jacob Astor & Son was merged in the American Fur Company, he became its president.

Later Developments.—The first great establishment founded in Saint Louis — one of the principal depots of the fur trade from the middle of the 18th century until 1859 — was that of Laclede, Maxon & Company, in 1763. In the early days of this house the brothers Auguste and Pierre Chouteau were connected with it, and the establishment, which was extremely successful, employed a large number of trappers and voyageurs. In 1808, the Chouteau brothers and a number of their associates in the older firm withdrew to form the Missouri Fur Company. This prospered until about 1813, when, because of the war with Great Britain, it was dissolved. During the next few years several of its members transacted business independently, but, in 1827, the Rocky Mountain Fur Company of Saint Louis was formed to send trappers to the Pacific coast. At this time the perils of the work were so great that fully 40 out of every 100 persons employed in it perished, and yet the life of adventure offered so many fascinations that there was no lack of hardy men eager to take the places of the slain. After several years of varying success the company was dissolved. In 1834, however, Pierre Chouteau, Jr., who had been educated in the fur trade by his father, organized the house of Pierre Chouteau, Jr. & Company, a firm name which was a household word among hunters and trappers during the next 25 years. In 1859, the business was sold to Martin Bates and Francis Bates of Saint Louis and New York.

The table that follows is designed to present a list of the principal fur-bearers of the world, their habitat and their average yield during the 30 years previous to the opening of the European War which has wrought far-reaching disturbance in this trade, but will benefit the animals, especially in Russia. The authority is the fur statistician, Emil Brass, of Leipzig.

The year 1859 saw the American fur trade more widely diffused than ever before. The

NAME OF ANIMAL	Explanations	Habitat — Source of raw fur	Average annual supply, 1900–1913
Badger	Several species	N. America, 30,000; Europe and Asia, 130,000	150,000
Bear, black	*Ursus americanus*	North America	20,000
Bear, brown	Several species	N. America, 2,000; Asia and Europe, 12,000	14,000
Bear, grizzly	*Ursus horribilis*	North America	1,200
Bear, white	Polar bear (*U. maritimus*)	Polar regions	1,000
Cat, domestic	Common house cats	N. America, 80,000; Europe, chiefly Holland and Russia, 770,000; Asia, 150,000	1,000,000
Cat, wild	Various species, not lynx	See WILD CAT.

Fox, black	Variety of red fox	Rare and extremely costly	....
Fox, blue	Blue variety of white fox	Polar regions, especially Alaska	11,000
Fox, cross	Variety of red fox	North America	15,000
Fox, gray	*Uracyon cinereo-argenteus*	North America	50,000
Fox, Japan	Raccoon-dog (*Nyctereutes procyonides*)	China, Japan, Korea	260,000
Fox, karganer	....	Central Asia	150,000
Fox, kit	Small species of open plains	N. America, 4,000; Central Asia, 60,000	64,000
Fox, pampas	Several Patagonian fox-wolves	Argentina	15,000
Fox, silver	Variety of red fox	North America, 4,000; Siberia, 300	4,300
Fox, white	Arctic fox (*Vulpes lagopus*)	Alaska and polar regions	105,000
Fur seal	*Otaria ursina*	Bering sea	68,000
Hamster	*Cricetus frumentarius*	Germany, 2,000,000; Austria, 250,000	2,250,000
Hare, polar	Several northern, winter-white species	N. America, 200,000; Siberia, 5,000,000	5,200,000
Karakul	See LAMBSKINS.		
Kolinsky	Siberian polecat; also similar skins	Siberia, etc., 200,000; China, 500,000; Japan, 200,000	900,000
Lambskins	Newly-born lambs of Asiatic sheep	Persia, Turkestan, southern Russia	2,860,000
Lynx	American and Old World lynxes	N. America, 90,000; Europe and Asia, 40,000	130,000
Marmot	Woodchucks and other ground-squirrels	N. America, 30,000; Asia, 4,550,000	4,580,000
Marten	Three Old World species, except sable	Europe, 530,000; N. Asia, 60,000	590,000
Marten, Hudson Bay	Pine marten (*Mustela Americana*)	North America	120,000
Mink	*Putorius vison*, and other species	North America, 600,000; North Asia, 60,000	660,000
Mole	Old World species	Europe and Asia	1,000,000
Muskrat	Musquash (*Fiber sibethicus*)	North America	8,000,000
Nutria	(*Myopotamus coypu*). Coypu; Otter	Northern South America	5,000
Opossum	American (*Didelphys virginiana*)	Southern United States	1,000,000
Opossum	Australian, several marsupials	Australia and New Guinea	4,000,000
Ocelot	Leopard cat (*Felis pardalis*)	(Included in WILDCAT)	....
Otter	*Lutra canadensis*	North America, 30,000; Asia and Europe 86,000	116,000
Polecat	*Putorius fœtidus:* Fitch	Europe and Siberia	290,000
Rabbit	The European Coney (*Lepus cuniculus*)	France and Belgium, 50,000,000; Germany and Russia, 1,000,000; Australia, 20,000,000	71,000,000
Raccoon	*Procyon lotor*	North America	600,000
Raccoon-Dog	See FOX, JAPAN.		
Sable	Mustela zibellina	Siberia, 70,000; China, 20,000; Japan, 5,000	95,000
Skunk	*Mephitis mephitica*	North America, 1,500,000; South America, 5,000	1,505,000
Squirrels	Several Old World species	Siberia, 15,000,000; China, 500,000 (Also 75 tons of squirrel-tails).	15,500,000
Weasel	See ERMINE; KOLINSKY (Chinese).		
Wildcat	Common European Wildcat, and others	Asia and Europe, 50,000; South America, 10,000	60,000
Wolf, gray	Several species	North America, 8,000; Russia and Asia, 22,000	30,000
Wolf, prairie	Coyote	North America	40,000
Wolverine	Glutton; carcajon	North America, 3,000; Europe and Asia, 5,000	8,000
Total (1909)			*123,213,100

* There is good reason to estimate that by June of 1914 this total had been increased to 130,000,000 skins. Only those are counted that pass through the world's auction markets, where the total cash value realized by the sellers of this raw material is probably not less than $100,000,000 annually.

passage of the industry into the hands of individuals had commenced to be apparent as early as 1821, and while, by the middle of the century, the aggregate amount collected each year was much greater than it had been 40 years previously, the opportunities for making great fortunes in the trade had gone. A writer in *Silliman's Journal* (1834) gives an interesting description of the situation of the fur trade at that time. He says:

«The Northwest Company did not long enjoy the sway they had acquired over the trading regions of the Columbia. A competition, ruinous in its expenses, which had long existed between them and the Hudson's Bay Company, ended in their downfall and the ruin of most of the partners. The relict of the company became merged in the rival association, and the whole business was conducted under the name of the Hudson's Bay Company. This coalition took place in 1821. Almost all the American furs which do not belong to the Hudson's Bay Company find their way to New York and are either distributed thence for home consumption or sent to foreign markets. The Hudson's Bay Company ship their furs from their factories of York Fort and from Moose River, on Hudson Bay; their collection from Grand River, etc., they ship from Canada; and the collection from Canada goes to London. None of their furs come to the United States, except through the Indian market. The export trade of furs from the United States is chiefly to London. A quantity of beaver, otter, etc., is brought annually from Santa Fe. Dressed furs for edgings, linings, caps, muffs, etc., such as squirrel, genet, fitchskins, and blue rabbit, are received from the north of Europe; also cony and hare's fur; but the largest importations are from London, where is concentrated nearly the whole of the North American fur trade.»

As early as 1834 those who were interested in this industry began to fear that the American fur trade had commenced to decline and, even at that time, it was quite freely predicted that its downfall would be rapid. By this period there were practically no new lands to be explored. The hunters and trappers in the employ of the great fur-trading companies had gone everywhere and had slaughtered so indiscriminately that it seemed almost impossible that the fur-bearing animals should not be exterminated. It is true that now the buffalo and large deer, the bears and the puma and the otter, beaver and pekan are gone or become rare so far as their interest to the trade is concerned, but the smaller, and on the whole, more important fur-bearers, are about as numerous as ever, several kinds maintaining their numbers in the very midst of civilization, as does the muskrat, mink and skunk. As a matter of fact the yield of American pelts in early times was far less a year than recently. Take the muskrat, for example. The average number of skins sold on the London market between 1800 and 1850 was about 411,000; from 1850 to 1900 it was more than 2,500,000. In recent years the London sales were: 1911, 5,197,530; 1912, 5,014,921; 1913, 6,876,417; 1914, 10,488,647. In addition to this an enormous number of skins was used from year to year in the United States and Canada. The average sales of skunks increased in the same way. In 1858 London disposed of 18,255 skins; in 1878, 285,103; in 1898, 482,130; in 1908, 1,037,641; in 1909, 1,115,910; in 1910, 1,282,000; in 1911, 2,009,465; in 1912, 1,821,485; in 1913, 1,659,773. The persistence of these two, and other animals, against such a warfare is largely due to the laws that now protect them except during the breeding-season. Nevertheless the finest fur-bearers, such as the sable, marten, sea-otter and silver fox have rapidly decreased in the present century.

Consult files of the *Fur Trade Review*, *Fur News Magazine* and the publications of the United States Department of Commerce and Labor, especially the consular and trade reports; also of the Canadian Commission of Conservation.

ERNEST INGERSOLL.

FÜRBRINGER, für'bring-ẹr, **Max Karl**, German anatomist: b. Wittenberg 1846. He received his education at the universities of Jena and Berlin; was appointed professor at the former institution in 1888 and at the University of Heidelberg in 1901. His works have been noteworthy contributions in their special field; they include 'Die Knochen und Muckeln der Extremitäten bei den schlangenähnlichen Saurien' (1870); 'Zur vergleichenden Anatomie der Schultermuskeln und des Brustschulter apparatus' (5 parts, 1872–1902); 'Zur Entwicklung der Amphibiennière' (1877); 'Untersuchungen zur Morphologie und Systematik der Vögel' (1888); 'Morphologische Streitfragen' (1902); 'Abstammung der Säugetiere' (1905).

FURETIÈRE, fü-rẹ-tyār, **Antoine**, French lexicographer and litterateur: b. Paris 1619; d. there 1688. He studied law at first, followed the profession of advocate and became fiscal procurator of the Abbaye de Saint-Germain. Later he became abbé of Chalivay and prior of Pruines. In 1655 he published a volume of 'Poésias diverses'; in 1658 the 'Nouvelle allégorique ou Histoire des derniers troubles arrivés au royaume d'éloquence'; 'Voyage de Mercure' (1659); the two last-named secured his admission to the Academy in 1662. Later from his pen appeared 'Fables' and 'Le Roman bourgeois,' in which he depicted with extraordinary realism the manners of Paris in 1666. About this time he became intimate with Racine, Boileau, Molière and La Fontaine; with whom he collaborated in 'Le Chapelain décoiffe.' Furetière was one of the greatest satirists of his age and also the most learned. For over 40 years he labored on a 'Dictionnaire universel,' for which in 1684 he had obtained the royal privilege. It did not appear until 1690 at Rotterdam, two years after the author's death. The Academy, which for many years had in preparation a dictionary of its own, was greatly opposed to Furetière's project and in 1685 brought about his deposition from the Academy. His dictionary had many special merits and served as a basis for the 'Dictionnaire de Trévoux. Consult Gosse, 'The Romance of a Dictionary' (in New York *Independent*, 1901) and Chatelain (in *Revue Universitaire*, Paris 1902).

FURIES, EUMENIDES, or ERINYES, called by the Romans FURIÆ and DIRÆ, were Greek mythological divinities, the avengers of murder, perjury and filial ingratitude. They sprang from the drops of blood which fell from Uranus when he was mutilated by his son Kronos or Saturn. Others make them the daughters of Acheron and Night, and of Pluto and Proserpine. Later mythologists reckon three of them and call them Alecto the unresting, Megæra the jealous, and Tisiphone the avenger. They were supposed to be the ministers of the gods and to execute their irrevocable decrees; their sphere of action consequently was both in the infernal regions, to punish condemned souls, and on the earth to rack the guilty conscience and chastise by mental torments. Æschylus, in the celebrated tragedy of the Eumenides, introduced 50 furies, and with them Horror, Terror, Paleness, Rage and Death upon the stage. These terrible beings were described as clothed in black robes, with serpents instead of hair, with fingers like claws, a whip of scorpions in one hand and a burning torch in the other, an outstretched tongue and eyes dripping with gore. They were suckers of the blood of men; when they were enraged, a venom oozed from them that spread like a leprosy-spot wherever it fell and made the ground barren. They were regarded with great dread and the Athenians hardly dared to speak their names, but called them the *venerable goddesses,* by a similar euphemism the name Eumenides, signifying the soothed or well-pleased goddesses, being introduced. They dwelt in the cave called after them, at the northeast corner of the Areopagus at Athens, below the seats of the judges. Erinyes, the more ancient name, signifies the hunters or persecutors of the criminal, or the angry goddesses. The sculptors represented them as beautiful hunting nymphs, whose character was indicated only by the sternness of their expression, by the torch, dagger and other similar emblems.

FURIUS, Marcus Furius Bibaculus, Roman poet: b. Cremona 103 B.C.; date of death unknown. He is classed by Quintilian along with Catullus and Horace as one of the most distinguished of the Roman satiric iambographers. From the scanty and unimportant specimens of his works transmitted to modern times, we are scarcely in a condition to form any estimate of his powers. A single senarian is quoted by Suetonius, containing an allusion to the loss of memory sustained in old age by the famous Orbilius Pupillus; and the same author has preserved two short epigrams, not remarkable for good taste or good feeling, in which Furius sneers at the poverty to which his friend, Valerius Cato, had been reduced at the close of life, as contrasted with the splendor of the villa which he had once possessed. It seems certain that he published a poem on the Gallic wars, entitled 'Pragmatia Belli Gallici.' This is known to us only from a metaphor parodied by Horace, who ridicules the obesity which distinguished Furius. Consult Bährens, 'Fragmenta Poetarum Romanorum' (Leipzig 1886); Schang, 'Geschichte der Römischen Litteratur' (3d ed., Munich 1907); Weichert, 'Poetarum Latinorum Fragmenta'; id., 'Dissertatio de Turgido Alpino S. M. F. Bibaculo' (Meissen 1882).

FURLOUGH, the absence, with leave, of enlisted men. In the United States army the post or regimental commander may grant furloughs not to exceed one month in duration, the brigade commander for two months, the division or department commanders for three months, and the Secretary of War for longer periods, in case of necessity. Not to exceed 5 per cent of any command may be absent on furlough at any one time. Soldiers on furlough are entitled to pay, and to commutation of rations at the rate of 25 cents per diem. Consult latest edition of 'United States Army Regulations.'

FURMAN, Richard, American Baptist clergyman: b. Esopus, N. Y., 1755; d. Charleston, S. C., August 1825. While he was an infant his father removed to Sumter district, S. C. His education, though obtained irregularly, became considerable, including a knowledge of Latin, Greek and Hebrew. He was converted at an early age, and soon began to preach, and at 19 was ordained pastor of the High Hills Baptist Church. On one occasion he was not allowed by the sheriff to preach in the courthouse at Camden because he was not a member of the established (Episcopal) church. At the beginning of the Revolution he actively promoted measures for removing the disabilities under which the Dissenters labored. During that struggle he became so conspicuous as a patriot that Lord Cornwallis offered a reward for his apprehension, and after a while he retired to Virginia, where Patrick Henry was a regular attendant on his ministry. In 1787 he became pastor of the First Baptist Church in Charleston, S. C., in which relation he continued for 37 years. He was a member of the convention that framed the first constitution of South Carolina, and vigorously opposed in that body the provision which excluded ministers from certain offices. In 1814 he was elected first president of the Triennial Convention of Baptists, and for several years was president of the South Carolina Baptist Convention. He published several sermons and addresses, including one commemorative of George Washington. Furman University at Greenville, S. C., was named in his honor. Consult Sommer, 'Memoir of John Stanford' (New York 1835).

FURMAN UNIVERSITY, a coeducational institution in Greenville, S. C., founded in 1854 under the ausipces of the Baptist Church. Reported in 1916: Professors and instructors, 16; students, 276; volumes in the library, 8,000.

FURNACE, an apparatus wherein a vehement fire and heat may be made and maintained, as for melting glass, ores or metals, heating the boiler of a steam-engine, warming a house, firing pottery or baking bread and other such purposes. Furnaces are constructed in a great variety of ways, according to the different purposes to which they are applied. In planning furnaces the following objects are kept in view: (1) To obtain the greatest quantity of heat from a given quantity of fuel. (See FUEL). (2) To prevent the dissipation of the heat after it is produced. (3) To concentrate the heat and direct it as much as possible to the substances to be acted on. (4) To be able to regulate at pleasure the necessary degree of heat (see HEAT) and have it wholly under the operator's management.

The materials of which a furnace is constructed must be able to endure wide variations of temperature as well as the highest degree to which it may be subjected, without losing their physical or chemical constitution. Such materials are called "refractories" (q.v.).

Furnaces are hand-fired when the fuel is added from time to time by hand. There are two types of mechanical stokers — underfeed and overfeed. The former employs a steam ram which forces the fuel up from below, and is used generally in connection with forced draught: the overfeed type employs a grate which moves horizontally from the front of the furnace toward the rear, the fuel being fed from a hopper on to the front end, and the ashes and cinders passing off at the rear. The grate resembles an endless chain. The Murphy furnace has a V-shaped cross-section, with feeders along each side, at the top of the V, the grates forming the sides of the V. At the bottom is a shaft which may be revolved to remove the ashes.

In all furnace construction the effort is made to secure smokeless combustion, and many smoke-consuming devices have been invented. Most of these have been unsatisfactory, and in any event the formation of smoke in the first place shows that the problems of economical combustion have not been solved. One of the improvements has been the admission of air above the fire through the fire-door, which supplies oxygen for the consumption of the unburned gas. Steam jets have been tried for the same purpose, but their disadvantages overbalance the gains. The indirect-fired furnace, which has a separate chamber for the fire, obviates the smoke difficulty to a large extent, and, by using the chimney gases to heat the air admitted to the fire chamber, a higher degree of working heat is secured.

An air furnace is one in which the flames are urged only by the natural draught of the chimney; a blast furnace, one in which the heat is intensified by the injection of a strong current of air by artificial means; a reverberatory furnace, one in which the flames in passing to the chimney are thrown down by a low-arched roof on the objects which it is intended to expose to their action. A gas furnace is one in which gas is used for fuel.

The gas to be consumed and the air to be used in the combustion are introduced into the combustion-chamber by separate pipes or openings, preferably in parallel streams near to each other, or in opposite directions along one channel so as to mingle before entering the chamber. The fuel may be either natural gas, or what is called «producer gas» specially manufactured for the purpose; or it may be the by-product of some other industrial process, for example, the waste gases of the blast furnace. Regenerators are furnaces in which the gaseous fuel and the air to be mixed with it are heated before combustion with a view to increasing the working temperature of the furnace. The advantages of gas furnaces may be briefly summarized thus: no ashes or slag, high temperature, certainty of action and capability of exact regulation, simplification of working power, comparative cheapness and economy. The electric furnace utilizes the electric current to produce the highest temperatures used in the arts. (See COMBUSTION; ELECTRIC FURNACE; HEATING; GAS; GAS, NATURAL). Consult Clark, T. M., 'The Care of a House' (New York 1912); Damour, E., 'Industrial Furnaces' (New York 1906); Havard, F. J., 'Refractories and Furnaces' (New York 1912); Hays, J. W., 'Combustion and Smokeless Furnaces' (Chicago 1915); Peebles, J. C., 'Furnace Efficiency' (Chicago 1914).

FURNACES, Metallurgical. See METALLURGY.

FURNEAUX, fur-no', **Tobias**, English navigator: b. Swilly, Plymouth, 21 Aug. 1735; d. there, 19 Sept. 1781. Entering the royal navy he saw active service in the latter part of the Seven Years' War, 1760–63. In 1766–68 he was second lieutenant to Captain Wallis of the *Dolphin* in a voyage around the globe. He commanded the *Adventure* which accompanied Captain Cook in his second voyage of discovery. On this voyage from February to May 1773 he was separated from Cook and again from October 1773 to July 1774. He pursued the objects of the expedition, however, and made the first British chart of the coasts of Tasmania where much of the nomenclature given by him survives. Cook named the islands in Bank Straits after Furneaux, also a group now known as the Low Archipelago. In 1775 Furneaux became a captain and on 28 June 1776 commanded the *Syren* in the attack on Charleston, S. C. Consult the life by Rev. Henry Furneaux (in 'Dictionary of Natural Biography').

FURNEAUX ISLANDS, a group in the South Pacific off Tasmania, to which colony they belong. The total area is about 1,050 square miles. The principal islands are Flinders, Cape Barren and Clarke. The inhabitants number about 700, and earn their livelihood by seal-fishing, the capture of sea-fowl, etc. The islands were discovered in 1733 by Tobias Furneaux (q.v.).

FURNESS, SIR **Christopher,** English ship builder and ship owner, 1ST BARON: b. West Hartlepool, 23 April 1852; d. Ripon, 10 Nov. 1912. The son of a farm laborer who became a corn merchant, he achieved his first success for the firm by shipping flour from Sweden during the Franco-German War.. In 1874 he founded the «Furness» line of steamships, which now owns nearly 100 steamers, with a total tonnage of close on 300,000 tons. He also established the great ship-building firm of Furness, Withy and Company, Hartlepool, in connection with which in 1909 he set on foot a profit-sharing scheme, which, however, was abandoned two years later at the request of the unskilled workers. He represented Hartlepool in the Liberal interest 1891–95 and 1900–10. He was knighted in 1895, and raised to the peerage in 1910.

FURNESS, Horace Howard, American Shakespearian scholar and editor; son of William Henry Furness (1802–96) (q.v.): b. Philadelphia, 2 Nov. 1833; d. 13 Aug. 1912. He was graduated at Harvard in 1854; studied law, and was admitted to the bar in 1859. The honorary degree of Ph.D. was conferred on him by the University of Göttingen in recognition of his services to Shakespearian literature. He is the editor of the exhaustive 'New Variorum Edition' of Shakespeare, the successive volumes of which appearing since 1871 include 'Romeo and Juliet' (1871); 'Macbeth' (1873); 'Hamlet' (2 vols., 1877); 'Lear' (1880); 'Othello' (1886); 'Merchant of Venice' (1888); 'As

You Like It' (1890); 'Tempest' (1892); 'Midsummer Night's Dream' (1895); 'Winter's Tale' (1898); 'Twelfth Night' (1901); 'Love's Labor Lost' (1904); 'Antony and Cleopatra' (1907), and 'Cymbeline' (1913). He was aided in his editorial work by his wife and his son. He received honorary degrees from Columbia, Harvard and Yale, and was a member of the American Academy of Arts and Letters. The 'Variorum Edition' is most exhaustive, being practically the last work on the text of Shakespeare. Consult 'Appreciations of Horace Howard Furness' (1912).

FURNESS, William Henry, American clergyman and author: b. Boston, Mass., 20 April 1802; d. Philadelphia, 30 Jan. 1896. He was educated at Harvard; studied theology at Cambridge, Mass., and was pastor of the First Unitarian Church in Philadelphia in 1825–75. He was an earnest supporter of the anti-slavery movement and was a German scholar of eminence, translating much from the German in both prose and verse. He was radical in his religious views but made a life study of the character of Jesus, which forms the theme of several of his works. Among his numerous works are 'Remarks on the Four Gospels' (1836); 'Jesus and His Biographers' (1839); 'A History of Jesus' (1850); 'Thoughts on the Life and Character of Jesus of Nazareth' (1859); 'The Veil Partly Lifted' (1864); 'Jesus' (1871); 'Verses and Translations from the German Poets' (1886); 'Pastoral Offices' (1893).

FURNESS, William Henry, American artist, son of the preceding: b. Philadelphia, Pa., 21 May 1828; d. Cambridge, Mass., 4 March 1867. He very early made a reputation by the excellence of his crayon portraits, and having earned from the sale of these the means for foreign travel, studied art in Europe for two years. On his return to America he established himself as a portrait painter in Philadelphia, and subsequently in Boston, and at the time of his death was one of the foremost portrait painters in the country. Among noted portraits by him are those of his father, Dr. Furness; Charles Sumner and Lucretia Mott.

FURNESS, William Henry, American ethnologist: b. Wallingford, Pa., 18 Aug. 1866. He is a son of Horace H. Furness (q.v.), and in 1888 was graduated at Harvard University, subsequently graduating at the medical school of the University of Pennsylvania. He made scientific tours in South America and elsewhere, the results of which are embodied in several volumes from his pen. In 1904 he became secretary and curator of the Free Museum of Science and Arts of the University of Pennsylvania. He is a fellow of the Royal Geographical Society. His works include 'Folklore in Borneo' (1899); 'Life in the Fuchu Islands' (1899); 'Home Life of the Borneo Head Hunters, its Festivals and Folklore' (1902); 'Uap, the Island of Stone Money' (1910), also several monographs to the American Philosophical Society. In April 1917 he was commissioned captain in the Medical Reserve Corps.

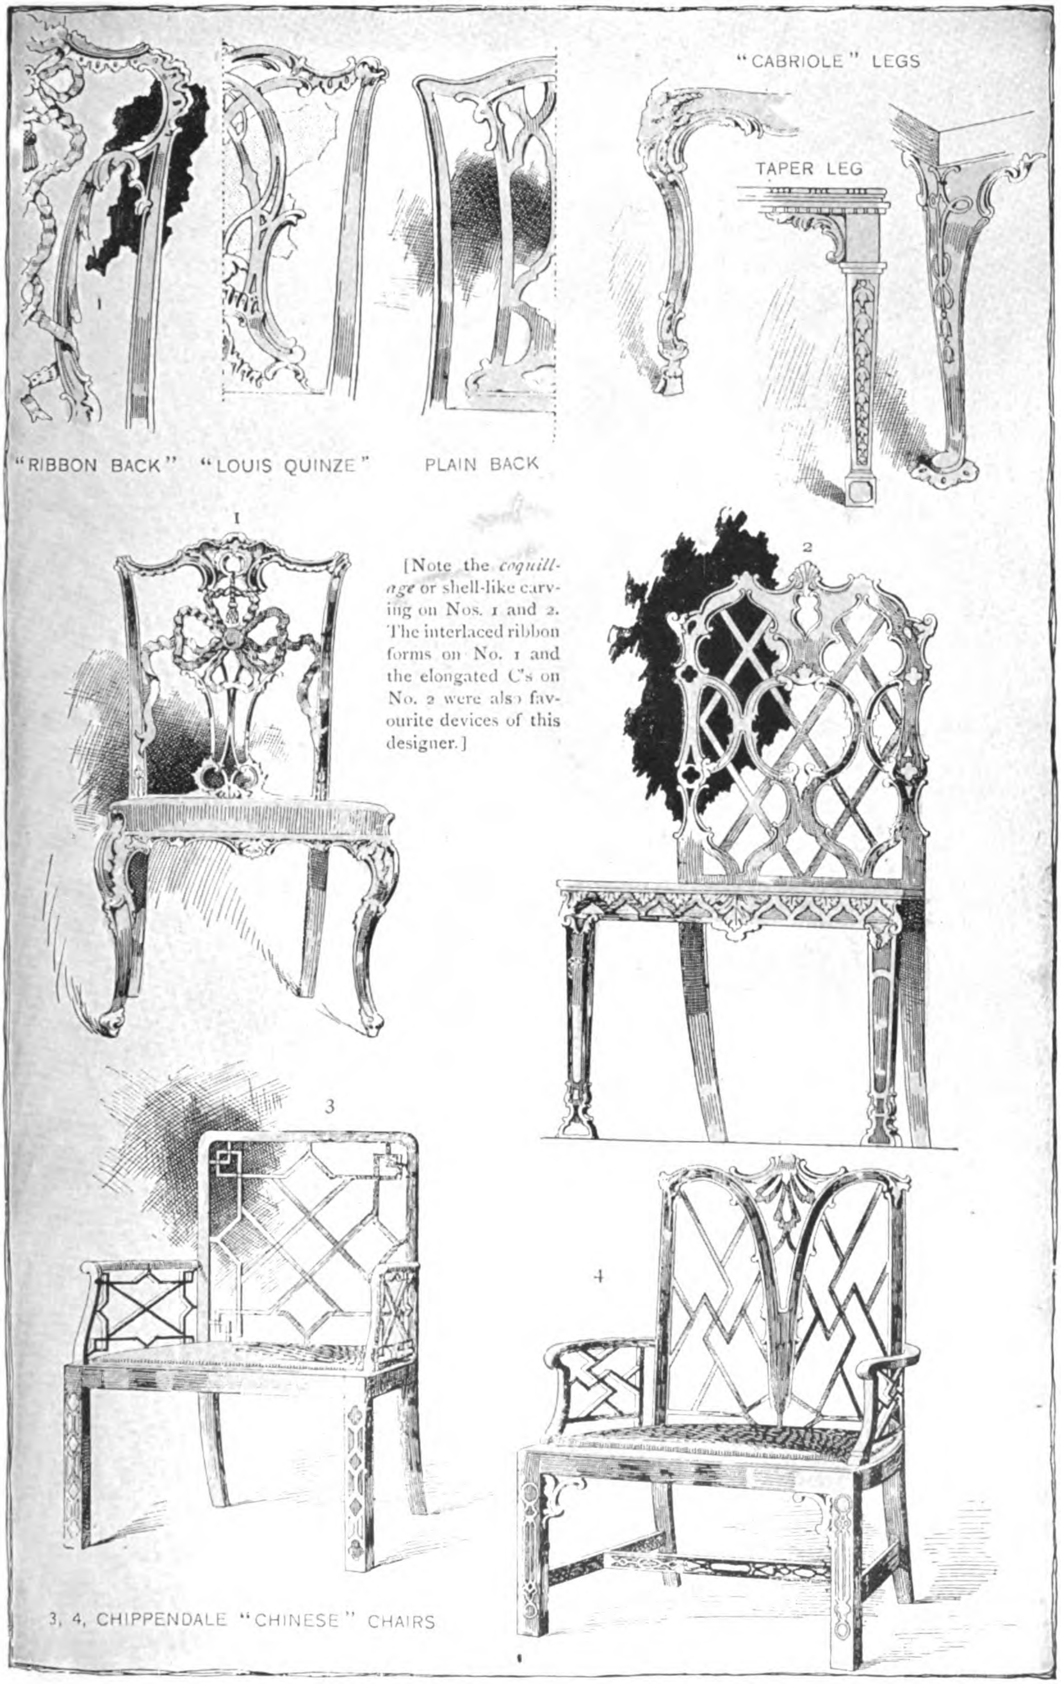
FURNI (foor'nē) **ISLANDS,** a group of the Grecian Archipelago, situated between Samos and Nikaria. Furni is the largest and gives its name to the group. Its area is about 10 square miles and it is the only inhabited island. Its inhabitants are almost cut off from intercourse with the outer world.

FURNISHING GOODS. See CLOTHING AND FURNISHING TRADE.

FURNISS, Harry, English illustrator and caricaturist: b. Ireland 1854. From 1880 to 1894 he served on the staff of *Punch,* producing many humorous cartoons on social and political life. He started two comic journals on his own account, but the venture proved a financial failure. His numerous artistic contributions to the wide series of British and American illustrated journalism brought him international fame. As a humorous lecturer with «lightning sketches» drawn before the audience, he toured the United States and Great Britain with much success. He wrote 'Romps' (1885); 'Royal Academy Antics' (1890); 'P. and O. Sketches' (1898); 'America in a Hurry' (1900); 'Confessions of a Caricaturist' (2 vols. 1901); 'Poverty Bay' (1905); 'How to Draw in Pen and Ink' (1905); 'Our Lady Cinema' (1914); 'Political Sale Catalogue' (1914). He also illustrated complete editions of Thackeray and Dickens, besides other works. In later years he wrote and acted for moving pictures.

FURNITURE, formerly all the various movable appliances or articles in the interior of a house, now more commonly applied to articles of wood or metal. The ancient Egyptians aimed to variety rather than symmetry in the arrangement of their houses. They had chairs made of the finest woods in great variety of design, covered with rich cloths or skins, and inlaid with gold or ivory. They also used folding stools, sofas, couches and carpets or rugs. Their tables were of variety of shapes and constructions. Bedsteads were made of wickerwork and sometimes of bronze. The forms of household articles of furniture found in or represented on Assyrian monuments and remains show great artistic elaboration and a profusion of highly wrought ornament. The Assyrians were especially skilful in the chasing of metals, and they delighted in reproducing natural objects on their ornaments. The Greeks had couches covered with skins or drapery, on which several persons might lie with their bodies half raised; these were used at meal times by the men only, women and children sitting on seats; they had large armchairs with footstools, portable small chairs without arms and stools with carved legs made to fold up.

Among the Romans, Greek art gained a predominant influence, and the conquerors of the world were at all times glad to employ natives of Greece to design and execute the works intended to display the opulence of their masters. On the ornaments of the *triclinia* or couches on which they repose, immense sums were bestowed. They were often inlaid with precious materials, such as ivory, tortoise shell, gold and silver and had ivory or metal feet. They consisted of a framework which was strung with girths, on which rested a mattress stuffed with straw, wool or feathers, and covered with rich drapery. The *lectus cubicularis,* or bed, was higher than the couch, but not unlike it. The tables were generally of costly foreign wood, resting on frames of carved marble or an ivory column. The curule chairs, or seats of state of the patricians and magis-



CHARACTERISTIC CHIPPENDALE CHAIR-DESIGNS

Thomas Chippendale flourished about 1750–1760. His "Design Book" was published in 1752

CHARACTERISTIC HEPPELWHITE FURNITURE

Messrs. A. Heppelwhite & Co., Chippendale's successors, published their "Design Book" in 1789. The Hepplewhites were designers rather than manufacturers

trates, were wrought in ivory; and to form an estimate from the number of beautiful utensils in marble and bronze richly chased and inlaid with silver, that have been found in the ruins of a comparatively insignificant city, Pompeii, the wealth of the Romans in movable property of this nature must have been very great. The library first appears as a separate apartment in a Roman house; that discovered at Herculaneum was small, and lined with presses about the height of a man, in which the rolls of papyrus and parchment were kept. Still, according to modern ideas, the Roman rooms would seem rather bare of furniture. They had no writing tables or cabinets; couches, chairs, tables and candelabra comprised the whole of the furniture with the exception now and then of a water clock, or a chafing dish.

Among European states from 500 A.D. to 1500, the ecclesiastical style prevailed in furniture as in every other species of art, attaining its greatest eminence in the decorated Gothic of the 14th century. Articles of furniture previous to 1500 are very rare. For three centuries after the Conquest domestic furniture was very scanty. The hall was furnished with tables and benches, the furniture of a bedroom consisted of little more than a bed and a chest. Chairs were large and cumbrous, and were usually fixtures; wooden forms, sometimes with back rails, being placed against the walls. The furniture of the dining-room was very limited. Boards on trestles were in general use as tables. In the 14th and 15th centuries remarkable progress was made and a considerable degree of splendor in furniture was attained. Defense began to be not the only object studied in the construction of buildings. The Gothic paneling of the carved bedsteads, chairs, screens, etc., was dazzling with scarlet, blue and gold, and costly embroidered hangings and curtains heavy with heraldic symbolism, cabinets, reading-desks, prie-dieus, ivory and enameled coffers, fire dogs or andirons elaborately chased and gilded, began to appear.

The progress of this decorative style was suddenly arrested by the "Renaissance," or revival of ancient classical art and literature, of which Italy was the earliest seat, and from whence the impulse was given that communicated itself speedily to the rest of Europe. A genuine and self-evolved style instantly went out of fashion, and was discarded for an imitation and counterfeit one based on the copying of understood classic models which were applied without consideration to the most incongruous objects. The classical temple was the dominant idea in the manufacture of furniture as well as in the construction of a palace or a cathedral, and columns were considered as necessary in one species of art as in the other. All the architectural details of Roman buildings were then applied to furniture; the lions, griffins, chimeras, etc., of the temple frieze encumbered the stately pillars of the Italian palaces, and caryatides and Roman trophies replaced the patron saint and the crucifix. With all its absurdities, it must be noted that this style was in the hands of great men, and their productions display a boldness and vigor of line, and a mastery over human and animal forms that give dignity to a licentious freedom of design in which all appropriateness is forgotten. Specimens of the Renaissance are still met with, though daily increasing in value. Gothic art never recovered its lost ground.

With various modifications the Renaissance style continued dominant for nearly two centuries. In England it degenerated into positive ugliness, the furniture of the time of Elizabeth and James I having very little to recommend it in tasteful design. It is distinguished by a mixture of overwrought heavy molding, combined with thin spindly columns, twisted legs, and other inelegant characteristics. Magnificence is sometimes attempted in the value of the material, as in the famous set of chamber furniture in chased silver executed for a royal visit at Knowle Park, the seat of the dukes of Dorset in Kent. It was succeeded by the style named after the French monarch, its patron and encourager, Louis XIV.

The modern predominance of France in the construction of furniture is owing to the minister Colbert. He it was who brought together the best workmen of Europe, and by an edict of the year 1667 established the French royal manufactory of furniture. The new style which the productions of this establishment assumed appears to have been worked out undesignedly, and, like every such successful phase of art, was the genuine product of circumstances. Novelty and magnificence seem to have been the great features aimed at; these were sought by varied treatment of surface in cabinet furniture (as inlays of metals, ivory, enamels, porcelain tablets, tortoise shell, etc.), and by an incrustation of broken scroll panel work, which hid the real constructive forms and frittered away the graceful outlines of the Renaissance into a confused and unsymmetrical mass. Under Louis XV the same school of art continued, and it received new elaboration under the successors of Boule, Riesner and Gouthier; their works are known to connoisseurs as articles of vertu by the respective styles of each master, and fine specimens bring almost fabulous prices. Probably more of this class of furniture is to be found in Great Britain than in all the rest of Europe, a great change of owners having been brought about by the French Revolution. While the splendid extravagances of Louis XIV were holding sway in France, the prevailing taste in England seems rather to have been modified by the fashion introduced from Holland by William III. The native woods, oak or wainscot, chestnut, etc., were about this time superseded for furniture by the dark and heavy West India mahogany, the invariable material of the ill-designed and awkward furniture familiar to us in the immortal designs of Hogarth. A better style based on that of France was introduced by Chippendale, but a severer and more artistic taste was displayed by the designs of Heppelwhite and Sheraton. In the latter part of the reign of Louis XVI another change is apparent in French furniture. Greece and Rome were looked up to as standards of correctness in furniture as well as in politics. But instead of impressing their own genius on designs inspired by ancient models as did the great artists of the Renaissance, the authors of this revival were too often content with frigid imitation. The classical style did not long hold sway, and since that time the practice of both France and England (and with them the rest of Europe) has been purely eclectic. At present designs after the best work of the older makers are much in favor in both Europe and America. See FURNITURE INDUSTRY IN AMERICA, THE.

FURNITURE, Colonial. When the colonists first landed, and during their early struggle for existence, little if any attempt was made to import furniture, and we have nothing now which could be rightfully claimed to have been brought over from Europe before the coming of the *Mayflower* (1620). The New Englanders were the first to make furniture, copying the designs of the original pieces, which were of heavy oak with severe lines and flat carvings. Their puritanical minds apparently abhorred anything of an ecclesiastical cast. As early as 1650 the Southern planters imported fine pieces from England, of oak, richly carved and inlaid, the designs being influenced by the Renaissance just dawning in France, and the Elizabethan and Jacobean periods in England. The authorities in the South tried to prevent trade with Holland and New England, so a comparison of the English furniture, prior to the Revolutionary War, with that of Maryland and Virginia, shows that the English life of that time was planted there as far as it was possible. Since we find so few of these original pieces, we can only think that the planters, becoming wealthy so rapidly, and wishing to keep up to the «prevailing English style,» must have discarded the old for the new, as their invoices show large importations of furniture up to the Revolutionary War.

There was a marked difference between the houses of New York and of New England. The Dutch built theirs of brick, while those in New England were mostly of timber, and a striking feature in the living-room of the former was the chimney-piece, which among the wealthy was elaborately carved and tiled and held vessels of brass repoussé and Delftware. The fire-place with its colored tiles continued to be a decorative feature, even after coal succeeded wood as fuel and grates took the place of andirons. The floor of the average house was sanded, and rooms had no special character. The ideas which the Dutch brought from the Orient influenced the designs not only around New York but in New England as well, and fast grew into favor. Strange shapes from the East, introducing marqueterie in exotic woods, were eclipsing the old chests of drawers, cupboards, etc., and actual products of the Far East filled many of the Dutch houses. The cabriole legs superseded the severer lines. Other woods beside oak, such as walnut, pine, red cedar, maple, etc., were introduced; ebony was scarce, so the «black egg ornament» was often of white wood stained black.

In the first half of the 18th century New York was an important place, and inventories show that fashions in New York compared favorably with those of London and Amsterdam. The bed was disappearing from the hall; carpets were introduced, and in 1750 they had flowered carpets and «painted floor cloths.» The walls, of houses of the better class, were papered before the middle of the 18th century, and for 50 years we have an interesting wall-paper period; their chief designs were large illustrating panels, such as «The Lady of the Lake,» «The Four Seasons,» etc. Fire-places were growing smaller as wood was harder to obtain, and in 1745 Franklin invented what is now known as the «Franklin stove.» Upholstery was taken up and there were many cabinet-makers in New York, Boston and Philadelphia; skilled workmanship was in demand, and «choice timber and metal furnishings for cabinets» were advertised. Then came the period when mahogany was the favorite wood, and, just as in England, all designs had a tendency toward greater lightness and grace of line, and showed the Chinese influence strongly. In 1776 the home of a wealthy American compared favorably with that of an Englishman in similar circumstances. «Chippendale» was the rage, both imported and domestic. There was a marked difference between the North and South — the Northerners lived more simply, but with a certain amount of fashion and elegance; in the South everything was ease and luxury, and many houses were noted for their costly furnishings. Around Charleston, S. C., at the present time are some excellent examples of typical Southern homes of the 18th century, containing many of the original pieces of furniture. The classic or Greek style adopted by Adam in England found its way here, and was seen in architecture and interior woodwork, noticeably in mantels and built-in cupboards, but was little used in articles of furniture.

Mount Vernon — now a museum of relics—is the most interesting colonial house, on account of its associations. It was inherited by George Washington in 1751 from his half-brother, Lawrence Washington. Soon after it was almost entirely refurnished, and though by no means palatial was extremely comfortable. There were few of the original Washington pieces left there, as Mrs. Washington bequeathed the furniture to four grandchildren, but now many articles are gradually finding their way back, either through gift, or through purchase by the Mount Vernon Ladies' Association of the Union. There are many Washington pieces, used by him while in Philadelphia, now in possession of the Historical Society of Pennsylvania. Second in interest is Monticello, the home of Thomas Jefferson. Its architecture and decorations are delightful, and it still contains proofs of the owner's good taste and love of art.

«Colonial designs,» as termed in the vocabulary of the dealer of to-day, were not known until the colonies had become States. They are traced in America first through the Dutch, who had taken many points from Spain and the Orient, namely, the ball and claw pattern. Chippendale adapted them with more lightness and grace of line, but the French Empire style which came in at that time changed it into the massive mahogany, and gave the rope-carved pillars and lion-claw feet. American makers omitted the elaborate brass and ormolu trimmings used by the French, and depended upon the beautiful grain of the wood, often veneering to obtain handsome effects. The superiority of the old furniture is due to its construction; the old makers worked solidly, dove-tailing and blocking all drawers, and to-day the age of the wood has greatly added to its value; the stained mahogany loses the beautiful golden shafts of light. The polish was attained by constant rubbing, while to-day most pieces are simply varnished.

Mahogany was brought into England by Sir

COLONIAL FURNITURE

9 Four-post bed

Walter Raleigh, but was not in general use until about 1725. In New England it was extensively used a little later, being imported from the West Indies. The Honduras and Mexican varieties most commonly used to-day do not materially improve with age, and are much lighter in weight than the West Indian, therefore a really old piece may often be told by its heaviness. The date of a bureau, chest of drawers, etc., may frequently be ascertained from its handles.

Handles.— The oldest handles, chiefly brass, rarely pewter, were drop-handles, formed like an earring, backed by a small plate. Next in order was a larger plate, usually engraved, with a bail large enough to insert two fingers. The next was a larger plain plate similar to a fleur-de-lis in shape, the bail being much larger, and from now on held into the drawer by brass nuts instead of wires as formerly, but in reproductions iron nuts are nearly always used. It gradually developed into a thin oval plate embossed with moldings, sometimes with centre design, and the bail, fitted into posts, falls outside the plate, preserving the same curve. Still later came the knob and empire rosette handles, sometimes with ring, usually of brass but also of glass or plain wood.

Chests.— No matter how meagre an inventory, it always included a box, chest or case. First the ordinary ship's chest of pine with iron handles, which was appraised very low. There are several good examples of these in State historical societies, including one brought over in the *Mayflower*. Few of these were made after 1725. The oldest carved chests were in low relief with often the date and name of the person for whom it was made; they were afterward made with one drawer, having panel or turned ornaments. This developed into the «chest of drawers,» made of oak and more elaborately decorated, which in turn developed into the «chest upon chest,» sometimes having as many as nine drawers, and the three-tier «steps» for displaying china was sometimes placed upon these. The «high-boy» is not mentioned until the chest of drawers was placed upon a frame about three feet high, having one or more drawers; it had six legs, and later the part where the centre legs were omitted was finished with «drops.» This, in the latter part of the 18th century, became a very handsome article of furniture, with carved top, usually «shell» or «sun» pattern, decorated with gilt torches or balls and cabriole legs and carved feet.

The Dressing-Table, or «low-boy,» came from England in 1716. At first it had but one drawer, afterward it was the same as the frame for the «high-boy,» only about three inches lower. The «high-boy» and «low-boy» were often made to match. The Chippendale and Sheraton designs were usually furnished with dressing-boxes and mirror.

The Settle was an evolution of the chest. Handsome examples are rarely found in this country, although there are many varieties of the «fire-side» settle in painted pine and oak found in New England, with a shelf to hold a candle. The settles which appeared in the latter part of the 18th century, following the Chippendale, Sheraton and Heppelwhite designs, might better be termed sofas, which later took on the Empire designs, with «claw-and-ball» and «wings-and-claw» feet, and «cornucopia» and «swan-neck» ends.

Beds were among the first and most frequently mentioned articles of furniture in wills, being highly prized. In the 17th century the Southern planters owned elaborate European bedsteads, usually of oak. In New England they were very simple affairs, while among the Dutch the bed, at first, was only a sort of bunk. The four-poster soon supplanted all, first of oak, but later of mahogany. Some were most elaborate, with rope-carved, or pineapple and acanthus-leaf posts, and ball-and-claw feet, with tester drapery, valance, curtains and coverlet to match, of white or bright-colored materials, chiefly drugget, linsey-woolsey or dimity, though later chintz was popular. In the South, mosquito canopies were prevalent, sometimes colored to match the color scheme of the room. Feather beds were universally used, resting on ropes or sacking pulled taut, and owing to their height, «bed steps» were necessary. We also find mention of turkey feathers and cat-tails being used as fillings, and early in the 18th century hair mattresses appeared.

Cupboards were usually built into the wall, and whether called «livery,» «court,» «standing» or «press,» were all fitted with light movable shelves to hold linen and display china and glass. There are few of these open cupboards to-day. First the upper part was enclosed with doors (later ones show glass doors with lattice work), afterward a drawer was added, then the lower part was enclosed, and when fitted with lock and key was highly prized as an article of furniture. These partly opened cupboards were called «beaufait,» afterward contracted to «boufet.» Closed-in cupboards show German as well as Dutch origin, and the finest examples were found among the Dutch, usually spoken of as «kasse,» carefully carved and painted.

Chairs are scarcely mentioned before 1650, forms or benches being used almost entirely, the chair being considered the seat of honor, but toward the end of the century there was a marked increase in the numbers mentioned in the inventories. They were made of oak, pine and walnut, turned or paneled, simply carved and with high backs, the seats either rush or cane. About the 17th century we notice leather and «turkey-work» seats with brass nail-heads. The «ball-and-claw» foot, introduced by the Dutch, appeared at the close of the 17th century and remained in favor for nearly a hundred years. Chairs made of wicker and cane were known as early as 1711, and in 1720 came the painted chairs from Holland, usually black, often decorated, with rush or cane seats. The Windsor chair, first made and used in Philadelphia in 1725, was the most popular style up to the 19th century. It was usually of hickory or ash and had a wooden seat, the back was high and either «spindled» or «fan-shaped,» sometimes having an extra headpiece. The style known as Chippendale appeared in 1720, the development being apparent before Chippendale worked. Its chief characteristics were the traceried splat, bow-shaped back and cabriole legs, also the «plate-backed,» which was a solid splat, usually jar-shaped, and hoof feet. The all-upholstered «wing» chair seemed to be in general use before 1750. Mahogany was now easily procurable and the tendency was toward greater lightness, and most of the designs, from now on, follow the English cabinet-makers; Chippendale, with a strong Chinese influence, then Sheraton and Heppelwhite, some being beautifully decorated with hand-paintings, carvings and inlay. In 1770 we have another style, modeled after the old "splat-back," but with the splats crosswise. About 1800 the style commonly known as "empire" began to be felt, and gave us the "lion" and "bear" claw-feet and rolling backs, copied after old Egyptian designs. The strong empire was partially modified here by the Sheraton influence. There is a style in America, a modification of the empire, with heavy mahogany splat-back, usually jar-shaped, often having the back and back legs in one piece. These were in favor until 1840; they were usually covered with "horse-hair" and are now offered as "Colonial" designs.

Tables.— What has been said of the development of chairs may be applied to tables, as almost every form of chair had its corresponding table. First we had the "table-borde," a board, often 12 feet long by 2 wide, resting on a cross-legged trestle. It gradually became customary to leave the "borde" on the trestle instead of removing it after each meal, and it was then known as a table. Marble and slate-topped tables appeared about 1693, and were considered "the latest thing." Before the 18th century we had imported "chair-top" tables, "drop-leaf" and the "100 legged," which was the first extension table, all with turned posts. About 1735 the Dutch influence was strong, and to-day we have some excellent examples, dating from 1750, of mahogany "pie-crust," "dish-top," etc. The "centre-pillar" table came in with the Empire period. Tea tables were found in every parlor of the 18th century, always ready with complete tea-service, spirit-lamp, kettle, tea-box, tongs, strainer, etc. Among the Dutch the table was frequently of rare or japanned woods, many with adjustable tops. Card tables, of which there were many, usually had a plain surface, though some were covered with green cloth; they had folding tops and corner shallows for counters. Work tables were mostly of Sheraton design, the top lifting up, disclosing compartments for sewing materials. Candle tables were of various heights, with a top only large enough to hold a candlestick.

Desks.—A desk was originally a wooden box with slanting lid, the writing materials, and frequently the Bible, were kept inside under lock and key, and the top served the double purpose of reading and writing desk. The large desk or "secretary" appeared about 1660 and seems to have been another development of the "chest of drawers," usually having two or more drawers in the lower half. The lid on the upper part was either let down on chains or rested on two wooden slides. The interior was fitted with many drawers and pigeon-holes, and they had often secret compartments. Later, a cabinet was placed on top and developed into the "cabinet-top" desk, made in one piece and reaching almost to the ceiling. The "table-topped" desk belonged to a later period, a good example being the one used by Washington while in New York in 1789, now in the city hall. There are some good specimens of Sheraton and Heppelwhite desks in this country belonging to their respective periods. The later empire or "Colonial" pieces were large and heavy, mostly "bureau-fronts."

Clocks.— There is slight mention of household clocks prior to 1700, but in the 18th century clock-making was quite an art; the Willard brothers of Massachusetts were the first to become famous. Around New York were found some "Frisian" wall clocks from Holland, run by weights, with elaborate designs of gilded and painted mermaids, cherubs, etc. The English "lantern" clock was on the same order, being of brass with heraldic metal work. This developed into the "bracket" clock, through having a wooden hood placed over it for protection; it was very popular about 1700. The first mention of a tall clock is in the latter part of the 17th century, when long pendulums, also moving figures upon the dial, became fashionable. It was spoken of as "clock and case," and was very plain, of oak or walnut but later of mahogany. Many of them were destroyed during the Revolution, the works being hidden and the cases, in some instances, used for shipping bayonets. Few tall clocks were made after 1815. After the Revolution cheaper time-pieces were in demand, and to meet it, clocks having white enamel dials and wooden works were invented. From then on there were many styles of cheap clocks for walls and mantels, including the "banjo" clock patented by Willard in 1802; the "lyre" clock and many "Colonial" designs in wood, some with painted glass covering the pendulum.

Looking-Glasses.— The first record is in an inventory in Maryland 1639. They were rare at that time even in England, being imported from Venice. The frames were of olive-wood, black or gilt, and when the glass exceeded four feet were made of small pieces joined by moldings. Later the frames were heavily carved and inlaid, but always retained the Italian appearance. We find mention of a parlor in a Maryland house in 1732, "set off with pier glasses." In New England it hung over the mantel-piece and was known as the "chimney-glass," usually ornamented at either side with candle sconces. At the end of the 18th century the shield and oval glasses appeared, showing the influence of the English cabinet-makers, followed by the Empire, with rope-carved pillars, acanthus-leaf and lyre carvings, sometimes having the top partitioned off for paintings. What is known as the "Constitution" mirror did not appear until after 1800; most of them bore the eagle at the top.

Mirrors, during the 17th and 18th centuries, were either of convex or concave glass with elaborate frames, and were frequently used for decoration.

Sideboards came into fashion about 1780, taking the place of cupboards and side tables. They were nearly always of mahogany. First after Sheraton, with inlay, noticeably the "bell-flower" design down the slender legs; later "Colonial" of heavy mahogany with the cupboards extending nearly to the floor, ball-and-claw feet and rounded pillars, similar to the bed-posts.

Washstands.— First called a "bason-frame." Few good examples before the later part of the 18th century, which were influenced by the English cabinet-makers, and later by the Empire.

Warming-Pans were a necessity, especially in New England. The pan was usually of brass with cover, 14 inches in diameter, with a long wooden handle fastened to the pan by an iron socket. Hot coals were placed in it, and when rubbed between the sheets warmed the beds. They were often decorated with open-work carvings and were quite ornamental hanging beside the fire-place.

Screens were used to protect the face from the heat of the fire, were small, made of embroidery or painted wood, with round or square frame, fastened on a post which could be raised or lowered.

Children's Articles.— We find frequent entries of articles of furniture for children. Cradles, the first one brought over in 1620; high-chairs, also «fenders,» to keep the children away from the fires.

There were several miscellaneous articles of furniture mentioned after 1750, including «dumb-waiters,» now called «butler's trays»; «wine-coolers,» «knife-boxes,» «sewing-boxes,» «clothes-trees,» etc.

Collections.— Some of the many permanent collections of Colonial furniture may be found in the Connecticut Historical Society, Hartford, Conn.; the Pilgrim's Society, Plymouth, Mass.; the Essex Institute, Salem, Mass.; Van Courtlandt Mansion, Van Courtlandt Park, N. Y.; American Antiquarian Society, Worcester, Mass.; Historical Society of Pennsylvania, Philadelphia; Washington's Headquarters, Morristown, N. J.; Independence Hall, Philadelphia, Pa.; and Mount Vernon, Va.

Of George C. Flint Company, New York.

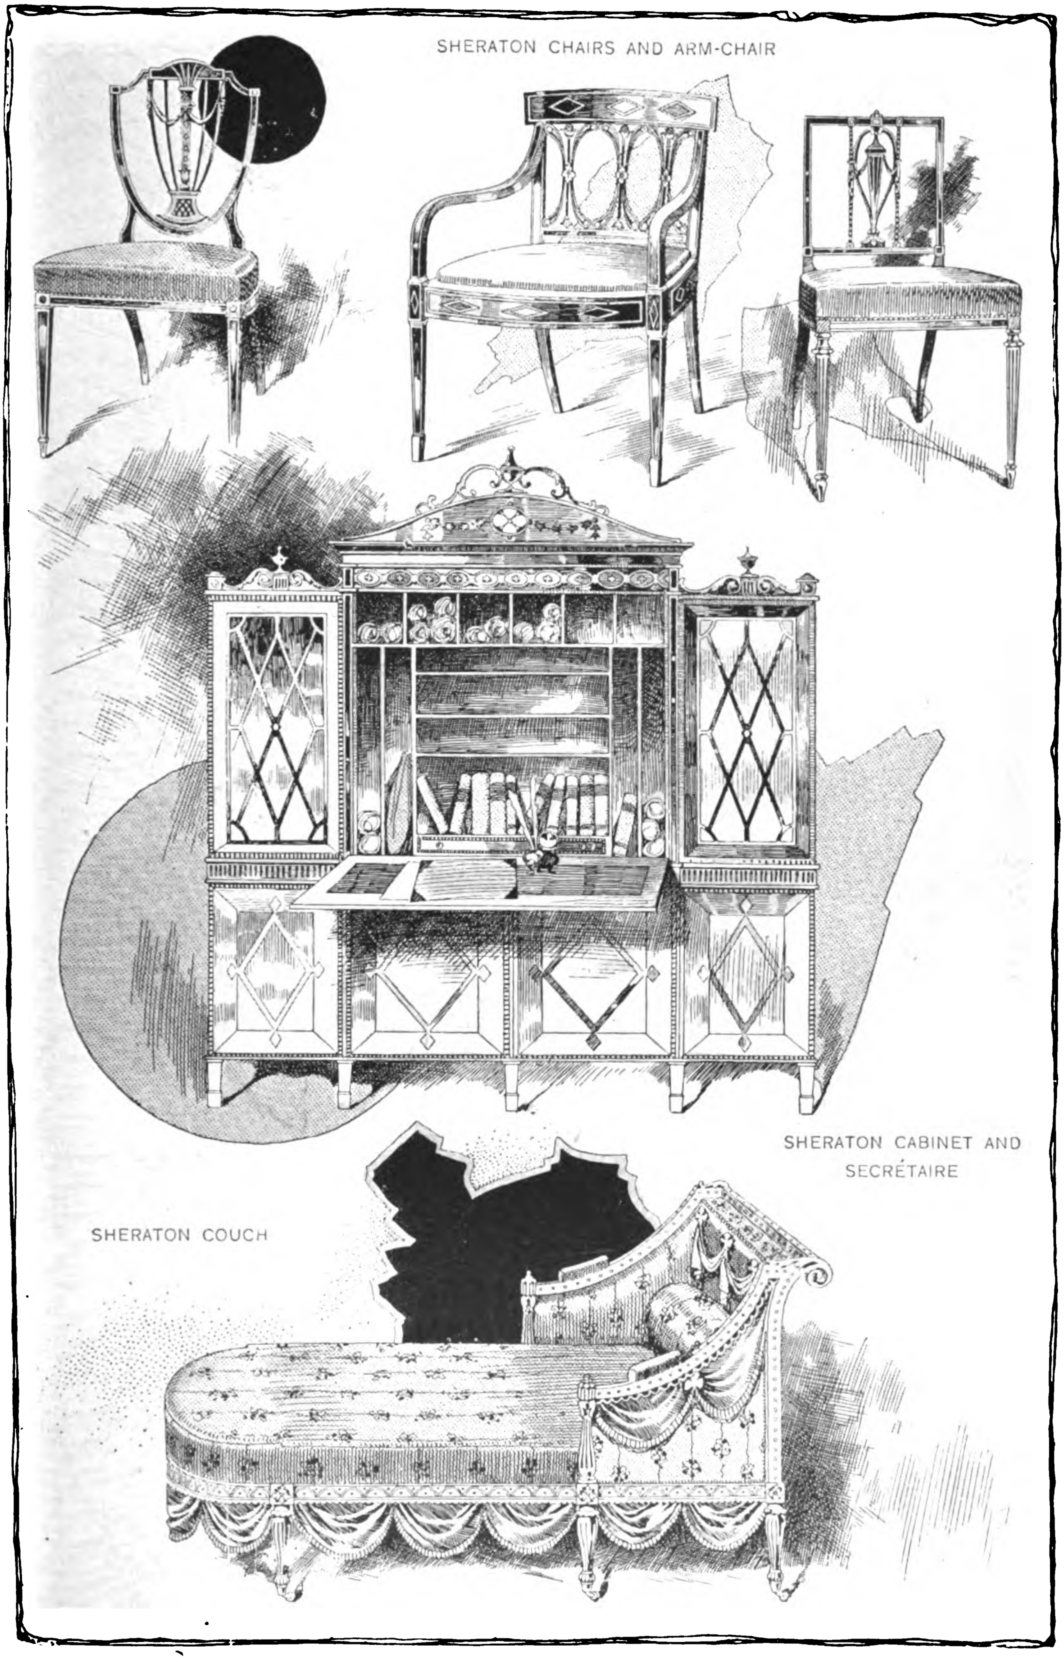
FURNITURE, History of Ancient. In the Far East, in ancient times, little if any furniture of wood or metal appears to have been used in the household, even the palace dwellers contenting themselves with cushions, rugs, curtains and other hangings. Of the furniture used by the ancient Jews little is known, though their long residence in Egypt would lead one to suppose they must have learned the art of woodworking, in which Egyptians were so adept. Even the little knowledge we have of the Babylonian and Assyrian furniture is derived, mostly, from sculptured remains; atmospheric influence long since destroyed such pieces of workmanship. Layard and Smith found that Nineveh furniture was ornamented with heads of lions, bulls, rams, etc. One noticeable feature of Assyrian chairs or thrones was the use of human figures as supports of arms, etc. These are conjectured as representing *captives.* The carved forms of bulls were also used as supports. The tables and couches were of wood and metal encrusted with ivory. Gold, silver and bronze were also used. The luxuriousness of the Assyrian despotic monarchy is fully proved. A Greek author mentions 100 tables and 100 beds, all of gold, piled on the funeral pyre of Sardanapalus. Herodotus tells of altars, tables and statues of gold in the temple of Baal. The thrones had footstools.

Egyptian.— The absence of humidity in Egypt's atmosphere has been the cause of preservation of numerous pieces of ancient native furniture, as well as the vivid depictions of the living habits of its citizens as displayed on the many stone monuments, tombs, sarcophagi, etc. Many furniture specimens extant date back 3,000 years or more. The oldest known piece of furniture in the world is the throne of the Egyptian Queen Hetshepsu, in the British Museum. We find chairs with X legs, like our campstools, with heads of geese carved on the lower extremities of the legs. Some legs and chair-rails appear to have been turned on the lathe; they used mortise and tenon joints and their strength of construction is shown in the fact that 18th dynasty pieces hold firm yet. Seats were of leather, linen cords or plaited rushes. Other pieces extant are footstools with three legs, ebony settees, tables, armchairs, bedsteads, coffers on legs, flower stands, cushions of woven cloth, mattresses, etc. Besides animals, human figures frequently act as supports, as found on Assyrian furniture, and, like the latter, probably represent «captives» or prisoners. Chair-legs show delicate curved forms and clawed feet as in modern furniture, with «tie-pieces» and diagonals to brace the slender framework. Furniture has decorations (besides carving) in gilding, inlays of colored stones, glazes, ivory (both of the elephant and hippopotamus) and different woods. Woods used are acacia, ebony, cedar, sycamore, etc.

Greek.— Concerning the furniture of the ancient Greeks we are far more clearly informed. The early styles are not of complex construction nor are they subjected to much decoration. A common piece was the four-legged stool (*diphros*), first heavily built, then becoming more slender and inlaid with ivory and pieces of metal plate. Some had straight legs, others outwardly bent. The *tripous* was a three-legged stool as its name implies. The folding X legged folding stool (similar to our camp-stool) was in favor from the earliest Greek days and was in two styles, one with curved legs, the other straight, the first being in more common use. In early days these legs actually folded but later, while keeping the same form, they were fixed. The feet were generally carved to represent the claws of lions or tigers, sometimes the hoofs of stags or goats. These claws often turned inwards. Rarely these chair-legs took on architectural forms. The *kathedra* was a chair style used chiefly by women and guests. Its form continued, with slight modifications, throughout antiquity. It consisted of four light legs gracefully curved outwards and had a horizontally curved back-board, about shoulder high, fastened to the seat by strong curved supports. Arms are absent. The most beautiful curved forms appear to have been made about the 5th century of our era. No decoration is found on such pieces. The *thronos* or armchair was a show chair for the reception room. In ordinary civil life it was the seat of the master of the house, in official life it was the seat of dignitaries, in the temples the seat of the gods. In pictures, therefore, of ordinary day life we rarely meet the *thronos.* It was furnished with a back and two arms. The throne seat of honor at public functions differed from that of the ordinary household in being so high as to need a footstool to climb into it. In the later styles we find the back straight and so high as to reach above the head of the sitter. The elbow-pieces of the throne seat often terminated in a segment of a sphere, later to become an animal's head, usually of a ram. Another early type had massive posts as legs, the heaviness being broken by two palmettes joined together by a stem, the legs being cut into the small size of the stem; such archaic style throne seats have the back rests very low and terminating in a human or animal figure, this decoration appearing at times on each corner of the seat. Another form of leg decoration has volutes where the joints of the front and back legs meet the seat. Still another throne leg style is the turned "baluster." Lastly, there was the massive stone-built *thronos* used by dignitaries in theatres, for judges, princes, and acting as seats of the gods in temples; some are quite plainly built, others have all kinds of pictorial representation as the Sphinx, griffins and other animals. The Greek bedstead (*kliny*) closely resembles the Roman *lectus* in the main and answered for two kinds of furniture of the modern house — the bed and the sofa. But the antique sofa was not made, like the modern, for seating several persons, but was for one person to recline on; in this the dining couches were an exception as they were so large that several persons reclined alongside of each other. Originally the *kliny* was intended as a sleeping couch and only when the old custom of Homer's day of sitting at meal times went into disuse and one reclined at meals did the *kliny* find any use except for sleeping. Reclining then became the custom also for writing, studying, etc., and the more diverse the uses for this piece of furniture became the more they advanced in art handwork, in alteration of construction, according to the use they were to be put to, this without changing the fundamental form at all. This main form answers, in general, to the modern *chaise longue*, having only a raised projection at the head end. They have occasionally head, foot and back pieces, like the modern sofa. The difference, which maintains the bedstead character of the piece, is the absence of fixed upholstering and use of bolsters and cushions. The bedstead (*kliny*) is made of wood or bronze and consists of an oblong framework mortised to four corner posts and resting on four feet. Over this is stretched webwork or straps (*tonoi*). This is all that is found in the more primitive pieces. There is usually, however, a raised head-piece and, less frequently, one at the foot that is not as high as that at the head. The Greek bedstead was often so high as to need a stool to reach it. Ancient Greek tables were of two kinds: the tables off which they ate and those used as a dresser. In Homer's time people ate their meals seated at table; later they ate in a reclining posture. We read of each person, at times, having the meal at his separate table; these must have been small tables with round or square tops. And this fact is further proved by statements that these tables were used as shields in cases of murder. Again we read of a number of persons eating in common at one table. This larger dining table was displaced by small tables for the drinks when the *symposium* followed the meal. These tables were oblong and were furnished with three legs, one only at the foot end of the reclining guest at whose couch (*kliny*) it stood beside. A shelf was sometimes placed below the table-top upon which to rest the utensils after use. The use of only three legs would make the table more steady considering the unevenness of the unboarded floor. The dresser or display table (*abax*) was divided into separate compartments in which wine cups were placed; it was a species of cupboard or early credence on which to array gold and silver vessels.

Roman.—As might be supposed, the Roman and Greek furniture are very closely similar, and the earlier Greek civilization afforded the models. The common stool (*sedile*) was like the Greek *dithros;* the bench was termed *scamnum* or *subsellium;* their settle was called *sella,* while the magistrate's stool was known as *sella curulis.* A special wide seat, without back or side rests, was the *bisellium.* The Roman *cathedra* was a magistrate's chair but also designated the comfortable, cushioned armchair of the women. The *thronus* or *solium* was the elevated chair dedicated to the gods, kings and other illustrious personages. The Roman bedsteads (*lecti*) formed several functions, like those of the Greeks, and were called, according to the purposes for which they were intended: *Lectus cubicularis* was for sleeping purposes and was generally open on all sides (*spondus*), some had a backboard (*pluteus*); *lectus lucubratorius,* for study, often had an attachment on which to write; *lectus tricliniaris* was used to recline on at meal-times. The Romans favored a rather large round table, for convivial purposes, with one leg (*monopodium*), a style not found among the Greeks. They were very costly, and had legs of ivory, silver, etc., and the much-prized African *thya* wood in beautiful grains formed the tops. On such tables were used marble, gold, silver, bronze, engraved and damascened work; they were even enriched with precious stones. Inconceivable prices were paid for such pieces of furniture and we are told that Cicero's table cost a million sestertiæ (over $45,000) and that of King Juba fetched over $50,000 at auction. Such tables were not used with the three rectangular couches (*tricliniaria*) but with a semi-circular sofa (*sigma*). When the Romans gradually became conquerors of the entire known world their excessive luxuriousness demanded elaborate carving as well as inlays of box-wood, ebony, cherry, holly, terebinth, ivory, tortoise-shell, stained horn, etc. Beautiful veneering was done to bring out artistic designs of the fanciful grains. In furniture construction they used cedar, pine, elm, olive, ash, beech, bird's-eye maple, ilex, etc. Bronze tripods of most exquisite designs were a much favored form of stand with the Romans as we know from the numerous examples excavated from ruins.

Byzantine.— The art product of Byzantium or Constantinople was the outcome of the centuries of war, which ended in the dissolution of the Roman Empire besides destroying all vestiges above ground of the costly furniture of the period. True Byzantine art lasted till about 1202, when the city was taken by the



CHARACTERISTIC SHERATON FURNITURE

Thomas Sheraton (1751-1806) was the last of the famous cabinet-makers of the 18th century. In 1790 he published his first collection of " Designs for Furniture," and this was followed by numerous other publications of a similar class

Permission of the Metropolitan Museum of Art, New York

English Corner Cabinet 1725-30; black lacquer with Chinese scenes in gilt

Latins. It differed from the Classic art in absorbing Oriental motifs and combining them with Greek in a manner that has ever since had world admiration. With centuries of luxury and prolific art production nothing remains of her furniture except several chairs or «thrones,» supposed to be of Byzantine origin. The Iconoclasts did more to destroy the city's art work than all the devastation of the passing centuries. The so-called «chair of Saint Peter» in the basilica of that saint in Rome belongs probably to a date between the 4th and 6th centuries. Its arcaded back and other details show mixed styles of Classic Greek, Asiatic Greek and Persian. Another supposed Byzantine chair is in San Marco, Venice. In the later days of Byzantium furniture became luxurious and was ornamented with gold, silver and precious stones. There is a seat in the British Museum with a high back which may be of Byzantine make. The so-called Saint Maximinian's chair, at Ravenna, of this period, is of wood overlaid with plaques of ivory carved with scenes from the life of Joseph, but some of the workmanship, at least, is certainly of later date. From manuscripts we learn that beds of this period were of old Roman form. The former custom of reclining at meals ceased and guests sat at table.

Romanesque.— This style is sometimes termed «Romano-Byzantine» and «Italo-Byzantine.» It has been called the debased Classic during the settlement of the Northern barbarians. It grew up in western Europe when Italy and Oriental Europe were flourishing in the Byzantine style. Its furniture is really Byzantine but shows less ornamentation.

Clement W. Coumbe.

FURNITURE, Mediæval. Much of the few pieces of furniture used by the nations not reached by Byzantine or Romanesque influences was without decoration and consisted of bare boards fastened together. But under Gothic influence the pieces of utility began, in the northern countries, to receive some artistic attention. The wealthy alone owned anything outside of chests and settles. The *bahut* (chest) of the nobility was used as a piece of furniture when not traveling. It acted as a seat, a bed, and often as a table, and when change of place was at hand the bedding, hangings of leather or arras were packed into the bahut. The chest was also known as a *huche,* and the chestmakers or carpenters were called *huchiers.* Continuous warfare subjected Europeans to very frequent and hurried change of abode and the court and nobles had little use for the comforts afforded by much furniture. In early mediæval times the Church alone, with its altars, choir-stalls and patriarchal chairs, possessed permanent, substantial furniture. In the absence of actual specimens we have to fall back on illuminations in old MSS. and the inventories attached to old wills, for information as to the household equipment. By the 11th century we find *dressoirs,* cup *bordes* (on trestles); and the *armoire* takes an early place with the *faldestool.* The bedstead was built into the wall. Even the luxuriousness of the French was one more of show than of comfort right into the 15th century. And, while we read of beautifully carved wainscoting and ceilings, these rooms held but few chairs, mostly hassocks (*carreaux*) or cushions, carved bench, perhaps, while the magnificent bahuts, architecturally constructed and decorated, hold immense services of the precious metals to be displayed on state occasions (their silver and gold services representing their only realizable wealth). When a medium of exchange was needed this precious metal was melted down for payment.

European Furniture.

Italian Furniture.— The Gothic style never gained a full hold in Italy, for, as Dr. Semper says: «Already by the 12th century the Renaissance era was opened in furniture, especially in Italy.» Most of these Gothic pieces are found in the church furnishings, as closets, with Gothic façades, and were used in chapels, choirs, sacristies, etc. For a short period in the 14th century Gothic architectural motifs were used in structural parts as niches, pillars, balustrades, etc. When (1453) Mohammedans captured Constantinople, the Greek artists, fleeing to the west, brought back the grand Classic traditions and the Renaissance blossomed forth. A favored method of decoration was painting and the craftsmen's guild of Saint Luke, in Florence (1349), admitted artists as members. Woodcarving advanced in artistic merit, but the greater fondness in the 15th century was still for painted panels for the great wall cupboards (*credences*) and coffers (*cassoni*), and even chairs and bedsteads. The tendency was toward depictions of Biblical subjects, history or fable. The Florentine artist, Dello, did much fine painting on woodwork. Along with this fondness for painted furniture there was an increasing fondness for the marquetry work (called *intarsia*), which, starting with geometric inlays, of black and white woods, had advanced, by the 15th century, to historical and landscape representations in stained woods with very realistic effects. Giovanni da Verona is said to have invented the staining of half-tones with oils and acids. Giulio Majano and Benedetto da Majano, Guido Servellino, Domenico di Marietto, Baccio Cellini, Girolamo della Cecca were noted in that period. In the 16th century great Italian marquetry artists were the family of Bartolommeo de Pola, and the ecclesiastics Giovanni, Raffaello and Damiano. Venice became the most active centre and her marquetry work was in demand all over Europe. The trecento, quattrocento and cinquecento styles of decoration were each well represented in their periods by the furniture makers of Italy. The *credence* or dresser developed into a true sideboard, losing its open shelves. The cabinet grew out of the press or closet. Tables were soon most ornately carved. Bureaus of drawers came into being in the Renaissance. The heavy

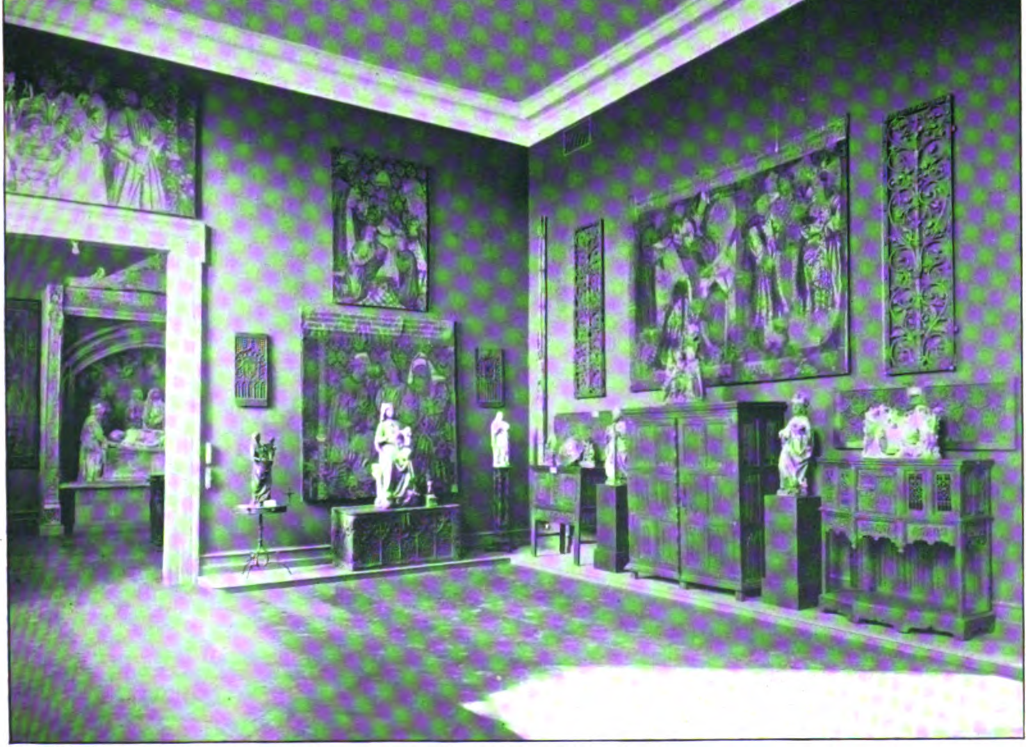
Gothic bedstead became a light frame with slender posts (columns) supporting a canopy of tapestry or brocade, and the high headboard showed magnificently carved designs such as the owner's heraldic bearings. Lovely screens were in use in stamped leather or with painted decoration. The *cassone* (marriage chest) became more and more ornate, receiving beautiful decoration in *gesso* relief, gilding, intarsia and wood carving. An artist noted for such work was Andrea di Cosimo. The 17th century saw the development of bookcases and writing desks as part of the furniture of the wealthy. These were formerly only seen in the great libraries or used by Church dignitaries. The true couch belongs to this period — a piece of furniture for day comfort entirely apart from the bed.

French Furniture.— The Gothic style ruled supreme in the designs of French furniture up to the 16th century; that is to say Gothic architectural motifs and outlines formed the constructive parts. In the 16th century Italian influence sets in and we find Venetian marquetry arabesques adorning the furniture. Francis I, through his campaign in Italy, brought the Renaissance style to France and we find great carved work in caryatids, grotesques and sculptured human heads protruding from medallions in miniature garrets, heavy garlands of fruits. Mythological and allegorical subjects appear on the marquetry panels. Architectural pediments crown the furniture, the «broken» pediment often having its statue in the open space. Under Louis XIII all decoration as well as the furniture itself is characteristically heavy, including the columns, cartouches, garlands, balustrades, furniture feet. The motifs are Renaissance but the lightsome and open work is gone, all is opaque and sombre. Panels are sometimes octagonal. The cabinetwork begins to show the influence of the Flemish *ébénist* (cabinet-maker), for the king had sent artisans to the Netherlands and they had brought back the Flemish Renaissance technique. The queen was Spanish and she introduced Moorish traditions (mosaic incrustations of mother-of-pearl, ivory, etc.). The *chaise à vertugadin* was armless to allow ladies to sit with their immense spreading farthingales. Chairs had often straight medallion-backs; armchairs were of wood entirely; settles, generally bare, had leather or cane seats. The Louis XIII cabinet is typically heavy; it succeeded the dresser and had channeled pilasters to break the front surface; statues in niches were in the upper tier, the swinging doors were paneled. The queen's Spanish goldsmiths made some furniture pieces of solid silver.

Louis XIV Style.— The pompousness of the «Grand Monarch» is reflected in the furniture as a prevailing feature till toward the end of his long reign, when the Bérain style of minuteness and delicacy arrived. With Colbert as Controller-General, ruling the decorative arts with his genius and enthusiasm, with the Louvre and Gobelins factories, aided by the Aubusson and Beauvaix furniture tapestries, France produced furniture that astonished the world and was able to discard Italian and Flemish styles for new conceptions. To this reign belong the art products of the genius of such artists as the sculptors Caffieri, Tuby, Anguier; the engravers Le Clerc, Audran, Rousellet; the cabinet-workers Boulle, Cucci, Oppenord, Poitou, Varin; and designers LePautre and Bérain. The heavy first phase in the Louis Quatorze period is heroic or Roman decorative treatment (trophies of Roman arms, allegorical and mythological figures, cornucopias, cartouches with bulging fields). In the late phase of the period the minute detail decoration of «chinoiseries» by Bérain commence, to continue into the Regence period. Pieces of furniture are broad, heavy, stiff armchairs with capacious backs and massive arms and legs; the couch (*lit de duchesse*) was introduced, also the screen and fire screen of lacquer. Some pieces of furniture are of solid silver. Rosewood veneer appears late in this reign. Bedsteads have plumes (*panaches*) at the four corners of the canopies. Stiff, heavy, capacious, but grand, is the type of furniture of «le Roi Soleil.»

Regency Style.— The King Louis XV was five years old on the death of Louis XIV, and Louis Philippe of Orleans was made regent. The light, graceful arabesques of Bérain, the drawings of Oppenord, the «singeries» (ape-groups) of Gillot were inherited in fresh form from the later years of the former reign. Charles Cressent gave life and exquisite beauty to furniture pieces with his talented sculpture work ornament, in bronze, brass and or-moulu, his delicate tortoise-shell marquetry, inlays of colored woods, etc. Financiers, merchants and the wealthy bourgeoisie were taking prominence in luxurious surroundings. Meissonnier and Thomas Germain brought their genius into this period. In decorative motifs we find the shell (*coquille*), used often in the Louis Quatorze period, is pierced and more or less conventionalized. Multiplied opposing curves and volutes frame panels and mirrors. It is the beginning of the «rococo» decoration. Chiseled copper and bronze gilt are profusely used in ornamentation of wardrobes, bureaus, chiffoniers and sidetables. Corners of furniture display high relief busts of women. Legs bend to «cabriole» curves; tie-pieces are discarded leaving the legs free. Vernis-Martin (see LACQUERS AND LACQUERWORK) furniture is in vogue. Chairbacks are of rounded outline and concave; chests of drawers acquire styles «à la Régence,» «à la Harant,» «à la Dauphine.»

Louis XV Style.— The fashions in furnishing changed considerably in this reign on account of arranging the dwellings (formerly immense rooms) into small apartments of cozy dimensions. With the arrival of these small comfortable suites of rooms, the furniture becomes of reduced size and takes on bolder curves and «bombé» fronts. The «rococo» style with its opposed C's and fantastic shellwork was in full vogue till 1750, when Madame Pompadour converted the court to favor a return to Classic models (first termed *á la reine*). Cressen's genius was now rivaled by Oëben and, later, by Riesener. Other great cabinet-makers were Duplessis, Hervieux, Bernard, Boudin, Olivier, Joubert, etc. Jacques and Philippe Caffieri (sons of the noted Caffieri of the last reign) did lovely furniture decoration. Gladbach came from Cologne and Gouthière did master work in metal adornment on Riesener and other creations. Boucher painted entrancing cupids. The «Duchesse»



1 Louis XIV Room, Metropolitan Museum, New York

2 Gothic Room, Metropolitan Museum, New York

long chair often was divided by partitions; *écoinçons* (corner pieces) or *encoignures* admirably adapted themselves to these small rooms. Hand-made Aubusson and Beauvais tapestries were coverings for *chefs-d'œuvres,* besides satin, velvet-plush, embossed taffeta, chenille, silk brocatelle, etc., in soft-toned colors. Some chair seats were caned, some gilded. Marquetry grew into still greater favor. Trophy motifs are now tied with ribbons and contain bouquets of flowers, groups of musical instruments, quivers (*carquois*), torches, doves, cupids and other Love emblems. To the comfortable «bergères» are added «marquises,» «vis-à-vis» and sofas. Fire screens and folding screens continue greatly in favor. Imitation Chinese lacquers are the rage (*vernis Martin*), with decorations of pagodas, pastoral scenes, groups of gallants, etc. Lacquer artists of note are Watin, Lequay, Girardin. The harpsichord (*claveçin*) became a favored piece of furniture. Bedsteads remained as in the Regency, those *à la duchesse* having no posts. Large chiffoniers had sliding-doors. Writing tables often had flat tops, fluted legs, chased bronze decorations. Cylinder bureaus were in use. «Coquilliers,» or shell cabinets came into vogue, for conchology was a popular fad. These and other cabinets, toilet tables, gueridons, etc., have as decoration cartouches and escutcheons *set always oblique* (it is *rococo*). Armchairs had their arms set halfway back on the seat to allow room for the ladies' hoops of the crinolines in fashion.

Louis XVI.— With the advance in the excavation of the beautiful furnishings of Pompeii and Herculaneum, the Classical style came into full power in the decorative arts. Furniture was built on more rigid lines, but light and portable, even slender, not on the Louis Quatorze massive scale; the former contorted panels now become rectangles with plain lines. A list of tables must include work tables, toilette tables, gueridons (small round tables), «kidney-shaped» tables, consoles, as well as bureaus, secretaires, etc. The tops of tables, secretaires, etc., often have a small «gallery» or balustrade of open-work copper serving as border. Chairs are light, sofas narrow. Bedsteads have canopies and flowing silk curtains; the woodwork is painted or has tapestry panels. It stands in a niche in the wall. Chests of drawers are in mahogany and have eagle-claw feet. Very fancy furniture supports run to griffins and sphinx forms. Most furniture legs are straight and show fluted decoration. Some legs curve *inwards.* Carving is always carefully executed. Seats, sofas, benches and forms have stuffed cushions; much of these are more the work of upholsterers than joiners or cabinet-makers. The armchair «à medaillon» (medallion back) is a characteristic Louis Quinze piece. The «tête-à-tête» settee held only two persons. There were «tabourets à accotoirs» (stools with sides to lean on); the «cabriolet» was a small seat for the boudoir; the «pliant» (folding chair) had X supports. Decorative motifs are the Classic: egg-pattern (*oves*), molding, laurels, chaplets, strapwork, palms, antique urns, heads of lions, pine-apples, rings, crowns, imbrications, medallions, shields, quivers. Truly characteristic is the «flowing ribbon,» found also knotted. Noted cabinet-makers were Roentgen, Beneman, Saunier, Schwerdfeger, Avril, Carlin, Lavasseur. Riesener continued his successes. Noted carvers were Gouthière, Clodion, etc. Thomire was a talented bronze worker.

Empire.— War had done its work. Art talent and inspiration were dead. Cæsarism produced mediocre copies of the Roman models in the coldest form. We find *curule* chairs, referring to the Consulate; candelabra (*lampadaires*); there are «Neptune» beds, «trophy» beds. Tables are mostly round, and consoles, pier-tables, etc., have frequently marble tops. There are bookcases, cabinets, secretaires, dressing tables, all in the sombre, heavy, exaggerated «Roman» lines. Desks often have a hinged flap that lets down. There is an excess of veneering. Mahogany is in its fullest vogue, but does not lend itself well to the chisel; it best displays itself in architectural molding and turned work. Its mottled and veined beauties show best in flat, polished surfaces. The decorative motifs are the sphinx, war trophies in Roman style (helmets, glaives, etc.); the consular *fasces* with projecting axe refer to the consulate of Napoleon; swan-necks are frequent as supports; rams' and lions' heads are common, also the anthemion. The initial N surrounded by a laurel wreath is ubiquitous. The imperial eagle perches everywhere; Liberty (Phrygian) caps and «winged Victories» abound. The Jacob brothers were leading cabinet-makers; Thomire did fine bronze decoration. Architect Perrier devoted time to decorative furniture designs, Fontaine also.

German Furniture.— Germany was in utter pagan barbarism until the English monk Winfrid (about 718) with his missionaries preached the Gospel there. He was murdered there in 755 and canonized (as Saint Boniface) later. In the course of his activities he built Catholic churches and monasteries at Saint Galle, Fulda, Reichenau, Saint Emeran, etc., and in these establishments his followers trained native artisans in woodwork and metalwork. They formed schools and centres for all the arts. They became, by this means, participators in the Carlovingian epoch. But till the 13th century the arts were almost entirely devoted to the Church. Secular furniture remained mostly roughly carpentered pieces, such as trestles and boards for tables, benches of wood for table seats, benches of stone or brick built into the walls for the retainers. The earliest pieces in the decorative arts show Byzantine tendency, then Byzantine-Gothic. With the 13th century the Gothic style of architecture arrived and, of course, the decorative work on furniture was on strictly architectural lines. Gradual advancement in civilization and wealth brought to the middle classes the pieces of home furniture conducive to comfort in civil life. Augsburg, Nuremberg, Ulm, Ratisbon, Lunéville became industrial centres with artistically furnished homes. Artist decorators produced fine carving and elaborate furniture construction, and engravers and artists aided with clever designs for the artisans. These latter so-called «Little Masters» had among them such talented genius as is found in the work of J. Collaert, Theodor and Johann de Bry, of Frankfort, Virgil Solis of Nuremberg Dieterlin, etc. And as productions of these talents we get the most interesting art effects in woodcarving. The German cabinet-makers made beautiful pieces of furniture rich in architectonic design enriched with grotesques, grimacing human faces, etc., boldly yet minutely carved. The German bureau (*Kunstschrank*) with its architectural façade, its multitude of incrustations, and its cleverly hidden secret drawers, was so popularly useful as to have a great demand for over a hundred years. But German woodcarvings are the great inspiration the world over, rivaling the Italian though differing so entirely with the Teutonic love for the feudal and Gothic treatment. Noted workers of the 16th century were Krug, Flötner, Teschler, etc. Peter Vischer, Kornemann and others brought the Italian Renaissance to Germany, and the great advances and prolific work of the second half of the 16th century were continued into the next century. Marquetry and encrusted panels, also «pietra dura» or Florentine mosaic (inlays of colored pebbles), ivory and mother-of-pearl inlays were beautifully carried out on bureaus as in Italy. Nuremberg and Augsburg were the centres for such cabinet furniture. Ulrich Baumgarten, maker of the renowned «pommerscher Kunstschrank» (now in the Berlin Museum), was of Augsburg. This art object was built for Phillip II of Pommerania and took 25 years to decorate. Phillip Hainhofer was his partner. Lorenz Zick of Nuremberg did wonderful openwork in ivory. Locksmithing was a German art carried to great perfection in that century with its picturesque metal artistry in chiseled and beaten iron in great and elaborate designs. War in Germany in the 18th century destroyed all chance of notable advancement in the decorative arts; and in the latter part of that century the Louis Quinze style was saturating all artistic endeavor throughout Europe. In the 19th century the great evolutions in furniture brought about by the English cabinet-makers carried everything in the way of opposition before it.

English Furniture.— From its insular position England's progress in the furniture and cabinet-making art has been, at different periods, a tardy copying of Continental styles when traveling experts visited her shores, of developing entirely original conceptions of construction or decoration, or of blending foreign and native methods and motifs. Its earliest, crude work is as its neighbors.

Tudor Period (1485–1558).— Pollen says: «The Tudor style denotes that particular modification of Renaissance mingling with Gothic art, which arose in England under the first four sovereigns of the House of Tudor» (Henry VII, Henry VIII, Edward VI and Mary), «but more especially under Henry VIII.» The development of this style under Elizabeth is called Elizabethan. Henry VIII greatly encouraged the arts and, as patron, invited foreign talent to his court. Artists and artisans alike found profitable patronage. It has been termed the «English Renaissance,» Carving done by native hands is crude flat work, but inlay work shows advance. The «linen fold» pattern carving for panels was in use by the end of the 15th century. Gothic ornamental decoration prevailed till Henry VIII severed relations with the Catholic Church, when Renaissance treatment commenced. Tudor tables were narrow (evolved from the narrow trestle board); they had heavy stretchers several inches from the ground to keep the feet off the cold, damp, rush-strewn stone floor. The credence table or dresser held the foods served at table, and some had enclosed closets below to hold broken food, and shelves above to display plate. Chairs (a rare piece of furniture till Henry VIII) during the first half of the 16th century were similar to the French; the *currule* X-legged chair came into favor about 1530 with curved decoration in front, and the curve at the back had projections above and leather bands stretching across the back to lean against. The «thrown» (turned) spindle chair was for bedrooms and stayed till the end of the 17th century. «Joined» or «joint» stools were in later days called «coffin» stools, being supposed to have been used to support coffins in churches, but were really for private residences. Those extant are mostly Jacobean. Benches and forms were the retainers' seats. Tudor settles were boxed in below and used for storage purposes as well as seats; panels were often carved. The high backs were to keep off draughts, and they were placed at right angles to the fireplace. Monks' bench-settles had backs that could be let down to form a table resting on the arms. In the 15th and 16th centuries the coffer (called often *huche and bahut*) was the principal piece of furniture, serving as bed at night and seat by day; it held the textiles used for comfort and adornment. The highly decorated Gothic ones, seen in museums, are mostly *muniment* chests and held church furnishings. Tudor beds had «testers» supported on four posts.

Elizabethan Period (1558–1603).— The anomaly of Elizabethan furniture is that the earlier pieces are far superior to the later. The Italian, French and Flemish artisans brought over by Henry VIII continued their fine work at almost princely pay. The native makers, already lacking in skill and genius, under the competition, had to produce the cheaper pieces for common use only and, consequently, depended on the quick action of the lathe and rapidly but poorly executed carving. Chairs in this period are more in number but not in common use. They are heavy ceremonial furniture with large seats (hoop petticoats are still worn), and have high, carved, paneled backs, heavy stretchers. Alongside these we see the native spindle (turned), rush-bottomed uncouth pieces. A parlor was added to the living rooms necessitating more decorative furniture. The «withdrawing» table with its «melon-bulb» supports originated with the Italian Renaissance artisans; its legs had carved acanthus and grape-bunch decoration. Its name was derived from the two slabs that could be *withdrawn* on runners so that the table could be extended by dropping a centre slab in the opened space. The «court cupboard» came into use. «Day-beds» were in use, for Shakespeare mentions them; those extant, however, are Carolean or Jacobean. Headposts are not used because the «tester» is supported by the high head-paneling. We find «nail-head» ornament often on furniture. «Elizabethan strap-work» is a species of *intreccio* or interlacing flat band-work.

Jacobean Period (1603–1689).— This includes

the reigns of James I, Charles I, the Commonwealth or Cromwellian period, Charles II or the Restoration and James II. It has also been termed the Stuart Period. The reigns of the two Charles have been termed the Carolean Period. Woodcarving, descendant of Elizabethan days, is now in its lowest stages. It consists of "scratch carving" largely; this is done by the primitive method of drawing an outline of the design, then excising these lines. Another style is done by chiseling and gouging out a little of the surface and leaving the motif or design in the original flat surface. "Split balustre" was a favored decoration, also pendants on corners of cornices. In panel work the Jacobean Period holds a high position; typical is the "rising" panel built up with moldings so as to project beyond the surface of the *carcase*. Lozenge-shaped bosses are often found on panels. Chairs became so common in the 17th century that even children and servants used them. The upholstered chair usually had straight legs and straight back; there was an open space at the bottom of the back as the upholstering did not start at the seat. Until the Cromwellian time upholstering in finer material had a tasseled border, but in the Commonwealth period, leather (chiefly pigskin) was mostly used and the edges fastened with brass-headed nails. The front brace disappears as better flooring made a foot-rest unnecessary. Cromwellian legs were either turned or rectangular, always straight. Side tables with round tops in two pieces, one of which could be let down or "dropped" by turning a pivoted leg, belong to this day. All Puritan pieces are very sober, simple and strong. Some leather chairbacks were quite low. With the return of Charles II from French exile (Restoration) the style became ornate and French. Stuart furniture legs are typically *spiral* turned, on chairs, tables, drawers, cupboards. Inlays continue in bone, mother-of-pearl, ivory, tortoise-shell. Walnut, solid and veneered, takes the place of oak. In the fashionable marquetry work we find apple, pine, plum, lignum vitæ, pear, yew, box, holly; some is burned or stained to get the desired color. Engraving is sometimes found in the inlay. The so-called "oyster-veneer" is produced with cross sections of walnut branches. The number of drawers in furniture increases as clothing becomes more plentiful. "Court-cupboards" and "bread-and-cheese" cupboards are in most households. Jacobean coffers lose architectural design and take on decoration of acorns, drops as pendants, lathe-turned beads, split-spindles, etc. Geometrical designs prevail. They stand on globular or egg-shaped feet. Small tables are in vogue as tea-drinking came into fashion; the "gate-leg" was a favorite table (it is frequently termed "thousand" or "hundred" legged) because it could be reduced to almost the space of its balustres. The Elizabethan "melon-bulb" protuberance on furniture supports had dwindled to balustre knobs, but now grew into a big ball, half-way down the leg. Cane and open work appear in chairbacks, displacing leather, in late transition pieces. Day-beds are now of walnut.

Queen Anne Period.— In the short reign of William and Mary the only change was in the form of imported pieces. The Queen Anne style continued all through the reign of George I, but only arrived rather late in the queen's reign. Seats had been largely cane-bottomed till now and loose cushions were used on them. The upholsterer in this style did the chief work in the production of furniture to sit on. The stiff, angular wooden seat and back of chairs were no longer common usage. Chairs were built to the shape of the human form and softly padded, seat and back. The same with couches and settees. Seat frames are rounded in front, arms are scroll form and set half-way back to allow for the spreading crinoline. The double chair became a favorite and is called also a "love-seat." "Turned" (spindle) chairs with high backs, called "Windsors," came into use. The "wing-ear" or "grandfather" chair was perfected as an evader of draughts. The *cabriole* leg came into general use now, but was seen also in William and Mary's time. In decoration we see the scallop-shell; and the "claw-and-ball" feet are on fine pieces. Splats appear in furniture-backs. Tables of Jacobean style persist in early walnut examples and the "inverted bowl" appears on balustred legs. Stretchers are carved and "tied" (X form). Inlays are frequent and show great perfection. Early examples of bureaus have an overhanging upper story, but, in general, they are in present-day form by 1710. Chests of drawers show brass drop handles, mostly pear-shaped, and the brass escutcheons are usually openwork. These had three or more drawers on a stand which had or had not drawers. Now from one to five drawers are in the stand. The "high boy" or "tall boy" came into being with 8 to 12 drawers. Cabinets for curios belong to this time in which collectors displayed behind glass doors their bric-a-brac, for Chinese porcelain collecting was a craze.

Georgian Period (1727–1820).— The styles of furniture in use during the reign of George I were those passed over by Queen Anne; this furniture has been styled by some "Early Georgian." To it belongs the "Hogarth" chair and the gilt pieces that stayed in vogue. The period, so full of furniture talent (1735 to 1805), with the achievements of Chippendale, Adam Brothers, Heppelwhite, Shearer and Sheraton has been called "Mid-Georgian." The following period marked by decadence and depraved fashions has been termed "Late-Georgian." William Kent, the architect, included furniture in his work when he returned from his studies of antiques at Rome, but he included the prevailing French styles in Classic work, till his death in 1748. With the brothers Adam decoration conformed rigidly to the Greco-Roman and their styles in furniture were immensely popular from the middle to the end of the century. The Chippendale and Heppelwhite creations were adapted to the Louis XV interiors then so popular. Heppelwhite, Shearer and Sheraton worked to fill interiors in Louis XVI style, in fashion at the end of the century. In the early 19th century Sir William Chambers gained some popularity with his Chinese motifs in furniture. This is the age of mahogany.

CLEMENT W. COUMBE.

FURNITURE INDUSTRY IN AMERICA, The. The early cabinet-shops of America were like the second-hand repair-shops to be seen to-day in New York, Boston, Philadelphia, and other large cities. A great many cabinet-makers made furniture until late in the 1st century of commercial independence on simple Chippendale lines. Gradually the Empire fashions, which were making themselves felt all over Europe, spread to America, and shapes became heavier and more pretentious, mahogany being used almost exclusively. Heads of animals were also used, and claw-feet became a general feature. Common furniture was heavy and unattractive. The general condition of things at this time was unfavorable to the development of art industries. Little thought was given to progress in the manufacture of furniture and for some years there was a decline. Upon a revival of commerce cabinet-makers changed their style, and began producing a debased rococo style, which did not have the elegance or character of the Louis XV, but was covered with a florid ornamentation in which the only consideration was display. The extravagance of curves and lavish ornamentation brought about a reaction, and toward 1830, following the fashion in England and France, an attempt was made to construct furniture in the Gothic style, but with very unsatisfactory results. The lack of artistic training of the manufacturers who were, as a rule, cabinet-makers or carvers by trade, made it very difficult for them to handle a method of decoration and construction so little appropriate in itself to the requirements of home comfort. This Gothic style of furniture, monumental in appearance, was made to a limited extent only, although its influence is to be noticed on other furniture placed on the market at this time and later. The making of rococo furniture was kept up by a large number of cabinet-makers, the cheaper furniture being for many years made in this style. It was also during this period that steam, applied to cabinet-makers' machinery for the first time in 1815, occasioned a revolution in the manufacture of furniture, bringing labor-saving devices into more general use, and enabling the cabinet-maker to supply the rapidly increasing demand for his product. In 1825, Richardson, of Philadelphia, introduced the circular saw, and Taylor, Rich & Company erected the first mahogany-mill in America, a number of these saws being used there. Ordinary furniture, which until now had been very plain, was covered with endless scroll-work and moldings, produced so easily by the new machines. The manufacturers indulged for a time without restraint in this ornamentation. The use of machinery in shops, and the increased facilities for transportation, wrought a wonderful improvement in the furniture trade; and the cabinet-shop, which had until this time been of small importance and partially engaged in making articles kindred to furniture, suddenly assumed large proportions, and confined itself to furniture only, using in the making of it the new devices which were constantly being brought forth by ingenious inventors. The value of the furniture product in the year 1850 may be estimated at about $15,000,000, and the industry gave employment to 37,000 people, out of a population of a little over 23,000,000. For a long time a great number of hand-shops survived, making to order special high-grade work and they succeeded in impressing their patrons with the idea of the inferiority of machine-made furniture, which at this early stage in the introduction of machinery was not entirely without foundation. The extensive use of machinery in shops had the immediate effect of again changing the style of furniture. Manufacturers looked for a fashion in which they could use their facilities to the best advantage, and at the same time retain the attractiveness of their earlier work. This they found in the Renaissance, which for a number of years superseded all other styles in the best class of furniture.

Up to this time the furniture industry had been confined to the Eastern States, principally in and around Boston; but a number of factories were now started in the West, where situated in proximity to large forests and regions where population and wealth were rapidly increasing, they soon became important factors in the production of furniture in the United States. These factories, equipped with new machinery and using native timber, produced at first a low grade of furniture in which art seems to have been very little considered. Those who wanted more artistic furniture purchased it from the East. The art revival which had taken place in Boston and New York was fostered by increased travel in Europe, where exhibitions were taking place at short intervals in London and Paris. Moreover, the consideration that old furniture was beginning to receive brought forcibly to the people the inferiority of that then made, and manufacturers gave more attention and study to its appearance than before. Trade kept increasing with the general wealth, and in 1860 the production reached $25,500,000; but the number of workingmen employed in this industry, owing to the improvements in machinery, had fallen to 28,000, although the population had then reached almost 31,500,000.

Industries in general were now to receive another blow, on account of the War of the Rebellion. As soon as this conflict was over, the extraordinary activity which had prevailed in military circles was transferred to the industrial field, and from this time on it is by leaps and bounds that improvements can be noted. The furniture trade was in the hands of two classes of manufacturers, one class of whom, having taken the place of the old-handshop workers made high-class work to order, continuing the old traditions, but now using machinery extensively. The other class of manufacturers studied the wants of the people, and produced suitable articles at prices which were within the reach of the masses. It is to them that we are indebted for the gigantic development of the industry, as they placed within the reach of all, strong, ornamental and practical furniture. We have seen that men of taste had recognized for some time that our furniture was inferior to that made at the end of the last century, and had begun to study not only the styles of that period, but also those of the English and French prevailing in the past. As a result we find that a great variety of styles were employed in the productions of the leading firms, who were always striving for novel effects.

A work published in London, England, in 1868, entitled 'Hints on Household Taste,' by C. Eastlake, waged war on modern work, advocated returning to the primitive principles of Gothic construction; and gave positive instructions as to what was right or wrong, not only in the line of furniture, but in draperies, carpets, and other household decoration, as precisely as if the art had been a science. This book was looked upon as a sort of gospel treatise on furnishing, and however much we may at this time ridicule some of the ideas conveyed, it directed the public mind in its search for more artistic surroundings at home. From that time other styles were discarded, and designs in accordance with the newly developed taste took their places. The movement in favor of more perfect construction and the use of straight lines exclusively became general, the stiff appearance being relieved by an abundant use of arches, spindles, turnings, etc. This style allowed the manufacturers to do the greater part of the work by machinery, for which it seemed specially adapted. The increased interest that the public took in furniture developed the trade in an unprecedented manner, the production for 1870 being $68,500,000, or nearly two and one-half times that for 1860. The number of men employed at this time shows a similar increase, being 55,800, out of a population of 38,500,000 people. The Centennial Exhibition in Philadelphia (1876) had a far-reaching influence, especially on western manufacturers, who until this time had not had occasion to compare their products with those of the best manufacturers of America and Europe. This exhibition marks the highest point that the Eastlake or early English was to attain. A number of the most prominent manufacturers of this country had their exhibits made in this particular style. It was quickly taken up by the manufacturers of cheaper furniture, who until then had given very little attention to artistic form, and they are responsible for the enormous quantity of furniture in imitation of this description that can yet be seen in the auction-rooms of large cities. The strife for originality, which was soon to be one of the characteristics of western manufacturers, had now begun to show itself; but an insufficient knowledge of art subjects rendered many of their designs more strange than beautiful, and more noticeably so when they were working on the lines of any given style; but through diligent efforts their designs were steadily improved, and this, in connection with their superior facilities, has secured to them a large part of the eastern trade. The volume of business showed a substantial increase during this decade, although not as large as during the preceding period. The value of the output of furniture for 1880 was $77,845,000 — an increase of 13.5 per cent in value, but a decrease from $1.77 to $1.55 per capita of the population. The wonderful changes which occurred in architecture in the next decade, especially the Romanesque revival due to H. H. Richardson, had a distinct effect on furniture. Richardson himself designed some Romanesque furniture. Furniture manufacturers eagerly welcomed this departure, for the ceaseless demand for new things, as strong then as it is now, obliged them to change their patterns very frequently. Unfortunately, by passing through the hands of manufacturers of cheap furniture, it lost all of its original beauty. During this decade great improvements were made in woodworking machinery, and a large number of new devices were invented. Among them was the carving machine, which enabled manufacturers to ornament even the cheapest kind of furniture. The amount of business done in 1890, large as it was, did not keep up with the increase of population. The value of the product in 1890 was $86,362,685, an increase of 11 per cent over that of 1880, but the amount per capita of population dropped to $1.38 as compared with $1.55 in 1880, and $1.77 in 1870. The International Paris Exposition of 1889 revived a taste for the 18th century furniture, especially of the Louis XV style, which was quickly taken up by the people of the United States. In spite of the seeming difficulty of using machinery in making such work, American manufacturers made and are still making a large quantity of furniture, in that dainty mode, which certainly equals that of the same class made in Europe, and is generally better constructed. All the 18th century styles, French or English, have been and to a certain extent are now used by American manufacturers:—Louis XV, Chippendale, Louis XVI, Sheraton, Hepplewhite, Empire and the Flemish Renaissance.

Since the decline of the Empire style in the first half of the last century manufacturers have been satisfied to copy the styles of the past, with such modifications as conformed to commercial requirements. The public demand for reproductions of old furniture increased to such an extent as to leave little room for originality in their production. Within recent years a strong feeling has developed that the old styles are not in keeping with present ideals and new styles should be evolved to emphasize simplicity of construction, grace of style, beauty of proportion and harmony of color. The Mission style, at first heavy and shapeless, is acquiring more subtle and refined lines, thereby increasing in public favor. The novelty of the last century is a free natural style called Art Noveau. Its introduction to this country from France a few years ago was attended by failure. The market was flooded with goods of inferior make in which the vagaries of this style were mistaken for its distinctive features. The meaningless curves and coarse ornaments of the beginning are being discarded and a refined elegance is now taking their place. The extensive adoption of this style in other art industries warrants the belief that it soon will be a distinctive feature in furniture.

Many of the numerous articles of furniture manufactured are distinctly American. The bureau, the rocking-chair, the folding-bed, the chiffonier, as now made with toilet, and in general most of the combination pieces of furniture made with a view of economizing space in apartments in large cities, are of this class. The American bureau is a combination of the old chest of drawers and the dressing-table, having the drawer-room of the one and the swinging mirror and table-top of the other. This has been imitated in Europe to a limited extent, in the production of what is known as the English dressing-table. As made in this country, the bureau is one of the most practical pieces of furniture used. The rocking-chair, almost entirely unknown in Europe, is found in every home in this country, yet it is difficult to ascertain when it was first put in use. We do not find any mention of it in the descriptions of articles of furniture in the 18th century. The first patent issued for improvements in rocking-chairs is dated as far back as 1830. The folding-bed, in the shape of a sofa, with a box-seat for bedding, has been used in Europe for over a hundred years, but America claims the folding-bed in other forms, such as the wardrobe, the cabinet, the mantel, and the combination; some of these were made as early as 1847. The demand for folding-beds, which reached its climax a few years ago, is now showing a material decline.

The woods used in the manufacture of furniture are varied, and subject to frequent changes. Early in the century, mahogany, maple and black walnut were in favor; then cherry and ash became fashionable; toward 1880, oak, so long forgotten, took a prominent place. At the present time black walnut is almost entirely out of use. Oak has kept its popularity for the hall, the library, and the dining-room. Mahogany, curly birch, and maple are still extensively used; all of them for the bedroom, and mahogany for the dining-room and the drawing-room in the better grades of furniture. The changes in furniture covering have been more frequent and radical than those of the woods. Haircloth and other coverings in use 30 years ago have been superseded by materials more varied in texture and coloring. Their variety is almost endless, and they show, perhaps as much as anything else, the advance that art as applied to furniture has made in this country. The present centres of the furniture industry are, with one exception (Grand Rapids, Mich.), the largest cities, which, with their densely populated suburbs and surroundings, offer large markets. The cities whose productions amount to more than $2,000,000 per annum, in the order of their importance, are: New York, Chicago, Grand Rapids, Philadelphia, Cincinnati, Saint Louis, Boston.

During the past 10 or 15 years there has been a very steady progress towards more refined furniture and to-day the manufacturers of the better grade furniture are producing articles in quantities that a few years ago could only be found at shops making furniture to order by the single piece. The manufacturers of medium and lower grade goods are placing upon the market designs with feeling following the thoughts of some of the earlier masters of the Flemish and English schools, therefore our furniture stores are full of many simple and good pieces which the consumer can buy at very moderate prices. One can furnish a home today which will bear close inspection by the artists at a cost which is within the reach of the more modest incomes. There is to be found some very ugly furniture which is still produced for certain trade, but the desire for this kind of furniture is fast disappearing. The manufacturers all over the country are eager to secure artists and draughtsmen who can lead them forward to better production and choicer class of wares.

During the last 10 years there has been published many readable books and monthly publications which picture the better homes and home furnishings. They have done much to help the people to understand better furniture. We are seeing the demand come very fast for more refined furnishings in all branches of the industry. The day is not far distant when furniture will have the same thought given to its selection as we give to other objects of art that we expect will live and adorn our homes. Furniture should grow in favor as the years pass by.

The manufacturers of to-day have endeavored to keep well abreast of the demand and the keen competition which has always existed has been the means of producing more new things in the past few years than has ever been produced in a like period. In many instances too much has been produced for the sake of getting something new rather than of confining our efforts to really good pieces that prove their worth by age. The semi-annual furniture sales of the manufacturer have been continued up to the present time. The points most prominent for such exhibitions are New York City, Chicago, Ill., Grand Rapids, Mich., and Jamestown, N. Y., the latter coming into prominence within the last five years. This was brought about by the large number of factories located there combining their efforts in erecting a large exhibition building which is open to the dealers during the months of May and November of each year. The selling dates of July and January are maintained at the other points mentioned. Dealers from all over the country assemble at these sales to purchase their six months' requirements. Both the New York and Chicago exhibition buildings show many lines of the cheaper grades of furniture. Both of these cities, however, have many manufacturers of the better grade who exhibit in their local factories. Grand Rapids has for many years stood out very prominently with its lines of bedroom, dining-room and living-room furniture. No market in recent years has shown more marked progress. This market, like New York and Chicago, has many exhibitors whose factories are located in various sections of the country. Six large buildings have been erected for the convenience of these manufacturers to show their product, there being about three hundred who exhibit at these semi-annual sales in Grand Rapids. To-day many kindred lines are shown and one can find in this market almost anything that is required in the furnishing of a home or public building. The quantity of furniture manufactured has greatly increased until the total output in this country averages about $300,000,000.

The manufacture of furniture is so easily undertaken that there are a large number of small companies and but few whose volume exceeds a million dollars per annum. The same method of starting these companies is true today where cabinet-makers rally about them a few men and organize a small company. Furniture factories are located in practically all of the States of the Union, excepting the prairie and mountain districts. The manufacturers of furniture are fast reaching efficiency methods in both manufacturing and selling. Much has been accomplished along this line in the past few years where costs have been reduced and the production is better. The commercial product of to-day consists of furniture largely made of mahogany, American walnut, oak and other woods that can be enameled in various colors and also decorated according to requirements. Other woods are used in some instances and in the better grades the choicest of woods can be found.

The working conditions have been greatly improved, and labor is receiving a much larger compensation than in the past. The majority of furniture factories in the country are working on the 10-hour a day basis. This is true especially with the factories located in the smaller towns. Some, however, have adopted the nine-hour a day basis, Grand Rapids being one of the most prominent centres working on this basis.

The exporting of furniture is still very limited, although certain grades of chairs and office desks have been exported for some years. Just before the World War our South American markets were making purchases from manufacturers of the better quality furniture and from reports received our furniture has proved quite satisfactory in South America. Manufacturers are in a fair way to do much more business there when the shipping conditions between the two countries become more favorable.

During 10 years (1907–17) there developed quite a departure in office and public building furniture, such as desks, tables, chairs, filing cabinets, wardrobes, etc. All of these articles being also made of steels, painted or finished to imitate mahogany. Metal furniture, however, has not come into favor for the home excepting the brass and iron beds, which have been made for many years and continue to be made. These articles, however, have been changed to more refined lines and proportions. Articles for the kitchen and bath-room are also made in metal and are growing in favor.

We are fast becoming lovers of outdoor life and our homes are being built with large porches both open and closed. This calls for a different class of furniture. The demand is supplied quite largely by reed, rattan and fibre-seating furniture, trimmed with bright colors of chintz or cretonne. This character of furniture has increased in demand very materially. The breakfast room is much more common in our modern homes and therefore a bit of color or fancy wood is very appropriate for such furnishings, thereby calling for changes in design to meet new needs.

This industry was affected to a considerable extent by the World War. The furniture business is commonly considered as one of the non-essential industries on account of the inability of the government to supply orders for more than 10 per cent of the output of the woodworking factories of the country. Every manufacturer hoped, however, that his organization could be held together by older men and the women who were fast filling furniture factories. For the duration of the war the manufacturers entered into an agreement with the Conservation Division of the War Industries Board at Washington, to produce no new pieces of furniture and to discontinue special sales seasons of July and January, November and May, and established one sale season a year during the month of May, this sale being held at the various points at the same time. Many other economies were inaugurated. Knock-down construction whenever possible was demanded to save shipping space. Metals and glass were largely conserved owing to the great shortage of the raw product. To conserve capital, the variety of designs was reduced 50 per cent. This conservation program caused some manufacturers to take up other lines of work more essential to winning the war. It also created quite a change in the present method of doing business, and especially after the war. Some factories were unable to stand the strain, and all of the war casualties were not found in Europe.

WM. H. GAY.

FURNIVALL, Frederick James, English scholar and editor: b. Egham, Surrey, 4 Feb. 1825; d. 2 July 1910. He was a graduate of Trinity College, Cambridge, and was called to the bar in 1849. He devoted his life chiefly to the study of early and middle English literature; and he was mainly instrumental in establishing the Early English Text Society, the Chaucer Society, the New Shakespeare Society, the Browning Society, the Wickliffe Society and the Shelley Society. The societies named have given a powerful impulse to English scholarship by their publications, and this was in no small measure due to Dr. Furnivall. For them and for the Roxburghe Club and the Rolls Series he edited numerous works, notably the Six-Text edition of Chaucer's 'Canterbury Tales' (1868–75). Other works of his are 'Early English Poems and Lives of the Saints' (1862); 'Early English Meals and Manners' (1867); 'Book of Nurture' (1867); 'Education in Early England' (1867); 'Bibliography of Browning' (1881); and 'The Fifty Earliest English Wills in Court of Probate' (1882).

FURNIVAL'S INN, an ancient inn of chancery and appanage of Lincoln's Inn. It is named after Sir William Furnival, whose family became extinct in the 14th century. It stood in Holborn and gradually falling into disuse finally ended its history in the 18th century. Consult Pearce, R. R., 'Guide to the Inns of Court and Chancery' (London 1855), and Headlam, Cecil, 'The Inns of Court' (New York 1909).

FURRER, fur'ĕr, **Jonas**, Swiss statesman: b. Winterthur 1805; d. 1861. After studying at Zürich, Heidelberg and Göttingen he became president of the Grand Council of Switzerland in 1839, a position which he again occupied in 1844. In 1845 he received his appointment as president of the Cantonal Diet, and when the new federal constitution went into effect he was elected President of the Swiss Confederation and was thrice re-elected. He wrote 'Das Erbrecht der Stadt Winterthur' (1832).

FURS, fọrs, **FORS**, or **FURANI**, Moslem negroes, whose habitat is in Darfur in eastern Sudan. They are very black, tall and have wooly hair. They have been classed with the Nigritians, the race which once covered the Egyptian Sudan. Their modern history is a continuous record of wars and insurrections.

FURS are articles made from the skins of fur-bearing animals prepared with the hair left on. A fur-bearer, in the language and practice of the fur-trade, is an animal that has a short, fine, soft coat through which grow longer hairs. (For a list of fur-bearing animals and their residence, see FUR-TRADE). This overhair is straight, smooth, somewhat stiff and serves as a protection against cold and wet. The beauty of such pelts as those of foxes and the weasel tribe is due largely to this long overhair, and when it is at its best, in preparation for winter, the animal is said to be «prime.» In some, however, as the otter, beaver and sometimes the skunk the pelt is improved for use by pulling or «plucking» out these long hairs. Conversely, long hairs are sometimes inserted, or «pointed,» into manufactured skins, as in making a fraudulent silver-fox.

The underfur, or «fur» proper, consists of soft, silky, curly filaments. It is usually short and thick, and toward the skin it grows lighter in color. It is barbed lengthwise and hence is capable of felting — whence the value of rabbit-fur in hat-molding. «In a prime pelt,» says Jones, «the underfur is hardly discernible unless the overhair is blown apart. Then the light color of the underfur appears. If it were generally known that the undyed skin is whitish, and that the underfur close to the skin is a light drab, or pale blue color, it would not be so easy to sell dyed skins as 'natural.'»

Two methods are used in taking the pelt off the animal's body and saving it for market. The larger animals, as bear, wolf, wolverine, beaver and others, are regularly skinned and the hides are scraped clean of flesh, stretched on a flat surface and dried in a cool place. Small skins are opened by slitting inside the hind legs, the bones of which are removed, clipping and taking out the tail-bones and then stripping the skin from the body. The pelt, then wrong side out, is stretched by means of hoops or wedged boards fitted to each kind, cleaned and permitted to dry in this stretched form. This is called «casing.» Much of the value of the pelt depends on the care of this original preparation and the subsequent packing for shipment. Sealskins are packed with salt in barrels as soon as flayed.

Dressing and Dyeing.— Until the modern introduction of machinery, the dressing of the «raw» pelt began with the placing of them in a bath of lye. «When the pelt has become soft,» it was prescribed, «the skins are tubbed and then shaved, by passing them over a large knife, and placed in an upright position; they are next buttered, and put in a large tub of sawdust by men half naked, who tread on them for some time . . . rendering the leather soft and supple; they are then beaten out and finished.» The complicated operations of the art, varying with different pelts, are now performed mainly in great factories, and by special machinery. The process in general is as follows: The skins are first dampened on the flesh side and left all night to soften. In the morning they are placed, perhaps 2,000 at once, in a tramping-machine and kneaded for 8 or 10 hours, then taken out and left to soak over night in a mixture of brine and sawdust. The next morning they are fleshed by hand, then stretched and hung up to dry. When thoroughly dry they are again moistened with salt water and left over night. Brushed on the leather side with some animal oil or fat, they are then laid together in pairs, hair side out, and the next day are kneaded again in a tramping machine until perfectly soft and supple, after which they are stretched in every direction.

The next process is cleaning, 300 or 400 skins being placed in revolving drums exposed to steam heat, with sawdust which in time absorbs all their grease. The skins are next incased in a beating-drum, where they are revolved and hammered for two or three hours. On removal they are beaten by hand with rattans, and finally the hair is combed.

Well-dressed furs as clothing furnish a maximum of warmth with a minimum of weight, due to the air entangled among the hairs, excelling any practicable garment of cloth of the same shape. Their durability varies greatly, however. Jones gives a long table exhibiting the comparative value of most furs in this respect. The otters, both land and sea, are the most durable, and are reckoned at 100 per cent. Others follow: Beaver, .90; seal, .75; raccoon, .70; skunk, .70; Persian lamb, .65; martens and sable, .60 to .40; fox, .40; muskrat and opossum, .37; nutria, .27; and others from .25 down to hare or rabbit only .5. These facts should be borne in mind in purchasing any article made of fur.

The dyeing of furs is a distinct branch of the industry which heretofore has been almost wholly in German hands, except that until recently all seal-skins were dyed and otherwise dressed in England. Now, however, much of this preparation is done in Canada and the United States. The Bureau of Manufactures recorded that the value of the seal-skins prepared in this country in 1916 was $74,530.

Almost every sort of fur, raw as well as manufactured, has quadrupled in price during the last 30 years, although with many fluctuations. Coincidently, the demand for, and utilization of, furs in garments, and as trimmings, has enormously increased since the beginning of the present century. Political disturbances in Europe, and especially religious persecution, caused the emigration to western Europe, and to North America, of great numbers of workmen skilled in the preparation and sewing of skins and furs. This influx of comparatively cheap, yet competent labor, and other influences, led the capitalists of the trade, in concert with the controllers of fashion, to stimulate, and then to cope with, an unprecedented expansion in the use of ornamental furs — even in summer. This was followed by the setting up, almost wholly, as is natural, by Russian and Polish Jews, of thousands of small factories in every large town. Meanwhile the decreasing supply of first-class skins, competition resulting from the wide diffusion of business and much doubtful responsibility, and the great demand for showy appearance at a cheap rate, have led to a sad disguising and counterfeiting of materials by means of dyeing, manipulation and the invention of trade-names.

The deceptive misnaming of furs is encouraged by the ignorance of buyers, most of whom are willing to believe it when told by an unscrupulous salesman that a cape or muff offered at a ridiculously small price is true sable or seal or other rare and expensive article. It will be interesting and useful to mention some of the frauds constantly perpetrated — though less so than formerly. Take, for instance, sable. Precisely, it is the pelt of the Siberian marten, of which only about 75,000 skins were received annually previous to 1914, worth wholesale perhaps a million dollars. The price of even a small cape of Russian sables must be reckoned in three or four figures. But experts tell us that most «sables» in the fur-shops are made of dyed skins of the Canadian or pine marten, or of polecat, or mink, or plucked skunk («Alaska sable»), muskrat, marmot, hare or even rabbit. Genuine sealskin now has a price far beyond the reach of ordinary purses; but when the fur-dressers produced a clipped and dyed muskrat pelt that resembled sealskin almost perfectly it could be sold far cheaper — not, however, under its own name. Consequently this popular, and even now, high-priced product is sold as «Hudson Bay seal» (no true fur-seals live or ever did live in Hudson Bay; and the seals that do live there are not used). The fur of the common wild rabbit of Europe and elsewhere is the raw material of «electric seal,» «clipped seal» and «Baltic seal.» The rabbit and hare indeed may become almost anything in the hands of fur-dressers and salesmen. When white it may masquerade as coney, ermine, white fox, «foxaline,» «mock fox» or «chinchilla,» and when dyed may become seal of various trade varieties, sable or French sable, fox, lynx, marten, fisher, chinchilla and «muskrat-coney.» Skunk fur was formerly disguised under more elegant names as Alaska sable, black marten, etc., but its beauty and really excellent quality have become recognized and it is now sold for what it is; and curiously the Australian wallaby (a kangaroo) often figures in the market as skunk. Nutria, the fur of a South American aquatic rodent, is so nearly like beaver and otter, that it ekes out those rare skins without much harm; but it also becomes «seal.» Black domestic cats are valuable as fur-bearers and their coats go to market as «genet,» and the ponies and great dogs of Tibet, Manchuria and western China furnish thousands of shaggy hides to the modern furrier. Finally the demand for furs of high class is being met by breeding in captivity foxes, martens, skunks, Astrakan sheep and other animals yielding valuable pelts.

The United States is not only a large producer, but the greatest consumer of furs. Our export of skins in 1916 were valued at $9,288,786, and our imports of furs and fur-manufactures at $16,891,699.

ERNEST INGERSOLL.

FÜRST, Julius, German scholar: b. Zerkowo, Posen (Prussian Poland), 12 May 1805; d. Leipzig, 9 Feb. 1873. He was of Jewish parentage, and at an early age he had a remarkable knowledge of Hebrew literature, Old Testament Scriptures and Oriental languages. In 1825, after having studied at Berlin, he took a course in Jewish theology at Posen. In 1829, after having abandoned his Jewish orthodoxy, he went to Breslau, and in 1831 to Halle, where he completed his studies in Oriental languages and theology. In 1833 he entered journalism in Leipzig, later securing a position as tutor and lecturer in the university there, from which position he was promoted in 1864 to the chair of Oriental languages and literature, a post he filled with great distinction until his death. His works, especially those on the Semitic languages, are of great value, and among the most important may be mentioned 'Lehrgebäude der aramäischen Idiome' (1835); 'Concordantiæ librorum Sacrorum veteris Testamenti Hebraicæ et Chaldaicæ' (1837–40); 'Bibliotheca Judaica' (1849–63); 'Hebräisches und Chaldäisches Handwörterbuch' (1851–61); 'Geschichte des Karäerthums' (1862–65); 'Geschichte der biblischen Litteratur und des jüdisch-hellenistischen Schrifttums' (1867–70). From 1840–51 he edited *Der Orient*. He compiled 'Bibliotheca Judaica' (1849–63).

FURST, William, American composer and conductor: b. Baltimore, Md., 25 March 1852. He studied music in his native town and was a church organist at the age of 14. His comic opera 'Electric Light' was produced and conducted by him in 1878 and for the five seasons following he received engagements as conductor of opera. He became musical director of the Tivoli Theatre, San Francisco, in 1884. His opera 'She' ran for nine weeks there, and was produced for two seasons in New York. His chief productions are 'Theodora' (1888); 'The Isle of Champagne' (1891); 'Honeymooners' (1893); 'Princess Nicotine' (1893); 'The Little Trooper' (1894); 'Ghismonda' (1894); 'The Merry World' (1895).

FÜRSTENBERG, PRINCE **Maximilian Egon zu,** German noble: b. 1863. An intimate friend and adviser of the German emperor the prince bears territorial titles for Prussia, Austria, Hungary, Württemberg and Baden, and by virtue of this he has a seat in the Houses of Lords in all five countries. His principal seat is at Donaueschingen, near the source of the Danube, where he owns a magnificent castle and great deer forests. The Kaiser frequently visits there, and the prince invariably accompanies the emperor on his hunting expeditions and Norwegian trips. He became Imperial Chancellor in October 1918. He possesses vast forests, coal mines, hotels and breweries.

FÜRSTENBERG, a mediæval principality, now comprised in Baden, Hohenzollern and Württemberg. The name is perpetuated by the princely house of Fürstenberg of Austria, by the landgraves of Fürstenberg of Lower Austria and by the counts of Fürstenberg in Rhenish Prussia and Westphalia. Consult Tumbült, G., 'Das Fürstentum Fürstenberg' (Freiberg 1908).

FÜRSTENWALDE, für'stĕn-väl'dĕ, Prussia, town in the province of Brandenburg, on the Spree, 30 miles southeast of Berlin. It contains several churches, a gymnasium and many public monuments. It owns a neighboring forest 20 square miles in extent. Its industries include woolen manufactories, machinery, bricks, glass, alcohol and electric supplies. The town obtained municipal privileges as early as 1285. Pop. 23,000.

FURTADO, foor-tä'dō, **Francisco José,** Brazilian statesman: b. Oeiras (Piauhy), 13 Aug. 1818; d. Rio de Janeiro, 23 June 1870. After graduating from the Academy of Law at Caxias and serving for some time as judge, he entered politics and rose to be leader of the Liberals. In 1847 he was elected deputy and reelected several times. In 1856 he was elected president of the new province of Amazonas, remaining such until 1859, when he was made Minister of Justice. In 1864 he was elected senator, but held that position for a few months only, and in August 1864 was made Premier and Minister of State, in which position he did much toward the establishment of a good monetary system. During his term of office as Minister of State the dispute with Uruguay was settled and war between Brazil and Paraguay was declared. In 1870 he was again a member of the Senate and as such, being an opponent of slavery, exerted all his influence in behalf of legislation looking toward its final abolition.

FÜRTH, Bavaria, town situated at the confluence of the Pegnitz and the Regnitz, five miles northwest of Nuremberg, and 950 feet above sea-level. It has broad streets and is entirely modern in appearance, has many fine churches, a synagogue and a modern Rathaus. It manufactures mirrors, mirror-frames, bronze and gold leaf, toys, haberdashery, optical instruments, pencils, silver work, machinery, leather goods, etc. It has a large trade in these and in hops, wool and coal. A large annual fair is held here in October. Fürth was a Vogtei for some time under the burgravate of Nuremberg; in 1314 it passed to the bishops of Bamberg; it was besieged by Gustavus Adolphus in 1632, and two years later it was pillaged and burned by the Croats. It extended tolerance to the Jews and in great part owes its commercial prosperity to them. It passed to Bavaria in 1806 and was chartered in 1818. Pop. 66,500.

FURTWÄNGLER, Adolf, German archæologist: b. Freiburg, 1853; d. 1907. He received his education at Freiburg, Leipzig and Munich; took part in the excavations at Olympia in 1878–79, and in 1884 was made professor of archæology at the University of Berlin. After 10 years in Berlin he removed to Munich. At Ægina he conducted excavations in 1901 and two years later similar operations at Orchomenos. He was universally recognized as an expert on vases and ornaments of antiquity. He published 'Plinius und seine Quellen über die bildenden Künste' (1877); 'Meisterwerke der griechischen Plastik' (1893; English trans. 1894); 'Ueber Statuenkopien im Alltertum' (1896); 'Die antiken Gemmen' (1900); 'Griechische Vasenmalerei' (1900–04), with Reichold; the catalogue, 'Beschreibung der Glyptothek König Ludwig I zu München' (1900); 'Ein hundert Tafeln nach der Bildwerken der konigliche Glyptothek zu München' (1903); abridged edition of 'Meisterwerke der griechischen Plastik' (1908; translated into English by Taylor, London 1914).

FURY AND HECLA STRAIT, in the Arctic region, lat. 70° N., separates Melville Peninsula from Cockburn Island, and connects Fox Channel with the Gulf of Boothia. It was discovered by Parry (q.v.) in 1822 and named after his ships.

FURZE, fėrz, Anglo-Saxon *fyrs Ulex,* a genus of very branched and thorny shrubs with linear sharply pointed leaves, solitary flowers and two-lipped calyx, belonging to the order *Leguminosæ,* sub-order *Papilionaceæ.* The common furze (*U. europæus*), also called whin and gorse, is abundant in many parts of southern Europe and in Great Britain, although not reaching any considerable elevation and often suffering from the frost of severe winters. It affords a wholesome fodder, especially when young, or when the thorns are artificially bruised, and is grown often on dry and barren hillsides not fitted for other forage crops. A double flowering variety is grown in gardens. Furze is sometimes used as a sand binder and it frequently acts in this capacity of its own accord.

FUSAGASUGÁ, foo'sä-gä-soo-gä', Colombia, town in the department of Cundinamarca, 25 miles distant from Bogotá, the capital, in a southwesterly direction. It has extensive coffee interests and is a favorite summer resort of the inhabitants of Bogotá, its elevation of nearly 6,000 feet making it most salubrious. Pop. 12,000.

FUSAN, foo-sän', or **PUSAN,** Korea, seaport on the south shore, about five miles from the embouchure of the Nak-Tong, at the southern end of the Seoul Railroad, 285 miles south of Seoul. In 1876 a treaty was concluded with Japan which permitted the Japanese to trade in the port. It consists of two towns, old and new Fusan; the older portion being the native town with about 5,000 population, the new inhabited by Japanese. Under the Japanese régime great improvements have been made; waterworks, lighting systems, roads, streets, harbor, etc., constructed or improved. It has a good harbor protected by several islands. It has steamer communication with Nagasaki and other ports in Japan, also with Shanghai, Port Arthur and Vladivostok. The ruling authority is a prefect appointed by the governor at Seoul. There are now about 20,000 Japanese at Fusan. Hides, beans, fish, whale meat and oil and rice are the chief exports, and cotton, petroleum and Japanese manufactured goods form the bulk of the imports, which total about $6,250,000 annually, and are double the value of the exports.

FUSARO (foo-sä'rō) **LAKE,** Italy, lake in the province of Naples, in ancient Campania, one-half mile west of Baia, and about one mile south of the acropolis of Cumæ. It is the Acherusia Palus of the ancients and is connected with the sea by two canals. It may have been the harbor of Cumæ at an early period. Along its shores are the remains of numerous villas. Oyster cultivation is carried on extensively. Consult Beloch, J., 'Campanien' (2d ed., Breslau 1890).

FUSE, a device employed for firing explosives. In mining, quarrying and in military and naval mining operations there is used the "Bickford, safety running" or "tape" fuse which consists of a tubular cord of cotton or hemp that has been rendered slowly combustible, the cavity in the centre of the cord being filled with a slow-burning gunpowder composition. To make the fuse firm and hard, so as to prevent its being cut by the sharp edges of the rock during tamping, the outside of the cord is served with a covering of strong twine, which is wound about it at nearly right angles to the direction of the twist of the cord by the process called countering. To protect the powder from moisture, the wrapped fuse is immersed in a bath of heated varnish composed of glue, soap and whiting. Finally, to prevent the surfaces of the fuse from sticking together when coiled they are coated with dry whiting, bran or powdered soapstone. The fuse described is known as "single fuse" and, as the varnish used is not waterproof, this fuse is only suitable for use in dry ground. In wet ground, a fuse is used which is made by coating the countered cord with tar or resin varnish and then, before the varnish is quite set, countering it with tape and again coating it with varnish. This is known as "taped fuse." When the fuse is to be subjected to especially severe treatment, it is provided with a double coat of twine or thread and is known as "double fuse." The varieties in use are "common hemp fuse"; "common cotton fuse"; "white fuse"; "superior mining fuse"; "single-taped fuse"; "double-taped fuse"; "triple-taped fuse"; "small gutta-percha"; "large gutta-percha"; "small gutta-percha taped" and "large gutta-percha taped." Running fuse comes in lengths of about 50 feet, and, when properly made, is so uniform in quality that it can be depended upon to burn at the rate of three feet per minute. This is important, as it is necessary for the safety of the operator. The fuse should be stored in a dry place so that the powder core may not become damp; and, if so treated, it will retain its efficiency until the varnish has lost all its essential oils and become dusty. Care must be taken not to touch the tape with any oily or greasy matter, as this penetrates through the varnish to the powder core and affects the rate of burning. The fuse should not be roughly handled, as pinching and squeezing alter the rate at which the powder burns. Care should be exercised in opening out a coil which has become stiff through age or exposure to cold weather, for the fuse is then brittle, and if the covering is cracked by sudden and violent unrolling the fuse becomes unfit for use. If there be any doubt as to the behavior of a coil of fuse a piece one foot long should be taken and its rate of burning timed.

Although in firing single charges, safety fuse answers admirably, where several charges are to be fired simultaneously, the safety fuses are connected together by "instantaneous fuses." These consist of a strand of quickmatch enclosed in hemp or flax and several layers of gutta-percha and tape, or of a core of guncotton enclosed in a leaden tube. Besides these nitroglycerine compositions have been proposed by Quentin and Nobel, and one containing mercuric fulminate by Philip Hess. Within recent years it has become the practice to enclose trinitrotoluene (T. N. T.) in leaden tubes for use as a fuse to be exploded by a detonator. Such fuse is now put upon the market under the name of "cordeau detonant," and is meeting with much favor in blasting with "high" explosives.

In naval and military operations, and for simultaneous blasts in mining and quarrying, "electric fuses" are preferred to running fuses. These are gunpowder "igniters" or fulminate "detonators," that are fired by electricity. They are classified as "low tension fuses," designed for use with strong currents of low potential, from primary or secondary batteries, or from dynamo-electric machines; "medium tension fuses," for use with magneto-electric machines which generate currents of medium potential, and "high tension fuses," for use with condensed sparks capable of traversing a sensible air space. The use of the word tension is not warranted by the present condition of electrical science, but it has become technical in this art. To-day, only low tension electric fuses are employed and they are described under DETONATORS (q.v.).

Fuses are employed in ordnance for exploding shell and they may consist of a compressed core of gunpowder enclosed in a tube of wood or metal, or of a fulminating composition or of both. They are known as "nose fuses" when put in the front end or "nose" of the conical pointed shell, or "base fuses" when inserted in the lower end or base of the shell. They are known as "time fuses," when they are planned to burn a certain length of time after they have become ignited, before they set fire to the explosive charge in the shell; "percussion fuses" when they are set in operation by the impact of the shell against an object after it has been projected from the gun. They may act instantaneously in firing the charge in the shell, or there may be a column of compressed powder interposed between the charge of explosive in the shell and the fulminating composition which is fired by impact. As sometimes a second or more intervenes between the striking and the bursting of the shell, these are styled «delayed action fuses.» They may be used with armor piercing shells designed to penetrate armor and burst within the ship. In time fuses, used with spherical shell, the powder in the fuse used to be ignited from the flame of the burning charge with which the shell was propelled from the gun. In modern time fuses there is a metal cylinder which serves as a hammer placed within the fuse case and held in place by brittle pegs of metal, or by a number of small balls. When the shell containing such fuses is fired, the inertia causes the hammer to strip from the pegs and set back toward the base of the shell, or, if it be a shell from a rifled gun, the centrifugal force causes the balls to fly outward and release the hammer. When the shell strikes, and is arrested in its flight, the hammer moves forward, strikes a percussion cap and fires the charge.

«Chemical fuses» have been used in firing gunpowder mines and torpedoes. As an example of these we cite the mixture of cane sugar and potassium chlorate used in the Harvey torpedo. Above a column of this mixture was placed a small glass bulb filled with concentrated sulphuric acid, the whole being enclosed by a soft copper cover projecting from the torpedo. When this cap was struck, it collapsed and broke the glass bulb, and, as the sulphuric acid came in contact with the mixture of sugar and chlorate, the latter burst into flame and ignited the powder in the torpedo. Such fuses have been used by anarchists in infernal machines and they have ascertained the rate at which the acid would eat through sheets of bibulous paper so that by interposing a sufficient number of sheets of paper they could set the train in operation and get safely out of the way before the machine exploded. Fuses, consisting of columns of compressed gunpowder composition, are used in pyrotechny by which to ignite the charges in rockets, bombs, roman candles and other devices. By their use the operator is enabled to get to a safe distance after igniting the device before it functions fully.

Fuses are used in «electrical installations,» but these are of an entirely different character from the above. They consist of strips of metal of low fusibility which are interposed, in electric lighting and other circuits, between the generator and the lamp, or other device, to prevent damage to the device by an excess of current. When the load is greater than is desired the current heats the fuse to its fusion point, when it melts and cuts out the circuit. See GUNPOWDER; EXPLOSIVES.

CHAS. E. MONROE,
George Washington University, Washington, D. C.

FUSED QUARTZ. See ELECTROCHEMICAL INDUSTRIES.

FUSEE, fū-zē', in clock and watch making, is the conical pulley used in connection with the main spring, to equalize the power of the latter, so that the watch may run regularly. The spring coiled within the barrel, when fully wound up and at its greatest tension, draws on the part of the chain wound on the smaller portion of the fusee. The first wheel of the watch or clock is attached to the fusee, and as the latter unwinds by the gearing motion in the watch, the spring also uncoils and loses a part of its tension; as this proceeds, the chain draws on a larger portion of the fusee, and attains an increased leverage on the latter to counterbalance the decreased power of the spring.

FUSEL OIL, an injurious and exceedingly objectionable constituent of improperly prepared distilled liquors (q.v.), consisting of an indefinite and variable mixture of the amyl alcohols (see AMYL) with certain other alcohols and ethers, and certain organic acids and their esters. Fusel oil usually contains butyl and propyl alcohols. It comes over in the later parts of the distillate, and may be separated from ethyl alcohol (in large measure at least) by resort to fractional distillation.

FUSHIMI, foo-shē'mē, Japan, seaport town in the province of Kioto, southern coast of Hondo, on the right bank of the river Uji-gawa, which serves as a trade outlet and depot for Kioto, Otsu and Nara, and is connected by steam service with Osaka. It is noted as the place where a battle occurred between the Imperialists and the adherents of the Shogun in January 1868. Pop. about 22,000.

FUSIBLE METAL, or **FUSIBLE ALLOY,** any alloy, or metallic mixture, which melts at a comparatively low temperature, that is, below the melting point of tin (442° F.). (See ALLOY; AMALGAM; BISMUTH; CADMIUM). Fusible metals are either binary, ternary or quarternary alloys of lead, tin, bismuth and cadmium. These metals, constituting what is known as «the fusible group,» form simple alloys, which consist of practically pure metals and eutectics. As eutectics have a lower melting point than either of their components, we may, by combining these components in the proportion necessary to form the eutectic, obtain alloys whose melting point is much lower than any of the combined metals. The eutectic of three metals melts at a lower point than that of two metals, and the eutectic of four metals lower than that of three.

The alloy known as Wood's Metal, or Wood's Alloy melts at the lowest temperature of all the fusible alloys — 145° F. Its composition is: tin, 4 parts; lead, 4 parts; bismuth, 8 parts; and «a little» cadmium. Other fusible alloys melting at very low temperatures are constituted as follows: (1) lead, 25 per cent: tin, 12.5 per cent; bismuth, 50 per cent; cadmium, 12.5 per cent — melting at 150° F.; (2) lead, 26.7 per cent; tin, 13.3 per cent; bismuth, 50 per cent; cadmium, 10 per cent — melting at 153° F.; (3) lead, 26.7 per cent; tin, 14.8 per cent; bismuth, 52,2 per cent; cadmium, 7 per cent — melting at 156° F. (See BISMUTH). Fusible metals are used in the arts for many purposes. Automatic sprinklers, for example, are capped with alloys of this sort, which are chosen so as to have melting points that are higher than any temperature that would normally occur in the room that is to be protected. If a fire breaks out, however, the abnormal rise of temperature so produced causes them to melt, the water in the sprinkler pipes being thereby released and the fire extinguished.

Fusible metals have also been used quite generally in the manufacture of 'fusible plugs,' for the protection of steam boilers; such plugs being screwed into the boiler at the height which is considered to be the lowest limit to which the water level in the boiler can be allowed to descend with safety. So long as the inner end of the plug is covered with water, the plug itself is thereby kept too cool to melt under the influence of the furnace gases; but when the protecting action of the water is removed by the water level descending below the safety limit, the hot furnace gases melt the material of the plug and the steam in the boiler escapes. Fusible plugs are excellent appliances and in fact they are required by law in some of the States. There is no advantage in filling them with an alloy, however, because in any event the alloy must have a melting point higher than that of the steam that the boiler is to generate (365° F., for a gauge pressure of 150 pounds per square inch), and pure tin, with a melting point of 442° F., is entirely satisfactory for the purpose. Indeed, tin is far superior to any alloy for this purpose, because its melting point remains sensibly constant for an indefinite time (so long as oxidation is prevented), while the melting points of alloys that are continuously exposed to heat for considerable periods become quite uncertain and are often found to be far higher than when the alloy is freshly prepared. The eutectic alloy of lead, tin and bismuth expands at the moment of solidification. It is therefore of value in making metallic casts of substances which will not endure the heat of molten single metals.

FUSIBLE PLUG. See FUSIBLE METAL.

FUSIDÆ, fū'sĭ-dē, a family of gastropod mollusks, by some conchologists regarded as only a genus (*Fusus*) of the family *Fasciolariidæ*. In either case it is a world-marked group allied to the turban-shells and volutes in structure, but having a long, more or less spindle-shaped, comparatively thin shell, with a very long canal. The animal is closely similar in its soft parts to a whelk or a murex. The family contains the genera *Fasciolaria, Clavella, Latirus*, etc., but interest centres chiefly on the genus *Fusus*, of which many species are known in various parts of the world and which goes back to Cretaceous time in geological history. North American species are inconspicuous, but some of the several kinds found upon the coast of Great Britain are highly valued by collectors of shells and constantly sought for by fishermen who bring them up in their dredges from time to time. The «red-whelk» or «roaring buckie» of Scotland is a species (*F. antiquus*) made famous in folklore and by Wordsworth's poem; it is extensively eaten in various parts of Great Britain and along the continental coast. In Zetland its shell was formerly used by the peasantry as an oil lamp. *F. proboscidialis* is one of the largest of mollusks.

FUSING POINT. See FREEZING POINT; MELTING POINT.

FUST, or **FAUST, Johann,** German pioneer printer and associate of Gutenberg: date of birth unknown; d. about 1466. He appears to have been a money-lender or banker; was shrewd enough to see the possibilities of gain in Gutenberg's printing apparatus. He financed the latter's undertaking but when Gutenberg was unable to make repayments, he sued him and seized enough of the printing outfit to cover the mortgage. With his son-in-law, Peter Schöffer, he carried on printing at Mainz; the first publication was a 'Psalter' (14 Aug. 1457), a folio of 350 pages, the first printed book with complete data and with initials printed in red and blue from two-piece types. At the capture and sack of Mainz in 1462, the printers were dispersed and their secret became common property. See GUTENBERG; PRINTING.

FUSTEL DE COULANGES, fos'tel dẹ koo-länzh', **Numas Denis,** French historian: b. Paris 1830; d. Massy 1889. He was educated at the École Normale and at the French School at Athens. After his return to France he became professor of history at Amiens and later at Paris. He received the degree of doctor in 1858, and soon after became professor at Strassburg. After the war of 1870 he returned to Paris, where he taught at the École Normale; became in 1875 member of the Academy of Moral Sciences; succeeded Geffroy in the faculty of letters at Paris, and in 1878 became professor of mediæval history there. From 1880 to 1883 he was director of the École Normale; returned to the Sorbonne in 1884 and remained until 1888. He published 'Mémoire sur l'ile de Chio' (1887); 'Polybe ou la Grèce conquise par les Romains' (1858); 'La Cité antique étude sur le culte, le drait, les institutions, de la Grèce et de Rome' (1864); 'Histoire des institutions politiques de l'ancienne France' (1875–89); 'Recherches sur quelques problèmes d'histoire' (1885). Consult Guirand, 'Fustel de Coulanges' (Paris 1897).

FUSTIAN, named after Fustat, a suburb of Cairo, where the material originated, (1) a species of cotton cloth similar to velvet, having, in addition to the warp and weft, a species of pile consisting of other threads doubled together, which are thrown up in ridges and conceal the groundwork of the fabric. When in the loom, this pile presents the appearance of a set of loops. These are cut in two and sheared down, and when polished and finished, present an evenly ribbed surface on the exterior. The best fustians are known as cotton-velvet and velveteen; besides these there are moleskin, corduroy, and several other kinds. (See WEAVING). (2) In literature, fustian signifies a forced, bombastic style of writing, abounding with metaphors or other rhetorical figures. Consult Passelt, 'Technology of Textile Design' (Philadelphia 1895).

FUSTIC, name of certain kinds of dyewood, which yield a yellow color, capable of being chemically changed to other hues, as brown, green, etc. One variety (*Chlorophora tinctoria*) is a handsome tree of the West Indies, Central and South America; is sometimes used as a cabinet wood, but principally as a dyewood because of its large content of yellow. Another variety is the *Rhus cotinus*, known in commerce as «young fustic.»

FUTA-JALLON, foo'tä zhä-lôn', West Africa, a region in central French Guinea, extremely mountainous, and remarkable for the romantic beauty of its scenery; and the source of the rivers Senegal, Gambia, Niger, etc. Large herds and flocks are pastured, and the soil produces in abundance bananas and other fruits, besides coffee, maize, rice, cotton and numerous palm trees, which furnish dates, wine and oil. The region has an area of about 42,500 square miles and since 1902 has been subdivided into four districts for administrative purposes. The native princes are called almamys, and rule each for two years, subject to the edicts of a council of nobles. The French protectorate dates from 1893. Pop. 700,000. Consult De Sanderval, 'La conquête du Fouta-Djallon' (Paris 1899) and Machat, 'Les rivières du sud et le Fouta-Djallon' (ib. 1906).

FUTA-TORO, foot'ạ.tō'rō, West Africa, a territory in the northern part of French Senegal. It has a population estimated at 125,000, chiefly Fulahs. The soil is fertile and much of the country is covered with tamarind forests. Iron is mined in considerable quantities.

FUTHARK, foo'thôrk, the Runic alphabet which derives its name from the first six letters, *f, u, th, a, r, k,* and is applied to all the systems of phonetic signs of the Teutonic stock, for the same reason as those of classical derivation are called «alphabet» or «abecedarium.» They occur in the same order in Old German, Gothic, Anglo-Saxon and Northern Runes, with a nomenclature in all of them borrowed from trees and other familiar natural objects, suggestive of the derivation of the series of phonetic symbols from a primitive system of pictorial writing. See ALPHABET; RUNIC CHARACTERS.

FUTURE ESTATE, a landed estate of which a person is to become possessed at some future time. In England under the common law the number of such estates was very limited until the reign of Henry VIII, when, in 1535, new classes of future estate were rendered possible by legislation. In England many legal distinctions still remain, such as executory devise, springing use, shifting use, etc., but in very many of the United States all future estates are placed on the same basis so that future estates of all kinds may be created directly by deed as well as by last will and testament. It is also possible to create future estates or interests in personal property as well as in real. All future estates of a contingent character are subject to the rule against perpetuities, which makes void any interest which is not to vest within a lifetime, and 21 years after the creation of the future estate.

FUTURE LIFE. The purpose of this article is not to discuss the varying conceptions of a future life which have been believed and taught through the many generations of human existence. It is not an attempt to trace the history or development of the doctrine of a future life. It is no part of the plan to prove or disprove the matter of continued existence after death or any particular theory thereof, nor to disclose the ground on which this belief has been built. All that is attempted is to present, as fully as space will allow, a summary of this belief as held and expressed by fairly representative minds in all generations. To record every shade of difference, or to quote from authorities in each of the different religious movements is impossible on account of the length to which this article would run. By a series of carefully selected quotations it is hoped to enable the reader to get a hint of what men in different nations and periods of human history have thought on this unceasingly important matter.

Prehistoric.— In the prehistoric period of human life there is in the nature of things no written record of man's belief concerning the future or anything else. The evidence dug up from the burial places of very ancient man is such as to convince any one that in the remote periods of human existence man believed that death of the body was not the end of life. It was believed that the spirit of man lived on; that it often returned to the place of its earthly existence; that it knew those who still lived on earth. It is not at all certain that all primitive races had this belief.

Pre-Christian.— The earliest records known in which man has tried to express his ideas of the future are not easy to understand. It is far from easy to select sentences that express the idea with any clearness.

ASSYRIA.

The future was frequently spoken of as «The land from which there is no return,» and in the 'Izdubar legends,' we read, «Formerly Pir-napistim was of human nature, now Pir-naptistim and his wife must be like the gods.»

EGYPT.

The tombs of Egypt have yielded considerable material on this subject; a 26th century B.C. inscription on a tomb reads:

«Now I caused that I should be buried in the same tomb with this Zau (His father's name) in order that I might be with him in the same place; not, however, because I was not in a position to make a second tomb; but I did this in order that I might see this Zau every day, in order that I might be with him in the same place.»

During the Osirian period the Egyptian dead are identified with Osiris, which explains the following from Pyramid Texts:

"As surely as Osiris lives, so shall he live also;
As surely as Osiris did not die, so shall he not die.
As surely as Osiris is not annihilated, so shall he too not be annihilated."

«When thou hast triumphed over thy present, Re and Horus will provide a ladder for thee; one of them shall stand on this side and one on that, and thou shalt mount up to heaven. The gate of heaven will open to thee, and the great bolts will draw back for thee. There thou findest Re stationed . . . he takes thee by the hand and leads thee into the sanctuary of heaven, and sets thee upon the throne of Osiris»;

From the 'Book of the Dead':

«The blessed dead has his place in the Hall before the great god and he knows every great god . . . He goes out into the field of Earu. There is given to him cakes and bread and fields of barley and spelt seven cubits high. The servants of Horus gather in the harvest, and he eats of this barley and this spelt.»

On Egyptian Tombs (2,000 B.C.) we find:

«May thy soul attain to the Creator of all mankind . . . These have found grace in the eyes of the Great God. They dwell in the abodes of glory, where the heavenly life is led. The bodies which they have abandoned will repose forever in their tombs, while they will enjoy the presence of the Great God."

It was believed that the dead go to the lower world and occupy vast caverns thro' which the sun passed during his night absence:

"The departed, who are in their halls, in their caverns, praise the sun; their eyes are opened, their heart is full of felicity when they behold the sun; they shout for joy when his body is over them."

PERSIAN.

We read in the 'Prayer to the Angels' (Yazatas) recited in last death rites:

"O victorious and holy Srosh, we have removed (N. or M.) from the earth, Spendarmad, and have committed him (or her) to the stone Ayokhshust. O angel Srosh, we turn our backs upon him (her), but do thou turn thy face towards him (her); into thy keeping we have given him (her); do thou take his (her) hand. . . . O, Srosh, Mihr, and Rashn the Just, we have delivered him (her) into your keeping; take his (her) hand and lead him (her) to the abode of our forefathers and the righteous and the pure. So be it in accordance with the will of the Angels and Archangels; so be it, so, verily let it be."

In the 'Zendavesta (589 B.C.) *is found:*

"The man who has constantly contended against evil, morally and physically, outwardly and inwardly, may fearlessly meet death; well assured that radiant Sprits will lead him across the luminous bridge into a paradise of eternal happiness, . . . Souls rise from the graves will know each other, and say, That is my father, or my brother, my wife, or my sister."

"What is the world? It is simply a halting place with two gates. By the one ye enter; by the other ye depart."

From Airyama Prayer:

"In the earth shall Ahriman hide,
In the earth the demons hide,
Up the dead again shall rise,
And within their lifeless bodies
Incorporate life shall be restored."

The Pahlavi Texts have:

"In that assembly (the risen dead) every one sees his own good deeds and his own evil deeds; and then, in that assembly, a wicked man becomes as conspicuous as a white sheep among those which are black." The heavenly work being completed "all men become of one voice and administer praise to . . . the merciful Lord, who makes the final retribution, and who will at the end deliver the wicked from hell and restore the whole creation in purity."

HINDU.

The 'Ancient Vedas' (c. 1500 B.C.) *state that:*

"The God of the Dead waits enthroned in immortal light to welcome the good into his kingdom of joy: to the homes he had gone to prepare for them, where the One Being dwells beyond the stars."

The Bhagavadgita (c. II), *The deity said:*

"You have grieved for those who deserve no grief, and you speak words of wisdom. Learned men grieve not for the living nor the dead. Never did I not exist, nor you, nor these rulers of men: nor will any of us ever hereafter cease to be. . . . For the one that is born death is certain; and to one that dies, birth is certain."

Dhammapada (Buddhist):

"The evil-doer mourns in this world, and he will mourn in the next world: in both worlds has he sorrow.

"The virtuous man rejoices in this world, and he will rejoice in another world: in both worlds hath he joy.

"As kindred, friends, and dear ones salute him who hath travelled far and returned home safe, so will good deeds welcome him who goes from this world and enters another."

The Satapatha-Brahamana (Pt. IV, Third Brahmana):

"Henceforward no one shall be immortal with the body: only when thou shalt have taken that (body) as thy share, he who is to become immortal either through knowledge, or through holy work, shall become immortal after separating from the body. Now when they said, 'either through knowledge or through holy work' it is this fire-altar that is the knowledge, and this fire-altar that is the holy work.

"And they who so know this, or they who do this holy work, come to life again when they have died, and, coming to life, they come to immortal life. But they who do not know this, or do not do this holy work, come to life again when they die, and they become the food of him (Death) time after time."

Buddhist Suttas:

"The devout Kakudha, Ananda, by the complete destruction of the five bonds that bind people to these lower worlds of lust, has become an inheritor of the highest heavens, there to pass entirely away, thence never to return."

CHINESE.

Buddhist Scriptures:

"Man never dies. The soul inhabits the body for a time, and leaves it again. The soul is myself: the body is only my dwelling place. Birth is not birth: there is a soul already existent when the body comes to it. Death is not death: the soul merely departs, and the body falls. It is because men see only their bodies that they love life and hate death."

The writings of Kwang-tze (Book XVIII, 4):

"When Kwang-tze went to Khu, he saw an empty skull, bleached indeed, but still retaining its shape. Tapping it with his horse-switch, he asked it, saying, 'Did you, Sir, in your greed of life, fail in the lessons of reason and come to this? Or did you do so, in the service of a perishing state, by the punishment of the axe? Or was it through your evil conduct, reflecting disgrace on your parents, and on your wife and children? Or was it through your hard endurances of cold and hunger? Or was it that you had completed your term of life?'"

"Having given expression to these questions, he took up the skull and made a pillow of it when he went to sleep. At midnight the skull appeared to him in a dream, and said, 'What you said to me was after the fashion of an orator. All your words were about the entanglements of men in this life-time. There are none of those things after death. Would you like to hear me, Sir, tell you about death?' 'I should,' said Kwang-tze, and the skull resumed: 'In death there are not (the distinctions of) ruler above and minister below. There are none of the phenomena of the four seasons. Tranquil and at ease, our years are those of heaven and earth. No king in his court has greater enjoyment than we have.' Kwang-tze did not believe it, and said, 'If I could get the Ruler of our Destiny to restore your body to life with its bones and flesh and skin, and to give you back your father and mother, your wife and children, and all your village acquaintances, would you wish me to do so?' The skull stared fixedly at him, knitted its brows, and said, 'How should I cast away the enjoyment of my royal court and undertake again the toils of life among mankind?' »

SIAM.

Buddhist Scriptures:

«The effect of water poured on the root of a tree is seen aloft in the branches and fruit; so in the next world are seen the effects of good deeds performed here.»

CEYLON.

Buddhist Scriptures:

«There are treasures laid up in the heart,—treasures of charity, piety, temperance and soberness. These treasures a man takes with him beyond death, when he leaves this world.»

JAPANESE.

From letter of old Japanese Buddhist woman quoted by Reischauer in 'Studies in Japanese Buddhism' (1917):

«I am old and I am a woman, and it is not to be expected that a woman will know much of such subjects, but I will tell you what thoughts I have. I am weak and sinful, and have no hope in myself; my hope is all in Amida Buddha. I believe him to be the Supreme Being. Because of the wickedness of man, and because of human sorrow, Amida Buddha became incarnate and came to the earth to deliver man; and my hope and the world's hope is to be found only in his suffering love. He has entered humanity to save it; and he alone can save. He constantly watches over and helps all who trust in him. I am not in a hurry to die, but I am ready when the time comes; and I trust through the gracious love of Amida Buddha, I shall enter the future life which I believe to be a state of conscious existence, and where I shall be free from sorrow.»

From a letter written by Japanese Amidaist on death bed (ibid.):

«Should my sickness change for the worse, I shall never see you again in this life. But I shall, of a certainty, see once more, in the pure Land, all those who are partakers with me in the faith that I have in Amida.»

PHŒNICIAN.

Inscription of Eschmun 'Azar':

«Let there be no resting-place among the Rephâim for the man, even if he be of royal lineage, who ventures to open this chamber of repose, or remove the sarcophagus in which I am at rest.»

HEBREW.

Old Testament:

"For there is hope of a tree, if it be cut down, that it will sprout again, and that the tender branch thereof will not cease. Though the root thereof wax old in the earth, and the stock thereof die in the ground; yet through the scent of water it will bud, and put forth boughs like a plant. But man dieth, and is laid low: Yea, man giveth up the ghost, and where is he?"— Job xiv, 7–10.

"If a man die, shall he live again? All the days of my warfare would I wait, till my release should come. Thou wouldest call, and I would answer thee: thou wouldest have a desire to the work of thy hands.—Job. xiv, 13–15.

"But I know that my Avenger liveth, and that at the last He will appear above (my) grave: and after my skin hath been thus destroyed, with out my body shall I see God: and whom I shall see for myself, and mine desire to the work of thy hands.»— Job. xiv, 25–27.

"For thou dost not commit me to Sheol,
Nor sufferest thy faithful ones to see the pit.
Thou teachest me the pathway of life;
In thy presence is fulness of joys,
Fair gifts in thy right hand forever."

Psalm xvi, 10–11 (transl. by H. H. Furness).

"Like sheep they sink into Sheol
Death rules them, terrors affright them;
They go down straight into the grave
Sheol is their mansion forever."

Psalm xlix, 14–15 (transl. by Dr. Cheyne).

"And many of them that sleep in the land of dust shall awake, some to everlasting life, and some to shame and everlasting contempt."—Daniel xii, 2.

«For God created man to be immortal, and made him to be an image of his own eternity. . . . The souls of the righteous are in the hand of God and there shall no torment touch them. In the sight of the unwise they seemed to die: and their departure is taken for misery, and their going from us to be utter destruction: but they are in peace. For though they be punished in the sight of men, yet is their hope full of immortality. And having been a little chastised, they shall be greatly rewarded: for God proved them, and found them worthy for himself. As gold in the furnace hath he tried them, and received them as a burnt offering."—Wisdom of Solomon ii, 23 — iii, 1–6.

2 Baruch li, 7–10, 12 (quoted from R. H. Charles in his Eschatology):

"Those who have been saved by their works, and to whom the law has been now a hope, and understanding and expectation, and wisdom a confidence, to them wonders will appear in their time. For they will behold the world which is now invisible to them, and they will behold the time which is now hidden from them. And again, time will not age them. For in the heights of that world shall they dwell, and they shall be made like unto the angels, and be made equal to the stars, and they shall be changed into every form they desire, from beauty into loveliness, and from light into the splendor of glory. . . . Moreover there will then be excellency in the righteous surpassing that in the angels."

Book of Enoch xxii (quoted from R. H. Charles):

«And thence I went to another place, and Uriel showed me in the West another great and high mountain of hard rock. And there were four hollow places in it, deep and very smooth: three of them were dark and one bright, and there was a fountain of water in its midst. And I said: How smooth are these hollow places, and deep and dark to view. Then Raphael answered one of the holy angels who was with me, and said unto me: These hollow places have been created for this very purpose, that the spirits of the souls of the dead should assemble therein, yea that all the souls of the children of men should assemble here. And these places have been made to receive them till the day of their judgment and till their appointed period, till the great judgment (comes) upon them. I saw the spirit of a dead man making suit, and his voice went forth to heaven and made suit. And I asked Raphael, the angel who was with me, and I said unto him: This spirit which maketh suit, whose is it, whose voice goeth forth and maketh suit to heaven? And he answered me saying: This is the spirit which went forth from Abel whom his brother Cain slew, and he makes his suit against him till his seed is destroyed from the face of the earth, and his seed is annihilated from amongst the seed of men. Then I asked regarding all the hollow places, why is one separated from the other? And he answered me saying: These three have been made that the spirits of the dead might be separated. And this division has been made for the spirits of the righteous, in which there is the bright spring of water. And this has been made for sinners when they die and are buried in the earth and judgment has been executed upon them in their lifetime. Here their spirits will be set apart in this great pain, till the great day of judgment, scourgings and torments of the accursed forever, so that (there may be) retribution for their spirits. There shall He bind them forever. And this division has been made for the spirits of those who make their suit, who make disclosures concerning their destruction, when they were slain in the days of the sinners. And this has been made for the spirits of men who shall not be righteous but sinners, who are godless, and they of the lawless shall be companions: but their spirits shall not be punished on the day of judgment, nor shall they be raised from thence.»

GREECE.

In Homeric times the destiny awaiting man after death is one of totally unrelieved gloom. One passage in the 'Odyssey' gives a glimpse of something different in store for Menelaus:

" To thee it shall not come
In the horse-kind land of Argos to meet thy death and doom.
But unto the fields Elysian and the wide world's utmost end,
Where dwells tawny Rhadamanthus, the Deathless thee shall send,
Wherein are the softest life-days that men may ever gain;
No snow and no ill weather, nor any drift of rain;
But Ocean ever wafteth the wind of the shrilly west,
On menfolk ever breathing, to give them night and rest."

From early Orphic poems:

«They who are pious in their life beneath the rays of the sun enjoy a gentler lot when they have died, in the beautiful meadow around deep-flowing Acheron.»

«I have paid the penalty for deeds unjust and now I am come as a suppliant unto noble Persephone, beseeching her to be gracious, and to send me into the abodes of the pious.»

Pythagoras (589 B.C.):

«When thou shalt have laid aside thy body, thou shalt rise, freed from mortality, and become a god of the kindly skies.»

Heraclitus 500 (B.C.):

«My body must descend to the place ordained, but my soul will not descend: being a thing immortal, it will ascend on high, where it will enter a heavenly abode.»

From the second Olympian-Pindar:

«The guilty souls of the dead straightway pay the penalty here on earth; and the sins committed in this kingdom of Zeus are judged by One beneath the ground, hateful Necessity enforcing the doom he speaks. But ever through nights and ever through days the same, the good receive an unlaborious life beneath the sunshine. They vex not with might of hand the earth or the waters of the sea for food that satisfieth not, but among the honored Gods, such as had pleasure in keeping of oaths enjoy a tearless life; but the others have pain too fearful to behold. Howbeit they who thrice on either side of death have stood fast and wholly refrained their souls from deeds unjust, journey on the road to Zeus to the tower of Cronus, where the ocean-breezes blow around the island of the blest, and flowers gleam bright with gold, some on trees of glory on the land, while others the water feeds; with wreathes whereof they entwine their arms and crown their heads.»

Æschylus:

" There thou shalt see in durance drear,
'Gainst god or guest or parents dear,
Like thee who sinned, receiving their due meed.
For Hades, ruler of the nether sphere,
Exactest auditor of human kind,
Graved on the tablet of his mind
Doth every trespass read."

Sophocles:

" But a good hope I cherish, that, come there,
My father's love will greet me, yea and thine,
My mother — and thy welcome, brother dear."

Socrates in the 'Apology':

«If death is, like sleep, even then I say that to die is gain: for eternity then is only a single night. But if death is the journey to another place, and there, as men say, all the dead are, what good, O my friends and judges can be greater than this? If, indeed, when the pilgrim arrives in the world below, he is delivered from the professors of justice in this world, and finds the true judges who are said to give judgment there, Minos and Rhadamanthus and Aeacus and Triptolemus, and other half gods who were righteous in their own life, that pilgrimage will be worth making. What would not a man give if he might converse with Orpheus and Musæus and Hesiod and Homer? Nay, if this be true, let me die again and again. Above all I shall be able to continue my search into true and false knowledge; as in this world, so also in that; and I shall find out who is wise, and who pretends to be wise, and is not. . . . Besides being happier in that world than in this, they will be immortal, if what is said is true.»

«Is it not strange, my friends, that, after all I have said to convince you I am going to the society of the happy, you still think this body to be Socrates? Bury my lifeless body where you please; but do not mourn over it, as if that were Socrates. . . . It would be wrong for me not to be grieved to die, if I did not think I should go to dwell with men who have departed from this life, and are better than any who are here. And be assured I hope to go and dwell among good men. I entertain a good hope that something awaits those who die, and that it will be better for the good than for the evil, as has been said long since.»

Xenophon introduces dying Cyrus to his children:

«By the paternal gods, my sons, respect one another, if you care to please me. For you surely do not imagine that you know clearly that I shall be nothing, when I have finished with my human life. For even now you never saw my soul, but you knew its existence from what it did. And have you not seen, what terrors the souls of those who have suffered injustice bring upon the criminals; what avenging spirits they send to the evil doers? And do you believe that the honors paid to the dead would continue, if their souls had no longer any power? I, indeed, O sons, have never believed that the soul while it is in a mortal body lives, and is dead when it is free from it: for I see that even these mortal bodies live only so long as the soul is in them. Nor can I believe that the soul will be without reason, after it has been separated from this unreasoning body; but when the mind has been separated, unmixed and pure from the body, then it is likely that it will be most rational. . . . Consider also that nothing is nearer to human death than sleep, and that the soul of man seems then most divine, and sees then something of the future, because it is then most free. If then these things are as I believe, and the soul leaves the body, do what I ask from reverence for my soul. But if it is not so, and the soul remains in the body and dies, even then do not do or think anything impious or unholy for fear of the eternal, the omniscient, the omnipotent gods, who hold together this order of all things, flawless, unfading, unfailing and inconceivable by its greatness and by its beauty.»

Euripides:

«Let now the dead bodies be covered by the earth, and each go away whence it came into the body; the breath to the æther, the body to the earth.»

Plato ('Phædo'):

«Those who have been pre-eminent for holiness of life are released from this earthly prison, and go to their pure home which is above, and dwell in the purer earth; and those who have duly purified themselves with philosophy, live henceforth altogether without the body, in mansions fairer far than these, which may not be described, and of which the time would fail me to tell.»

«The soul of each of us is an immortal Spirit and goes to other immortals to give an account of its actions. Those who have lived a holy life, when they are freed from this earth and set at large, will arrive at a pure abode above, and live through all future time. They will arrive at habitations more beautiful than it is easy to describe.»

Popular verses on Harmodius and Aristogiton:

Dearest Harmodius, thou art surely not dead,
Thou dwellest, they say, in the isles of the blest,
Where the swift-footed Achilles,
Where the son of Tydeus, the brave Diomedes, dwells.

Greek inscription on a daughter:

«Mother, leave thy grief, remembering the soul which Zeus has rendered immortal and undecaying to me for all time, and has now carried into the starry sky.»

Epitaph (trans. by Hon. Lionel A. Tollemache):

" Dying, thou art not dead!—thou art gone to a happier country,
And in the aisles of the blest thou rejoicest in weal and abundance,
There, Proté, is thy home in the peace of Elysian meadows,
Meadows with Asphodel strewn, and peace unblighted with sorrow.
Winter molests thee no longer, nor heat nor disease; and thou shalt not
Hunger or thirst any more; but, unholpen of man and unheedful,
Spotless and fearless of sin, thou exultest in view of Olympus;
Yea, and thy gods are thy light, and their glory is ever upon thee."

ROMAN.

Cato (quoted by Cicero, 200 B.C.):

«O glorious day, when I shall remove from this confused crowd to join the divine assembly of souls! For I shall go not only to meet great men, but also my own son. His spirit, looking back upon me, departed to that place whither he knew that I should soon come; and he has never deserted me. If I have borne his loss with courage, it is because I consoled myself with the thought that our separation would not be for long.»

Seneca:

«This life is only a prelude to eternity, where we are to expect another state of things. We have no prospect of Heaven here, but at a distance: let us, therefore, expect our last hour with courage. The last I say to our bodies, not to our minds. The day which we fear as our last is but the birthday of eternity. . . . This we presume, either we shall pass out of this life into a better one, where we shall live in diviner mansions, or else return to our first principles, free from any sense of inconvenience. . . . It is the care of a wise and good man to look to his manners and actions; and rather how well he lives than how long. To die sooner or later is not the business, but to die well or ill; for death brings us to immortality.»

CHRISTIAN ERA.

Paul (Cor. xv, trans. by Dr. James Moffatt):

«Someone will ask, 'How do the dead rise? What kind of body have they when they come?' Foolish man! What you sow never comes to life unless it dies. And what you sow is not the body that is to be; it is a mere grain of wheat, for example, or some other seed. God gives it a body as he pleases, gives each kind of seed a body of its own . . . There are heavenly bodies and also earthly bodies, but the splendor of the heavenly is one thing and the splendor of the earthly is another. There is a splendor of the sun and a splendor of the moon and a splendor of the stars — for one star differs from another star in splendor. So with the resurrection of the dead: what is sown is mortal, what rises is immortal; sown inglorious, it rises in glory; sown in weakness, it rises in power; sown an animate body, it rises a spiritual body. As there is an animate body, so there is a spiritual body. . . . I tell you this, my brothers, flesh and blood cannot inherit the Realm of God, nor can the perishing inherit the imperishable. Here is a secret truth for you: not all of us are to die, but all of us are to be changed — changed in a moment, in the twinkling of an eye, at the last trumpet-call. The trumpet will sound, the dead will rise imperishable, and we shall be changed. For this perishing body must be invested with the imperishable, and this mortal body invested with immortality; and when this mortal body has been invested with immortality, then the saying of Scripture will be realized. Death is swallowed up in victory.»

1 *Thessalonians, iv:*

«We would like you, brothers, to understand about those who are asleep in death. You must not grieve for them, like the rest of men who have no hope. Since we believe that Jesus died and rose again, then it follows that by means of Jesus God will bring with him those who have fallen asleep. For we tell you, as the Lord has told us, that we the living, who survive till the Lord comes, are by no means to take precedence of those who have fallen asleep. The Lord himself will descend from heaven with a loud summons when the archangel calls and the trumpet of God sounds; the dead in Christ will rise first; then we the living, who survive, will be caught up along with them in the clouds to meet the Lord in the air, and so we will be with the Lord forever.»

Revelations xx and xxi (trans. by Dr. Moffatt):

«Then I saw a great white throne, and One who was seated thereon; from his presence earth and sky fled, no more to be found. And I saw the dead, high and low, standing before the throne, and books were opened — also another book, the book of Life, was opened — and the dead were judged by what was written in these books, by what they had done . . . I heard a loud voice out of the throne, crying, 'Lo, God's dwelling place is with men, with men will he dwell; they will be his people and God himself will be with them; he will wipe every tear from their eyes, and death shall be no more — no more wailing or crying or pain.' »

NON-CHRISTIAN.

Marcus Aurelius Antoninus:

«If souls survive, how has ethereal space made room for them all from eternity? How has the earth found room for all the bodies buried in it? The solution of the latter problem will solve the former. The corpse turns to dust and makes space for another: so the spirit, let loose in the air, after a while dissolves, and is either renewed into another soul or absorbed into the universe.»

EARLY CHURCH.

The Clementina Homilies:

«For there is every necessity, that he who says that God who is by His nature righteous, should believe also that the souls of men are immortal; for where would be His justice, when some having lived piously, have been evil treated, and sometimes violently cut off, while others who have been impious, and have indulged in luxurious living, have died the common death of men? Since therefore, without all contradiction, God who is good is also just, He shall not otherwise be known to be just, unless the soul after the separation from the body be immortal, so that the wicked man, being in hell, as having here received of his good things, may there be punished for his sins; and the good man, who has been punished here for his sins, may there, as in the bosom of the righteous, be constituted as heir of good things. Since therefore God is righteous, it is fully evident to us that there is a judgment, and that souls are immortal.»

Gregory of Nyssa (394 A.D.):

«Is it a misfortune to pass from infancy to youth? Still less can it be a misfortune to go from this miserable life to that true life into which we are introduced by death. Our first changes are connected with the progressive development of life. The new life which death effects is only the passage to a more desirable perfection. To complain of the necessity of dying is to accuse Nature of not having condemned us to perpetual infancy.»

Council of Florence (1439 A.D.):

«The souls of those who, after baptism, did not incur any spot of sin, and of those who, after committing sin, were purified in life and by purgatorial pains, are immediately received in heaven, and there they clearly behold God, as He is one and triune with a perfection proportionate to each one's merits.»

POST REFORMATION.

Martin Luther:

«The Scriptures say that the holy and just go into the unseen world, and there enjoy the most pleasant peace and sweetest rest. As in this life they were wont to fall asleep in the guard and keeping of God and of the dear angels, without fear of harm, though the devils might prowl about them — so, after this life, they repose in the hand of God. When my soul departs, I know that highest kings and princes are appointed to attend me; namely, the dear angels themselves who will receive me and guard me on the way.»

Heidelberg Catechism (A.D. 1563):

«Not only my soul after this life shall be immediately taken up to Christ, its head, but also this body, raised by the power of Christ, shall be again united with my soul and made like unto the glorious body of Christ.»

Westminster Confession (xxxiii, 1):

«The bodies of men, after death, return to dust, and see corruption; but their souls (which neither die nor sleep), having an immortal substance, immediately return to God who gave them. The souls of the righteous, being then made perfect in holiness, are received into the highest heavens, where they behold the face of God in light and glory, waiting for the full redemption of their bodies: and the souls of the wicked are cast into hell, where they remain in torments and utter darkness, reserved to the judgment of the great day. Besides these two places for souls separated from their bodies, the Scripture acknowledgeth none.»

Episcopal Prayer Book:

«Almighty God, with whom do live the spirits of those who depart hence in the Lord, and with whom the souls of the faithful, after they are delivered from the burden of the flesh, are in joy and felicity.»

John Wesley ('Letters'):

«What is the essential part of heaven? Undoubtedly it is to see God, to know God, to love God. We shall then know both his nature, and his works of creation and providence and of redemption. Even in paradise, in the intermediate state between death and the resurrection, we shall learn more concerning these in an hour, than we could in an age, during our stay in the body. We cannot tell indeed how we shall then exist, or what kind of organs we shall have; the soul will not be encumbered with flesh and blood; but probably it will have some sort of ethereal vehicle, even before God clothes us 'with our noble house of empyrean light.'»

Catholic Encyclopædia:

«The blessed dead (after the resurrection with glorified bodies) enjoy, in the company of Christ and the angels, the immediate vision of God face to face, being supernaturally elevated by the light of glory so as to be capable of such a vision. There are infinite degrees of glory corresponding to degrees of merit, but all are unspeakably happy in the eternal possession of God.»

CLERGYMEN AND THEOLOGIANS: RECENT.

Charles H. Spurgeon:

«I believe that heaven is a fellowship of the saints, and that we shall know one another there. I have often thought I should love to see Isaiah. . . . I am sure I should want to find out good George Whitefield. . . . We shall have a choice company in heaven when we get there.»

Henry Ward Beecher:

«I believe I shall know my friends, and that they will know me in heaven; but there will be a great difference between the knowing in this life and the knowing in that. I know that we shall be as angels of God; I know we shall be as the sons of God.»

Charles Kingsley:

«'Brother,' said the abbot, 'make ready for me the divine elements, that I may consecrate them.' And he asking the reason therefor, the saint replied, 'That I may partake thereof with all my brethren before I depart hence. For know assuredly that within the seventh day I shall migrate to the celestial mansions. For this night stood by me in a dream those two women whom I love, and for whom I pray, the one clothed in a white, the other in a ruby-colored garment, and holding each other by the hand, who said to me that life after death is not such a one as you fancy: come, therefore, and behold what it is like.'»

Robert Collyer:

«If the Higher Powers should say to me, 'We have nothing else for you here or hereafter,' I think I should answer: 'I make no claim. I would love to see those I have lost once more; but if it is not to be so, I am still debtor for the untold blessings of my many years.'»

Cardinal Newman:

«It would be presumption to attempt to determine the employments of that eternal life which good men are to pass to in God's presence, or to deny that that state which eye hath not seen, nor ear heard, nor mind conceived, may comprise an infinite variety of pursuits and occupations. Still so far we are distinctly told, that the future life will be spent in God's presence, in a sense which does not apply to our present life.»

James Martineau:

«Were it the will of the Creator to change his arrangements for mankind, and to determine that they should henceforth live in this world ten or a hundred times as long as they do at present, no one would feel that new souls would be required for the execution of the design. And in the mere conception of unlimited existence there is nothing more amazing than in that of unlimited non-existence; there is no more mystery in the mind living for ever in the future, than in its having been kept out of life through an eternity in the past. . . . It is far more incredible that from not having been, *we are*, than that from actual being, we shall *continue to be*.»

Phillips Brooks:

«If we could only know, somewhat as John must have known after his vision, the presence of God into which our friend enters on the other side, the higher standards, the larger fellowship with all his race and the new assurance of immortality in God; if we could know all this how all else would give way to something almost like a burst of triumph as the soul which we loved went forth to such enlargement, to such glorious consummation of life.»

C. C. Everett ('Immortality and Other Essays'):

«Death is a sleep and an awaking; and we must believe that the soul emerges from the darkness of this sleep such as it was when it entered into it. The spirit will stand forth beautiful or deformed, pure or defiled, strong or weak, complete or imperfect, healthful or diseased, according to its nature while it was living, half concealed, in the tabernacle of flesh. . . . Death we believe leaves the spirit free to follow its own gravitation. He that struggles after the right and good . . . that spirit shall mount up into the realms of blessedness and peace; while those whose love has been downwards, and not up, shall fall . . . .»

Mgr. Vaughan (‹*Man or Ape*›):

«As to the past we are creatures of yesterday. As to the future, we are everlasting. . . . We are children of eternity, not of time. . . . It is in the future, endless existence that, as Christian faith assures us, our mental capacities will receive their full development, and all our aspirations will be completely gratified. The infinite, wise and beneficent Creator, who has filled our hearts with most ardent yearnings after an eternal life of light, happiness and love, has made ample provision for their realization.»

Borden P. Bowne (*in North American Review*, 1910):

«We have the sure conviction that moral and spiritual interests are the higher things in life, and we have also the clear conviction that these interests find no adequate completion and fulfilment in the life that now is. . . . Our reason, our conscience, our spiritual aspirations, carry us beyond the actual and beyond all that is possible under terrestrial conditions. These are the things within us which bear witness to immortality. All thinking about the world presupposes it to be rational, and if life is to end with the earthly act, then the play is a farce, a hideous opera bouffe, and there is no reason in it.»

Prof. H. A. Youtz (*in Biblical World*, 1912):

«The Christian doctrine of a future life has for its core and center the affirmation of the permanence of the spiritual order. . . . The spiritual universe can be trusted and all spiritual achievement is secure. . . . Goodness and love and courage and the spirit of service — we cannot believe that these can perish in a spiritual world. . . . They will survive in any spiritual world that is continuous with the life we know. And since character and love are not abstract ideals but concrete facts — expressions of personality — their continuance point to the persistence of personal identity.»

NON-CHURCHMEN.

Thomas Paine:

«I trouble not myself about the manner of future existence. I content myself with believing, even to positive conviction, that the Power which gave me existence is able to continue it in any form and manner he pleases, either with or without this body; and it appears more probable to me that I shall continue to exist hereafter, than that I should have existence as I now have, before that existence began.» . . . «I hope for happiness beyond this life.»

Robert G. Ingersoll:

«The larger and the nobler faith in all that is and is to be tells us that death, even at its worst, is only perfect rest. . . . There is this consolation: the dead do not suffer. If they live again, their lives will surely be as good as ours. We have no fear. We are all children of the same mother, and the same fate awaits us all. We, too, have our religion, and it is this — help for the living, hope for the dead.»

SCIENTISTS, POETS, LITERATI.

Kant:

«After death the soul possesses self-consciousness, otherwise it would be the subject of spiritual death, which has already been disproved. With this self-consciousness necessarily remains personality and the consciousness of personal identity.»

Benjamin Franklin:

«Life is a state of embryo, a preparation for life. A man is not completely born until he has passed through death.»

Charles Darwin (‹*Life and Letters*›):

«Believing as I do that man in the distant future will be a far more perfect creature than he now is, it is an intolerable thought that he and all other sentient beings are doomed to complete annihilation after such long-continued slow progress.»

John Stuart Mill (‹*Essay on Theism*›):

«All the probabilities in the case of a future life are that such as we have been made or have made ourselves before the change, such we shall enter into the life hereafter; and that the fact of death will make no sudden break in our spiritual life. If there be a future life, it will be at least as good as the present, and will not be wanting in the best features of the present life, improvability by our own efforts.»

Thomas Carlyle:

«Man endures but for an hour, and is crushed before the moth. Yet in the being and in the working of a faithful man is there already (as all faith from the beginning, gives assurance) a something that pertains not to this wild death-element of Time, but that which triumphs over Time, and *is*, and will be, when Time shall be no more.»

Ralph Waldo Emerson:

«Of what import this vacant sky, these puffing elements, these insignificant lives, full of selfish loves, quarrels and ennui? Everything is prospective, and man is to live hereafter. . . . All the comfort I have found teaches me to confide that I shall not have less in times and places that I do not yet know. . . . All I have seen teaches me to trust the Creator for all I have not seen. Whatever it be which the great Providence prepares for us, it must be something large and generous, and in the great style of his works.»

George Eliot:

" This is life to come
Which martyred men have made more glorious
For us to strive to follow. May I reach
That purest heaven; be to other souls
The cup of strength in some great agony;
Enkindle generous ardor; feed pure love;
Beget the smiles that have no cruelty;
Be the sweet presence of a good diffused,
And in diffusion ever more intense."

John Fiske (‹*Through Nature to God*›):

«So far as our knowledge of Nature goes the whole momentum of it carries us onward to the conclusion that the Unseen World, as the objective term in a relation of fundamental importance that has co-existed with the whole career of mankind, has a real existence. . . . The lesson of evolution is that through all these weary ages the human soul has not been cherishing in religion a delusive phantom, but in spite of seemingly endless groping and stumbling it has been rising to the recognition of its essential kinship with the ever-living God.»

Mark Twain (*'A Biography,' by Albert Bigelow Paine*):

«I have never seen what to me seemed an atom of proof that there is a future life. And yet — I am strongly inclined to expect one.»

Richard Watson Gilder (*on the death of Alice Freeman Palmer*):

"When fell to-day the word that she had gone,
Not this my thought: Here a bright journey ends
Here rests a soul unresting; here, at last,
Here ends the earnest struggle, that generous life—
For all her life was giving. Rather this,
I said (after the first swift, sorrowing pang)
Radiant with love, and love's unending power
Hence, on a new quest, starts an eager spirit . . ."

Hugo Münsterberg (*'The Eternal Life,'* 1905):

«Who dares to speak the word 'uncompleted'? Are the influences of our will confined to those impulses which directly and with our knowledge act on the nearest circle of our neighbors? Will not our friend, who left us in the best energy of his manhood, influence you and me and so many others throughout our lives, and what we gained from his noble mind — will it not work through us further and further, and may it not thus complete much of that which seemed broken off and uncompleted?»

Sir Oliver J. Lodge:

«Nor is it so with intellect and consciousness and will, nor with memory and love and adoration, nor all the manifold activities which at present strangely interact with matter and appeal to our bodily senses and terrestrial knowledge; they are not nothing, nor shall they ever vanish into nothingness or cease to be. They did not arise with us: they never did spring into being; they are as eternal as the Godhead itself, and in the eternal Being they shall endure for ever.»

Edward Roland Sill:

"What can we bear beyond the unknown portal?
No gold, no gains
Of all our toiling: in the life immortal
No hoarded wealth remains,
Nor gilds, nor stains.

"Naked from out that far abyss behind us
We entered here:
No word came with our coming, to remind us
What wondrous world was near,
No hope, no fear.

"Into the silent, starless night before us,
Naked we glide:
No hand has mapped the constellations o'er us,
No comrade at our side,
No chart, no guide.

"Yet fearless toward that midnight, black and hollow,
Our footsteps fare:
The beckoning of a Father's hand we follow—
His love alone is there,
No curse, no care."

CHARLES GRAVES.

FUTURE LIFE IN MYTHOLOGY. See MYTHOLOGY; NATURE WORSHIP.

FUTURISM, the word applied in 1911 by five Italian painters to a new theory of art which they claimed their own works exemplified. They themselves characterized their art as «violently revolutionary,» and exhibited paintings at that time (in the «first exposition of futurist paintings in Paris») which added zest to their declaration that «all truths taught in schools and ateliers are abolished.» Their guiding principles were sought in individual intuition and they declined to lean for support upon the example of the Greeks and the old masters, their frankly expressed purpose being the establishment of wholly new laws which should rescue modern painting from incertitude. Thus, Futurism is a movement away from old ideals and toward new ones, differentiated somewhat in this respect (and more obviously in methods of expression) from the nearly synchronous cubism.

FYFFE, fīf, **Charles Alan,** English historian: b. Blackheath, Kent, England, December 1845; d. 19 Feb. 1892. He was graduated at Oxford in 1868; and called to the bar in 1876, but never practised. As correspondent of the *Daily News* during the Franco-Prussian War he is said to have sent to that journal the first account of the battle of Sedan that appeared in print. His historical works are distinguished by accuracy and a pleasing, perspicuous style. They include 'History of Greece' (1875), in a series of 'History Primers'; and the well-known 'History of Modern Europe' (1880, 1886, 1890), covering the period from 1792 to 1878.

FYLES, Franklin, American dramatic critic and author. In 1886 he became dramatic critic of the New York *Sun*. He wrote several successful plays, including the military dramas 'Cumberland '61' and 'The Girl I Left Behind Me' and some works in book form, among them 'The Theatre and Its People' (New York 1900), a popular account of the profession; 'A Ward of France'; 'Drusa Wayne,' etc.

FYNE LOCH, Scotland, an inlet of the sea extending northeast from Bute Sound in Argyll. It is abo t 44 miles in length and its width varies from three to eight miles; the average depth being from 50 to 70 fathoms. The rivers Fyne, Aray and Shira flow into it. Great quantities of herrings are caught in its waters, and it is a favorite summer resort for hundreds of city dwellers.

FYT, fīt, **or FEYDT, John,** Flemish painter: b. Antwerp, 1611; d. there, 1661. He studied under Van den Birch, and at 20 was received into the Guild of Saint Luke. He spent a long time in Italy, as the numerous works executed there by him abundantly attest. His subjects embrace almost all living animals and reveal a deep knowledge of form. He was associated with Jordaens, Willeborts, etc. Among the works which they executed together may be mentioned the 'Repose of Diana' (1650), in the Vienna Museum. He is represented in all the principal collections of the world; the Metropolitan Museum of New York has three fine specimens of dead game pieces. He also executed some gravures.

FYZABAD, fiz'ō-băd, British India, a division of Oudh, in the United Provinces. Its area is 12,000 square miles, with a population of 6,646,362. Agriculture is in a prosperous state; wheat, rice and other cereals being grown extensively. Other crops are cotton, tobacco and indigo. The capital is Fyzabad, near the river Gogra, 75 miles east of Lucknow. It is rich in ancient remains and is a holy city of the Hindus. It has sugar factories and trades in the agricultural products of the region. A British commissioner resides in Fyzabad. Pop. 54,600.

G

G seventh letter of the English alphabet and of other alphabets derived from the Latin. In very early Latin, G stood for the proper g-sound (g hard, as in go) and also for the k-sound of C, as in cup; afterward the k-sound was represented by K, while G continued to represent the sound of G hard; but K did not remain long in the Latin alphabet, being superseded by C (always hard and equivalent to K). Both in Greek and Latin the gamma (Γ. G) was always the hard guttural in whatever situation, and hence *geographia* was pronounced gheographia, *genus* ghenus, etc. The softening of g-hard to j when g precedes e, i or y, began to prevail in the 6th century of our era, and it persists in the modern languages derived from Latin and in our own. In languages having words derived independently by each from some common stock, for example, the Indo-European languages, the interchange of c-hard, g-hard, k, and the aspirate gutturals ch, gh, is very common; examples: Eng. kin, Lat. *genus*, Gr. *genos;* Gr. *chen*, Ger. *gans*, Eng. goose; Gr. *gnonai*, archaic Lat. *gnosco*, Ger. *kennen*, Eng. ken; Lat. *hesternus*, Gr. *chthes*, Ger. *gestern*, Eng. yester: the same equivalence of g and y is seen in Ger. *gelb*, Eng. yellow; Ger. *gähnen*, Eng. yawn; Ger. *garn*, Eng. yarn. In French words of Teutonic origin an original w is often represented by gu (equal to g-hard), thus Wilhelm becomes *Guillaume;* Ger. *weise*, Fr. *guise;* Teuton *werra*, Eng. war, Fr. *guerre*.

GAÁL, gäl, **József**, Hungarian writer: b. Nagy Károly, 1811; d. 1866. He was educated at the University of Pesth, and soon after entered the employment of the Hungarian Council of Lieutenancy. He took a conspicuous part in the troubles of the revolutionary year of 1848. He contributed much to periodicals, especially sketches of country life. His works include 'Szirmay Ilona' (1836); 'Peleskei Notarius' (1838); a four-act comedy; 'Szvatopiuk,' a tragedy; 'Pusztai Kaland'; Tengeri Kalandaz Alföldön'; Hortobágyi éjszaka.' In 1837 he became a member of the Hungarian Academy. An edition of his novels was issued by Badics (Budapest 1880–82).

GABBATHA, a word occurring only in John xix, 18. It occurs in connection with the judgment by Pilate where he sat on a place called the Pavement, but in Hebrew, Gabbatha. Josephus does not mention this word, nor can it be found in other writings outside of the New Testament. Various attempts at identification with well-known sites have been made but without success. The introduction of the word has also made a philological puzzle which has brought forth many guesses as to the origin and form of the word. It was a place undoubtedly outside the Prætorium. One conjecture is that it was a local name for the outer court of the temple.

GABBRO, găb'rō, a general name for a large group of evenly crystalline igneous rocks, composed, typically, of plagioclase and pyroxene, and having granitic texture. Gabbros show by analysis much the same composition as basalts; the silica ranging from 46 to 59 per cent. They may be regarded as plutonic equivalents of basalts, basaltic magmas which have cooled at great depths. Under the general term gabbro are included anorthosites, abundant in Canada and the Adirondacks, high in silica and composed almost wholly of crystalline labradorite; true gabbros; norites, composed of plagioclase and orthorhombic pyroxene. With decreasing pyroxene and increasing olivine gabbros grade into peridotitles. Gabbros are heavy, dark-colored, usually greenish, rocks. They occur in the Adirondacks, in the neighborhood of Baltimore, Md., and particularly in the highlands along the north shore of Lake Superior, from Duluth to the international boundary. The gabbro near Duluth has this composition: SiO_2 49.15; Al_2O_3 21.90; Fi_2O_3 6.60; FeO 4.54; CaO 8.22; MgO 3.03; Na_2O 3.83; K_2O 1.61. See BASALT.

GABELENTZ, gä'bę-lents, **Hans Conon von der**, German philologist: b. Altenburg, 1807; d. 1874. He received his education at the universities of Leipzig and Göttingen; secured employment from the government of Saxe-Altenburg and in 1848 became chief minister. He studied many foreign and little known languages. He published 'Elements de la grammaire mandchoue' (1833); 'Grundzüge der syrjänischen Grammatik' (1841); 'Ueber der Passivum' (1860), which has examples from over 200 languages. He also published an edition of Ulfilas' Bible with Latin translation and Gothic glossary and grammar, and wrote 'Ueber die melanesischen Sprachen' (2 vols., 1860; 1873). He aided in founding *Zeitschrift für die Kunde des Morgenlandes*.

GABELLE, a term originally applied to all imposts; came in time to designate in particular the impost or tax on salt. This tax, one of the most crushing under the old monarchy, is already mentioned in an edict of Louis IX in 1246. At first levied only temporarily after a time it was made a permanent tax. In 1340 salt was declared a state monopoly and every household was obliged to buy a certain amount. The price was strictly regulated but was not the same in all provinces. Some provinces were exempt from the tax, having paid a special price for such exemption; others paid one-fourth the regular tax. The monopoly was always unpopular and was the cause of much rioting and disaffection. It persisted, however, as late as 1790 when it was finally suppressed. Consult Gasquet, A., 'Précis des institutions politiques de l'ancienne France' (2 vols., Paris 1885).

GABELSBERGER, gä'bels-bĕr'gĕr, **Franz Xaver,** German pioneer in stenography: b. Munich, 1789; d. 1849. He was educated in his native city; secured the position of private secretary to the Ministry of the Interior there, and published texts and charts for schools. He finally became interested in stenography, gave public exhibitions of his system, and at length received the approval of the Academy of Sciences for his work in the new field. His system achieved a wide popularity in Germany and was adapted also to other European languages. A monument to Gabelsberger was erected at Munich in 1890. He published 'Anleitung zur deutschen Redezeichenkunst' (1834; Eng. trans. by Richter 1899); 'Neue Vervollkommnungen in der deutschen Redeschreibekunst' (1849); 'Stenographische Lesebibliothek' (1838).

GABES, gä bĕs, or **CABES,** Tunisia, capital and seaport of the province of Arad, at the head of the gulf of the same name, 70 miles southwest of Sfax. It is on the site of the Roman Tacape, has European and Arab quarters and a large trade in dates, skins, wool and oil. It is the seat of the provincial governor and has a garrison of French troops. Pop. 20,000.

GABII, gä'bē-ī, city of Latium in ancient Italy, 13 miles east of Rome. It occupies a prominent part in early Roman history; was captured by Tarquinius Superbus, and gradually fell into decay. Subsequently it was granted municipal rights and in the reign of Tiberius again prospered owing to its sulphur springs bringing numbers of Romans. Thereafter for about three centuries it enjoyed renewed prosperity, but again sank into decay, and little is heard of it beyond that it continued to be the seat of a bishop until the 9th century. There are many interesting ruins, especially those of a temple of Juno. Excavations have brought to light many works of art, now scattered in the museums of Europe. Statues and busts have been turned up in great numbers and include Agrippa, Tiberius, Hadrian, Germanicus, Caligula, Nero, Trajan, M. Aurelius, Geta and others. Consult Visconti, E. Q., 'Monumenti Gabini della Villa Pinciana' (Milan 1835).

GABINIUS, Aulus, Roman statesman: d. 48 or beginning of 47 B.C. When tribune of the people in 67 B.C., he brought forward the *lex Gabinia*, by which Pompey was granted the command of the war against the pirates, and absolute control over the Mediterranean and its coasts for 50 miles inland. Gabinius was prætor in 61 B.C., and provided public games on a scale of great splendor. In 58 he became consul and during his term helped Clodius to bring about the exile of Cicero. In 57 Gabinius went to Syria as proconsul; he reinstated Hyrcanus as high-priest at Jerusalem, suppressed various revolts and, at the request of Pompey, and without the consent of the Senate, went into Egypt and restored Ptolemy Auletes to his kingdom. While absent in Egypt, his province of Syria was overrun by robbers and freebooters, resulting in serious loss of revenue to the Equites, who farmed the taxes. On his return to Rome he was brought to trial on three charges, was acquitted of treason, but convicted of extortion and sent into exile. He was recalled by Cæsar in 49, and by him was sent to Illyricum. He defended himself bravely against Marcus Octavius, the Pompeian commander, but died of illness after a few months. Consult Stocchi, G., 'Aulo Gabinio e i suoi processi' (Torino 1892).

GABION, a cylindrical basket without bottom used for various purposes in military engineering. When placed in position it is filled with earth or sand and is usually woven from brush cut nearby. See FORTIFICATIONS.

GABLE, the triangular or quadrangular end of a house or other building, from the cornice or eaves to the top, and distinguished from a pediment by this, among other things, that it has no cornices, while a pediment has three. The word is also applied to the highly decorated canopy or screen which in Gothic church architecture rises over some doors or windows. The wall of a house which is surmounted by a gable is called the gable-end. In modern towns the gable-ends of houses are usually at right angles to the line of the street, but in the Middle Ages the reverse was usually the case, the gable ends being turned toward the street. Many old towns in France, Belgium and Germany are still to be seen with this peculiarity, and some even in Britain. In Scotland, a wall separating two houses, and common to both, is called a mutual gable, and according to Scotch law such a gable is the property of the builder, who can therefore prevent the owner of an adjoining property from using the support of his gable, unless he pays half the cost of erecting it.

GABLONZ, gä'blonts (Czech, *Jablonec*), Bohemia, town on the Neisse, 95 miles northeast of Prague. It contains a gymnasium and several trade and professional schools. It is the chief seat of the glass and imitation jewelry manufacture. It has also woolen and cotton factories, hardware, papier mâché and other paper goods factories. Pop. 29,600.

GABORIAU, gä-bō-rē-ō, **Emile,** French writer of detective stories: b. Saujon, Charente-Inférieure, France, 9 Nov. 1835; d. Paris, 28 Sept. 1873. His early years were a succession of vicissitudes; the army, the law, and even the Church, were in turn the objects of his inconstant attentions till at last when he had already contributed to some of the smaller Parisian papers, he leaped into fame at a single bound with his story 'L'Affaire Lerouge' (1866), in the feuilleton to *Le Pays*. It was quickly followed by 'Le Dossier 113' (1867); 'Le Crime d'Orcival' (1868); 'Monsieur Lecoq' (1869); 'Les Esclaves de Paris' (1869); 'La Vie Infernale' (1870); 'La Clique Dorée' (1871); 'La Corde au Cou' (1873); 'L'Argent des Autres' (1874); and 'La Dégringolade' (1876).

GABRIAC, gä-brē-äk, **Paul Joseph de Cadoine,** MARQUIS DE, French diplomatist: b. Heidelberg, Baden, 1 March 1792; d. Paris, 12 June 1865. He was consul-general in New York in 1812–14; appointed Minister to Stockholm in 1823; and Minister to Brazil in 1826. While in Brazil he induced all the other states in South America to adopt the French maritime law. He was created a peer in 1841, and made a life senator in 1853. His publications include 'The Question of Brazil' (1829); 'The Republics of South America Considered in Their Future' (1851); 'King Pedro I, Notes and Personal Recollections' (1854).

GABRIEL (Heb. "hero, or man, or champion of God"), among the post-exilic Jews, one of the seven archangels (q.v.). In the book of Daniel and in the third gospel he is the messenger and interpreter of God. The rabbins represented him as the angel of death to the Israelites, as Azrael was to the Mohammedans. According to the teaching of the Koran he is one of the four angels, of which the other three are Michael, Uriel and Raphael, most highly favored by God. The Gnostics held that Gabriel was one of the creators of the universe; and Paul warns the Colossians against errors of this kind (Col. ii, 18). They also held that Gabriel was one of the celestial law givers; and oratories were erected to him in Asia Minor, where he was worshipped as a god. One of the old conceptions of Gabriel was that he was the great culture hero who rid the earth of giants and evil spirits of all kinds; and in the book of Enoch the Creator is represented as commanding: "Go Gabriel, against the giants, the spurious ones, the sons of fornication, and destroy the sons of the watchers from among the sons of men." The old belief that Gabriel was the messenger of death is still preserved in the north of England in the popular superstition of "Gabriel's hounds," a spectral pack thought to foretell death by their howling at night. They are believed to be the souls of unbaptized children doomed to wander through the air until the day of Judgment. According to the rabbins Gabriel had distinctly the offices of an ancient culture god. He was the prince of fire; he presided over the ripening of fruit; he taught Joseph the 70 languages spoken at the dispersion of Babel; he helped Michael destroy the host of Sennacherib; he set fire to the temple at Jerusalem and he was the only one of the angels who understood Chaldee and Syriac. According to the Mohammedans he is the great judge destined to weigh men's actions on the last day; and the Koran calls him the Holy Spirit, The Spirit of Truth. He it was who gave the Koran, the book of knowledge, to Mohammed. His characteristics, as thus outlined, correspond to those of Thoth, the Egyptian culture god and judge of the dead, the giver of all knowledge and the special patron of learning. It is interesting to note that Gabriel's characteristics become strongly marked after the exile of the Jews to Egypt.

GABRIEL, The Congregation of the Brothers of, a religious order in the Roman Catholic Church, founded in 1705, by Grignon de Montfort, to educate the young and to look after orphans and deaf, dumb and blind. Abbé Deshayes established the order firmly in France in the 19th century. In this work he acted in concert with the Abbé de Lamennais. The latter subsequently left the institution and organized the Brothers of Christian Instruction; and the original "Congregation" in 1835 took its present name. In 1858 the Congregation had 73 establishments and over 400 members. On the suppression of the order in France in 1905 the headquarters were transferred from Saint-Laurent-sur-Sèvre (La Vendée) to Péruwelz, Belgium. In the following year 170 schools, 12 homes for deaf, dumb and blind, and others for orphans were conducted by the "Congregations." The order in Canada was introduced there in 1888, and has establishments in several places and also in Burlington, Vt. They have three colleges and close upon a score of elementary schools in America.

GABRIELS, Henry, American Roman Catholic prelate: b. Wannegem-Lede, Belgium, 6 Oct. 1838. He studied classics in the colleges of Audenarde and Saint Nicholas, and theology in the Seminary of Ghent, where he was ordained priest, 21 Sept. 1861. He continued his studies at the University of Louvain, from which institution he received the degree of S.T.L. in 1864 and the honorary degree of doctor of theology in 1882. When the Theological Seminary of Troy, N. Y., was founded, Dr. Gabriels was one of the four priests sent from Belgium to manage it. He was diocesan examiner for New York and Albany, vicar-general of Ogdensburg and Burlington and one of the secretaries of the Third Plenary Council of Baltimore, the decrees of which he assisted in formulating. For 20 years Dr. Gabriels was rector of Troy Seminary and for nearly 30 years its professor of dogmatic theology, Church history and Hebrew. On 21 Dec. 1891, Pope Leo XIII appointed him bishop of Ogdensburg and he was consecrated at Albany, N. Y., 5 May 1892.

GABRIEL'S INSURRECTION, an attempted slave rising near Richmond, Va., in 1800, headed by a slave named Gabriel, called also "General Gabriel" and "Jack Bowler." He belonged to a planter named Thomas Prosser, and was about 24; tall, powerful and noted as a fighter. He drew about a thousand negroes into a plot to attack Richmond by night, massacre the inhabitants, seize the arsenal and arming themselves effectively, rouse a general insurrection. One August night he collected his forces, armed them with scythe blades and marched toward the city. Meanwhile a negro had disclosed the plot; James Monroe, then governor, had ordered out the militia; a creek in Gabriel's way proved to be unfordable, and hearing that the citizens were in arms, the whole force dispersed to the swamps and woods. They were hunted out, and many hanged, including Gabriel.

GABRILOVITCH, Ossip, Russian pianist: b. Saint Petersburg, 7 Feb. 1878. He was educated at the Saint Petersburg Conservatory of Music, was a pupil of Tolstoff and Rubinstein. In 1894 he won the Rubinstein prize and later studied with Leschetizky and Navratil, Vienna. In 1896 he made his début in Berlin, and subsequently went on a concert tour of Russia, England, Sweden, Austria and America. He has made many successful tours in the United States since his first appearance there in 1900. He married Clara Clemens, daughter of Mark Twain, in 1909.

GAD, the Tribe. Gad, the son of the Patriarch, was descended from Jacob and the slave-girl Zilpah. The position of the tribe on the march to the Promised Land was on the south side of the tabernacle. The leader of the tribe on the march from Sinai was Eliasaph, son of Deul or Reul. On the division of the land of

Canaan, their portion was east of the central part of the river Jordan. They numbered 40,500 which was 5,150 less than when they left Egypt. They bravely took their share in the subjugation of the country and thus complied with the conditions made by Moses. They were a tribe of shepherds and cattle men and asked for the allotment which they received because of its suitability as a grazing country. They were also a fierce and warlike people. When the kingdom was divided, Gad adhered to the northern section. Gad was taken into captivity by Tiglath-Pileser. Her cities in the time of Jeremiah were occupied by the Ammonites, and the tribe never returned to its homeland. At one time Gilead and Gad were synonymous terms.

GADARA, Palestine. It is not mentioned in the Bible, but the country of the Gadarenes is, which probably amounts to the same thing. It was the scene of the casting out of the demons by Jesus and their entry into the swine. Gadara was a Greek city of importance, east of the Jordan, mentioned by Josephus, Polybius, Epiphanius, Pliny and Eusebius. It was a strongly fortified city. According to the Nishna it was fortified by Joshua. The first mention it receives in history was its capture along with other cities by Antiochus the Great in 218 B.C. About 20 years later it capitulated to Alexander Jannæus after a siege of 10 months. It was in the hands of the Jews for some time but was destroyed during the civil wars. Demetrius, a Gadarene, was a freeman of Pompey and to please him the city was rebuilt and the citizens given complete freedom under Gabinius, the proconsul. Judea was divided into five districts, Gadara was made the executive centre of one of them (B.C. 57–55). Under the reign of Herod the Great it was under his dominion, having been presented to him by Augustus Cæsar. After Herod's death it again became part of the province of Syria. When the Jews revolted in 70 A.D. the city was captured by Vespasian. Later its importance continued and it was the seat of an episcopal see. Its bishops were members of the councils of Nice and Ephesus. It is also mentioned in the Talmud. After the Mohammedan conquest the city went to ruin and has been deserted for centuries. Its ruins have been identified at a site now called Umm Keis. The ruins prove the city to have been very rich and beautiful. They occupy a space of about two miles in circumference. Near the city were some baths known as the Thermiæ Heliæ and said to be inferior only to the baths of Baiæ. Epiphanius states that a yearly festival was held at the baths. He also intimates that some of the inhabitants dwelt in the caverns later used for tombs. For some years the Christians of Nazareth held an annual festival at Umm Keis, but Bedouin raids have put a stop to their observance.

GADDI, the name of four painters of the early Florentine period. (1) GADDO GADDI, b. about 1260; d. 1333. He began his career as both painter and mosaicist. The mosaic near the portal of the cathedral at Florence is attributed to him, as also those in the portico of the basilica of S. Maria Maggiore. Other mosaics by him were in old Saint Peter's, Rome, and in S. Maria Novella, Florence, but these have long since perished. No picture from his hand is now extant. (2) His son, TADDEO GADDI, b. about 1300; d. 1366, is said to have been Giotto's assistant for almost a quarter of a century. His works include 'The Virgin and Child with the Phophets,' in the Giugni chapel, at S. Croce, Florence; 'Virgin and Child,' in the Berlin Museum; other subjects in the Naples Museum; 'Scenes from Life of St. Lorenzo' in the Brooklyn Museum; frescoes in S. Maria Novella, Florence, and mosaics in the Florentine baptistry. He planned the Ponte Vecchio, and was architect of the Companile after the death of Giotto. (3) AGNOLO GADDI, son of Taddeo, b. about 1350; d. October 1396. His works include 'Resurrection of Lazarus' in S. Jacobo tra' Fossi, Florence; frescoes in the Pieve di Prato and in Santa Croce. (4) GIOVANNI GADDI, brother of the preceding, d. 1383. He was also a painter and gave promise of genius which was cut short by his early death. Consult Crowe and Cavalcaselle, 'History of Painting in Italy' (Vol. I, London 1903), and Vasari, 'Lives of the Most Eminent Painters, Sculptors and Architects' (10 vols., New York 1912).

GADE, Niels Wilhelm, nēls vĭl'hĕlm gä'dė, Danish composer: b. Copenhagen, 22 Feb. 1817; d. there, 21 Dec. 1890. In 1841, by his overture entitled 'Echoes of Ossian,' he gained in Copenhagen the prize of the Musical Union. He was supported during his studies abroad by a royal stipend, and in 1844 was appointed to succeed Mendelssohn in the direction of the Gewandhaus concerts at Leipzig. In 1850 he was appointed musical director to the king of Denmark, and in 1876 received a life pension. His works, which are Mendelssohnian in character, include seven symphonies, several overtures, sonatas, quintets, etc.; a lyrical drama, 'Comala'; a religious cantata, 'The Crusaders'; an opera, 'The Nibelungen,' etc.

GADFLY. See HORSEFLY.

GADIDÆ, găd'ĭ-dē, a family of fishes, the cods, sub-order *anacanthini* (spineless fishes), with ventral fins attached to the breast or throat. The body is rather long, a little compressed and covered with small, soft scales; the teeth are in several rows; the gill covers, which are large, have seven rays; the median fins are generally very large, and divided into several portions. They are voracious fishes. They are found chiefly in the depths of the colder seas, and are largely used for the food of man. Fossil remains are rare, but scattered bones have been found as far back as the Eocene. See COD; HADDOCK; LING; etc.

GADOLIN, gä'dō-lēn, **John,** Finnish chemist: b. Abo, Finland, 5 June 1760; d. Wirmo, Finland, 15 Aug. 1852. He studied chemistry under Bergman and in 1797 was appointed professor of chemistry in Abo — an office which he held till 1822. He devoted himself to investigations on mineral and metallurgic subjects. But the research for which he is specially remembered was upon a black mineral found in the porcelain feldspar quarry at Ytterby, near Stockholm, by Arhenius, of which an account had been published in 1788. In 1794 he read a paper to the Academy of Sciences, and showed that it contained a new kind of earth. This discovery was subsequently confirmed by Ekeberg, who called the earth yttria, and the mineral gadolinite, after its first investigator. The yttria was afterward shown to be a mixture of several earths.

GADOW, gä'dow, **Hans Friedrich**, German-English naturalist: b. Pomerania, 8 March 1855. He was educated at Frankfort-on-Oder, and at the universities of Berlin, Jena and Heidelberg. In 1880–82 he was employed in the natural history department of the British Museum and in 1884 was made Strickland curator and lecturer on zoology at the University of Cambridge. His publications are 'In Northern Spain' (1897); 'A Classification of Vertebrata' (1898); 'The Last Link by E. Haeckel' (1898); 'Through Southern Mexico' (1908); 'Aves' (in Brown's 'Animal Kingdom'); 'Amphibia and Reptiles' (in Cambridge 'Natural History'); 'The Wanderings of Animals,' and papers in Royal Society transactions and other scientific periodicals.

GADSDEN, Christopher, American patriot: b. Charleston, S. C., 1724; d. there, 28 Aug. 1805. He was educated in England; returned to the United States in 1741 and later engaged in business in Philadelphia; was a member of the first Colonial Congress which convened in New York in October 1765, and was also a member of the first Continental Congress which assembled in Philadelphia in 1774. He joined the American army as colonel at the beginning of the Revolution, and was promoted brigadier-general in 1776.

GADSDEN, James, American diplomatist: b. Charleston, S. C., 15 May 1788; d. there, 25 Dec. 1858. He was graduated at Yale College in 1806; served with distinction in the War of 1812. He was aide-de-camp to General Jackson in 1818 and took part in the campaign against the Seminole Indians. He became military inspector of the South Division in 1820 and had the principal part in the removal of the Seminoles to southern Florida in 1820. He was appointed Minister to Mexico in 1853, and on 30 December of that year negotiated the Gadsden Purchase (q.v.), which fixed a new boundary between Mexico and the United States.

GADSDEN, Ala., city and county-seat of Etowah County, on the Chattanooga Southern, the Louisville and Nashville, the Southern and the Nashville, Chattanooga and Saint Louis railroads, 56 miles northeast of Birmingham. It is dominated by Lookout Mountain, on the north bank of the Coosa River which gives its name to the rich coal and iron mines in the vicinity. There are several steam-mills which manufacture considerable quantities of yellow-pine lumber. Further industries include steel and wire-nail mills, cotton mills, a pipe works, a car and foundry establishment, a pressed-brick plant, a cotton-seed-oil mill and ginnery, and manufactories of wagons, doors, blinds, handles, etc. There are 15 churches, a national and a State bank, and two newspapers, a daily and a semi-weekly. Pop. 14,642.

GADSDEN PURCHASE, The, a tract of territory, embracing 45,535 square miles, which was purchased by the United States from Mexico in 1854. This region, which is bounded on the north by the Gila River, on the east by the Rio Grande, and on the west by the Colorado, was acquired by treaty and the payment of $10,000,000, and is now included in the southern part of the Territories of Arizona and New Mexico. It is called the Gadsden Purchase after James Gadsden (q.v.), United States Minister to Mexico in 1853, by whom, in December of that year, the treaty of sale was negotiated with Santa Anna (q.v.). Issues growing out of the execution of the Treaty of Guadalupe-Hidalgo (q.v.) made this negotiation a matter of great importance, as well as a business of much difficulty. Disputes had arisen concerning the boundary line between Chihuahua and New Mexico, involving the possession of the Mesilla Valley, of which, though claimed by the United States, the Mexicans took armed possession. The 11th article of the treaty, imposing upon the United States the obligation to restrain the Indian marauders on the Mexican frontier, had been neglected, and the reclamations in consequence amounted to between $15,000,000 and $30,000,000. By Gadsden's treaty that article was abrogated and a new boundary was agreed upon, while Mexico also agreed to forego all claims against the United States for damages on account of Indian depredations between the years 1848–53. The settlement of the boundary dispute was considered in this country to be of greater moment than the requisition of the land, which was thought to be of little or no value for cultivation; and it was in the minds of enterprising Americans that through this region the Southern Pacific Railroad, already projected, might find an advantageous route, as in fact it did. In Mexico the transaction was vigorously opposed, and on account of his part in the sale Santa Anna, in 1855, was banished from his country as a traitor. On the part of the United States, the Senate made some modifications in the original treaty and then ratified it. On 30 June 1854 it was finally proclaimed. Consult Haswell, 'Treaties and Conventions' (Washington 1889).

GADSDEN TREATY. See ANNEXATION; BOUNDARIES OF THE UNITED STATES; GADSDEN PURCHASE.

GADSHILL, England, a hill near Rochester, on the road from London to Gravesend. It is commemorated in Shakespeare's play, 'Henry IV,' as the place where Falstaff had his encounter with the robbers, and an inn at the place is called Falstaff's Inn. It is interesting in modern times for Gadshill Place, opposite the hill, which was long the residence of Charles Dickens and was the home in which he died.

GADSKI, gädz'kē, **Johanna**, German opera singer: b. Anclam, Prussia, 1871. She received her musical training in Stettin, made her début in opera in Berlin in 1889, and six years afterward, as one of the Damrosch German company in New York, appeared as Brünhilde and in numerous other Wagnerian parts. She made a concert tour in America in 1898–99; married an Austrian, T. Tauscher, in 1892; has excelled in the interpretation of heroines of Wagner's operas.

GADWALL, or **GRAY DUCK**, a migratory wild duck (*Chaulelasmus streperus*) found on all the four continents. It is less in size than the mallard and mainly black, brown and white in color. It frequents western marshes in small flocks, but is rare east of the Alleghany Mountains. As a table delicacy it is highly prized.

GÆA, gē'ȧ, or **GE,** gē, in Greek mythology, the goddess of the earth. She appears in Hesiod as the first-born of Chaos and the mother of Uranus and Pontus. She also bore the Titans, Cyclops, Erinyes, Giants, etc. As the vapors which were supposed to produce divine inspiration rose from the earth, Gæa came to be regarded as an oracular divinity; the oracles at Delphi and Olympia were believed to have once belonged to her. Her worship extended over all Greece, black female lambs being offered on her altars. She was also the goddess of marriage, and again of death and the lower world. At Rome Gæa was worshipped as Tellus.

GAEDERTZ, gĕd'ĕrts, **Karl Theodor,** German poet: b. Lübeck, 8 Jan. 1855; d. 1911. In 1880 he obtained a post in the Royal Library of Berlin and he was appointed chief librarian at Greifswald in 1903. His poems in Low German include 'Julklapp' (3d ed., 1899) and 'Eine Komödie' (2d ed., 1881). He also wrote valuable monographs on German poets and on the history of German drama, his chief works in this field being 'Goethe's Minchen' (2d ed., 1888); 'Aus Fritz Reuters jungen und alten Tagen' (3d ed., 1899); 'Emanuel Geibel: Ein deutsches Dichterleben' (1897); 'Bismarck und Reuter' (1898); 'Bei Goethe zu Gaste' (1900), and 'Im Reiche Reuters' (1905).

GAEL, gāl, the name of a branch of the Celts inhabiting the Highlands of Scotland, Ireland and the Isle of Man. Gadhel, or Gael, is the only name by which those who speak the Gaelic language are known to themselves. By way of distinction the Highlanders of Scotland call themselves Gael Albinnich (Gaels of Albin) and the Celtic population of Ireland call themselves Gael Erinnich (Gaels of Erin). See CELTS.

GAELIC LANGUAGE. See CELTIC LANGUAGE.

GAELIC LEAGUE, The. From the passing of the Statute of Kilkenny in 1367, the policy of the English governors of Ireland was to discourage the use of the Irish language, and even to root it out entirely; and from time to time other laws, with various pains and penalties attached in case of non-observance, were enacted with the same end in view. It was a vain attempt. The people clung with singular tenacity to their own language, and many of the English settlers adopted it, so that in the early part of the 19th century, out of a total population of 7,000,000, at least 4,000,000 spoke Irish as their native tongue. A more insidious method than penal legislation was then adopted. Under the primary school system, conducted by the Board of National Education established in 1831, the Irish language was both banished from the curriculum and forbidden as a medium of instruction, the motive of course being to establish, in process of time, the universal use of the English language in Ireland, to the exclusion of the native speech. This method of killing a language by degrees was so effective that, before the end of the century, Irish had practically disappeared from Ireland as a written language, and survived as a spoken one only in a few districts of the south, west, and northwest. The figures showing its decline in 66 years are startling: a drop from 4,000,000 Irish speakers in 1835 to 1,524,286 in 1851, and to 641,142 in 1901, tells its own tale. Worse perhaps than the actual decline here disclosed was the neglectful or even contemptuous attitude adopted toward their own language by great numbers of the Irish people.

In the meantime, however, the great Celtic Renaissance (q.v.), which had accomplished so much in other fields, had begun to produce its effects on the moribund Irish language — slowly, indeed, at first, for the political and social unrest in Ireland from 1878 onward was an insuperable barrier to the widespread success of any mere linguistic or literary movement. The Society for the Preservation of the Irish language and the Gaelic Union did something to stem the tide; but the more ardent spirits of the latter body, dissatisfied with the progress made, and believing that, in order to achieve their purpose, a great popular movement was necessary, decided to establish another organization. To this new body was given the title of THE GAELIC LEAGUE (Cumann na Gaedhilge).

The Gaelic League was founded on 31 July 1893, at 9 Lower O'Connell street, Dublin. The number present on that historic occasion was small, seven perhaps or nine at most; but many of them were young men of great force of character and with a clear concept of what they intended to do and of the difficulties which they had to face. At the outset the three recognized leaders were John MacNeill, Rev. Eugene O'Growney, and Douglas Hyde. By using the native language as their basis of operation, they contemplated the deanglicization of Ireland and the restoration of that distinctive Irish culture which they regarded as then well-nigh lost: the re-establishment, in fact, of what came afterward to be called an Irish Ireland. The program of the League, as announced, was:

1. The preservation of Irish as the national language of Ireland and the extension of its use as a spoken tongue.

2. The study and publication of existing Irish literature and the cultivation of a modern literature in Irish.

Although conceived on strictly non-political and non-sectarian lines, the League made but slow progress at first. It had to encounter suspicion and even secret and open opposition, it had to endure the mock and the jeer of the scoffer and the scorner, and, worst of all, it had before it the herculean task of overcoming the apathy of the great majority of the people. The heads of the League, however, set about their work with courage and high hope and with a dogged perseverance, which in the long run produced results. Taking over and continuing the monthly *Irisleabhar na Gaedhilge* (The Gaelic Journal), which had been begun in 1882 by the Gaelic Union, the Gaelic League also started a weekly of its own, *Fainne an Lae* (The Ring of Day, The Dawn), which was subsequently replaced by *Claidheamh Soluis* (The Sword of Light). In time, its propaganda attracted men of all classes and all creeds, various daily and weekly newspapers helped on the movement, and a national sentiment was created. By 1905 thousands of books and pamphlets printed entirely in Irish were produced annually, and, exclusive of prayer manuals and other religious works, more books were published in Dublin in Irish than in English. In 1908, 5,814 intermediate, or secondary school, students presented themselves for examination in Irish. By 1906 close on 100,000 children were learning the Irish language in the national, or primary, schools, and the ban on the teaching of Irish history in those institutions had been lifted. A new literature in modern Irish was also in process of formation, and an Irish Texts Society was busily engaged in rescuing from oblivion the ancient Irish classics and the works of the 17th and 18th century Irish poets, like Geoffrey O'Donoghue, David O'Bruadair, Egan O'Rahilly, John Claragh MacDonnell, and Owen Roe O'Sullivan.

Among the people the principles of the Gaelic League flourished apace. Branches to the number of about 1,000 were formed not only in Ireland but also among people of Irish birth or descent in England, the United States of America, Canada, South America, and Australasia. A long-continued struggle resulted in the admission to the mails of letters, postal cards, newspapers, and parcels addressed in the Irish character, and in forcing banks to accept checks similarly signed, all of which meant that postal clerks and bank clerks with a reading knowledge of Irish had to be employed, and that Irish had to be introduced as a subject into the competitive examinations by which such officials are selected in Ireland. One week in the year was set aside as "Irish language week," and a collection for its propagation was taken up. Festivals were organized at which there were competitions in Irish story-telling, Irish dances, Irish songs, Irish music, Irish games. The national festival, the Oireachtas, held annually in Dublin from 1897, carried out these proceedings on a national scale. Under the auspices of the League, Irish concerts were held and lectures on Irish history, art, antiquities, and literature were delivered. Organizers were appointed to keep the Irish language alive in the districts where it still existed and to spread its use in others where it had decayed. Distinctive Irish schools were established and the Irish School of Learning for higher Celtic studies, with a publication of its own named *Eriu*, was founded. Similar works, like 'Gadelica' (1912–13), were from time to time brought out. Sermons were preached and public prayers were recited in Irish. A national drama in the national tongue sprang into existence and was presented by capable actors to understanding and appreciative audiences. The industrial revival in peculiarly Irish arts was due in no small degree to the spirit evoked by the Gaelic League. Its influence was also largely felt in that wonderful efflorescence of Irish literature in English which is known, *par excellence*, as the Irish Literary Revival (q.v.).

When the National University of Ireland was founded by act of Parliament in 1908 and came into being in 1909, the success of the efforts of the League was plainly discerned. In University College, Dublin, one of the Constituent Colleges of the University, there were established professorships in Celtic Archæology, in Early and Mediæval Irish History, in Early and Mediæval Irish Language and Literature, and in the National Economics of Ireland, and lectureships in Modern Irish History and in Irish Language; in University College, Cork, another Constituent College, a professorship of Irish Language and Literature and a lectureship in Modern Irish were provided; and in University College, Galway, the third Constituent College, there were founded professorships in Modern Irish Language and Literature and in Celtic Philology. Furthermore, a great agitation arose to have a knowledge of Irish made compulsory on students entering the university and up to a certain point in their undergraduate courses. A compromise on this question was finally arrived at, by which it was arranged that a knowledge of Irish was not to be essential for the first three years, but was to be obligatory thereafter. This controversy was made memorable by the declaration of the Standing Committee of the Irish Catholic bishops, who, while thinking that for the time being Irish ought to be an optional subject, yet went on record as expressing the hope that the day might come when Irish would be not only compulsory but would also be the recognized medium of instruction in the university.

Since then the Gaelic League has pursued its course, not quite so demonstratively perhaps, but none the less perseveringly. Political events, like the bitter struggle over the Home Rule bill from 1912 to 1914, the threatened revolt in Ulster in 1912, and the counter-movement of the Irish Volunteers in 1913 and 1914, as well as the advent of the great World War in the latter year and the developments to which it has led in Ireland, have tended in great measure to curtail the activities of the League. It has not yet by any means succeeded in deanglicizing Ireland, nor has it made substantial progress in extending the use of Irish as a spoken tongue. Whether it will succeed in those objects depends largely on the status of Ireland after the war. It is certain, however, that the rebellion of Easter week, 1916, and the spirit generated by its aftermath, as plainly shown in the trend of events since, are likely, when peace is restored, to give the Gaelic League a new lease of life and a fresh and stronger hold on the Irish people.

GAELIC LITERATURE. Although the oldest existing MSS. in Gaelic are of no earlier date than the 7th century, there is ample evidence that the literature of the Gaels, not only the traditional but the written literature, is of much greater antiquity. The internal evidence furnished by the ancient sagas, songs and chronicles preserved in mediæval manuscripts indicates a regular development extending from a period antedating by many centuries the beginning of the Christian era, down to a time well within the compass of authentic history. And both the internal and external evidence point to the existence of a written as well as a traditional literature long before the Gael came into close contact with the civilization of the other nations of western Europe.

The Gaelic, or Gaedhealg, language is an Indo-European tongue, highly inflected, and rich in beautiful forms and euphonious combinations. It is spoken in Ireland, the Highlands of Scotland and the Isle of Man. Being a Celtic tongue it is akin to the Brythonic group of languages, the Welsh, Cornish and Breton, and to the tongues, now extinct, spoken by the Celtic peoples who occupied central Europe before the extension of the Roman power. The isolation of Ireland ensured the development of the language along lines peculiarly its own, unaffected by outside influences. This is true not only of those centuries before the dawn of history, when the language was in the making, but is true also of the later period when momentous changes were stirring the rest of Europe and the modern nations were springing into being out of the fragments of the shattered Roman Empire. This isolation made for the development of a unique language and literature and it resulted, too, in the preservation and development of those peculiar social conditions, the record of which is now shedding light on a period which would otherwise be shrouded in darkness. The development of the language is usually assigned by scholars to three periods: Old Gaelic, from the earliest time to about the end of the 10th century, A.D.; Middle Gaelic, from the 11th to the 17th century; and Modern Gaelic, from the 17th century to the present day.

Though much of the old Gaelic literature came down to mediæval times in the form of oral tradition it must not be supposed that it is on that alone that its history is based. The fact that the earliest writing extant can be traced no further back than the 7th century is far from proving that previous to that time writing was unknown in Ireland. During the 8th, 9th and 10th centuries Ireland, like the other nations of Europe, suffered from the incursions of the Danes and Northmen. These marauders landed on the coast, established themselves in seaport towns, set up their own government and raided the interior. Monasteries were sacked and burned and, as in England, almost every existing book and manuscript was burned at their hands. That such manuscripts and books existed before that time, however, is amply proved. Ireland had at that time been long in touch with the rest of Europe, and her schools had supplied teachers and missionaries to the western world for centuries. During the Dark Ages, when continental Europe was plunged in almost universal war, Ireland was the home of the monastic schools, where the learning of the ages was preserved and the arts of writing and illuminating were generously fostered.

The present alphabet, which is a modification of the Roman, was introduced, it is believed, by Saint Patrick when he came in the 5th century to preach Christianity. But the art of writing was known before that. Many inscriptions have been found, especially in the southern counties, in Ogam, a system of writing which was peculiar to the early Irish. This script consisted of a series of short lines, drawn either above, below or through a stem-line. Each group of short lines represented a letter, the letter being indicated by the number and position, some being at right angles and some being at acute angles with the stem-line. This stem-line was generally the angle between two sides of a long upright rectangular stone. The vowels were indicated by very small cuts on the angle of the stone, but much larger than points. The use of Ogam was not confined to monumental inscriptions, for some small metal articles have been found inscribed with it, and the old sagas and chronicles contain many allusions to Ogam writings on poets' staves, the shields of warriors and other articles. With the introduction of the modified Roman alphabet the use of Ogam was practically discontinued, although instances of its occasional use have been discovered. In a Saint Gall manuscript of the 9th century eight Ogam sentences were discovered, and others as late have been commented on by Zeuss, Nigra and others. How Ogam was invented is still a profound mystery, but it is certain that it is peculiar to the Irish Gael and only found where he settled.

The literary form in which the primitive Gaelic genius chiefly found expression was the *sgeul*, or *ursgeul* — the saga or song-story — partly in prose, partly in verse, which recited the deeds of gods and demi-gods and heroes in spirited and dramatic fashion. Of drama, strange to say, no trace can be found in ancient Ireland; there is not a record of even a mystery or a miracle play in the early Christian days. But the romance began early and reached a very advanced stage of development, probably long before the art of writing was known. It took the form of prose narrative, interspersed with flights of spirited and highly imaginative poetry. The 'Book of Leinster,' a MS. of the 12th century, enumerates 187 of these romances and the names of many more are given in the 10th or 12th century tales of Mac Coise. Many of these tales show evidence of accretions during subsequent periods. Some of palpably pagan origin bear traces of Christian additions, such as the legend of Niul, the ancestor of the Milesians, meeting Moses and the Israelites fleeing from Pharaoh, with the miraculous healing of Niul's infant son by the Hebrew lawgiver; and the tale of the children of Lir, whose enchantment was to be ended by the ringing of the first mass-bell in Ireland. But in every instance it is an easy matter to separate the accretions from the original tale and so reconstruct the story in its primitive form.

The value to the antiquarian and student of history of the material thus obtained is incalculable. For these old hero-tales give a vivid picture of the social life of the primitive Celts, a history of the early stages of Celtic civilization, that it is impossible to find elsewhere. For although the entire of central Europe, as well as the British Isles, was peopled by Celtic tribes, the records of their civilization have been obliterated everywhere except in Ireland. The Romans, wherever they planted their standards, introduced their own civilization, wiping out of existence whatever antedated their coming, and their historians, writing of the Roman conquests, measured everything by a Roman standard and found nothing worthy of record in the culture of the barbarian. Hence, practically all record of the continental Celt prior to his subjugation by the Roman has been lost. But the Roman legions never secured a foothold in Ireland, and the Gaelic Celt worked out his own destiny without interference. The record of this development is found in his traditional literature and is proving a mine of invaluable material for the investigator of conditions in ancient Celtic Europe. The most important of these sagas resolve themselves into three distinct groups, representing three periods of the history of the race: The Mythological Cycle; the Heroic, or Red Branch Cycle; and the Fenian or Ossianic Cycle.

The Mythological Cycle.— In the oldest Gaelic sagas the confusion of gods and men is baffling. . So thoroughly have the ancient deities been euhemerized that later generations came to look upon them simply as earlier races of inhabitants. These romances tell the story of successive settlements of Ireland. They tell of Partholan and his followers who were the earliest settlers; of Nemedh, who followed and possessed himself of the land; of the Fomorians, who conquered the Nemedians and drove them out; of the return some centuries later of the descendants of a part of the Nemedian force, now known as Firbolgs, to dispute with their former conquerors, and the subsequent return of the descendants of another division of the Nemedians, the Tuatha de Danaans, who in turn became masters of the land, holding it until the coming of the conquering Scots, or Gaels, or Milesians as they are variously called. The saga of the 'Battle of North Moytura' tells of the fight between the Tuatha de Danaans and the Firbolgs, which resulted in the utter defeat of the latter, who were driven into the smaller islands. This story and the story of the 'Battle of South Moytura' between the Tuatha de Danaans and the Fomorians, abound in descriptions of the marvelous achievements of the heroes and ends in the complete defeat of Fomorians. To this period belongs also the pathetic tale of the 'Death of the Children of Tuireann,' included by Hyde in 'The Three Sorrows of Story-Telling.'

The Red Branch, or Heroic Cycle.— This group of tales deals with the history of the Milesians, the warlike race which finally conquered the island and held it until the coming of the English. Unlike the earlier tales, which palpably treat of a fabulous age and purely mythical persons and events, these romances deal with a world which has an apparent basis of reality, despite the legendary character of many of the events there recorded, and of the heroes who participate in them. The people of this cycle, Cuchulain, Conall Cearnach, Deirdre, Naoise, Meve, Conor mac Nessa, Fergus mac Roigh, though of heroic stature, are yet human; their deeds, and the motives for those deeds, are human; and though the marvelous and the preternatural are found there in as marked a proportion as in the 'Iliad' and the 'Odyssey,' they do not dominate as in the tales of the Mythological Cycle. This group of romances is, without question, the finest in all the ancient Irish literature. The period, which is identified by the annalists with the birth of Christ and the beginning of the Christian era, is associated chiefly with the long war between Connaught and Ulster arising out of the murder of the children of Usnach. This incident is recorded in one of the most beautiful and pathetic tales in the whole range of ancient story-telling, the tale of 'Deirdre, or the Fate of the Children of Usnach.' Cuchulain, the Ultonian champion, is the great hero of this cycle. Conall Cearnach, Ferdiad and Meve, the warrior-queen, are figures hardly less heroic. The most important of the romances of this group is the 'Tain Bo Cuailgne,' or the 'Cattle-Spoil of Cooley,' a tale that has proved a valuable source of information for the antiquarian from the light it throws on early Celtic life and manners. The 'Death of Conlaoch' is a curious parallel of the story of Sohrab and Rustum.

Fenian or Ossianic Period.— Though Cuchulain is the great hero of the heroic age of the Gael, there is another of a later age who comes closer than he to the popular heart. Fionn, or Finn, mac Cumhail, if one may judge by the affectionate reverence with which his name and the records of his deeds are preserved in peasant lore, is without question the most popular of the traditional heroes. While the wonderful achievements of the elder hero are familiar to the scholar, those of Fionn are known to every unlettered peasant and are embalmed in folksongs and folktales without number. Moreover, the whole body of Fenian story is intimately bound up in the popular interest. Hyde points out that for a period of from 1,200 to 1,500 years these tales showed a most remarkable instance of continuous literary evolution. Century after century saw accretions in the form of stories and poems about Finn and the Fenians, and there are to-day extant in Gaelic-speaking communities numberless stories that have never been reduced to writing in which Finn is the central figure. This was never, at any time, true of Cuchulain and the Red Branch Cycle. Finn is distinctively the popular hero, the hero who stands in the popular imagination for all that is heroic and patriotic.

Like Cuchulain, he is the central figure of a cycle of romance, almost as important as the Red Branch Cycle. The Fenian Cycle, so-called from the fact that it deals largely with the Fianna, or Irish Militia; or the Ossianic Cycle, from Ossian, or more properly Oisin, the son of Finn, who is credited with the authorship of many of the poems, comes nearer than either of the other cycles to the limits of authentic history. These sagas treat of such historical personages as Conn of the Hundred Battles, Ard-Ri (High-King), whom the annalists assign to the 2d century; his son, Art the Lonely; his grandson, Cormac mac Art (A.D. 227, according to the "Four Masters;" 213, according to Keating); and his great-grandson, Cairbre of the Liffey. Finn, himself, is generally accepted as an historical figure, though much of myth and romance has been woven into his history. The earliest, in point of the chronology of the romances of this period, is the tale of the 'Battle of Cnucha,' in which Cumhail, the father of Finn, is killed by Conn of the Hundred Battles. Thence through a long cycle of romances the many adventures of Finn and his redoubtable band of warriors, Oisin, his son, Oscar, his grandson, Caoilte, the poet, Diarmidh and many another, are related until in the 'Battle of Gabhra,' which closes the series, is told how Cairbre of the Liffey broke the power of the Fenians forever.

The most fascinating, and when everything is considered, perhaps the most meritorious of the Fenian sagas is the 'Pursuit of Diarmidh and Grainne.' Like the story of 'Deirdre,' despite its antiquity the human appeal is almost modern, so close does it come to our own manner of thought. It tells of Finn's suit for the hand of Grainne, daughter of Cormac mac Art, the High-King; Grainne's passion, developed while the negotiations for her hand were in progress, for Diarmidh of the Love-Spot, one of Finn's warriors; the flight of the pair and the pursuit of the vengeful Finn.

Miscellaneous Romances.— Besides the stories of the three main groups above enumerated, there is a considerable number of sagas, some as old as those of the Red Branch Cycle, and some more recent, which cannot well be included under any of these headings. The most important is the 'Bruidhean of Da Derga,' a Leinster tale of the Red Branch period; and others that fall under this same heading are 'The Dream of Mac Conglinne,' a satire full of an irresistible humor; the 'Voyage of Maelduin' and the 'Battle of Moy Rath.'

Early Christian Period.— With the coming of Christianity came a new phase of Gaelic literature. Saint Patrick and his followers found a soil ready to receive the seed of Christianity. Theirs was a bloodless conquest, and although the Bardic Schools struggled long against the innovation of Christianity they at length succumbed and the subsequent literature of Ireland is thoroughly Christian and largely devotional in tone. Saint Patrick himself was a man of works rather than a man of letters, and yet it is to him that the earliest literature of Christian Ireland and, if we except the Ogam inscriptions, the earliest authentic writings now in existence can be traced. Of the 'Canon Phaidraig,' or 'Patrick's Testament,' a MS. copy of the late 8th or early 9th century is still in existence, and this, it has been demonstrated, was made from an older copy in the saint's handwriting. The authenticity of 'Saint Patrick's Confession,' which, strictly speaking, is not a confession but an apology, has been questioned, but it is vouched for by such eminent authorities as Stokes, Todd and Hyde. These two works, it is true, are in Latin and might be excluded from a consideration of purely Gaelic literature, but as they are the first literary utterance of Christian Ireland, they are worthy of note, despite the alien tongue in which they are written. This objection, however, does not apply to the 'Epistle to Coroticus' and 'The Cry of the Deer,' two compositions in Gaelic which are also attributed to Saint Patrick. Seachnall, a nephew of the great apostle, is looked upon as the first Christian poet in Ireland, although he, too, wrote in Latin.

Biography, chronicle-history and genealogy make up a large part of the remains of Gaelic literature and, as might be expected from the fervor with which the Irish adopted Christianity, the literature of this period is rich in lives of the saints. It is appropriate, too, that among the earliest we should find lives of Saint Patrick. The 'Book of Armagh' contains two very early biographies. There are many others, but the most important is the 'Tripartite Life,' the MS. of which, written in ancient Gaelic, was discovered by O'Clery, one of the "Four Masters," early in the 17th century. This "Life" might, perhaps, be more fittingly described as a group of three semi-historical homilies on the life of the saint. Saint Columcille (521–597), after Saint Patrick the most renowned of the early churchmen, contributed generously to the Gaelic literature of this period. His Gaelic poems voice an ardent patriotism, those written after his exile to Iona especially breathing a passionate love for the land of his birth. The same century that knew Saint Columcille boasts of another great churchman and writer, Saint Brendan the Navigator, founder of the famous abbey and school of Clonfert. Saint Brendan is the reputed author of the 'Navigatio Brendani,' a tale of marvelous romance, the influence of which was felt throughout Europe. MS. copies of it may be found in many monasteries on the Continent, and it has been edited and annotated in many tongues. Giraldus Cambrensis (1146?–1220?) alludes to it as being well known in his time. The life of Saint Brendan in the 'Book of Lismore' tells of his setting out in three vessels in search of an isle in the west which was to be a land of promise, probably the Moy Mell and Hy Brassil of the ancient pagan legends.

But it must not be supposed that the making of literature in Ireland was confined to the churchmen. The arts of poetry and prose composition flourished after, as before the coming of Christianity, and the race of bards did not die out for many centuries. Notable among those who flourished prior to the period of the Danish incursions was Eochaidh, better known as Dallan Forgaill, a contemporary of Saint Columcille. He was Chief Ollamh of Ireland, a dignity which on his death devolved on his pupil, Senchan Torpeist. Others, equally as important, were Cernfaeladh (c. 678) and Angus Céile Dé, or the Culdee. The 'Saltair na Rann,' a collection of 162 poems in Early Middle Gaelic, giving a rather fanciful account of the creation of the world and the fall of Adam and Eve, was long attributed to Angus, but later research by Whitley Stokes has shown that it could not have been written earlier than 1000.

Danish Occupation to Norman Invasion. — Despite the continual warfare and waste of life and property that marked the two or three centuries of Danish occupation of Ireland, literature and learning flourished. Cormac mac Culinan (d. 908), king, and bishop of Cashel; statesman, ecclesiastic, poet and scholar, is the most eminent figure at this stage of Gaelic literary development. 'Cormac's Glossary' is the earliest attempt at a comparative vernacular dictionary made in any language of modern Europe. It is valuable not only as an example of early scholarly effort, but also for the light it throws on pagan customs, on law, history and romance. The 'Saltair of Cashel,' also the work of Cormac, has been lost. Others of lesser fame have left examples of their work, the most noted of them being Cinaeth O'Hartigan, Eochaidh O'Flynn and Mac Liag, bard to King Brian Boroimhe, the monarch who in the decisive battle of Clontarf (1014) defeated the Danes and broke forever their power in Ireland. Mac Liag and Errard mac Coise are credited with the joint authorship of the valuable chronicle, 'The Wars of the Gael with the Gall' (i.e., Norsemen), the accuracy of which has withstood some very remarkable tests of modern scholarship. Clontarf saw the end of the Scandinavian power in Ireland, and the 11th and 12th centuries witnessed a great revival of learning. The industrial arts, architecture, letters, all flourished, and it is to this period that we are indebted for the three most important relics of Celtic literature now in existence: the 'Leabhar na h-Uidhre,' the 'Book of Leinster' and the 'Book of Hymns.' Tighearnach, abbot of Clonmacnois, the great annalist, and Flann, head-teacher of the school of Monasterboice, chronologist and poet, are the most eminent individual figures. Irish scholars traveled to the Continent and left the impress of their learning on many a European school.

Arrest of Development and Subsequent Revivals.— With the Norman invasion in 1169 came the arrest of development. Hitherto wars, whether between the septs or with foreign invaders, did no lasting injury to the intellectual or æsthetic development of the race, but with the coming of the Normans began a period of decay that lasted for four centuries. The tradition of poetry was kept alive, but no great names illumine the record, and it is not until the beginning of the 17th century that we find a reawakening of the literary spirit. With this period came the last great outburst of classic Gaelic poetry. Teig mac Daire is looked upon as the last of the classic poets and the greatest of his time, although Lughaidh ua Clerigh, with whom he engaged in a notable controversy («The Contention of the Bards»), is also conspicuous for the merit of his poetry. Others whose work has survived were Teig Dall O'Higin and Eochaidh O'Hussey.

This period, too, saw some of the earliest and most notable achievements in the field of antiquarian research and compilation of annals. Chronicle-history and genealogy had been favorite fields of literary effort for the Gael from the earliest time, but this period brought to the ancient labor the resources of mediæval scholarship and the habit of study bred in the monastery. Among the chroniclers of the 17th century we find men of acknowledged learning and skilled in antiquarian research, such men as Brother Michael O'Clery, the learned Franciscan, who compiled the 'Reim Rioghraidhe («Succession of Kings») and the 'Leabhar Gabhala' («Book of Invasions»); and who, with O'Mulconry, O'Duigenan and Peregrine O'Clery, compiled that greatest of all mediæval Irish chronicles, the 'Annals of the Four Masters.' This work, covering the whole field of Irish history, legendary and authentic, is the most comprehensive and exhaustive record of the kind in the language. Others equally eminent were Duald mac Firbis, the genealogist; and Geoffrey Keating, theologian, poet and historian, whose 'History of Ireland' is a model of Gaelic prose. Keating, in one sense the greatest of these, was the first to depart from the dialect of the learned, the ancient bardic idiom, and write in a popular style. All his predecessors were learned men writing for the learned few; he, a learned man, writing for the many. His history was the most popular book ever written in Gaelic. In his poetry, as in his prose, he was an innovator and was the first to depart from the ancient metres.

The metrical systems of the old bardic schools were intricate and elaborate and, technically, had reached an advanced stage of development at an early period. The underlying principle was not alliteration as in Anglo-Saxon and other Teutonic verse; or quantity as in the metres of the Classic tongues, but a consonantal rime, based on a division of the consonants into groups, any consonant in a particular group riming with any other consonant in that group. The syllables, too, were reckoned, but without regard to stress. It was an intricate system, and ease of composition according to it could be acquired only after years of arduous labor over its technicalities. But with the breaking up of the bardic schools in the 17th century came the introduction of a new verse-form in which accent and not syllable was the unit of measure and in which vowel rime took the place of consonantal. The change was almost instantaneous, and with the introduction of the simpler form the whole nation seemed to burst into song. The new method was elaborated and developed until the rime affected every accented syllable in the line, with a result that was wonderfully melodious. «The Gaelic poetry of the last two centuries both in Ireland and in the Highlands,» says Hyde 'Literary History of Ireland,' 1903, p. 542, «is probably the most sensuous attempt to convey music in words, ever made by man. It is absolutely impossible to convey the lusciousness of sound, richness of rhythm, and perfection of harmony, in another language. Scores upon scores of new and brilliant metres made their appearance.»

Eighteenth Century and After.—The 18th century was a period of persecution, and with the means of education and the opportunities for bettering themselves denied them, the Irish people found an outlet for their feeling only in song. The number of poets produced is almost countless, but a few names, such as David O'Bruadar, John O'Neaghtan, Torlogh O'Carolan, Tadhg Gaoloch O'Sullivan, Donough Mac Conmara and Brian Mac Giolla Meidhre, are worthy of special mention. But with the 18th century the history of Gaelic literature practically ends. Through the early years of the 19th century the struggle to preserve it was kept up, but the famine, coming as the climax of a long series of calamities, put an end to it. Such men as O'Curry, O'Donovan, Petrie and Todd; such societies as the Ossianic Society and the Society for the Preservation of the Gaelic Language, labored for the salvation of the tongue, but it was not until the great popular movement of the last two decades of the century that any real progress was made. The Gaelic League during that time stirred the nation to a sense of its impending loss and as a result the study of the language has been taken up with enthusiasm not only in Ireland but in the United States, South America and Australia. Although this movement, which is purely popular and patriotic and has for its object the restoration of the language and the literature, is distinct from the scholarly interest shown by such scholars as Zeuss, Zimmer, Kuno Meyer, Windisch, D'Arbois de Jubainville, Whitley Stokes, yet its indebtedness to the researches of these investigators is unquestionable. That indebtedness is greater, however, to men like Dr. Douglas Hyde, Dr. Sigerson, Rev. Eugene O'Growney, Rev. P. J. Dineen, Rev. Peter O'Leary, Lady Gregory and others, who couple with thorough scholarship an enthusiasm that makes their efforts doubly effective. Dr. Hyde is a poet of undoubted gifts, with a command of Gaelic and the intricacies of its metres as sure as is his command of English, and a prose writer of equal fluency in both languages. Father O'Growney's series of textbooks is the standard course in most of the classes, and the others have contributed generously to the product of the new school. See also CELTIC LANGUAGES.

THOMAS GAFFNEY TAAFFE,
Professor of English, Fordham University.

GAETA, gä-ā'tä, a city and seaport of Italy and one of the most strongly fortified maritime cities of the country, located in the province of Caserta on the Gulf of Gaeta, 74 miles by rail northwest of Naples. It is picturesquely situated on an abrupt promontory projecting into the Mediterranean and connected with the mainland by a low and narrow isthmus protected by solid walls. On the summit of the promontory stands the circular tower D'Orlando, said to be the ancient mausoleum of Lucius Munatius Plancus, friend of Augustus. Many interesting classic remains have been found in Gaeta, including a fine marble vase by the Athenian sculptor Salpione, the ancient campanile of the cathedral of Saint Erasmus and the remains of a Roman theatre and a Roman amphitheatre.

The inhabitants of Gaeta derive their chief profits from the fisheries and their coasting-trade in oil, wine and fruit — principal productions of the surrounding country. Cajeta, ancient name of Gaeta, derived its origin, according to tradition, from its being the burial-place of Caieta, the nurse of Æneas. On the dismemberment of the Roman Empire, Gaeta became a centre of civilization and commercial prosperity, and gained still more importance after the decadence of the Eastern Empire. It successively withstood the invasions of the barbarians and the Lombards and Saracens. Both in ancient and modern times, Gaeta has sustained remarkable sieges, and recently it has been the theatre of several interesting events. In 1134 it fell before Roger II, and was annexed to the Norman kingdom of Sicily. In 1806 it was defended for six months by Prince Ludwig von Hessen-Philippsthal against the forces of Masséna. From 1848–50 it was the refuge of Pope Pius IX, when the revolution at Rome compelled him to retire. In 1860 after the defeat of the Neapolitans on the Volturno by the forces of Garibaldi, Gaeta was the last stronghold of the Bourbon dynasty of Naples, and after a protracted siege lasting from November 1860 to 13 Feb. 1861 Francis II of Naples surrendered the city to General Cialdini. Pop. about 6,000.

GAFF, in a ship or boat, spar or a sort of boom to which the head of a fore-and-aft sail is bent, such sail having its foremost side made fast by rings to the mast, and its lower edge, in most instances, held straight by the boom proper. The thick end of the gaff is constructed with «jaws» to pass half round the mast, the other half being inclosed by a rope or wire; this serves to keep it close when the sail is hoisted or lowered. The jaws are usually made by fastening two pieces of wood by means of bolts to the thick end of the gaff, the forward side of these pieces being hollowed out in the form of a semicircle so as to fit snug to the mast but sufficiently loose to allow of free play for the hoisting and shifting of the sail. Lately these jaws have been made entirely of metal, chiefly bronze. The after end of the gaff is called the «peak,» because it is usually raised much higher than the jaws when the sail is set. The ropes used in hoisting and lowering the gaff are called «halyards,» the rope for raising the peak being designated the «peak-halyard» and that near the «jaws» or «throat» the «throat-halyard.» «Spankers» and «trysails» are the only ones which have gaffs in square-rigged ships, but these gaffs do not ordinarily lower or hoist and in place of jaws have eyelets holding the forward end to the mast or to a traveler working on a batten to the mast. The latter method, however, is preferable as the gaff may be lowered when the sail is reefed.

GAFFAREL, gäf-fä-rĕl, **Paul (Louis Jacques)**, French historian: b. Moulins 1843. He received his education at the École Normal Supérieure; was made professor of history at Besançon, removing afterward in a similar capacity to Dijon and Marseilles. He has published many noteworthy works on colonial history; these include 'Étude sur les rapports de l'Amérique et de l'ancien continent avant Christophe Colomb' (1869); 'Histoire de la Floride française' (1875); 'Histoire du Brésil français' (1878); 'Les colonies françaises' (1880); 'L'Algérie: histoire, conquête et colonisation' (1882); 'Les explorations françaises de 1870 à 1881' (1882); 'Les campagnes de la première République' (1883); 'La conquête de l'Algérie jusqu'à la prise de Constantine' (1887); 'Les Français au delà des mers' (1888); 'Campagnes du Consulat et de l'Empire' (1888); 'Campagnes du premier Empire' (1890); 'Le Sénégal et le Soudan français (1890); 'Histoire de la découverte de l'Amérique (2 vols., 1892); ‹Le politique coloniale in France de 1789 à 1830› (1908).

GAFFKY, Georg Theodor August, German physician: b. Hanover 1850. He was educated at the University of Berlin and in 1888 was appointed to the chair of hygiene at the University of Geissen. In 1883–84 he visited Egypt and India as member of an expedition to study epidemics of cholera. He gathered much valuable material which he published three years later in collaboration with Dr. Koch. In 1892 during a cholera epidemic at Hamburg he was adviser to the municipality and in 1897 again visited India to make further studies of cholera. He became director of the Institute for Infectious Diseases at Berlin in 1904. His published works include ‹Zur Aetiologie des Abdominaltyphus› (2 vols., 1884); ‹Die éxperimentelle Hygiene in Dienst der öffentlichen Gesundheitspflege› (1895).

GAFFNEY, S. C., city and county-seat of Cherokee County, 110 miles northwest of Columbus, on the Southern Railway. Its industries comprise cotton and cotton-seed-oil mills, fertilizer works, lime, fibre works, tin and monazite mines, etc. It has extensive cotton-growing interests; has a woman's college, a Carnegie library, several schools and churches, and owns and operates the electric-lighting plant and the water supply system. Pop. 4,800.

GAG-RULES, a series of rules adopted 1836–44 by the House of Representatives, to prevent the reception of anti-slavery petitions and check the possibility of debate on the subject. No other measure created more virulent debate. The Constitution forbids Congress to pass any law «abridging the right of the people to petition the government for a redress of grievances,» and impliedly to refuse to receive petitions, as an unheard petition is a nullity. From 1831 on, the abolition societies rained petitions on Congress, urging the abolition of slavery in the District of Columbia, over which it had complete legislative power. They were referred to the Committee on the District, which at first reported adversely, then ceased to report at all, despite complaints. The 24th Congress, 1835–36, laid them on the table instead; but in both Houses there soon arose an outcry to bar them from congressional cognizance altogether. In the Senate, Calhoun on 7 Jan. 1836 moved not to receive two such petitions, on the ground that the South must in the end be worn out and degraded by having constantly to justify its institutions before a body which had no jurisdiction over them anywhere; but after two months' debate, it was voted to receive them and they were immediately rejected, which remained the rule thereafter. In the House, on 8 February, Henry L. Pinckney of South Carolina moved that all the petitions be referred to a select committee, under instructions to report that Congress could not constitutionally interfere with slavery in the States, and ought not to do so in the District; on 18 May the committee so reported, with another resolution that all petitions relating to slavery be laid on the table without action or reference. Under the previous question both resolutions were passed 25–26 May; the last 117 to 68, John Quincy Adams refusing to vote and denouncing them as a violation of the Constitution, the rules of the House and the rights of his constituents. Thereafter Mr. Adams, as the champion of the right of petition, became involved for years in an endless struggle against the «gag.» On 18 Jan. 1837 this struggle was renewed. The furious scenes in which Mr. Adams was pitted against nearly all the rest of the House are among the most picturesque in American history. On 21 Dec. 1837, John M. Patton of Virginia moved and secured the passage (122 to 74) of a resolution to lay on the table without debate, reference or action, all papers concerning slavery in any State, «District or Territory» of the United States. Adams again denounced it and refused to vote. On 11 Dec. 1838 the «Atherton Gag» was moved by Charles J. Atherton of New Hampshire, and passed 126 to 73; it was the same in essence as the others. On 21 Jan. 1840 the House adopted as its 21st Rule that no paper praying the abolition of slavery or the slave trade should in future be received by the House or entertained in any manner. But this only passed by 114 to 108; the refusal of the right of petition was incensing the North, and forcing even Democratic representatives to protest. Thereafter at every session, in adopting the rules, Mr. Adams moved to strike out the 21st. The violence of the assaults on him increased, but the majorities against him decreased. At the special session of 1841 his motion was carried on a motion to adopt the rules only for 10 days, but reconsidered and defeated. Finally, on 3 Dec. 1844 a motion to lay his motion on the table was lost by 104 to 81, and the 21st Rule was abolished by 108 to 80. Nothing of the kind was again attempted. Since 12 Dec. 1853 petitions are no longer presented in the House, but handed to the clerk. Consult Adams, ‹Memoirs› (Philadelphia 1874–77); Benson, ‹Abridgment of the Debates of Congress 1789–1856› (New York 1857–61); ‹Thirty Years' View› (New York 1854–56); Wilson, ‹Rise and Fall of the Slave Power in America› (Boston 1872–77).

GAGARIN, gä'-gä-rēn, **Alexander Ivanovich**, Russian soldier: d. 1857. He distinguished himself in the campaigns in the Caucasus especially in the Dargo expedition, and in 1847 became military governor of Kutais; in 1853 he took command of the troops on the Turkish frontier, becoming afterward commander of the 18th Infantry division. He was seriously wounded at Kars and in 1857 returned to his duties at Kutais as governor-general. He was charged with the subjugation of Suanethea and ordered to bring the prince of that province to Tiflis. The latter, Constantin Dadeschkalian, surprised Gagarin in his castle and inflicted on him wounds from which he died a few days afterward.

GAGARIN, Ivan Sergeyevich, Russian diplomat and churchman: b. 1814; d. 1882. He was a member of the princely house of Gagarin; entered the diplomatic service of his country and became secretary of embassy at Paris. He was converted to the Catholic faith in 1843, and subsequently entered the Jesuit order. He wrote ‹Les starovères, l'église russe et le pape› (1857); ‹Les hymnes de l'églin russe› (1868).

GAGARIN, Matthew Petrovich, Russian prince and statesman: d. 1721. In 1703 he was governor of Nertchinsk and four years later became president of the Siberian Chamber. He was named governor of Moscow in 1708, and after 1711 was governor of Siberia. After administering this office for a few years he was charged with various offenses, especially with a project of separating Siberia from the empire and constituting it a separate and independent nation. He spent two years in prison, was tortured frequently and finally put to death by Peter the Great.

GAGE, Lyman Judson, American financier: b. De Ruyter, N. Y., 28 June 1836. His family moved to Rome, N. Y., in 1848, and he was educated at the Rome Academy. He worked in the Oneida Central Bank 1853–55, when he went to Chicago, becoming a clerk, and later bookkeeper and cashier of a planing-mill company. In 1868 he became cashier and in 1891 president of the First National Bank of Chicago. He was the first president of the board of directors of the World's Columbian Exposition, and several times president of the American Bankers' Association and the Civic Federation of Chicago. On 5 March 1897 he was appointed Secretary of the Treasury, by President McKinley; in 1901 was reappointed; resigning in March 1902. He received the degree of LL.D. from the New York University, 4 June 1903. He was the originator of the movement for civic reform which started in Chicago under his inspiration and became a national influence. He wrote the platform of the Economic Conferences, a unique feature of Chicago's social organization, where Republican and Democrat, rich and poor, conservative and anarchist, meet for debate and exchange facts and theories.

GAGE, Simon Henry, American embryologist: b. Maryland, Otsego County, N. Y., 20 May 1851. In 1877 he was graduated at Cornell University and in 1878–81 was instructor, in 1881–89 assistant professor, and in 1889–93 associate professor of physiology at Cornell. From 1893 to 1895 he was associate professor of anatomy, histology and embryology and in 1895–96 professor at the same institution. In 1906 he became professor of histology and embryology emeritus after 25 years' service to undertake special investigations, on an allowance from the Carnegie Foundation for the Advancement of Teaching. He is coeditor of the *American Journal of Anatomy* and is a member of many scientific societies, American and foreign. He is the author of 'The Microscope and Microscopic Methods' (12th ed., 1916); 'Anatomical Technology,' with B. G. Wilder; 'Optic Projection with the Magic Lantern and the Moving Picture Machine' (1913–14); also numerous papers on biological subjects; collaborator to Foster's 'Encyclopædic Medical Dictionary'; Wood's 'Medical Dictionary' and Wood's 'Reference Hand Book of the Medical Sciences,' etc.

GAGE, Thomas, English general: b. Firle, Sussex, 1721; d. 2 April 1787. He was son of first Viscount Gage and was educated for the army which he entered as lieutenant in 1741. He took part in the battle of Culloden and served in Flanders as aide-de-camp to Lord Albemarle. Appointed lieutenant-colonel of the Forty-fourth Foot in 1751, he came with it to America three years later with General Braddock. In 1755 he accompanied Braddock's ill-fated expedition as lieutenant-colonel. In 1758, while stationed at Oswego, he raised and trained a regiment of provincial troops for Abercrombie's expedition against Ticonderoga. The following year he became brigadier-general with command at Niagara. He was appointed by General Amherst, in 1760, military governor of Montreal, and in 1763 commander-in-chief of the British forces in America. His inflexible character led the government to regard him as well fitted to end the disturbances in the American colonies. In 1774 he was nominated governor of Massachusetts, a post of peculiar difficulty, and his enforcement of the rigorous decrees of Parliament brought matters to a climax. On the night of 18 April 1775 he dispatched an expedition to seize a quantity of arms which had been stored at Concord; and next day took place the memorable encounter of Lexington, which announced that the Revolution had begun. The battle of Bunker Hill (q.v.) made him unpopular. For a short time he was commander-in-chief in America, a post he soon resigned to return to England.

GAGER, (Charles) Stuart, American botanist: b. Norwich, N. Y., 1872. In 1895 he was graduated at Syracuse University and later studied at Harvard and Cornell. In 1897–1905 he was professor of biological science and physiography at New York State Normal College; from 1906 to 1908 was director of the laboratories of the New York Botanical Garden and in 1908–10 was professor of botany at the University of Missouri. Since 1910 he has served as director of the Brooklyn Botanical Garden. His publications include 'Errors in Science Teaching' (1901); 'Effects of the Rays of Radium on Plants' (1908); 'Non-Technical Lectures' (1913); English translation of De Vries, 'Intracellular Pangensis' (1910).

GAGNON, găn'yôn, **Charles Alphonse Nathanaël,** Canadian author: b. Port Joli, Quebec, 1851. He received his education in the public schools; entered journalism at Montreal and afterward moved to Quebec. He was reporter in the courts there and afterward secured a position from the provincial government in the Department of Public Works. His tales, sketches, etc., include 'Douleurs et Joies' (1876); 'Geneviève, Saint Jean, Port Joli' (1876); 'Quelques considerations pour les temps actuels' (1882); 'Les banques d'epargnes scolaires' (1887); 'Études archæologiques et variétés) (1894); 'L'Amérique précolombienne; essai sur l'origine de sa civilisation' (1908).

GAHNITE, gä'nīt, "zinc spinel" (named after J. Gottlieb Gahn, a Swedish chemist and mining engineer), a zinc-aluminate, $Zn\ Al_2O_4$. The variety automolite has this formula; in kreittonnite the zinc is in part replaced by ferrous iron and magnesium, and the aluminum by ferric iron. The variety dysluite is similar except that manganese is present instead of magnesium. Gahnite usually occurs in octahedrons of a black, gray, dark green or brown color, with a hardness of 7.5 to 8. Its most important localities are in Sweden, Bavaria and Sussex County, N. J.

GAIL HAMILTON. See DODGE, MARY ABIGAIL.

GAILLARD, gī'yär', **Claude Ferdinand,** French painter and engraver: b. Paris, France, 7 Jan. 1834; d. there, 19 Jan. 1887. He was a pupil of Léon Cogniet and studied painting and engraving at École des Beaux-Arts. In 1856 he gained the Prix de Rome. Among his pictures are 'The Education of Achilles' (1863); 'Saint Sebastian' (1876); 'Christ at the Tomb' (1877), besides several portraits and some copies of old masters. His principal engraved portraits are 'Chateaubriand,' 'Monseigneur Bouvier,' 'Count of Chambord,' 'Monseigneur Merode.' 'The Plates of Saint Sebastian,' of one of Botticelli's 'Holy Families' and of the 'Man With the Pink,' of Van Eyck, rank among the masterpieces of modern engraving. Gaillard gained three medals for engraving and one for painting, and was decorated with the cross of the Legion of Honor in 1876. Consult Beraldi, H., 'Les graveurs du dix-neuvième siècle' (Paris 1885–92).

GAILLARD, gāl'lerd, **David Du Bose**, American soldier and engineer: b. Sumter County, S. C., 1859; d. 1913. In 1884 he was graduated at the West Point Military Academy and from 1891 to 1894 was a member of the International Boundary Commission of the United States and Mexico. In 1895–98 he superintended work on the Washington aqueduct and during the war with Spain was colonel of a regiment of volunteer engineers. In 1909 he was made lieutenant-colonel in the regular army. In 1907 he was appointed on the Isthmian Canal Commission and was made director of the Panama Railroad Company. In 1908 he was made engineer of the division of the Panama Canal from Gatun to Pedro Miguel. He wrote 'Wave Action in Relation to Engineering Structures' (1904).

GAILLARDET, gī-yär-dā, **Théodore Frédéric**, French dramatic author: b. Auxerre, 7 April 1808; d. Plessis-Bouchard, 12 Aug. 1882. He practised law at Tonnerre. He sent a drama to the Porte Saint-Martin, which partly rewritten by Alexander Dumas, the elder, and signed by him, achieved an enormous success as 'La Tour de Nesle,' 28 May 1832. This led to a duel with Dumas, Gaillardet afterward gaining a lawsuit which permitted him to place his name as one of the authors of the piece. He is the author of two other plays, 'Struensée ou le Médecin de la Reine' (1832) and 'Georges, ou le Criminel par Amour' (1833). He also wrote from private papers found at Tonnerre and the archives of foreign affairs the 'Mémoires du Chevalier d'Eon' (1836, new ed. 1866). Coming to New York in 1839 he founded the *Courrier des Etats Unis*, a French newspaper, which he edited until 1848 and which is still published. He returned to France later and served on the editorial staff of the *Presse*.

GAILLARDIA, a genus of plants of the family *Asteraceæ*, composed of about 20 species, natives of western North America. They are annuals or perennials with toothed leaves, bearing usually very showy heads, surrounded by yellow and red rays. Some of the species are common in cultivation.

GAILOR, Thomas Frank, American Protestant Episcopal bishop: b. Jackson, Miss., 17 Sept. 1856. He was graduated from Racine College, Wisconsin, in 1876, and from the General Theological Seminary, New York, in 1879. Entering the ministry he was rector of the Church of the Messiah, Pulaski, Tenn., 1879–82; and in 1882 became professor of ecclesiastical history in the University of the South, Sewanee, Tenn. In 1893 he was consecrated bishop-coadjutor of Tennessee, and in 1898, on the death of Bishop Quintard, became bishop of Tennessee. Elected chancellor and president of board of trustees of the University of the South, Sewanee, Tenn., 1908. He delivered 'Bedell Lectures on the Christian Church and Education' (1908). His writings include 'A Manual of Devotion'; 'The Apostolical Succession'; 'Things New and Old'; 'The Trust of the Episcopate'; 'The Episcopal Church — The Prayer Book, History, Ministry' (1914).

GAINES, Edmund Pendleton, American army officer: b. Culpeper County, Va., 20 March 1777; d. New Orleans, 6 June 1849. He was appointed second lieutenant in the Sixth regiment, United States Infantry, in 1799; in 1805 became collector of customs of the port of Mobile, Ala., and received the rank of captain 1807. Serving through the War of 1812, he became brigadier-general in 1814, commanding at Fort Erie, in August, until wounded. He afterward became brevet major-general; commanded the Southern Military District during the first war against the Seminoles 1817, the Western District 1821, being wounded in the second war with the Seminoles in 1837, and the Department of the Southwest when war was declared with Mexico.

GAINES, Myra Clark, American claimant: b. New Orleans 1805; d. 1885. She was a daughter of Daniel Clark, who emigrated from Ireland to New Orleans and inherited his uncle's property there in 1799. He was supposed to have lived a bachelor, but it was known that he was the father of two daughters by a French woman of great beauty. He died in 1813; his will gave his property to his mother. In 1830 letters were found detailing the circumstances of Myra's birth; in 1832 one that gave an account of a will made by her father in 1813, in which he acknowledged her as his legitimate daughter and bequeathed her all his property. She then began her remarkable litigation, first to establish her legitimacy, then to secure her father's estate. The Supreme Court of Louisiana pronounced her legitimate and his lawful heir in 1856. Subsequently, the United States Supreme Court decided that the facts of her father's secret marriage in Philadelphia and her own legitimacy were fully established. Then began the struggle to secure possession of the estate. She filed a bill in equity in the United States Supreme Court in 1856, and a favorable decision was rendered in 1867. In 1861 the property in New Orleans was valued at $35,000,000, and previous to 1874 she obtained $6,000,000. Appeals and counter-suits were in progress at the time of her death in 1885. She married W. W. Whitney in 1832 and at his death, Gen. Edmund P. Gaines in 1839.

GAINES' MILL, Battle of. After the battle of Mechanicsville or Beaver Dam Creek, 26 June 1862, McCall's division was withdrawn from the field of its victory and Gen. Fitz John Porter, with it and the Fifth corps, took up a defensive position near Gaines' Mill, east of Powhite Creek, a small stream flowing into the Chickahominy. Porter's corps and McCall's division, numbering in all about 20,000 infantry and artillery and 2,500 cavalry, were the only Union troops north of the Chickahominy, the rest of McClellan's army being south of it. Porter's line was formed in the shape of a semi-circle, its left resting in the low ground near the Chickahominy, with its right bending around south of Old Cold Harbor. The line was naturally strong and was strengthened by rifle-pits, by felling trees in front of them and by piling rails and such other material as was at hand. The east bank of the creek was quite high and the slope to the creek was covered with brush and timber. The line covered several of the bridges over the Chickahominy and through the centre and right ran the roads from New Cold Harbor and Old Cold Harbor to Dispatch Station. Sykes' division of the Fifth corps was on the right and Morell's division on the left, with McCall's division in reserve. General Cooke, with three small cavalry regiments, watched the left. The line was somewhat too extended for the number of troops Porter had at his disposal, but these were well posted and his artillery placed in good positions, sweeping the ground in front. On 27 June the Confederates advanced upon Porter's position, A. P. Hill and Longstreet from the west, Jackson and D. H. Hill from the northwest. A. P. Hill led the advance from Mechanicsville, and on reaching Powhite Creek, near Gaines' Mill, at noon, Gregg's South Carolina brigade was so stoutly resisted by the Ninth Massachusetts, holding an advanced position, that Hill was checked and compelled to deploy a large force to push the Massachusetts men back, which consumed the time until 2 P.M. Meanwhile the other divisions had come up, Longstreet on A. P. Hill's right, Jackson, Ewell and D. H. Hill in the order named, on A. P. Hill's left. The main battle began a little after 2 o'clock with an impetuous assault by A. P. Hill on Porter's left division and resulted in the final repulse of Hill with great loss. Longstreet came to his support, Jackson and D. H. Hill closed in on Porter's right and for nearly two hours Porter's entire line was successively assailed and pressed at every point, but held firm, so firm that General Lee thought that "the principal part of the Federal army was on the north side of the Chickahominy" and "apparently gaining ground." McCall's division was placed in line. All fought well and were admirably handled; but there were not enough of Porter's men long to withstand the energetic and continued pressure of 57,000 Confederates at all parts of the line. At about 4 P.M. Slocum's division of Franklin's corps came on the field from beyond the Chickahominy. Its three brigades were separated and disposed of in weak places on the line and the general attack was repulsed about 5 P.M. A few minutes later another attempt was repulsed, the Union line holding fast and not yielding a foot. The Confederate forces were now all up. Whiting's division had come to the relief of A. P. Hill; and Stuart, with his cavalry and artillery, opened heavily on Porter's right. General Lee now ordered a general advance, which was responded to in a most gallant manner. Porter's lines were fiercely assaulted; parts remained firm, but other parts gave way and soon all gave back, losing 22 guns and some 2,800 prisoners. Some of the commands fell back in much confusion; others retired in good order upon the brigades of French and Meagher, of Sumner's corps, which had crossed the Chickahominy, and now assisted in checking the Confederate pursuit. During the night the Union troops crossed to the south side of the Chickahominy, destroyed the bridges behind them and joined the rest of the army in its retreat to Harrison's Landing on James River. The entire number of Union troops engaged was about 34,000; the loss was 894 killed, 3,107 wounded and 2,836 missing, an aggregate of 6,837. The number of Confederate troops engaged was about 57,000, of whom 8,751 were killed and wounded.

GAINESVILLE, Fla., city and county-seat of Alachua County, on the Seaboard Air Line, the Atlantic Coast Line and the Tampa and Jacksonville railroads, 70 miles southwest of Jacksonville. Owing to its temperate climate it is a favorite winter resort. Its industrial interests are chiefly agricultural; fruit growing, is largely carried on, and we mention also the phosphate mining, the foundries and planing mills. Pop. 6,737.

GAINESVILLE, Ga., city and county-seat of Hall County, on the Southern, the Gainesville Northwestern and the Gainesville Midland railroads, 53 miles northeast of Atlanta. From its situation at the summit of the Chattahoochee ridge, and owing to the numerous mineral springs in the vicinity, it is a much-frequented health resort. The educational establishments include Brenau College and Conservatory of Music, the Riverside Military Academy, etc. There are milling industries and manufactures of machinery and wagons, and the city owns its electric-lighting plant and waterworks. Pop. 5,925.

GAINESVILLE, Tex., city and county-seat of Cooke County, on the Missouri, K. and T., and the Gulf, C. and S. F. railroads, 65 miles north of Fort Worth. This is the centre of an important agricultural and stock-raising district. It has large meat-packing establishments and manufactures of flour, foodstuffs, cottonseed oil, carriage works, hide and leather factories and pressed-brick works. The town was first settled in 1851, and was incorporated in 1873. It is governed under a charter of 1879 by a mayor and council elected by popular vote every two years. The post office, city hall, library and city park are noteworthy. Pop. 7,624.

GAINSBOROUGH, gānz'bŭr-ō, **Thomas,** English painter: b. Sudbury, Suffolk, May 1727; d. London, 2 Aug. 1788. He was the son of a wool manufacturer, and was educated under his uncle in the grammar-school of his native town.

His artistic genius early displayed itself, and for a time he studied art in London under the French engraver Gravelot, and afterward under Frank Hayman. He married at 19, set up as a portrait painter in Ipswich, and in 1758 took up his residence in Bath, where he soon acquired a leading position as a portrait painter. He sent pictures to the exhibitions of the Society of Artists from 1761 to 1768, and in the latter year was elected one of the original members of the Royal Academy. He contributed to the Academy exhibitions during the period 1769–72, and again, after an interval of estrangement from Sir Joshua Reynolds, from 1777 till 1783. The pictures shown during the first of those periods comprised some landscapes and numerous portraits, among them those of Garrick (two), the Duke of Argyll and Lord Nugent. Owing to a quarrel with his friend and patron, Philip Thicknesse, he left Bath for London in 1774, and in the metropolis his fame rapidly increased. Among the pictures exhibited at the Academy after his arrival in London none is more celebrated than the 'Blue Boy' (1779), said to have been painted to refute a statement made by Sir Joshua Reynolds in one of his discourses. Among portraits painted during this period are those of the Duchess of Devonshire, Duchess of Cumberland, Duke of Argyll, General Conway, Sir Bate Dudley, George III and his queen, Bishop Hurd, the Prince of Wales, Colonel St. Leger, Lord Cornwallis, the Princess Royal and other members of the royal family. Owing to a quarrel about the hanging of some pictures, he never exhibited at the Academy after 1784. Before his death he was reconciled to Sir Joshua Reynolds. Among his other works the following should be mentioned: portraits of Mrs. Siddons, Hon. Mrs. Graham, Pitt, Blackstone, Johnson, Sterne, Richardson, Clive, Burke, Canning, Franklin, besides others; 'The Market Cart'; 'The Watering Place'; 'The Brook'; 'Rustic Children'; 'The Cottage Door'; 'Cows in a Meadow'; 'Gainsborough's Forest,' and other fine landscapes. Gainsborough painted in all 300 works, of which 220 were portraits, and he had 56 subjects on hand at the time of his death. Both in portraiture and in landscape he is in the first flight of English artists. Graceful, spirited, sure of touch, exquisite in his colorings, his subjects, who invariably look pleasant and often distinguished, epitomize the fashion and culture of the 18th century. In his landscapes he shows a partiality for pastoral scenes, for evening lights and cloudy skies. Many of his portraits have within recent years found a home in the United States. Among private collectors in New York, Mr. George J. Gould, Mr. E. H. Huntington and Mr. Henry C. Frick possess valuable specimens. The J. Pierpont Morgan collection in Metropolitan Museum of New York includes, among other portraits, 'Georgina, Duchess of Devonshire,' also known as the 'Stolen Duchess.' This was sold to Messrs. Agnew of London in 1876 for £10,605, and was immediately thereafter stolen, its fate remaining a mystery until it was returned in 1901 by the thieves from Chicago, because of their inability to dispose of it, when it was purchased by J. Pierpont Morgan. Consult 'Lives,' by Fulcher (1856); Brock-Arnold (1881); Bell (1897); Gower (1903); Fletcher (1904); Boulton (1905); Wedmore, 'Studies in English Art,' first series (1878); Armstrong, 'Gainsborough and His Place in English Art' (1898); Chamberlain, 'Gainsborough' (1903).

GAINSBOROUGH, England, an ancient town in Lincolnshire, on the Trent River, containing a timber-framed Old Moot Hall of the 15th century and other edifices of antiquarian interest and modern use. In George Eliot's novel, 'The Mill on the Floss,' this town is called Saint Ogg's. The trade by water, river and canals is great. To Americans this place is of interest because here gathered, before 1604, the congregation that became the Pilgrim Fathers (q.v.) of New England, some of the fathers of the Baptists in America, and some also identified with the earliest historic literature of the Western world. The leaders were John Smythe and John Robinson (q.v.), the former leading a party into the Dutch Republic in 1606 and the latter in 1608. On 29 June 1896, a large company of Americans, "New World Pilgrims to Old World Shrines," with the United States Ambassador, T. F. Bayard, who made the address of the day, visited Gainsborough to lay the cornerstone of the John Robinson Memorial Church and to celebrate the spiritual movement in Tudor times of "men who beyond their dark age led the van of thought," which meant "the emancipation of England from Norman domination." The church edifice has been in use since 1897. Consult 'The Book of the Pilgrimage' (Boston 1896).

GAIRDNER, gărd'nėr, **James,** English historian: b. Edinburgh, 22 March 1828; d. 4 Nov. 1912. When 18 years old he entered the Public Record office in London as a clerk, and was assistant keeper from 1859 to 1893. He distinguished himself by the rare combination of profound erudition, patient accuracy and judicial temper which he displayed in the editing of a long series of historical documents: 'Memorials of Henry VII' (1858); 'Letters and Papers Illustrative of the Reigns of Richard III and Henry VII' (1861–63), in the Rolls series; 'Calendar of Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII' (11 vols., 1880–96); and 'Historical Collections of a London Citizen' (1876), and 'Three Fifteenth-Century Chronicles' (1880), for the Camden Society series; 'The English Church in the Sixteenth Century' (1902); 'Lollardy and the Reformation in England' (1908, 1911). Equally valuable are the books addressed to a wider audience: an edition of the 'Paston Letters' in Arber's series (1872–75); 'The Houses of Lancaster and York,' in 'Epochs of Modern History' (1874); 'Life and Reign of Richard III' (1878); 'England' in 'Early Chroniclers of Europe' (1879); 'Studies in English History' (1881), written in conjunction with Spedding; and 'Henry VII,' 'Statesmen' series (1889).

GAIRDNER, Sir **William Tennant,** Scottish pathologist: b. Edinburgh, 8 Nov. 1824; d. 28 June 1907. He was graduated M.D. at Edinburgh in 1845, and from 1862 until his retirement in 1890 occupied the chair of medicine in Glasgow University. Among his published books are 'Pathological Anatomy of Bronchitis and Diseases of the Lungs' (1850); 'Clinical Medicine' (1862); 'Public Health in Relation to Air and Water' (1862); 'Insanity: Modern Views as to its Nature and Treatment' (1885); 'The Physician as Naturalist' (1889).

GAISERIC, gī'sėr-ĭk. See GENSERIC.

GAISFORD, Thomas, English scholar and Greek philologist: b. at Ifort, Wiltshire, England, 22 Dec. 1779; d. 2 June 1855. He was educated at Christ Church, Oxford, took orders in the Church, and in 1811 was appointed regius professor of Greek in the University of Oxford. In 1831 he became dean of Christ Church, remaining such till his death, and in 1847 rector of Westwell and curator of the Bodleian Library. He was a prolific writer, his principal works being 'Hephæstronis Enchiridion de Metres' (Oxford 1810, Leipzig 1832); 'Poetæ Græci Minores' (1814–20, 4 vols.); 'Stobæi Florilegium' (1822, 4 vols.); 'Herodoti Historiæ' (1824); 'Sophoclis Tragædiæ' (Oxford 1826, 2 vols.; Leipzig 1827, 8 vols.); 'Suidæ Lexicon' (1834, 3 vols.); 'Parænuographi Græci' (1836); 'Scriptores Latini rei Metricæ' (1837); 'Entymologicum Magnum' (1848); and 'Eusebii Demonstratio Evangelica' (1852, 3 vols.). He was elected a member of the Institute of France, and in 1856 the Gaisford prize, for Greek composition, was founded at Oxford in his memory.

GAIUS, gā'yŭs, the name of several persons mentioned in history: (1) A Roman general, the son of Marcus Agrippa and Julia, daughter of Augustus Cæsar. He was adopted by Augustus and distinguished himself as a soldier during the 1st century B.C., having reduced Armenia and routed Tigranes. (2) A Roman jurist who lived 130 to 180 A.D. Before the revision of the Roman law and the reform of legal studies by Justinian, the 'Institutes' of Gaius, afterward the ground work of the 'Institutes' of Justinian, were the received textbooks of the schools of law. Almost completely lost until 1816, their discovery at Verona by Niebuhr threw a flood of light on the history of the early development of Roman law. (3) A Christian controversialist of the 3d century. He regarded the Epistle of Saint Paul to the Hebrews as apocryphal, and was the first who wrote against Cerinthus and the Millenarians. (4) GAIUS, SAINT, bishop of Rome, 283 to 296; d. 22 April 296. A native of Dalmatia and nephew of Diocletian, he suffered many hardships during the first persecution of the Christians by the emperor.

GALABAT, gä-lä-bät', or **KALABAT,** Africa, a small district situated near the western frontiers of Abyssinia contiguous with the Anglo-Egyptian Sudan. The people, some 20,000 in number, and fanatical Mohammedans, trade with Abyssinia in coffee, cotton, hides and beeswax. The district contains about 1,500 square miles. It was for a number of years within the Italian sphere of influence.

GALACTIC CIRCLE, the great circle of the heavens which coincides best with the course of the Galaxy or Milky Way. According to Sir John Herschel, the north pole of this great circle is situated approximately in right ascension 12 hours 47 minutes, and declination +27°, the circle crossing the equator at the points whose right ascensions are about 6 hours 47 minutes and 18 hours 47 minutes. See GALAXY.

GALAGO, ga-lā'gō, a genus of African lemurs (q.v.), arboreal and nocturnal in habit, living on fruit and insects. They vary from the size of a rabbit to that of a rat, are covered with soft fawn-gray woolly fur, have somewhat bushy tails longer than the body, and hind legs longer and stronger than the arms, with two of the ankle bones (*calcaneum* and *navicular*) greatly elongated. The head is round like a cat's; the eyes are large with oval pupils contracting in daylight to vertical slits; the ears are naked and very big, expanded during activity, but rolled together when the animal rests. The female is said to bear one young one at a birth, and often carries it about. Soft nests are also made in the branches. The Galago proper (*G. senegalensis*) seems to be distributed throughout tropical Africa, and is known in Senegal as "the gum animal" from its frequent habitat in mimosa or gum-acacia forests, and from its alleged habit of gum-chewing. It is said to be eaten there. The largest species (*G. crassicaudatus*) measures a foot in length, not including the bushy tail, which is 15 or 16 inches more. In Zanzibar the komba (*G. agisymbanus*) is said frequently to make itself intoxicated with palm-wine, so that it falls from the tree and gets caught. It is readily tamed and utilized to catch insects and mice in the houses. There are numerous species, and the Madagascar genera *Chirogale*, *Microcebus* and *Opolemur* are joined with it in the sub-family *Galaginæ*. Consult Beddard, 'Mammalia' (London 1902).

GALAHAD, SIR, son of Launcelot and Elaine and the noblest of the Knights of the Round Table, of whom he alone was successful in the search for the Holy Grail. He was introduced into the Grail legend by Walter Map (q.v.). (See GRAIL; ROUND TABLE, KNIGHTS OF). Consult Morley, 'English Writers' (Vol. III, London 1887–90).

GALANGAL, a dried rhizome obtained from different species of *Alpinia* growing in the East. What is known as the lesser galangal is brought from China. It occurs in small pieces, cylindrical and forked, striated and diversified with whitish rings; the outside is brown, the inside paler. It has an aromatic taste and odor, and is an agreeable substitute for ginger in dyspepsia. It yields an oil and a soft resin, but its chemical composition is not settled. The larger or Java galangal is coarser, and is not so strongly aromatic. The rhizome of *Alpinia officinarum* has been used in medicine as a stimulant aromatic.

GALANTHA, gä-lăn'thȧ, **Eszterhazy von,** Hungarian Magnates and, later, princes of the German empire. See ESTERHAZY VON GALANTHA.

GALANTHUS. See SNOWDROP.

GALAPAGOS, găl'-a-pä'gōs, **ARCHIPELAGO,** a group of volcanic islands in the Pacific Ocean, belonging to the Republic of Ecuador (q.v.). It consists of 15 larger islands and about 40 smaller, with a total area estimated at 2,400 to 3,000 square miles, and all included between lat. 0° 38′ N. and 1° 27′ S. and long. 89° 16′ 30″ W. and 91° 40′ 45″ W., except Culpeper and Wenman which lie somewhat farther toward the North. The more important in area are Albemarle, Indefatigable, Marlborough, Chatham, James and Charles — to give them the names in general use; at the same time we note that the government of Ecuador in 1892 renamed the archipelago, rather inappropriately, «Colón» and invented novel designations for separate members of the group. The distance from Chatham Island to Guayaquil is 620 miles, to Panama 840 miles, and to San Francisco 2,990 miles. Features of wholly exceptional interest in the natural history of the archipelago were noted by Charles Darwin in his journal of the voyage of the *Beagle*, which forms the basis of the present description. The constitution of the whole is volcanic; with the exception of some ejected fragments of granite every part consists of lava, or of sandstone resulting from the attrition of such materials. The higher islands (which attain an elevation of 3,000 to 4,000 feet) generally have one or more principal craters toward their centre, and on their flanks smaller orifices. There are, in all the islands, at least 2,000 craters. Though the islands are placed directly under the equator, climate is not in all parts of them excessively hot; a circumstance which is owing to the singularly low temperature of the surrounding ocean (compare the observations mentioned below). Very little rain falls, except during one short season, but the clouds generally hang low; therefore the summits, at an elevation of 1,000 feet or more, possess a tolerably luxuriant vegetation, while the lower parts of the islands are extremely arid. On a part of Chatham Island, black cones, the former chimneys of the subterranean heated fluids, are so numerous and in form so regular that they give the country a «workshop» appearance, which strongly reminded Mr. Darwin of the great iron foundries of Staffordshire. All the craters on Chatham are extinct, but on the western islands «the volcanic forces were in frequent activity.» Charles Island was frequented by buccaneers and whalers long before Ecuador established a small penal colony there. The soil of the elevated portions of that island is fertile black mud; the climate of the same regions is tempered by a cool southerly tradewind; and wild pigs and goats are found in the woods, «but the main article of animal food is derived from the tortoises»— which sometimes weigh 200 pounds each. On both Albemarle and Marlborough islands, eruptions occasionally take place. Of the former, Mr. Darwin writes: «I should think it would be difficult to find in any other part of the world an island situated within the tropics, and of such considerable size (namely, 75 miles long), so sterile and incapable of supporting life.» On James Island there is a lake from which salt is procured. The equatorial heat was observed in its effect upon the soil of the lower and sterile parts.. There the thermometer placed in sand of a brown color immediately rose to 137°, and black sand was so much hotter that it was disagreeable to walk over, even in thick boots. An acacia, a cactus, and one of the euphorbiaceæ — a bush with minute brown leaves — are common in some parts of these lowlands. Near the summits the vegetation has a very different character; ferns and coarse grasses are abundant; and the commonest tree is one of the Compositæ. There are no members of the palm family. «The natural history of this archipelago,» Mr. Darwin says, «is very remarkable. It seems to be a little world within itself; the greater number of its inhabitants, both vegetable and animal, being found nowhere else.» And again, «In my collections from these islands there are 26 different species of landbirds. With the exception of one, all probably are undescribed kinds, which inhabit this archipelago and no other part of the world.» The order of reptiles forms the most striking feature in the zoology of the islands, the species not being numerous, but the number of individuals of each kind extraordinarily great. There is one kind both of the turtle and tortoise; of lizards four; and of snakes about the same number. Of the tortoise (*Testudo Indicus*) some old males have been found so large that it required six or eight men to lift them from the ground. Mr. Darwin says: «I frequently got on their backs, and then, upon giving a few raps on the hinder part of the shell, they would rise up and walk away; but I found it very difficult to keep my balance. The tortoise is very fond of water, drinking large quantities, and wallowing in the mud. The larger islands alone possess springs, and these are always situated toward the central parts, and at a considerable elevation. The tortoises, therefore, which frequent the lower districts, when thirsty, are obliged to travel from a long distance. Hence broad and well-beaten paths radiate off from the wells even down to the seacoast. Near the springs it was a curious spectacle to behold many of these great monsters; one set eagerly traveling onward with outstretched necks, and another set returning, after having drunk their fill.» Mr. Darwin inclined to the opinion that the Galápagos islands are the original home of the *Testudo Indicus*, though it is now found in many parts of the world. Also characteristic of this archipelago are the lizards, individuals of the aquatic variety being three or four feet long. Many of the islands possess trees, plants and birds, which do not occur on the others. At the date of Mr. Darwin's visit the birds had not learned to fear man. He wrote: «A gun is here almost superfluous; for with the muzzle of one I pushed a hawk off the branch of a tree.» The *Pan American Union Bulletin*, Vol. XXXII (Jan.-June 1911), pp. 222 *seq.*, states that in 1814 and 1825 English skippers reported activity in the Galápagos craters, and as late as 1907 a new opening appeared on James Island from which a torrent of lava flowed to the sea. The Eucadorian government took possession of the group 12 Feb. 1832, and it seems that the act of occupation was suggested by a citizen of the State of Louisiana, Mr. Villamil, who obtained a concession from Ecuador and was governor of the islands at the time of Darwin's visit. The average temperature is about 72° F. The mitigating influence of the Humboldt current is mentioned in the article LATIN AMERICA — *climate*. But remarkable differences of temperature are observed: for example, on one side of Albemarle Island a foot below the surface the ocean's temperature was 80° F., while on the other side it was less than 60° F. The number of indigenous botanical species is now given at 190; and there are 58 distinct species of land birds.

MARRION WILCOX.

GALATA, gä'lä-tä, a suburb of Constantinople (q.v.).

GALATEA, găl-a-tē'a, (1) In Greek mythology, daughter of Nereus and Doris. The Cyclops Polyphemus persecuted with his love this charming nymph, though he gained nothing but ridicule in return. The handsome shepherd Acis, of Sicily, enjoyed her affection, and suffered death on her account; for Polyphemus, finding them together, and mad with jealousy, hurled a rock at them, which dashed Acis in pieces, while Galatea escaped into the sea. Acis was transformed into a fountain, and hastened to meet his mistress in a safer region. Other legends have Galatea the mother of Galas by Polyphemus. Poets and sculptors both ancient and modern have derived much inspiration from the myth. In English literature it has been used by Gay 'Acis and Galatea,' by Proctor in 'Death of Acis,' by Buchanan in 'Polypheme's Passion' and by Austin Dobson in 'Tale of Polypheme.' (2) A sheperdess in Virgil's 'Third Eclogue' who throws an apple to her lover, and flees, taking care to be seen, hence a type of the coquette. (3) A statue endowed with life by Venus at the prayer of Pygmalion.

GALATIA, gă-lā'shĭ-a, Asia Minor, the ancient name of an extensive region, so called from its Gallic inhabitants, who were immigrants from Europe. With the Gauls were intermingled a considerable proportion of Greeks; hence the inhabitants were often called Gallogræci, as well as Galatians. The Apostle Paul visited Galatia twice and addressed the 'Epistle to the Galatians' to the churches of Antioch in Pisidia of Lystra and other places.

GALATIANS, Epistle of Paul to the. The Apostle Paul wrote this letter to the churches of Galatia (i, 2) in order to counteract the influence of an extreme type of Judaistic christianity which, he was convinced, was threatening to undermine faith in Christ alone as the fundamental principle of the Gospel and which appears to have gained a strong footing in those churches which he himself had founded. Apparently, the Judaizers had attacked not only Paul's doctrine but also had insinuated that he was not really an apostle and therefore his teaching had no apostolic authority.

The news of the defection of his Galatian churches came to Paul as a great surprise (i, 6) and filled him with grief and indignation. He wrote immediately and his letter is intense, even severe, written hastily perhaps, but not thoughtlessly or carelessly.

He first sought to show that both his apostleship and the gospel he preached were of divine, not human authority. He had been called to his apostolic work directly by God and to no man did he owe his knowledge of the gospel (i, 6–24). Nevertheless, both he and the gospel as he preached it had been fully recognized and approved by the leaders of the mother church in Jerusalem (ii, 1–10), and on one occasion he had even rebuked Peter for inconsistency and disloyalty to the truth of the gospel when he weakly yielded to the Judaizing extremists (ii, 11–21). He then asked the Galatians to recall their own past experience as evidencing that "faith," and not "Works of the Law," is the condition of the Spirit's presence and power (iii, 1–6). He next showed that the principle of "faith" antedated and is superior to that of the Law even in the Old Testament. The Law is only of a secondary and temporary significance entailing bondage; it was simply preparatory to the dispensation of faith which alone brings liberty and sonship (iii, 7–v, 12). After a few hints as to the true character of christian conduct (v, 13–vi, 10) the letter closes with a final warning against trusting to circumcision in preference to faith in the crucified One (vi, 11–16).

The purpose of the letter is thus perfectly clear from its contents and no reasonable doubt can exist as to its authorship by Paul. In importance Galatians is second to no other of Paul's epistles. Its biographical material in chaps. i and ii is invaluable, while in its statement and exposition of Paul's great doctrine of justification by faith this epistle, along with Romans, has been the great source from which theologians from Augustine to Luther and Calvin have drawn their arguments.

The critical questions regarding Galatians are mainly two, as to its destination and date.

Who were the "Galatians" (iii, 1) and where were "the churches of Galatia" (i, 2) to whom Paul addressed this remarkable letter? The traditional view (now commonly called the *North Galatian* theory) is that the Galatians addressed lived in old Galatia proper, a large district in the interior of Asia Minor, north of Lycaonia and east and northeast of Phrygia (the boundaries of which were rather vague). A more modern and widely accepted view is that by "Galatia" in (i, 2) is meant the recently organized Roman Province of Galatia (which included old Galatia and parts of Phrygia, Lycaonia, etc.) and that the "churches of Galatia" were those founded by Paul and Barnabas on the first missionary journey (Acts xiii and xiv), i.e., Antioch of Pisidia, Iconium, Lystra and Derbe. For the traditional view it is claimed that it is based on the simpler and more natural interpretation of the terms "Galatia" and "Galatians," and that Acts (xvi, 6 and xviii, 23) imply, or at least allow for, missionary work by Paul in old Galatia. For the other, or *South-Galatian* theory, it is claimed that these passages do not imply any missionary work in old Galatia, but on the contrary refer to the western part of the Province of Galatia traversed by Paul on his first and second journeys. In favor of this theory it is urged that churches so important must certainly have been mentioned by Luke in Acts and therefore they are the ones whose founding is told in Acts xiii and xiv. But since Luke omitted many important details of Paul's missionary work, which are referred to or implied in his epistles, this argument has little force.

As to the date of the epistle it is evident from i, 18–ii, 1, that it was written *after* more than about 15–17 years had passed since Paul's conversion. And since about 33 A.D. is the earliest possible date for the latter event, Galatians could not have been written before 49 or 50 A.D. In other words, the visit to Jerusalem, mentioned in ii, 1–10, which took place 3+14 years (=about 15–17 years) after Paul's conversion, must have been made about 49 or 50 A.D., and as the way Paul refers to it implies that it had transpired a considerable time before he wrote, the probable date of the epistle would be some years after 50 A.D. Incidentally, these considerations seem fatal to the identification of the visit to Jerusalem of Gal. ii, 1–10 with that mentioned in Acts xi, 27–30 (advocated by many who adopt the South Galatian view) instead of the traditional identification of Gal. ii, 1–10 with Acts xv, since the former visit took place, apparently near the time of the death of Herod Agrippa, 44 A.D. (cf. Acts xii). In spite of differences between Acts xv and Galatians ii, 1–10, these two must be interpreted as referring to the same occasion, and Luke's account must be adjusted to Paul's. The advocates of the South Galatian theory are not at all unanimous as to the date of the epistle. Some (e.g., Luke) would date it even before the council of Acts xv; while others would put it later. On the North Galatian view the epistle would be dated after the time of Acts xviii, 23, especially if the expression τὸ πρότερον (Gal. iv, 13) is taken strictly as meaning the *former* (of two visits). On the whole a date in the latter part of the period covered by Paul's third journey, either during the last months of his stay at Ephesus (54 A.D.) or while he was *en route* from Ephesus to Corinth (early in 55) seems most satisfactory. In this way the close resemblance between Galatians and Romans is best accounted for, the Galatian defection having brought forcibly to Paul's mind the danger to the Church in the Judaizing propaganda, and his hurried argument in the epistle to the Galatians being more deliberately worked out in Romans which was written soon after, while he was resting at Corinth (spring of 55 A.D.).

Bibliography.— The literature on Galatians is extraordinarily voluminous, and for a full bibliography one may consult Moffatt, 'Introduction to the Literature of the New Testament' (New York 1915). Monographs of especial value are Lagrange, M. J., 'Les Judaisants de l'Epitre aux Galatea' (in *Revue Biblique*, 1917, pp. 129–167); Lake, K., 'The Earlier Epistles of Paul' (London 1911); Lightfoot, 'Saint Paul's Epistle to the Galatians' (11th ed., 1892); Steinmann, 'Abfassungszeit des Galaterbriefes' (Munster 1906), and 'Der Leserkreis des Galaterbriefes' (Ibid 1908); Watkins, C. H., 'Saint Paul's Fight for Galatia' (Boston 1914).

EDWARD E. NOURSE,
Professor Biblical Theology, Hartford Theological Seminary.

GALAX, a genus of plants of the family *Galacaceæ*, containing a single species, *G. aphylla*, occurring from Virginia to Georgia, chiefly in the mountains. The plant is a perennial, with a basal cluster of leaves and slender simple flowering stems terminating in slender spikes of small greenish flowers. The leaves are rounded, heart-shaped, somewhat leathery and shining. In autumn they assume a beautiful bronze color and then, as well as at other times, they are gathered in large quantities to be used for decorative purposes, especially for wreaths and for Christmas greens.

GALBA, Servius Sulpicius, Roman emperor: b. 3 B.C.; d. 15 Jan. 69 A.D. Caligula appointed him general in Germany. He soon repulsed the Germans who had invaded Gaul, and restored the ancient military discipline. After the death of Caligula he caused his troops to swear allegiance to Claudius, who sent him in 45 A.D. as proconsul to Africa, where great confusion prevailed. In two years Galba restored order, obtained the honors of a triumph, and was received among the priests of Augustus. Nero appointed him in 61 A.D. governor of Hispania Tarraconensis, but soon after became so exasperated against him that he ordered him to be secretly assassinated. Galba then revolted, but when news arrived of the insurrection among the prætorians at Rome, and of the death of Nero, 68 A.D., he himself was chosen emperor by the prætorian cohorts in Rome. Ambassadors from the senate made known to him his elevation. He chose a colleague in the government under the name of an adopted son, but instead of Otho, favored by the soldiery, he selected Piso Licinianus, hated by them on account of his rigid virtue. Otho, offended by this neglect, resolved to get possession of the throne by force of arms. The prætorian cohorts first declared themselves in his favor, and Galba, attempting in vain to restore order, was attacked and slain.

GALBANUM, a gum-resin obtained from *Ferula galbaniflua* and allied plants, used in medicine as a carminative and expectorant, and externally as an irritant.

GALBRAITH, John, Canadian engineer: b. Montreal 1846; d. 1914. He received his education at the University of Toronto, studied engineering and surveying and was engaged on the construction of the Intercolonial Midland and Canadian Pacific railroads. He led an exploring expedition in 1880 from Georgian Bay to Fort Churchill and Lake Mistassini. In 1878 he was appointed professor of civil engineering in the newly-founded school of practical science at Toronto, and in 1889 was made director of the institution. He was one of the original founders of the Canadian Society of Civil Engineers; was an associate of the English Institute of Civil Engineers. In 1907 he was appointed on a royal commission to report on the causes of the collapse of the great railroad bridge over the Saint Lawrence at Quebec.

GALDÓS, Benito Pérez, a noted Spanish writer born in 1840. See PÉREZ GALDÓS, BENITO.

GALE, Henry Gordon, American physicist: b. Aurora, Ill., 12 Sept. 1874. In 1896 he was graduated at the University of Chicago; began his connection with the department of physics there in 1899, and in 1911 became associate professor. He was physicist of the Solar Observatory at Mount Wilson, Cal., in 1906 and in 1909–11 was research associate there for the Carnegie Foundation. With R. A. Milliken he wrote 'A First Course in Physics' (1906); 'A Laboratory Course in Physics' (1906); with Adam, W. S., 'An Investigation of the Spectra of Iron and Titanium under Moderate Pressures' (1912).

GALE, James S., American missionary, editor and lexicographer in Korea, who has done more than any other writer to open the treasures of the language and literature of the Koreans. Commissioned by the Presbyterian Church, he arrived in the peninsula in 1889. In collaboration with H. G. Appenzeller and H. G. Underwood, the noted pioneers, he worked for many years upon the translation of the holy scriptures. His great dictionary of the Korean language, published in 1898, supersedes all others. He is also the author of 'The Vanguard,' a novel of early missionary life in

Korea; 'Korea in Transition' (1909); and of a great variety of learned articles on Korean history, literature and antiquities and on life and manners published in *The Korean Repository* (1892–98); *The Korean Review* (1901–06); *The Korean Magazine* (1917). Consult Griffis, 'A Modern Pioneer in Korea: H. G. Appenzeller' (1912).

GALE, Norman Rowland, English poet: b. Kew, Surrey, 1862. He received his education at Exeter College, Oxford. His 'Country Muse' appeared in 1892 and attracted general attention. A second series appeared within the same year. Other publications are 'Orchard Songs' (1893); 'A June Pastoral' (1894); 'Songs for Little People' (1896); 'Barty's Star' (1903); 'More Cricket Songs (1905); 'Song in September' (1912); 'Solitude' (1913); 'Collected Poems' (1914).

GALE, Zona, American author: b. Portage, Wis., 26 Aug. 1874. In 1895 she was graduated at the University of Wisconsin; was employed on the staffs of Milwaukee journals until 1901 and from 1901 to 1904 was on the staff of the New York *World* and also contributed to other journals. She has published 'Romance Island' (1906); 'The Love of Pelleas and Etarre' (1907); 'Friendship Village' (1908); 'Friendship Village Love Stories' (1909); 'Mothers to Men' (1911); 'Christmas' (1912); 'When I was a Little Girl' (1913); 'Neighborhood Stories' (1914); 'Hearts' Kindred' (1915); 'A Daughter of Tomorrow' (1917); and a one-act play, 'The Neighbors.'

GALE, a tree. See CANDLEBERRY.

GALEN, or **CLAUDIUS GALENUS,** Greek physician: b. Pergamus, Mysia, 131 A.D.; d. Sicily, about 201 A.D. He began the study of medicine at Pergamus, and afterward studied at Smyrna, Corinth and Alexandria. On his return to his native city in 158 he was appointed physician to the school of gladiators. Six years later he went to Rome, where he stayed four years, and gained wide reputation. Scarcely had he returned to his native city when he received a summons from the emperors M. Aurelius and L. Verus to attend them in the Venetian territory, and shortly afterward he accompanied them to Rome. There he remained several years, though how long is not known precisely, and about the end of the 2d century was employed by the Emperor Severus. Galen was a voluminous writer not only on medical, but also on philosophical subjects, such as logic, ethics and grammar. The works that are still extant under his name consist of 83 treatises, acknowledged to be genuine; 19 whose genuineness has been questioned; 45 undoubtedly spurious; 19 fragments; and 15 commentaries on different works of Hippocrates. His most important anatomical and physiological works are: 'Of Anatomical Administrations' and 'Of the Use of the Parts of the Human Body.' As an anatomist, he combined with patient skill and sober observation as a practical dissector — of lower animals, not of the human body — accuracy of description and clearness of exposition as a writer. He gathered up all the medical knowledge of his time and fixed it on such a firm foundation of truth that it continued to be, as he left it, the authoritative account of the science for centuries. His physiology does not, according to modern ideas, attain the same level of scientific excellence as his anatomy. He seems to place a more implicit faith in amulets than in medicine, and he is supposed by Cullen to be the originator of the anodyne necklace which was so long famous in England. His practice was based on the two general principles: (1) that disease is contrary to nature and is to be overcome by something that is contrary to the disease itself; and (2) that nature is to be preserved by that which has relation to nature. In the 9th century Galen's works were translated into Arabic and were in great vogue for centuries throughout the East. The Greek text has been issued four times; the Aldine (5 folio vols., 1525) was the first; the best and most complete modern edition is that by Kuhn (20 vols., 1821–33). Several minor works were issued by Helmrich and Müller (3 vols., Leipzig 1893) and there are several German and French translations of the more important treatises. Consult Daremberg, 'Exposition des connaissances de Galien sur l'anatomie' (Paris 184); Kidd, 'Transactions of the Provincial Medical Association' (Vol. VI, London 1831) and *Rhenisches Museum für Philologie* for the years 1889, 1892, 1896.

GALENA, Ill., city and county-seat of Jo Daviess County, a port of entry on the Galena River, and on the Illinois Central; Chicago, Burlington and Quincy and the Chicago and Northwestern railroads, 17 miles from Dubuque. Galena is famous as the home of Gen. U. S. Grant from May 1860 until the opening of the Civil War, and the old Grant homestead still remains one of the attractions of the city. Grant Park, a fine statue of General Grant, a government building, a public library, an excellent school system and a number of fine churches are evidences of public interest. A fine white stone building, formerly the custom house, is now used as a post office. In an upper room of this building is the famous painting, by Thomas Nast, representing the surrender of Gen. Robert E. Lee to Gen. U. S. Grant at Appomattox. The city has an extensive trade by rail and river, and is the centre of large lead and zinc mining interests. There are also smelting works, shoe factories, brick yards, marble, granite, cement works, iron-bridge works, furniture and cigar factories. The town, which was named after the galena ore found in the vicinity, was settled in 1827 and incorporated as a city in 1839. The mayor and council are elected every two years. The city owns its electric-light plant which supplies power to industries and towns in the vicinity, and has an artesian water system. Pop. 6,000.

GALENA, Kan., a city in Cherokee County, on the Missouri, Kansas and Texas and the Saint Louis and San Francisco railroads; seven miles west of Joplin, Mo. Like its namesake in Illinois, Galena is engaged largely in lead and zinc mining and smelting. The mining district, about four miles square, has 200 concentrating mills, and gives employment to 3,000 men. Among the industrial establishments are lead smelters, a large foundry, and a planing mill. There is a supply of natural gas in the neighborhood which furnishes heat and power at very low cost. It has paved streets, electric lights and sewers, and is situated in a prosperous farming and dairying centre. Over

$2,000,000 in ore was mined in 1915. The mayor and council are elected every two years. The deputy marshal and police are appointed by the council. Galena was settled and incorporated in 1877, and its population rapidly increased from 1,463 in 1880 to 8,000 in 1915.

GALENA, a sulphide of lead (PbS), containing when pure 86.6 per cent lead. It crystallizes in the isometric system, commonly in cubes or cubo-octahedrons, but is often found massive with a well-marked and characteristic cubic cleavage. It has a metallic lustre and lead-gray color. Its hardness is 2.5 and its specific gravity 7.5. Galena is the most important ore of lead, nearly all the world's supply of that metal being obtained from it. As it is always more or less argentiferous the mineral is frequently an important silver ore, the amount of silver present sometimes amounting to over 1 per cent, but galena containing less than 1 per cent silver is often mined as a lead-silver ore. The mineral is widely distributed, frequently being associated with the sulphides of iron, copper or zinc, and often with native gold. The principal mines working deposits of galena in the United States are in Missouri, Colorado, Idaho, Utah and Montana. See LEAD; SILVER.

GALENISTS, gā'lĕn-ĭsts, a religious sect founded by Galen or Galenus Abrahans de Haan. They were a branch of the Mennonites. Galen was a doctor of medicine and a minister among the Mennonites at Amsterdam. He taught freer doctrine in practice and belief than his co-religionists, declaring that the Christian religion was not so much a body of truths to be believed as of principles to be obeyed. His enemies accused him of having Socinian proclivities, a charge from which the States-General acquitted him 14 Sept. 1663. See MENNONITES.

The term was also in medical controversy during the Renaissance to mean a follower of Galen, whose authority as a physician they maintained against the introduction of new chemical methods into the preparation of medicinal drugs. The new school professed to extract essences, or quintessences, and, like modern homœopathists, gave doses small in bulk, but alleged to be powerful in effect, as containing a concentrated preparation of the original drug. The Galenists adhered to the ancient tinctures and extracts, which, they maintained, possessed all the virtues necessary.

GALEOTO, The Great. See EL GRAN GALEOTO.

GALERITES, găl-ę-rī'tēz, a genus of fossil sea-urchins, peculiar to and abundant in the Cretaceous system. The body in breadth is nearly circular or polygonal. The under surface is entirely flat, and has the mouth placed in its centre, with the vent near the margin. There are five avenues of pores reaching from the mouth to the summit of the conical dorsal surface. These fossils are often found silicified. *G. albogalerus* is one of the most abundant; it has received its specific name from its resemblance to the white caps worn by the priests of Jupiter.

GALERIUS, gă-lē'rĭ-ŭs, or **GALERIUS VALERIUS MAXIMIANUS,** Roman emperor: b. near Sardica, Dacia; d. 311 A.D. Entering the imperial army, he rose rapidly to the highest ranks. In 292 Diocletian conferred on him the title of Cæsar, made him administrator of Gaul, Spain and Mauretania, and gave him his daughter in marriage. In 295 he was victorious over the Carpi and Bastarnæ. In 297 and 298 he carried on an ultimately successful war against Persia. In 302 he urged Diocletian to suppress the increasing power of the Christian hierarchy. On the abdication of Diocletian (305) he and Constantius Chlorus became joint rulers of the Roman Empire, Galerius taking the east half. When Constantius died in York (306) the troops in Britain and Gaul immediately transferred their allegiance to his son, Constantine (afterward Constantine the Great), who was not recognized by Galerius till 308. Galerius, however, retained possession of the East till his death.

GALES, Joseph, American journalist: b. Eckington, England, 10 April 1786; d. Washington, D. C., 21 July 1860. He came to the United States with his father in 1793, was educated at the University of North Carolina and learned the printer's trade of his father. In 1807 he was made assistant and later partner of Samuel Harrison Smith in the management of the *Independent Gazetteer,* which had been removed to Washington and its name changed to the *National Intelligencer.* He became sole editor of that paper in 1810, and took his brother-in-law, William Winston Seaton, into partnership in 1812. Had it not been for the industry of Gales and Seaton an important part of the proceedings of the Senate and House of Representatives, which they reported, would not have been preserved. Especially is this true of the great debate between Hayne and Webster.

GALESBURG, Ill., a city and county-seat of Knox County, on the Atchison, Topeka and Santa Fé; the Chicago, Burlington and Quincy, and Chicago and Northwestern railroads, 43 miles northeast of Burlington, Ia. This is the seat of Knox College, founded in 1837, where took place the famous Lincoln-Douglass debate in 1859. Lombard University (Universalist) was established here in 1852, and the Saint Joseph Academy and the Ryder Divinity School are also located here. There is a public library containing 24,000 volumes. The Burlington railroad shops give employment to many mechanics, and there are extensive stock-yards, brick-making plants, boiler and engine works, farm machinery works and carriage factories. The census bureau's summary for 1914 is as follows: Number of industrial establishments, 60; persons engaged in manufactures, 1,709; proprietors and firm members, 47; salaried employees, 263; wage-earners, 1,399; primary horsepower, 1,984; capital, $2,488,000; services, $1,204,000; salaries, $263,000; wages, $941,000; materials, $1,515,000; value of products, $3,192,000. Under a general State law, passed in 1872, the mayor and city council are elected every two years, and the smaller offices are filled by appointments made by the mayor with consent of the council. The town was settled in 1837 by pioneers from New York State and named in honor of Rev. George W. Gale, who planned to establish a theological seminary here. During the Kansas-Nebraska struggle Galesburg was a rendezvous and rallying point for the free-soilers. The city was chartered in 1857. The municipality owns and operates its electric light and water plants. Pop.

(1910) 22,809; census bureau's estimate 24,276 on 1 July 1914.

GALETON, Pa., borough of Potter County, on Pine Creek, the Buffalo and Susquehanna railroad, 50 miles southeast of Bradford. Its industries are numerous and thriving; they comprise stave and wagon mills, a tannery, stove works, breweries, machine shops, railroad repair shops, knitting mills and lumber dressing mills. Pop. 4,100.

GALI, gä'lē, **Francisco,** Spanish navigator: b. Seville 1539; d. Mexico City 1591. He sailed from Acapulco in 1585 with two vessels, under commission of Pedro Moya de Contreras, provisional viceroy of New Spain, to look for a harbor on the coast of California where ships returning from the East Indies might be restocked with provisions. He visited the Philippines, Macao, the Lin-Kins, Japan and other islands, and on his return (1584) discovered what is now the Bay of San Francisco. The report of the voyage sent by him to the viceroy of the Indies was published by Linschot in a Dutch rendering in 'Track Charts of the Indies' (1596), and an English translation appears in Hakluyt's 'Voyages.' In the National Library, Mexico, are fragments of what is believed to have been a more extended narrative by Gali under the title of 'Viaje, discubrimientos y observaciones de Acapulco a Filipinas.' He was a skilful navigator and acute observer.

GALICIA, gă-lĭsh'ĭ-ą, Austria, a crownland or province of Austria, composed of the kingdoms of Galicia and Lodomeria, the duchies of Auschwitz and Zator and the grandduchy of Cracow, and formerly including the duchy of Bukowina. It is bounded on the north, northeast and east by Russia, southeast by Bukowina, south by Hungary and west by Moravia and a small portion of Prussian Silesia; area, 30,311 square miles; pop. 8,025,675 in 1910, and at the outbreak of the war about 8,200,000. The physical features of the country are determined by the Carpathians, which form a long and irregular curve on the south, the convexity being toward Galicia. Farther north the hills subside and merge into vast plains. The chief river in the northwest is the Vistula, which partly bounds the province. The Western Bug, a tributary of the Vistula, is partly in Galicia. The chief river is the Dniester. The only part of the surface belonging to the basin of the Danube is in the southeast. It is drained by the Pruth and is of limited extent. The climate is severe, particularly in the south, where more than one of the Carpathian summits are beyond the limit of perpetual snow. While Galicia is open to the cold north and east winds, these mountains intercept the warm winds from the south. The winters are long and rigorous and the summers very warm but comparatively short.

The soil is much diversified. In the more mountainous districts scanty pasture only is obtained, but in general, where the elevation is small, the ground, more especially where resting on a substratum of limestone, is of great fertility, and yields abundant crops of wheat, rye, barley, oats and maize. Hemp, flax and tobacco are also extensively grown, and the sugar beet is cultivated. The domestic animals include great numbers of horned cattle, generally of a superior description, and a fine, hardy breed of horses, well adapted for cavalry. Sheep are neglected; but goats, swine and poultry abound. The rearing of bees yields great quantities of wax and honey and is a lucrative industry. Bears and wolves are frequently met with in the forests, and all the lesser kinds of game are in abundance. The minerals include marble, alabaster, copper, lead, zinc, calamine, coal, iron and rock-salt. Only the last two are of much importance. Iron occurs in numerous parts of the central Carpathian chain and bog-iron ore is frequently met with in extensive seams on the plains. They are both worked to a considerable extent. Rock-salt is particularly abundant, stretching in continuous beds for nearly 250 miles along the base of the Carpathians, and of course beyond the limits of Galicia, into Bukowina and Transylvania. The most important mines have their central locality at Wieliczka. Manufactures have not made much progress. The spinning and weaving of flax and hemp prevail to a considerable extent on the confines of Silesia. Distilleries exist in every quarter. Tobacco, sugar, leather, beer, agricultural machinery, etc., are also manufactured. The principal exports are salt, wood, grain, coal, aniseed, linen and spirits. The population is generally of Slavonian origin and consists of two principal branches — Polish in the west and Russniak in the east. In religion they are divided among Roman Catholics, Greek Catholics and Armenians. The number of the Jews is considerable. The court of third instance for the country is the Superior Court at Vienna; there are two courts of second instance, one at Lemberg and the other at Cracow; and there are various district courts of first instance. The government has its headquarters at Lemberg. Educational establishments, both for superior and ordinary instruction, are numerous. At the head of the former stand the University of Cracow, with about 130 instructors and some 1,300 students, and the younger University of Lemberg, with 80 instructors and a similar attendance. The principal towns are Lemberg, the capital, Brody, Cracow, Stanislau, Tarnopol, Przemysl, Sambor, etc.

The nucleus of the modern kingdom of Galicia and Lodomeria was formed by the duchies of Halicz and Vladimir (the original forms of the present names), which were established about the beginning of the 12th century under two princes of the Russian dynasty of Rurik.

After being the field of continuous strife between Russians, Poles and Hungarians, Galicia continued a Polish dependency from 1382 till the first partition of Poland, in 1772, when it was acquired by Austria and became one of the Cis-Leithan provinces of the Austrian Empire, represented in the Reichsrat by 63 deputies, while the affairs peculiar to itself were deliberated and determined on by its own Landtag or Diet. Polish is the language of official intercourse and of the higher educational institutions. During the war in Europe, Galicia was for a long time an arena in which the Allies and the Central Powers struggled for supremacy. See WAR, EUROPEAN.

GALICIA, Sp. gä-lē'thē-a, Spain, an ancient kingdom and province, bounded north and west by the Atlantic, south by Portugal and east by León and Asturias, with an area of 11,256 square miles. It has been divided since 1833 into the minor provinces of Coruña, Lugo, Orense and Pontevedra, whose joint population is about 2,109,000. The country is mountainous, being traversed by offsets of the Asturian chain, rising in their highest peaks to about 6,500 feet. The west spurs, Capes Ortegal and Finisterre, project into the Atlantic. The numerous short but rapid rivers form small estuaries which afford secure havens and roads. The principal river is the Minho, which, with its feeder, the Sil, is navigable for small vessels on its lower course. Galicia has a mild, damp climate, favoring the development of a sturdy race devoted to agricultural pursuits; capital, however, is scarce, roads are bad and railways are few. Rich meadows and dense forests occur everywhere, but the soil is more suited to the cultivation of garden produce than of corn. Mines of lead, tin, copper and iron pyrites are worked. The inhabitants, called Gallegos, are robust, vigorous, industrious and, in comparison with the Spaniards of the southern and central parts of the peninsula, heavy witted and unpolished. Great numbers of them annually visit central and southern Spain and Portugal, where they find employment as harvesters, water carriers, porters, etc., and laboring men from this region seek employment in many parts of Latin America. Chief exports, live cattle, preserved meat, eggs, minerals, fish, fruits and grain; imports, coal, oil, hides, spirits, sugar and tobacco. The principal towns are Santiago di Compostella and the seaports Vigo, Coruña and Ferrol. Galicia was a kingdom under the Suevi from 411 to 585, and again for a few years after the death of Ferdinand the Great, in 1065, was an independent kingdom under his son Garcia for a few years. In the main, however, its fortunes were united with those of Castile.

GALILEAN, one of the followers of Judas the Gaulonite, who resisted the payment of the tax imposed by Quirinius, the Cyrenius of Saint Luke (Luke ii, 1), and gave the Romans trouble till the capture of Jerusalem by Titus in 70 A.D. Galilean is a name applied to Jesus and his disciples, from the intimate connection they had with Galilee (Matt. xxvi, 69; Mark xiv, 70); hence applied by pagans and Mohammedans as a term of reproach to Christians generally.

GALILEE, Palestine, during the Roman period and at the commencement of the Christian era a province comprehending the northern part of Palestine west of the Jordan. In pre-Roman times it was referred to as a district inhabited by the tribe of Naphtali.. Its name is derived from the Hebrew *galil,* signifying a circle or circuit. It now forms part of the pashalic of Damascus, in the Turkish province of Syria. Anciently it was divided into Upper and Lower Galilee, and was a fertile region with many towns and villages, thickly inhabited by Syrians, Phœnicians, Arabs, Greeks and Jews. The Jewish inhabitants, on account of their ignorance, simplicity of manners and less rigid sentiments in regard to religion, were held in contempt by other Jews; but after the destruction of Jerusalem despised Galilee became the refuge of the doctors of Jewish law, and the city of Tiberias the seat of Rabbinical learning. As the cradle of Christianity and the scene at Nazareth, Cana, Capernaum, the Lake of Gennesaret, Mount Tabor and other localities, of a great deal of Christ's ministry on earth, Galilee has world-wide interest. Consult Merrill, 'Galilee in the Time of Christ' (New York 1885); id., 'East of the Jordan' (ib. 1881); Smith, George Adam, 'Historical Geography of the Holy Land' (London 1894); Masterman, 'Studies in Galilee' (Chicago 1909).

GALILEE, Sea of, in biblical history also called the SEA OF CHINNERETH or CINNEROTH, LAKE OF GENNESARET and SEA OF TIBERIAS, is a large pear-shaped lake in the north of ancient Galilee (q.v.), Palestine. It lies 682.5 feet below sea-level; is 13 miles long by 8 broad and 150 feet deep. It occupies the bottom of a great basin, and is of volcanic origin. The Jordan flows into it red and turbid from the north, and it is fed also by many warm and brackish springs, but its waters are cool, clear and sweet. Its shores on the east and north sides are bare and rocky; on the west gradually sloping. For half the year the hillsides are bare, but in spring a subtropical vegetation abounds. Fish are plentiful and are caught with nets by a guild of fishermen. Sudden changes in temperature often cause violent storms. Near the shores of the lake are numerous ruins and sites of ancient settlements; the most notable of these are Talhoum (Capernaum), Kerazeh, the ancient Chorazin, Tubariya, the ancient Tiberias or Rakkath and Mejdel, supposedly the ancient Magdala. Kerak, at the southern end of the lake, has been identified by some as the city of Tarichea. The identification of the ruins and sites on the east shore is less satisfactory. In modern Arabic the lake is called *Bahr Tubariya,* often translated "Lake of Tiberias."

GALILEI, Galileo, gä-lē-lā'ō gä-lē-lā'ē, Italian physicist and astronomer: b. Pisa, 14 Feb. 1564; d. Arcetri, 8 Jan. 1642. His father, Vincenzo Galilei, an impoverished nobleman of Florence, caused him to be instructed in Latin and Greek, drawing and music, and he very early showed a strong inclination to mechanical labors. In 1581 Galileo entered the University of Pisa, to attend lectures on medicine and the Aristotelian philosophy. Here he became conspicuous in refusing to accept without question the dogmatic statements of his teachers. That spirit of observation for which he was distinguished was early developed. When he was only 19 the swinging of a lamp suspended from the ceiling of the cathedral in Pisa led him to discover the isochronism of the pendulum, which he was the first to apply as a measure of time. He studied mathematics under Ostilio Ricci, soon exhausted Euclid and Archimedes, and was led, by the works of the latter, in 1586, to the invention of the hydrostatic balance, by which the specific gravity of solids might be ascertained with much accuracy.

He now devoted his attention exclusively to mathematics and natural science, and in 1589 was made professor of mathematics in the University of Pisa. In the presence of numerous spectators he went through with his experiments, which he performed on the leaning tower of Pisa, to show that weight has no influence on the velocity of falling bodies. By this means he excited the opposition of the adherents of Aristotle to such a degree, that after two years he was forced to resign his professorship. Through the influence of the Marchese Guidobaldo, the Senate of Venice, in 1592, appointed him professor of mathematics in Padua. Here he remained till 1610.

He lectured with unparalleled success. Scholars from the most distant regions of Europe crowded about him. In 1597 he invented the sector.

One of the most important mathematical discoveries which he made at a period subsequent to this is that the spaces through which a body falls, in equal times, increase as the numbers 1, 3, 5, 7; that is, if a body falls 16 feet in the first second, it will fall 48 in the next second, 80 in the third, and so on. Whether the thermometer was his invention it is difficult to determine; perhaps he only improved it. By means of a telescope, constructed by himself, he made a series of the most important discoveries. He found that the moon, like the earth, has an uneven surface; and he taught his scholars to measure the height of its mountains by their shadow. A particular nebula he resolved into individual stars, and even conjectured that the whole Milky Way, with good instruments, might be resolved in the same manner. His most remarkable discovery was that of Jupiter's satellites, 7 Jan. 1610. He likewise observed Saturn's ring, though he had not a just idea with regard to it. He saw the sun's spots somewhat later, and inferred, from their regular advance from east to west, the rotation of the sun, and the inclination of its axis to the plane of the ecliptic.

Galileo's name, meantime, had grown so celebrated that Cosmo II, grand duke of Tuscany, appointed him grand-ducal mathematician and philosopher, and invited him to become first instructor in mathematics at Pisa. Here he gained a decisive victory for the Copernican system by the discovery of the varying phases of Mercury, Venus and Mars; as the motion of these planets about the sun, and their dependence on it for light, were thus established beyond the possibility of doubt. He wrote a work afterward on the floating and sinking of solid bodies in water, and in this, as well as in all his other writings, scattered the seeds of many new doctrines.

While thus employed in enlarging the field of natural philosophy, a tremendous storm was gathering about his own head. He had declared himself in favor of the Copernican system, in his work on the sun's spots, and was therefore denounced as a heretic by his enemies. In 1611 he visited Rome for the first time, where he was honorably received, and where a favorable report was made on his writings by the mathematicians of the Collegio Romano at the instance of Cardinal Bellarmin. On his return to Florence, however, he became more and more involved in controversy, which gradually took a theological turn, and in the course of which he declared the literal understanding of the utterances of Scripture with regard to physical phenomena to lead to absurdities. From Rome he received, in the name of the Cardinal Barberini (afterward Pope Urban VIII), the warning not to overstep the limits of mathematics and physics, but he paid no heed to the well-meant advice. The monks preached against him, and in 1616 he found himself again obliged to proceed to Rome, where he is said to have pledged himself to abstain for the future from promulgating his system either orally or otherwise. The genuineness of the document on the basis of which this is asserted, has, however, been questioned in modern times, and the controversy regarding this matter is not yet finally settled.

In 1618 the appearance of three comets gave him an opportunity to communicate to his friends some general observations, on these bodies. His scholar, Mario Guiducci, wrote a work immediately after, in which he severely condemned the Jesuit Grassi. Supposing Galileo to be the author, Grassi attacked him. Galileo replied in his 'Saggiatore,' a masterpiece of eloquence, pronounced by Algarotti to be the finest controversial work Italy has ever produced, and, notwithstanding the errors contained in it, a work always worthy to be read.

About this time he completed his famous work, in which, without giving his own opinion, he introduces three persons in a dialogue ('Dialogue on the Two Chief Systems of the World'), of whom the first defends the Copernican system, the second the Ptolemaic, while the third appears as a blind and unreasoning supporter of the views of Aristotle. With this work, in which the greatest elegance and accuracy of style is united with the clearest and most concise statements, Galileo went to Rome in 1630, and succeeded in obtaining the privilege to print it. Having obtained the same permission in Florence, he published it there in 1632—'Dialogo di Galileo Galilei, dove ne' Congressi di quattro Giornate si discorre de' due massimi Sistemi del Mondo, Tolemaico et Copernicano.' Scarcely had it appeared when it was attacked by the disciples of Aristotle, and most violently of all by Scipione Chiaramonti, teacher of philosophy at Pisa. A congregation of cardinals, monks and mathematicians examined his work, condemned it as highly dangerous, and summoned him before the tribunal of the Inquisition. The veteran philosopher was compelled to go to Rome, and in June 1633 was condemned to renounce, in presence of a great assembly, kneeling before them, with his hand upon the gospel, the great truths he had maintained. «Corde sincero et fide non ficta, abjuro maledico et detestor supradictos errores et hereses,» was the formula which he was compelled to pronounce. His famous whisper, «But nevertheless it [the earth] does move,» is a fiction. He was sentenced to the dungeons of the Inquisition for an indefinite time, and every week, for three years, was to repeat the seven penitential psalms of David. His 'Dialogo' was prohibited and his system condemned as contrary to the Bible. His judges were merciful enough to commute his sentence of imprisonment to banishment to the villa of the grand duke of Tuscany at Rome, then to the archiepiscopal palace at Sienna, and soon after he was allowed to return to Arcetri, not far from Florence.

He employed his last years here principally in the study of mechanics and projectiles. The results are found in two important works on the laws of motion, the foundation of the present system of physics and astronomy. At the same time he tried to make use of Jupiter's satellites for the calculation of longitudes; and though he brought nothing to perfection in this branch, he was the first who reflected systematically on such a method of fixing geographical longitude. He was at this time afflicted with a disease in his eyes, one of which was wholly blind, and the other almost useless, when, in

1637, he discovered the libration of the moon. Blindness, deafness, want of sleep and pain in his limbs united to embitter the last years of Galileo's life. He died in the year Newton was born, and his relics were ultimately deposited in the church of Santa Croce, at Florence, where a splendid monument was erected to him near that of Michelangelo.

Galileo was of diminutive size, but strong and healthy. His countenance was agreeable; his conversation lively. He loved music, drawing and poetry. He knew Ariosto by heart; and in one of his works, first printed in 1793, 'Considerazioni al Tasso,' the product of his leisure hours, he points out the superiority of Ariosto to Tasso, whom he criticizes very severely. His style is lively, natural and fluent. His collected works have been edited by Alberi (16 vols., Florence 1842–56). Consult Brewster, 'Martyrs of Science' (London 1841); Chasles, 'Galileo Galilei' (Paris 1862); Epinois, H. de l', 'Les Pièces due procès de Galilée' (1877), and 'La question de Galilée' (1878); Fahie, J. J., 'Galileo: his Life and Work' (London 1903); Favaro, A., 'Galileo Galilei' (Florence 1882); Gebler, K. von, 'Galileo Galilei und die Römische Kurie' (1876); Wegg-Prosser, F. R., 'Galileo and his Judges' (Eng. trans., London 1889).

GALIMBERTI, gä-lēm-bār'tē, **Luigi,** Italian cardinal and diplomat: b. Rome 1838; d. 1896. He became professor of church history in the College of the Propaganda and of theology in the University of Rome, and was appointed by Pius IX canon of the Lateran in 1868. From Leo XIII he received appointment as canon of Saint Peter's, archbishop of Nicæa, and secretary to the Congregation of Extraordinary Ecclesiastical Affairs. He was papal arbiter in the award to Spain, as against Germany, of the Carolines, and in 1880 was sent as ambassador to Germany, where he was successful in adjusting the difficulties of the «Kulturkampf» through the abrogation by the Crown of the so-called «May Laws.» In 1893 he was made a cardinal and prefect of the papal archives.

GALINÉE, gäl-ē-nā, **René de Brehant de,** Sulpician missionary: b. Brittany; d. 1678. He came to Canada in 1668, and in 1669–70, in company with Dollier de Casson (q.v.), made a notable journey, in the course of which they explored Niagara, the north shore of Lake Erie and the east and north shores of Lake Huron, and took formal possession of the country in name of Louis XIV. On their return to Montreal Galinée made a map of their explorations — the first map of the upper lakes made at first hand, and one which marked a notable advance in cartographical knowledge.

GALION, Ohio, a city in Crawford County, on the Erie and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, 80 miles southwest of Cleveland. Galion is an important railroad town, being a connecting point and division terminal. There are railroad shops and round-houses here, brick and tile works, carriage and wagon factories, wheel and gear works, iron foundries and lumber mills. The town was originally laid out in 1831, by settlers from western Pennsylvania, and was chartered as a city in 1878. The city owns and operates its electric light and water plants. The government is composed of a mayor, who holds office for two years, and a common council, elected by popular vote. Pop. 7,214.

GALITZIN, gäl-ĕt'sĕn, or **GOLITZIN,** the name of a noble Russian family, whose members have been equally prominent in war and diplomacy from the 16th century downward. VASILI, surnamed the Great (b. 1643; d. 1714); was the councilor and favorite of Sophia, the sister of Peter the Great, and regent during his minority. His great aim was to bring Russia into contact with the west of Europe, and to encourage the arts and sciences in Russia. His design to marry Sophia and plant himself on the Russian throne miscarried. Sophia was placed by her brother in a convent and Vasili banished (1689) to Siberia and later to Archangel. ADELHEIDEN AMALIE, PRINCESS GALITZIN (1748–1806), daughter of the Prussian general, Count von Schmettau. She was noted for her literary culture, her sympathetic relations with scholars and poets, but, above all, for her ardent piety, which found in Catholicism its most congenial sphere. Having separated from her husband, Prince Dimitri Alexievitch, she took up her residence in Münster, where she gathered round her a circle of learned companions. PRINCE DYMITRI ALEXIEVITCH, diplomat (b. 1735; d. 1803). He was ambassador to the court of France in 1763, and to The Hague in 1773, and was the author of several works relating to geology.

GALL, Saint, Irish monk: b. Ireland about 550; d. Saint Gall, Switzerland, about 645. He accompanied Saint Columba to France about 585 and took part with him in all his missionary labors. Banished from France, they went together into the wilder regions of Switzerland, and near the Lake of Constance they founded the monastery which bore the name Saint Gall and gave name to the town and canton of Saint Gall. After a few years Columba retired to Italy, leaving his companion abbot of the new house. The monastery was burnt by Hungarians in the 10th century.

GALL, gäl, **Franz Joseph,** German phrenologist: b. Tiefenbronn, Baden, Germany, 9 March 1758; d. Montrouge, near Paris, 22 Aug. 1828. He studied medicine at Strassburg and Vienna, and settled in the latter city in 1785 as a physician. In 1796 he began to give courses of lectures on phrenology (q.v.) in Vienna; but these lectures were prohibited in 1802 by the Austrian government as being subversive of the accepted religion. With Spurzheim, who became his associate in 1804, he quitted Vienna in 1805, and began a lecturing tour through Germany, Holland, Sweden and Switzerland. He reached the height of his fame when in 1807 he settled as a physician in Paris. On 14 March 1808 he and Spurzheim presented to the Institute of France a memoir of their discoveries, on which a committee of the members of that body (including Pinel, Portal and Cuvier) drew up an unfavorable report. Thereupon Gall and Spurzheim published their memoir, 'Introduction to Physiology of the Brain'; this was followed by 'Researches on the Nervous System' (1809), and by 'Anatomy and Physiology of the Nervous System' (1810–19) with an atlas of 100 plates. In 1811, in answer to accusations of materialism and fatalism brought against his system, Gall published 'Of the Innate Inclinations of the Soul and

Spirit.' He continued to practise medicine and pursue his researches at Montrouge, near Paris, till his death. See SPURZHEIM, KASPAR.

GALL. See BILE.

GALL, Abbey of Saint. A Benedictine abbey in the canton Saint Gall, Switzerland. It was founded in the 7th century and placed under the patronage of Saint Gall, or Gallus, an Irish missionary and a disciple of Saint Columbanus. Saint Gall died in 646 and a chapel was erected on the site of his cell by Charles Martel. Under his patronage and that of his son, Pepin, a community of monks grew up there and the monastery was dedicated to Saint Gall. Under Othmar, the first abbot, a school was founded which soon acquired a great influence. The early years of the abbey were marked by frequent conflicts with the bishops of Constance, who refused to recognize the exemptions and other privileges of the community, but in the time of Louis the Pious its rights were confirmed and its independence secured. In the 9th century the library was considerably enlarged and a catalogue, prepared at that time and still in existence, shows the possession of manuscripts on a wide range of subjects. In the 13th century the importance of the abbey as a centre of religion and learning waned. This may have been due in part to the fact that at this time the town became an independent principality over which the abbots ruled as territorial sovereigns. After the Reformation the town threw off the rule of the abbots. At this time many of the most valuable books and manuscripts were carried away. In 1530, under Abbot Diethelm, the library and schools were restored and later in the century a printing press was established there which eventually became one of the most important in Switzerland. In 1712 the abbey was raided by the Swiss who carried away many books and manuscripts to Zürich, Berne and other cities. By a curious irony of fortune the abbot was obliged at this time to place the abbey under the protection of the townspeople, who had once been the subjects of his predecessors. After this trouble a final attempt was made to restore the library and schools, but in 1798 the Swiss Directory suppressed the ecclesiastical principality and secularized the abbey. In 1846 Saint Gall was erected into a separate bishopric, with the abbey church as its cathedral. A portion of the monastery was assigned as the bishop's residence and the rest used for the offices of the civil government and the remains of the library.

THOMAS GAFFNEY TAAFFE.

GALL-BLADDER, the reservoir for the bile, a pear-shaped membranous sac, about four inches long, one inch in breadth at its widest part and holds from an ounce to an ounce and a half, is lodged in a depression on the under surface of the right lobe of the liver. Its fundus or broad extremity is directed downward and forward and occasionally projects a little beyond the edge of the liver, almost touching the abdominal wall about three inches from the middle line of the body, its body and neck extend upward and backward. The bile is conveyed to the small intestine by biliary ducts or canals about the size of a quill except when distended. The cystic duct, the smallest, and about an inch in length joins the neck of the gall bladder with the hepatic duct, about one inch and a half long, which issues from the liver and so is formed the common excretory duct of the liver and gall bladder, the largest of the biliary ducts and about three inches in length, which empties into the duodenum. Bile is not conveyed into the intestine until it is needed in the process of digestion, but as secreted in the liver passes into the gall-bladder through the hepatic and cystic ducts to be stored until needed.

Catarrhal cholangitis, acute or chronic, is an inflammation of the lining membrane of the ducts, causing swelling of them and obstruction to the flow of bile. Usually it is an extension of a gastritis or duodenitis, or may be due to the presence of gall stones, to stricture, to cancerous disease or pressure from enlarged or contracted liver, etc. Whenever there is an interference with the flow of bile from the liver there is usually jaundice more or less pronounced. Catarrhal jaundice is attended by few symptoms, no emaciation, some discoloration of skin, liver little larger than usual and tender to pressure — usually runs a course of about six weeks. Marked jaundice coming on gradually and attended by severe pain-points to gall stones or something worse. Biliousness, sallow complexion, depression of spirits, digestive disturbance is probably more often due largely to a deficient flow of bile rather than to an excessive amount, and may end in gall stones.

Cholecystitis, inflammation of the gall-bladder due to infection by microbes from the intestines may be a mild catarrh, or suppuration may occur leading to perforation and peritonitis. If a severe attack there is violent pain, great tenderness and a high temperature. If persistent, and especially if stones are believed to be present, an operation is necessary. Cholelithiasis, the tendency to the formation of gall stones, occurs mostly among persons engaged in sedentary occupations who take but little if any exercise in the open air and who eat too much nitrogenous and fatty food. The bile becomes too thick and is retained, and stagnant, infection occurs and gall-stones form chiefly from cholesterine, a normal constituent of the bile. The congestion of the biliary tracts may result from poisons taken into the body or manufactured within the body, from interference with the circulation of the liver, and from displacements of the liver.

Gall-stones, even in large numbers (100 or more) may be formed and held in the gall-bladder for years without causing discomfort, but there is always the tendency to local inflammation of the gall-bladder or of one or more stones being forced into the cystic or common duct, damming back the bile, causing adhesions and intense pain. Getting rid of gall-stones by medicines is unsatisfactory. There is no known solvent. Operation for their removal in obstinate cases is necessary. Statistics show that only 1.4 per cent of operated cases die, under the care of experienced surgeons. The operation is not so much in reality to get rid of the stones as to get rid of the bacteria causing infection, and of inflammation, irritating fluids, etc.

Hepatic or gall-stone, colic, is the name given to the intense cramp that accompanies the passage of a gall-stone through the bile-ducts or an attempt at such a passage. There is a sudden excruciating pain in the right side at the free border of ribs or even over the whole abdomen; frequently the pain may shoot up to the right shoulder blade and arm. The patient rolls and tosses in agony with his face suffused with cold perspiration. Sometimes there is a chill followed by fever. The duration depends on the course of the stone; frequently relief is had in a few hours, only soreness remaining.

Cholecystectomy — surgical removal of the gall-bladder, now-a-days quite frequently resorted to.

Cholecystotomy — surgical incision of the gall-bladder.

Cholecystastomy — surgical creation of permanent opening into gall-bladder through the abdominal wall.

GALL-FLY, one of the several minute gall-making insects, as the British ash-fly. See GALLS AND GALL-MAKERS.

GALL-GNATS, a gall-making gnat of the genus *Cecidomyia.* See GALLS AND GALL-MAKERS.

GALL-STONE. See CALCULUS.

GALLA. See NUT-GALLS.

GALLAIT, gä-lā, **Louis,** Belgian historical painter: b. Tournai, Belgium, 10 May 1810; d. Brussels, 20 Nov. 1887. He studied in Tournai, Antwerp and Paris, where he acquired a name by his portraits as well as his genre and historical paintings. Among his earlier pictures of note were 'Christ Restoring Sight to a Blind Man' purchased by subscription and presented to Tournai Cathedral; 'The Strolling Musicians'; 'The Beggars'; 'Montaigne Visiting Tasso in Prison'; 'Abdication of Charles V.' Among his subsequent pictures are 'Temptation of St. Anthony'; 'The Dead Bodies of Counts Egmont and Hoorn'; 'The Prisoner's Family'; 'The Last Moments of Count Egmont'; 'Alva Signing Death Warrants'; and lastly (1882), 'The Plague at Tournai,' purchased for Brussels Museum at the price of $24,000. He painted several of his best historical works for the French government. He had a powerful influence on modern art not only in his native country but throughout Europe; it was especially felt in Germany. Consult Dujardin, 'L'Art flamand' (Brussels 1899); Henne, 'Louis Gallait' (in *Annales de l'academic Belgique,* Brussels 1890); Muther, 'Die belgische Malerei im 19ten Jahrhundert' (Berlin 1904); Teichlin, 'Gallait und die Malerei in Deutschland' (Berlin 1853).

GALLAND, gä-lŏṅ, **Antoine,** French Orientalist and archæologist: b. Rollot, France, 4 April 1646; d. Paris, 17 Feb. 1715. Attached in 1670 to the French embassy at Constantinople, he three years later accompanied the ambassador to Syria and the Levant. In 1676, and again in 1679, he made other visits to the East. In 1701 he was made a member of the Académie des Inscriptions, and in 1709 professor of Arabic in the College de France. The greatest part of his writings relate to archæological subjects, especially to the numismatics of the East; but the work which has secured him the greatest reputation is his translation of the 'Arabian Nights Entertainments' (1704–17), the first translation of these stories made into any language of Christendom. Among his other writings are 'Remarkable Sayings, Witticisms and Maxims of the Orientals' (1694), and 'The Indian Tales and Fables of Pilpay and Lokman' (1724). See ARABIAN NIGHTS, THE.

GALLARDO, gäl-lär'dō, **Aurelio Luis,** Mexican poet: b. León, Guanajuato, Mexico, 3 Nov. 1831; d. Napa, Cal., 27 Nov. 1869. He published three volumes of poems: 'Dreams and Visions' (Mexico 1856); 'Clouds and Stars' (Guadalajara 1865); and 'Legends and Romances' (1868); also a collection of poems, 'Home Stories.' He wrote many comedies. The drama, 'Maria Antonieta of Lorena' is regarded as his best work.

GALLAS, gäl'läz, a Hamitic people inhabiting Africa approximately between lat. 9° N. and 3° S. and long. 34° and 44° E. Their language is a descendant of the ancient Geez of Abyssinia. Though they bear a perceptible strain of Negro blood, they are the purest type of the Ethiopian branch of the Hamitic race. They are tall, with good, often European, features, strong, well-made limbs, skin of a light chocolate brown, hair frizzled but not woolly. Though cruel in war they are frank and faithful to promises and obligations. They are distinguished for their energy, both physical and mental especially the southern tribes, which pursue pastoral vocations, notably the breeding of horses, asses, sheep, cattle and camels, and those which live by hunting, especially the elephant. These same tribes are mostly still heathens, though Mohammedanism is rapidly making way among them. The more northerly tribes who dwell about Harar profess a crass form of Christianity, derived from Abysinnia, and for the most part raise cotton, durra, sugar and coffee. The total Galla population, who call themselves Ilm 'Orma (Sons of Men, or Sons of the Brave), is estimated at upward of 3,000,000. Politically they are divided into a great number of separate tribes, which are frequently at war with one another. But their inveterate foes are the Somali, who have gradually driven back the Galla from the shores of the Red Sea and the extremities of the Somali peninsula regions which were occupied by them in the 16th century, just as on the other side the Abyssinians and Shoans have beaten them back. The country they now inhabit is a plateau northwest of the Indian Ocean, with a hilly, well-timbered surface. Consult Keane, A. H., in Stanford's 'Africa' (Vol. I, London 1907); Salivac, P. M. de, 'Les Galla' (Paris 1901); Smith, A. Donaldson, 'Through Unknown African Countries: First Expedition from Somaliland to Lake Lamu' (London 1897).

GALLATIN, Abraham Alfonse Albert, generally known as ALBERT GALLATIN, American statesman and diplomat, and one of the foremost public financiers of the United States: b. Geneva, Switzerland, 29 Jan. 1761; d. Astoria, N. Y., 12 Aug. 1849. In 1773, both his parents having died a few years previously, the boy was sent to a boarding-school and in August 1775 to the Academy of Geneva, from which he graduated in May 1779, the first in his class in mathematics, natural philosophy and Latin translation. In 1780, after refusing a commission as lieutenant-colonel of a regiment of mercenaries under the Landgrave of Hesse, he and a friend, Henri

Serre, secretly left Geneva for the United States and established themselves in business at Machias, Me., but in 1781 abandoned this unsuccessful enterprise, Gallatin going to Boston where he supported himself by teaching French. In July 1782 he received permission to teach French in Harvard College, in which occupation he remained for about a year. In July 1783 he left Boston and purchased several thousand acres of land on the south side of the Ohio between the Monongahela and Kanawha rivers, in March 1784 establishing himself in a country store in Fayette County, Pa. In May 1789, against the wish of her mother, he married Sophie Allègre, but in the following October she died.

Gallatin had early evinced an intense interest in the political affairs of his adopted country and, after the adoption of the Constitution by the Federal Convention, joined the Anti-Federalists (q.v.). In September 1788, after Pennsylvania had ratified the Constitution, Gallatin represented Fayette County at a conference at Harrisburg for the purpose of suggesting amendments. In 1789–90 he was a delegate to a convention called to revise the constitution of Pennsylvania, and in October 1790, as also in the two following years, was elected to represent Fayette County in the State legislature. In this body he was conspicuously active, being a member of 35 committees, preparing all their reports and drawing all their bills, his report prepared for the committee of ways and means of the session of 1790–91, laying the foundation of his reputation. He bitterly opposed the excise laws, acting as secretary of meetings and drafting resolutions which, if not criminal, at least reached the utmost limit of indiscretion and expressed sentiments which he himself later acknowledged to be «violent, intemperate, and reprehensible.» On 28 Feb. 1793 the Pennsylvania legislature elected Gallatin a United States Senator and on 2 December he took his seat, but on 28 Feb. 1794 the Senate refused his admission to that body because he had not actually been a citizen for nine years as prescribed in the Constitution. On 11 Nov. 1793, prior to taking his seat in the Senate, he had married Hannah Nicholson, daughter of Commodore James Nicholson, and for a few months was engaged in cultivating his lands, but in 1794 again plunged into the vortex of public life in connection with the Whisky Insurrection (q.v.). In October 1794 he was elected both to the State legislature and to Congress; his election to the legislature was declared void on 9 Jan. 1795, but he was immediately re-elected and sat from 14 February to 12 March, when he was granted leave of absence. In December 1795 he took his seat in the House of Representatives, joining the Republican party, became a member of the finance committee, and immediately exhibited his grasp of national affairs and his unique financial talents. He steadfastly opposed the Jay treaty (q.v.) and the increase of the army and navy, earnestly advocated the protection of the frontier, favored direct taxes, criticized the operations of the Treasury Department, objected to the manner of handling relations with France, fought the passage of the Alien and Sedition laws (q.v.) and by 1801 had become a powerful influence in the councils of his party.

Gallatin's 'Sketch of the Finances of the United States' (1796) and his 'Views of the Public Debt, Receipts and Expenditures of the United States' (1800) gained for him great renown as an economist and statistician, and together with his known abilities as an administrator of public finances brought him in 1801 the appointment as Secretary of the Treasury, which office he held continuously until 1813. He persistently urged and to a considerable degree effected a rigid economy in governmental financial operations, improved the internal revenue and sinking fund systems, reduced the public debt, provided funds to carry on the war without disturbing the financial system of the country, and devised a comprehensive plan for internal improvements. (See UNITED STATES — FINANCES OF THE, 1789–1816). He also ably but unsuccessfully urged the renewal of the charter of the Bank of the United States. Always a free-trade advocate, in 1831 he was the leading spirit in a free-trade convention at Philadelphia, drafting a memorial on that subject for presentation to Congress. His views on finance and banking were eagerly sought, among his notable essays on these subjects being 'Considerations on the Currency and Banking System of the United States' (1830) and 'Suggestions on the Banks and Currency of the United States' (1841).

In 1813 Gallatin was sent to Saint Petersburg as one of the commissioners to urge Russian mediation between Great Britain and the United States, but as he had not resigned from the Treasury, the Senate in July 1813 withheld confirmation and in January 1814 he left Saint Petersburg. A few weeks later, however, he received a regular appointment as one of the peace commissioners to settle the War of 1812 and materially influenced the shaping of the Treaty of Ghent (q.v.). In 1815, with Adams and Clay, he also negotiated a commercial convention with Great Britain. On his return home he declined a nomination to Congress and a second appointment to the Treasury portfolio, preferring diplomatic life instead, and from 1816 to 1823 rendered inestimable service as Minister to France. He aided Richard Rush at London in negotiating a new commercial convention with Great Britain and signed the compromise convention of 20 Oct. 1818. In 1824, after his return to New York, the Crawford Republicans nominated him for Vice-President but in October he withdrew in favor of Clay. A year later he declined to represent the United States at the proposed Congress of American republics at Panama, but in the spring of 1826 accepted an appointment as Minister to Great Britain, prior to his return in 1827 negotiating several important conventions. With his return to New York Gallatin's diplomatic career terminated, but during the next two years he prepared a statement of facts regarding the northeastern boundary to be laid before the King of the Netherlands. In 1846 he rendered his last diplomatic service when he published a pamphlet entitled 'The Oregon Question.' He protested against the annexation of Texas and in 1847 published a pamphlet entitled 'Peace with Mexico.'

The last years of Gallatin's life were in a large measure devoted to scientific researches, since his position as president of the National Bank of New York, which he occupied for several years, allowed him ample time for study;

he declined to re-enter public life, in 1843 refusing President Tyler's offer of the Treasury portfolio. He ardently supported all educational movements and actively assisted in founding New York University; but his chief interest was research in the field of American ethnology. He had previously made an extensive study of the Indians and their languages, publishing several essays on the subject, but after his permanent settlement at New York he made a deeper and more scientific investigation, in 1836 publishing 'A Synopsis of the Indian Tribes within the United States, East of the Rocky Mountains, and in the British and Russian Possessions of North America.' In 1842 he founded in New York the American Ethnological Society and three years later in the first volumes of its 'Transactions' published an 'Essay on the Semi-Civilized Nations of Mexico and Central America, Embracing Elaborate Notes on their Languages, Numeration, Calendars, History and Chronology, and an Inquiry into the Probable Origin of their Semi-Civilization.' From 1843 until his death in 1849 Gallatin was president of the New York Historical Society and despite his age never lost interest in his historical, economic and scientific pursuits. Consult Adams, Henry, 'Life of Albert Gallatin' (Philadelphia 1879), and 'The Writings of Albert Gallatin' (3 vols., Philadelphia 1879); Bartlett, J. R., 'Reminiscences of Albert Gallatin' (in 'New York Historical Society Proceedings' for 1849, pp. 281–98); Gallatin, Albert, 'Autobiography' (in 'Maine Historical Society Collections,' Vol. VI, pp. 93–103, 1859); Gallatin, James, 'A Great Peace Maker: the Diary of James Gallatin, Secretary of Albert Gallatin, U. S. Envoy to France and England 1813–27 and Negotiator of the Treaty of Ghent,' edited by Count Gallatin (London 1914); Hale, E. E., 'Memoir of Albert Gallatin' (in 'American Antiquarian Society Proceedings,' 23 Oct. 1849); Meany, Edward S., 'Three Diplomats Prominent in the Oregon Question' (in *Washington Historical Society Quarterly*, Vol. V, pp. 207–14, Seattle, Wash., 1914); Stevens, John A., 'Albert Gallatin' (Boston 1890).

IRVING E. RINES.

GALLATIN, Mo., city and county-seat of Daviess County, on the Wabash and the Chicago, Rock Island and Pacific railroads, and on the Grand River, 55 miles northeast of Saint Joseph. It is in a farming region, has lumber industries, municipal waterworks and an electric-light plant, and an academy. Pop. 1,825.

GALLATIN, Tenn., town and county-seat of Sumner County, on the Louisville and Nashville Railroad, 27 miles northeast of Nashville and three miles from the Cumberland River. Its industrial and commercial activities are connected with stock-raising, agricultural products, lumbering, cotton and woolen manufactures, flour milling and foundry and machine products. It contains a training school and the Howard Female College. Pop. 2,399.

GALLAUDET, găl-â-dĕt', **Edward Miner,** American educator: b. Hartford, Conn., 5 Feb. 1837; d. 26 Sept. 1917; son of Thomas H. Gallaudet (q.v.). He was graduated at Trinity College in 1856. He organized the Columbia Institute for the Deaf, Dumb and Blind in Washington, D. C., in 1857, and from it developed the Gallaudet College for the Deaf, of which, in 1864, he became president (May 1911 emeritus president). His publications include 'Manual of International Law' (1879), and 'Life of Thomas Hopkins Gallaudet' (1888).

GALLAUDET, Thomas, American Episcopal clergyman: b. Hartford, Conn., 3 June 1822; d. 27 Aug. 1902. He was a son of T. H. Gallaudet (q.v.); he was graduated at Trinity College in 1842; was teacher in the New York Institution for Deaf-Mutes 1843–58. He was ordained in 1851; founded and became rector of Saint Ann's Church, New York, for deaf-mutes, in 1852; was appointed general manager of the Protestant Episcopal Church Mission to Deaf-Mutes in 1872; and founded the Gallaudet Home for Deaf-Mutes, near Newburg, N. Y., in 1885.

GALLAUDET, Thomas Hopkins, American educator: b. Philadelphia, 10 Dec. 1787; d. Hartford, Conn., 9 Sept. 1851. In 1817 he founded at Hartford, Conn., the first deaf-mute institution in America and was president of the same till 1830. In 1838 he became chaplain of the Insane Asylum at Middletown, Conn., where he remained till his death. He was the author of 'Bible Stories for the Young' (1838), and 'The Child's Book of the Soul,' etc. Consult Lives by Humphrey (1858), and Gallaudet, E. M. (1888); Barnard, 'Tribute to Gallaudet.'

GALLAVRESI, gäl-lä-vrā-ze, **Giuseppe,** Italian paleographer: b. Milan, 26 June 1879. He was educated in private schools, the University of Genoa, and the Royal School of Paleography of Milan. Since 1905 he has been a trustee of the Museum at Castello Sforzesco, Milan, and since 1908 has been lecturer on modern history at the Royal Academy in the same city. He has been very active in Catholic social work, has served as general secretary of the Aid Society for Italian Workmen Abroad, is member of the Royal Historical Commission of Italy, the Society of Social Science. He is a knight of the Crown of Italy and honorary attaché of the Royal Italian Legation, Berne. He has written 'Nava Memoirs' (1902); 'Carteggio del Conte Federigo Confalonieri' (1910); 'Electoral Law of the Cisalpine Republic,' etc. He is a contributor to 'Nuova Antologia,' 'Rassegna Nazionale,' 'Archivio storico italiano'; 'Archivio storico lombardo'; 'Giornale storico della litteratura italiana'; 'Il libro e la stampa'; *Correspondant*, *Revue des questions historiques*, *Revue d'histoire diplomatique*. Since 1910 he has been editor of *Rassegna storica del Risorgimento Italiana*.

GALLE, gäl'le, **Johann Gottfried,** German astronomer: b. in Pabsthaus, Prussia, 9 June 1812; d. Potsdam, 11 July 1910. He studied natural sciences and mathematics in Berlin 1830–33; discovered three comets in 1839–40; was the first to observe the planet Neptune (23 Sept. 1846); and in 1851 became director of the observatory in Breslau and professor of astronomy in Breslau University. In 1875 he advocated planetoid observations to determine the solar parallax. Among his published works are 'Grundzüge der schlesischen Klimatologie' (Breslau 1857); 'Ueber eine Verbesserung der Planetenelemente' (Breslau 1858); 'Neber eine Bestimmung der Sonnenparallaxe aus Korrospondierenden Beobachtungen der Flora im Oktober und November 1873' (Breslau 1875); 'Mitteilungen der Breslauer Sternwarte' (Breslau 1879); 'Verzeichnis der Elemente der bisher berechneten Kometenbahnen' (Leipzig 1894).

GALLEGO, gä-yä'gō, **Juan Nicasio**, Spanish poet: b. Zamora, 14 Dec. 1777; d. Madrid, 9 Jan. 1853. He was possessed of great natural poetical talent; but he was careless and, in a sense, indolent so that his life's work does not correspond to his talents. Graduated from the University of Salamanca, he entered the Church and became Court chaplain in 1805. It was in Madrid that he became acquainted with Quintana and Cienfuegos and other men of literary and other note. This friendship encouraged him to literary exertions, which were broken by the entrance of the French into Madrid in 1808. On this occasion Gallego wrote 'El dos de mayo,' one of his best known poems. Losing his position on account of the political changes at this time, he soon became noted as one of the best poets of Spain. His burning patriotism and love of independence coupled with his fight for the freedom of Spain appealed to the nation; and his compositions were passed from hand to hand throughout the land and read in every household. On the return of the French to Madrid, Gallego went to Seville and from there finally to Cadiz; where he seems to have led a rather active existence until the return to power of the Spanish government in 1814. In 1810 he was elected deputy from the Isle of León to the Cortes and he gave so much attention to his political duties that he had apparently little time left for literary work. On account of this political activity, he was imprisoned for 18 months on the return to the throne of Fernando VII, in a public prison, after which he was sent to Cartuja de Jerez, where he was held until 1816, when, owing to his ill health, he was taken to La Luz Monastery at Moguer, and later to Loreto Convent in Seville, where he remained until he was freed by the revolution in 1820. Shortly afterward he was appointed Archdeacon of Valencia, a position he held until he was deposed by royal order, in opposition to the laws of the Church, and on account of his former political activities, and he was compelled to go to Barcelona, then held by the French; and from there he went to France on the retirement of the French. Later on he returned to Spain and was appointed Canon of Seville.

GALLEGOS, gäl-yä'gōs, Argentina, a river and city in the extreme southern part. The river rises in the Latorre Mountains and empties into the Atlantic Ocean; length 160 miles. The city is near the mouth of the river in Santa Cruz Territory and has a population of about 5,000.

GALLEIN, găl'ẹ-ĭn (*Pyrogallolphthalein*), a coal-tar color used in dyeing. Formula, $C_{20}H_{10}O_7$. Obtained by heating for some hours one part of phthalic anhydride with two parts of pyrogallol from 190° to 200°, then dissolving the fused mass in alcohol, precipitating with water, and recrystallizing from dilute hot alcohol.

GALLENGA, găl-lĕn'gä, **Antonio Carlo Napoleon**, Italian publicist and historian: b. Parma, Italy, 4 Nov. 1810; d. Llandogo, Wales, 17 Dec. 1895. He left Italy in 1831 by reason of political disturbances in which he took a part. He visited the United States and France. Returning to Italy he became more deeply involved in political intrigue. Finally he again became exiled because he could not agree with the policy of assassination held to by his party by which he had been selected to murder Charles Albert, king of Sardinia. Going to London (1843) he was elected to the chair of Italian literature in University College. He took part in the insurrection in Italy in 1848; and he returned in 1854; and was a member of the Italian Parliament 1858–64. He was long the London *Times'* special correspondent in Italy. His works, many of them issued under the name of "L. Mariotti," include 'Italy, Past and Present' (1841–49); 'Castellamonte, an Autobiography' (1854); 'Mariotti's Italian Grammar,' which went through 12 editions; 'History of Piedmont' (1855–56); 'The Pearl of the Antilles' (1873); and several books of travel.

GALLEON, a name formerly given to a very large kind of a vessel, with three masts and three or four decks, such as those used by the Spaniards in their commerce with South America, to transport the precious metals. They were large, clumsy, square-sterned vessels, having bulwarks three or four feet thick, all of which were so encumbered with tophamper and so overweighted in proportion to their draft of water, that they could bear very little canvas, even with smooth seas and light wind.

GALLERY, *in architecture*, any of various rooms, corridors, platforms, etc.: (1) A corridor or long, narrow room, sometimes serving as a means of access to other parts of a house; especially, a covered space for walking, partly open at the side; in English country houses, a main corridor having a continuous row of windows on one side. Galleries of this class include the low, paneled halls of the old châteaux and manor houses, particularly English houses of the 16th and 17th centuries; here were kept family portraits, arms and armor, trophies of the chase, banners, fine furniture, bric-a-brac, etc. (Compare (4) below). Belonging to this class also are such galleries as the one connecting the Sainte Chapelle with the Palais de Justice at Paris and the one connecting the Palazzo Pitti with the Palazzo Vecchio at Florence. (2) A long, narrow platform, balcony or passage projecting from a wall and open at the outer side except as having a balustrade or railing; especially, a passage either within the thickness of a wall, or supported on corbels, having its open side toward the interior of a building and serving both for ornament and as a means of communication. It is connected in some intimate way with the architectural design of the building. To this class belong the triforium and external galleries of many Gothic churches. These galleries are often filled with statuary, as the *galerie des rois* at the cathedrals of Paris and Amiens and at the ruined cathedral of Rheims. (3) A platform, supported by columns, brackets, or the like and projecting from the interior wall of a building, as a church or theatre, usually to provide additional room for an audience; specifically in a theatre, the highest of such platforms, containing the cheapest seats. (4) A room, typically long and narrow, or a building, for the exhibition of works of art. Famous galleries are the Louvre at Paris, the Uffizi and Pitti at Florence, the Vatican and Borghese at Rome, and the National at London. Other galleries containing renowned paintings or sculptures are at Versailles, Venice, Milan, Petrograd, Madrid, Dresden, Vienna, New York, etc. (5) A place of business or pleasure shaped like a gallery or in some way analogous to it; as a photograph gallery, a shooting gallery.

As a nautical term, gallery means a platform outside the body of the ship, at the stern or at the quarters. It was formerly common. *In mining,* a working drift or level. *In fortification,* any sunk or cut passageway that is covered both overhead and at the sides.

GALLEY, the ancient and mediæval ship of the Mediterranean, propelled primarily by oars. The Venetian galleys were about 160 feet long above, and 130 feet by the keel, 30 feet wide and 20 feet length of stern-post. They were furnished with three masts, and 30 banks of oars, each bank containing two oars, and every oar being managed by six or seven slaves, who were usually chained to it. In the fore part, after the invention of cannon, they had three small batteries of cannon, namely, two 36-pounders, two 24-pounders and two 2-pounders. They had also three 18-pounders on each quarter, and carried from 1,000 to 1,200 men.

The term galley, as applied to the ships of the ancient Greeks and Romans, refers especially to their warships, which were propelled chiefly by oars.

The Greek or Græco-Etruscan vases show many illustrations of biremes, that is, galleys with two banks, or longitudinal rows, of oars. The invention of this form of vessel was a very important advance in naval construction, for it permitted of a large increase in rowing-power, in proportion to the bulk and weight of the vessel. It was the trireme, however, which formed the chief warship of Greece during her prime. It had three banks of oars on each side. The seats for the rowers, which were removable, were placed between the sides of the vessel and a series of upright and inclined timbers supporting the main deck. The stem of the vessel was generally curved, and terminated in an ornamental figure-head, and the stern-post was also usually curved upward and finished off ornamentally. At the stern there was an elevated quarter-deck whence the helmsman and the trierarch or naval captain gave orders. The latter had full command of the ship; the former acted as navigating officer, having the oarsmen and sailors under his command. The trireme had regularly two masts — a mainmast with one large sail, and a very small foremast.

The rowers formed much the largest portion of the crew, while an Attic trireme carried also 10 marines, 17 sailors, a sort of paymaster, two men in charge of the lines of towers, besides two boatswains, one with a flute, to give the time to the rowers. The total crew would thus be about 220. The total length of a trireme was about 120 feet, of which about 100 was devoted to the rowers; the breadth at the water-line was some 12 feet; and the draught about 6 feet. A speed of 8 or 9 knots was probably about the highest obtainable.

The Romans did not become important as a maritime nation till the period of their struggle with Carthage. They built large numbers of ships, chiefly of higher rates than the trireme. But the triumph of the bireme vessels, known as Liburnian galleys, at Actium led the way for a reversion to lower-rated ships. Consult Parker, F. A., 'Fleets of the World: The Galley Period' (New York 1876); Chatterton, E. K., 'Sailing Ships and their Story' (London 1900); and 'Ships and Ways of Other Days' (Philadelphia 1913); Holmes, G. C. V., 'Ancient and Modern Ships' (2 vols., London 1906).

GALLI, găl'ī, the emasculated priests of Cybele, who was worshipped as symbolizing the procreative powers of nature. Cybele was the «Great Mother» and inspired the arts of agriculture. The chief seat of this cult in historic times was Pessinus in Galatia, but it never obtained public recognition in Greece, where the excesses and mendicity of its priests exposed it to contempt. It was introduced into Rome 204 B.C., at the bidding of the Sibylline oracle, and for the purpose of expelling Hannibal from Italy. The Galli were permitted to pass in a procession through the streets of the city, led by an Asiatic priest and priestess, but Roman citizens were forbidden to participate in this service. The cult gained an increasing favor and popularity and in the 2d century A.D. other rites were added, such as baptism in the blood of bulls and rams, by which the devotee was supposed to be cleansed from pollution and regenerated. This baptism was undergone by the Emperor Julian, called the Apostate. The worship of Cybele was checked by Constantine and abolished by Theodosius.

GALLIC ACID, $C_6H_2(OH)_3COOH$, is an acid which exists in small quantity in gall-nuts, in valonia (the acorn-cup of *Quercus ægilops*), in dividivi (the pod of *Cæsalpinia coriaria*), in sumach, and other vegetables. It is usually prepared from gall-nuts, which, in addition to gallic acid, contain a large proportion of tannin (tannic acid or gallo-tannic acid). When the gall-nuts are digested with water for some weeks fermentation takes place, and the tannic acid is gradually converted into gallic acid. The same result is obtained more quickly if sulphuric acid be present. To obtain pure gallic acid the gall-nuts are boiled with water, and the hot liquor separated. On cooling gallic acid crystallizes out, and is further purified by solution in hot water and treatment with animal charcoal. It forms delicate, silky, acicular crystals, nearly colorless and having a sourish taste. It is soluble in three parts of boiling water, but only in 100 of cold water, and on this account it can be readily purified by recrystallization. With solution of iron salts (ferric) it produces a blue-black color, and finally yields a black precipitate on exposure to the air. Hence it may be used in the production of ink, for which purpose it has some advantages over tannin or gall-nuts. When the crystals are strongly heated pyrogallic acid ($C_6H_3(OH)_3$) is produced and sublimes over. Gallic acid is a useful astringent. As it does not coagulate albumen it is readily absorbed into the blood, and in this way it is efficacious in Bright's disease. Where a decided local astringent effect is desired tannic acid is much more powerful. It has been used in excessive sweating and is useful for sweating feet and as a local spray and gargle in tonsilitis, pharyngitis and similar affections of the nose and throat.

GALLIC WAR, Cæsar's Commentaries on the. Cæsar had filled the consulship in the year 59 B.C. Shortly after the end of his year of office, he had set out (early in 58 B.C.) for the province of trans-Alpine Gaul, to which he had been appointed for a period of five years. The situation in this province was most serious. Various wild tribes were becoming restless and were threatening the fringe of Roman cities scattered along the Mediterranean in southern Gaul. Appreciating the menace to Roman interests and Roman prestige, Cæsar gathered troops to meet the immediate crisis. The Gallic tribes, suspicious of Cæsar's first success, soon began organized resistance to his evident purposes of ambition, and in the attempt to maintain their freedom and realize their national aspirations waged campaign after campaign against the Romans. Despite their gallant efforts they were finally crushed in the year 52 B.C., when with the surrender of Vercingetorix and the fall of Alesia, the last attempts at Gallic independence were proved futile.

Cæsar's Commentaries on the Gallic War give an account of the events of his contest with the Gallic tribes. This account is contained in seven books, each book being devoted to the campaigns of a year. The struggle lasted from 58 to 52 B.C. The work seems to have been published in the winter of 52 to 51 B.C. Book I deals with the unsuccessful attempt of the Helvetians to invade southern Gaul; also with the defeat of the Germans under Ariovistus, who had established a tyranny over the Sequani and Haedui in eastern Gaul and was now threatening Roman influence in this region. Book II is devoted to an account of the overthrow of the Belgian league. To forestall the establishment of Roman ascendancy in northern Gaul, the Belgian tribes had organized a strong confederacy. One of these tribes, the powerful and warlike Nervii, almost succeeded in inflicting a crushing defeat on Cæsar's troops in a fierce engagement on the Sambre. Book III embraces a description of the successful maritime war against the Veneti and their allies on the northwestern coast of Gaul, along with the account of scattered operations by Cæsar's lieutenants in other quarters. Book IV deals first with the campaign against the Germans. This was waged partly to the west, partly to the east, of the Rhine. To cross the river, Cæsar (in 10 days) constructed his famous bridge. He then penetrated far into the interior of the country. The remainder of Book IV describes Cæsar's first invasion of Britain in the autumn of 55 B.C. Book V begins with the events connected with the second invasion of Britain and gives an interesting description (chapters 12–14) of the island and its inhabitants. The concluding portion of the book is devoted to an account of the overthrow of the new league of Gallic states against the Romans. Book VI describes a second expedition into Germany. In this connection a somewhat lengthy account of German institutions and customs is given and a contrast drawn between the Germans and the Gauls (chapters 11–28). The year 52 B.C. was signalized by a general revolt of all the Gallic tribes against the Roman rule. The leader in this movement was the able, courageous and patriotic king of the Arverni, Vercingetorix. The struggle was futile. Alesia, Vercingetorix's stronghold, was captured, his forces crushed, and he himself taken as a prisoner to Rome. These operations are described in Book VII. An eighth book, detailing the Gallic operations of 51 B.C., has come down to us. It was written by Hirtius, one of Cæsar's lieutenants.

The importance of the Commentaries lies partly in the subject matter, partly in the authorship. They are the composition of a great personality, dealing not merely with great events, but events of world-historic import of which he himself was the directing genius. Cæsar's account in the main is authentic and trustworthy. By always speaking of himself in the third person, he aims to produce the impression of detachment and impartiality. Yet at times he suppresses the truth, and at times colors his narrative in his own favor. Specific literary charm, as ordinarily understood, is totally lacking. Cæsar's simplicity and directness have always appealed to his readers, but the composition of the work was evidently hasty. Much of it may have even been the unrevised draft of notes made at the time of the events described.

Translation: T. Rice Holmes (London 1905). A scholarly discussion of the contents of the work may be found in the same writer's 'Cæsar's Conquest of Gaul' (Oxford 1911).

CHARLES E. BENNETT,
Professor of Latin, Cornell University.

GALLICAN CHURCH. See GALLICANISM.

GALLICAN CONFESSION, The, or French Confession of Faith, was prepared by John Calvin and his pupil De Chandieu and approved by the Synod of Paris in 1559. In 1561 it was delivered by Theodore Beza to Charles IX at Poissy. In 1571 it was formally adopted by the Synod of La Rochelle, and due to that fact is sometimes called the "Confession of Rochelle." It was also sanctioned by Henry IV. It consists of an address to the king and 40 articles. The text of the articles may be found in 'The Creeds of Christendom' by Philip Schaff (Vol. III, pp. 356–382, New York 1877). The arrangement is the same as in Calvin's 'Institutes' and the Geneva Catechism of 1540. In 1848 an attempt was made to substitute a new confession but failed. In 1872, however, a second attempt proved successful but created a division in the Church.

GALLICANISM, the tendencies, principles, or action of those members of the Roman Catholic Church in France who, notably in 1682, sought to increase the power of the national church and to restrict in that country the authority of the Pope. By extension, the tendency to enlarge the prerogatives of any national Church in restriction of the authority of the Roman See. This term takes its derivation from the controversies between the French monarchy at various times and the Roman pontiffs in regard to ecclesiastical jurisdiction. It is a mistake to suppose that Gallicanism took its rise in France prior to the 13th century, or that the decrees of Louis IX, including the Pragmatic Sanction, were in any proper sense an attempt to restrict the authority of the Roman pontiffs. So far from this being true, their object was to assure the immunities and franchises accorded to the clergy from the exactions of the royal officers and feudal lords. In his ordinance of April 1228, Louis IX, or rather his mother, Blanche of Castile, the regent, says not a word about the relations of the clergy or the laity with the Roman pontiff, and Pope Innocent IV, in 1250, in a letter to the queen, thanks her for issuing it.

It was not until the time of Philip the Fair that Gallicanism in any proper sense can be said to have manifested itself. That monarch in his contest with the papacy sowed the seeds of the controversy as to the question of papal jurisdiction, which so long agitated the French Church. As a result of his contest with Boniface VIII, and of the later declarations of the Councils of Constance and Basel, the principles began to be enunciated by the national party; one that the king of France was absolutely independent of the Pope in all temporal matters; the other, that the papal power was not absolute, must be exercised within the limits of the canons, and was inferior to that of a general council. By the Pragmatic Sanction passed at Bourges in 1438, the Gallican Church, in union with the king, adopted the decrees of the Council of Basel abolishing papal reservations and expectatives, and restricting appeals to Rome to the *causæ majores*. Against this many popes protested, but it was not until the date of the concordat (1516) between Leo X and Francis I, that it was abolished.

During the 16th century there were many customs and privileges of more or less ancient date still extant, which the national party delighted to call "Gallican liberties." The crisis came in the 17th century, during the reign of Louis XIV, over the question of the royal right of regalia. Two bishops excommunicated the crown nominees to benefices in their dioceses. Their Metropolitans canceled their sentences; whereupon they made appeal to Rome, and the Pope annulled the decisions of the Metropolitans. The Crown resented the Pope's decision as an intrusion upon its rights. Louis XIV called an assembly of French bishops (1682) to confirm his position. This assembly formulated the famous Four Articles setting forth the "Gallican liberties." The first declared that the jurisdiction of Peter's successor did not extend to civil and temporal affairs, that kings were subject to no ecclesiastical power in temporals, and denied the deposing power of the popes. The second ratifies the third and fourth sessions of the Council of Constance as regards the respective authority of the Pope and general councils, and denies that these sessions refer only to times of schism. The third asserts the validity of the laws, customs and constitutions of the realm and of the Gallican Church. The fourth declares that although the Pope has the principal share in questions of faith, and that his decrees regard all and particular churches, still his judgment is not irreformable, unless the consent of the Church be added.

Afterward, at the command of the king, who subsequently realized the radical character of the Four Articles, the bishops who had signed them individually wrote to the Pope retracting their *Declaration*. Later Louis himself wrote to Innocent XII, in 1693, stating that he had "given the necessary orders to the effect that the contents of my edict of 22 March 1682, concerning the *Declaration* emitted by the clergy of France, be not observed."

Nevertheless, the spirit of Gallicanism lingered on in France, finding fresh impetus in Jansenism. During the 18th century its strength rapidly waned, and by the time of the French Revolution (1789) it had ceased to have any vital significance. Consult Jervis, W. H. P., 'The Church of France' (2 vols., London 1872) and 'The Gallican Church and the Revolution' (ib. 1882); Le Roy, 'Le Gallicanisme au XVIII siècle' (Paris 1892); Valois, P. N., 'La France et la grand schisme de l'Occident' (4 vols., Paris 1896–1902); Sabatier, P., 'France To-Day: its Religious Orientation' (New York 1913).

GALLICO, Paolo, American pianist: b. Trieste, Austria, 1868. At the Vienna Conservatory of Music he studied under Julius Epstein and there won two firsts for piano playing. Next he toured the principal countries of Europe, giving concerts in all the principal music centres. He visited the United States in 1892 and thereafter made his abode in New York, where he became a noted teacher of piano. He has composed several songs and pieces for piano and has appeared frequently at recitals and as soloist with orchestras.

GALLIENI, gäl-lē-ä'nē, **Joseph Simon,** French general and colonial administrator: b. Saint-Béat, Department of Haute-Garonne, 24 April 1849; d. Versailles, 27 May 1916. The son of an officer, he was educated at the military college of Saint Cyr and served as lieutenant in the Franco-German War. From 1877 to 1881 he served in West Africa in military, scientific and administrative capacities. With General Faidherbe, his chief, he was mainly instrumental in founding French Equatorial Africa. Being sent on a mission to a savage chief, Ahmadou, in the interior, he was held prisoner for ten months and informed every morning that he was to die that day. Gallieni finally succeeded in concluding a treaty with his captor. He next served three years in Martinique and in 1886 became governor of Upper Senegal. He was sent to Indo-China (Tonquin) in 1893 and fought for two years against the Black Hand pirates. In 1896, when Madagascar (q.v.) became a French colony, he was appointed governor and commander-in-chief. His vigorous and determined policy made a great improvement in the condition of the island. He first crushed rebellion and brigandage, and then pursued a policy of enlightened pacification. His efforts were so successful that the young women of Tananarivo were soon wearing Paris fashions and learning French dancing. When Gallieni laid down his office in 1905 he left a peaceful and prosperous colony. On his return to France he became military governor of Lyons, and in 1908 a member of the Supreme War Council. In the dark days of August 1914, when the German armies were pouring in like an irresistible avalanche upon Paris, that city was not in a position to defend itself. On the 26th Gallieni was placed in command of the entrenched camp, of Paris. A new spirit of courage and energy entered with him. Great gangs of laborers left the city every morning in "sight-seeing" cars to throw up hasty trench defenses; the arrival of naval guns and numerous other indications showed that Gallieni was preparing to defend Paris inch by inch if necessary. But the decisive battle of the Marne saved the city. On 29th Oct. 1915 Gallieni became Minister for War in the newly-formed Briand Cabinet. In March 1916 his health broke down and he retired. He was replaced by Gen. Pierre Roques. An accomplished scholar and linguist, Gallieni was a member of various learned societies and published several volumes on the Sudan and Madagascar. See MADAGASCAR.

GALLIENUS, găl-ĭ-ē'nŭs, **Publius Licinius Valerianus,** Roman emperor: d. 268 A.D. He received the title of Cæsar from the senate at the same time with his father, Valerianus, and associated with the latter in the empire on his accession in 253 A.D. His father having been defeated and taken prisoner by Sapor, king of the Persians, in 260, Gallienus showed complete indifference, and continued to reign alone without making any attempt to deliver his father. With a like indifference he saw his empire dismembered by numerous usurpers, and invaded in all parts by barbarians.

GALLIFFET, gä-lē-fā, **Gaston Alexandre Auguste,** MARQUIS DE (PRINCE DE MARTIGUES), French general: b. Paris, France, 23 Jan. 1830; d. there, 8 July 1909. He joined the army in 1848, serving in the Crimea, Mexico and Algeria. He took part with the Army of the Rhine during the Franco-German War, being made prisoner at Sedan, after leading the memorable cavalry charge of the *chasseurs d'Afrique.* During the second siege of Paris he commanded a brigade of the Army of Versailles, and was unenviably distinguished for his severity to the Communard prisoners. He was promoted general of division in 1875, and was placed in command of the Ninth Army Corps in 1879 and of the 12th Army Corps in 1872. He became Minister of War in June 1899; he resigned in May 1900 after strongly supporting the government in the crisis following the Dreyfus affair.

GALLINÆ, a group of birds, styled gallinaceous or "game-birds," deriving its name from the Latin *gallus,* the domestic cock, which is a typical example. The group is non-classified as a suborder *Galli* of the order *Galliformes,* situated between the tinamous and the rails. The order embraces the singular mesites of Madagascar; the various partridges and quails of the Eastern Hemisphere *Tumices;* and the hoatzin besides the typical gallinaceous birds, which far outnumber the rest. All are ground-keeping, running birds, agreeing in the possession of a globular crop adapted to the digestion of the seeds and hard insects that form the greater part of their food, and in having the young hatched in such a state of advancement that they are clothed in a uniform coat of down-feather, and are able to run about and pick up food after a few hours. They are distributed throughout the world, but are most numerous and reach their highest perfection in the forested parts of the Orient. The group (*Galli*) includes the mound-birds or brush-turkeys, and other *Megapodes* of Australasia; the curassows and guans of tropical America; and all the pheasants, guinea-fowls, turkey, jungle-fowls (parents of our domestic fowls), tragopars, American quails and partridges, grouse, ptarmigan, and similar species of various parts of the world. Many have been successfully domesticated; others are prized as ornaments, or for their plumage, and all are good eating. Hence they have ever been the object of capture, and some of them afford the finest sport to be enjoyed with dog and shotgun. Special articles described the most important species under their popular names.

GALLINGER, Jacob H(arold)., American physician and Republican politician: b. Cornwall, Ontario, Canada, 28 March 1837, being one of 12 children; d. Franklin, N. H., 18 Aug. 1918. He received a common-school and academic education; was a printer in early life; studied medicine and was graduated in 1858; and followed the profession of medicine and surgery until he entered Congress. He was on the board of trustees of Columbia Hospital for Women, and a member of the board of visitors to Providence Hospital; was a member of the House of Representatives of New Hampshire in 1872, 1873 and 1891, and member of the constitutional convention in 1876; of the State Senate in 1878, 1879 and 1880, being president of that body the last two years. He was surgeon-general of New Hampshire, with the rank of brigadier-general, in 1879–80; received the honorary degree of A.M. from Dartmouth College in 1885; served as trustee of George Washington University for several years, and was chairman of the Republican State committee from 1882 to 1890, when he resigned the place, but was again elected to the position in 1898, and continued to serve until 1908, when he declined re-election; was chairman of the delegations from his State to the Republican national convention of 1888, 1900, 1904 and 1908; was for a time a member of the Republican national committee; was chairman of the Merchant Marine Commission of 1904–05, composed of five senators and five representatives in Congress; was a member of the National Forest Reservation Commission, and vice-chairman of the National Waterways Commission; served as president *pro tempore* of the Senate during a portion of the 42d Congress; was elected to the 49th and 50th Congresses, and declined renomination to the 51st Congress; was elected to the United States Senate, to succeed Hon. Henry W. Blair, for the term beginning 4 March 1891, and successively re-elected by the legislature without opposition in 1897, 1903, 1909; was re-elected by popular vote 3 Nov. 1914 for a fifth term.

GALLINULE. See MUD-HEN.

GALLIO, găl'ĭ-ō, **Lucius Junius Annæus,** Roman pro-consul of Achaia under Claudius when Saint Paul was at Corinth, 53 A.D. Born at Cordova, the son of the rhetorician Annæus Seneca and elder brother of the famous philosopher and statesman, Lucius Annæus Seneca, he procured his name by adoption into the family of Gallio the rhetorician. The narrative in the 'Acts of the Apostles' tells how, with regard to the clamor of the Jews against Paul, he was "not minded to be a judge of these matters" and how "Gallio cared for none of these things"; hence his name has become a synonym for a careless, easy-going, and indifferent man who keeps himself free from trouble and responsibility. Gallio's behavior, however, rather shows the impartial attitude of Roman officials, at that time, toward provincial religions.

GALLIPOLI, gäl-lēp'ō-lē, Turkey, a seaport on the peninsula of the same name, in the vilayet of Edirneh, in lat. 40° 24′ N. and long. 26° 39′ E., 130 miles west of Constantiople. The ancient Callipolis, of which some ruins remain, it was formerly the most important commercial town on the Hellespont, and still retains considerable trade. There are two harbors, extensive bazaars, and some manufactures. The town was taken by the Turks in 1354, and formed their earliest European possession; and here the allies disembarked during the Crimean War. Pop. about 30,000.

GALLIPOLI, Peninsula of, Turkey, a tongue of land separating the Hellespont from the Ægean Sea and the Gulf of Saros, about 55 miles long, by a varying breadth of from 4 to 13 miles. Lat. between 40° 3′ and 40° 38′ N., long. between 26° 10′ and 27° E. Its chief city is also called Gallipoli (q.v.). The western portion of this peninsula was the scene of desperate fighting in 1915. See WAR, EUROPEAN.

GALLIPOLI OIL, a coarse olive oil, used in Turkey-red dyeing and for other purposes, and prepared from olives grown in Calabria and Apulia, the latter being considered the best. The oil is conveyed in skins to Gallipoli, where it is clarified and shipped in casks.

GALLIPOLIS, găl-ĭ'pō-lēs, Ohio, city and county-seat of Gallia County; on the Ohio River, and on the Hocking Valley and Kanawha and Michigan railroads. It contains a United States Marine Hospital, Gallia Academy, the State Hospital for Epileptics, Washington High School, a library and park. Industries are iron and wood manufactures, etc. First settled in 1790, Gallipolis was incorporated as a village in 1842 and chartered as a city in 1865. Pop. 5,560.

GALLITZIN, Demetrius Augustine, PRINCE, American clergyman: b. The Hague, 22 Dec. 1770; d. Loretto, Pa., 6 May 1840. He was a son of Prince Dimitri Gallitzin, and became a Roman Catholic in his 17th year. He served with Austria against France in 1792. He was ordained a priest in the United States in 1795, and after preaching at Port Tobacco, Canewago and Baltimore, betook himself to a bleak region among the Alleghany Mountains in Pennsylvania, where he was known as «Father Smith.» Here he laid the foundation of a town called Loretto. He declined to return to Russia on his father's death, and as a Catholic priest, was adjudged to have lost his right of inheritance. He was for some years vicar-general of the diocese of Philadelphia. He was austere in his mode of life, but liberal in the highest degree to others, and an affectionate and indefatigable pastor. In 1809 he resumed his original name. He wrote various controversial works, including a ‹Defense of Catholic Principles› (1816); ‹Letter to a Protestant Friend› (1820), and ‹Appeal to the Protestant Public› (1834). Consult Heyden, ‹Life and Character of Rev. Prince Demetrius A. de Gallitzin› (Baltimore 1869).

GALLIUM, a metallic element, symbol Ga, atomic weight 69.9. Gallium is a triad element. Specific heat 0.079. It was discovered by the French chemist, Lecoq de Boisbaudran, by means of the spectroscope; but the Russian chemist Mendeléeff had shown in his periodic law (q.v.) that an element must exist having intermediate properties between aluminum and indium. He called his supposed element eka-luminum. The metal is obtained by dissolving the blende in sulphuric acid and placing in the solution plates of zinc. This precipitates antimony, arsenic, bismuth, copper, cadmium, etc., while gallium, aluminum, iron, zinc, etc., remain in solution, and after solution and precipitation basic salts of gallium are thrown down by zinc. The metal is then isolated by electrolysis. Gallium is a hard metal, very slightly malleable and leaves a bluish-gray trace on paper; when melted it adheres to glass; it does not tarnish in the air. Its specific gravity is 5.95. It melts at 30.15° C. It gives two brilliant violet lines in the spectrum. When heated in the air it oxidizes on the surface, and does not volatilize. It dissolves in hydrochloric acid with disengagement of hydrogen. It is scarcely attacked by nitric acid in the cold; when heated it dissolves slowly with evolution of nitrous fumes.

At least one oxide, two chlorides, and iodide, a bromide, a nitrate, a sulphate, a double sulphate with ammonium and probably a hydroxide are known. The chief means of detecting gallium is by its spectrum.

GALLIUM CHLORIDE, in chemistry, $Ga\,Cl_3$. It is colorless, crystalline and deliquescent.

GALLIUM SALTS, salts precipitated by ammonia. If redissolved by hydrochloric acid, and again precipitated by ammonia, the precipitate is soluble in excess. If zinc is present the gallium is precipitated along with the zinc. Potassium ferrocyanide gives a yellow precipitate with strongly acid solutions of gallium chloride.

GALLON. See WEIGHTS AND MEASURES.

GALLOTANNIC ACID. See TANNINS.

GALLOWAY, Beverly Thomas, American horticulturist and plant pathologist: b. Millersburg, Mo., 16 Oct. 1863. He was graduated from the University of Missouri, agricultural course, in 1884; was assistant in the horticultural department of the university in 1884–86, and chief of divisions in the United States Department of Agriculture, division of vegetable physiology and pathology, in 1887–88. In 1900 he became chief of the Bureau of Plant Industry and served in this capacity until 1913, when he was appointed assistant secretary of agriculture. In 1914 he was made dean of the College of Agriculture at Cornell University. His writings include works on plant diseases, botany, horticulture, rural education and allied subjects.

GALLOWAY, Charles Betts, American bishop of the Methodist Episcopal Church, South: b. Kosciusko, Miss., 1 Sept. 1849; d. 12 May 1909. In 1868 he entered the Mississippi conference and for several years he was pastor of various churches in that State. From 1882 until 1886 he was editor of the New Orleans *Christian Advocate*, and in the latter year was made bishop. He was also elected president of the board of education of his church, and published a 'Life of Bishop Linus Parker'; 'Handbook of Prohibition'; 'Open Letters on Prohibition,' written during his controversy with Jefferson Davis on prohibition, of which he was an earnest advocate; 'Modern Missions: Their Evidential Value'; and 'Christianity and the American Commonwealth.'

GALLOWAY, Joseph, American lawyer: b. near West River, Md., about 1729; d. Hertfordshire, England, 29 Aug. 1803. He was admitted to the bar in Philadelphia, and was a member of the Pennsylvania Assembly 1757–74. He held a seat in the Congress of 1774, where he suggested a plan of government headed by a president-general to be appointed by the king and to hold office during the latter's pleasure, and a grand council elected every three years by the assemblies of the several colonies. Before the conclusion of the Revolutionary War he removed to England; and in 1788 was charged with high treason by the Assembly of Pennsylvania, which ordered his estates to be sold. He was the author of 'A Candid Examination of the Mutual Claims of Great Britain and the Colonies with a plan of Accommodation on Constitutional Principles' (1780); History and Political Reflections on the American Rebellion' (1780); etc. Consult Balch (ed.), 'Examination of Joseph Galloway by a Committee of the House of Commons' (1855); Tyler, 'Literary History of the American Revolution' (1897).

GALLOWAY, an extensive district in the southwest of Scotland, once somewhat larger, but now comprised in the shires of Wigtown and Kirkcudbright. To-day, the designation is nothing but a name, having no political bearing. It enjoys a mild climate, and is famous as a pastoral district, its breeds of small horses and of large, hornless, black cattle being well known. Dairy-farming is now an important industry. The old district or province is about 70 miles in length by 40 at its utmost breadth, and contains the greatest diversity of scenery — mountain, lake and stream, as well as dreary waste and almost pathless moor. There is no mineral wealth and few industries. The province owes its name to the fact that the natives were called Gall-Gael, or Foreign Gaels, at first because of their falling under the foreign rule of the Anglians; but as the Picts of Galloway they continued to be known so late as 1138. Their geographical position had shut them off from their northern kinsmen and they continued under their ancient names a distinct people till the 12th century, and preserved their language — a dialect of Gaelic — down to the 16th century, when it finally disappeared before the Reformation and the use of Lowland Scotch in the churches and schools, leaving only a rich crop of place names similar to those of Ireland and the Highlands of Scotland. The earliest inhabitants are styled by Ptolemy the *Novantæ* and their towns are given as Lucophibia, Perigonium, Corda and Carbantorigum. Tacitus tells us that Agricola concentrated a force in that part of Britain which looked on Ireland, and most authorities identify this with Galloway, and they are borne out by discovery of Roman forts in Wigtown. Galloway was subdued by the Northumbrian Anglians of Bernicia in the 7th century, and governed by them for about 200 years, and it was to this period apparently that the modern name is due. After about three centuries of more or less complete independence, interrupted only by Norse ravages and at length by a period of Norse supremacy, it was recovered by Malcolm Canmore, granted as an earldom in 1107, to his youngest son David, and on his accession to the throne in 1124, formally united with Scotland. Of the native lords of Galloway several rose in revolt in attempts to throw off the Scottish yoke, even offering fealty to England. Finallly in 1455 the lordship of Galloway was attached to the Crown. Consult Briggs, 'Angling and Art in Scotland' (New York 1908); Mackenzie, 'History of Galloway' (1841); M'Kerlie, 'Galloway in Ancient and Modern Times' (1891); Maxwell, 'History of Dumfries and Galloway' (Edinburgh 1900); Skene, 'Celtic Scotland' (ib. 1876).

GALLS AND GALL-MAKERS. Galls are unnatural plant-growths caused by various forms of parasitic animals or plants, more particularly by the hymenopterous family of gall-flies (*Cynipidæ*). Gall-gnats (*Cecidomyiidæ*),— (minute two-winged midges or flies), many species of mites, certain aphids, nematode worms, some forms of caterpillars, and the larvæ of weevils and other beetles also cause galls. Among plant gall parasites, the most important are bacteria, slime molds and certain algæ. The formation of a gall is due to the puncturing of any portion of a plant, the surface of the leaf, stem, roots or bark and the deposition of an egg in the cavity formed, or by the presence of larvæ subsequently hatched from it. Within

FIG. 1. — Bedeguar Gall of Wild Rose.

these excrescences the larvæ feed and grow, and either eat their way out while still grubs or remain till the pupa stage is past and emerge as adolescent insects. A gall may contain a single egg and larvæ or many, and both external form and internal structure vary widely. Each gall-fly has its favorite or exclusive host, and usually restricts its egg-laying to some special part of the plant. While most produce true galls, some members of the family utilize galls already formed.

The process of gall formation is but imperfectly understood. It is not known whether the gall-forming stimulus is mechanical or chemical in nature, nor whether it consists in the oviposition of the female or the growth and movements of the larvæ. The extreme complexity and specialization of the gall adds greatly to the difficulty of explanation. A cynipid oak gall may consist of an outer shell, with radiating fibres supporting a larval chamber with well developed food-layers, Not only is there a considerable increase in the number of cells, but their size is also often immensely greater than normal. The gall is often full of waste products, such as resins and tannic acid — whence comes their commercial value in tanning and in the manufacture of ink. Galls of closely related species may maintain a constant difference in structure. Many galls are hairy or spiny, while the plant is naturally smooth.

The reproductive relations of gall-flies are very interesting. In many cases parthenogenesis undoubtedly occur; in some species, for example, of *Rhodites,* no males have ever been found; in other forms the males when they occur are very few in proportion to the females. It must be emphasized that many gall-wasps

FIG. 2. — a, oak gall produced by *Cynips quercus-folii;* b, section of gall; c, gall-insect (*Cynips quercus-folii*).

distinguished by entomologists as separate species or even referred to different genera have turned out to be the parthenogenetic and the sexual forms of one species. A common life history is as follows: (a) Out of a summer-gall male and female forms emerge; (b) the females lay their fertilized eggs and give origin to winter-galls in so doing; (c) from these winter-galls there arise parthenogenetic females which in their egg-laying produce the summer-galls from which we started.

Galls vary greatly in shape, and may be solid or spongy, and contain one or several cavities, in each of which a larvæ is lodged. Though galls are very generally distributed, they occur in commerce chiefly as Levantine articles of trade. The Aleppo nut-galls are spherical and tubercular; blue, black and white varieties are recognized, the two former being picked before the escape of the larvæ, the latter after its exit. They are produced by a gall-fly (*Cynips gallætinctoriæ*) on twigs of an oak (*Quercus infectoria*). The galls made on oak by the common British «ash-fly» (*C. quercifolia*), or by the hundred or more American species of Cynips, might serve the purpose of ink making, tanning, etc., just as well; the 70 to 80 per cent of tannin they contain is the principal element of value. Dead Sea Apples, or Mecca or Bussorah galls, or Apples of Sodom (*mala insana, or C. q. infectoriæ insana*), are varieties of this vegetable product. The artichoke or strobile galls consist of several pieces, and resemble the fruit (strobilus) of the hop. They are exemplified by the gall produced on the willow by a *Cecidomyia.* The hairy galls, or bedeguars, or rose sponges, are chiefly found on *Rosa rubiginosa;* they are produced by *Rhodites rosæ.* A peculiar fact about many galls is that they contain insects other than those which have caused them. These are called inquilines. They are often, but not always, closely related to true gall-forming insects. Consult Adler, H., 'Alternating Generations: A Biological Study of Oak Galls and Gall Flies' (Oxford 1894); Beutenmüller, 'The Insect-Galls of the Vicinity of New York City' (*American Museum Journal,* Vol. IV, New York 1904); Kuster, E., 'Die Gallen der Pflanzen' (Leipzig 1911).

GALLUP, N. M., a city on the Atchison, Topeka and Sante Fe Railroad; in McKinley County in the western part of the State. Several large coal mines are in the vicinity and also two brick works. There is an auto road to Pueblo of Zuni 35 miles south and to Ganado, Saint Michaels and Fort Defiance to northwest. The city has extensive trade with Navajo Indians who have a reservation not far north. There are large supplies of water from artesian wells. Pop. about 2,500.

GALLUS, sometimes mentioned as Saint Gal, Saint Gilian or Saint Gall: b. Ireland about 560; d. at the monastery of Saint Gall, Switzerland, 16 Oct. 646. He is known to have been a disciple of Columban. With a few companions, he established the hermitage of Saint Gallus in 613 which later became a noted monastery. An account of his life appeared in the 8th century but is so filled with legends as to make it seem without authority. He is said to have seldom left his cell. The monastery had a continuous and eventful career until 1805 when it was suppressed. The buildings were used as a spinning factory from 1801–08. The wonderful collection of manuscripts numbering over 80,000 is still in the town.

GALLUS, Caius Cornelius, Roman poet: general and administrator: b. Forum Julii (modern Fréjus), in southeastern Gaul, about 66 B.C.; d. 26 B.C. He was educated at Rome, where he became an intimate friend of Virgil, Varus and Asinius Pollio. After the assassination of Julius Cæsar, Gallus joined the party of Octavius (afterward Augustus), by whom he was appointed to assign lands in northern Italy to army veterans. He commanded a division at Actium, and in Egypt defeated the forces of Antonius and captured Cleopatra. When Cleopatra died (30 B.C.), Gallus became the first governor of the Roman province of Egypt, which he administered with considerable success for four years. Then charges against him were laid before Augustus, and, deprived of rank and estates and sentenced to banishment, he killed himself by falling on his sword. Gallus, who imitated the Greek Euphorion, is regarded as the founder of the Roman eligy, and by Ovid is given first place among the elegiac poets of Rome. He wrote four books of elegies chiefly on his mistress, a notorious actress named Cytheris, whom he called Lycoris. Little or nothing of his verse has survived. He is introduced in the well-known story of Roman domestic life, entitled 'Gallus: Roman Scenes from the Time of Augustus,' by W. A. Becker (Eng. trans., London 1844; 9th ed., 1888). Consult Nicholas, A., 'De la vie et des ouvrages de C. Gallus' (Paris 1851); Mackail, J. W., «Virgil and Virgilianism» (in 'Lectures on Poetry,' London 1911); Smith, K. F., 'The Elegies of Albius Tibullus' (New York 1913).

GALOIS, găl'wä', **Evariste**, French mathematician: b. Bourg-la-Reine, 25 Oct. 1811; d. Paris, 31 May 1832. He obtained his early education in the Collège de Louis-le-Grand and entered the Ecole Normale in 1830, while there writing a theorem on the solubility of irreducible equations of prime degree by radicals, six articles on the theory of equations and theory of numbers, and with others founded the theories of groups and functions. His works were published in Paris under the auspices of Le Société Mathématique de France (1897). See EQUATIONS, GALOIS THEORY OF.

GALOPARO, gäl-ō-pä'rō, an agitated body of water off Capo del Faro, the Charybdis (q.v.) of the ancients. It forms the whirlpool on the outside of the harbor of Messina, in the strait separating Italy from Sicily. Opposite, on the Italian coast, is the rock Scylla.

GALSWORTHY, John, English author: b. 1867. His early works appeared under the *nom-de-plume* of "John Senjohn" and attracted little notice, being purely of a conventional type. 'Jocelyn' (1898), 'Villa Rubein' (1900) and 'A Man of Devon' (1901), all belong to this period. His later novels and plays departed from the conventional and are more individual, more serious and vastly more interesting, because of their dealing with acute social problems of the 20th century. Such are 'The Island Pharisees' (1904; 1908), a satire on British insularity and provincialism; 'The Man of Property' (1906), dealing with capitalism; 'The Country House' (1907), depicting English bourgeois types; 'Fraternity' (1909, German translation 1911), a study of class consciousness and solidarity; 'The Patrician' (1911); 'Moods, Songs and Doggerels' (1911); 'The Inn of Tranquillity' (1911); 'The Dark Flower' (1913); 'The Little Man and Other Satires' (1915); and 'The Freelands' (1915). His plays present social problems even more strongly than his novels. Of these the most important are 'The Silver Box' (1906), showing the all too frequent legal differentiation between rich and poor; 'Joy' (1907); 'Strife' (1909), the story of a strike; 'Justice' (1910), a play of prison life; 'The Little Dream' (1911); 'The Pigeon' (1912, produced in New York in 1913), a problem in poverty; 'The Eldest Son' (1912); 'The Fugitive' (1913); 'The Mob' (1914); 'The Foundation' (1917); 'Beyond' (1917). Galsworthy was included in the king's New Years honors (1918) for a knighthood which he declined. (See JUSTICE). Consult Skemp, A. R., 'Plays of John Galsworthy,' in 'Essays and Studies by Members of the English Association' (Vol. IV, London 1914).

GALT, gâlt, SIR **Alexander Tilloch**, Canadian statesman: b. London, England, 6 Sept. 1817; d. Montreal, 19 Sept. 1893. He was a son of John Galt (q.v.) and went to Canada while still a boy. He was closely identified with the Eastern Townships; was first elected to the Canadian legislature in 1849; was Minister of Finance 1858–62, 1864–66 and in 1867; and Canadian High Commissioner to England from 1880–83. He was the first to bring Confederation within the range of practical politics, and he stoutly claimed for Canada the right to determine her own fiscal policy. His budget of 1859, embodying as it did his policy of incidental protection, was inconsistent with the treaty of reciprocity then subsisting between Canada and the United States, and helped to put a period to the agreement. He was created K. C. M. G. in 1869, and was one of the fisheries compensation commissioners under the Washington Treaty of 1871.

GALT, John, Scottish novelist: b. Irvine, Ayrshire, 2 May 1779; d. Greenock, Scotland, 11 April 1839. In 1804 he went to London, and entered into a mercantile partnership, but the venture soon ended in bankruptcy. He then entered himself at Lincoln's Inn, but made small progress in law, and quitted England in 1809. He made a tour of the south of Europe and the Levant, and on his return in 1812 published 'Voyages and Travels in the Years 1809, 1810 and 1811,' and in 1813 'Letters from the Levant.' In 1812 he had published 'Life of Cardinal Wolsey,' and also a volume of tragedies, which received a rough handling from the *Quarterly Review*. In 1820 and 1821 the 'Ayrshire Legatees,' a series of letters descriptive of a supposed visit by a Scottish minister's family to London, appeared in *Blackwood's Magazine*, and attracted universal attention. Its success induced him to publish immediately afterward his 'Annals of the Parish,' which was received with no less approbation. 'The Provost,' 'The Steamboat,' 'Sir Andrew Wyllie' and 'The Entail' appeared in rapid succession. These were all extremely popular, but his subsequent novels, 'Ringhan Gilhaize,' 'The Spaewife' and 'Rothelan,' did not sustain the reputation which he had acquired. 'The Omen' (1825), which was praised by Scott, was followed by 'The Last of the Lairds' (1826). In 1826–29 he was superintendent to the Canada Company. While in Canada he founded the town of Guelph (1827). After his return to England he produced many works, including 'Lawrie Todd' (1830), containing sketches of frontier life in America; 'Southennan'; 'Life of Lord Byron'; 'Autobiography of John Galt'; 'Literary Life and Miscellanies' in three volumes. Collected editions of his works were published in London (4 vols., 1868; 8 vols., 1899); the novels were edited by Meldrum (8 vols., London 1895–96).

GALT, Canada, town of Waterloo County, Ontario, on the Grand River, the Canadian P. and the Grand T. railways, 25 miles northwest of Hamilton; named for John Galt, the Scottish novelist (q.v). The town is picturesquely situated on both sides of the river which is here crossed by several bridges. It is substantially built and lighted by gas and electricity; an important jobbing centre; the seat of a United States consular agent; and has manufactories of flour, axes, paper, woolens, leather, foundry products, woodenware and paper. Between 1900 and 1910 its manufactures increased by nearly 140 per cent. Lumber, limestone and sand are in the neighborhood. An electric railway gives connection with Kitchener, Paris and Brantford. Pop. 10,299.

GALTON, gâl'tŏn, SIR **Francis**, English scientist: b. Birmingham, 16 Feb. 1822; d. 17 Jan. 1911. He was a grandson of Erasmus Darwin and a cousin of Charles Darwin, the scientist. He was educated at King Edward's School, Birmingham; studied medicine at the Birmingham Hospital and King's College, London; and graduated at Trinity College, Cambridge, in 1844. Having in 1846 traveled in North Africa, he explored in 1850 lands hitherto unknown in South Africa, publishing his experiences in his 'Narrative of an Explorer in Tropical South Africa' (1853), and in 'Art of Travel' (1855). His investigations in meteorology are recorded in 'Meteorographica' (1863). Later he specially devoted himself to the problem of heredity and anthropology. He is celebrated as the founder of the science of «eugenics» (q.v.), designed to improve the human family by discouraging and checking the propagation of the unfit and selective breeding among the fit, and he left his fortune to found a chair in that science in the University of London. Another subject that attracted him was identification by means of fingerprints; he devised a directory for that purpose; and practical application of his theories is now being made by the criminal authorities. Among his works are 'Hereditary Genius: its Laws and Consequences' (1869); 'Experiments in Pangenesis' (1871); 'English Men of Science: their Nature and Nurture' (1874); 'Life-History Album' (1884); 'Natural Inheritance' (1889); 'Finger Prints' (1893); 'Fingerprint Directory' (1895); 'Noteworthy Families' (1906); 'Memories of My Life' (1908); 'Essays in Eugenics' (1909). He was knighted in 1909.

GALUPPI, gä-loo'pē, **Baldassare**, Italian composer: b. island of Burano, near Venice, 18 Oct. 1706; d. Venice, 3 Jan. 1785. He was sometimes called «Il Buranello.» From 1722 he was an organist in Venetian churches, and he early wrote an opera, 'Gliamici rivali.' After study of advanced composition as a pupil of Antonio Lotti, he again turned to writing, and achieved notable success with more than 70 comic operas, among them 'Il mondo della luna,' and 'Il mondo alla rovescia.' He has generally been considered the originator of comic opera (opera buffa) in Italy. From 1741 he was for some time resident and active in London, in 1762 became maestro di capella at Saint Mark's and director of the Conservatorio degli Incurabili, and in 1765–68 was in Russia as court composer and director of music. Returning to Venice, he continued as director at the Incurabili. He wrote some sacred works, but none of his compositions are known to-day save a harpsichord sonata which finds place in Pauer's 'Alte Klaviermusik.' He is apostrophized by Browning in 'A Toccata of Galuppi's.' Consult Wotquenne, A., 'Baldassare Galuppi, étude bibliographique sur ses œuvres dramatiques' (Brussels 1901).

GALVANI, gäl-vä'nē, **Luigi**, Italian physiologist; the discoverer of galvanism: b. Bologna, 9 Sept. 1737; d. there, 4 Dec. 1798. He studied medicine, and in 1762 entered on the practice of his profession. His favorite studies were anatomy and physiology. He soon received the appointment of professor of anatomy in the celebrated university of his native city and published a treatise on the urinary organs of birds. While engaged in these pursuits he was fortuitously led to the discovery which has immortalized his name. It is related that his wife, the daughter of Galeazzi, a medical professor under whom he had studied, and a woman of superior intelligence, having observed that the contact of the inanimate body of a skinned frog with a scalpel lying on the table produced in the frog a series of remarkable muscular convulsions, the knife having been in contact with an electric machine, informed her husband of the fact, who instituted a series of experiments, and formed conclusions which led to a controversy with Volta. Galvani rightly ascribed the convulsive movements to electricity, but erroneously concluded that the electricity was generated by nerves and muscles. On a journey to Sinigaglia and Rimini he was so fortunate as to trace the cause of the electric appearances which are observed in the torpedo, and wrote a learned treatise on this subject. The loss of his beloved wife in 1790 rendered him inconsolable. Having refused to take the oaths to the Cisalpine Republic in 1797, he was deprived of his chair, and refused to resume it, when the government, in consideration of his celebrity, offered to allow him to do so unconditionally.

GALVANIC BATTERIES. See PRIMARY BATTERIES.

GALVANISM. See ELECTRICITY; GALVANIZATION, TREATMENT OF DISEASE BY.

GALVANIZATION, Treatment of Disease by. Of the different forms of electricity used in medicine the galvanic or direct current is perhaps the most widely employed. This form of current is derived from a primary battery, a storage battery, or a direct current dynamo. Its therapeutic use has a wide range: invigoration of the muscles; stimulation of the nutritive processes and of the secretory organs; allaying congestion; equalizing the blood pressure; elimination of morbid substance from the tissues; repulsion of bacterial attack; and sedative effects upon the nervous system. General galvanism is sometimes applied before a surgical operation to put the patient in a satisfactory state, and after the operation as a tonic measure, and also where the healing processes tend to produce local deformities. It may be administered either locally or centrally; local galvanization is used especially for the relief of pain. It is applied to the brain, eye, ear, sympathetic nervous system, spinal cord, urethra, bladder and chest, either by what is known as «stabile» application, in which both electrodes are kept in a fixed position, or by «labile» application, in which one or both electrodes are slid over the surface, but not lifted from the skin. It is found that a greater sedative influence is obtained if the galvanic current is not interrupted. Labile and stabile interrupted currents are generally preferred for the galvanization of muscles of the head, spinal cord and nerve-tracts. Stabile continuous currents, either uniform or increasing, give the best results. When the galvanic current is interrupted it causes, as is well known, pronounced muscular contraction. This is of service as a tonic to poorly nourished and atrophied muscles.

By «central» galvanization is meant that mode of treatment by the galvanic current by which the entire central nervous system may be brought under the influence of the electrical fluid. In order to accomplish this, one electrode, usually the negative, is placed over the solar plexus, at the pit of the stomach, while the other is firmly pressed to the top of the head and passed gradually over the back of the head and along the inner border of the strong muscle that pulls the neck to one side, the sternoclidomastoid. From here the electrode is passed down the spine. It is thought to increase the electrical excitability of the central nervous system, inducing sleep and relieving general tire. It is a method, however, that should be used with great caution, as it may do more harm than good. See ELECTROTHERAPEUTICS.

GALVANIZED IRON, sheets of iron coated with tin by a galvanic process, and with a second metal, zinc, which is effected by preparing a bath of fluid zinc covered with sal ammonia mixed with earthy matter. When the tin-coated sheet is plunged into this preparation the zinc is precipitated with a crystal-like diaper upon the tin. The term is sometimes improperly applied to sheets of iron which have been coated with zinc without recourse to the use of galvanism. The iron, after being thoroughly cleaned from all trace of oxydization, by a dilution of sulphuric acid, is then plunged into a bath of melted zinc and other substances such as sal ammoniac, or mercury and potassium.

GALVANOCAUTERY, the use of a cautery knife, loop, point or blade heated by the passage of a galvanic current. It is of value wherever a limited cautery action is desired, and particularly valuable in being easy to control. See ELECTROTHERAPEUTICS.

GALVANOMETER, an instrument for detecting and measuring the intensity, direction or length of duration of an electric current by means of the magnetic force it produces. The many types of indicating instruments such as voltmeters and ammeters, where the pointer is held at zero by some directive force, such as the earth's field, a spring or weight or a permanent magnet, come under this head. With very few exceptions, all galvanometers may be classed under two heads: (1) Those having a magnetized needle suspended so as to move freely in a horizontal plane, the needle being normally held at zero position by means of the earth's field or an external field produced by auxiliary magnets placed to accomplish this result. The needle is suspended on a pivot or a quartz fibre or fibre of silk or other appropriate material. (2) Those having a coil of wire in place of the needle in the first class. This is the type usually called the d'Arsonnal type, and has the coil suspended by means of a fine wire, which provides a way for leading current to the coil, and has another wire underneath the coil for conducting the current from it. The coil, with the conducting wires, is then suspended between the poles of a magnet, its axis being normally at right angles with the lines of the field. The second class of galvanometers, those having a moving coil, are to be preferred for most classes of work, all except those requiring the very greatest delicacy, for the following reasons: The readings are but very slightly affected by the presence of an external field or by magnetic substances in vicinity of the instrument, and are practically independent of the variable influence of the earth's field; this form of instrument may easily be made dead-beat (that is, when the coil is deflected it goes at once to its position without long vibration), on account of the strong field in which the coil moves; many forms are portable and much less affected by vibrations than those of the first class.

The figure of merit of a galvanometer may be expressed either as the current necessary to cause a deflection of one scale division, or as the resistance through which one volt will cause a deflection of one scale division when such resistance is inserted in the circuit. Such an expression of the delicacy of a galvanometer should be accompanied with the following data: The resistance of the instrument, the scale distance and size of one division of the scale. The sensitiveness of a galvanometer is expressed as the difference of potential across the galvanometer terminals necessary to cause a deflection of one scale division; and to be exact, should be accompanied with the same data as for the figure of merit. Of the moving needle class of galvanometers the tangent galvanometer and the Thomson astatic galvanometers are probably in most general use. The tangent galvanometer is constructed so that the inside diameter of the coil which surrounds the needle is at least 12 times the length of the needle. Under these conditions, the needle being held at zero by the earth's field, the current strength will vary directly as the tangents of the angle of deflection; hence the name of the instrument. Although at one time much used for the absolute determination of current strengths, it has of late been replaced by other types, on account of its many correction factors, some of which are of uncertain magnitude, a prolific cause of error being the necessity of knowing the exact value of the horizontal component of the earth's magnetism, which quantity is subject to continual change and is affected by large masses of iron or heavy electric currents in the vicinity. The sine galvanometer is similar but the coil is moved so as to bring the needle back to zero. This makes the sine of the angle through which the coil is moved proportional to the deflecting current.

The Thomson Galvanometer.— This type was designed by Lord Kelvin, and to him we are indebted for the most sensitive instruments as yet made. The moving system consists of a slender quartz rod to the centre of which is fastened a small mirror of glass which reflects a ray of light to a graduated scale. Above and below the mirror at each end of the quartz rod is fastened a complex of carefully selected magnetized needles, minute in size, placed parallel to the plane of the mirror. In the upper complex the north poles of the needles are all placed in one direction, and in the lower complex the north poles of the needles are placed in the opposite direction, the combination forming an astatic system, on which the earth's field exerts a very slight directive force. This directive force exerted by the earth's field would be zero if the two complexes could be made exactly equal in magnetic strength. Each complex of needles is enclosed by two coils, thus making four coils in an instrument. These coils are provided with binding posts for series or parallel connection, and are connected so that the current flowing through them will cause the magnetized needles to be deflected in the same direction in each complex. An adjustable magnet mounted on top of the instrument provides a directive action on the needles which may be modified to any extent, a weak directive force increasing the sensitiveness greatly, and also increases the period of oscillation, so that in the best instruments the sensitiveness is limited largely to the patience of the observer. Refinements of this type have eight coils and eight needles or groups of needles.

Moving Coil Galvanometers.— This type is most familiar in the d'Arsonnal galvanometers, and is to be preferred for most purposes within the limits of its sensitiveness. Its preference lies in the fact that it may easily be made deadbeat, and the readings are practically independent of the earth's field or magnetic substances in its vicinity. The construction also adapts itself to a portable type of instrument, and it may be so constructed as to be very slightly affected by vibrations. The sensitiveness of this class of galvanometers may be further increased by substituting an electro-magnetic field for that produced by permanent magnets.

Among the newer European galvanometers are the following: The Broca galvanometer is of the type having fixed coils and a moving magnetic system. Its distinctive feature is the form of this system, which consists of two steel wires hung vertically and close together. Each wire has like poles at its ends, making the system astatic. The Einthoven string galvanometer has a single fine wire or quartz fibre in the intense field of a powerful electromagnet having a narrow air gap. When a current flows through the string, the latter moves across the field. The motion is observed with a microscope or is registered by projecting the image of the string on a screen. This galvanometer has an extremely short period, as low as one one-hundredths of a second. It is highly sensitive and is free from inductance and capacity. The Duddell thermo-galvanometer has suspended in the field of a permanent magnet a loop of silver wire which is closed at the bottom by a thermo-couple of bismuth and antimony. The current to be measured is caused to flow through a heating coil placed below the thermo-couple. The heat sets up a current in the loop and deflects it more or less according to its strength. This galvanometer works equally well with either direct or alternating currents. It can be used with the wireless currents and for the telephone. Another type called the Duddell oscillograph is made for voltages up to 50,000 in either of two forms — with permanent magnet and with electromagnet. The former is preferred for the high-frequency currents and is more readily transported when necessary.

J. E. Taylor,
Western Electric Company, Philadelphia.

GALVANOSCOPE. See Electrical Terms.

GALVESTON, Tex., city, port of entry and county-seat of Galveston County, located on the east end of Galveston Island which is 30 miles long and two miles from the mainland. Galveston Bay lies to the north and Gulf of Mexico on the south. The city is connected with the mainland by the Galveston Causeway, an arched reinforced concrete structure, and used by electric interurban, steam railways, auto and vehicle traffic. It is on the Southern Pacific, the Missouri, Kansas and Texas, the Gulf, Colorado and Santa Fe, the International and Great Northern, the Galveston, Houston and Henderson, and the Gulf and Interstate railroads, and Galveston-Houston Electric Interurban. The city possesses a fine beach automobile speedway, 25 miles long. Semi-tropical winters and balmy summer breezes offer a delightful climate the entire year. The annual average temperature is 69°. Galveston has a magnificent gulf front, brick paved, brilliantly illuminated boulevard and walk, four and a half miles long and 17 feet above sea-level. It has two splendid bathing pavilions, pleasure and fishing piers, city-owned gulf front public park with free band concerts, boating, fishing and one of the finest and most up-to-date resort hotels in the country. Fishing is confined to no season. Tarpon, Jack fish, trout, Spanish mackerel, red fish, pompano and red snapper are freely caught at and near Galveston. The coast country in the vicinity of Galveston, during the fall and winter, is a hunter's paradise. The bays and creeks in this locality abound with ducks, geese and snipe. Miles of oleanders and palms line the streets. It is a city of beautiful residences and many conventions and large gatherings have been held here.

Public Buildings.— Galveston has a magnificent fireproof city auditorium, seating 4,200. The finest public library in the State, endowed with a fund of $535,000. The finest and best equipped public hospital in the South. A large Roman Catholic hospital, Y. M. C. A. building, a Masonic temple and Scottish Rite cathedral, Elks, Knights of Columbus and Eagles buildings. Galveston has 31 churches for white people and 12 churches for colored people, two orphan asylums, a home for homeless children and a home for aged women; the School of Medicine of the State University, 12 private or sectarian schools, a Roman Catholic University, two Roman Catholic academies, a business college and public high school and seven graded schools for white children. One high and two graded schools for colored children.

Docks and Terminals.— The city possesses 30 piers and berth room for 100 ocean-going vessels, coal elevators and floating bunker plants, fuel oil stations, 246 miles of standard gauge terminal tracks and 3,000,000 feet of covered storage space on water front. The Galveston Wharf Company in which the city owns a one-third interest has an improved channel frontage of 12,400 lineal feet and the Southern Pacific Terminal Company, 1,350 lineal feet. The city has 22,990 lineal feet of undeveloped channel frontage, a powerful wireless telegraph station, termini of the Mexican Telegraph Company, cable communication direct with Mexico and a United States quarantine station. There are commodious and modern immigration station and buildings. A United States revenue cutter is stationed at Galveston. The average yearly business passing over the Galveston docks is over $400,000,000. The export cargo in 1917 reached approximately $275,000,000. The facilities at Galveston for the proper storage of cotton are unequaled, there being ample space to store on end 913,500 bales. Galveston has a 10,000-ton dry dock and several ship repair plants. It has taken the national government 41 years and has cost $11,000,000 to develop the port of Galveston. It has a very large and impressively beautiful and well-fortified harbor, a channel six miles in length from open sea to docks, more than 32 feet of water on the bar with 35 feet on the inside, magnificent up-to-date system of docks, warehouses, compressers, fine grain elevators, railroad terminals and facilities and is well located with respect to the Panama Canal. Cars are unloaded and released on an average within one and a half days after arrival. Grain ships are loaded in one day.

Trade and Commerce.— Galveston is the natural entry port for the great Southwest. Its trade, particularly in cotton, places it among the foremost cities of the world in the volume and value of its exports and imports, as the figures will indicate. Galveston has advanced from third to second place in its rank among exporting ports of the United States. The total value of foreign exports for the trade year of 1917 was $275,000,000 and for 1916, $198,298,736. These figures place Galveston the fourth city in the United States in the volume of its foreign commerce. Galveston has over 50 lines of steamships to foreign ports, besides two regular lines of coastwise vessels to New York and points in the Gulf of Mexico. The domestic exports are cotton, wool, hides, oil cake and oil meal, cottonseed oil, fish oil, cement and poultry. The domestic imports are drugs, boots and shoes, hats, dry goods, chemicals and like commodities. The foreign exports are cotton, cottonseed oil, oil cake and meal, wheat, corn, flour, copper and iron ores, cattle, lumber and timber and provisions. The foreign imports include fire brick, tiles, chemicals, cement, liquors, earthenware, prepared vegetables and fancy woods. There are four export grain elevators, with a storage capacity of 4,000,000 bushels, and one clearing and conditioning elevator.

Government, Public Utilities, etc.— Galveston is governed by a mayor and four commissioners, known as the board of city commissioners. The commission plan was inaugurated by the city of Galveston, 18 Sept. 1901 and has proved highly satisfactory. The city owns Pelican Island, immediately across the channel from the city and with a channel frontage of 15,000 feet. On this island are located the dry dock and ship-repairing plants. It is susceptible of development into docks, warehouses and an ideal location for shipbuilding plants. The city owns four public parks. The waterworks, fire department, sewer system and street electric-light plants are owned by the city. The waterworks is valued at $2,000,000. The supply of water comes from artesian wells on the mainland and is piped under the bay. The city also owns a one-third interest in the Galveston Wharf Company and is represented on its board of nine directors by the mayor and two of the four city commissioners.

Finances and Industries.— The city has three State, four private and two national banks, 21 building, loan, abstract and real estate corporations. Two daily papers and six weekly papers are published here; 20 hotels, a large jobbing trade, brewery, cement and pipe works, ice plants, cold storage plants, iron works, sash, door and blind manufactories, cotton presses, clothing, flour, meal, coffee, baking powder, spices, extracts, pickles, preserves, macaroni and mineral water manufactories and rice mills, book manufacturing, lithographing and printing establishments.

Taxes and Assessments.—The assessed valuation of the city for 1918 was $43,000,000. The rate of taxation for the city on $100 valuation is $1.65, and for school purposes 25 cents additional. The public debt is $5,655,525.30, including grade raising bond issue.

History.—About the year 1782, a Spanish fleet made an examination of the coast of the Gulf of Mexico west of the Mississippi River, and named Galveston Bay and Island in honor of Conde de Galvez, then governor of Louisiana. The explorers found on the island one white man who subsisted by hunting and fishing. Galvez was governor of Louisiana from 1780 to 1785. Until the year 1816 Galveston Island remained in its primæval state, a low island formed in process of time by the sea throwing up sand and shells. The conjecture that La Salle visited Galveston Island during his brief stay in Texas is without reasonable foundation. The island was long a favorite hunting ground for the Caroñkawas, the once powerful and warlike tribe which inhabited so much of the coast of Texas. Francisco Xavier Mina, a young Spanish soldier, resolved to lend the patriotic cause in Mexico his sword and aid the people of that country in their struggle for liberty. He determined to make Galveston Island his base of operations. He worked in cooperation with Don Luis Aury, a naval officer. His plan was approved by Herrera, a commissioner of the Mexican revolutionary or Morelos government to the United States. Herrera, with Aury, landed on Galveston Island with an expedition in September 1816. A government was organized, Aury was made civil and military governor of Texas and Galveston Island and took the oath of fealty to the Republic of Mexico. In November 1816, Mina arrived at Galveston with a few small vessels and about 200 men. Mina and Aury abandoned the island in March 1817. Just about the time they left Galveston Island we have the first account of Lafitte coming to the island. The pirate is supposed to have reached Galveston late in 1816. He held letters of marque from the revolutionary government of Venezuela authorizing him to prey upon the commerce of Spain. He had a number of vessels and quite a force of adventurers. He also assumed to be governor of Texas under the revolutionary government of Mexico, probably having received some such authority from Herrera, the Mexican commissioner in New Orleans. Lafitte's purpose was to capture Spanish vessels sailing under the flag of the Mexican republic. By the close of the year 1817 the population of Galveston had increased to nearly 1,000. The United States and Spain found cause for complaint against the pirates, but Spain feared the United States would claim the island if the pirates were dispersed by the American naval establishment and the United States did not feel called upon to take action, owing to the attitude assumed by Spain, consequently Lafitte was left undisturbed. In 1820 an American vessel was taken by Lafitte's men. The United States government then dispatched an armed vessel under Lieutenant Kearney to break up the establishment at Galveston. Lafitte left Galveston for good, but continued his depredations upon Spanish shipping until 1826. In 1820 Dr. James Long visited Galveston Island to induce Lafitte, who was about leaving Galveston, to co-operate with him in the establishment of a government at Nacogdoches. Lafitte referred to the failure of all previous attempts to invade Texas and refused to join Long. Before Long left Bolivar Point a French sloop freighted with wine stranded on Galveston Island. Caroñkawas to the number of 200 were encamped in the vicinity. They attacked and butchered the crew, plundered the sloop and engaged in a drunken jollification. Long determined to chastise them. After nightfall with 30 men he passed over to the island in small boats. In the fight the Caroñkawas outnumbered the whites seven to one. Long was compelled to retreat. Three of his men were killed; 32 Indians were left dead on the field.

Little is heard of Galveston Island after Long's expedition until just previous to the battle of San Jacinto. The island was practically abandoned from 1820 until along in the thirties, when the Mexican government established a custom-house on the island. On the occasion of the preliminary meeting at Brazoria to declare the independence of Texas in 1835 there was no representitive present from Galveston. The same is true of the more formal declaration of independence which was made on 2 March 1836, at Washington on the Brazos. Just prior to the battle of San Jacinto the new Texas government retreated from Washington to Harrisburg. As Santa Anna and his army approached Harrisburg, President Burnet and his Cabinet sailed down to Galveston Island, narrowly escaping capture. The news of the victory at San Jacinto reached President Burnet on Galveston Island 26 April 1836. The provisional government of Texas under Governor Smith in 1835 had granted letters of marque and reprisal and had provided for the establishment of a small navy. The *Liberty*, one of the vessels of this navy, was at Galveston at the time of the battle of San Jacinto. Several prizes were taken by the Texas navy and brought into Galveston Bay. During the hostile period following the battle of San Jacinto the Mexican government proclaimed a blockade against the ports of Texas and in attempting to enforce it interfered with vessels of the United States. In 1837 the Texas navy was increased and several vessels were stationed at Galveston. The Third Congress of the Texas republic assembled at Houston in November 1838. The county of Galveston was represented for the first time in the third House of Representatives by Moseley Baker. After the annexation of Texas and the outbreak of the Mexican War the first Texas regiment to join General Taylor was composed of six months' men raised and organized in Galveston, commanded by Albert Sydney Johnston. Galveston County was created 15 May 1838. The battle of Galveston during the Civil War occured 1 Jan. 1863. The first railroad begun in Texas was at Harrisburg in 1852. The Galveston, Houston and Henderson road was begun at Virginia Point in 1855. Trains were first run from Virginia Point to Houston in 1859 and in that year a contract was let for the first Galveston Bay bridge, which was completed and trains were run into Galveston in 1860.

The jetties at Galveston were completed in 1896, since which time the water at the point where the bar existed has been slowly deepening. (See GALVESTON, JETTIES AT). Galveston wharves are only one hour from the deep sea for a laden steamer. Galveston wharf and terminal facilities, as a system, have few equals in the country, being excelled in no particular except size.

In December 1836, Col. Michael B. Menard purchased of the republic of Texas for the sum of $50,000 one league and labor of land on the east end of Galveston Island. He associated with him a number of persons and they formed a joint-stock company known as the Galveston City Company, which was incorporated in 1841. This company is still in existence, although its present holdings of real estate are not large. The city of Galveston was incorporated in 1839. The first mayor was John M. Allen.

Recent Civic Achievements.— The building of the causeway, connecting Galveston Island with the mainland, the building of the sea-wall and extension thereof and the raising of the grade of a large part of the city are three great achievements. On 8 Sept. 1900 Galveston was visited by a West Indian hurricane which did much damage to property and caused great loss of life. To guard against any such disaster in the future the city government secured the services of an engineering board composed of Gen. Henry M. Robert, Alfred Noble and H. C. Ripley, whose duty was to prepare plans looking to the protection of the city against storm damage. The county of Galveston assisted by the railroads constructed the great causeway. The county constructed the sea-wall and the United States extended same. The wall is 17,593 feet long, 16 feet wide at base and 17 feet high. (See GALVESTON SEA-WALL). The raising of the city grade was financed and carried out by the city with aid extended by the State, under the direction of a grade raising board, composed of J. P. Alvey, chairman; John Sealy and E. R. Cheesborough, secretary, appointed by the governor, S. W. T. Lanham. The total cost of the sea-wall and grade raising was $4,783,138.54, not including the cost of raising 2,156 buildings and other improvements aggregating $1,000,000 additional. The plan adopted in raising the grade of the city was not only remarkable in itself, but was one that called for great sacrifice on the part of the people. A canal, two and one-half miles long, 300 feet wide and 20 feet deep, was excavated from Galveston Bay through the residence section of the city. The people, for the mere payment of taxes, leased their land to the city and improvements were moved to vacant lots. Five self-loading, self-propelling and self-discharging hopper dredges were employed. Sand was sucked up from the bottom of the bay and brought in through the canal and discharged through pipe lines, the water draining back into the canal. The work completed, the canal was refilled and houses replaced. On 1 May 1918, actual construction started on the extension of the present sea-wall, looking to the protection of Fort San Jacinto, the eastern part of the channel of Galveston Bay and that part of the city area lying east of Sixth street, at the joint expense of Galveston County and the United States government, at a cost of $2,741,000, which includes fill to grade for 200 feet back of the wall, a sidewalk and brick driveway. The total length of this additional sea-wall is 10,300 feet. The sea-wall and grade raising have rendered Galveston absolutely safe from serious damage from the most violent storm that could possibly occur. According to the city directory Galveston's population in 1917 was 52,289.

E. R. CHEESBOROUGH,
President of the Galveston Commerical Association.

GALVESTON, Jetties at. The entrance to Galveston Harbor was originally obstructed by an inner bar upon which the depth of water was 9½ feet and an outer bar with a depth of 12 feet. The Federal government adopted the jetty system for improving the entrance to this harbor. Two jetties have been constructed of sandstone riprap and are covered with granite blocks weighing from 5 to 12 tons each. The south jetty is 35,603 feet in length and the north jetty 25,907 feet in length. They are built to a height of five feet above mean low tide and are from 12 to 15 feet in width at the top with a slope of about one and one-half feet to each vertical foot in depth. The distance between the shore ends of the jetties is about two miles; they converge until their sea ends are about 7,000 feet apart apart. The jetties, by confining the water, have increased the tidal scour and secured a depth of 30 feet at mean low tide on both bars. These works, damaged by the hurricane of 8 Sept. 1900, were repaired with granite blocks of 10 tons weight.

GALVESTON, Military and Naval Operations at. In the summer of 1862 Farragut sent several light squadrons to cruise along the coast of Texas, and a blockade was maintained against Galveston, which was abandoned by the Confederate military forces, and 8 October surrendered by its civil authorities to Commander Renshaw of the United States navy. Six United States vessels lay in the bay, commanding the city. Lieutenant Jouen, with two launches, captured and burned the privateer *Royal Yacht*, carrying one heavy gun, and took 13 prisoners, with a Union loss of two killed and seven wounded, 7 November. On 24 December 260 men of the 42d Massachusetts regiment were landed and encamped on the city wharf. At daybreak, 1 Jan. 1863, General Magruder, the Confederate commander in that department, made a combined naval and land attack upon the Union fleet in the bay and the military in the city. He secured four steamers from the adjacent rivers, used cotton-bales for armor, mounted them with guns and filled them with sharpshooters, and attacked the six United States vessels. The *Westfield* was blown up and destroyed by her officers to prevent capture; the *Harriet Lane* was boarded, and surrendered after her captain and executive officer had been killed. One of Magruder's boats went to the bottom in its encounter with the *Harriet Lane*. The land force was attacked by a largely superior force and, after a stout resistance, in which it had 20 men killed and wounded, surrendered. Magruder reported his loss as 26 killed and 117 wounded. The other United States vessels then abandoned the blockade, but Farragut quickly restored it. Soon afterward (11 January) a strange vessel was seen outside and the *Hatteras* was sent to overhaul her. She proved to be the noted *Alabama*, and after a short and hot fight she sunk the *Hatteras*, saving her crew. Ten days later the Union gunboats *Velocity* and *Morning Light*, blockading Sabine Pass, were attacked by Confederate steamers, driven out to sea, and captured, with guns, prisoners and a large amount of stores. Galveston remained in Confederate possession until the close of the war. Consult 'Official Records' (Vol. XV); Mahan, 'The Gulf and Inland Waters'; Maclay, 'History of the Navy' (Vol. II); Lossing, 'Field Book of the Civil War' (Vol. II); the Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

GALVESTON BAY, an inlet of the Gulf of Mexico, extending northward from Galveston about 35 miles.

GALVESTON ISLAND, an island off the coast of Texas on the northeastern end of which is Galveston. Length, about 28 miles.

GALVESTON PLAN OF CITY GOVERNMENT. See COMMISSION FORM OF GOVERNMENT.

GALVESTON SEA-WALL. The date 8 Sept. 1900, in Galveston, Tex., will be referred to by its inhabitants for generations to come. The appalling loss of life and the destruction of property on that date, due to the terrific West Indian hurricane which drove the waters of the Gulf of Mexico over the oleander city, shocked the civilized world. Over 6,000 lives were sacrificed to satisfy the storm king's anger, and over $17,000,000 worth of property was completely destroyed. The city of Galveston is located on the east end of an island about 30 miles in length and from one to three miles in width. The entire south side of the island fronts on the Gulf of Mexico, while the north side fronts on Galveston Bay.

Why the Wall Was Built.— In September 1875 a hurricane swept over the island, causing considerable damage to property. At this time the convention was in session which framed the present constitution of the State of Texas. The impression produced by this hurricane led to the insertion of sections 7 and 8, in Article XI of the constitution, granting all counties and cities bordering on the coast of Mexico the right to issue bonds and construct sea-walls, or breakwaters. Judge Wm. P. Ballinger, one of Galveston's most honored citizens and a lawyer of marked ability, was a member of this Constitutional Convention, and the author of the sections before named. On 28 Aug. 1886 Judge Ballinger addressed an open letter to the citizens of Galveston, calling to their attention this constitutional provision and warning them of the great necessity for the construction of a sea-wall as a means of protection. This letter was a strong appeal, and while it provoked much newspaper discussion, no active steps were taken to carry out the plan offered. When the people of Galveston awoke from their night of death in September 1900, Judge Ballinger's plan was again brought to light, and, although the author had long since passed away, it required no new appeal to spur the then thoroughly aroused people to the point of action.

On 22 Nov. 1901, the Board of Commissioners of the city of Galveston appointed a board of engineers, consisting of Brig.-Gen. H. M. Robert, United States army (retired), Alfred Noble and H. C. Ripley, engineers of national renown, to devise a plan for the protection of Galveston against destructive overflows. On 25 Jan. 1902 this board submitted a plan calling for the construction of a solid concrete sea-wall and the raising of the city's grade. The raising of the grade was not only intended to furnish a solid backing for the sea-wall, but also to prevent the water from the Gulf, in the severest storms, from ever reaching a depth in the city dangerous to life or property. The plan for protection submitted by this engineering board was accepted as the best that could possibly be devised. The county of Galveston, through the Commissioners' Court, agreed to construct the granite concrete sea-wall, and provide a 150-foot right of way and filling for the same, with the understanding that the city proper, with aid from the State of Texas, would undertake the task of raising the grade.

Construction of the Sea-Wall.— This wall is 16 feet at the base, 16 feet high and 5 feet wide at the top, curving from the top to the base. The concrete is composed of one part of cement, three parts of sand and six parts of crushed granite. At intervals of three and one-half feet there is placed in the wall one and one-half inch square corrugated steel reinforcing rods 10 feet long. The riprap on the Gulf side of the wall is 27 feet wide and from three to seven feet in thickness, and is composed of granite.

Raising the Grade.— In order to carry out the plan for raising the grade, the legislature of the State authorized the city to issue bonds to the amount of $2,000,000 at a rate not to exceed 5 per cent. In order to aid the city in caring for these bonds the State granted it $70,000 per annum for a period of 17 years. The management, control and direction of this work were entrusted to three commissioners appointed by the governor and known as the «Grade Raising Board of the City of Galveston.»

GALWAY, Ireland, a municipal and parliamentary borough, a seaport and a county of itself at the mouth of the river Corrib, on the north shore of Galway Bay, 65 miles northwest of Limerick by road. The old town is poorly built and irregular. The new town consists of well-planned and spacious streets, and is built on a rising ground which slopes gradually toward the sea and the river. Galway is the see of a Roman Catholic bishop, but is in the Protestant Episcopal diocese of Tuam. The principal buildings are the cruciform church (Episcopal) of Saint Nicholas (1320); Saint Augustine's Roman Catholic church (1859), monasteries, nunneries, the county courthouse, barracks, prison, infirmary and Queen's College (1849). Galway has flour-mills, a distillery, iron foundries, marble yards, extensive salmon and sea fishing, one of the best and safest harbors on the Irish coast and a lighthouse. The exports consist mainly of agricultural produce, wool and black marble. It was taken by Richard de Burgh in 1232. From the 13th till the middle of the 17th century it continued to rise in commercial importance. In 1652 it was taken by Sir Charles Coote, after a blockade of several months; and in July 1691 it was compelled to surrender to General Ginkell. The borough returns one member to the House of Commons. Pop. 15,944.

GALWAY BAY, a large bay on the west coast of Ireland, between County Galway on the north and County Clare on the south, about 30 miles in length and from 20 to 7 miles in breadth. Across its entrance lie the Aran Islands, and there are numerous small islands in the bay itself.

GÁMA, gä'mä, Antonio Leon de, a Mexican scientist: b. City of Mexico, 1735; d. 12 Sept. 1802. He was secretary to the Supreme Court for a number of years, and subsequently was a professor at the School of Mines. He is best known for his study of the celebrated Aztec calendar stone which was discovered in his time. He was one of the first students of the remains of the past civilizations of America to place the development of archæology upon a scientific basis. For this reason his name stands high in Latin-American scientific circles.

GAMA, José Basilio da, Brazilian poet: b. São José (Minas Geraes), 1740; d. Lisbon, 31 July 1795. He was educated by the Jesuits and joined the company; but on the expulsion of the order in 1795 he left Rio de Janeiro where he had been in a monastery and returned to the seminary of São José. Later on he went to Portugal; and from there he paid a visit to Rome, where he seems to have become closely identified with the prominent representatives of the Catholic faith. On his return to Rio de Janeiro, he was seized as a Jesuit and sent back to Lisbon. There he saved himself by renouncing the Jesuit order and allied himself to the strongly royalist interests. This, backed up by the powerful influence of statesmen, among them Pombal, and his poetical flatteries addressed to the royal family, secured for him an important position in the Ministry of Foreign Affairs. Returning to Rio de Janeiro in 1777 he founded the *Arcadia Ultramarina* on the lines of that of Rome, and became himself a prominent literary figure in the life of the colony. Suspected of plotting treason, by the viceroy, Count Rasende, Gama returned to Lisbon where he spent the rest of his life. His epic poem, 'O Uraguay,' which accused the Jesuits of attempting to form an independent papal nation of the Indians of Uruguay, attracted to Gama considerable notoriety. He was a fairly good poet and has left numerous lesser poems of considerable merit.

GAMA, Vasco da, väs'kō dä, Portuguese navigator: b. Sines, Portugal, 1450; d. Cochin, India, 24 Dec. 1524. He was the first navigator who made the voyage to the East Indies by the Cape of Good Hope. Bartholomew Dias, a Portuguese explorer, having visited the cape, which he called Cabo Tormentoso, or stormy cape, brought back such interesting accounts of his discoveries that the Portuguese sovereign, Emanuel, following the policy of his predecessor, John II, determined to urge discovery beyond the point where Dias left it, and if possible to reach by sea the countries of the Indies. Accordingly an expedition was placed under the command of Vasco da Gama, a gentleman of the king's household and a skilful and experienced mariner. The fleet consisted of the *San Gabriel*, flagship of 120 tons, the *San Rafael* of about 100 tons, a caravel of 50 tons and a store-ship, with a total force of 160 men. On 8 July 1497 Gama's expedition departed from Lisbon for the Cape Verde Islands, whence it set sail on 3 August southward along the African coast. On 7 November they put into a bay called Saint Helena, and departed on the 16th. They then encountered a succession of tempests such as had gained for the southern promontory of Africa the name of the Cape of Storms. The courage of Gama's companions failed, and they besought him to put back, which he not only refused to do, but put the ringleaders of the movement in irons, and held on his course into the stormy sea. On Wednesday, 20 November, they doubled the Cape of Good Hope. On Christmas Day having sighted the coast, it was named Natal, in honor of the day. Further north they discovered Mozambique; the island of Açoutado; the island of Mombassa, and Melinda, where the king gave them a pilot to conduct them across the Indian Gulf. The Melindese pilot is reported to have been acquainted with the astrolabe, compass and quadrant. Under his guidance the voyagers steered 750 leagues across the open sea. In 23 days they arrived off the Malabar coast, and on 20 May 1498 they reached Calicut, the object of their search. Their mission was thus accomplished, and a new route to the East established. Gama's relations with the ruler of Calicut were not cordial; and, therefore, leaving the Indian coast on 15 October, Gama returned to Lisbon, calling at Melinda on the way to take on board an ambassador to Emanuel's court, and arriving in the Tagus September 1499, after an absence of two years and two months. He brought back one ship, a caravel which he had chartered at Cape Verde, and 55 men. The king received Gama most cordially.

Emanuel immediately fitted out a second fleet of 13 ships, with 1,200 men, under the command of Pedro Alvarez Cabral, to establish trading posts; but failing in its ends, another fleet of 20 ships was placed under command of Gama. This expedition, which was warlike in its character, sailed early in 1502. On reaching Calicut, Gama immediately bombarded the town, enacting deeds of inhumanity and savagery too horrible to detail. From Calicut he proceeded to Cochin, and, having made favorable trading terms with it and other towns on the coast, he returned to Lisbon in September 1503 with richly laden ships. He and his captains were welcomed with great rejoicing; Da Gama himself having great privileges conferred on him, and being made admiral. Soon after his return Vasco retired to his residence in Evora, and for 20 years took no part in public affairs, either from pique at not obtaining, as is supposed by some, so high rewards as he expected, or because he had in some way offended Emanuel. During this time the Portuguese conquests increased in the East, and were presided over by successive viceroys. The fifth of these was so unfortunate that Gama was recalled from his seclusion by Emanuel's successor, João III, created count of Vidigueira, and nominated viceroy of India, an honor which in April 1524 he left Lisbon to fill. Arriving at Cochin in September of the same year, he immediately set himself to correct, with vigor and firmness, the many abuses and evil practices which had crept in under the rule of his predecessors. He was not destined, however, to prosecute far the reforms he had inaugurated, for on Christmas eve following his arrival he died, and was buried in the Franciscan monastery there. In 1538 his body was conveyed to Portugal and entombed in the town of Vidigueira, of which he was count. The important discoveries of Vasco da Gama had the result of enriching Portugal, and raising her to one of the foremost places among the nations of Europe. Consult Correas, 'The Three Voyages of Vasco da Gama' (Hakluyt Society 1869); the 'Journal' of his first voyage, edited by Ravenstein (Hakluyt Society 1898); Jayne, 'Vasco da Gama and His Successors 1460–1568' (London 1910).

GAMALIEL ("God is a reward"). Two persons of this name are mentioned in Bible history. The first, Gamaliel, the son of Pedahzur, in the book of Numbers, i, 10; ii, 20; vii, 54, 59; x, 23, as prince or head of the tribe of Manasseh. The other and better known Gamaliel is mentioned twice in the Acts of the Apostles. In both passages he appears as a learned doctor of the law of the sect of the Pharisees. From the one we learn that he was the preceptor of Saint Paul, who was brought up in Jerusalem, "at the feet of Gamaliel." In the other we find him advising the council of Sanhedrim in regard to their treatment of the apostles, and it is the advice given on this occasion which has rendered him famous. "If this counsel or this work," he said, "be of men it will come to naught, but if it be of God ye cannot overthrow it, lest haply ye be found to fight even against God." Ecclesiastical tradition makes Gamaliel become a Christian, and relates that he was baptized by Saint Peter and Saint Paul; but the story does not appear to be supported by any evidence. He has been identified by scholars with Gamaliel, the son of Simeon and grandson of Hillel, president of the Sanhedrim under Tiberius, Caligula and Claudius.

GAMARRA, gä-mär'rä, Augustin, Peruvian general: b. Cuzco, 27 Aug. 1785; d. Yngavi, 20 Nov. 1841. He fought in the Spanish army in 1809–21, attaining the rank of lieutenant-colonel. He went over to the revolutionists in 1821, became general and was made grand marshal. He marched into Bolivia (1827), and effected the Treaty of Pisagua (1828). From 1829 to 1833 he was President of Peru, and on the expiration of his term of office he tried to continue to hold the presidency by military force; but was compelled to depart hurriedly into Bolivia and later was variously identified with the political disturbances of the time. In 1837 he took a leading part in Chilean opposition to the Bolivia-Peru confederation; and upon the conclusion of a successful campaign in which he commanded the Peruvian reserves, he became President of Peru (1839). He was killed in battle during an invasion of Bolivia.

GAMBA, a stringed instrument of the viol sort, called also viola da gamba, with six strings, weaker in tone and smaller in size than the violoncello, so called because it was held between the knees of the player, as distinguished from viola da braccia, played on the arm. Also an organ stop, the pipes of which are, in continental organs, generally cylindrical, of small scale, and well cut up, but sometimes conical in shape.

Its tone is pungent, and not unlike that of a violin or violoncello.

GAMBADO, or GAMBADE, a leather legging for equestrians; it is wrapped round the leg, reaching from the knee to the foot, and is fastened at the side by clasps. The term is also used for boots fixed to the saddle instead of stirrups.

GAMBESON (spelled also *gambeison*). A defensive body garment worn in the chain mail period. (See CHAIN ARMOR). Its description and name vary at different times or at the hands of different contemporary writers, being termed also *wambais, wambeys* or *wambeis* and *acketon* or *haketon*. It was wadded with wool and quilted in parallel lines. In the 13th century it took the place of the tunic under the coat-of-mail (see HAUBERK) to break the force of blows in combat. It, at times, was long enough to reach the knees and shows up (in old illustrations) for several inches below the shorter hauberk. The gambeson was worn also by foot-soldiers and knights often as the sole body defense; again, it appears to have been worn over the hauberk, sometimes with a superimposed surcoat; or the surcoat has been termed *gambeson* when gambisoned (quilted) with cotton wool. A defensive coat of this same form but made of leather appears to have been termed *gambeson*.

GAMBETTA, găm-bĕt'tä, **Léon Michel,** French statesman: b. Cahors, France, 3 April 1838; d. Sèvres, France, 31 Dec. 1882. He was of Genoese extraction; was educated for the Church; but finally decided in favor of the law; and going to Paris became a member of the metropolitan bar in 1859. In November 1868 he gained the leadership of the Republican party by his defense of Delescluze, a noted Republican. In 1869, having been elected by both Paris and Marseilles, he chose to represent the latter city; and in the Chamber of Deputies showed himself an irreconcilable opponent of the empire and its measures, especially of the policy which led to the war with Prussia. On the downfall of the empire, after the surrender of Sedan in 1870, a government for national defense was formed, in which Gambetta was nominated Minister of the Interior. The Germans having encircled Paris, he left that city in a balloon, and set up his headquarters at Tours, from which, with all the powers of a dictator, he for a short time organized a fierce but vain resistance against the invaders. In the capitulation of Paris, he resigned. After the close of the war he held office in several short-lived ministries, was president of the Chamber under Grévy, and the director of its policy; and in November 1881 accepted the premiership. The sweeping changes proposed by him and his colleagues speedily brought a majority against him, and after a six weeks' tenure of office he had to resign. The accidental discharge of a pistol led to his death, which was deeply mourned in France. He had remarkable oratorical gifts, the faculty of command and showed consummate tact in uniting the extremists of the Republican party with the centre, in opposition to all the reactionary elements in France. He founded *La republique française* in 1871. Consult Reinach, 'Léon Gambetta' (1884); Harrison, 'Leon Gambetta, a Positivist' (1892); Tournier, 'Gambetta' (1893); Gheusi, 'Gambetta: Life and Letters' (English trans. 1910).

GAMBIA, (1) a British colony in West Africa, occupying portions of territory at the mouth of the river Gambia, some of its islands, and (including the adjacent territory under British protection) about six miles of land on either bank for a distance of 250 miles from the sea, and the navigable waters of the Vintang Creek. It thus forms a narrow strip running through French territory; total area, about 4,500 square miles. The principal settlement is Bathurst, at the mouth of the river. There is comparatively little fertile land, and agriculture is primitive. Gambia differs very little from the other West African settlements in being unhealthful. The position of Bathurst, the seat of government, is very unhealthful in the rainy season. There are a number of Anglican, Roman Catholic and Wesleyan schools in the colony. Cotton cloth is manufactured to some extent by the natives, who also prepare palm-oil, build boats, etc. The principal exports are groundnuts, rubber, beeswax, ivory, hides, gold and palm-oil. The value of imports in 1912 was over \$3,700,000 and the exports amounted to \$3,600,000 and in 1915 \$1,471,941 and \$1,766,-543 respectively. Gambia is a Crown colony under an administrator, who is assisted by an executive and a legislative council. The population of the entire region in 1911 was about 138,400, including about 200 whites, the remainder being chiefly negroes. (2) A river flowing through the above colony and giving to the colony its name. Rising in the mountains of Senegal, after a course of about 700 miles it expands into a broad estuary and at Bathurst enters the Atlantic Ocean. For 170 miles it is navigable by seagoing vessels.

GAMBIER, găm'bĕr, **James,** BARON, English naval officer: b. New Providence, Bahamas, 13 Oct. 1756; d. near Uxbridge, England, 19 April 1833. He entered the navy and off Ushant fought with distinction as commander of the *Defence* under Lord Howe in 1794. In 1802 he was appointed governor of Newfoundland. As admiral he commanded the British fleet at the bombardment of Copenhagen in 1807 and was rewarded with a peerage. At the action in Basque Roads in 1809 he refused to act on the instructions of Cochrane, Lord Dundonald, was tried by friendly court-martial and acquitted. He was one of the commissioners who negotiated the Treaty of Ghent in 1814. Gambier attained the rank of admiral of the fleet in 1830.

GAMBIER, Ohio, village of Knox County, on the Cleveland, Akron and Columbus Railroad, 50 miles north of Columbus. It is noted for its educational institutions, including Kenyon Episcopal College (q.v.), Bexley Theological Seminary and the Harcourt Place School. Pop. 537.

GAMBIER ISLANDS, or ARCHIPELAGO, a group of small islands of the south Pacific about lat. 23° 8′ S. and long. 134° 55′ W. The total area of the group is about 10 square miles. The natives are a well-formed race and have made some progress in civilization. On Mangareva, the largest of the group, some French missionaries settled in 1834 and the islands now belong to France. The total population is about 500 or 550.

GAMBIR, or GAMBIER, called also *Terra japonica*, an astringent substance obtained from the *Uncaria gambir*, a tree of the family *Cinchonaceæ*, cultivated in Sumatra and other islands of the Malay Archipelago. It is obtained from the leaves by boiling or infusing them in water, inspissating the resulting fecula and forming into cakes. The Chinese use it for chewing and in the Western world, principally in Great Britain, it is employed in dyeing and tanning, also medicinally. It is mostly exported from Singapore. It is often considered as one of the articles of catechu (q.v.).

GAMBLE, Francis Clark, Canadian civil engineer: b. Toronto, Ontario, 1848. He was educated at the College of Upper Canada; in 1869 became a civil engineer on the Intercolonial Railroad, in 1872 assistant engineer of the Great Western. He was later assistant engineer of the Canadian Pacific and in 1881 was made assistant engineer of the Department of Public Works of British Columbia, was resident engineer and agent from 1887 to 1897 and from 1898 to 1911 was engineer of public works. In 1911 he became chief engineer and inspecting engineer of railways. He is a member of the Canadian Society of Civil Engineers and of the English Institute of Civil Engineers and the American Society of Civil Engineers.

GAMBLE, Hamilton Rowan, American statesman: b. Winchester, Va., 1798; d. 1864. He was admitted to the bar in Virginia, settling in Missouri 1818 and being elected secretary of state of that Commonwealth 1823. Practising law at Saint Louis he became judge of the Supreme Court and was elected a member of the Constitutional Convention 1861 and appointed by it governor in place of C. F. Jackson, who had become a secessionist.

GAMBLING, or GAMING, the practice of playing for a money stake, games depending solely on chance, like roulette, for instance, or those other games into which the element of skill enters, as in the cases of whist or billiards. Strictly speaking, gambling may be understood as gaming in its worst sense and as implying professional play for a money stake by men who are unscrupulous adepts at so-called games of chance. Gambling has been common among most nations, civilized and uncivilized. The practice of civilized communities in regard to these acts has been far from uniform. The odium of gambling has sometimes been attached to games perfectly innocent in themselves and these games have been prohibited to the manifest prejudice of the law, which has thus been brought into dishonor and contempt. At other times, governments, tempted by the facilities of sharing in the dishonest gain, have openly and shamelessly encouraged gambling by licensing gaming-houses, or instituting lotteries under their own authority. See LOTTERY.

Gambling in Europe.— In England gambling was early made the subject of penal enactments. Statutory restrictions upon games and gaming go back as far as Richard II. In France, public gaming-tables were suppressed from 1 Jan. 1838. Previous to the formation of the new German Empire gambling was encouraged by official countenance in several of the principalities of Germany. Baden-Baden, a watering-place in the grand-duchy of Baden, and Homburg, then in the landgravate of Hesse-Homburg, were until comparatively recent times the two most famous resorts in Europe of the frequenters of gaming-tables. Since the suppression of gambling in these places, after the formation of the Empire (31 Dec. 1872), the principally of Monaco in Italy has become the last public resort of this species of grambling in Europe.

Repression of Gambling in the United States.— In the United States the keeping of a gambling-house is indictable at common law as injurious to morals; and most States and Territories have passed laws against gambling, some of them severe and stringent. Yet till 1880 gambling was common and open in many parts of the United States; and it was left largely to societies for the suppression of vice, especially in New York, to stir up the authorities to put the laws in force. In 1881–84 prosecutions and convictions were very numerous; in 1885 almost all the chief cities in the Union followed the example of New York and since that time the progress of legislation on this subject has been noteworthy in many of the States. Always there is difficulty in legally defining gambling and distinguishing in judicial practice between acts which violate the gambling laws and those which, while presenting some questionable appearances, are yet not obviously to be classed in the same category. As in so many other matters of public policy, there is also a loss of power to the regulative sentiment of the people through want of uniformity or any considerable degree of identity among the laws of various States and sections. Therefore it is scarcely strange that, in spite of all prohibitive legislation and repressive influences brought to bear by public opinion, gambling should, either through connivance of the authorities or by secrecy and evasion, continue to be practised in many of the large cities of the United States. As in all other matters of public interest, the moral sentiment of the community steadily seeks and no doubt gradually finds a controlling expression through its official representatives in the legislative field and in local and general administration. Consult Coldridge and Hawksford, 'The Law of Gambling, Civil and Criminal' (London 1913).

GAMBOGE, găm-bōj' or -booj', a gum-resin derived from *Garcinia cambogia*, a member of the order *Guttiferæ*. The gamboge tree itself is a native of Siam, Cochin-China, Cambodia (which gives the drug its name), from which places the drug is imported to Europe and to the United States. Other forms of gamboge that are rarely seen in the American market are found in India, China and the Asiatic Islands. The gum-resin is obtained by cutting or wounding the trunks of the trees causing a bright yellow juice to flow. This is collected, usually in bamboo joints, and hardens naturally, or is dried over a fire, until a solid mass results, which generally takes the shape of the collecting vessel. In the drug market pipe gamboge, press gamboge and cake gamboge are recognized. Pipe gamboge is preferred because it is usually clean. As a pigment for painting, gamboge has been known for centuries and as a purgative it has been used in

China as long as history gives any definite information.

The gum-resin contains a large amount of gum, 15 to 20 per cent and 70 to 80 per cent of a yellow resin, gambogic acid, on which its purgative properties depend. The formula of gambogic acid is $C_{40}H_{28}O$. Taken into the body in doses of from two to five grains, it acts as a very active hydragogue cathartic, producing numerous watery stools, with much griping. It is principally valuable when combined with some other drug that tends to diminish the pain and it is one of the most important ingredients in the compound cathartic pill of the United States Pharmacopœia, which contains one-quarter of a grain of the resin. Overdoses cause violent poisoning with intense prostration.

GAMBRINUS, găm-brī'nŭs, a mythical king of Flanders, inventor of beer, said, probably incorrectly, to have an original in Jan Primus (or Jan. I), Duke of Brabant. He is represented in Germany as Saint Gambrinus, patron of drinking. His figure is familiar in German beer-cellars, often seated astride a cask, a foaming tankard in his hand.

GAME BREEDING signifies to most persons the rearing in captivity of gallinaceous birds for purposes of sport, as pheasants, grouse, quails and the like; but it must be extended to include the rearing of wild ducks and geese in confinement to be sold as food. The peacock, turkey and our domestic poultry (originally jungle fowls) are familiar examples of ancient success in this direction and local species of wild birds of this order are «pets» in all parts of the world. Great Britain rears annually, under personal care, millions of the common South-Russian pheasant (see PHEASANT) for the sake of sport in the autumn; and great quantities of this game and of the red grouse preserved on the grouse-moors of Scotland and elsewhere have been utilized as food in the scarcity of food resulting from the present war in Europe. The ring-necked pheasant of eastern China and Japan was long ago taken to Europe and has interbred with the Western pheasants until now it is difficult to find any of either kind there of pure blood. This ring-neck was introduced from semi-domesticated Japanese stock into Oregon about 1890 and in a few years had become a common wild bird throughout all that coast-region and still remains so, although no particular care has been given to it. This is owing to the similarity of the mild climate to that of their native lands. Some years later pairs of these and of the British pheasants were acclimated in the Eastern States and did well. They are now reared on country estates and farms all over the United States for both pleasure and profit and in many places have been turned out as wild birds. They are described as light eaters, of good size and are very prolific; and both birds and eggs bring excellent prices. Several other species are reared, with more trouble, for ornamental purposes, principally the golden, silver, eared, Reeve's and Lady Amherst's pheasants; but they are more costly and less hardy. Very full and trustworthy directions for their care during the breeding season, the treatment of the young, feeding, etc., may be found in the books quoted below.

The wild turkey has been bred in some cases, but only where an extensive tract of enclosed wild woodland is available. It is possible to rear any of the grouse, but only the ruffed grouse has been successfully produced and this is attended with many difficulties on account of the pugnacity of the male and other troublesome factors. Each pair requires a large, separate wire-enclosure, the cost of which is so great that grouse-culture will not be profitable commercially until the wild supply is much diminished. The cultivation of bob-white (our American «quail,» called «partridge» in the South, where the ruffed grouse is known as «pheasant») has been undertaken on a large scale and with considerable success on Long Island and in some other favorable places; but each breeding-pair must have a small separate enclosure and the eggs must be incubated in almost every case by a bantam hen. The increase is fast, but when the birds are strong the coveys are likely to stray out of bounds. The Mexican scaled quail, a very pretty and interesting bird, has been reared on several Northern estates as also has the California and other Western quails; but these are pets and ornaments only, as yet. The methods of culture have been learned, however, and hereafter may be of much service in restocking depleted areas. The common European partridge was imported very largely a few years ago under the name Hungarian partridge and was bred easily in preserved tracts; but it disappointed the hope of sportsmen, has not multiplied and is no longer in favor. On the whole the breeding of game-birds, while a very delightful amusement, has not become of any practical importance.

The breeding of waterfowl has much the same history. The Canada and other wild geese have long been reared by themselves in confinement, or are mixed with tame flocks; so, also, has the mallard, from which, indeed, our domestic ducks are mainly derived. Black ducks are easily domesticated and these, with mallards, are produced for market in some places. Experiments show that with labor and much expense any of the fresh-water ducks may be reared; but thus far the matter is one of enjoyment rather than profit. Many extensive «game-farms,» devoted to cultivating and selling breeding-stock of these various birds, exist in the Northern States; but the movement for general game-production in this way encounters considerable popular opposition and does not receive the legal encouragement that it desires and perhaps needs, owing to popular prejudice against its apparent exclusiveness. Consult files of the *Game Breeder* magazine and the writings of its editor, Dwight Huntington; Bulletins No. 1 and No. 2 of the National Association of Audubon Societies; Job, H. K., 'The Propagation of Wild Birds' (New York 1915).

ERNEST INGERSOLL.

GAME-FOWLS. See COCKFIGHTING; POULTRY.

GAME LAWS, legislative enactments adopted by nations and states to prohibit or regulate the killing of wild animals, birds and fishes. In Great Britain the game laws are a relic of the forest laws, which in the time of the Norman kings were so oppressive; it being under the Conqueror as great a crime to kill one of the king's deer as to kill one of his subjects. A certain rank and standing, or the possession of a certain amount of property, were for a long time qualifications indispensably necessary to confer upon any one the right of pursuing and killing game. By the Game Act of William IV the game laws were greatly modified, the necessity for any qualification except the possession of a game certificate being then abolished and the right being given to any one to kill game on his own land, or on that of another with his permission. Every uncertificated person selling game is also required to take a yearly license. The animals designated as game by this act are hares, pheasants, partridges, grouse, heath-game or moor-game, black-game and bustards. These animals (with the exception of hares) are not allowed to be killed at all times, there being a certain season of the year — the close season — during which all people are prohibited from killing game. By an act of 1880 every occupier of land has a right, as inseparable from and incident to the occupation of the land, to kill and take ground game (hares and rabbits) thereon, concurrently with any other duly authorized person, all agreements in contravention of this right being declared void. Game laws of greater or less strictness are in force in many other countries. In Canada the chief restrictions are in regard to killing wild animals during the breeding season.

Game Laws in the United States.— In the United States wild game whether of forest, field or stream is perhaps better protected than in any other country in the world. Although there are certain general national laws, all States have passed game laws of their own and many States have organized societies for the protection and preservation of game. There are eight national organizations, the most important being the League of American Sportsmen. The others are the American Ornithological Union; the National Sportsmen's Association; the National Bird, Game and Fish Protective Association; Bird Protective Society of America; Boone and Crockett Club; International Forest, Fish and Game Association and North American Fish and Game Protective Society. Nearly every State in the Union has now a Game and Fish Commission and numerous game wardens.

The national game law, known as the Lacey Law, passed by Congress in 1900, gave to the Department of Agriculture certain powers, by which among other provisions no importation of wild animals, birds or fishes could be made without a permit from Secretary of Agriculture.

Many important additions and amendments to the Federal laws have been passed during the last 10 years, all tending to protect game and game birds in their natural state without interfering with the importation of birds, birds' eggs or animals for breeding purposes. During 1910 there was an increase in these importations. Foreign mammals were imported to the number of 7,862, less than 600 of which could be classified as game animals, while the number of game birds imported was 49,989. Among the importation of the year were the valuable specimens obtained for the National Zoological Park at Washington through the Roosevelt expedition and containing, among other mammals, several African antelopes and a lophiomys, a peculiar maned rodent rarely seen in zoological collections. Another shipment worthy of special mention was the six musk oxen brought from the Arctic regions for the New York Zoological Park by Paul J. Rainey, this being the largest number ever brought to the United States.

European Game Birds for American Covers.—A great deal of interest has been manifested in the experimental stocking of American covers with European game birds. The Hungarian partridge was the favorite prior to 1910, but since that time there has been a marked tendency to return to the pheasant. Thousands of pairs of partridges and English ringneck pheasants have been imported and distributed in Indiana, New Jersey, California, Colorado, Louisiana, Oklahoma, Iowa, Vermont, the Dakotas and other States. Pheasant eggs have been imported for hatching and later liberation. The experiments with other game birds has been so disappointing that practically nothing was done along these lines.

The movement toward securing uniform laws for the protection of song, insectivorous and other non-game birds has also made substantial progress since 1900. The Shea plumage bill, prohibiting the sale of aigrettes and other plumage, took effect 1 July 1911. Laws protecting non-game birds have been very generally adopted in Canada.

Protectors, Seizures, Sportsmen's Associations, Close and Open Seasons.— New York since 1902 raised the number of salaried protectors from 50 to 90 and New Jersey has given its wardens every power to make searches and seizures. The total number of authorized game protectors in the 42 States reporting in 1910 was 9,354. Of these 748 were salaried officials, 1,167 were paid per diem and 7,439 performed their services without remuneration.

Under the Lacey Act numerous seizures were made of game shipped from the West and Southwest and proceedings were instituted in a number of cases in State and Federal courts. In some of the cases in Iowa and South Dakota convictions were secured with penalties ranging from $150 to $200. The inspection of foreign birds at the port of New York was made more effective and special inspection service was established in Hawaii and extended in scope so as to prevent the introduction of noxious reptiles into the islands.

Even more important than the enactment of new game laws has been the work of game commissions and voluntary organizations interested in the practical protection of birds and game. In 1910 important changes were made in the game commissions of several States and five salaried game wardens were appointed in Alaska. Several sportsmen's game and fish protective associations were added to the large number already existing and the Audubon Society began a special campaign of bird protection in the South. Nearly all the States now have Audubon societies, which are formed primarily for the protection of birds other than game. The committee of the American Ornithologists' Union on the protection of birds extended its work along the coast and now maintains supervision of all the breeding colonies of sea birds on the Atlantic coast from Eastport, Me., to Chesapeake Bay, as well as at some points in Florida.

Practically all the State game laws passed by the various State legislatures prohibit the export of game, hunting or fishing for commercial purposes and hunting big game with dogs. In a few States the netting of minnows for bait is also prohibited. The killing of song birds is forbidden in most of the States, but this law does not apply to the hawk, owl, crow, blackbird and English sparrow. Hunting and fishing in the national Yellowstone Park is prohibited.

While the close and open season for hunting and fishing are well defined in all the States, there is no general statement that can cover the question, the seasons and conditions varying so widely. In Alabama, for instance, deer may be shot for two months only (November to January), in Indiana at no time, and in Illinois no deer can be shot until 15 June 1919. All State game laws are peculiarly adapted to local conditions.

New regulations on close seasons for migratory birds were made public 22 Aug. 1916 by the United States Department of Agriculture, after its approval of recommendations by the Federal Advisory Committee on the Migratory Bird Law. Spring shooting has been everywhere refused. It has been adopted as a fixed rule for the present that in no part of the country may there be shooting after the game has started for its breeding grounds in the North. The committee recommended a maximum shooting season of three and one-half months for any section of the country and tried to equalize opportunity as best it could in fixing that season. Among the valuable North American birds that the committee said were "candidates for extinction" were the whooping crane, trumpeter swan, American flamingo, roseate spoonbill, scarlet ibis, long-billed curlew, upland plover, Hudsonian godwit, red-breasted sandpiper, golden plover, dowitcher, willet, pectoral sandpiper, black-capped petrel, American egret, snowy egret, wood duck, band-tailed pigeon, heath hen, sage grouse, white-tailed kite, prairie sharptail, pinnated grouse and woodcock. See AUDUBON SOCIETY; FISHING; HUNTING.

GAME PRESERVES, or GAME PARKS, are large reservations of land, usually including mountain and forest, set aside by the government or individuals, for the propagation and preservation of game. Game preserves have been well known in Great Britain and on the Continent for upward of five centuries. Henry VIII established a royal deer park near Hampton Palace in 1526, and the Duke of Sutherland at the present day owns the largest game preserve in the world. Game preservation in the United States first attracted attention just prior to the Civil War and later when the rapidly increasing settlement of the States threatened the extinction of all kinds of wild game.

The United States government took up the question of game preservation almost as soon as the individual, and the establishment of the Yellowstone National Park in the Rocky Mountains and the Yosemite National Park in California had as much to do with the protection of big game as in the preservation of forests. In these two reservations the government ranges have endeavored to preserve and protect such large game as the buffalo, elk and moose. The other nine national parks nearly all include reservations for the protection and preservation of wild animals, including birds. In 1902, President Roosevelt, himself a hunter of big game, declared no less than 12 new national forest reserves which, while largely important to forestry, will greatly assist in the protection of big game. These new reserves had a total area of 14,276,476 acres. Since that time many important additions have been made to the list of reservations, some of which follow:

	Acres
San Isabel, Colorado	77,980
Santa Rita, Arizona	337,300
Niobrara, Nebraska	123,779
Dismal River, Nebraska	85,123
Santa Catalina Arizona	155,520
Mount Graham, Arizona	118,600
Lincoln, New Mexico	500,000
Chiricahua, Arizona	169,600
Madison, Montana	736,000
Little Belt Mountains, Montana	501,000
Alexander Archipelago, Alaska	4,506,240
Absaroka, Montana	1,311,600
Grand Canyon, Arizona	1,402,930
Afognak Forest, Alaska	512,000
Mount Olympus, Washington	608,640
Montana National Bison Range	18,521
Munkunyuweap, Utah	15,840
Colorado National Monument, Colorado	13,883
Billy Meadows Pasture, Oregon	2,560
Mobrara Reservation, Nebraska	1,250

There are also numerous State preserves. Wyoming has five, including Teton State Preserve of 576,000 acres; Pennsylvania five, of a total of 1,600 acres; Montana has the Snow Creek Game Preserve of 57,600 acres; and New York State has the famous Adirondack State Park.

Of private game parks in the United States, the first of record was that of Judge J. D. Caton of Ottawa, Ill., the author of 'Deer and Antelope in the United States.' This he established in 1860, for sport and study, bringing together on his large estate many varieties of game animals native to America. In 1889, Austin Corbin enclosed the area known as Blue Mountain Forest, situated near Newport, N. H. It contains over 36,000 acres and is surrounded by a wire fence, eight feet high, forming an oblong tract 12 by 5 miles, and which is crossed by a mountain range, the peaks of which are 3,000 feet high. Here are miles of wooded slopes, dense forests and broad meadows, giving food and shelter to all kinds of game animals, from the buffalo, elk and moose to the smaller species. The experiment has been most successful, nearly all of the animals thriving and increasing rapidly in numbers. In 1870, F. S. Giles laid out the Grove Park reservation, containing 17,000 acres and this experiment was followed by Dr. W. Seward Webb with a preserve of 9,000 acres at Nebasane, N. Y., in the Adirondacks, Northern New York, and another preserve at Shelburne, Vt. The Litchfield Park at Tupper Lake, N. Y., in the Adirondacks, was established in 1893, with 9,000 acres, and in 1900 hundreds of herds of large game were roaming the mountain forests within this tract. In the same region the Adirondack Timber Company has a park of over 30,000 acres, well stocked with animals. George W. Vanderbilt at his Carolina estate of Biltmore has 80,000 acres, 6,000 acres of which are enclosed and well stocked with game. A small army of men are engaged here as keepers. In many of the smaller parks particular attention has been paid to game birds, such as the English pheasant, prairie chicken and wild turkey. A lover of birds imported large numbers of Japanese pheasants for his preserve in Oregon in 1893, the experiment proving a great success. E. C. Benedict of Greenwich, Conn., has established extensive fish preserves in Long Island Sound, which are the largest and most successful of their kind in this country. Near Plattsburg, N. Y., Paul Smith owns an immense preserve around Saint Regis Lake of 40,000 acres. Large numbers of elk were brought here from the West in 1903. William C. Whitney of New York has been active in stocking the Adirondack region with big game, and in conjunction with Dr. F. E. Kendall of Saranac Lake, has restocked the forests with elk and deer. At Delaware Water Gap, Pa., on the New Jersey side of the Delaware River, Barclay Warburton of Philadelphia established in 1902 an extensive deer park, which is one of the most successful in that section of the country. Dr. R. V. Pierce bought about 20 square miles for a preserve at Saint Vincent Island, which was established in 1909 for the preservation of waterfowl. Marsh Island, La., was purchased by Mrs. Russell Sage in 1912, and set aside as a refuge for waterfowl. George Vanderbilt's Biltmore estate in North Carolina has been largely donated to the United States government as a game preserve.

In Canada there are several large game preserves, prominent among which is the Caughnawaga reservation on the Maquacippi River. The Roberval Club, which has a membership of 300 including both American and Canadian, owns a big game preserve containing 500 square miles, located in the Laurentian Mountains. Henri Menier occupies as a game park the whole of Anticosti Island, in the Gulf of Saint Lawrence.

GAME PROTECTOR LEGISLATION AND GAME LAWS, legislative enactments adopted by nations and states to govern the appointments of game officials, and formulating the rules and regulations to be observed in fishing and the hunting of game. See GAME LAWS.

GAMES, Gutierre Diez de, a Spanish chronicler and soldier of the first half of the 15th century, attached to the person of Pero Niño, Count de Buelna (1379–1453). His work which constitutes an interesting and faithful account of the life of Pero Niño from his early boyhood days is one of the most curious in any language. It is simple in form and language and direct in manner and aim. It is, therefore, of considerable value for the historical point of view. Of the life of Games himself nothing is known except what he himself personally and incidentally reveals in the course of the 'Chronicle.' He seems to have followed his master in all his wars and to have struck many a stout blow for him and his cause. So vivid and faithful are his pictures of his young master that they show how the young sons of noble families lived and acted in that age; what their interests were and how they proceeded to satisfy them. Games boasts that he was Pero Niño's standard-bearer on many an occasion when the battle raged fiercely. But he was never more truly his standard-bearer in the ardor of combat than in the intimacy of his personal description of his patron in his delightful and chatty 'Chronicle' ('Crónica de Don Pero Niño'). This work, which lay long in manuscript, appears to have been used by subsequent chroniclers and historians and to have been cited frequently from early times, as one of the most important documents relating to the history of the reign of Henry III. It was finally edited and considerably abridged by Eugenio de Llaguno Amirola, appearing in print in Madrid in 1782. Under the title 'Cancionero de Baena' a second edition was published by P. J. Pidal (Madrid 1851), and a third by Fr. Michel (Leipzig 1860). Consult Cueto, L. A. de (Marquis de Valmar), *Revue des Deux Mondes* (15 May 1853); Menéndez y Pelayo, M., 'Antología de poetas liricos, etc.'; Ticknor, 'History of Spanish Literature' (New York 1854).

GAMES. Games are an expression of the play instinct, a distinct species or form of play. A study of them includes a definition of games as distinguished from play; and a consideration of games from historical, educational and recreative viewpoints. While the term play includes games, so that we "play games," it is technically applied to informal play activities, such as playing horse, playing house and playing in the sand. In such play there are no fixed rules, no formal mode of procedure and generally no climax to be achieved. The various steps are spontaneous, not predetermined, and are subject to individual caprice. In games, on the contrary, as in blindman's buff, prisoner's base or football, there are prescribed acts, subject to rules, generally penalties for the infringement of rules and the action proceeds in a formal evolution until it culminates in a given climax; which generally consists of a victory of skill, speed or strength. This definition applies to games that require considerable bodily activity, such as those mentioned, and to so-called quiet games, as dominoes, cards, jackstraws, chess, checkers and other board games. Our concern in this article is chiefly with active games.

Among the simplest of active games are singing games, in which the action is mainly a repetition of dance movements, or of some dramatic or descriptive motions, as when the farmer sows his seed or London bridge falls down upon its victim. More strenuous are the games of chase, such as tag, cat and rat, and Red Rover; or competitive games of skill, strength or speed, illustrated by relay races and athletic contests. Highest of all, both in their organization and their demands upon the varied powers of players, are team games, of which baseball and football are popular examples. Team games are peculiar to the Anglo-Saxon race; nearly all games of the other classes are of very ancient origin and of wide distribution among the races and nations of men. Indeed, the games of children form a distinct branch of anthropology, ethnology and folklore and throw much light on early customs from which they are descended; for they come trooping out of the past unconsciously bearing the relics of primitive civilizations, of old religious rites and grim superstitions, of marriage and May-time festivals and "battles long ago.» «Oats, peas, beans and barley grows» had its origin in a religious rite intended to increase the fertility of the fields; «London bridge,» in the offering of a human sacrifice at the building of a bridge; «Here we go round the mulberry bush» is the survival of a custom, still practised by some of the European peasantry and known to have existed at least as far back as the early Greeks, of celebrating May day or spring time with the gathering of flowers and marching in procession. This usage prevailed among the American colonists and from it have come our May basket and May pole customs. Indeed, most of these singing games and many other active parlor games now played by children, such as stage coach and going to Jerusalem, were used instead of the dance by the young people of the Puritan era. Among the games of religious or superstitious origin tag should be mentioned, which, in its earliest form of iron tag, represented flight from an evil spirit, against whose influence iron was a protection. The little kindergarten game, «I put my right hand in,» is very ancient and with its chorus «Looby loo» gives evidence of having been part of a religious rite to some deity. In time it became a stately court dance, which rank it held a century ago. From the superstitious customs of divination by lot have come the doggerel «counting out» rhymes used by children the world over for choosing the principal players in games. Familiar are the stanzas of this kind beginning «Ena, mena, mina, mo» and «Onery, twoery, tickery, tee.» Of similar derivation is the custom of assigning parts by «holders,» in which one child holds a pebble in the closed hand and another guesses which hand contains it. Courtship and marriage customs are perpetuated in «Round and round the village» and «Little Sallie Waters.» Still other games, for example, «Uncle John is very sick,» come from the ballad days when a versified narrative was sung and acted at the same time;— days when to «sing a dance» and «dance a song» were interchangeable terms.

Athletic games, or competitive trials of individual strength, speed or skill under fixed rules, are probably prehistoric. The mention of them takes one's thought at once to «the glory that was Greece and the grandeur that was Rome.» The Greek games have been immortalized in literature and art; prominent examples of which are the Iliad and Odyssey, Pindar's 'Odes of Victory' and, in sculpture, the discobolus or discus thrower and the wrestlers. These Greek games were played at four stated festivals, the greatest being the Olympic, which became a national festival about 776 B.C., and recurred every four years at Olympia in Elis. The importance of the Olympic festival in Greek national life may be judged from the fact that time came to be reckoned in Olympiads. The Pythian games were celebrated in the third year of each Olympiad, the Nemean games in the second and fourth years of each Olympiad, and the Isthmian games in the first and third years of each Olympiad. All were held in honor of some god. In Homeric times the events in athletic games were chariot racing, boxing, wrestling, foot racing and javelin throwing. The Olympic contests, which came later, were probably confined at first to foot racing; to this other events were gradually added until the pentathlon came into existence, about the 18th Olympiad, and boxing and chariot racing were added in the 23d Olympiad. The pentathlon consisted of leaping, spear throwing, discus pitching, running and wrestling. It thus called for «all-over» work, thereby preventing inharmonious development by over-specialization. A competing athlete was obliged to enter for all five contests and was considered a victor only upon winning at least three of the five events. The best modern athletic games embody these principles in what are called group contests. For instance, in the pentathlon of the Young Men's Christian Association, the 100-yard dash is equivalent to the Greek foot race; throwing the 12-pound hammer is equivalent to discus throwing, the running high jump to leaping; pole vaulting for height is a substitute for hurling the spear and the one-mile run for wrestling. The prizes for the Greek games had no intrinsic value and were merely symbols of honor, as wreaths or palm branches. The prestige and indirect advantages accruing to a victor, however, became in time so great that contestants spent all of their time training for the games. The entrance of this professional and commercial spirit led to the decadence of the games. A similar degeneration occurred much more quickly in Rome. In these latter days we have had the dramatic spectacle of the revival of the Greek games as international contests, the first of these occurring in Athens in 1896. The countries represented by the contestants in these international games included Germany, England, Austria, France, Italy, Switzerland, Sweden, Hungary, Denmark, Greece, Australia and the United States. See Olympic Games.

No mention of the Greek games would be adequate that did not include the balanced relation which they held to the intellectual, artistic and ethical interests of the time. The contestants were examples of balanced culture, and the festivals drew together the greatest poets, philosophers, orators and artists whose achievements were there displayed. The tournaments or jousting bouts of the age of chivalry may be cited as a further example of athletic contests of great popularity in which the concern for physical prowess was blended with higher interests. It is notable that the modern organizations which have made physical training most popular, the German Turnverein, the Young Men's Christian Association and the colleges, also combine these varied elements.

Ranking higher as games than individual contests, because more complicated in their organization and demands, are team games in which opposing groups contest, each as a unit against the other. Each player on such a team has his assigned part or duties, differing from many of the others, but as an individual he is subordinate to the interests of his team. Games of this class are an expression of the fighting instinct and undoubtedly are a development from the simpler fighting games played by young boys, such as stealing sticks (Scots and English), and prisoner's base, which in turn are supposed to have originated in border warfare. Between these simpler games and the highly developed team games there exists the same differences of organization as between primitive and modern warfare. The former was merely a series of individual combats, the parts enacted by the various contestants being homogeneous, and, the fight, once on, very largely a matter of individual initiative. In modern warfare there is greater differentation of duties. and the individual is subordinated to the organized whole. The team games most popular in the United States are baseball, football, basket ball, cricket and hockey. Baseball has been called the national game of the United States, as cricket and Rugby football are distinctive of England, golf of Scotland and hand ball of Ireland. Basket ball bears the unique distinction of being the only game of wide and enduring popularity which was deliberately invented. Dr. James Naismith devised the game about 1892, as a result of studying the principles involved in successful games. Though invented for and played by men, it is the only team game that has become popular with women. Competitive adult games largely in vogue, which depend upon skill, rather than upon a combination of skill and organization, are tennis, golf and croquet.

The anthropological tenet, that in his development the child passes through the stages which the race has gone through before him, finds strong confirmation in children's plays and games. "The work of adults in one age of human history becomes the play of children in another." While the play of civilized children, as of savage, shows imitations of current adult activities, nearly all of the games of civilized children would seem to take their players through the primitive culture epochs. Just what this, or the lack of it, may mean for individual development we cannot say; but it may be inferred from the direct training of power which games provide.

Intellectual pastime are quite as educative as the more active physical games. In the process of the evolutional development of the average child there comes a time when mental play is a real necessity, and in later life games that employ the mind are usually preferred to those that call for physical exertion. Grandmother is often as fond of her backgammon as the college youth of his chess or the clerk of his proficiency at checkers. Backgammon, like most board games, is partly a game of chance, but there is considerable opportunity for the exercise of skill and experience. These same conditions make most of the fascination involved in games of cards. Chance determines what cards each player shall hold but he usually has choice as to what he shall play, and this affords opportunity for skill, judgment and application of the law of averages. Some games of cards, like whist, call for really scientific play to excel; others, like draw-poker, call for quick judgment of human nature, courage and bluff. Card games in which there is bidding, like auction bridge, develop the trading qualities useful to the merchant.

The gambling game, which involves the staking of money, affords another sort of mental excitement of the sort that mature minds consider harmful, but which seems to have a part in the mental development of the average individual. Intellectual games of pure ability, experience and science are typified by checkers and chess. Checkers being easy to learn is widely played by those who enjoy this mimic warfare of the calculating powers of mind against mind. Chess is far more complicated, and serves to amuse many of the highest intelligences. It is a common pastime with educated men of a mathematical turn. Every good chess player can discuss enthusiastically the training of the mind involved in playing this game of games.

The training of the hand and eye, as well as judgment and skill, are evidenced in pool and billiards, which have their devotees of all ages and both sexes, though mainly played by men, apparently because the equipment is not often conveniently within the reach of the woman or child. Pool compares with checkers, as the easy game to learn, played by the crowd, while the expert prefers billiards, and has much the same condescending air toward pool that the expert chessplayer exhibits toward the simpler game of checkers.

It thus appears that games, like the activities of life, show an evolutionary progress. First the rattle, then the doll, then the kindergarten play, then athletic sport and team play, then the test of hand and eye as in billiards, then the evolution through games of chance to games of intelligent skill — all pastimes imitating the more real and serious affairs of life. There is a game for every age and every taste; there is development of body and of mind; there is distinguishable an element of social progress, in recognition of the rights of others and of superior ability. The power of co-operation is recognized; resourcefulness is developed; the need of caution and value of courage are made apparent, and often the error of selfishness is thoroughly taught. The games common to an earlier age call for individual play, or the competitive element, or the homogeneous social characteristics of the folk-games. The training of the will is another strong educational feature of games. The timid, hesitating child, who at first shrinks from exposed positions or an aggressive part, gains courage and self-reliance; defeat becomes, instead of a discouragement to all effort, a spur to greater; and the inhibitive control required to obey rules and regulations, especially under strong excitement, touches another of the well springs of character. So, from the first, clumsy, timid efforts of the little child, to the skilful team work of the college athlete, at once aggressive and self-controlled, games afford a means of development and training for body, mind and character. Were any of these results objects of conscious endeavor on the part of the players, the recreative element of games would be lost. But their unique power lies in the fact of this recreation — this objective interest which holds the attention involuntarily and renders the training incidental, unconscious and natural. Because of this psychological distinction, the expression "gymnastic games," which is frequently heard, is a contradiction in terms and a misnomer. A mistake also is an occasional tendency to discard gymnastic exercise in favor of games, and vice-versa. While each is an important part of physical training, psychologically and physically there are essential differences between the two forms of exercise. Gymnastics are taken for the purpose of bodily development, and the mind is continually in the unnatural attitude of consciously directing the automatic processes of muscular co-ordination; games are played for the frolic or the victory, without subjective or utilitarian end. This psychological difference is exactly that between work and play. Physically, gymnastic exercise may be more closely adapted to individual powers and needs than the exercise of games; it can afford more vigorous exercise in a brief time to large numbers in limited space; and it is corrective of posture — of faulty neuro-muscular habits. Games, on the other hand, offer a more natural form of exercise, have a larger emotional content and in their social and psychological training are not approached by gymnastics.

The recreative element in games, the sheer fun and frolic spirit, and the engrossing interest that springs from primitive instincts, cannot be too highly valued as a relief from the pressure which modern civilization brings to bear upon both children and adults. Especially under city conditions should this be fostered. The paucity of childish play and normal youthful sport in cities, owing to lack of space, is not only pitiable, but tragic in view of all that it may mean for the healthful, balanced development and life of the individual. The growth of indoor games as basket ball and indoor baseball is admirable because making a virtue of necessity; but the movement to provide playgrounds is still better, for gangs of youthful criminals and depredators are found to melt away before them, and the play and games which they foster belong by inherent right to the open sky and the free air. See Baseball; Basket Ball; Cards; Checkers; Chess; Cricket; Football; Folklore; Golf; Hockey, etc.

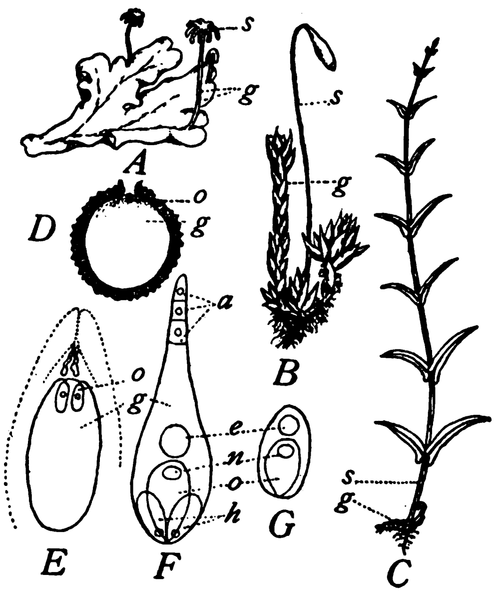
GAMETOPHYTE, gă-mē'tō-fīt, **Reduction of.** The gametophyte, as the name implies, is the gamete-bearing plant. In all plants which have reached the level of sexuality there is a gamete-bearing plant in the life history, alternating with another phase which may or may not bear spores. This other phase, in some algæ and fungi ,and in all plants above these two groups, does bear spores and, consequently is called the sporophyte. The gametophyte produces gametes, usually called sperms and eggs; a sperm unites with an egg, and this fertilized egg is the first cell of the sporophyte. The sporophyte, at maturity, produces spores; a spore produces the gamete-bearing plant and so the gametophyte and sporophyte generations alternate. See Alternation of Generations.

In the liverworts, the gametophyte generation is the conspicuous one, and the only one likely to be seen, except by the botanist, the sporophyte being comparatively small and parasitic upon the gametophyte (Fig. 1, *A*).



GAMETOPHYTE.

FIG. 1.— A series illustrating the reduction of the gametophyte. *A*, Marchantia, a liverwort; g, gametophyte; s, sporophyte, represented as a small black dot (one-half natural size). *B*, a moss: g, gametophyte; *s*, sporophyte; natural size. *C*, a young fern: g, gametophyte nearly rotted away; s, sporophyte; natural size. *D*, megaspore of Selaginella containing female gametophyte; the black dot, *o*, represents the egg; greatly magnified. *E*, female gametophyte of Pine; the dotted lines indicate the surrounding tissue of the ovule: g, gametophyte; *o*, egg; greatly magnified. *F*, female gametophyte (embryo sac) of Sunflower, consisting of three antipodal cells, *a;* endosperm nucleus, *e;* egg, *o;* two synergids, *h;* nucleus of egg, *n;* greatly magnified. *G*, female gametophyte (embryo sac) of Plumbaginella, greatly magnified.

In mosses, the matted cushions, which everyone calls moss, are masses of gametophyte plants. The sporophytes are the capsules, often nodding on slender stalks, which are seen attached to the gametophytes, upon which they are parasitic (*B*). In the common ferns, the gametophyte — called the prothallium — is a small thin, prostrate plant, seldom as large as one's finger nail. It produces eggs and sperms, a sperm fertilizes an egg, which then grows into the familiar fern plant. As the fern plant — the sporophyte — develops roots and becomes independent, the gametophyte dies (*C*). While this gametophyte is small and evanescent, it is green and independent as long as it lives. In some of the fern allies — Selaginella, Isoetes and the water ferns — the sporophyte produces two kinds of spore cases containing two kinds of spores, small spores, called microspores, and large spores, called megaspores. The microspores develop microscopically small prothallia (male gametophytes) which produce a few sperms; the large spores develop female gametophytes which produces one or more eggs. Both male and female gametophytes are contained within the spore, so that they are exposed only through cracks in the spore coats (*D.*) They are not green and consequently, are practically parasitic. The male gametophyte dies as soon as it has discharged its sperms; the female gametophyte, with a larger supply of stored food material, not only matures its eggs, but nourishes the young embryo until it develops roots and leaves and thus becomes independent. The gametophyte then dies. In the seed plants, which include the gymnosperms and angiosperms, there are also two kinds of spores, microspores and megaspores, which develop parasitic gametophytes. The male gametophyte consists of the microspore and a long tube, the pollen tube, which contains two sperms. The female gametophyte is not only entirely included within the megaspore but the megaspore itself is entirely included within the sporangium (ovule) (*E*). This inclusion has resulted in a more and more pronounced dependence, accompanied by reduction. In the gymnosperms, e.g., in the pine, the female gametophyte still bears considerable resemblance to that of some fern allies, but in the angiosperms, e.g., in the sunflower, the reduction has gone so far that a megaspore and female gametophyte are identified only by the evidence of comparative morphology. In this case, which represents the majority of the flowering plants, the female gametophyte consists of only seven nuclei, or loosely organized cells, so specialized that they have received individual names. The egg with two accompanying cells occupies one end of the gametophyte while three antipodal cells occupy the other extremity. Between these two groups is the endosperm nucleus, formed by the fusion of two polar nuclei (*F*). The final stage of reduction is found in an unfamiliar plant, Plumbaginella, in which four megaspore nuclei form a female gametophyte of only four nuclei, one of which organizes the egg, two unite to form the endosperm nucleus, while the fourth disorganizes; thus, at the time of fertilization, the female gametophyte has only two nuclei, the egg to start the embryo and the endosperm nucleus to start the endosperm, or nutritive tissue which support the embryo until it develops root and leaves (*G.*)

Summarizing for the female gametophyte, it will be seen that in the lower plants, the gametophyte is green and independent and is the phase which we recognize as the plant, the sporophyte being parasitic upon it. In the flowering plants, the sporophyte is the conspicuous phase which we recognize as the plant, while the gametophyte has become entirely parasitic. A mean, between these two extremes, is illustrated by the mosses, in which both gametophyte and sporophyte are green, so that the sporophyte, although still attached to the gametophyte during its entire life, nevertheless is partially independent. The reduction, however, is very gradual and numerous intergrades could be cited to make the series complete. The reduction of the male gametophyte is similar, but there is less difference between the extremes.

CHARLES J. CHAMBERLAIN,
Professor of Morphology and Cytology, University of Chicago.

GAMEWELL, Francis Dunlap, American missionary: b. Camden, S. C., 31 Aug. 1857. He studied civil engineering at the Rensselaer Polytechnic Institute and at Cornell, was graduated at Dickinson College, Pa., in 1881. From 1881 to 1884 he was engaged in educational work at Peking, China, from 1884 to 1887 was superintendent of the West China Mission and from 1889 to 1900 was professor of chemistry and physics at Peking University. At the siege of Peking in 1900 he was chief of staff at the fortifications of the British embassy, was field secretary and executive secretary of the board of foreign missions of the Methodist Episcopal Church in New York from 1901 to 1908 and secretary of education for China since 1909. Since 1912 he has served also as general secretary of the China Christian Educational Association. He is editor of the *Educational Review* and member of the editorial board of the *Chinese Recorder.*

GAMING AND WAGERING. See GAMBLING.

GAMMER GURTON'S NEEDLE, a «comedie» by Bishop John Still, very popular during the 16th century, and supposed to have been the first play that was acted in the English tongue. In 1575, nine years after its appearance on the stage of the university mentioned below, it appeared in print under the quaint title, 'A Ryght Pithy, Pleasaunt, and Merie Comedie; Intytuled Gammer Gurton's Needle; played on Ye Stage not long ago in Christes College in Cambridge; Made by Mr. S[till], Master of Art.' Thomas Warton had been misled into believing that the first issue of the play from the press dated from 1551, and having so described it in his 'History of Poetry,' he misled others, who on this account took it to be the very first English comedy. 'Ralph Roister Doister,' and possibly even another comedy, had however, already appeared when Bishop Still's work was not yet in press. Readers of the present time who penetrate behind the quaint, uncouth language of this old play, will find in it an interesting picture of the 16th century village life. The plot, one of the simplest sort, turns on merely the loss of Gammer («old wife») Gurton's «needle,» as she mends her man Hodge's «breeches.» The action proceeds on the search for the needle — a search by the entire household — and the pranks of Diccon the Bedlam, a clown (the «vice» of this play) who induces a quarrel between Gurton and the neighbors; and concludes, to the discomfiture of the wearer, in the finding of the needle in exactly the place on which Gammer Gurton's industry had been employed. Lord Morley, a high authority in these matters, in an attempt at a literary evaluation, found this play — to use his own words — «indelicate, but not indecent.» It was revived successfully by Stuart Walker and the Portmanteau players in 1917. Consult Morley, 'English Writers' (Vol. VIII, 1897); and Saintsbury, 'History of Elizabethan Literature.'

GAMMON THEOLOGICAL SEMINARY, school for the training of colored men for the ministry of the Methodist Episcopal Church located at South Atlanta, Ga. Rev. Elijah H. Gammon was a Maine man who came to Illinois in 1851 for the benefit of his health and actively labored in the Rock River Conference in and around Chicago until 1858 when he retired from the ministry at the age of 39. He then entered upon a business career and became a wealthy man. He founded Gammon Theological Seminary with gifts and bequests of nearly half a million dollars, besides contributing generous sums to other causes. He died in 1891. The first dean of the seminary was Rev. W. P. Thirkield, D.D., now a bishop of the Methodist Episcopal Church. Rev. W. H. Crawford, D.D., president of Allegheny College, was a member of its faculty. Bishop Thirkield was succeeded by J. W. E. Bowen 1899–1910. Rev. S. E. Idelman, D.D., was president 1910–13. Since 1915 Rev. Philip M. Watters, D.D., has been the president. At present it has a faculty of six, an average attendance of 80 and over 300 graduates. The buildings are valued at $82,000 with the present endowment of $481,000, and a library of more than 15,000 volumes.

GAMP, Mrs. **Sairey,** in Dickens' 'Martin Chuzzlewit' (1843–44), a stout and elderly professional nurse with a watery eye and a fondness for spirits. She is loquacious and confidential, and continually refers to the opinions of a fabulous being, «my friend Mrs. Harris.» Her amorphous umbrella has furnished the name «gamp» for that type of impedimenta.

GAMTOOS (găm'tōs) **RIVER,** Cape Colony, South Africa, which rises in the plateau of Great Karoo and empties into the Indian Ocean. In 1770 this river was officially declared the eastern boundary of Cape Colony. Consult Theals, S. McC., 'History and Ethnography of South Africa before 1795' (London 1910).

GAMUT, găm'ŭt, in music, a name applied in a three-fold manner:—(a) in its original sense, to the first or lowest note of the scale; (b) to the mediæval «great scale» whereon the musical notes are disposed in their several orders; (c) to the whole range of a voice or instrument, in the modern sense of «compass.» Gamut is derived from the Greek letter Γ, γ, γαμμα, gamma, which was combined in the Middle Ages with the Latin adverb or conjunction *ut*. Thus arose «gamma ut,» which was later contracted into gamut. Ut is derived from the first syllable of the mediæval Latin hymn, «Sancte Johannes,» well-known in the history of musical development. The invention of the hexachord, the origin of which is bound up with that of the gamut, when understood to mean the great scale, is usually ascribed to Guido Aretino or d'Arezzo (q.v.) who (about A.D. 1020) designated the notes of the hexachord by the first syllables of each line of the above mentioned hymn.

Guido d'Arezzo is commonly credited with many musical improvements, mutations, the hexachord and even gamut. But in the evolution of musical notation out of the classical alphabetical system, the invention of the mediæval is more properly assigned to Hucbald (A.D. 840–932). Hucbald used lines and the first letters of the Latin alphabet as a means of fixing the intervals of the scale, and thus may have been an important forerunner of Guido d'Arezzo. (Consult Hans Muller's 'Hucbalds echte und unechte Schriften über Musik,' Munich 1884). If by the invention of the gamut (taking the word in what was probably its original sense as employed in music), one is to understand the addition of the note «G,» at the bottom of the scale, it is quite certain that this note was sung ages before the time of Guido d'Arezzo. Aristides Quintilianus (fl. circa A.D. 110) tells us that whenever a note was wanted before the προσλαμβανόμενος, or proslambanomenos (added note) (A) of the Hypodorian Mode, it was represented by the recumbent Omega (ꞷ). And S. Odo, writing in the 10th century, represents it exactly as Aretino did, by the Greek letter Γ, γ, Guido d'Arezzo himself speaks of gamma as in his time a recent addition. He writes: «In primis ponitur Γ Graecum a modernis adjectum.» It is thus certain that he was not the first to extend the scale downwards to «Γ-ut.»

Gamut in its second sense, as the name of a plan of the musical scale (from G to ℓ), was early so understood, and the plan to which it was assigned persisted as long as the hexachords were recognized; that is, down to quite recent times. They are alluded to in Shakespeare. The Greek letter, Γ, γ, was used in this plan to denote the first note, or ut, of the lowest hexachord: the lowest note of the bass stave, where the first hexachord had its starting point. The gamut (in this second sense), seems indeed to have been employed as a mnemonic system whenever it was desired to effect a change from hexachord to hexachord, according to the principles of mutation; and on this account the gamut may be regarded as the ancestor of the Tonic Sol-fa modulator. In modulating with the Tonic Sol-fa system, for example, from the tonic to the dominant, the «sol» of one bar becomes the «do» of the next, which illustrates the survival of the very principle for which the gamut once existed. Sometimes the scale is referred to as the harmonical hand, from Guido d'Arezzo's having used the figure of the hand to demonstrate the progression of his system of sounds. The understanding of the scene between Bianca and Hortensio, in the 'Taming of the Shrew' (ii. I.) is possible only when one in some measure understands the gamut. There the words «one clef, two notes have,» refer to the fact that note «B» was expressed by a natural and a flat, being in the former case the third or «mi» of the hexachord beginning at «G,» and in the latter the fourth or «fa» of the hexachord beginning on «F.» «This small circumstance was the commencement of the system of accidentals, and thus opened the door for modern modulation.» Consult Fuller-Maitland, J. A., on the 'Gamut.'

GANANOQUE, gă-nă-nōk', Ontario, Canada, a port of entry of Leeds County, 18 miles northeast of Kingston, on the Saint Lawrence River, at the point where it flows from Lake Ontario. It is opposite the Thousand Islands, and has long been popular as a summer resort. It has a fine insular public park, and manufactures machinery and farming implements. Pop. 3.804.

GÁNDARA, găn'dä-rä, Philippines, a pueblo of the island of Samar, situated in the western part of the island on the left bank of the Bachao Bangahón River. In 1900 it was almost entirely destroyed during an engagement with insurgents; before that it had a large trade. A United States military station and depot for stores is situated eight miles by river from Gándara. Pop. about 15,000.

GANDIA, gän'dē-ä, Spain, town of the province of Valencia, 45 miles southeast of the city of that name, on the Alcoy, about two miles distant from the coast. It contains many mediæval remains, old walls surrounding the town, a ducal palace, a college, churches, etc. It has silk mills, tanneries and velvet manufactories and has a good trade in the grain, rice, fruit and oil of the district, which is very fertile. Consult Calvert, A. F., 'Valencia and Murcia' (New York 1911). Pop. 12,000.

GANDIER, gän'dē-ä, **Alfred,** Canadian preacher and educationist: b. Hastings County, Ontario, 29 Nov. 1861. He was educated at Queen's University, Kingston, where he graduated B.A. in 1884, and at Edinburgh University, where he graduated B.D. in 1889. After holding charges at Brampton, Ontario (1889–93), and Fort Massey Church, Halifax, Nova Scotia (1893–1901), he was called to Saint James' Square Church, Toronto, where he labored until 1908. He was appointed lecturer on apologetics at Knox College, Toronto, in 1902, and in 1908 was elected principal of the college.

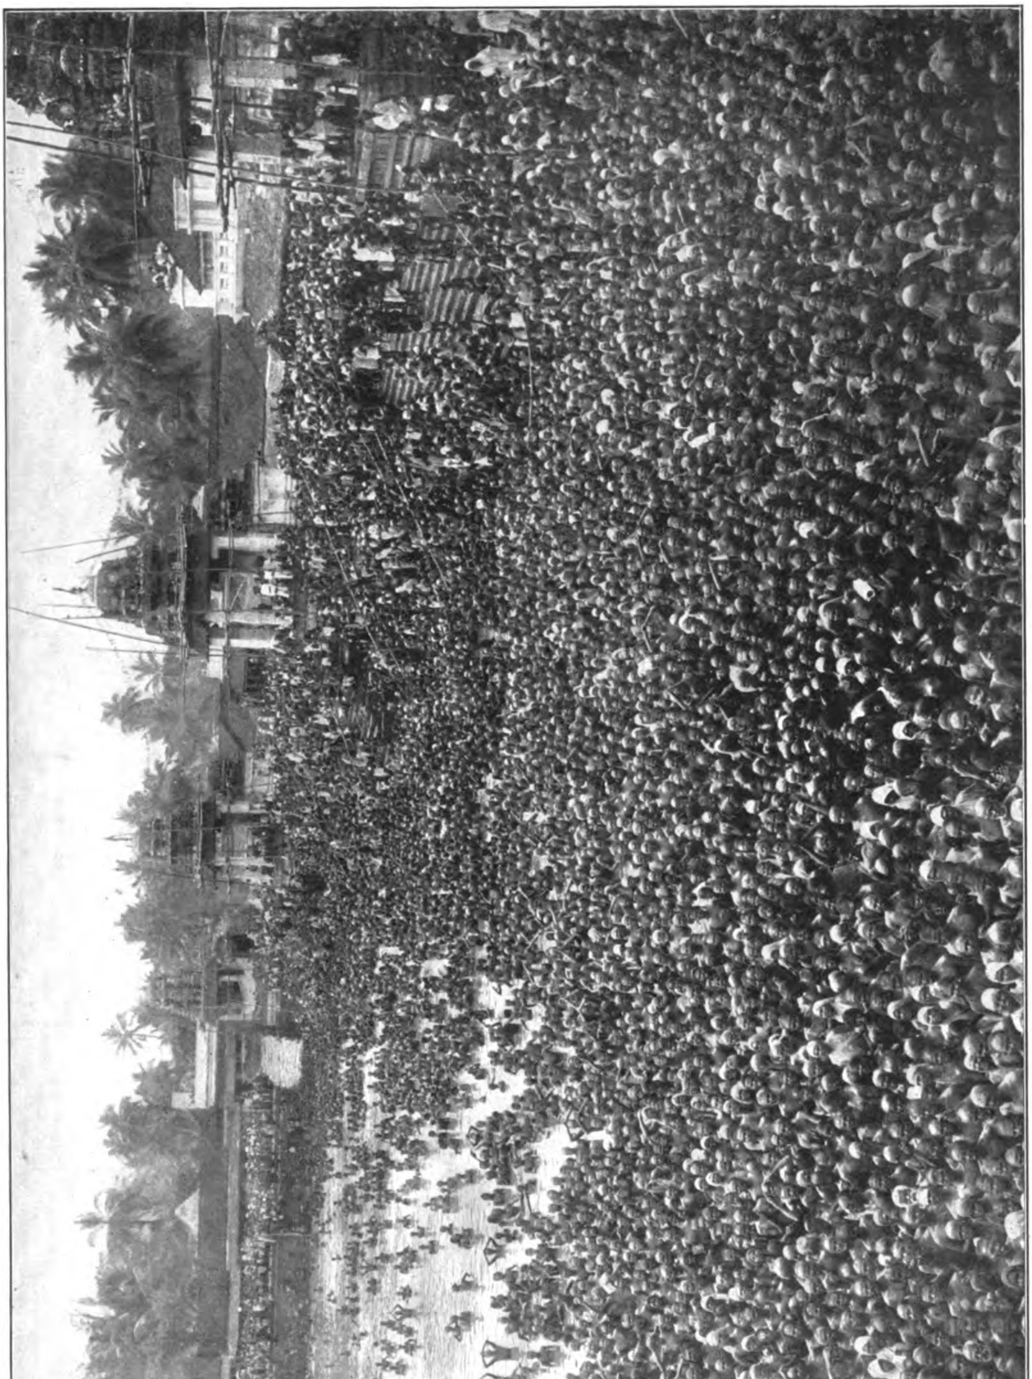
GANDO, gän'dō, Africa, a portion of the colonies of Nigeria, Dahomey and Upper Senegal and western Sudan, intersected by the Niger and inhabited chiefly by Hausas, Fulbes and Surhais. It is a most fertile district, the rain being plentiful. Mohammedanism is the prevalent religion. Pop. estimated at 5,500,000.

GANGES, gän'jēz, one of the greatest rivers of Asia, and "the sacred river of the Hindus," rises in the Himalaya Mountains, in the province of Garhwal, northern India. It is formed by the junction of two head streams, respectively called the Bhagirathi and the Alaknanda, which unite at Deoprayag, 10 miles below Srinagar, 1,500 feet above the level of the sea. The Bhagirathi which flows from an ice cave in a snow field, 13,800 feet above sea-level, is usually considered the source of the Ganges from its being a sacred stream in Hindu mythology; but the material claims of the Alaknanda are preferable, as it flows farther and brings a larger volume of water to the junction. At Hardwar, about 30 miles below the junction of the head streams, and about 120 miles north-northeast of Delhi, the river is only 1,000 feet above sea-level. Here it enters the great valley-plain of Hindustan, and flows in a southeast by south direction until it discharges itself by numerous mouths into the Bay of Bengal, a distance exclusive of windings of fully 1,100 miles. Its length, with deviations, is calculated at about 1,500 miles. During its course it is joined by a number of large rivers, the principal of which are the Jumna and Son, joining on the right bank; the Ramganga, Gumti, Gogra, Gandak and Kusi, on the left bank. Some of the principal cities on the Ganges and its branches, descending the stream, are Cawnpore, Allahabad, Benares, Patna, Behar, Murshidabad and Calcutta. The Ganges is navigable for boats of moderate size nearly 1,300 miles from its mouths. It is a great feeder of irrigation and navigation canals. (See GANGES CANAL). Its utmost breadth is about three miles, with a maximum depth of about 30 feet in the dry season, and 60 feet in the wet. Its descent is computed at four inches per mile; its current in the dry season is less than three miles an hour; in the wet season five or six. The quantity of water discharged into the ocean is estimated at 500,000 cubic feet per second during the flood season, and 100,000 during the remaining eight months of the year. Its current brings down a great quantity of mud, which in the course of ages has contributed to form the wide delta which belongs to it in common with the Brahmaputra. The delta, intersected by numerous branches, extends from east to west from 80 to 200 miles, and commences about 200 miles, or 300 by the course of the river, from the sea. A part of it is an uninhabited region called the Sundarbans, overgrown by jungle, infested with tigers and crocodiles. The westernmost deltaic branch of the Ganges, called the Hugli, is the only branch commonly navigated by ships; and vessels drawing 26 feet are safely piloted up to Calcutta. The construction of embankments, and continuous dredging, are necessary to keep a clear channel. The Ganges, as the Padna, continues eastward until it joins the Jamuna, the main branch of the Brahmaputra, which flows through the estuary of the Megna, the deltaic boundary on the east, into the Bay of Bengal. The periodical inundation of the Ganges commences about the end of April with the tropical rains. It rises gradually till it attains, near the commencement of the delta, a height of 32 feet above its ordinary level. By the end of July, the flat country of Bengal is overflowed to the extent of 100 miles in breadth, leaving visible little but tops of trees and villages, which are often built on artificial mounds above flood mark. After the middle of August the water begins to recede, and decreases till the period of the next inundation.

That part of the Ganges which lies between Gangotri, the first temple and pilgrim resort on its banks, 10 miles from its source, and Saugor Island, below Calcutta, is held particularly sacred. Wherever the river runs from south to north contrary to its usual direction, and at the junction of its affluents, it acquires a more peculiar sanctity. Its junction with the Jumna at Allahabad (q.v.) forms the most venerated place of Hindu ablution. The Hindus believe that this river rises immediately from the feet of Brahma, and that it possesses great and miraculous cleansing powers, on account of its divine origin. There is a scientific basis for this universal faith among Hindus, repeated and careful experiments showing that the river possesses extraordinary but hitherto inexplicable antiseptic qualities.

It is an imperative duty of the Hindus to bathe in the Ganges, or at least to wash themselves with its waters, and to distribute alms, on certain days. Whoever dies on its banks, having drank of its waters before his death, is thought to be exempted from the necessity of returning into this world and commencing a new life. Whenever, therefore, a sick person has been given over by the physicians, his relations hasten to carry him to the bank of the Ganges, in order that he may drink of the holy water, or be immersed in the river. Such as live too far from the river to admit of this always preserve some of the precious water, as a sacred treasure, in a copper vessel, that it may be given them in the hour of death. This water is, therefore, a considerable article of commerce in India. It is also customary, after the dead have been burned, to preserve the remains of the bones and the ashes until an

GANGES



Bathing in the Ganges

opportunity offers of throwing them into the Ganges.

The name Ganges signifies merely *the stream* (Sanscrit *Gangâ*). In Hindu mythology the river, personified as the goddess Gangâ, held a position equal in importance and interest to that which *the stream* (the stream par excellence) holds to-day.

GANGES CANAL, The, in India, an important irrigation work and navigable channel, the older portion called the Upper Ganges Canal, opened in 1854, and extending on the right of the Ganges (q.v.) from Hardwar to Cawnpore and Etawah, with a main canal 440 miles long, navigable throughout: and with 2,634 miles of distributaries. The Cawnpore and Etawah terminal lines are now absorbed in the Lower Ganges Canal, commenced in 1873 and completed in 1878, which continues in its main branch for 260 miles to Allahabad, drawing its supply from the river at Narora, in the Aligarh district. The weir and headworks at Narora include a solid wall, 3,800 feet long, with 42 weir sluices, founded on huge square blocks.

GANGHOFER, gäng'hōf-er, **Ludwig,** Bavarian poet, dramatist, novelist and statesman: b. 7 July 1855 at Kaufbeuren. He was the son of August G. (1826–1900), who bore the title of Oberforstrat and was the author of several useful books on forestry. As a youth he showed ability in mechanics and was trained in the technique of machinery. He studied philosophy, philology and the natural sciences at Würzburg, Munich and Berlin. But after 1879, making his début with a volume of lyrics, he devoted himself entirely to literary activities, taking up his residence in Leipzig. The following year he issued his translation of De Musset's 'Rollo.' He continued pouring forth poems, collecting them from time to time under the titles 'Bunte Zeit' (1883); 'Heimkehrer' (1884); 'Es War Einmal: Moderne Märchen' (1891); 'Fliegender Sommer: kleine Erzählungen' (1893) and 'Die Sünde der Väter,' (1886), the last reaching its seventh edition in 1902. He then turned his attention to dramatic writing and attained his first success with 'Der Herrgottschnitzler von Ammergau' which he wrote for the Wandertruppe of the Munich Dialect Theatre and which was played with Hans Neuert in the chief part in 1880. In 1881 he was invited to Vienna to become Dramaturg for the Ringtheater. From 1886 until 1892 he was editor of the feuilleton of the *Wiener Tageblatt.* But when the theatre was burned the stock company was scattered. His first successful play was published in 1890 in the 'Neuer Novellenschatz' with illustrations by Engel and in 1901 had reached its 10th edition. Among his other plays were 'Der Prozesshansl' (1884); 'Der Geigenmacher vom Mittelwald' (1884; new ed., 1900) and in collaboration with Marco Brociner, 'Die Hochzeit von Volini' (1889; 3d ed., 1905); 'Die Falle' (1891); 'Auf der Höhe' (1892). He also wrote the five-act drama 'Wege des Herzens' and a one-act comedy, 'Der Anfang vom Ende.' Having an intimate knowledge of the Bavarian mountain-forests and the dialect of the people living there, he found among them an inexhaustible source of tales and romances. The best known of the 'Tales of the Highlands' are 'Der Jäger von Fall' (1882); 'Almer- und Jagerleut' (1885); 'Edelweiskönig' (1886); 'Oberland' (1887); 'Der Unfried' (1888); 'Die Fackeljungfrau' and 'Doppelte Wahrheit' (1893); 'Rachele Scarpa' and 'Tarantella' (1898); 'Das Kaser-Mandl' (1900). The titles of the longer romances, some of them in two volumes and illustrated with characteristic vignettes, are 'Der Klosterjäger' (1894) 'Die Martensklause' (1894); 'Schloss Hubertus' (1895); 'Die Bacchantin' (1896); 'Der laufende Berg' (1899); 'Das Schweigen im Walde' (1899); 'Der Dorfapostel' (1900), and 'Das neue Wesen' (1902). The rather difficult dialect in which much of the dialogues in these dramatic and fascinating novels is cast is undoubtedly the reason why they have never been translated into English, as they well deserve to be. Ludwig Ganghofer has of later years been one of the most trusted counsellors in the entourage of Kaiser Wilhelm, although in a strictly private capacity.

NATHAN HASKELL DOLE.

GANGLION, connective tissue membranes enclosing small amounts of clear synovial fluids. They are usually found where tendons or muscles glide over bony parts, or where the skin, muscles or fascia are subjected to pressure or to friction. The number, size and location of these structures are subject to much individual variation. One of the commonest is found on the back of the hand, at the wrist, particularly in people who stretch their fingers widely, as piano players, or as librarians who handle many books, grasping several at a time. In this form is a firm and painless swelling, liable to be caused by any excessive exercise of the wrist, as in playing tennis, golf, etc. This swelling gives the impression that there is fluid beneath the skin, and grandmother's advice to break it with the family Bible or the dictionary is often followed, sometimes with serious results. This forceful method of reduction is foolish, as most of the swellings disappear with rest and the application of heat. If they persist, a surgeon should be consulted. Another very persistent variety of this trouble is found in the knee — causing housemaid's knee, or miner's knee. Obviously the breaking of these tumors by force is out of the question. There are many places in the body in which similar collections of fluid may accumulate, but these rarely cause much inconvenience unless they become infected through some knock or cut. In this event prompt surgical treatment is advisable, and aseptic surgery should be insisted on. A careless and unclean surgeon may render a limb useless.

GANGOTRI, gän-gō'trē, a square temple, about 20 feet high, erected on the right bank of the Ganges (q.v.), which here forms a small bay; about 10,319 feet above the level of the sea. This spot is regarded by pilgrims as the source of the holy stream, here called the Bhagirathi, which, however, rises eight miles higher up. The water here is peculiarly sacred, but few pilgrims come so far, and the only dwelling-house in the locality is occupied by the officiating Brahmins, by whom flasks of the holy element are sealed for conveyance to the plains.

GANGRENE, găn'grēn, the term applied to death of soft tissue in masses large enough to be seen. There are two forms, differing in causation, appearance and progress. Dry or senile gangrene results from the gradual occlusion of arteries, the venous return being unimpaired. For weeks or months the toes and feet, the parts most frequently affected, may feel cold or numb, or be actually painful, then gradually the skin becomes dry, then purple and black. The spread is usually very slow. It is particularly a disease of old age, due to the tendency at that period of life toward thickening and stiffening of the arterial walls. Moist gangrene results from sudden stoppage of the arteries, obstruction of veins, mechanical destruction of the issues or from specific infection by germs. It is generally due to an injury which destroys a part of the living flesh, as in wounds, frostbite, burns by fire or corrosion by acids, etc. It also follows carbuncles and bedsores in some cases, and has occurred as the result of a tourniquet too vigorously applied or left on too long. This form shows a soft, boggy, bluish mass covered with blisters and emitting the odor of putrefaction. In both forms of gangrene there may be a zone of inflammation between the dead and the living tissue, called the line of demarcation. The dead flesh may separate naturally leaving a scar on the healthy tissue, or the separation may have to be made by amputation of the diseased part.

Hospital gangrene was formerly very prevalent in military hospitals; a wound becoming infected would quickly change to a gray slough, which in a few hours might involve the entire limb unless prompt removal of the tissue was undertaken. Aseptic surgery has made this fatal disease a thing of the past. Spreading gangrene is due to infection by a specific germ, the bacillus of malignant œdema, so called from the fact that it generates a gas that puffs up the tissue affected. The spread is rapid, and life is sometimes saved by amputation far above the wound. The treatment of gangrene is usually a matter of amputation, well beyond the affected part. Careful aseptic dressing is imperative, particularly where the condition of the patient is apt to contra-indicate radical cure.

GANGUE, găng (Ger. *Gang,* a vein), the matrix or veinstone of ores. These are always included in some stony matter, which forms the principal portion of the veins or beds which are worked for the sake of their metalliferous contents. Quartz is the most common veinstone, and has been called the mother of ores. Calcareous spar, calcite, is also a frequent predominant material of veins. Sulphate of barytes or heavy spar, and fluor spar, are also often found as gangues.

GANISTER, a name originally given in England to a particular clay high in silica, used in the manufacture of fire-brick. In this country the term is used more loosely and includes non-plastic rocks that are not clays at all but approach sandstones in character. Ganister may, therefore, be defined as highly silicious material used in the manufacture of fire-brick, more particularly what are known as silica-brick, for lining blast-furnaces, Bessemer converters, etc. The manufacture of such brick is an important industry in western Pennsylvania. See CLAY.

GANNAL, gä-näl, **Jean Nicolas,** French chemist: b. Saarlouis, Prussia, 28 July 1791; d. Paris, January 1852. He is noted for his invention of the method of embalming by injection.

GANNETS, large sea-birds constituting the family *Sulidæ,* of the order *Steganopodes,* characterized by having all the toes connected by webs, the absence of external nostrils and a very short tongue. They are closely related to the pelicans and cormorants, have large powerful bills and feed upon fish, frequenting the sea-coasts of various parts of the world. The common gannet (*Sula bassana*), to which the name properly refers, is restricted in the breeding season to a few rocky islets on the coast of the British Isles and Iceland — notably the Saint Kilda group, and to Bird Rock in the Gulf of Saint Lawrence; and their numbers have been much diminished by the fishermen who gather their eggs for food. They nest in colonies among the crevices and ledges of the rocks, and each bird lays a single large chalky white egg. When the young are on the wing they all leave together and scatter widely in search of food, extending their range on our coasts as far as the Gulf of Mexico. In the southern hemisphere are two closely related gannets. *S. serrator* of Austria and *S. capensis* of South Africa. Eight other somewhat smaller species, called "boobies" (q.v.), breed on various tropical islands. The common gannet is pure white with black outer wing-feathers and a buffy suffusion on the head. The young are mottled grayish brown. The other species are similar, many of them with red and blue coloring on the bare skin of the throat and around the eye.

GANNETT, Ezra Stiles, American Unitarian clergyman: b. Cambridge, Mass., 4 May 1801; d. near Boston, 25 June 1871. He was graduated from Harvard in 1820, in 1824 became assistant to W. E. Channing at the Federal Street Church, Boston, and later succeeded to the pastorate. In the Unitarian controversies of 1825–35 he took a prominent though conservative part. He was the first secretary of the American Unitarian Association, its president 1847–51 and president of the Benevolent Fraternity of Churches 1857–62. He was also founder and editor of the *Scriptural Interpreter,* and an editor of the *Christian Examiner* and the *Monthly Miscellany of Religion and Letters.*

GANNETT, Henry, American geographer: b. Bath, Me., 24 Aug. 1846; d. 5 Nov. 1914. He was graduated at the Lawrence Scientific School in 1869; became geographer of the United States Geological Survey in 1882; was geographer of the 10th, 11th and 12th censuses, and of those taken by the War Department in Cuba and Porto Rico in 1899. His publications include 'Manual of Topographic Surveying' (1893); 'Statistical Atlases, 10th and 11th Censuses'; 'Dictionary of Altitudes' (3d ed., 1899); 'Commercial Geography'; 'The Building of a Nation' (1895); 'Gazetteer of Cuba' (1902); 'Gazetteer of Texas' (1902); 'Origin of Certain Place Names in the United States' (1902).

GANNETT, William Channing, American Unitarian clergyman: b. Boston, Mass., 1840. He is a son of E. S. Gannett (q.v.). He has held Unitarian pastorates at Saint Paul, Minn., and other places, and is now pastor emeritus at Rochester, N. Y. He is the author of 'A

Year of Miracle' (1881); 'Memoir of Ezra Stiles Gannett' (1875); 'The Thought of God in Hymns and Poems' (with F. L. Hosmer, 1885, 1904); 'The Faith that Makes Faithful' (with J. Ll. Jones, 1886); 'Of Making Oneself Beautiful' (1899); 'The Childhood of Jesus' (1884), and other books.

GANODONTA, a group of primitive mammals regarded as ancestral to the edentates, whose remains are found in the lowest Eocene formations of the western United States. These remains are not numerous nor complete, but plainly exhibit a progressive relationship toward modern Edentata (q.v.). The earliest known is *Hemiganus*, from the Puerco beds of New Mexico, which was as big as a medium-sized dog. A later genus of similar size is *Psittacotherium;* and a still later (Lower and Middle Eocene) is *Stylinodon*. In reviewing the series, says Beddard, we see a gradual diminution of the incisors, a gradual loss of enamel on the teeth generally and the production of hypsilodont teeth growing from persistent pulps, all of which are features of the later edentates. The progression is gradual, but the forms seem to be a continuous series culminating in the ground-sloths. (See PALÆONTOLOGY). Consult Wortman, 'The Ganodonta,' in *Bulletin of the American Museum of Natural History* (Vol. IX, New York 1897).

GANOID FISHES, an order of fishes founded by Agassiz on the character of the scales of certain fossil fishes, which are bony and lustrous, now regarded as a group-name for a rather heterogeneous series of low and chiefly extinct fishes. They are distinguished from the Clasmobranchs by their scales, their possession of true bone and of an air-bladder, and from the teleosts or true fishes by the possession of a spiral valve and a contractile bulbus arteriosus and the absence of decussation in the optic nerves. (See ICHTHYOLOGY). The ganoids were most numerous in Palæozoic and early Mesozoic times, and few and diverse are the surviving forms, which include the paddle-fishes and sturgeons, the gar-pikes, the mud-fishes of the African rivers and a few others, all elsewhere described. In this group fall some of the most famous fossil fishes of palæontology, described by Hugh Miller in his 'Old Red Sandstone' and otherwise introduced long ago to the public. The berry-bone (*Coccosteus*), the seraphim (*Pterichthys*) and the *Asterolepis* also had a bony shield, the flexible trunk having scales in *Pterichthys*, being naked in *Coccosteus*. The anterior limbs, or pectoral fins, of *Pterichthys* were long, covered with closely fitted plates and had a complex joint connecting them with the thorax. The gar-pikes of the American lake region are the modern representatives of the *Lepidotus, Æchmodus*, etc., of Mesozoic strata and of the Carboniferous *Palæoniscus*. *Polypterus*, the type of this group, is confined to the Nile and a few other African rivers. The group is most abundant in the Palæozoic strata, *Dipterus, Osteolepis, Holoptychius, Phaneropleuron*, being Old Red Sandstone genera; *Rhizodus, Megalichthys* with rhomboidal scales, *Strepsodus* with cycloid scales, Carboniferous. The cœlacanths range from the Carboniferous to the Chalk formations, and are the only members of the order in which the tail is homocercal.

The Ganoids are not a homogeneous group. The *Crossopterygii*, whose sole extant representatives are *Polypterus* (see BICHIR) and *Calamoichthys* from equatorial Africa, stand close to the common origin of the other Ganoid stocks, the teleosts, or ordinary bony fishes, and the dipnoi. The *Chandrostei*, including the sturgeons and spoon-bills, stand later palæontologically and in their degree of specialization, but show some interesting resemblances to the sharks and rays. Still later in their degree of development and definitely on the track of teleost evolution are the *Holostei*, of which the bow-fin and gar-pike survive.

GANONG, William Francis, Canadian historian and botanist: b. Saint John, New Brunswick, 19 Feb. 1864. He was educated at the universities of New Brunswick, Harvard and Munich. He was assistant professor of botany at Harvard 1887–89; instructor 1889–93; and since 1893 has been professor of botany and director of the botanical garden at Smith College, Northampton, Mass. Among his works are 'The Teaching Botanist' (1899); 'Laboratory Course in Plant Physiology' (1901); 'The Living Plant' (1913). He has written a number of monographs on the history of the Maritime Provinces and has translated and edited for the Champlain Society Denys' 'Natural History of Acadia' (1908); Le Clercq's 'New Relation of Gaspesia' (1910).

GANSEVOORT, gän'sę-vórt, **Johan Wessel,** Dutch theologian and ancestor of American families: b. Groningen, Netherlands, 1420; d. 4 Oct. 1489. Educated at Deventer in the school of the Brothers of the Common Life, he came also under the influence of Thomas à Kempis at Zwolle. As student or teacher, he spent some years in Cologne, Paris, Rome, Basel and Heidelberg, becoming versed in Hebrew, Greek and Latin, and in contact with many minds and the ablest men of his day. His fame as a renowned teacher of philosophy and theology was over all Europe. Eschewing strife and declining ecclesiastical honors, he returned to Groningen to spend the remainder of his life amid many disciples and as director of the cloister of the Spiritual Virgins. His theology was of the mystical and mediæval type, yet he is justly reckoned a "reformer before the Reformation." In 1521 Martin Luther published a collection of his writings, declaring that his own ideas had been already contained in the writings of Gansevoort, whose views on the sacraments, however, were those of Zwingli. Various editions of Gansevoort's works in Latin, Dutch and German have been published, but the first complete translation into English, with biography and comments, was made in New York 1917. He was the ancestor of the family of the same name in New Netherland and New York, including Colonel Gansevoort (q.v.) of Continental and Revolutionary fame. Consult his biography and writings (1917).

GANSEVOORT, gans'voort, **Peter,** American officer: b. Albany, 17 July 1749; d. there, 2 July 1812. In 1775 he joined the army which under Montgomery invaded Canada, and in 1776 he was appointed to the command of Fort George. In 1777 he was placed in command of Fort Stanwix, which he gallantly defended against a vigorous siege of 20 days by British and Indians under St. Leger, and received the thanks of Congress for having thereby prevented the co-operation of that general with Burgoyne, and contributed to the defeat of the latter. In 1781 the State of New York raised him to the rank of brigadier-general, which he held till the termination of the war. He afterward filled various important offices under the Federal government. He was successively commissioner of Indian affairs, commissioner for fortifying the frontiers and military agent. In 1809 he was appointed brigadier-general in the United States army.

GANSS, Henry George, American composer: b. Lancaster, Pa., 22 Feb. 1855; d. there, 25 Dec. 1912. He was educated at a parochial school in Lancaster, Saint Vincent's College, Latrobe, Pa. He was ordained to the Catholic priesthood in 1878 and from 1878 to 1881 was curate at Lykens, Pa. In 1881–86 he was rector at Milton and from 1890 to 1910 was rector of Saint Patrick's, Carlisle, and spiritual director of Catholic Indians in the Carlisle Indian School. In 1910–12 he was rector of Saint Mary's Church, Lancaster. He has been much interested in the Carlisle Indians and has done much to ameliorate their position. His musical compositions include 'First Mass in D,' with orchestra; 'Second Mass in D,' with orchestra; 'Fourth Mass in C'; 'Requiem in D Minor'; 'The Banner of the Sea,' hymn of the navy; 'Long Live the Pope,' hymn, translations in 25 languages. He has published 'Mariolatry: New Phases of an Old Fallacy'; 'History of Saint Patrick's Church, Carlisle, Pa.'; pamphlets on the Reformation, Anglican orders and on Indian questions. He was a contributor to 'The Catholic Encyclopedia,' *The Messenger,* the *American Catholic Quarterly Review,* the *American Ecclesiastical Review,* the *Ave Maria,* etc.

GANYMEDE (Gk. Γανυμήδης; Lat. *Ganymedes*), in Greek mythology the son of Tros and of Callirrhoë, a daughter of the Scamander. Zeus sent his eagle from heaven, which carried him off from Mount Ida to the seat of the gods, where he discharged the office of cup-bearer to the immortals, Hebe having rendered herself unworthy of this office. This fiction has afforded, both to poets and artists, an inexhaustible supply of subjects. Numerous paintings, statues, cameos and intaglios, masterpieces of ancient art, have descended to us, upon which this youth, scarcely past the years of boyhood, is represented as of great beauty. The representations of Ganymede are to be recognized by the Phrygian cap and the eagle, which is either standing beside him or carrying him in his talons to Olympus. Ganymede was identified with the Nile god who presided over the source of the river, and seems to have been originally one of the water gods and the sender of water upon the earth. He was also identified with Aquarius (the waterman) among the stars and was said to have the honor of being the cup-bearer of the immortal gods.

GANZ, gänts, **Rudolf,** Swiss composer: b. Zürich, 1877. He studied in his native city under Freund and Hegar, and appeared in public as a 'cellist at the age of 10. From 1893 to 1896 he paid especial attention to piano and composition, being instructed in the former by Eschmann-Dumur and in the latter by Blanchet. At Strassburg he prosecuted his studies under Blumer, and later removing to Berlin studied there under Busoni and Urban. In 1899 he made his début in the German capital and soon afterward came to the United States, where he remained for 13 years, being chief of the piano department at the Chicago College of Music from 1900 to 1905; from the latter year he went on the concert stage, playing all over the country with the great symphony orchestras and meeting everywhere with the greatest success. He is the author of a symphony in E; concertstuck for piano in B; several male choruses; piano pieces, and about 150 songs. His concert numbers have avoided the beaten path, presenting as a rule little known but meritorious works, whether of old composers or of recent writers struggling for recognition.

GANZ, Wilhelm, eminent musician: b. Mainz, Germany, 6 Nov. 1833; d. London, 12 Sept. 1914. At the age of 15 he came to London with his father, who was chorus master at Her Majesty's Theatre. In 1850 he definitely settled in London as an accompanist, in which capacity he acted for Jenny Lind in England and Scotland. He was a church organist for some years and also played the violin in the New Philharmonic Orchestra in 1852, of which he became conductor in 1874. In 1884 Ganz turned his attention to the teaching of singing, and up to his death was a professor at the Guildhall School of Music. He had a jubilee concert at the Albert Hall in 1898 to celebrate the 50th anniversary of his first visit to England, and a diamond jubilee concert in 1908. A number of leading sopranos — including Patti — preferred his style of accompaniment to that of more strenuous players.

GAP, France, capital of the department of Hautes-Alpes, on the Luye, 2,418 feet above sea-level, 50 miles from Briançon and 85 from Grenoble. It contains a fine cathedral, entirely reconstructed in 1866–1905, an episcopal palace, the tomb of the constable de Lesdiguières, a lyceum, library, a prefecture containing scientific and archæological collections. Gap has a few small manufactories, including those of hats, leather, cement, etc. The town was founded as Vapincum by Augustus in 14 B.C. It was long a part of Provençe but passed to the dauphins of Viennois in 1232. From the 5th century it was an episcopal see and its bishops for a time (1232–1512) ruled the district. In 1512 it was annexed to the Crown of France. It is the birthplace of Guillaume Farel, the reformer. Pop. 11,000. Consult Roman, J., 'Histoire de la ville de Gap' (Gap 1892).

GAPÁN, gä-pän', Philippines, a pueblo of the province of Nueva Ecija, Luzon, situated four miles east of San Isidro, the capital. It is at the junction of several roads, and is the largest town in the province. Pop. about 12,000.

GAPER, gą'- or gä'per, a name given to many animals who have great mouths, or in some other way suggest gaping. Thus it is one of the British names for the European soft clam (*Mya truncata*) in reference to the wide separation of the shells, as is characteristic of deeply burrowing bivalves; and it is applied to relatives on the Pacific Coast of the United States. Among birds, the broadmouths (q.v.) are called gapers; and among fishes some of the sea-bass, which open their mouths in dying to the widest extent.

GAPES, a disease of young poultry, caused by a parasitic nematode worm in the throat. See POULTRY, DISEASES OF.

GAPON, George, Russian revolutionist: b. Biliki, Poltava, about 1870; d. 1906. He studied theology, entered the priesthood and worked as a missionary among the poor people of Saint Petersburg. He set about organizing labor unions and the better to further this end secured the consent of the Russian secret police to the project. This was about 1903; in April of the following year the Industrial Workers' Association of Saint Petersburg was formally launched and many branches were formed in the capital and suburbs. In December Gapon, who had come under the influence of the Zemstovs, began a systematic propaganda for a general strike as an aid to the reform movement which was then sweeping Russia. He secured a large following and was a prominent figure in the troubled year of 1905. He escaped from Russia, reached London and there wrote an autobiography which was published in the *Strand Magazine*. His subsequent activities are shrouded in mystery. On 11 April 1906 the body of a man, who had either been hanged or had committed suicide, was found in a villa near the capital and was identified as that of Father Gapon. About a month afterward the newspapers of the capital published a letter forwarded them from Berlin, in which it was alleged that Gapon had betrayed his associates by returning to Saint Petersburg and agreeing to reveal the activities of the revolutionaries to the authorities; for this he was marked for death by the latter, who succeeded in carrying out the decree. Consult Gapon, 'Story of My Life' (London 1905).

GAR, GARFISH, or GAR-PIKE, one of two sorts of fish, both long and slender, with a prolonged spear-like snout filled with teeth, and hence bearing such local names as "bill-fish," "needle-fish," "bony-pike," etc.; and "greenbone," because of the greenish tinge on the bones. The group originally called "gar" was that of the family *Belonidæ* (or *Esocidæ*), allied to the sauries and flying-fish, the type of which is the common European *Belone belone*. This is a swift, voracious fish which darts along the surface picking up little fishes, and especially playing havoc in shoals of young mackerel. It is usually about two feet in length, is often brought to the London market, and forms a wholesome dish, in flavor somewhat like mackerel. The young forms have at first jaws of a normal size, but in growth the lower outstrips the upper. Very similar, but larger, are the "silver" gars, "agujas" or "needle-fish" of American tropical waters, which offer good sport by their speed and strength, but are hated by practical fishermen whose nets they frequently destroy or damage by their effort to get at imprisoned prey. There are several species, all of the genus *Tylosurus*.

Both these kinds, as well as their Oriental representatives, are often called "gar-pikes" from their pike-like form and voracity; but in the United States this term is suitably reserved for a very different kind of gar, not known in the Old World, and a relic of the ganoid tribe prevalent in the palæozoic seas. This gar-pike represents the family *Lepidosteidæ* (see ICHTHYOLOGY), and has a long almost cylindrical body encased in an armor of white, bony, enameled rhomboid plates, which are imbricated in oblique rows running downward and backward. The jaws are long, narrow and furnished with sharp teeth, each of which fits into a depression in the opposite jaw; and are covered with a granulated shagreen-like integument. They have the air-bladder subdivided and used in respiration; no spiracle; strong fins, a heterocercal tail; swim well, and prey upon small fishes. Their own flesh is not edible and they interfere with fishing, and therefore are destroyed freely. They inhabit the rivers and lakes of North America, where the commonest species is the long-nosed gar (*Lepidosteus osseus*). Another, more southerly, is the short-nosed gar (*L. platystomus*); and a great and powerful subtropical species (*L. tristœchus*), reaching 8 or 10 feet in length, and called "manjuari" in the West Indies, is known as "alligator-gar" in the lower Mississippi district. Another species occurs on the west coast of Central America; and another in the rivers of China.

All these gar-pikes frequent shallow, reedy or grassy places, basking in the sun like the pike, and devouring living prey with great voracity. The manner of seizing prey differs from that usually observed in fishes, and resembles that of reptiles; instead of taking their food at once with open mouth and swallowing it immediately, they approach it slyly and sideways, and then, suddenly seizing the fish or other animal, hold it until by a series of movements it is placed in a proper position for being swallowed, in the manner of alligators and lizards; the ball of food is also seen to distend the body as it passes downward, as in snakes.

GAR-PIKE. See GAR.

GARABIT, gă-rä-bē, France, in the department of Lozère, is a picturesque locality on the railway from Marvejols to Neussargues, where the line spans a gorge of the Truyère River, about 10 miles south of Saint Flour. The viaduct planned by M. Eiffel is 1,852½ feet long, and is built partly of girders and partly of masonry. Where it crosses the river at a height of 401 feet, it is supported by an arch, with a span of 541 feet 4 inches. Consult Eiffel, 'Le Viaduc de Garabit' (1889).

GARANCINE, găr'ạn-sĭn, is prepared from the ground root of *Rubia tinctorum* or madder (in French *garance*) by washing it with 8 or 10 times its weight of water acidulated with sulphuric acid, 1 part of acid being used for 100 parts of powder. After digesting for seven or eight hours the fluid is run off and the paste is boiled for two or three hours by steam with more acid, and then the mass is thrown into cold water contained in a large trough with a perforated bottom covered with cloth to act as a filter. Here it is washed till all the acid is got rid of, and the paste is afterward pressed, dried and ground to fine powder. It is used for dyeing, and has the advantage over madder (q.v.) of containing a large proportion of coloring matter. It is preferable to madder for mixing with other dyestuffs to produce chocolate and some other shades.

GARAY, gä-rī, **Juan de**, Spanish soldier: b. Badajoz, 1541; d. South America, 1584. About 1565 he went to South America, where he became secretary to the governor of Paraguay, was sent on a voyage up the Paraná, discovered a vast territory and founded near the river the town of Santa Fé de Vera Cruz. He defeated the Charruas Indians not far from the Uruguay, received the commission of lieutenant-general and was appointed (1576) governor of Asuncion. In 1580 he refounded the city of Buenos Aires on its previous site, and subsequently did much to improve the condition of neighboring native tribes. Having landed in an unfamiliar region on a journey up the Paraná to Asuncion, he was there killed by hostiles.

GARBAGE is kitchen refuse and table waste, offal or discarded material from the preparation and use of human food. Assembled, it is an ever-varying mixture of animal and vegetable food waste, the nitrogenous or proteids being largely in excess of the non-nitrogenous properties. Garbage decomposes rapidly in the open air and becomes offensive, especially in warm weather. When thrown upon the ground and allowed to decompose, or when used as a fertilizer in a raw state, it may contaminate sources of water supply, and thus become a menace to public health; but, contrary to the popular belief, the garbage heap does not generate bacteria — they die when exposed on the garbage pile. In country districts and in most towns and small cities much garbage is used as food for domestic animals, and when fresh no more proper disposition of it can be made. When the material is allowed to become partially decomposed before feeding, and where caustic solutions are used for the cleansing of cooking utensils, etc., the mortality precludes its use. American cities produce from one-half pound to one pound per day per capita. European cities produce less than one-half of this amount. Analysis of American city garbage shows moisture, 70 per cent to 80 per cent; grease, 2 per cent to 3 per cent; and solids, principally wood fibre, 18 per cent to 28 per cent. Garbage from European cities contains more of solids and less of moisture and grease.

Previous to 1900 the garbage problem was a serious trouble to officials and boards of health in American towns and cities. The thoughtless citizen throws it in the street, or leaves it in his back yard until his neighbors rebel, or he burns it in his range or furnace and has more trouble with his neighbors. He puts it with ashes and other refuse and it is dumped on a vacant lot, or a depression in the ground is filled with it, and injunction proceedings are brought by near-by residents; protests and complaints of every description are made to councilmen, heads of departments and boards of health. Newspapers take it up and everyone who can possibly be held accountable is abused. The first attempts at collection and disposal in a community are apt to be crude and imperfect. All kinds of household wastes are put together in boxes or barrels and teams are hired to cart it away. In some cases the city owns the horses and wagons required for the work. This lasts until there is no longer a dumping place within hauling distance. In a few instances it has been taken to sea in scows and dumped in deep water. This is found objectionable, as the lighter portions float to shore. Total destruction of the material is the next resort. Inventors and promoters take advantage of the situation, and it is proposed to burn or utilize the material at huge profit. Corporations are formed, stock is sold and plants are built for final disposal. Then there are indignation meetings and injunction proceedings. No one wants a garbage-disposal plant near his property. Should it be completed and started, it is generally closed within a year, either by injunction or owing to the lack of funds for its operation. The country is strewn with such wrecks.

It has been found that when garbage is mixed with ashes, paper and other household waste, final disposal is rendered very difficult, the mass being unfit for filling, fuel or fertilizer. Numerous American cities separate household waste into three parts, namely, «food waste,» «combustible waste» and «non-combustible waste.» By this means final disposal is more readily effected, each class of waste having properties of commercial value when kept separate from the others. Most European cities do not attempt a separation, excepting it be at the plant where final disposal is effected. In some cases the whole mass is passed through what are termed «destructors,» burning the unconsumed carbon found in the ashes and the combustible portions of other household waste. This system of final disposal has not been found satisfactory in American cities, and has been equally unsatisfactory in some European cities, particularly on the Continent, where, as in America, it is found that much additional fuel is required in order to maintain a proper temperature in the furnaces.

It would scarcely be possible to name in this connection all those who have contributed to the development of principles, systems and apparatus which go far toward the practical solution of this difficult problem. Boston installed the first modern refuse-sorting plant, and the first reduction plant was at Buffalo. Much impetus was given to effective practical development of the principle of utilization by the determined efforts of the late Col. Geo. E. Waring, New York's indomitable commissioner of streets. After a most exhaustive investigation of the whole subject, and a thorough inspection and test of every system of disposal then in existence, both in Europe and America, Colonel Waring became thoroughly convinced that utilization was right in principle and practice, and proceeded at once to have the garbage of the city of New York disposed of in this manner.

Prior to this time there were successful utilization plants in Philadelphia, Pa., Saint Louis, Mo., and Detroit, Mich. The system adopted by Colonel Waring, and which is now in use in many of the principal cities of the United States, is first, thorough sterilization by subjecting the material to the action of live steam in enclosed vessels, condensing all vapors and passing insoluble gas through flame. By this treatment the structure of the material is broken down,— even bones are disintegrated,— the liquids carrying the oils and greases being separated from the solids by mechanical means. The further preparation of the ingredients, by which they are put in commercial form or finally disposed of, varies greatly in the different plants. In some cases the liquids are evaporated, in others they are allowed to run into sewers or water courses. In a number of the plants the solid portions are used for fuel; in others they are acidulated or dried and prepared as a base for commercial fertilizers. The greases are sometimes extracted by the use of a solvent, and reclaimed by evaporation, the solvent vapors being condensed and also reclaimed to be used again. The principles involved are not new, having been applied for many years to the treatment of slaughter-house waste. In its application, however, to the greater subject of garbage disposal, much new apparatus has been invented, and the plants have been equipped to handle very promptly a vast amount of the material; the plant which disposes of the entire garbage of the Greater New York having a daily capacity of more than 2,000 tons, and the plants located in Philadelphia, Pa., Boston, Mass., Newark, N. J., Baltimore, Md., Washington, D. C., Detroit, Mich., Saint Louis, Mo., Cleveland, Ohio, Columbus, Ohio, and in some of the smaller cities, are of sufficient capacity to dispose of all the garbage produced within 12 hours of delivery at the plant. It is this prompt and effective disposal that has rendered the utilization systems so popular in the large American cities. The entire work of collection and disposal is, in most cases, done by contract. The plants are owned by contractors, the cities in some cases collecting the garbage and delivering it upon the contractors' cars or boats for transportation to the place of final disposal.

Garbage collection is now common in all American cities and towns of 10,000 or more population, and is increasing in smaller places. It has been found that a collector making rounds once a week can serve 40 to 90 houses a day. Usually two men travel to a wagon, and the use of specially designed sheet-iron body wagons is increasing. It is common to ask householders to separate their garbage and ashes and refuse in separate cans, so that the collectors can conveniently dispose of them. The ashes can then be used for filling low land, which would be impracticable if mixed with garbage. Where there are incinerator plants there is a tendency to return to the old method of dumping all the garbage, ashes and refuse together, and taking it to the incinerating furnace. Here the unburned coal in the ashes and the wood in the refuse furnish fuel enough to consume all the moist garbage. Cities and districts are routed, and householders notified what days the collectors will come through their streets, and on such mornings they place their garbage cans on the sidewalks.

Incinerators or destruction plants are increasing in use. Seattle has five 60-ton destruction plants, distributed so as to reduce haulage, and pays \$1.94 per ton for collecting the garbage. Incineration costs only seven and one-half cents a ton. Figuring in depreciation, interest and all costs, the total expense is about \$3 per ton. One of the largest incinerator plants is in Columbus, Ohio; capacity 80 tons in 12 hours. The garbage is collected in steel wagons, 50 horses being employed in the hauling. Ashes are utilized to fill in low land; the garbage collectors deliver to railway garbage cars, of which there are four, built at a cost of \$1,890 each. These cars deliver over the trolley line to a plant four miles out, where the garbage is drained, the water being evaporated. The solid residue goes to digester tanks for treatment with hot steam at 60 to 70 pounds pressure for six hours. It is then pressed and the grease separated, as much as 400 tons a year being obtained and sold; the remainder of the solid product is pressed into cakes for fertilizer. This Columbus plant cost the city about \$200,000 and the collection system about \$100,000. It disposes of the garbage and ashes at a total cost of about \$3 per ton.

Many of the failures, both in incineration and utilization, are due to the improper location of plants. While it should be perfectly clear to everyone that such plants should be so located as to cause the least possible property loss or inconvenience to the people, yet it should be recognized that every city must have a place for final disposal of its waste and, once properly located, it must be recognized as such. Though plants for final disposal, when properly designed and operated, have not proved a nuisance to near-by residents, nor a menace to public health, yet the assembling at one point of the material is objectionable and should be restricted to a section for such purposes. See WASTES, CITY, DISPOSAL OF.

Much has been written on the subject by both European and American engineers, principally in the form of papers read before some of the engineering societies, and published in engineering journals. Valuable information can be obtained from the files of such journals. Very little of such material, however, has been put in book form. In a small volume published in 1897, entitled 'Street Cleaning and Its Effects,' by Col. Geo. E. Waring, interesting and valuable data is assembled, a portion of which bears directly on this subject. A most comprehensive treatise on the subject is 'The Wastes of a Great City,' by John McGaw Woodbury, commissioner of street cleaning, New York, in Vol. XXIV, p. 387, *Scribner's Magazine* (1903). Consult also Venable, 'Garbage Crematories in America' (1906); Morse; 'Collection and Disposal of Municipal Waste' (1908).

GARBAGE DISPOSAL. See SANITARY ENGINEERING.

GARBER, Daniel, American painter: b. North Manchester, Ind., 11 April 1880. He made his art studies at the Cincinnati Art Academy and the Pennsylvania Academy of the Fine Arts. Since 1909 he has been a member of the faculty of the latter institution. In 1902 he was awarded the first Toppan prize at the Pennsylvania Academy; held the Cresson scholarship in 1903–05 and in 1909 won the first Hallgarten prize at the National Academy of Design. He has received numerous other rewards, medals, etc. He is represented in the permanent collections of the Chicago Art Institute, the Cincinnati Museum, the Corcoran Art Gallery, Washington, Mary Brown Memorial, Providence, R. I., the University of Missouri, the Saint Louis Museum, the Carnegie Institute, Pittsburg, and the Museum of History, Science and Art, Los Angeles. He was elected to the National Academy.

GARBORG, gär'bôrg, **Arne,** Norwegian novelist: b. island of Time, Jæderen, 25 Jan. 1851. He was educated at Christiania, published anonymously in 1873 his essay, 'Ibsen's "Emperor or Galilean," and in 1877 founded the *Fedraheimen*, a liberal journal which he edited until 1882. Characteristic of this author's way of thinking is 'The New Norwegian Language and the National Movement' (1887). His best-known work was done in his stories, originally written in the popular tongue and largely rendered into Swedish and Danish. They are of the realistic vein so common to Scandinavian writers and include 'A Freethinker' (serially in *Fedraheimen* (1878); 'Men' (1886); 'Weary Souls' (1891); 'Fred' (1893).

GARÇÃO, gär-sä'ō, **Pedro Antonio Correa,** Portuguese poet: b. Lisbon, 29 April 1724; d. there, 10 Nov. 1772. As a lyric poet he stands very high; while his satires, odes and epistles —upon the models of Horace — are dainty and spiritual. He also wrote successful dramas. The Portuguese esteem him for the perfection with which he employed their language in his works. The 'Hymn to Dido' is one of his most popular productions. He was arrested for a personal satire, and died in prison after a long captivity. He is called, by his countrymen, the "Portuguese Horace"; and his work had considerable influence on native literature, the tone of which he worked earnestly to raise. The best of the numerous editions of his works is that published by Azevedo Castro in Rome in 1888.

GARCIA, Diego, dē-ā'gō gär-sē'ä, Portuguese navigator: b. Lisbon 1471; d. Madrid 1529. In 1526 he sailed with three vessels from Cape Finisterre for South America, in the employ of the company established at La Coruña for the spice trade. He explored the Uruguay (1827), and the Paraná to 27° S., defeated the Indians who had besieged Sebastian Cabot on the latter river, and in 1528 left for Spain. About 1532 he is said to have made a voyage to the East Indies. His account of his Brazilian explorations appeared in Vol. XV of the 'Revista do instituto histórico é geográfico do Brasil.' The island of Diego Garcia is said to have been named after Garção.

GARCIA, gär-thē'ä, **Manuel,** Spanish professor of singing in England: b. Madrid, Spain, 17 March 1805; d. London, England, 1 July 1906. He invented the laryngoscope (1855) and published 'Mémoire sur la Voix Humaine' (1840) and 'Traité complet du Chant' (1847). One of his pupils was Jenny Lind. From 1850 to 1895 he was professor of singing at the Royal Academy of Music, London.

GARCÍA, Manuel del Pópolo Vicente, Spanish tenor and composer: b. Seville, Spain, 22 Jan. 1775; d. Paris, 10 June 1832. After acquiring a considerable reputation as a tenor singer at Cádiz and Madrid, in 1808 he attained great success at the Italian opera in Paris, and afterward proceeded to Italy, where he was received with equal favor. From 1816 to 1824 he was constantly engaged as a singer, either in Paris or London. In 1825, with a select operatic company, composed in part of members of his own family, he crossed the Atlantic and visited New York, South America and Mexico. On the road between Mexico and Vera Cruz he was robbed of all his money; and after his return to Paris was compelled to open a class for singing, as his voice had become greatly impaired by age and fatigue. Many of Garciá's pupils reached a high degree of excellence, but none equaled his eldest daughter Mariá, afterward Madame Malibran (q.v.). His son Manuel and another daughter, Pauline Viardot, also attained to considerable fame. He was a prolific composer of operas in Spanish, French and Italian, several of which were very popular in his day. Of his 43 compositions of this class the 'Caliph of Bagdad' is probably the best known.

GARCIA Y ÍÑIGUEZ, gär-se'ä ē ē-nyē' gās, **Calixto,** Cuban patriot: b. Holguin, Cuba, 14 Oct. 1836; d. Washington, D. C., 11 Dec. 1898. In 1868, with Donato del Mármol and Carlos Manuel Cespedes, he organized the revolution known as the "Ten Years' War." In the early part of the struggle he won the battle of Santa María and recaptured Jiguani. In recognition of his services García was appointed brigadier-general under Gómez (q.v.), and subsequently succeeded that officer as commander-in-chief of the Cuban army. In 1873 he was captured and carried as a prisoner to Spain. In 1879 he returned to Cuba to start "The Little War," but was again captured and kept in Spain under police surveillance for 15 years. In 1895 he escaped and came to New York, where he fitted out a filibustering expedition, which failed to reach Cuba on account of the wreck of the vessel. Later he was successful in landing in Cuba with arms and supplies. He was given the command of the forces in Camagüey and Oriente, where he held almost complete possession, and in 1898 gave valuable aid to the American forces at the capture of Santiago. At the close of the Spanish-American War he was made chief of the commission to discuss with President McKinley the future of Cuba.

GARCÍA MORENO, gär-sē'ä mō-rā'nō, **Gabriel,** Ecuadorean politician: b. Guayaquil, Ecuador, 1821; d. Quito, 6 Aug. 1875. He was educated at Quito and in Europe, became professor of chemistry in the University of Quito, and in 1857 its rector. In 1859, upon the overthrow of the Roble's government, he was chosen a member of the provisional government, and in 1861 President for a term of four years. He declared himself dictator in 1864 and subsequently relinquished the title and office, though he maintained virtual control of affairs. In 1869 he led a revolution, became again dictator, and in 1875 was elected President for a six-years' term. Before his inauguration he was fatally wounded by assassins. Consult Berlichingen, Adolf von, 'Gabriel García Moreno'; Cancio, A. Z. de, 'Vida de Gabriel García Moreno' (Madrid 1889).

GARCIA DE QUEVEDO, kā-vā'dō, **José Heriberto,** South American poet and dramatist: b. Coro, Venezuela, March 1819; d. Paris, June 1871. Educated in France and Spain, he settled in Paris, and was killed in the communard insurrection of 1871. Among his poems are 'To Columbus'; 'To Liberty'; 'To Pius IX'; 'Frenzy'; 'The Life to Come'; and 'The Proscript.' His dramas were well received. He wrote the novels 'The Love of a Girl' and 'Two Duels Eighteen Years Apart.'

GARCILASO DE LA VEGA, gär-thē-lä'sō dā lä vā'gä (properly GARCIAS LASO DE LA VEGA), Spanish poet: b. Toledo, 6 Feb. 1503;

d. Nice, 14 Oct. 1536. His father was councillor of state to Ferdinand and Isabel; and later Ambassador at the Court of Rome; and his mother belonged to the noble house of Guzmán. According to an account given in the 'Historia de las Guerras Civiles,' the Garcilasos received their surname from their combats with Moorish heroes, in the great valley of Granada, called *La Vega.* Garcilaso soon found his proper sphere. His genius was kindled by the study of the ancients, particularly of the Romans. Boscan had already begun to transplant the versification of the Italians into Spanish poetry. Garcilaso followed his example, and succeeded so well that he is still ranked among the best Spanish poets. Most of the events of his life may be learned from his own works. He lived for a long time in Italy, and afterward traveled through part of Germany, in the service of Charles V. In 1529 he was engaged in the expedition against Soliman, and in 1535 in that against Tunis. In the latter he received a wound in his arm, after which he remained some time in Naples. In 1536 he commanded 30 companies of infantry, and accompanied the imperial army against Marseilles. He was mortally wounded during an attack on the part of Muy and died three weeks later. Spanish poetry is highly indebted to him; for without his aid Boscan, (his bosom friend) a foreigner, would never have succeeded in his innovations, more particularly as he had a formidable adversary in Christoval de Castillejo. His writings consist of eclogues, epistles, odes, songs, sonnets (in which he imitated Petrarch) and some smaller poems. A volume of his poems first appeared at Barcelona in 1543. An edition of his works, with notes, appeared in 1765, and Herrera's commentary (1580), with notes by Azara (1765). Consult Fernández de Navarrete, E., 'Vida de Garcilaso de la Vega'; Flamini, F., 'Imitazioni italiani in Garcilaso de la Vega' (Milan 1899).

GARCILASO (GARCIAS LASO) DE LA VEGA, surnamed the INCA, Spanish historian: b. Cuzco, Peru, 1540; d. Spain, 1616. He was a son of Garcilaso de la Vega, one of the conquerors of Peru, and a member of the illustrious de la Vega family and Elizabeth Palla, a princess of the race of the Incas. His mother taught him the Peruvian language, and is said to have inspired him with the idea of writing the history of his ancestors. He went to Spain where he was well received at court and made much of, probably due to his good family connections. Later on he was imprisoned at Valladolid by order of Philip II. On his release he returned to Peru where he began his work of writing the history of ancient Peruvian civilization. His great work on the history of Peru is in two parts: the first bearing the title of 'Historia de las Antiquedades y Conquista de Piru; Primera Parte de los Comentarios Reales que tratan del Origen de los Incas, etc.' (1609); the second being the 'Historia general del Peru' (1616). He wrote also 'Historia de la Florida' (1609). His history is the greatest source of information concerning ancient Peru, its history, religion, civilization, myths, sociology and customs. It is somewhat highly colored; but the author had plenty of documentary evidence which he used in an interesting and illuminating way. Consult Markham, 'The Incas of Peru' (1910); Prescott, 'History of the Conquest of Peru.'

GARCINIA, so called after Laurent Garcin (d. 1752), a Franco-Oriental traveler, is the botanical name for a genus of the family *Guttiferæ.* It consists of opposite-leaved trees, with a yellow resinous juice, and generally unisexual flowers with four sepals, four petals, many stamens in from one to four bundles, and a 2 to 10-celled ovary with a single seed in each cell. The fruit of *G. mangostana* is the highly-prized mangosteen of the East Indies. It is about the size and shape of an orange, purple outside, divided within into segments like those of an orange. The flavor is between that of a grape and a peach. The friuts of *G. pedunculata, G. cornea* and *G. kydiana* are also eaten, but are not greatly valued. *G. kola* of tropical Africa yields fruit and seeds similar in properties to the kola-nut. *G. cambogia* and other species of the genus furnish Gamboge (q.v.).

GARDA (gär'dä) or **BENACO LAKE,** the Italian *Lago di Garda,* and the *Benacus Lacus* of the Romans, is an extensive and beautiful lake in North Italy, 33 miles long from north to south, by 3 to 11 miles broad, and 213 feet above sea-level. It forms part of the boundaries of the provinces of Verona, Mantua and Brescia, while its north extremity enters the Austrian territory of Trent, in the Tyrol. It receives the Sarca, almost its only affluent, at its north end, and is drained by the Mincio, which issues from its southeast end near the fortress of Peschiera, and conveys its waters to the Po. Storms are not infrequent, and are sometimes violent. It is well stocked with excellent fish, including salmon-trout, trout, eels and pike. Garda is the largest lake in Italy, and attains a depth of over 1,000 feet in many places. Its shores are covered with villas, and steamboats ply on it regularly between the ports of Riva, Desenzano and Peschiera, which with Gardone-Riviera, Garda, Malcesine Salo and the beautiful promontory of Sirmione are its most popular resorts.

GARDE, Thomas William, Danish explorer: b. 1859. He made several tours of exploration in southeast Greenland, starting from Cape Farewell. He discovered Norse remains at Lindenows Fjord, over 200 live glaciers, very many over a mile wide between Nanortalik and Cape Farewell. In 1893 he explored the Greenland ice cap, which he found to exceed 8,000 feet in height at certain places. He received the commission of commander in the Danish navy; subsequently was appointed to the chief of staff, and in 1908–11 was made assistant to the Minister of the Navy. The story of his explorations is contained in 'Meddelelser om Gronland' (Vols. IX and XVI).

GARDE NATIONALE, gärd nä-sē-o-näl, a guard of armed citizens instituted in Paris 13 July 1789 for the purpose of preserving order and protecting liberty. At first it numbered 48,000 men, but was increased to 300,000 when it was organized throughout the whole country. Acting as a royalist and reactionary force, it was crushed by Napoleon in 1795. It was reorganized by the Directory and by Napoleon and again under the Bourbons, to whom, however, it was a source of such disquietude that it was dissolved by a royal ordinance in 1827. Under Louis Philippe it was resuscitated in its old form and contributed to his overthrow. In 1851 the national guard was again reorganized, but in 1855 it was dissolved. In 1870 the national guard of Paris was again formed for the defense of the city against the Prussians. The resistance of a section of the guard to the decree of disarmament issued under M. Thiers led to the Communal War, at the close of which the guard was declared dissolved by the National Assembly (1871).

GARDEN, Alexander, Scottish scientist: b. Charleston, S. C., about 1730; d. London, 15 April 1791. He was graduated from Aberdeen; became a professor in King's College, New York (now Columbia University), and in 1755 established himself in medical practice at Charleston. From 1783 he was in London, where he became vice-president of the Royal Society. The botanical genus *Gardenia* (q.v.) was named in his honor by Linnæus.

GARDEN, Alexander, American soldier: b. Charleston, S. C., 4 Dec. 1757; d. there, 29 Feb. 1829. He was for a time aide-de-camp to General Greene. He wrote 'Anecdotes of the Revolutionary War in America, with Sketches of Character of Persons the most distinguished in the Southern States for Civil and Military Services' (1st series, Charleston, 1822; followed by a second series), which is one of the authorities for the history of the period, containing information hardly to be found elsewhere.

GARDEN. The earliest known gardens are those of Solomon, which are described as having been of quadrangular form, surrounded by high walls. They contained aviaries, wells and streams of water. The gardens of Cyrus and other Persian monarchs were of great extent, and generally laid out in romantic situations. They were also distinguished for the great diversity of their uses and products. The first allusion to terraces in gardens is to be found in the description of the celebrated hanging gardens of Babylon, anciently reckoned among the wonders of the world. Their construction is variously ascribed to Queen Semiramis and to Nebuchadnezzar. Diodorus and Strabo have given descriptions of them. They are said to have formed a square with an area of nearly four acres, and rose in terraces, supported on masonry arches, to a height of 75 feet. They were irrigated from a reservoir built at the top, to which water was lifted from the Euphrates by a screw. Fountains and banqueting-rooms were distributed throughout the numerous terraces; groves and avenues of trees, as well as parterres of flowers, diversified the scene; while the view of the city and neighborhood was extensive and magnificent. Most of the elements of a modern architectural garden are alluded to in connection with those of Babylon. The grove of Orontes, described by Strabo, must be regarded as a park or large garden in the picturesque style; it was nine miles in circumference.

In ancient Greece, gardening was rather a neglected art at first, but in process of time great advance was made. The vale of Tempé, the Academus at Athens, and other public gardens were extremely elegant and were ornamented with temples, altars, tombs, statues, monuments and towers. The Greeks copied their gardening from the Persians; and the Romans, in their turn, copied that of the Greeks. Little is known of the early style of Roman gardening; the vast edifices projecting into the sea, and the immense artificial elevations, are apparently ridiculed by Cicero and Varro. About this time, however, began the cultivation of odoriferous trees and plants; and the planting of trees adjoining each other, whose odors assimilated, was then as much a study with the gardener as the harmonious blending of colors at the present day.

The early French and Dutch gardens were evidently adopted from the description of Pliny's garden. The use of glass in the construction of conservatories was early known to the Greeks and Romans; and the "Gardens of Adonis," mentioned by some of their most eminent authors, were probably of this kind. Gardening, like all the other arts, languished during the Dark Ages, but with the revival of learning, the invention of printing, and the Reformation, it began again to flourish. The art was revived and patronized by the family of the Medici in Italy; and their gardens, which were of the geometric and architectural style, long served as models for most of Europe. They continued to be imitated in France, Germany and Great Britain till the introduction of the English or natural style. In garden architecture very little progress, as far as hothouses are concerned, has been made in southern Europe, the warmth of the climate rendering them all but useless. There are, however, plant houses in many places in Spain and Portugal. The French and Dutch gardens resemble each other closely; symmetry and profuse ornament are the characteristics of both. The Dutch style is eminently adapted to the nature of the country, where there are no inequalities of surface, as in England. The French style seems to have arisen about the middle of the 17th century, during the reign of Louis XIV. The most celebrated gardener of the period was Le Nôtre, who laid out the famous gardens of Versailles. Le Nôtre's style spread rapidly into other countries. The first erection of hothouses in France took place toward the end of the reign of Louis XIV by M. Fagon, in the Jardin des Plantes. The first magnificent attempt at hothouse building was that of Francis I, of Austria, in 1753. They were in five ranges, extending altogether to the length of 1,290 feet, many of them being 30 feet high. From about 1760 landscape gardening, and the adoption of the English style, rapidly spread into France, Germany and Russia, where it still prevails. See CITY PLANNING; FLOATING ISLAND; FLORICULTURE; FLOWERS; GARDEN CITIES; GREENHOUSE; HORTICULTURE; CROSS-FERTILIZATION; PLANT BREEDING, ETC.

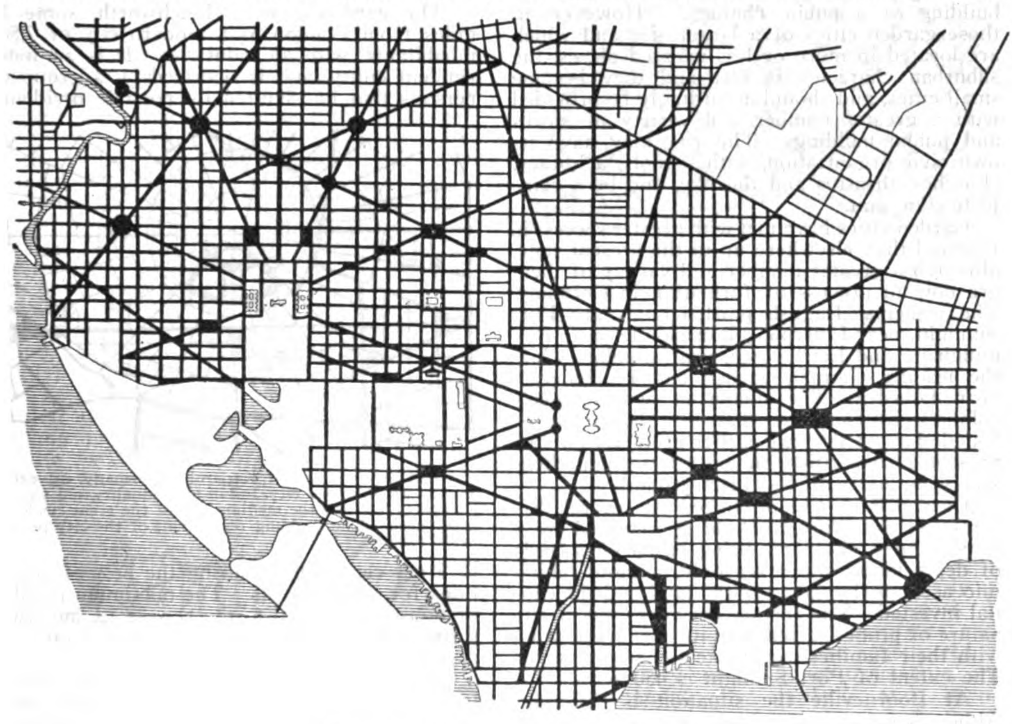
GARDEN CITIES. The disassociation of the idea of home life with modern existence in the metropolitan centres is a matter of serious concern to the social economist. In the body politic the city is merely a commercial organ, a convenience in the nation's commerce, a clearing-house for domestic and inter-nation commodities — in a word, an artificial juxtaposition of elements depending for their life or entertainment upon the power of capital or social standing. To those of wealth, or to the transient within its gates, metropolitan life is an ideal existence, offering advantages of social life, human interest, art, literature and the thousand and one things that day and night bring forth. On the other hand, the salaried man or the wage earner, forced to live in inadequate, and oftentimes unsanitary, quarters, lacking in opportunity for recreation, leads a most undesirable existence, tempered alone by the "hope eternal" that springs up in every human breast.

Is it a wonder then that men and women and children dream of the green fields and running brooks, and of the day when they may have their own home — a real hearthstone — in the country, where Nature in gladsome abundance welcomes all mankind as her children? Indeed, many do break the shackles of city life for rural retreats, but the vast majority dream on, existing from pay day to pay day, with the same old "hope eternal" burning in their breasts, but with constantly diminishing flame.

It is not possible for everyone to live in the country, but it *is* within the ability of many that are now housed in cramped quarters in the city to own their own homes and live and rear their families in the free country life — cheaper, more healthful and with a maximum of personal comfort and individual standing.

Among the plans that have been carried out abroad and in the United States to a rapidly increasing extent are those of garden cities, workingmen's colonies and suburban gardening. Of these the garden city in its best form is a well-organized development, in which from 100 to 500 homes make up a unit, which is intended to become little if any larger. When additional demands spring up for quarters, a new garden city is formed elsewhere, and thus the identity of the existing one is preserved indefinitely, and the residents, in the expectation of spending their whole lives in their own homes, have every incentive to improve and embellish them, and keep their grounds in the best possible condition.

The garden city in plan should be laid out in the simplest, yet in the most attractive, manner. There being little traffic of consequence, the streets should be laid out with that degree of irregularity that ensures charm. Some of the streets should be winding, while the straight ones should have suitable terminals. Each house should be provided with a spacious garden, as it is from such gardens that these cities derive their name. These gardens, though partially devoted to vegetable raising, should also be well laid out with flower beds, and the whole garden city should be subject to such regulations as will ensure sufficient attention to this feature to produce the intended appearance. Grass plots, trees, hedges, shrubbery and arbors should be provided in abundance, both in the front and in the rear of the houses. The neglect of the residents should not be allowed to mar the appearance of the city.



Great ground plan of Washington, D. C.

As to the houses, they may be quite simple and compact in design, but they should all be individual in character, and by no means the frightful rows of boxes all exactly alike that are put up for workingmen's use in the usual rural or suburban places devoted to such purposes. The economical design of the buildings and the small expenses for streets make the housing cost small, so that the rents may be low, or the workingman may, within a reasonable length of time, become the owner of his own home.

Garden cities should be laid out within easy reach of transit facilities and natural advantages of site should be availed of whenever possible, to give individuality and charm to the plan.

The sanitary arrangements of garden cities should be carefully planned and carried out, and the details should be simple and at the same time the construction should be solid and as inexpensive as possible.

A garden city is principally a place of residence and it should have as few stores as possible, only those of the most necessary character being provided. A school may be the only building of a public character. However, in those garden cities of a larger size and which are located in more or less isolated places, the suburban character is lost and they become small cities, and should accordingly be provided with a greater number and variety of stores and public buildings. The city may have its own civic organization, with schools, a library, churches, theatres and the like, and be a complete civic unit.

Garden cities have met with greater success in England than elsewhere up to the present time, although a greater number and variety of them are now in process of formation in Germany. The principal English garden cities are Port Sunlight, near Liverpool, Bourneville, near Birmingham, and Letchworth, near London, while the leading German garden city is Hellerau, near Dresden. The numerous workingmen's colonies in Germany that first began to be founded about 1863 are earlier prototypes of the present garden cities, but on a less comprehensive scale and with less open ground.

Garden cities are organized on several different plans. Port Sunlight is operated by a soap factory, the rents being based on a basis of depreciation and taxes only, without taking into account the value of the land and the capital invested. The factory considers this in the nature of profit sharing with its employees, who, with their families, constitute the sole tenancy. The extent of Port Sunlight is 450 acres.

At Bourneville the situation is different. Although half of the tenants are employees of the concern under whose patronage the city is operated, any one is eligible to become a resident. The rents are higher but the city is an individual entity administered by an independent corporation. There are some 5,000 inhabitants in Bourneville, occupying 925 houses. The city covers 612 acres of land, and one-tenth of the land, in addition to that occupied by roads and gardens, is reserved for parks and recreation grounds. In no case is the building allowed to cover more than one-fourth of the plot belonging to it, and the number of houses is usually from 7 to 10 per acre.

The large amount of ground left open permits of vegetable gardens, the produce of which materially reduces the cost of living of the householders. Under ordinary conditions land yields a return of about $25 per acre, but that portion utilized in Bourneville for raising produce returns a valuation of some $150 per acre, in addition to housing an average of 30 persons per acre in the occupied portions of the city.

Hellerau, which is about three miles from Dresden and covers 325 acres, has a population of about 1,000, and the land is held by a corporation which limits its dividends to 4 per cent. The village is occupied by the employees of a single concern, the *Deutsche Werkstäten für Handwerkkunst*, the chief owner of which — Karl Schmidt — is the leading spirit of the Hellerau improvement. The building is largely carried on by the Co-operative Building Association of Hellerau, which secures its capital at low rates from the governmental insurance funds. These enormous funds are thus utilized in a twofold manner — the principal for improving housing conditions and the income for the amelioration of the beneficiaries.

The garden city of Letchworth, some 35 miles from London, is a modern city of 7,500 inhabitants, with 49 industries. It is an independent entity, and is operated by a group of persons that has limited its possible dividends

Great ground plan of Karlsruhe, Germany, an exceptionally well-planned city, full of individuality and variety. The portion above the medium line of the great circle is a forest park. The building regulations of the city provide for 16 zones.

to 5 per cent, thus ensuring the best of conditions for the residents. The maximum number of houses permitted to the acre is 12, and two-thirds of the six square miles of the city are reserved for parks and similar uses.

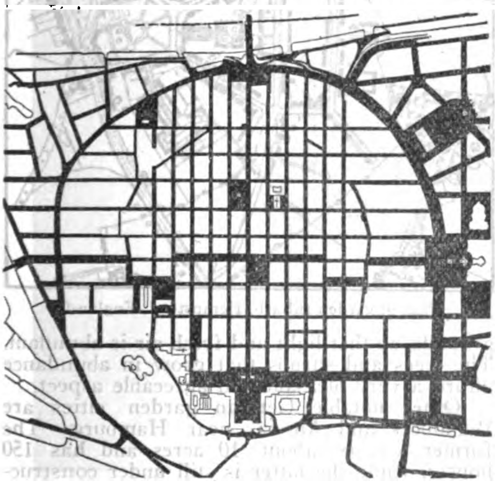
Another interesting example will be found in Forest Hills Gardens, Long Island, New York, a town-planning enterprise in which certain trust funds have been invested and which is conducted wholly on commercial lines in the expectation that a fair profit will be earned from the investment. As a real estate proposition it may not differ much from other first-class Long Island developments. It is not a garden city for workingmen, however, but is intended for persons of ampler means.

The main points in the general layout or great ground plan are the direct, ample, convenient thoroughfares, the gently curved residence streets, so laid out as to allow for deep front gardens; the interior parks for the private use of the residents, and the large amount of land in proportion to the size of the development that is put aside for common use. Each block is considered as a unit and treated as such. This separate block planning gives a beauty and variety not possible with the ordinary rectangular block plan.

Unity of design is the special attraction of the gardens, and this unity has been faithfully adhered to. The station, the inn, the stores, the apartments, and the houses, large and small, while varying in treatment and material, are all harmonious in design. The whole place has an atmosphere that is homelike, refreshing and distinguished with a real individuality. Like all other high-class suburban developments, the individual or free standing house will predominate, but an attractive feature of the building plan is the so-called "Group-Building." This plan makes it possible to buy a house of superior construction and enduring value at a lower price, for the reason that the land may be used more economically when the houses are either semi-detached or one of a group of three, four, six, eight or 10 houses set contiguously in a row. These groups and rows add greatly to the charm and variety of the building scheme. They have been planned so as to conform to the land and road contours, and are of different sizes and prices, with varying interior arrangement and architectural treatment. There is no subject upon which the developers of the gardens have laid more stress than upon the value of the common use of land as a factor in community life.

When the plans of this company were first officially made public, disappointment was expressed that the enterprise would not benefit the mechanic or day laborer, such as the English development at Port Sunlight. This, however, was impracticable owing to the location of the property, the initial cost of which would only permit the upbuilding of a high grade residential suburb.

These examples indicate the scope of the garden city idea in its various applications, from the housing of the employees of a single factory to the establishment of an independent and thriving city.



Great ground plan of Mannheim, Germany, a plan which with its outer horseshoe has proven highly satisfactory. It offers a solution of street replanning for American cities with their gridirons and has been followed in the proposed plans of Chicago and other cities.

The workingmen's colonies were the prototypes of the garden cities and had their origin in the workingmen's quarters established by the Krupp Company at Essen, beginning in 1855, with barracks affording lodging and board for 200 men to start with, continuing with the erection in 1863 of a colony of 160 dwellings at "Alt West End," the first actual colony continuing with various additions to the present time until, with the colonies of Westend, Nordhof, Baum-

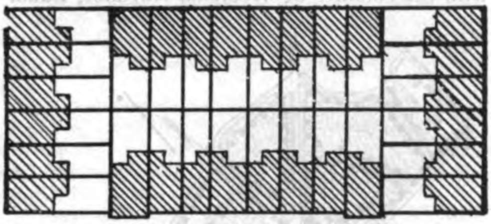
Plan of garden suburb, Dalhauser Heide, near Essen, Germany.

hof, Schederhof, Cronenberg, Alfredshof, Friedrichshof, Magarethenhof, Dalhauser Heide, Emscher Lippe and Colony Gaarden and the miscellaneous quarters in Essen, the Krupp works house 12,800 men and their families, a total of 46,000 persons.

The colony Cronenberg, the largest and best known, was mainly erected during the years from 1872 to 1874. The buildings are partly set up in rows of three-storied houses containing 30 to 40 dwellings in each block, and partly of three-storied semi-detached houses with 12 dwellings, six of them accessible from each gable front. The buildings are constructed of brick or quarry-stone without ornaments, and are surrounded by gardens and lawns. Throughout, each staircase gives access to six dwellings, to two each on each floor from a small landing, through a private front door. The streets are lined with trees, and in the midst of the colony there is a spacious park, which in connection with the gardens surrounding the houses gives to the whole a most agreeable aspect. Subsequent to 1891, 204 additional dwellings were erected, so that the entire colony now contains 1,454 workingmen's dwellings of from two to three rooms, and some of as many as six rooms.

From 1894 to 1899 the principal portions of Alfredshof and Friedrichshof were erected, and in the construction of these colonies æsthetic as well as practical and sanitary considerations were emphasized. The plans on which the streets were laid out, the varying positions of the buildings as regards the streets, the provision for spacious open grounds, the application of a handsome and varied architecture and the utilization of bright colorings in the roofs and façades lend to these colonies a most attractive aspect.

In fixing the ground plans of the several dwellings allowance was made for the high



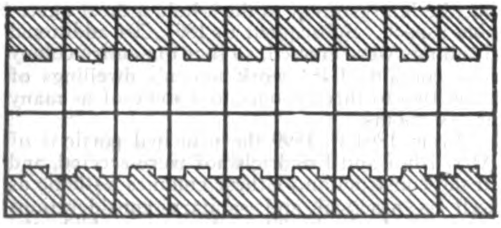
Type of half open block system found in England, Holland and Germany.

standard of the workingman's life at present, and accommodations of two rooms, therefore, were altogether abandoned, and sets of three or more rooms only were admitted. Each one-family cottage was given a small garden and houses of two or more stories were provided with verandas and loggias, to afford their occupants a sitting place in the open air. Each kitchen was also provided with a larder.

The first lot of houses in Alfredshof was erected on the cottage system, in one, two, three and four family cottages, in rows, each containing a small number of houses. To each family-lodging a small garden is attached. The dwellings in the semi-detached or double semi-detached cottages are also completely separated, each family having its own private entrance through its own garden. At the entrance of each dwelling is a veranda.

In 1899 construction work in Alfredshof came temporarily to an end. When it was resumed in 1907, the ground had in the meantime become so dear that it was deemed inadvisable to continue the system. Therefore, in order to utilize the building space more rationally, and in order to provide a sufficient number of dwellings in the neighborhood of the works, corresponding to the increased number of workingmen, a more compact mode of building had to be adopted.

The question could only be solved by the multiple-storied house arranged in flats, which at the same time afforded the possibility of harmonizing the colony architecturally with the town houses in the vicinity. The houses were arranged in blocks, an arrangement already adopted in the Friedrichshof. By an artistic grouping of the blocks, by leaving sufficient open ground, lawns and playgrounds between,



Block with open ends as found in Mannheim and Posen.

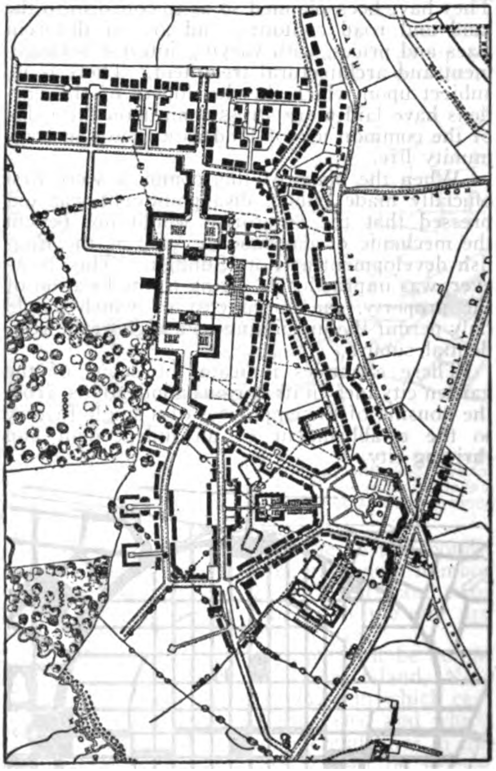
and by carefully preserving existing trees, this new part of Alfredshof was made to answer all modern requirements as regards healthfulness and beauty.

The annual rents in these colonies are:

	In One-Family House	In Multiple-Family House
Three-room dwelling	$47.50 to $55.00	$42.50 to $52.50
Four-room "	62.50	55.00 " 60.00
Five-room "	75.00 " 96.00	65.00 " 70.00

In opposition to the Altenhof and the older part of the Alfredshof, this colony was from the very beginning erected on the system of the two or more storied house on account of the valuable and rather limited building space. Six or four families enter the residence from one common entrance, and two or three families have one laundry in common. But apart from the street door each dwelling has its own private front door on the landing.

The three or two storied houses of this colony are united into more or less large blocks, which are grouped around squares and play-



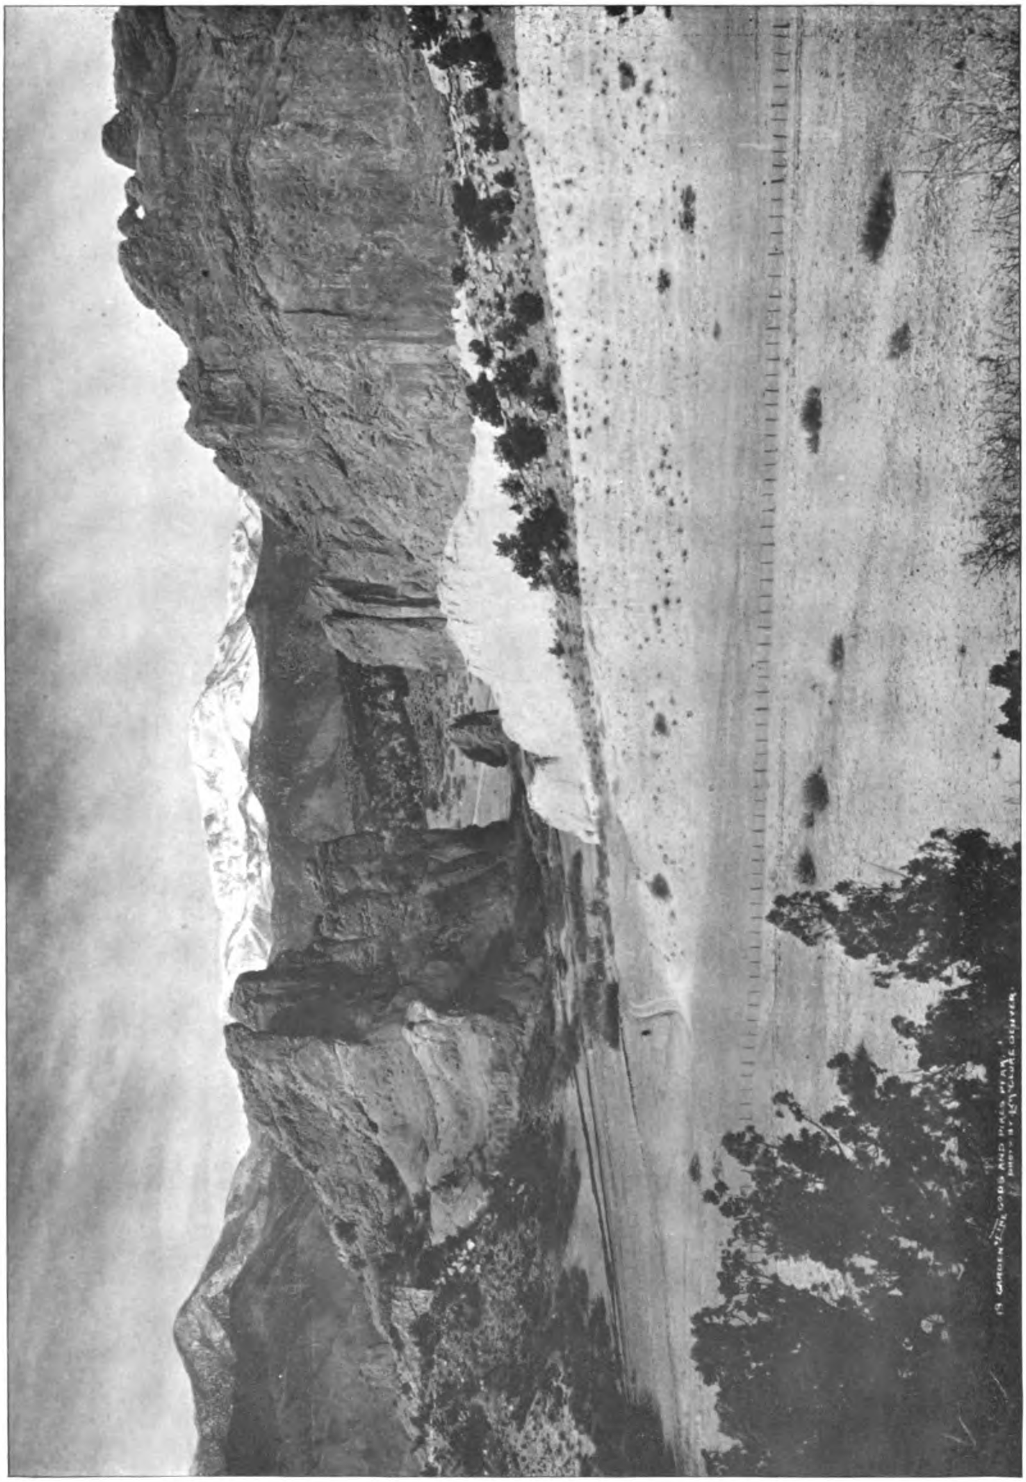
Plan of garden suburb, Hempstead, England.

grounds, so that light and fresh air is abundant. The trees and shrubs that grow in abundance afford a very pleasant and agreeable aspect.

Other notable German garden cities are Wandbeck and Altona, near Hamburg. The former covers about 10 acres and has 150 houses, while the latter is still under construction, with municipal assistance. It will ultimately provide for a population of 30,000 persons. In addition a large number of co-operative associations have been formed in Germany at Rostock, Plauen, Tilsit, Bonn, Chemnitz, Aachen, Halle, Dortmund, Erfurt, etc., and a considerable number of garden cities have been under construction or completed.

Industrial home towns is the usual term in the United States for what the British call

GARDEN OF THE GODS



Gateway to the Garden of the Gods, near Manitou, on the Denver and Rio Grande Railroad, Pike's Peak in the distance

garden cities, and the Germans, «Workingman's colonies.» The basic principles are practically the same, the exception being that in British practice there are fewer houses per acre — that is, more ground is allotted to gardens, lawns, parks, playgrounds and streets. The Hempstead suburban garden has eight one-family houses per acre, exclusive of streets; Hempstead tenants, 10; Ilford, eight; Letchworth Garden City, 12 one-family houses per net acre. American industrial home towns have as many as 18, and even more, houses per net acre.

Notable among the industrial house towns of the United States are those of the Goodyear Heights Realty Company, Akron, Ohio; Kenosha Home Association, Kenosha, Wis.; Delaware and Lackawanna Railroad Company, Kistler, Pa.; the Improved Housing Association, New Haven, Conn.; aside from those mentioned, there are numerous other industrial home town developments now under way in various parts of the country.

FRANK KOESTER,
Author of 'Modern City Planning and Maintenance.'

GARDEN CITY, N. Y., a village on Long Island in Nassau County, on the Long Island Railroad, 20 miles east of New York. It was founded by Alexander T. Stewart as a residential town. It is the seat of the Protestant Episcopal bishop of Long Island, and contains the cathedral of the Incarnation. Here are also the cathedral schools, Saint Mary's and Saint Paul's, and the factory of a large publishing house. Pop. about 1,000

GARDEN OF THE GODS, a small region in Colorado, near Colorado Springs, in which are seen some of the most striking effects of erosion ever found upon the globe. The «Garden» covers an area of about 500 acres, within which are sandstone rocks, red and white, in forms of grotesque magnificence — columns, «cathedral spires» and giant figures sometimes appearing almost as if made in human likeness. To many of these shapes have been given distinctive names suggested by their various formations. The road into the «Garden» enters through the huge «Gateway» of red rock-masses 330 feet in height.

GARDENIA, a genus of shrubs or small trees of the family *Rubiaceæ,* containing about 60 species in the subtropical regions of the Old World. They have mostly glossy, entire leaves and showy, solitary or clustered, yellow or white flowers. *G. Jasminoides,* the Cape jasmine, is a shrub with waxy double flowers, much cultivated for hedges from Virginia southward. It was formerly popular as a greenhouse plant but is little grown now.

GARDENING, Landscape. See LANDSCAPE ARCHITECTURE.

GARDINER, gärd'nėr, **Asa Bird,** American lawyer: b. New York, 30 Sept. 1839. He was educated at the College of the City of New York and New York University; during service in the Civil War attained the rank of captain and received a medal of honor for bravery; was professor of law in the United States Military Academy in 1874–78, and became district attorney of the county of New York in 1897. He held important posts in the Society of the Cincinnati and other organizations. Author of 'The Writ of Habeas Corpus as affecting the Army and Navy' (1874); 'The Order of the Cincinnati in France' (1905), etc.

GARDINER, Frederic, American Protestant Episcopal clergyman: b. Gardiner, Me., 11 Sept. 1822; d. Middletown, Conn., 17 July 1889. He was graduated from Bowdoin College in 1842, from the General Theological Seminary, New York, in 1845; was rector of Trinity, Saco, Me., 1845–47; rector of churches at Bath (1848–53) and Lewiston, Me., (1855–56); and in 1865 became professor of the literature and interpretation of Scripture in the Gambier (Ohio) Theological Seminary. In 1867 he was appointed professor of the Old Testament language and literature in Berkeley Divinity School (Middletown, Conn.), and in 1883 of New Testament interpretation and literature in that institution. He founded (1880) the Society of Biblical Literature and Exegesis, and published 'The Island of Life' (1851); 'Diatessaron' (1871); 'The Old and New Testaments in their Mutual Relations' (1885).

GARDINER, Harry Norman, American educator: b. Norwich, England, 6 Nov. 1855. In 1874 he came to the United States; was graduated at Amherst in 1878, and subsequently studied at Union Theological Seminary (1879–82), Göttingen, Leipzig and Heidelberg. In 1878–79 he taught in the Academy of Glens Falls, N. Y.; in 1891–92 was instructor in psychology in Amherst; was instructor (1884–88) and subsequently professor of philosophy at Smith College after 1888. He is member of the American Psychological Association, the American Philosophical Association (president 1907) and of the American Association for the Advancement of Science. He has published 'Outlines of Modern Philosophy' (1892) and edited 'Jonathan Edwards — A Retrospect' (1901) and 'Selected Sermons of Jonathan Edwards' (1904).

GARDINER, John, American lawyer: b. Boston, 1731; drowned off Cape Ann, 15 Oct. 1793. He was a son of Sylvester Gardiner (q.v.). He studied law at the Inner Temple, London, and was admitted to practice at Westminster Hall. He formed an intimacy with Churchill and Wilkes, and was junior counsel of the latter at his trial in 1764, and also appeared for Beardmore and Meredith, who for writings in support of Wilkes had been imprisoned on a general warrant. In 1766 he procured the appointment of attorney-general in the island of Saint Christopher, where he remained until after the American Revolution, when he returned to Boston. After residing there a few years, he removed to Pownalborough, Me., which place he represented in the Massachusetts legislature until his death. As a legislator he distinguished himself by his efforts in favor of law reform, particularly the abolition of special pleading, and the repeal of the statutes against theatrical entertainments. In connection with the latter subject he published a 'Dissertation on the Ancient Poetry of the Romans,' and an accompanying speech. The abolition of the law of primogeniture in Massachusetts was due to his efforts. He was one of the most influential of the early Unitarians of Boston, and participated in the change of King's Chapel from an Episcopal into a Unitarian Congregational church.

GARDINER, John Sylvester, American Episcopal clergyman: b. Haverford West, South Wales, England, June 1775; d. Harrowgate, England, 29 July 1830. He was a son of John Gardiner (1731–93) (q.v.); accompanied his father to the West Indies, and subsequently studied in Boston, and in England under the celebrated Dr. Parr. Returning to America, he became a candidate for orders in the Protestant Episcopal Church, and in 1797 was ordained. In 1805 he became rector of Trinity Church, the chief Episcopal parish in Boston, with which he remained connected until his death. He was an accomplished scholar and a forcible preacher. In the establishment of the *Boston Anthology and Monthly Repository*, for which he was a frequent writer, he contributed materially to the dissemination of literary taste and culture in Boston. He was also one of the founders of the Boston *Athenæum*. He wrote the 'Jacobiniad,' a satire in prose and verse directed against the liberal clubs of Boston to which, being in politics a strong Federalist, he had an antipathy.

GARDINER, Lion, English settler in America: b. 1599; d. 1663. After service in the English army, he came to America in 1635 as the representative of a land company which had a patent of territory at the mouth of the Connecticut. He built a fort to which he gave the name of Saybrook, compounded from the names of Lord Say and Sele and Lord Brook, two of the patentees, and remained in charge until 1639. He made on an island, called by him the Isle of Wight (now Gardiner's Island, township of Easthampton), the first English settlement within the limits of what is now the State of New York, and there he lived in baronial style.

GARDINER, Samuel Rawson, English historian: b. Ropley, Hampshire, 4 March 1829; d. Sevenoaks, Kent, 23 Feb. 1902. He was educated at Christ Church, Oxford, studied also at Edinburgh and Göttingen; was professor of history at King's College, London, in 1877–85, historical lecturer for the University Extension Society in 1880–94, and examiner in the Oxford final history school in 1886–89. He was elected to a research fellowship by All Souls, Oxford, in 1882, and to a similar fellowship by Merton, in 1894. On Froude's death (1894) he declined appointment to the Oxford regius professorship of modern history. It is for his work of research in the history of England from 1603 to 1660 that he is best known. The results were published in instalments later assembled in various collective editions. In the course of his investigations he examined the minutest details with extraordinary care. He inspected the scene of most battles which he described; he thoroughly familiarized himself with the state papers of the Record Office; and for the study of the state papers foreign and the contents of other national archives learned six continental languages. No source of information was left unexhausted. It is stated that he was the only one that ever read the entire collection of Thomasson tracts in the British Museum. Though himself a Liberal in politics, his writing was wholly judicial and impartial. Perhaps no other English historian ever labored more enthusiastically for historical truth and no one was more judicious in his treatment of sources. His style is clear and well-ordered, and in later volumes vigorous and often impressive. He was the first to describe in full the period of Commonwealth and Protectorate from an unprejudiced viewpoint, and he was also the first to explain satisfactorily the beginnings of the Cavalier party and the rise of the civil war. He was fortunately enabled to utilize many newly discovered sources. His work was not at first popular, but its worth was later fully recognized. In 1882 he received a civil-list pension of £150. The titles of the larger divisions of his great undertaking are 'History of England from the Accession of James I to the Disgrace of Chief Justice Coke' (1863); 'History of England from the Accession of James I to the Outbreak of the Great Civil War' (1883–84); 'History of the Great Civil War' (1886–91); and 'History of the Commonwealth and Protectorate' (1894–1901), in three volumes, a fourth to be completed by Firth. He wrote also 'Cromwell's Place in History' (1897); 'Oliver Cromwell' (1899); and other works, including 'The Thirty-Years' War' (1874); 'The First Two Stuarts, and the Puritan Revolution' (1876); 'Introduction to the Study of English History' (with Mullinger, 1881); 'Constitutional Documents of the Puritan Revolution' (1889); 'Student's History of England' (1890–92); 'School Atlas of English History' (1891); 'What the Gunpowder Plot Was' (1897).

GARDINER, Sylvester, American physician: b. Kingston, R. I., 1717; d. Newport, R. I., 8 Aug. 1786. He studied medicine in London and Paris, subsequently practised his profession in Boston, and opened there a drug establishment, from which the New England colonies were chiefly supplied. He was one of the early promoters of inoculation for the smallpox, and a liberal contributor for the erection of King's Chapel, Boston. He became possessed of large tracts of land in Kennebec County, Me., and about the middle of the century was instrumental in establishing there the settlement of Pittston, a portion of which was subsequently set off into a separate town, under the name of Gardiner, where he built and endowed Christ Church. He retired from Boston on its evacuation by the British troops, but returned to the United States at the close of the Revolutionary War, and passed the rest of his life there.

GARDINER, Me., a city in Kennebec County, on the Kennebec River, and on the Maine Central Railroad, six miles from Augusta. Separated from Pittston and incorporated as a town in 1803, it was chartered as a city in 1848. It has admirable water power, valuable manufacturing interests, and an assessed property valuation of more than $4,000,000. The ice-cutting industry employs 1,000 people, with an annual output valued at $75,000.

The commission form of government was adopted by the city, and became operative in 1912. Pop. 5,311.

GARDINER'S ISLAND, N. Y., an island in a bay of the same name at the northeastern extremity of Long Island. It is part of the township of East Hampton, Suffolk County, and has an area of 3,300 acres, mostly undulating pasture land. It was bought from the Indians by Lion Gardiner in 1639. Captain Kidd (q.v.) buried part of his treasures on the island in 1699, but they were recovered in the same year by the colonial authorities.

GARDNER, Augustus Peabody, American congressman and soldier: b. Hamilton, Mass., 5 Nov. 1865; d. Camp Wheeler, Va., 16 Jan. 1918. He was graduated at Harvard in 1886; was a member of the Massachusetts State senate (1899–1901), and was elected to nine congresses, from the 57th to 65th inclusive. During the Spanish-American War, he served as captain and assistant adjutant-general on staff of Gen. J. Wilson In 1913 he was Republican nominee for governor of Massachusetts. An earnest advocate of American participation in the European War, he entered the army in 1917 as colonel in the Officers Reserve Corps. He procured demotion to major, so that he might see active service sooner. He died while in training at Camp Wheeler, and was interred at the national capital.

GARDNER, Edmund Garratt, English scholar in Italian: b. London, 12 May 1869. He was educated at Gonville and Caius College, Cambridge. Intended for the medical profession, he soon abandoned it for the study of Italian literature and history, especially the study of Dante. He has devoted much time to research in Italian archives and libraries, and, more recently, to the investigation of mysticism and kindred subjects. He is Barlow lecturer on Dante at University College, London. His publications include 'Dante's Ten Heavens' (1898); 'A Dante Primer' (1900); 'The Story of Florence' (1900); 'Desiderio' (1902); 'The Story of Siena and San Gimignano' (1902); 'Dukes and Poets in Ferrara' (1904); 'The King of Court Poets' (1906); 'Saint Catherine of Siena' (1907); 'The Cell of Self-knowledge' (1910); 'Dante and the Mystics' (1914); 'The Book of Saint Bernard on the Love of God' (1916).

GARDNER, Ernest Arthur, English archæologist: b. London 1862. He was educated at Cambridge University, and was director of the British School of Archæology at Athens, 1887–95. From 1884 he has been engaged in archæological researches in Egypt, Athens, Paphos in Cyprus, Megalopolis and elsewhere, and has lectured and written much upon Greek art and archæology.

GARDNER, Eugene C., American architect; b. Ashfield, Mass., 28 March 1836; d. Springfield, Mass., 7 Feb. 1915. He was principal of the academy at Tallmadge, Ohio, 1852–62. He then removed to Northampton, Mass., where he resided 1863–68, engaged in architectural work, going to Springfield, Mass., in the latter year, editing *The Builder* 1885–87, and writing for the *Springfield Republican*. In 1901 he was elected a member of the Massachusetts House of Representatives. Among his works are 'Homes and How to Make Them'; 'Illustrated Homes'; 'Home Interiors'; 'The House that Jill Built'; 'Town and Country School Houses'; and 'Common Sense in Church Building.'

GARDNER, Henry Brayton, American educator: b. Providence, R. I., 26 March 1863. He was graduated at Brown University in 1884 and from 1884 to 1888 studied at Johns Hopkins, where he received the degree of Ph.D. in 1890. In 1888–90 he was instructor in political economy; in 1890–98, associate professor, and since 1898 professor at Brown University. He is a member of the American Economic Association, of which he was vice-president in 1897–98, and has published 'Statistics of Municipal Finance' (in publications of the American Statistical Association, New Ser., No. 6, 1889 and in publications of American Economic Association, New Ser., No. 2, 1899).

GARDNER, Percy, English archæologist: b. Hackney, Middlesex, 24 Nov. 1846. He was educated at Cambridge University, was Disney professor of archæology there in 1880 and has been professor of classical archæology at Oxford since 1887. Among his publications are 'Samos and Samian Coins' (1882); 'The Types of Greek Coins' (1883); 'New Chapters in Greek History' (1892); 'Manual of Greek Antiquities,' with Jevons (1895); 'Sculptured Tombs of Hellas' (1896); 'Exploratio Evangelica' (1899); 'Historic View of the New Testament' (1901); 'A Grammar of Greek Art' (1905); 'The Growth of Christianity' (1907); 'Religious Experience of Saint Paul' (1911); 'Principles of Greek Art' (1913).

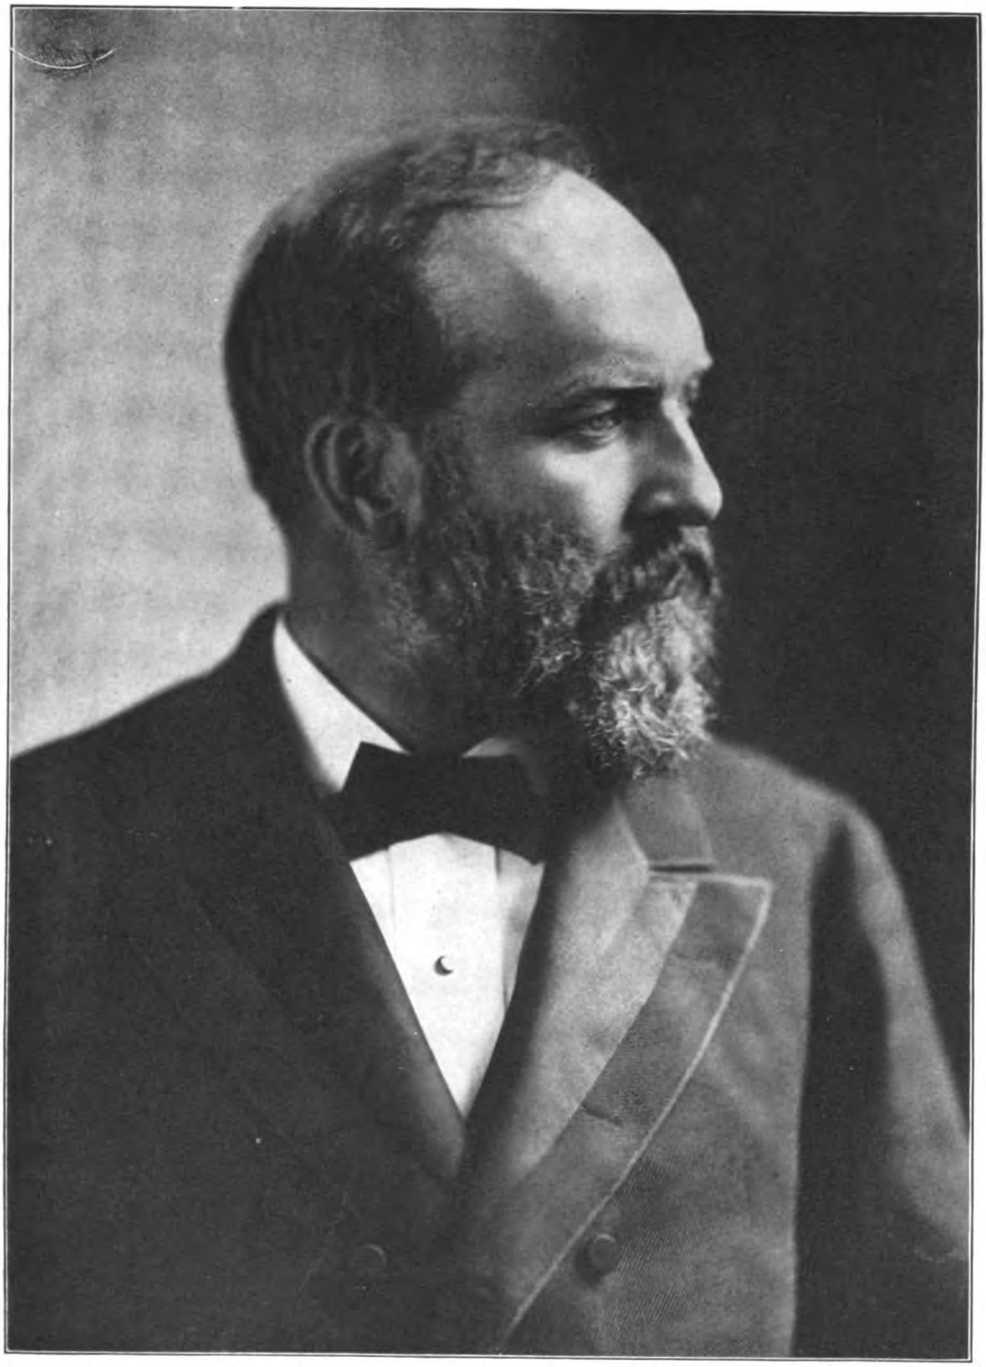
GARDNER, Mass., a town in Worcester County, including the villages of Gardner Centre, South Gardner and West Gardner. It is situated about 25 miles north of Worcester, on the Fitchburg division of the Boston and Maine Railroad, two branches of which pass through the town, intersecting at the station in Gardner Centre. Gardner is the trade centre of an agricultural region and has a large chair-manufacturing industry, with establishments employing about 3,000 people. Almost every known kind of chair is made here, and the products of this manufacture are shipped to all parts of the United States and to many foreign countries. The number of industrial establishments in 1914 was given in the Census Bureau's summary as 64; persons engaged in manufactures, 4,245; proprietors and firm members, 49; salaried employees, 232; wage earners, 3,964; primary horse power, 5,046; capital, $13,534,000; services, $2,447,000; salaries, $363,000; wages, $2,084,000; materials, $3,079,000; value of products, $7,450,000; value added by manufacture, $4,371,000. The town has two good parks and an excellent public library. Pop. 16,000.

GAREFOWL. See GREAT AUK.

GARFIELD, Harry Augustus, American educator and public official: b. Hiram, Portage County, Ohio, 11 Oct. 1863. He is a son of James A. Garfield, 20th President of the United States; was educated at Williams College, where he was graduated in 1885. In 1885–86 he taught Latin and Roman history at Saint

Paul's School, Concord, N. H., and practised law in Cleveland from 1888 to 1903. From 1891 to 1897 he was professor of contracts at the Law School of Western Reserve University; in 1903–08 was professor of politics at Princeton, and in the latter year was appointed president of Williams College. In 1908–09 he was president of the Cleveland Chamber of Commerce and in 1896 helped to organize the Cleveland Municipal Association, of which he was afterward president. In 1917, soon after the entrance of the United States into the World War, President Wilson appointed Mr. Garfield fuel controller. Because of the shortage of coal in the Northeastern States, especially New York City, and in Ohio, his administration of the office was severely criticized in the press, but Congressional investigation showed that the shortage was due to failure of the railroads to meet the extra demands upon them, and the situation cleared soon after Federal control of the roads was instituted, 28 Dec. 1917.

GARFIELD, James Abram, 20th President of the United States: b. Orange, Cuyahoga County, Ohio, 19 Nov. 1831; d. Elberon, N. J., 19 Sept. 1881. On his father's side he was of English Puritan descent; on his mother's, Huguenot. The father, a native of New York, settled in the «Western Reserve» in 1830 and died in 1833, leaving his widow with four small children, James being the youngest. Garfield's boyhood was passed amid the harsh but by no means destitute conditions of frontier life. He worked hard on the farm, helped in the support of the family, attended school three months each winter and read and reread every book which fell in his way. For a short time he was a driver and steersman on the Ohio Canal. Supporting himself chiefly by teaching, he studied successively at Geauga Seminary 1849, Eclectic Institute, Hiram, Ohio (now Hiram College), 1851–54, and Williams College, Mass., entering the junior class in 1854 and graduating with high honors in 1856. Returning to Ohio, he taught the classics at Hiram Institute 1856–57, and became its president 1857–59. Coincident with his teaching he studied law, was admitted to the bar in 1859 and, resigning his presidency, was elected to the Ohio State senate. The Civil War breaking out, he threw himself enthusiastically into the Northern cause, was commissioned lieutenant-colonel of the 42d Ohio and given command of a brigade, with orders to operate as an independent force in eastern Kentucky, December 1861. With a force of 1,100 men and no artillery he signally defeated 5,000 Confederates under the veteran general Humphrey Marshall, driving them from fortified positions of their own choosing, 10 Jan. 1862. For this exploit Lincoln promoted him brigadier-general. Subsequently he took part in the battle of Shiloh, in the operations around Corinth, and served with distinction on several courts-martial at Washington, one being that of Gen. Fitz-John Porter (q.v.). Appointed chief of staff to General Rosecrans, February 1863, his notable services at Chickamauga (see CHICKAMAUGA, BATTLE OF) caused Lincoln to make him a major-general, 19 Sept. 1863. In 1862 his home district had elected him to Congress. Thus, within six years he had been president of a college, State senator, major-general and representative-elect, a combination of honors without parallel in the national annals. Upon the advice of Lincoln and Stanton he resigned his major-general's commission 5 Dec. 1863 and took his seat as a representative on December 7. In this field his talents and genius found their true sphere. He stepped to the front at once, taking a prominent part in every debate of importance and becoming an authority on questions of finance, tariff, education and constitutional rights. Always the champion of sound money, his speech in March 1866 clearly outlined the policy which resulted in the resumption of specie payments 1 Jan. 1879. An eminent contemporary has well said of Garfield's speeches, that they are a compendium of the political history of the time and would give a connected history and complete defense of the important legislation of the 17 eventful years that comprised his legislative career. He was eight times re-elected to Congress, serving on such important committees as those on military affairs and on ways and means, and was the first chairman of the Committee on Banking and Currency. In the Reconstruction period he steadily opposed the theories of President Johnson (see JOHNSON, ANDREW); in 1876 he went to New Orleans at President Grant's request to watch the counting of the Louisiana vote, and in 1877 was chosen by acclamation one of the two members of the Electoral Commission allotted to the House of Representatives. In the 45th Congress Garfield displayed masterly qualities as a leader of opposition. His speech at Faneuil Hall, Boston, in 1878 on the national finances was circulated by thousands as a campaign document. On 13 Jan. 1880 the Ohio legislature unanimously elected him United States senator to succeed Hon. Allen G. Thurman (q.v.), and his last speech in Congress was delivered 23 April 1880. At the Republican National Convention at Chicago, 2–8 June 1880, he headed the Ohio delegation, nominated John Sherman (q.v.) for the Presidency, opposed the nomination of General Grant for a third term and was himself nominated on the 36th ballot as a compromise candidate. Contrary to all precedent, Garfield himself took part in the campaign that followed, making some 70 speeches in all, chiefly extemporaneous. At the November election he received 214 electoral votes to 155 given his Democratic opponent, General Hancock. The first months of Garfield's administration were disturbed by the opposition of the New York senators to certain of his appointments. Senators Conkling and Platt claimed the right to control the Presidential appointments in their State. This the President refused to concede. The senators resigned and appealed to their legislature to vindicate their attitude by a re-election, but failed to get it. On the morning of 2 July 1881, while in the Baltimore and Potomac station at Washington, on his way to New England, where he intended to deliver the commencement address at Williams College, President Garfield was shot by Charles Jules Guiteau (q.v.), a disappointed office-seeker. For weeks he lingered between life and death, suffering the greatest agony but bearing it with a magnificent fortitude that won the admiration and sympathy of the civilized world. A removal to Elberon, N. J., in the hope that the sea air



JAMES ABRAM GARFIELD

Twentieth President of the United States

might benefit him was of no avail. Blood poisoning set in on 15 September and he died on the 19th at 10.30 P.M. In February 1882 an impressive memorial service was held in the House of Representatives, the Hon. James G. Blaine delivering a commemorative address, which for eloquence, dignity and truth has rarely been equaled on such occasions. Garfield's body lies in a beautiful cemetery in Cleveland, Ohio, a stately monument marking the spot. His life was the fullest realization of the opportunities of American citizenship. Rising from nothing, by his own exertions he won high places in various spheres and filled them all adequately and with dignity. His 'Works' have been edited by Prof. B. A. Hinsdale (Boston 1882–83). Consult Hinsdale, 'President Garfield and Education' (Boston 1882).

W. N. C. CARLTON,
Librarian, Newberry Library, Chicago.

GARFIELD, James Rudolph, American government official, son of President James A. Garfield: b. Hiram, Ohio, 17 Oct. 1865. He was graduated at Williams College in 1885; studied at the Columbia Law School and in 1888 was admitted to the bar. In 1896–99 he was a member of the Ohio senate and in 1902–03 was a member of the United States Civil Service Commission. From 1903 to 1907 he was commissioner of corporations of the United States Department of Commerce and Labor and in 1907 became Secretary of the Interior in President Roosevelt's Cabinet. He retired from this post on 4 March 1909; during his term of office, he effected a complete reorganization of the department and instituted many land-office reforms. Since 1909 he has been engaged in law practice at Cleveland; in 1912 he was prominent in the councils of the new Progressive party.

GARFIELD, N. J., borough of Bergen County, opposite Passaic, on the Passaic River, and on the Erie Railroad, 10 miles northwest of New York. It contains machine shops, embroidery works, knitting mills, woolen mills and stone works, and there are manufactures of wax paper, chemicals, rubber goods, paper boxes, perfumes and clothing. In 1914 there were in operation 39 establishments with an aggregate capital of $16,083,000 and employing 6,144 persons. Salaries and wages amounted to $3,113,000. The products were valued at $16,113,000, of which $4,748,000 was added by manufacture. Garfield was incorporated in 1898; the government is vested in a mayor and council. The water plant is municipally owned. Pop. 15,455.

GARFIELD MONUMENT, a monument erected as a memorial to President Garfield, in the Lakeview Cemetery at Cleveland, Ohio. See CLEVELAND.

GARGANO, gär-gä'nō (ancient Garganus), a mountainous peninsula, the «spur» of Italy, in the province of Foggia, jutting out into the Adriatic Sea, and attaining in Monte Calvo a height of nearly 4,000 feet. Bee-keeping is yet as generally engaged in as in the time of Horace. The district is visited mainly by pilgrims to a shrine of Saint Michael on Monte Saint Angelo. It is about 50 miles long and 27 miles broad.

GARGANTUA AND PANTAGRUEL (*La Vie très horrifique du grand Gargantua and Pantagruel, roi des Dipsodes*) is the literary monument of François Rabelais. The significance of the work for its time is likely to be misapprehended by readers grown more squeamish, even in speaking, than he was in writing or printing, of matters concerning the processes of engendure, gestation, nutrition, digestion and excretion, while they have become heedless, through long and wonted use, of those liberties in education and in the saner social, political and intellectual outlook for which our age is indebted most to Rabelais and to Erasmus among the humanists of the 16th century. In the coarseness with which he expresses a lusty animalism, Rabelais had rivals but hardly an equal. Yet in the whole of his work there is not a prurient phrase. He likens (Bk. 1, Prologue) his work to a «silene,» i.e., to a little fancy box whose grotesquely ornamented lid hid some prized thing, a jewel perhaps, a spice, some healing salve. What is hidden is worth more than what appears. Let his readers «break the bone and suck out the marrow.»

The dates and even the order of publication of the five books that make up the current 'Gargantua and Pantagruel' are uncertain. Book 2, the first of 'Pantagruel' was certainly in print in 1533, as was the 'Pantagrueline Prognostication,' a parody of the current popular almanacs. Book 1, 'Gargantua,' is known first in an edition of 1535. A rather commonplace chap-book, 'The Grand and inestimable chronicles of the great and enormous giant Gargantua' is at least as early as 1532. Giant Gargantua was already a familiar figure in the folklore of France. Whether these 'Chronicles' are by Rabelais, or whether perhaps some other earlier 'Gargantua' by him has left no trace, is uncertain. A new edition of Books 1 and 2 appeared in 1542, the very important Book 3 in 1546. A part of Book 4 appeared in 1547, while Rabelais was in exile, the whole of it after his restoration to royal favor in 1552. Meantime a version of the much disputed Book 5 had appeared in 1549. The current version of this Book was first printed in 1562 and not incorporated with the other four till 1567. This latter version is at least sophisticated; possibly neither is genuine.

The work changed in character as it progressed. It began as a narrative of Brobdingnagian folk-lore, with sallies of ebullient animal spirits and passages of shrewd observation and deep wisdom regarding the errors and shortcomings of the time in education and in political, social and religious life. As the work proceeds these latter elements become more and more prominent, and with the development of the character of Panurge in Book 3, it grows clearer why Coleridge should speak of «the moral elevation of Rabelais' work» and rank him «with the creative minds of the world, Shakespeare, Dante, Cervantes.» Humor is the book's shell. Rabelais, with Erasmus and Hutten, killed obscurantism with laughter. But wisdom is its kernel. His insight into and sympathy with human nature, joined to his classical scholarship, shook a drowsing Europe to awakened intellectual life. Especially to be noted are the passages on education (Bk. 1; 14, 15, 21–24); those that tell of the words and deeds of the redoubtable Friar John of the Funnels, better, «of the Choppers» (Bk. 1; 27, 39–45) and his abbey of Theleme (Bk. 1; 52–57); Gargantua's letter of counsel to Pantagruel (Bk. 2; 8); the latter's encounter with the Limousin pedant (Bk. 2; 6); and with Panurge (Bk. 2; 9); Panurge's praise of debt (Bk. 3; 3–5) and his famous search for light on the question of his marriage, which, with many digressions, is the binding thread for the rest of the work. The key-note is its militant faith in human nature and liberty, informed by free thinking and free teaching, joined to a Greek aversion to ascetic restraint. Never was there a more robust believer that life for its own sake could be made worth living.

Among many annotated editions of Rabelais may be noted those by Marty-Laveaux (1870–81), by Montaiglon and Lacour (1868–72), by Moland (1881), by Clouzot (1912) and by Lefranc and others (unfinished, 1912–). The best-known translation was begun by Sir Thomas Urquhart and completed by Peter Le Motteux (1653–94). It has been often reprinted, notably with an introduction by Whibley (Tudor translations, 3 vols., 1900). W. F. Smith's annotated version (2 vols., 1893) is more accurate. Consult Tilley, ‘Rabelais’ (1907); Paillard, ‘L'Œuvre de Rabelais’ (1910); Stapfer, ‘Rabelais’ (1889); Gebhard, ‘Rabelais, le renaissance et le réforme’ (1877), and ‘Revue des études rabelaisiennes’ (1903–12) continued as ‘Revue des études du siezième siècle’ (1913–).

BENJAMIN W. WELLS.

GARGOYLE (Late Latin *gargula*, Old French *gargouille*, throat), a carved or moulded ornamental figure projecting at the upper part of a building, either connected with a water spout or in general design resembling those satirical figures which originally decorated water spouts. Thus, in ‘La Scultura nel Duomo di Milano’ (Milan 1908) we read that, contemporaneously with the locations of the first statues on parts of the exterior of Milan Cathedral, there began also the creation of those bizarre figures which enlivened the external architectonic organism. The Milanese gargoyles, «originating in the simple necessity of making channels for rainwater, became one of the most vivid and characteristic ornaments.» The important book devoted to this branch of art as exemplified at Rouen, Adeline's ‘Sculptures Grotesques et Symboliques,’ employing the word in its wider meaning, denominates both non-spouters and spouters *gargouilles*; and useful definitions are those by Canon Auber in the *Bulletin Monumental*: (a) Symbolic monsters, emblems of the paganism conquered by religion at Rouen, and (b) imitations of those chimerical animals, to conduct water from roofs. The 1608 edition of Withal's Dictionary has: «Gargels of men's figures, telamones, atlantes; gargels of women's figures, cariatides.» Mr. G. L. Hunter, in his ‘Notes on Gargoyles, Grotesques and Chimeras’ (*Architectural Record*, New York, February 1914) writes: «Gargoyles are as fundamentally Gothic as grotesques are Renaissance and chimeras are Classic.» Only by a perversion can the word *grotesque* be twisted from Renaissance to Gothic and substituted for gargoyle. «Even if *gargoyle* did mean the *spouter* only, the extension of its meaning to include all the Gothic satirical figures that throng the roofs and towers of Gothic buildings would be in line with the normal and natural development of language. All the more reason, then, for holding on to a meaning that is sanctioned by ancient general usage.» In the United States the day of the gargoyle and the grotesque in church decoration has gone by; secular architecture, however, retains and finds new applications for such «symbolic monsters.» Examples are seen at West Point, where one of the barracks is ornamented with quaint and humorous figures illustrating the development of war; at Princeton University, where (on a dormitory) are numerous interesting gargoyles designed by Mr. Borglum. One of the best modern examples of the free use of gargoyles and grotesques is seen at the College of the City of New York, whose buildings the architect has enriched with more than 600 figures, all different.

The highest-placed gargoyles in the world are those projecting from the 29th, 49th and 51st stories of the Woolworth Building in New York City. These, like other modern gargoyles, «do not spout even when in the horizontal position of water spouts. And unlike mediæval gargoyles, but like those of ancient Rome, they are made of terra cotta instead of stone, and consequently have the characteristics of moulded rather than of carved ornament.» Although not sufficiently numerous to be regarded as an important decorative feature of such an enormous structure, they certainly add to the attractive vitality of line, emphasize somewhat light and shade, and suggest the possibilities inherent in the employment of gargoyles on a larger and freer scale for the decoration of important commercial edifices.

GARIBALDI, gä-rē-bäl'dē, **Giuseppe**, Italian patriot: b. Nice, France, 4 July 1807; d. island of Caprera, Italy, 2 June 1882. His father being a poor fisherman he received little education, and for a number of years was a sailor on various trading vessels. In 1834, being condemned to death for his share in the schemes of Mazzini, he escaped to Marseilles and finally went to South America. In the service of the Republic of Rio Grande against the Brazilians he became known as a brilliant leader, and with his famous Italian legion he subsequently gave the Montevideans such effective aid against Buenos Aires as to earn the title of «hero of Montevideo.» While in South America, he married his first wife, Anita, who shared his dangers and privations. In 1848, on hearing of the rising against Austria, he returned to Italy, raised a band of volunteers and harassed the Austrians till the re-establishment of Austrian supremacy in Lombardy. In the spring of 1849 he proceeded to Rome to support Mazzini's republic. He was appointed to command the forces, but the odds were overwhelming, and after a desperate defense of 30 days Garibaldi escaped from Rome with 4,000 of his followers, and made a daring retreat through territory occupied by Austrian forces. Garibaldi, accompanied by his wife, ultimately set sail for Venice; but being pursued by Austrian vessels, was forced to land, when his wife succumbed and was buried in the sand. He reached the United States, and was for several years in command of a merchant vessel. He then purchased a part of the small island of Caprera, off the north coast of Sardinia, and made this his home for the rest of his life. Latterly the subscriptions of his admirers enabled him to become owner of the whole island.

In the war of 1859, Garibaldi and his Chasseurs of the Alps did splendid service; and on the revolt of the Sicilians in 1860 he crossed to the island, wrested it after a fierce struggle from the king of Naples, recrossed to the mainland and occupied Naples, where he was proclaimed dictator of the Two Sicilies. He readily acquiesced in the annexation of the Two Sicilies to Italy, and declining all honors, retired to his island farm. In 1862 he endeavored to force the Roman question to a solution, and entered Calabria with a small following, but was taken prisoner at Aspromonte by the royal troops. He was soon released, however, and returned to Caprera. In 1864 he received an enthusiastic welcome in Great Britain. In 1866 he commanded a volunteer force against the Austrians in the Italian Tyrol, but failed to accomplish anything of consequence. Next year he attempted the liberation of Rome, but near Mentana was defeated by the French and pontifical troops, and was again imprisoned by the Italian government, but soon pardoned and released. In 1870 he gave his services to the French republican government against the Germans, and at the end of the war was elected a member of the French Assembly, but speedily resigned his seat and returned to Caprera. Rome now became the capital of united Italy, and here in January 1875, Garibaldi took his seat in the Italian Parliament. The latter part of his life was spent quietly at Caprera. His second wife was the Countess Raimondi, whom he married in 1860; but the union was an ill-assorted one; and his third wife was Francesca, a peasant. After 1870 he wrote two or three novels of very mediocre quality. His autobiography was published in 1887, and translated into English with a supplementary biography in 1889.

Bibliography.— Dwight, 'Life of Garibaldi; from his Private Papers' (new ed., New York 1903); Bent, 'Life of Garibaldi' (London 1881); Guerzoni, 'Garibaldi' (2 vols., Florence 1881); and G. N. Trevelyan's admirable works, 'Garibaldi's Defence of the Roman Republic' (New York 1907); 'Garibaldi and the Thousand' (New York 1909); and 'Garibaldi and the Making of Italy' (New York 1911).

GARIBALDI (fish), a small, brilliantly colored, edible fish (*Hypsypops rubicundus*), scarlet when adult, which dwells in rocky pools along the coast of southern California, hiding and finding its food among the seaweeds.

GARIBALDI HYMN, the popular, though not official, national anthem of Italy. The real national air is the «Marcia Reale,» or Royal March. The other, known originally as the «Inno di Guerra dei Cacciatori delle Alpi» (War Hymn of the Alpine Hunters) was written by the poet Luigi Mercantini (1821–72), and is now called «l'Inno di Garibaldi» (since 1860). The music is by a military bandmaster, Alessio Olivieri; it is thoroughly Italian in spirit, being mainly a parade march with a dash of operatic aria. The words are:

All' armi! all' armi!
Si scopron le tombe, si levano i morti,
I martiri nostri son tutti risorti,
Le spade nel pugno, gli allori alle chiome,
La fiamma ed il nome d'Italia sul cor!
Corriamo, corriamo, su o giovani schiere!
Su al vento per tutto le nostre bandiere!
Su tutti col ferro! su tutti col fuoco!
Su tutti col fuoco d'Italia nel cor.
Va fuori d'Italia, va fuori ch'è l'ora,
Va fuori d'Italia, va fuori o stranier!

All'armi! all'armi!
La terra dei fiori, dei suoni, dei carmi,
Ritorni qual era la terra dell'armi;
Di cento catene ci vinser la mano,
Ma ancor di Legnano sa i ferri brandir.
Bastone tedesco l'Italia non doma,
Non crescono al gioco le stirpe di Roma;
Più Italia non vuole stranieri e tiranni
Già troppo son gli anni che dura il servir.
Va fuori d'Italia, va fuori che'è l'ora,
Va fuori d'Italia, va fuori o stranier!

Le case d'Italia son fatte per noi,
È là sul Danubio la casa de tuoi.
Tu i campi ci guasti, tu il pane c'involi,
I nostri figlinoli — per noi li vogliam.
Son l'Alpi e i due mari d'Italia i confini,
Col carro di fuoco rompiam gli Appennini:
Distrutto ogni segno di vecchia frontiera,
La nostra bandiera per tutto inalziam.
Và fuori d'Italia, etc.

The following translation, in blank verse, closely imitates the original, without attempt at rhyme:

To arms! The graves open, the dead arise,
Our martyrs all are resuscitated
With swords in hand, and laurels on their brow,
The flame and name of Italy in the heart.
Haste! haste! up, ye marshalled youth!
On every wind our banners fly!
Rise all with arms, all with fire!
Rise all with the fire of Italy in your hearts!
Depart from Italy, go, the hour has struck!
Out of Italy depart, Oh stranger!

To arms! The land of flowers, melody and poets,
Once more be a land of arms;
A hundred chains here bind the hand,
But Legnano* yet knows how to wield the sword!
German cudgel-blows cannot Italy tame,
The Roman stock was not raised to that game;
No more foreign tyrants will Italy bear,
Too many years has the servitude endured.
Depart from Italy, etc.

The homes of Italy are built for us,
Your home is away on the Danube;
You ravage our fields, you steal our bread,
Our own sons we want ourselves.
The Alps and the two seas are Italy's borders;
With fire we break through the Appennines;
Destroyed every sign of the old frontier,
Our flag shall be raised over all.
Depart from Italy, etc.

GARIGLIANO, gä-rēl-yä'nō, a river in southern Italy, formed by the junction of the Liri and Sacco near Pontecorvo. It flows southeast and southwest, and after a course of 40 miles falls into the Gulf of Gaëta.

GARLAND, Augustus Hill, American lawyer: b. near Covington, Tenn., 11 June 1832; d. Washington, D. C., 26 Jan. 1899. He opposed secession as a policy, but was afterward elected to the Confederate Senate, which office he held till the close of the war. In 1874 he was elected governor under the new constitution of Arkansas, and in 1885 became Attorney-General in the Cabinet of President Cleveland.

* Legnano, an ancient "borgo" of Lombardy, celebrated in history as the final scene of the great struggle for Italian liberty in 1176 against Barbarossa. The word "German" in the next line refers to the Austrians.

GARLAND, Hamlin, American lecturer and novelist: b. near West Salem, Wis., 16 Sept. 1860. When about 16 he became a pupil at the Cedar Valley Seminary, Osage, Iowa, though working as usual on the farm during six months of the year. He was graduated in 1881 from this school and for a year tramped through the Eastern States. He farmed and taught in Illinois and Dakota, went to Boston in 1884, intending to further qualify himself for teaching. He became a pupil and later an instructor in the Boston School of Oratory. During 1885–89 he taught classes in English and American literature and lectured on Browning, Shakespeare, The Drama, etc. In 1893 he took up residence in his native village of West Salem. Here he has resided ever since. A part of each year, however, is spent by the author in mountain traveling. His first book was 'Main-Traveled Roads' (1890), frankly realistic fiction. Somewhat similar in character are 'A Spoil of Office' (1892); 'Prairie Folks' (1893); 'A Little Norsk' (1891); 'Rose of Dutcher's Coolly' (1895). Other works are 'Jason Edwards' (1891); 'A Member of the Third House' (1892); 'Wayside Courtships' (1897); 'Her Mountain Lover' (1901). He has also written a volume of criticism entitled 'Crumbling Idols' (1894); 'Prairie Songs' (1894), a volume of verse; 'Ulysses Grant: His Life and Character' (1898); 'The Eagle's Heart' (1900); 'The Captain of the Gray Horse Troop' (1902); 'Hesper' (1903); 'The Light of the Star' (1904); 'The Tyranny of the Dark' (1905); 'Victor Olnee's Discipline' (1911); 'Forester's Daughter' (1914). He is vice-president of the National Institute of Arts and Letters, a member of the Players' Club and the originator and first president of the Cliff Dwellers, the leading artistic and literary club of the West. He is a persistent advocate of national character in fiction and in music.

GARLIC (*Allium sativum*), a species of onion long in cultivation. The leaves are grass-like, and differ from those of the common onion in not being fistulous. The stem is about two feet high, terminated by a head composed principally of bulbs instead of flowers; the flowers are white; the root is a compound bulb, consisting of several smaller bulbs, commonly denominated cloves, enveloped by a common membrane. Garlic has a strong, penetrating odor and a pungent acrid taste. It differs from the onion only by being more powerful in its effects. In warm climates, where garlic is considerably less acrid than in cold ones, it is much used both as a seasoning and as food. In the south of Europe, particularly in Spain, and among Italians in the United States, it enters into the composition of almost every dish, not only among the common people, but among the higher classes of society. At all times, however, while it has been prized by some nations it has been detested by others, as by the ancient Greeks. Its cultivation is easy, and it is reproduced by planting the radical or floral bulbs. Its medicinal virtues are celebrated.

GARLIC, Oil of. When the leaves, seeds or bulbs of garlic and other allied plants are distilled with steam, about 0.2 per cent of a brown oil, with acrid taste and strong disagreeable odor, passes over. By purification it is obtained as a pale yellow oil having the odor of garlic, and it is then found to consist of the sulphide of allyl $(C_3H_5)_2S$. This oil is nearly related to the pungent oil of mustard, C_3H_5NCS, an isomer of the sulphocyanide of allyl, and is of much interest chemically, but it is of no importance from an industrial point of view.

GARMAN, Harrison, American naturalist: b. Lena, Ill., 27 Dec. 1858. Educated in the public schools and the State Normal University; studied later at Johns Hopkins University. He has held many professional positions, among them, first assistant in the Illinois Laboratory of Natural History and associate professor of zoology in the University of Illinois and is now professor of entomology and zoology of Kentucky State University. He has been State entomologist of Kentucky since 1897. He has written numerous articles on botany, zoology and entomology.

GARMAN, Samuel, American naturalist: b. Indiana County, Pa., 5 June 1846. He was graduated at the Illinois State Normal University in 1870, and became assistant in herpetology and ichthyology in the Museum of Comparative Zoology, Cambridge, Mass., in 1873. His works include 'Fishes and Reptiles from Lake Titicaca' (in *Bulletin* Museum Comp. Zoology, Vol. III, 1871–76) and, as joint author, 'Exploration of Lake Titicaca' (same volume of that *Bulletin*).

GARNEAU, gär'nō, **François Xavier,** French-Canadian historian: b. Quebec, 1809; d. 1866. Educated in his native city, he became a notary in 1830, and devoted his leisure to making researches into the history of Canada. In 1831 he went to England and returned to Quebec in 1833. He afterward became translator to the legislative assembly of Lower Canada and city clerk of Quebec. His 'Histoire du Canada,' published in four volumes, recounts the story of all the French colonies in North America until 1763, and from that date deals with Canada only. Its publication gave a great impetus to literary productivity in French Canada.

GARNER CASE, 1856, the most tragic of the fugitive-slave cases. Simon Garner, his wife, and his son Robert, slaves of John Marshall of Kentucky, and Robert's wife Margaret and their four children, slaves of A. R. Gaines, ran away, crossed the Ohio on the ice, and took refuge with a Cincinnati colored man. Gaines tracked them, secured a warrant, and with a deputy marshal and a band of assistants attacked the house. After a desperate fight the fugitives were overpowered, one of the posse being badly wounded; but Margaret, who had shared in the conflict, found time before her capture to murder one of the children, severely cut the throats of two others, and considerably bruised the baby, to keep them from returning to slavery. In sympathy with them, and to establish their freedom as denizens of Ohio, a Cincinnati judge issued a writ of habeas corpus, and the grand jury indicted Margaret for the murder of her child, and her husband and his father as accessories. The United States Fugitive Slave Law of 1850 prevailed, however; the slaves were given back to their owners and sent down the river. On the voyage Margaret jumped overboard with the baby; she was rescued, but the child was lost, at which she expressed satisfaction.

GARNET, Henry Highland, Afro-American clergyman: b. New Market, Md., 1815; d. 1882. He was born in slavery and at the age of 10 was brought to New York by his parents, who effected their escape from slavery. He received his education at Canaan Academy and at Oneida Institute. He was made pastor of a Presbyterian Church in Troy, N. Y. in 1842. He became prominent among the Abolitionists and for many years edited the *Clarion*, a weekly periodical advocating the abolition of slavery. He lectured on slavery in Great Britain in 1850–53 and for the next two years was missionary in Jamaica under the protection of the United Presbyterian Church of Scotland. From 1855 to 1865 and again from 1869 to 1881 he was pastor of Shiloh Presbyterian Church in New York. In 1865–69 he held a pastorate in Washington, D. C. In 1881 he was made Minister and Counsel-General to Liberia, and died within a few months after his arrival in that republic.

GARNET. See GEMS; MINERAL PRODUCTION OF THE UNITED STATES.

GARNETT, James Mercer, American educator: b. Aldie, Va., 24 April 1840; d. Baltimore, Md., 18 Feb. 1916. He was graduated at the University of Virginia in 1859. He served with the Confederate army during the Civil War and rose to be a captain of artillery. During 1869–70 he studied in Berlin and Leipzig, and in 1870 was appointed president of Saint John's College, Annapolis, which post he occupied for 10 years. Following this he taught at the University of Virginia and the Woman's College in Baltimore. He was a former president of the American Philological Association, and vice-president of the Modern Language Association. For many years he was a member of the University Club of Baltimore. He edited 'Selections in English Prose' (1891); and published a 'Translation of Beowulf' (1882; 6th ed., 1900), a literal version in metre resembling the original; 'Elene and Other Anglo-Saxon Poems' (1889–1900); and a 'History of the University of Virginia' (1901).

GARNETT, Richard, English poet and librarian: b. Lichfield, Staffordshire, 27 Feb. 1835; d. London, 13 April 1906. He was appointed in 1851 assistant in the printed book department of the British Museum, became superintendent of the reading-room in 1875, but resigned in 1884 to devote himself more exclusively to the printing of the 'Museum Catalogue,' of which he had had charge from its commencement. He published 'Primula: a Book of Lyrics' (1858); 'Io in Egypt and Other Poems' (1859); 'Poems from the German' (1862); 'Relics of Shelley' (1862); 'Idylls and Epigrams' (1869); 'Selections of Shelley's Poems' (1880); 'Letters' (1882); 'Life of Carlyle' (1887); 'Life of Emerson' (1887); 'Twilight of the Gods' (1888); 'Life of Milton' (1890); 'Iphigenia in Delphi' (1891); 'Poems' (1893); 'William Blake: Painter and Poet' (1895); 'The Age of Dryden' (1895); 'One Hundred and Twenty-four Sonnets from Dante, Petrarch and Camoens' (1896); 'Richmond on the Thames' (1896); 'Life of Edward Gibson Wakefield' (1898); 'History of Italian Literature' (1898); 'Essays in Librarianship and Bibliography' (1899); 'The Queen and Other Poems' (1901); 'Essays of an Ex-Librarian' (1901); and, with Edmund Gosse, 'English Literature' (1903–04). He also contributed extensively to the magazines and cyclopedias. He resigned from the Museum in 1899.

GARNETT, Robert Selden, American soldier: b. Essex County, Va., 16 Dec. 1819: d. Carrick's Ford, Va., 13 July 1861. Graduated from the United States Military Academy in 1841 and made brevet second lieutenant of artillery, he served on the northern frontier during the Canadian border disturbances, and distinguished himself in the war with Mexico (1846–48), receiving the brevet of major for his conduct at Buena Vista. He was transferred to the Seventh Infantry in 1848, fought in Florida against the Seminoles, and was commandant at West Point in 1852–54. In 1855 he was promoted major of infantry, and in 1856 commanded the expedition against the Indians of Puget Sound. At the outbreak of the Rebellion in 1861 he resigned his commission, and was made adjutant-general, with colonel's rank, to organize the Virginia forces. Shortly afterward he was appointed brigadier-general, C. S. A., and given command of the troops in the western part of Virginia. While endeavoring to retreat to Beverly, he was overtaken by the Federals at Carrick's Ford, Cheat River, and took command of a detachment with which he sought to cover the retreat. His force was routed, and he was killed during the combat.

GARNETT, Kan., city and county-seat of Anderson County, on the Pottawattomie River, and on the Missouri Pacific and the Atchison, Topeka and Santa Fe railroads, 45 miles northwest of Fort Scott. It has good educational institutions, including a United Presbyterian college; large manufactures of furniture, flour, lumber and cheese. It adopted the commission form of government in 1913. Pop. 2,334.

GARNIER, gär'nyā', Charles, Jesuit missionary: b. Paris, 25 May 1606; d. 7 Dec. 1649. He was educated at the Jesuit College of Clermont and joined the order in 1624. In 1636 he was sent to the Canadian mission at his own request. He went to the Hurons and spent 14 years among them. In 1637, again in 1639 with Jogues, and later with Pijart — he attempted the conversion of the Tobacco nation and finally was successful. In 1646 they asked for the black robes and Garnier went to dwell with them until his death. In 1649 the Iroquois attacked the Tobaccos and during the massacre of Saint John's village Garnier was slain while ministering to the wounded. Parkman compares his life to that of Saint Peter Claver among the blacks, and calls it a voluntary martyrdom. Consult Bressau, 'Les Jésuites martyrs du Canada' (Montreal 1877); Martin, 'Vie manuscrite et lettres du Pére Garnier.'

GARNIER, Jean Louis Charles, French architect: b. Paris, 6 Nov. 1825; d. 4 Aug. 1898. He was a pupil of Leviel and Lebas at the Beaux-Arts, won the Prix de Rome in 1848 with his design for a conservatory of arts and industries, traveled in Italy, Turkey and Greece, and in 1861 won the competitive prize for plans of the new Paris Opera. In 1863–74 he superintended the construction of this costly and important work, whose chief feature is its grand staircase, but which is by some thought to be overladen with accessories of painting and sculpture. In addition to this, his principal achievement, he designed buildings, public and private, at Paris and elsewhere. He was the author of 'Travers les Arts' (1869); 'L'habitation humaine,' with Ammann (1892); and editor 'Le nouvel Opéra de Paris' (1876–81).

GARNIER, Marie Joseph François, commonly known as FRANCIS, French explorer: b. Saint-Etienne, 25 July 1839; d. Hanoi, Tongking, China, 2 Dec. 1873. He entered the French navy, served in the war with China in 1860–62 and became a civil officer in the newly-established colony of Cochin-China. In 1866 he was appointed to assist Capt. Doudart de Lagrée in an exploring expedition which set out from the coast of Cambodia and proceeded through Yunnan to Shanghai, the purpose being to open a highway of trade. Garnier explored the river Mekong, and, on the death of Doudart de Lagrée, assumed command of the expedition, which he brought successfully along the Yangtse-kiang to Shanghai. The geographical societies of France and Great Britain bestowed numerous honors upon him. He took part in the defense of Paris in 1870–71, and again undertook explorations in China. The governor of Cochin-China empowered him to negotiate a treaty with the viceroy of Tongking. Upon the refusal of the viceroy to open negotiations, Garnier captured Hanoi, the capital, and achieved further victories with a force of but 120. He was finally killed in an ambush. His 'Voyage d'Exploration en Indo-Chine pendant 1866–68' (1873) is a notable book.

GARNIERITE, a green, amorphous mineral, one of the most important ores of nickel. It is a hydrous silicate of nickel and magnesium, the ratio of the two metals varying widely. It is soft and very brittle and has a specific gravity of 2.3 to 2.8. It is extensively mined in New Caledonia and also occurs in large quantities in Douglas County, Ore., and Jackson County, N. C. It was named after the French geologist, Garnier.

GARNISHMENT, in law, a process by which a third person, in whose possession the effects of the defendant are attached, is warned not to turn over such effects to the defendant, but to appear in court and give information. This process is controlled by statute in the States where it exists, and the demands of the statutes must be fully met by any plaintiff seeking to make use of the process. A corporation's debts may not be garnisheed; neither may the process be invoked to interfere with a Federal court's judgment. The process is called in some States trustee process, in others factorizing, and in still others attachment, the more general title. The third party, who is known as the garnishee, is liable for only such property as is not encumbered by trusts and may be delivered by the officer serving said process. Virtually, the process is a secondary suit brought by the suing creditor against the third party, or garnishee, the creditor claiming the rights of the defendant in the primary action. Consult Rood on 'Garnishment' (1896). See ATTACHMENT; REPLEVIN.

GAROFALO, gä-rō'fä-lō, **Benvenuto** (originally BENVENUTO TISI DA GAROFALO), Italian painter: b. Ferrara, 1481; d. there, 6 Sept. 1559. In this city and in Cremona he cultivated his talents for painting; but the masterpieces of art in Rome exercised the greatest influence upon him. In the year 1505 he is said to have returned to Rome, and to have formed a very close intimacy with Raphael, who often made use of his assistance. He afterward painted for Alfonso I, in his native city. Garofalo's works show the influence of all the schools, particularly of the Lombard, and still more so of Raphael's, whom he surpassed in coloring. Most of his works are at Rome. Several of them, however, are in the galleries of Vienna and Dresden.

GAROFALO, Raffaele, BARON, Italian criminologist: b. Naples, 1852. He received his education at the University of Naples, became president of the Ferrara Civil Court, subsequently served as justice of the Naples Court of Appeals and finally became professor of criminal procedure and law at the University of Naples. He also prepared and edited material for a new code of procedure. He published 'Criminologia: studio sul delitto e sulla teoria della repressione' (1885; Eng. trans., by Millar 1914), and 'Riforma della procedura penale in Italia' (1889).

GARONNE (Lat. *Garumna*), a river of southwestern France, the chief one of that section, rising in the Pyrenees, at the foot of Mount Maladetta, in the Val d'Aran, within the Spanish border. It enters France at a distance of 26 miles from its mouth. The Garonne flows in a general northeasterly direction through the department of Haute-Garonne to Toulouse, whence it proceeds in a northwesterly course. Some 20 miles below Bordeaux it forms a junction with the Dordogne; it then takes the name Gironde, and enters the Atlantic Ocean by an estuary of 50 miles in length. The complete length of the river is about 400 miles. Ocean-going steamers may ascend to Bordeaux, and the river is navigable to Toulouse and beyond. From Toulouse the Canal du Midi extends to the Mediterranean. Several destructive floods have taken place, that of 1875 having caused special damage. With its 32 tributaries the Garonne offers a system of waterways navigable for more than 1,400 miles, — a total exceeding that afforded by any other French stream. The total drainage area approaches 38,000 square miles.

GARRARD, Kenner, American soldier: b. Cincinnati, Ohio, 1830; d. there, 15 May 1879. He was graduated from the United States Military Academy in 1851, was made brevet second lieutenant in the artillery, but in 1852 was transferred to the dragoons, and after service, largely in the Northwest, was made captain of cavalry in 1861. During the early part of the Civil War he was in the commissary-general's office at Washington, and in 1861–62 commandant at West Point. In September 1862 he was commissioned colonel of the 146th New York Volunteers, which he commanded at Fredericksburg, Chancellorsville and Gettysburg. For services in the last-named battle he was brevetted lieutenant-colonel. In 1863 he was promoted brigadier-general of the United States

Volunteers, and afterward he participated in the combat at Rappahannock Station and the Mine Run operations. He took part, also, in the invasion of Georgia, was brevetted colonel for services in the expedition against Covington, Ga., and from December 1864 to July 1865 commanded the second division of the 16th army corps. He distinguished himself by his efficiency in the battle before Nashville and in the operations against Mobile; led the storming column which finally captured Blakely (9 April 1865); and was in command of the district of Mobile in August–September 1865. Mustered out of the volunteer service in August 1865, he was assistant inspector-general of the Department of the Missouri in 1866, and in November 1866 resigned from the army, being at that time major, with the brevet of major-general for gallant and meritorious services in the field during the Rebellion.

GARRETT, Alexander Charles, American Protestant Episcopal bishop: b. Ballymot, County Sligo, Ireland, 4 Nov. 1832. He was graduated from Trinity College, Dublin, in 1855; was ordained priest in 1857; held the curacy of East Worldham, Hampshire, in 1856–59; was a missionary in British Columbia in 1859–69; rector Saint James', San Francisco, in 1870–72, and dean of Trinity Cathedral, Omaha, 1872–74. In 1874 he became missionary bishop of northern Texas, and subsequently bishop of Dallas. His publications include 'The Eternal Sacrifice'; 'Baldwin Lectures on the Philosophy of the Incarnation'; 'Historical Continuity' (1875).

GARRETT, Edmund Henry, American artist and author: b. Albany, N. Y., 19 Oct. 1853. Pupil of Laurens, Boulanger and Lefebvre. He has exhibited at the principal exhibitions in America and the Paris Salon. Medal, Boston 1890; was member jury, Saint Louis Exposition. He has published 'Elizabethan Songs' (1891); 'Victorian Songs' (1895); 'Three Heroines of New England Romance' (1894); 'Romance and Reality of the Puritan Coast' (1897); 'The Pilgrim Shore' (1900); 'Translation of Merimée's Carmen' (1896); 'Flowers of Fancy'; 'Roses of Romance.' He has received recognition in Italy for services to the Latin tongue.

GARRETT-ANDERSON, Mrs. Elizabeth, first English woman doctor: b. London, 1836; d. Aldeburgh, Suffolk, 17 Dec. 1917. She was one of the pioneers of that phase of the movement for the «emancipation» of women which aimed at throwing open to them the doors of the medical profession. Her attention was attracted to medicine by Miss Elizabeth Blackwell (q.v.), an Englishwoman who after many fruitless attempts was permitted to graduate M.D. of the University of Geneva, Beaver Falls, Pa. Miss Garrett, however, was the first woman to secure an English diploma. She began her medical studies in 1860, despite the fact that there was no school (in England) where she could be received, and no examining body willing to admit her to its examinations. The male students of Middlesex Hospital in London presented a memorial against the admission of women, and Miss Garrett was barred from that and other hospitals. Eventually the Society of Apothecaries authorized her to get her education privately from teachers of recognized medical schools, and finally gave her the desired qualification of L.S.A. in 1865, this being a genuine doctor's degree. She opened a dispensary for poor women and children in Marylebone, London, in 1866. Suddenly the Society of Apothecaries adopted a new rule which refused recognition of certificates granted for private studies, which made Miss Garrett's diploma void. She went to Paris, passed the examinations and returned to England with an M.D. degree in 1870. In 1870 she became a candidate at the London school board election, and was returned at the head of the poll for Marylebone, where her dispensary developed into the «New Hospital for Women and Children» in Euston road. She married in 1871. In 1874 she assisted in the establishment of the London School of Medicine for Women, in conjunction with her hospital of 26 beds. But the General Medical Council of England stipulated that only a general hospital of 150 beds could be recognized as adequate for teaching purposes. After three years of struggle and appeal, an alliance was formed between the Women's School of Medicine and the Royal Free Hospital in Gray's-in-road, which met the official requirements. The strenuous efforts of the devoted little band of women «would-be doctors» were rewarded in 1876 by an act of Parliament enabling British examining bodies to include women. Until 1892 Mrs. Garrett-Anderson was the only female member of the British Medical Association; in that year all restrictions were removed. Mrs. Garrett-Anderson was lecturer on medicine at the London School for Women for 23 years, and for over 24 years she was senior physician of the New Hospital for Women. In 1908 she was elected mayor of Aldeburgh, the first woman in England to receive that civic honor. Her son, Sir Alan Garrett-Anderson, succeeded Sir Eric Geddes as Controller of the Navy in August 1917; her daughter, also a doctor, was head of a military hospital in the European War.

GARRETT BIBLICAL INSTITUTE, the second oldest theological seminary of the Methodist Episcopal Church, located at Evanston, Ill. Although its plant is located on the campus of the Northwestern University it is not a department of the university. It has its own board of trustees, funds, property and library. It is, however, closely affiliated with the university. It was founded in 1855, through the liberality of Mrs. Eliza Garrett. Its first class graduated in 1858. It has had only six presidents in its long career: Dr. John Dempster, Bishop Matthew Simpson, Bishop W. Ninde, Dr. H. B. Ridgaway, Dr. Charles J. Little and Dr. Charles M. Stuart, the present incumbent. It has a faculty of 18 members, a student body in 1917–18 of 245. It has graduated 1,455 students and has had a total of over 3,700 students. Among its graduates and students are included nine bishops, 76 educators, 18 editors and 120 missionaries. It has not only prepared men for the Methodist ministry, but its men are serving in the Congregational, Presbyterian, Protestant Episcopal, Lutheran, Mennonite and other churches. In 1912 the school was divided into a Graduate School primarily for college men; and the Diploma School for men with less than collegiate training. In 1915 the quarter system was adopted, September being the only month when the seminary is not in session. In 1917 the first units of a new plant were erected which will ultimately cost a million dollars. The seminary owns considerable property in the city of Chicago. It has an endowment of over $948,000 and a library of 51,612 volumes.

GARRICK, David, English actor: b. Hereford, England, 19 Feb. 1717; d. London, 20 Jan. 1779. His grandfather was a French refugee, his father a captain in the army. He was educated at the grammar school at Lichfield. He gave an early proof of his dramatic tendency by inducing his school-fellows to act the 'Recruiting Officer,' in which he himself took the part of Sergeant Kite, being then only 12 years of age. Later he was placed with a brother under Dr. Samuel Johnson. In 1741 he joined Giffard's company at Ipswich, where under the name of Lyddal he played with uniform success.

At this time the stages of the metropolis were but indifferently supplied with leading performers, so that when Giffard, who was manager of a threatre in Goodman's-fields, introduced his accomplished recruit there, 19 Oct. 1741, the effect was immediate and decisive. He judiciously chose the part of Richard III, which did not require that dignity of person in which he was deficient, while it gave him scope for all the strong marking of character and changes of passion in which his principal excellence consisted. He at the same time adopted a natural mode of recitation, which was a daring innovation on the part of a new performer before audiences accustomed to the artificial declamation of the school which preceded him. He afterward visited Dublin, where his success was even greater than in the metropolis, and in 1745 became joint manager with Sheridan of a theatre there. In 1746 he was engaged for the season at Covent Garden, and at its close purchased Drury Lane, and opened it 15 Sept. 1747, with the 'Merchant of Venice,' to which Dr. Johnson wrote a prologue for the occasion. This period formed an era in the English stage, from which may be dated a comparative revival of Shakespeare, and a reform both in the conduct and license of the drama. In 1749 he married Eva Marie Violette (1724–1822), and his married life seems to have been happy. The next year (1750) he and Mrs. Bellamy were playing 'Romeo and Juliet' at Drury Lane, while Barry and Mrs. Cibber were giving the same play at Covent Garden; but the Covent Garden opposition failed, and it has been truly said of Garrick that the remainder of his theatrical career was an uninterrupted series of successes that brought enduring prosperity. He had written, while an actor, his farces of 'The Lying Valet'; 'Lethe,' and 'Miss in Her Teens'; and in 1766 he composed, jointly with Colman, the excellent comedy of 'The Clandestine Marriage.' The year 1769 was signalized by the famous Stratford jubilee—a striking proof of his enthusiasm for Shakespeare. It occupied three days at Stratford, and its representation at the theatre lasted for 92 nights. The last part which he performed was Don Felix in 'The Wonder,' for the benefit of the theatrical fund (10 June 1776). At the conclusion of the play he addressed a brief farewell to the audience. The general feeling with which this was delivered and received rendered it truly impressive. His remains were interred in Westminster Abbey, his funeral being attended by a numerous assemblage of rank and talent. As an actor Garrick has rarely been equaled for truth, nature and variety and facility of expression, for which his countenance appears to have been admirably adapted. Expression and the language of passion formed his great strength, as he was equaled by many of his contemporaries in the enunciation of calm sentimental and poetical declamation. His literary talents were respectable, but not eminent; besides the pieces already mentioned he wrote some epigrams, a great number of prologues and epilogues, and a few dramatic interludes, and made many and sometimes judicious alterations of old plays. A collection of his works was published in London (1768–98), and his correspondence 1831–32. Consult Knight, 'Life of David Garrick' (London 1894); Parsons, 'Garrick and his Circle' (Boston 1907).

GARRIGAN, Philip Joseph, American Roman Catholic prelate: b. Cavan, Ireland, 8 Sept. 1840. While he was still very young the family came to America and settled in Massachusetts and in the schools of that State he received his elementary education. He afterward studied at Saint Charles' College, Maryland, later taking an ecclesiastical course at Saint Joseph's Seminary, Troy, N. Y., where on 10 June 1870 he was ordained priest. He was then appointed assistant in Saint John's Church, Worcester, Mass. In 1873 he became vice-president of the Troy Seminary and after three years was recalled to the diocese of Springfield. In 1888 he was chosen vice-rector of the Catholic University, Washington, D. C., and continued to hold the vice-rectorship until 21 March 1902, when Pope Leo XIII selected him for the newly-created episcopal see of Sioux City. He was consecrated bishop at Springfield, Mass., 25 May 1902.

GARRISON, George Pierce, American historical scholar: b. Carrollton, Ga., 19 Dec. 1853. He was educated at Sewanee College, Tennessee, and the universities of Edinburgh and Chicago; became instructor in English and history in the University of Texas in 1884, assistant professor of history in 1888 and professor in 1897. He has published 'The Civil Government of Texas' (1898), etc.

GARRISON, Lindley Miller, American lawyer and cabinet officer: b. Camden, N. J., 28 Nov. 1864. He was educated at the Protestant Episcopal Academy of Philadelphia, at Phillips Exeter Academy and at Harvard University. He studied law in the offices of Redding, Jones and Carson, Philadelphia, and was admitted to the Pennsylvania bar in 1886. In 1888 he was admitted to the New Jersey bar and practised at Camden, N. J., until December 1898, when he became member of the firm of Garrison, McManus and Enright of Jersey City. From 1904 to 1913 he was vice-chancellor of New Jersey. On 5 March 1913 he became Secretary of War in the cabinet of President Wilson. On 10 Feb. 1916 he resigned his cabinet post and has since been a member of the law firm of Hornblower, Miller, Garrison and Potter of New York.

GARRISON, William Lloyd, American reformer: b. in Newburyport, Mass., 12 Dec. 1805; d. New York, 24 May 1879. He was apprenticed to a shoemaker, but eventually became a compositor on the Newburyport *Herald*, an occupation which suited his taste; he soon made himself master of the mechanical part of the business, and when only 16 or 17 began to write for the *Herald*. His contributions, which were anonymous, were favorably received, and he soon commenced to send articles to the Salem *Gazette* and other papers, drawing the attention of political circles by a series of articles under the signature «Aristides,» with the view of removing the almost universal apathy on the subject of slavery. In 1824 he became editor of the *Herald*, and some of Whittier's earliest poems were accepted by him, while their author was yet unknown to fame. In 1827 he became editor of the *National Philanthropist*, the first American temperance journal, and afterward of a journal in support of the election of John Quincy Adams. With Mr. Lundy, a Quaker, he then started at Baltimore the paper called the *Genius of Universal Emancipation* (1829). The vigorous expression of his anti-slavery views in this last paper led to his imprisonment for libel, from which he was released by Mr. Tappan, a New York merchant, who paid his fine. He then prepared a series of emancipation lectures, subsequently delivered in New York and other places. He returned to Boston, and in 1831 started *The Liberator*, without capital or subscribers, a paper published weekly with the aid of one assistant and a negro boy, and with which his name is inseparably associated, and which he carried on for 35 years, until slavery was abolished in the United States. In 1832 appeared his 'Thoughts on African Colonization,' and in the same year he established the American Anti-Slavery Society. For several years the mail brought hundreds of letters to Garrison, threatening his assassination if he did not discontinue *The Liberator*; the legislature of Georgia offered a reward of $5,000 to any one who should prosecute and bring him to conviction in accordance with the laws of that State; in 1835 he was severely handled by a Boston mob, and the mayor of that city was constantly appealed to from the South to suppress his paper. In spite of all, he successfully persevered. In 1833 he visited Great Britain. On his return the results of his conferences with English emancipators were seen, to a limited extent, in a platform for the American Anti-Slavery Society, founded in Philadelphia toward the close of that year. He went to England again, in the furtherance of his anti-slavery opinions, in 1846 and 1848. The diverging views of the anti-slavery party, as to whether a political platform should be adopted, and as to the voting and speaking of women, rent the body for a time, but on 1 Jan. 1863 Lincoln's proclamation of freedom to the slaves as a military measure placed the civil struggle on an anti-slavery basis. In 1865, when Garrison's labors had been completely successful, and after the total abolition of slavery in the United States, his friends presented him with the sum of $30,000 as a memorial of his services.

A bronze statue has been erected to his memory in Boston. Some 'Sonnets and Other Poems' by him were published in 1847, and 'Selections from Writings and Speeches' in 1852. Consult Johnson, 'William Lloyd Garrison' (1882); 'William Lloyd Garrison, the Story of His Life,' by his children (1885–89); and poems to his memory by both Whittier and Lowell. The reformer's character, as revealed in the accounts of his life, shows his great humanitarian schemes to have been the inevitable outcome of a sensitive conscience, a humane spirit and an overpowering sense of justice. Later biographies are those by Swift, L. (Philadelphia 1911), and Chapman, I. J. (New York 1913).

GARROD, Sir Alfred Baring, English physician: b. Ipswich, 1819; d. 1907. He was educated at University College and at the University of London. In 1847 he became assistant physician at the hospital of University College, and four years later became physician and professor of therapeutics there. He became physician to King's College Hospital in 1863 and consulting physician there in 1874. In 1856 he became Fellow of the Royal College of Physicians and two years later of the Royal Society of Great Britain. In 1896 he was nominated physician extraordinary to Queen Victoria. He made original investigations on the pathology of gout and prescribed lithia as a remedy. His 'Essentials of Materia Medica and Therapeutics,' which first appeared in 1885, went through very many editions and is in high favor as a textbook.

GARROTE, ga-rōt', a mode of punishment in Spain by strangulation, the victim being placed on a stool with a post or stake (Spanish, *garrote*) behind, to which is affixed an iron collar with a screw; this collar is made to clasp the neck of the criminal, and drawn tighter by means of the screw till life becomes extinct. This word, with the spelling *garrotte*, has of late years become naturalized in Great Britain and the United States as a term for a species of robbery effected by suddenly springing upon and throttling the victim, and stripping him of his property. A law was passed in 1863 to do away with this practice; and it proved efficient. Consult Andrews, W., 'Bygone Punishments' (London 1899).

GARRUPA, ga-roo'pa, the Spanish name, in the West Indian region adopted as generic, and also corrupted into «grouper» of the great black jewfish (*Garrupa nigrita*). See JEWFISH.

GARSHIN, gär'shēn, **Vsevolod Mikhailovich**, Russian man of letters; b. Yekaterinoslav, 2 Feb. 1855, of an ancient noble family; d. 1888. His childhood was not at all joyous; he was surrounded by unhappiness, his earliest anticipations of life were dark. This state of pessimism in a child was aggravated by his unusual precocity. At the age of seven he read Hugo's 'Notre-Dame de Paris' and his youthful soul was strangely impressed and his only desire was to perish in war. Therefore he tried to join the volunteer corps for Serbia (Serbo-Turkish War 1876), but, not being of military age, he was not allowed to go. When next year, however, Russia declared war on Turkey he threw his examination papers in a gymnasium where he was studying and immediately joined Bolkousi's regiment. In a battle on 11 Aug. 1877 he distinguished himself for bravery, receiving a serious wound in the leg. After the war he studied philology at the University of Saint Petersburg and wrote his war memories under the title 'Four Days,' published in 1877 and attracting immediate attention. But his soul was growing darker and darker and it was difficult for the best psychiatrists to establish in him where the high degree of his soul ended and where insanity began. After long wanderings he went to Yasnaya Polyana where Count Leo Tolstoi received him amiably and spent a whole night with him in a discussion as to "how to make all mankind happy." Partly Tolstoi's powerful logic and partly Garshin's happy marriage contributed to an improvement of the author's mental state, but in 1888 he jumped to death from the fourth floor of a building. The unusually human views on life and the necessity for struggle against evil as expressed in his 'Four Days' are in striking contrast to the author's mad wish for his own death. He considers the extermination of men by men in wars as most hopelessly vulgar and cruel, while he, himself, sought salvation in a war, justifying his action with his desire to free the brother-Serbians from the barbarian Turkish yoke. In his 'Hodozhniki' ("Artists") he, as a very subtle critic and admirer of arts, demonstrates that a moral-sensitive man cannot peacefully abandon himself to the æsthetic enthusiasm of creation in art when he is so cruelly surrounded by the suffering of mankind. His ever-burning wish to exterminate all the evil from the earth and his poetic thoughts about the ideal life have found expression in his remarkable story 'The Red Flower,' which is in some measure the author's autobiography. However, in the depth of his heart and soul Garshin did not believe in the triumph of good over evil, nor that the very annihilation of evil could ever constitute man's complete happiness. His other works 'From the Diary of the Private Ivanov,' 'Attala Princeps,' 'Nadezhda Nikolaevna,' 'Signal,' 'The Proud Aggei,' etc., show manifestly the author's powerful talent and bring home to the reader his passionate humane feeling and the softness and sincerity of his soul.

GARSTANG, John, English archæologist: b. Blackburn, 1876. He was educated at Jesus College, Oxford, where he was graduated in 1899. Since 1897 he has been engaged in archæological research; conducted excavations on Roman sites in Britain at Ribchester, Melandra Castle, Richborough, etc.; in Egypt at Abydos, Mahâsna, Bêt Khallâf, Beni-Hassan, Esna and elsewhere. He conducted an archæological expedition in Asia Minor and North Syria in 1907, and excavations on the Hittite site of Sakje-Geuzi in Asia Minor in 1908 and 1911. He was engaged on the continuous excavation of ancient Meröe from 1909 to 1914, and since February 1915 has been on special service in France. He published 'Short History of Ancient Egypt'; 'The Land of the Hittites' (1911); 'On Lucian's De Dea Syria' (1913), and various reports.

GARTER, Order of the, the highest order of knighthood in England. Two stories are told of its origin. The first is that Richard I at the siege of Acre caused some of his officers to tie leather thongs around their legs as a distinction. The origin of the order is, however, generally attributed to Edward III, and the legend runs that the Countess of Salisbury having dropped her garter while dancing, the king restored it after putting it round his own leg, amid the jesting of courtiers, with the words, *Honi soit qui mal y pense* —"Shame be to him who thinks evil of it." The date of the foundation or restoration by Edward III of the order is not exactly determined; 1344 is given by Froissart, while other authorities, founding on the statutes of the order, assign it to 1350. In the former year it appears that a festival was held, and a society or company instituted, called the Company of Saint George, with the design of furnishing soldiers of fortune to assist King Edward in asserting his claim to the crown of France, but it seems probable that the organization was completed as an order of chivalry in 1350. The order is said to have been founded in honor of the Holy Trinity, the Virgin Mary, Saint Edward the Confessor and Saint George of Cappadocia, the last being its special patron. Until the reign of Edward VI its common title was the Order of Saint George, which it still bears, beside that of the Garter. The original number of knights, 26, including the sovereign, its permanent head, is still retained, except that since 1786 princes of the blood are admitted as supernumerary members. The order is frequently conferred on foreign sovereigns. The vestures and insignia of the order are: The emblem of the order, the garter, a dark-blue ribbon edged with gold, bearing the motto, and with a buckle and pendant of gold richly chased; worn on the left leg below the knee; the mantle of blue velvet, the length of the train distinguishing the king; the surcoat and hood of crimson velvet, the hat of black velvet, with plume of white ostrich feathers, having in the centre a tuft of black heron's feathers, and fastened to the hat with a band of diamonds; the collar of gold consisting of 26 pieces, each in the form of a garter, with the badge of the order, called the George, pendent from it — a figure of Saint George on horse-back fighting the dragon — the lesser George being worn on a broad blue ribbon over the left shoulder. The star, formerly only a cross, is of silver, and consists of eight points, with the cross of Saint George in the centre, encircled by the garter. A star is worn by the knights on the left side when not in the dress of the order. The officers of the order are the prelate, the bishop of Winchester; the chancellor, the bishop of Oxford; the registrar, dean of Windsor; the garter king-of-arms, and the usher of the black rod. There are a dean and 12 canons, and each knight has a knight-pensioner.

GARTER KING-OF-ARMS, the head of the heraldic establishment in England, consisting of three kings-of-arms — Garter, Clarencieux and Norroy, and the herald of the military order of the Garter. The office of garter king-of-arms was instituted by Henry V in 1417. The duties of the garter king-of-arms are principally to grant heraldic supporters, to arrange funerals and to present the order of the Garter to foreign princes. The Garter is a member of the Heralds' College.

GARTER-SNAKE, or **GRASS-SNAKE.** Names given in the United States to several small striped harmless serpents of the genus *Eutænia*, especially *E. sirtalis*, which abounds in all temperate parts of the continent from Guatemala to Canada, and is exceedingly variable.

This species varies in color from light-green through olivaceous to black, marked by three stripes, but only the one along the spine is well defined, those on the sides being often obscure, broken or altogether absent. The spaces between these may be spotted in double rows, or not at all; and the belly, usually light greenish-blue, may be darker, almost to blackness. Some varieties have a metallic lustre. The ordinary eastern specimens are olive-brown, with dull spots and stripes. It is everywhere abundant, frequenting grassy meadows, farm-fields, roadsides and gardens, where it searches for mice as the principal part of its food, but it eats insects, small toads and frogs, and the eggs and young of birds whose nests are on or near the ground, for it is not a bold climber. It is abroad by day as well as by night, and itself forms the prey of such larger snakes as the blacksnake and king-snake. In the West it eats all the young gophers and ground-squirrels it can get, and in these habits commends itself to the protection of agriculturists. These snakes are extremely active and swift, as they must be not only to capture their prey, but to avoid being caught by the larger blacksnakes, king-snakes and the like which pursue them. They swim well and hide clearly in water, and in many habits, as in structure, resemble the water-snakes (*Natrix*); and like them they are pugnacious, and quick to bite when handled, but their teeth are minute and the bite, of course, quite harmless. Their abundance is due to these qualities, not only, but even more to their great fecundity, 25 to 40 young in a season not being an uncommon product for one mother, and an instance of 80 is recorded. These are born alive, in early warm weather, and are able to care for themselves from the start, but the mother remains near them and protects them vigorously for some time. When cold weather approaches, these serpents seek underground retreats, such as old gopher-holes, and there often gather in large numbers which hibernate entwined together in a mass; mating takes place at this season. The skin is usually shed in the spring, by creeping through some crevice and scraping off the old hide, which peels backward from the head.

Of the score or more of species the greater number are Mexican and Central American; and some are known by very few specimens. The beautiful slender ribbon-snake (*E. saurita*) of the Southern States is chocolate in color, with three narrow distinct stripes, and has highly aquatic habits. The common species of the plains region (*E. radix*) is peculiar in its fondness for fish, catching them constantly in the pools and seizing every dead one cast on shore. A similar fish-loving species is the subtropical *E. macrostemma,* which appears in the talons of the eagle in the coat of arms of Mexico. The common species of California is *E. elegans.* In the southern part of that State occurs a rare form (*E. infernalis*), sometimes wholly black, save a yellowish throat. For the identification of the various species of this wholly American group the reader should consult Cope's 'Crocodilians, Lizards, and Snakes of North America,' published by the Smithsonian Institute in 1900.

GARVEY, Eugene A., American Roman Catholic bishop: b. Carbondale, Pa., 6 Oct. 1845. He attended Saint Charles' College, Ellicott City, Md., and was graduated in theology from Saint Charles' Seminary, Philadelphia, Pa. He was ordained priest, and was assistant pastor at Hawley, Pa., 1870; pastor at Athens, Pa., 1871; Williamsport, Pa., 1871–99, and at Pittston, Pa., 1899–1901; when he was elected bishop of Altoona, Pa., and was consecrated 8 Sept. 1901.

GARVIE, Alfred Ernest, British Congregational clergymen: b. Zyrardow, Russian Poland, 1861. He was the son of a Scottish flax merchant, and received his education at George Watson's College, Edinburgh, Glasgow University and Oxford. In 1893 he was called to Macduff Congregational Church, and later to Montrose Congregational Church. From 1903–07 he was engaged in educational work as professor at Hackney and New colleges, and later as principal of the latter institution. He was elected president of the Congregational Union of Scotland in 1902. His publications include 'Ethics of Temperament' (1895); 'Ritschlian Theology' (1899); 'The Gospel for To-day' (1904); 'Religious Education' (1906); 'Studies in the Inner Life of Jesus' (1908); 'Handbook of Christian Apologetics' (1913). He also wrote commentaries on Romans and Saint Luke, and edited the 'Westminster New Testament.'

GARY, Elbert Henry, American financier: b. Wheaton, Ill., 8 Oct. 1846. He was graduated at the law school of Chicago University in 1867; admitted to the bar of the Illinois Supreme Court the same year, and to that of the United States Supreme Court in 1882. After serving as first mayor of the city of Wheaton for three terms, and as county judge of Dupage County for two terms, he applied himself to the practice of corporation law in Chicago, and became general counsel for a large number of railroad and industrial corporations. It was largely through his legal work that his talents as an organizer of large industries first came into recognition. He retired from law practice in 1898 to become president of the Federal Steel Company, which in 1901 was merged into the United States Steel Corporation, he then being chosen chairman of its finance committee, to which office was added that of chairman of the board of directors. The city of Gary, Ind., which the United States Steel Corporation built at the foot of Lake Michigan, a few miles out of Chicago, was named after him.

GARY, Lake County, Ind., the seat of the largest steel industry in the United States, and the largest as well as youngest city in the northwestern part of the State, is situated at the extreme southern end of Lake Michigan, 10 miles east of the Indiana-Illinois State line, 26 miles southeast of the heart of Chicago and 163 miles northwest of Indianapolis. The city of Gary was founded in April 1906, when the site was an almost impenetrable wilderness of swamps and sand dunes. The population in 1910, according to the Federal census, was 16,802; in 1916, 40,000. The city limits embrace a territory extending along the shore of Lake Michigan a distance of seven miles and extending inland a distance of five and three-fourths miles. The general elevation of the site occupied by the city is 30 feet above the lake, the entire site being covered with a layer of fine sand to a depth of 80 feet, once forming the bed of Lake Michigan when that body of water extended four miles south of the present shore line. The site of the city is traversed from east to west by two rivers, the Grand and Little Calumet, both of them susceptible of being converted into vast inner lake harbors, having 28 miles of water frontage. Gary has 70 miles of improved streets, 100 miles of cement sidewalks, 60 miles of main and lateral sewers, 34 miles of electric street railway tracks, two interurban railway lines passing through the city, two other interurban lines entering the city and making it their terminus, with a total of 455 miles of tracks, seven trunk lines of steam railroads and two belt and terminal lines connecting the city directly with the 32 trunk line railroads entering the Chicago-Gary region. In addition there is a splendid harbor accommodating the largest ore vessels on the Great Lakes, constructed by the Indiana Steel Company—(a subsidiary of the United States Steel Corporation) and used in conveying iron ores from the northern mines to the Gary furnaces and in carrying the steel and coke output of vast local industries to all parts of the United States and Canada reached by water transportation.

Equipment.— In 1916 the city of Gary possessed seven banks with an aggregate capital of $575,000; surplus, $139,500; deposits, $4,230,000, 24 churches, three hospitals, a Young Men's Christian Association building costing $250,000, a public library building costing $65,000, two of the finest and largest public school buildings in the Middle West, aggregating in cost $475,000, three other schoolhouses costing $150,000. Broadway, Fifth avenue and Washington street, the principal business streets of the city, are lined with handsome business blocks, Gary Theatre, banks, hotels and public buildings, while the residence streets and avenues are graced with hundreds of handsome homes and beautiful churches and schools, both public and parochial. The city is splendidly equipped with auto patrol and fire engines used by the metropolitan police force and the fire department of the city. Water for domestic purposes and drinking is drawn from Lake Michigan in inexhaustible quantities, while all other public utilities, such as gas, electric lights, and telephone service, are adequate for a city of 250,000 inhabitants.

Expenditures.— Gary was founded by the United States Steel Corporation, which, up to 31 Dec. 1916, had expended $85,000,000 in building steel furnaces, coke ovens, rail mills, axle mills, merchant mills, sheet and tin plate plants, structural steel works, pumping stations, electrical power plants, benzol works, Portland cement works, ore docks, machine shops and foundries and a corporation hospital, which, when fully equipped, cost nearly half a million dollars. In addition to this expenditure, the corporation, through its subsidiary concerns, expended in five years the sum of $15,000,000 on the improvement of the city and in constructing homes for its officials and employees. A further appropriation of $40,000,000 has been made by the steel corporation for extensions and improvements of its various local plants.

Industries of Gary.— In the year 1916 the various plants of the steel corporation and its subsidiary companies are giving employment to 18,000 men. When fully completed, these plants are capable of giving employment to 40,000 men. The Gary Bolt and Screw Works, an independent industry, began operations in 1912, giving employment to 1,000 persons at the start and has since greatly extended its operations. In the spring of 1912 the Baldwin Locomotive Company purchased a site adjacent to the city limits on the west. Other independent industries and fabricating plants are locating in Gary. During the first six years of its existence, the supply of houses in Gary for mill employees fell far short of the demand and thousands of the mill workers were forced to live in surrounding towns and cities. In 1911 nearly 1,000 homes were erected and more than 1,500 dwellings were planned for erection in 1912. The principal commercial artery of the city — Broadway — is 100 feet wide and five miles long. Fifth avenue, the principal east and west thoroughfare, is 80 feet wide and seven miles long. Both of these streets are improved their entire length. Within a radius of 10 miles from the intersection of Broadway and Fifth avenue there is a population of 120,000 people, largely supported by the manufacturing industries of the famous Calumet region, of which the city of Gary is the centre. The steel, cement, sheet and tinplate and coke oven industries of the city occupy seven miles of the lake front and also several miles of water front upon the Grand Calumet River, which the Federal government plans to convert into a great inner harbor, connecting with Lake Michigan at Gary, Indiana Harbor and South Chicago. The largest manufactory of Portland cement in the world, the Universal Portland Cement plant, with a daily capacity of 27,000 barrels and employing 2,500 men, is situated at Buffington, within the city limits of Gary, and is one of the subsidiary interests of the United States Steel Corporation. In the southern part of the city is located the Fairweight Scale plant, employing 500 men and covering nearly 20 acres of ground with its buildings and yards. The city hall, at the corner of Seventh avenue and Massachusetts street, would be a credit to a city of 250,000, while the new union station at Third avenue and Broadway, costing $250,000, is adequate to the comfort and needs of a city of 500,000 population. Although the city of Gary was only 10 years old in 1916 the assessed valuation of real estate aggregated a total of $28,000,000. The city of Gary through its park board has established a boulevard system, and has started condemnation proceedings for a park on the lake front. This will add very much indeed to the desirability of Gary as a residence city. The speeding-up of the steel and ancillary industries for war purposes brought about increased prosperity to Gary and added thousands to its population.

GAS. See Critical Point; Gases, Kinetic Theory of; Gasometric Analysis; Liquefied Gases.

GAS, Natural. By recognized usage the term «natural gas» has been restricted to the inflammable gases found accumulated in reservoirs in the earth's crust — leaving the equally natural supplies of carbonic acid gas and of nitrogen to be given a more specific title. In composition, various samples of natural gas differ very considerably, but its principal component is methane, or marsh gas (CH_4), ranging from 81 per cent for Pennsylvania and West Virginia gas to 98 per cent in some of the gas produced in Oklahoma. In the Glenn Pool (Oklahoma) gas, known as "wet" gas from its heavy content of petroleum vapors, the components are methane, 39 per cent, and ethane, 61 per cent. The gas at Dexter, Kan., has but 15 per cent methane, and 83 per cent nitrogen. The combustion factor of the Pennsylvania and West Virginia gas is made up by 14 per cent of other hydrocarbons, chiefly ethane, and hydrogen. In addition, natural gas contains from 2 to 5 per cent nitrogen; up to 2 per cent of carbonic acid; up to ½ of 1 per cent of carbonic oxide and up to ½ of 1 per cent of oxygen. Occasionally small quantities of helium are present; in one case 1.84 per cent. It has an average heating value of about 945 British thermal units per cubic foot at a pressure of four ounces per square foot, and a temperature of 60° F. At a greater pressure and at a higher temperature its heating value is increased by about one unit for each higher degree of temperature, and two units for each added pound of pressure.

The accompanying table presents a comparison of the principal types of natural gas with the other economic artificial illuminating and fuel gases.

ever there are hollows in which the pressure is less than its own, and only collects in considerable quantities where there is an impermeable stratum of clay or rock to prevent further movement. In these hollows it accumulates under varying pressures, depending upon their depth below the surface, the pressure having a close relation to the weight per square inch of a column of water of the same height; from which it is argued that the pressure found in natural gas reservoirs is derived from water forcing the gas out of a lower level. The maximum pressures reported have been 1,700 pounds per square inch in Green County, Pa., and 1,260 pounds more recently at Midway, Cal.

Wells and Conditions of Strata.— There is a great variation in the depth of natural gas wells, owing to the diversity of the strata in which the product exists and the changing position of the underlying rocks with reference to the general surface. Some natural vents have produced natural gas in considerable quantities and have proved the incentive for drilling down to the original reservoirs, from which the gaseous fluid was escaping. Other gas wells have been discovered in drilling wells for oil or salt brine. Some of the most important gas fields have been located by expert geologists, who have traced out the summits of the anticlinals, or rock waves, for many miles from surface exposures of the strata.

Constituents	Average for Penna. and W. Virginia	Average for Ohio and Indiana	Average for New York	Average of Coal Gas	Average of Water Gas	Average of Producer Gas from Bit. Coal
	Per cent	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*
Marsh gas (CH_4)	80.85	93.60	98.40	40.00	2.00	2.05
Other hydrocarbons	14.00	.30	0.25	4.00	.00	.04
Nitrogen	4.60	3.60	0.40	2.05	2.00	56.26
Carbonic acid, CO_2	.05	.20	.00	.45	4.00	2.60
Carbonic oxide, CO	.40	.50	0.95	6.00	45.50	27.00
Hydrogen	.10	1.50	.00	46.00	45.00	12.00
Hydrogen sulphide	.00	.15	.00	.00	.00	.00
Oxygen	Trace	.15	.00	1.50	1.50	.05
Total	100.00	100.00	100.00	100.00	100.00	100.00
Pounds in (a) 1,000 cubic ft.	47.50	48.50	49.10	33.10	45.67	75.00
Specific gravity, air being 1	0.624	0.637	0.645	0.435	0.600	0.985
B. T. U. per 1,000 (b) cubic feet	1,145,000	1,095,000	1,300,000	755,000	350,000	155,000

(a) 1,000 cubic feet of dry air at an atmospheric pressure of 14.7 pounds and at a temperature of 60° F. weighs 76.12 pounds and is a mechanical mixture of 23 parts of oxygen and 77 parts of nitrogen by weight.
(b) B. T. U. = British thermal units, which indicate the heat necessary to raise 1 pound of pure water at 39° F. one degree.

Natural gas is regarded as a form of bitumen, closely related to petroleum, maltha and asphalt. It may be mentioned in passing that the asphalt which is continually rising on the lake at Trinidad is aërated by large bubbles of natural gas. Opinion is divided as to the origin of natural gas, but the majority favors the theory that it is the product of vegetable matter slowly decaying at a low temperature. As it is found only in sedimentary rocks, the theory prevails that it is the product of carbonaceous matter deposited with those strata, although it is quite as likely to have been formed elsewhere, finding its way into those rocks because of their porous structure. Gas, because of its natural qualities, has a tendency to make its way for long distances wher-

The depth of wells varies from 250 to 3,000 feet, while their diameter varies from two inches up to eight inches; their output, or open flow, varies from 500 cubic feet per day to 35,000,000 cubic feet per day; their shut in, or rock pressure, varies from 1 to 1,500 pounds to the square inch in extreme cases, while 300 to 400 pounds to the square inch and a volume of 1,000,000 cubic feet per day is considered a profitable commercial well. The greatest yield on record for any one well is 7,781,946,000 cubic feet in 7½ years, an average of 2,842,700 cubic feet per day for the entire period. This well is in Pennsylvania. It is down 3,000 feet tapping the Gordon sand. In 1915 it was still yielding 1,000,000 cubic feet per day. In many of the deeper wells, two or more reservoirs of natural gas are often found. The cost varies from a few hundred dollars in the shallow shale districts to $10,000 in the deep wells in West Virginia. All large wells are usually tubed and a packer set just above the gas sand; the top of the tubing is held by clamps attached to bolts that are anchored and a heavy gate valve attached, so that the well can be shut in and the gas held in the rock when not in use.

The reservoirs in which natural gas is usually found stored when pierced by the drill are composed of porous sandstone or limestone. In some cases a limited quantity of the gas has been found in shales but this gas may be regarded as having gradually accumulated from the underlying rock formation. Almost invariably the large reservoirs have been developed in the strata on or near the crests of the anticlinal or rock waves, while petroleum has been generally collected on the lower horizon; and frequently salt water is found at a still lower level. Sometimes, however, the gas fields are entirely isolated from the petroleum producing areas. There are three leading requisites necessary for the accumulation of natural gas in merchantable quantity. These are as follows:

1. An open or porous strata capable of storing the gas under pressure, generally sandstone or limestone.

2. A slate or shale covering of this porous strata to seal in the upper surface and the fractures of the strata saturated with natural gas.

3. A sufficient flexure or relief of the strata to enable the separation of the salt water and the petroleum from the natural gas, which is almost invariably found in the higher portion of the strata.

These gas reservoirs have been accumulating for ages the gas they contain.

Original Pressure.— The original pressure of natural gas reservoirs has been found in many cases equal to the hydrostatic balance, or, in other words, to the weight of a column of water equal to the vertical distance between the reservoir and the surface of the ground. Allowing 2.3 feet for each pound, or about 43 pounds to the 100 feet, a reservoir at a depth of 1,000 feet should show 430 pounds rock pressure per square inch. This hydrostatic pressure has been equalized to a certain extent by a large number of minute vents that have permitted the escape of the lighter hydrocarbons to the surface. These vents are of common occurrence throughout the Appalachian gas field from northwestern central New York to central Tennessee and along the great Cincinnati uplift from central Kentucky to northern Ontario.

These vents have during past ages allowed the gas to escape in immense quantities, amounting to unnumbered millions of cubic feet, so that the supplies from which we are now drawing are presumably but a small fraction of what has been produced in the earth.

Reserves of Natural Gas.— Many of the original natural gas fields have been practically exhausted and a large number of the producing companies have had to seek new localities, where a fresh supply could be secured. This has been often accomplished by drilling deeper wells in more remote regions. The gas fields adjacent to Pittsburgh having been used up, most of the supply for that city now comes from the deep natural gas sands of southwestern Pennsylvania and West Virginia, distant from 80 to 100 miles. The gas pressure in the original pool in northwestern Ohio is nearly exhausted. That of central Indiana has only about 15 per cent of the original pressure and volume remaining. The newly developed field in eastern central Ohio has recently supplied a large and increasing quantity to the inhabitants of that State. West Virginia has, during recent years, supplied a constantly increasing quantity of natural gas to Ohio and Pennsylvania. New York and Ohio have also been supplied by Pennsylvania. In all the natural gas fields it requires constant drilling of new wells and their connection with the main lines to keep up the supply, which is continually being depleted. Owing to the decrease in pressure at the wells and the desire to deliver large quantities of natural gas to distant consumers without increasing the size of the main lines, the companies have erected powerful compressing plants in convenient localities. These plants are models of mechanical engineering skill. The compressors are, in many cases, operated by large internal combustion engines of from 500 to 1,500 horse power each. About nine cubic feet only of natural gas is required to develop one horse power; and 1,000 cubic feet of natural gas at a pressure of 0 may be compressed to 270 pounds, by consuming 33⅓ cubic feet (or 3⅓ per cent), where very close to double this quantity is required if the natural gas be consumed under boilers and the steam used in condensing engines. The deep sand reservoirs in southwestern and central Pennsylvania and those of West Virginia should keep up a fair supply for many years to come. The West Virginia field is estimated as good for 50 years at its present rate of utilization. What may result from the deeper drilling of wells in localities where structural conditions are favorable is a problem for future determination. The Caddo field of Louisiana is regarded as the most extensive and prolific of all. Its utilization was begun only in 1913. The California field, developed in 1910, has not yet reached its maximum.

Occurrence, Geological Horizons, etc.— In the United States the principal sources of natural gas are located on the west slope of the great Appalachian uplift, extending from New York through Pennsylvania and West Virginia to southern central Kentucky, with a considerable portion of southeastern Ohio, also along the northern portion of the great Cincinnati uplift in northwestern Ohio and central Indiana and southeastern Kansas. There has been recently developed an important natural gas field in eastern central Ohio.

In California, Texas, Louisiana, Colorado, South Dakota and Alaska gas is found in geologically more recent rocks, but no attempt is here made to correlate the rocks of one field with those of another. In the Mississippi Valley to the eastward natural gas occurs almost universally in rocks of Palæozoic Age, extending from the highest Carboniferous down at least as far as the Trenton limestone, a distance of over 9,000 feet. The rocks vary greatly in thickness from place to place, so that no one section can be regarded as typical of all parts of the region. The 50 gas-bearing horizons known are composed of very different material, ranging from the coarser sandstones of the Upper Carboniferous and Catskill period to the finer sands of the Middle and Lower Devonian, the limy sands of the Silurian period, the crystalline limestones of the Ordovician and the crystalline sands of the Cambrian period.

So far as at present discovered there are five great gas fields in the United States, the Pennsylvania and West Virginia field; the Kansas field; the Oklahoma field; the Louisiana field and the California field. During 1915 two wells in Montana flowing 6,000,000 cubic feet per day were opened, and there have been promising developments in new grounds in Indiana, Kentucky, Oklahoma and Louisiana. There were, in 1915, 23 States in which some natural gas was produced, though the yield was notably large only in nine. In all, the gas-yielding territory of the United States covers about 9,365 square miles, of which some 10,600,000 acres are being actively exploited by gas producers. The States that produce large quantities of natural gas, as Pennsylvania and West Virginia, distribute it to the adjoining States by a system of pipe lines, so that in some instances the natural gas consumed in a town or city is produced over 200 miles from where it is consumed. Thus Oklahoma and Kansas pipe gas into Missouri; Louisiana into Arkansas and Texas; Illinois into Indiana and Oklahoma into Arkansas.

In many localities the yield of gas is incidental to the production of petroleum, and the former has been frequently sacrificed for the more stable fuel. This is the case particularly in the Caddo field of Louisiana, where billions of feet of gas have been allowed to escape unhindered. For some years open gas vents known as «roarers» were of interest only as a night spectacle when, having been ignited, their flames, a hundred feet in height, lighted up the surrounding country. It is a satisfaction to record that in most localities this waste has been checked. Another avenue of serious waste, when the totals are considered, is that which has occurred in boring for oil. This, too, has been overcome by sealing the gas sands with clayey mud, when they are encountered in the search for oil.

Production of Natural Gas in the United States.— No other country enjoys the luxury of natural gas to the extent of the people of the United States. It is used in Canada and in a very limited way in England, Australia, Germany, Rumania, Galicia, Russia, Persia, India, China and Japan, but all these countries combined use only 2 per cent of the known world's commercial production of this efficient and convenient fuel, leaving 98 per cent to be consumed by the people of the United States. The total value of the natural gas produced and sold since its introduction, commercially, in the United States, in 1872, up to the close of 1915 was $1,164,717,474. Assuming the average price of the last 25 years, 12 cents per 1,000 cubic feet, this value should represent 9,705,978,950,000 cubic feet in amount. If it were possible to confine this immense quantity in a tank whose end was one square mile in area it would require to be 630 miles in length. Its heating value would equal 945,000,000 tons of coal. Large as this quantity seems, it is quite probable that it does not represent one-half of the actual quantity which has flowed from the earth's rocky reservoirs since the discovery of petroleum. The loss in developing petroleum fields has been so great that these figures, representing only that amount of gas which has been collected and sold on a commercial basis, give little idea of the actual evolution from the great gas reservoirs.

The volume of natural gas utilized in the United States in 1916 was greater by nearly 20 per cent than the record production of the preceding year. Owing, however, to a reduction in the service price in some of the Western and Southern States, there was a slightly lower ratio (18.6 per cent) of increase in the value of the product. The yield amounted to 753,170,253,000 cubic feet (628,578,842,000 cubic feet in 1915), and the value to $120,227,468 ($101,312,381 in 1915). This sum may be better comprehended in its true relation to the mineral wealth of the country, if it is recalled that it is $27,000,000 greater than the value of all the gold produced in the United States in the same year.

Among the several States, the largest producer was West Virginia, with 299,318,907,000 cubic feet; followed in order by Pennsylvania, with 129,925,150,000 cubic feet; Oklahoma, with 123,517,385,000 cubic feet; and Ohio, with 69,888,070,000 cubic feet. Louisiana, Kansas and California each recorded a production of about 32,000,000,000 cubic feet. Nearly two-thirds of West Virginia's production was piped into other States for utilization; and Oklahoma disposed of one-third of its yield in the same way. Pennsylvania, Ohio and Kansas bought practically all of this surplus, and New York bought a considerable share of Pennsylvania's output.

The gas was produced by 7,697 operators, from 37,989 active wells; 3,889 new wells having been added during the year to the 36,546 in production at the beginning of 1916, and 2,446 having been abandoned as no longer profitable. The area under control of the natural-gas producers in 1916 totaled 12,899,781 acres; an increase of 2,252,239 acres in the year.

Consumption and Cost.— The natural gas output of 1915 was consumed by 7,939 manufactories, 10,419 other industrial plants and 2,195,081 domestic consumers; the latter class consuming about 35 per cent of the total. The price to the manufacturers averaged 10.35 cents per 1,000 cubic feet. To the industrial plants it averaged 8.32 per 1,000 cubic feet; and to the domestic consumer, 28.32 cents per 1,000 feet. The prices which are thus expressed in an average figure varied from limits of 8.47 cents per 1,000 feet in Louisiana to $1.00 per 1,000 feet in Iowa; and some industrial plants in West Virginia using large quantities were supplied at the price of 5.41 cents per 1,000 feet.

The above separation of «manufacturing» from other industrial plants depends upon whether the gas is burned directly as fuel, as in the latter, or is used to produce power (steam or electric or gas engine), as in the former. About two-thirds of the 65 per cent used industrially was burned directly as fuel.

As used in the home, natural gas in itself is not dangerous to health. Tests made with canary birds, most delicately sensitive to poisonous gases, showed that they breathed as large a proportion as 34 per cent in the air of a room without showing the least disturbance. They became drowsy when the percentage reached 49 per cent, but did not collapse until it was as high as 66 per cent; and then quickly revived when taken to the outer air. The risk from fire is less than when wood and coal are used. There have been some cases of asphyxiation when a stove has been burned in a room without connection with the chimney flue, as it has been found that under these conditions the air in the room becomes more and more saturated with carbonic acid and the vapors of water and depleted of oxygen. When this vitiated air passes again into the stove the combustion is imperfect, the result being the formation of poisonous carbon monoxide (CO). There is more or less danger also from explosion in the case of a mixture of natural gas with air from a leaky stove. A comparatively small percentage of gas makes an explosive mixture, the limits being 5 per cent (low) and 11.5 per cent (high).

Products of Combustion.— The products of complete combustion of natural gas are water and carbonic acid, slightly over two cubic feet of the former in the form of water vapor and about one foot of carbonic acid gas for each cubic foot of natural gas consumed; both are invisible and nearly odorless. Somewhat more than two cubic feet of oxygen are necessary, but, owing to the air being composed of a larger percentage of nitrogen, a little over 10 cubic feet of air is required for thorough combustion.

It has been found that in a stove without a flue connection, especially if the air in the room becomes more or less saturated with carbonic acid and the vapor of water from lack of fresh air, there is a small percentage of carbon monoxide (q.v.) produced, which is a deadly and insidious poison, and if breathed by a man or an animal will soon cause death, even when a comparatively small percentage is present. When a small stovepipe connecting with a flue is used, no carbon monoxide is formed in the room, the greater portion of the products of combustion being carried outside as the fresh air is drawn in to supply their place. On the other hand, where there is no flue connection or large opening for the free entrance of an abundance of fresh air, a number of fatal results and narrow escapes from asphyxiation have occurred.

Carbon monoxide does not usually exist to such an extent in the natural gas produced in West Virginia or Pennsylvania as is found elsewhere. Analysis shows its presence in the natural gas produced in the Lima-Indiana field to the average extent of about one-half of 1 per cent, and to the average extent of 1 per cent in the natural gas produced in Kansas. Formaldehyde is in some cases formed upon putting the cold surface of a teapot in contact with the gas flame of a stove, or when the flame impinges on the cold sheets of a steam boiler. Its presence in small quantities is made known by its pungent and irritating effect upon the nostrils and throat. The effect is dangerous, yet there are no cases known in which death has resulted from this gas thus generated.

Illuminating Properties.— The illuminating properties of natural gas vary in different localities, because of the difference in the percentage of the heavier hydrocarbon, ethane (C_2H_6). All the natural gas found adjacent to petroleum fields has a larger proportion of ethane than the gas farther removed, and therefore the candle power is considered greater. Ordinary natural gas, if consumed with a common tip at the rate of 7 or 8 cubic feet per hour, will yield about 6 or 7 candle power. In an ordinary Argand burner with chimney, it will give about 12 candle power in consuming 5 to 6 cubic feet per hour. When natural gas is consumed in contact with a mantle of alkaline earth (thoria, etc.), the result is the cheapest and best illuminant known.

Calorific Value.— The calorific or fuel value of natural gas varies in different localities, as the amounts of carbon and hydrogen vary. Those natural gases which contain the highest percentage of carbon give the best results. The standard used in measuring fuel values is called the British thermal unit, written B. T. U., and is the amount of heat necessary to raise the temperature of one pound of pure water 1° F. at or near 39° F., which is the temperature of the maximum density of water. As tested by this standard various samples of natural gas showed heat values ranging from 740 to 1,312 B. T. U. per cubic foot. The quantity of air necessary for the perfect combustion of natural gas varies from 10.4 to 10.8 parts of air to 1 part of natural gas. A number of tests have fully demonstrated that when ordinary care is taken in burning natural gas under boilers in actual service, 1 cubic foot of natural gas will do work equivalent to the evaporation of 1 pound of water from and at 212° F. Since 20 cubic feet of ordinary natural gas weigh 1 pound, 1 pound of natural gas will evaporate 20 pounds of water, while, under similar conditions, 1 pound of petroleum will evaporate only 16 pounds of water, and 1 pound of good coal will evaporate but 10 pounds of water; therefore 10 cubic feet of natural gas or one-half a pound is equal to one pound of good coal. In fact in a number of tests with a Klein or a Kirkwood burner, .87 cubic foot of natural gas has evaporated 1 pound of water from and at 212° F., which will make 17,400 cubic feet equal to one ton of good coal. The actual heating effect of natural gas as a fuel approaches much nearer the theoretical result than can be attained with coal. The price paid by the domestic consumer for natural gas varies in localities, ranging from 13 to 27 cents per 1,000 cubic feet. The consumers near the supply pay less than those farther off. Manufacturers pay less, ranging from 6 to 18 cents per 1,000 cubic feet. About 20,000 cubic feet of natural gas will equal one ton of good bituminous or anthracite coal. If we assume the average price to the domestic consumer to be 22 cents per 1,000, then $4.40 worth of gas will produce the same heating effect as one ton of good coal delivered in the bins — to which must be added the expense of shoveling it into the furnace and the removal of the ashes, as well as the inconvenience of the necessary dust and dirt which invariably accompanies a coal fire.

The Natural Gas Engine.— Natural gas, as applied to the internal combustion engine, has caused a complete revolution in the methods of securing power throughout the gas belt. It has in nearly all instances superseded any other source of power in pumping petroleum wells, In some instances this has been done by substituting a gas cylinder for the steam cylinder, using the same engine bed. The economy in the use of natural gas and the dispensing with the costly and troublesome boiler, with its constant attendant, has brought it into great favor for all sources of power, from a 1 horse-power up to 1,500 horse-power engine.

The following table gives the equivalents of natural gas and coal for both the gas and steam engine per indicated horse power per hour:

Type of Engine	Gas	Coal
	Cubic feet	*Pounds*
Large natural-gas engine, highest type	9	0.9
Ordinary natural-gas engine	13	1.3
Triple expansion condensing steam engine	16	1.6
Double expansion condensing steam engine	20	2.0
Single cylinder and cut-off steam engine	40	4.0
Ordinary high pressure, without cut-off, steam engine	80	8.0
Ordinary oil well pumping steam engine	130	13.0

Uses.— Natural gas is used in domestic service principally as a source of heat and light. It is employed extensively in industrial establishments for many purposes, notably in the generation of steam; in the manufacture of glass; puddling of iron; in roasting ores; in heating furnaces, for lacquering and japanning, annealing and reheating, case hardening, tool tempering, preheating castings in oxy-acetylene welding; and for heating china kilns, water stills, fire expanders, etc.; and in the manufacture of steel and pottery; it is also utilized as a source of power in the gas engine, used in drilling and operating oil and gas wells and in pumping oil, and as a general source of power for all purposes. The heat value stored in natural gas is greater than that caused by any artificial combination of carbon and hydrogen, and it is a perfect fuel as it issues from its original rock-sealed reservoirs. No preparation is necessary for its combustion and no residue is left. It is not affected by ordinary temperature and it is easily distributed by pipes to points of consumption. It is a most economical source of light and power, and an ideal household fuel. Carbon black (q.v.) is the only commercial article that is made directly from natural gas.

Since 1911 a considerable industry has been built up in the production of gasoline from casing-head gas — that is the gas which comes up between the casing and the tubing of an oil well, and collects in the casing head. This gas is known as «wet» gas, carrying a proportion of the vapor of petroleum. The process is also applied to gas from gas wells if it carries as much as six pints of gasoline vapor to the 1,000 cubic feet. For the wetter gases the principle of compression is employed, with subsequent condensation. For the dryer gases the process is to pass the gas through a tank of heavy oil which absorbs the gasoline vapor, and the gasoline is afterward distilled out. In 1915 there were in the United States 414 plants devoted to the production of gasoline from natural gas. The total recovery was 65,364,665 gallons, nearly half of which was gained in Oklahoma. The highest percentage was secured from the gas of the Glenn Pool in Oklahoma, which yielded eight gallons of gasoline per 1,000 cubic feet.

Liquid Natural Gas.— Natural gas may be liquefied by a pressure of 415 pounds at a temperature of 36° F., or a pressure of 506 pounds at 48° F. Fifty cubic feet of the gas condense to one gallon of the liquid gas. The internal pressure in a cylinder of this liquid gas at 133° F. is but 755 pounds per square inch — only one-third the pressure of many liquefied gases. As an illuminant the vaporized liquid gas burns with a slightly yellower flame than the ordinary natural gas, and gives the best results with an inverted Welsbach mantle. It is entirely effective in heating if a plentiful supply of air is provided. With oxygen in a blowpipe it gives a very hot flame. It has been used successfully to run an automobile, where provision is made to keep the valve warm; the vaporing of the liquid gas produces a low temperature in which the unprotected valve quickly freezes up.

Early History.—Natural gas has been known since the earliest records of the human race as a curiosity. Perhaps the first historical record of the use of natural gas is that of the Apollo Oracle at Delphi in Greece, about 1,000 years before the Christian era. The Chinese are credited with the earliest practical application of this fuel at the wells at Tz-Lin-Ching, western China, in the evaporation of salt brine.

The fire worshippers on the shores and islands of the Caspian Sea, in the Baku region, Russia, and those of Punjab, India, have preserved a continuous flame in their temples, caused by a steady flow of natural gas for centuries. In after years it caused the deadly explosions in the deep coal mines in Europe and America, being known to the miners as fire damp. Its existence in the United States has been known since the first white men crossed the divide and explored the Ohio River watershed, as the Indians invariably conducted them to these natural vents, and, setting fire to them, viewed the effect with a semi-religious veneration. The discovery of vast reservoirs, sealed up in the porous rocks of the United States and Canada, is of recent years. The artesian driller, searching for salt brine, knew of its presence since the first wells were drilled on the western flank of the Appalachian uplift; afterward the driller in search of petroleum encountered it, but by both of these early prospectors it was considered a source of danger and annoyance. It frequently caught fire, causing loss of life and destruction of the drilling outfit by a sudden outburst. It is on record that Washington in 1755 conveyed to the United States a small tract of land in Virginia containing a «burning spring» fed by natural gas.

The earliest economic use of natural gas known in the United States occurred in 1821, when it was used for the illumination of the village of Fredonia, N. Y. A well one and one-half inches in diameter was drilled to a depth of 27 feet near a noted gas spring and for many years supplied the village with 30 street lights.

In 1838 a water well dug at Findlay, Ohio, encountered such quantities of a foul smelling gas that it was abandoned for the original object. It was subsequently covered up and the gas conveyed to a house near by and utilized for domestic fuel and lights for nearly 50 years.

About the year 1841, natural gas was found in a well near Charleston, W. Va., which also supplied salt brine, from which it was separated and for many years used as a fuel for making salt.

More or less natural gas was developed in the rush to find petroleum in the valley of Oil Creek in the winter of 1859 and the year following.

One of the first attempts to employ natural gas for fuel purposes was at a well drilled at Erie, Pa., in 1868, which was soon followed by many others; these wells were only 600 feet in depth and supplied from one to three families each. Titusville, Pa., enjoys the distinction of installing the first modern equipped natural gas plant, as well as the first well drilled for petroleum. This plant was constructed during 1872, 13 years after the first oil well was drilled by Colonel Drake.

During 1873 natural gas was introduced into many of the villages of Butler and Venango counties for light and fuel, being supplied from wells drilled not far distant in prospecting for petroleum. In the year 1875 the first long pipe line (17 miles in length) was built; the pipe used was six and a quarter inches in diameter, supplying the natural gas produced from the Harvey well at Larden Mills, in Butler County, Pa., to a large manufacturing plant known as the Etna Iron Company on the Allegheny River, a few miles above Pittsburgh. In the 10 years that followed slow progress was made in the actual use of the known gas wells; many were utterly ruined by pulling the casing and allowing the inflow of muddy water, which gradually sealed up the rock and prevented the flow; this was after a struggle for years. The gas from other wells was allowed to escape into the air for years. There seemed to be an uncertainty in the minds of all, as to the lasting supply of this natural product.

In the year 1876 the large Haymaker well was drilled in at Murraysville, Pa., but was not utilized until the year 1883, when its product was piped to Pittsburgh. By the close of 1883 a number of pipe lines were supplying Pittsburgh and the Beaver Valley with natural gas from a number of good gas wells drilled in Washington, Beaver and Butler counties. During May 1885, the first natural gas well from the deep Speechly sand was drilled, seven miles south of Oil City, Pa. During the same year the remarkable reservoir of natural gas in the Grapeville pool, near Greensburg, Pa., was also found.

These numerous natural reservoirs at this period with their great initial pressure encouraged the impression that it could be found in almost any locality and that the supply was practically inexhaustible.

In 1885 the large natural gas fields near Findlay, Ohio, became prominent and the year following large wells were also found in Indiana. These latter developments gave additional assurance of its unlimited supply.

In Pennsylvania, Ohio and Indiana immense quantities of gas were consumed in the most wasteful manner and in the extravagant display, which in numerous instances turned night into day. The effect upon witnessing mile after mile illuminated by the burning of escaping wells and torches produced an impression long to be remembered. This extravagance and waste were not realized until many of the then known fields began to show a serious decline in the rock pressure and, knowing the original pressure, it was a simple calculation to show that a large percentage of the quantity of natural gas originally contained in the natural reservoirs had been withdrawn and that something must be done to stop the waste. Even then the reforms were slow and gradual and many companies became bankrupt. It was not until the general introduction of the gas meter in 1890 and 1891 that economy in its use by the consumer was inaugurated. Formerly the natural gas was sold by month, according to the size of the orifice through which it was delivered without regard to the manner of its combustion and use. The meter made it to the interest of the consumer to use this convenient fuel in an economical manner. It is estimated that under the meter system a saving of fully one-half the gas required to accomplish the same results was made. Another economical improvement introduced consists of shutting in the wells when their flow is not required; their closing or opening being regulated by telephone from a central office. The wells are also more carefully watched and the salt water removed by pumps, instead of by blowing out as formerly. The pipe lines were thoroughly overhauled for leaks and the new pipe afterward used was heavier and of larger diameter, being supplied with heavier thimbles or improved rubber-packed joints. In the cities and towns larger distributing mains are used and a greater number of regulators secured — thereby maintaining a more even pressure — throughout all the variations in consumption, due to changes in seasonal temperature. GAS ILLUMINATION, History of. The development of gas lighting can properly be placed to the credit of the 19th century. Spirit of coal, produced by the distillation of coal, was known as far back as 1739, and the attention of Robert Boyle was called to this substance by Dr. Clayton, bishop of Cork. Its properties were studied and its inflammability and many of its general characteristics were known at this time, although an inflammable gas rising from the surfaces of certain stagnant pools had been noted as far back as 1659. The first practical application of gas for illuminating purposes was made in 1792. William Murdock, an English engineer, produced gas by the destructive distillation of coal in iron retorts and conducted it for a distance of 70 feet through iron pipes and lighted and heated his house in Redruth, Cornwall. Lebon in 1801 illuminated his house and garden in Paris by gas produced from the destructive distillation of wood. This method of illumination proved a failure on account of the poor illuminating power of the gas. In 1802 Mr. Murdock installed a plant for illuminating the foundry of Boulton, Watt & Co. (Watt being the inventor of the steam engine) near Birmingham, and a similar installation was introduced in Manchester shortly after this time. Street lighting was introduced by F. A. Winzer (afterward changed to Winsor) in 1807 in Pall Mall. Mr. Winsor promoted a company for general gas lighting in 1809, and was granted a charter by Parliament in 1810 for the establishment of the London Gas Light and Coke Company, generally known as the chartered gas company.

In America David Melville, of Newport, R. I., was attracted by the developments made along the lines of gas lighting in England, and installed in his house, and in the streets in front of his house, the first gas lights used in the United States. This installation was made in 1806, his apparatus, with improvements, was patented in 1813 and a general installation made in several cotton mills and lighthouses. Baltimore was the first city in the United States to install gas lighting, in the year 1817, and since that time the growth of the gas lighting industry has proceeded uninterruptedly, for its convenience and economy have been impressed upon the public.

The original promoters of gas lighting encountered many difficulties. At the time of the installation of gas pipes in the House of Parliament it was stipulated by this body that no pipes should be placed nearer than six inches to any woodwork. Numerous explosions and fatal asphyxiations caused by lack of experience in handling the new substance are recorded. The disagreeable and often injurious odor of the products of combustion of the gas greatly retarded its favor with the public. With the increasing experience of gas engineers, the dangers of explosions and accidental asphyxiations were eliminated. Considerable inventive genius was brought to bear to remove from the room the products of combustion, or to purify the gas for the removal of those constituents which gave the disagreeable products on burning. Several means were proposed for accomplishing these purposes. The most original improvement, and one in use at the present time, was the invention of Clegg, who introduced the use of slaked lime for removing the sulphurous constituents of the gas before it entered the holders. A later development was that of Lanning, who used ferrous oxide mixed with sawdust or wood pulp to make it porous for the absorption of the sulphur constituents. These methods are to-day in general use. Many other methods, of more or less value, have been proposed.

The illuminating power of a flame is derived from the heating of solid particles to incandescence, and the practice of gas illumination can therefore be divided into two general principles: (1) Where the solid incandescent material is supplied by the decomposition of the gas in the process of combustion; (2) where the complete combustion of the gas is produced by the Bunsen burner, and a permanent incandescing material is supplied as a part of the apparatus.

The latter method is what is generally known as the incandescent gas lighting system. The original developments in gas lighting were made on the first of these principles. The batswing or fishtail flame was produced by releasing the gas through a narrow slit, and its illumination was produced by the incandescence of the solid particles of carbon derived from the decomposing gas in the flame. The Argand gas burner is a modification of the old Argand oil burner, and consists of a ring of small openings arranged near enough together so that the gas flame is in the form of a continuous cylinder, admitting air to the inside and outside of the cylinder. The Siemens-Lungren system, known as the Regenerative system, consisted in applying to the burner gas and air which has been preheated. Professor Bunsen, professor of chemistry in Heidelberg, designed a burner to produce a non-luminous flame with complete combustion and to give the maximum heating effect of the gas. This was accomplished by so constructing a burner that it will carry in and mix with the gas a limited amount of air before it reaches the point of combustion. The additional air necessary to produce complete combustion is drawn from the atmosphere surrounding the flame. This type is known as the Bunsen burner.

The experiments of Henry Drummond in 1826, in which he placed a solid stick of lime in the oxy-hydrogen flame, was the first systematic attempt at the development of what is now known as the incandescent gas lighting system. The Drummond, or lime-light, was until recently in general use for the production of very high power lights, especially in theatres and for stereopticon practice, etc. This system, however, was not applicable to the ordinary conditions of gas lighting. A modification of the Drummond light was made by Tessie du Motay, in which he substituted coal gas for the hydrogen in the ordinary Drummond oxy-hydrogen flame. A burner exhibited at the Crystal Palace Electric and Gas Exposition in 1883, by Lewis, was constructed with a platinum mantle suspended over the flame, and designed to produce a high incandescence. This mantle, however, was unsuccessful, owing to the fact that it rapidly deteriorated by the reducing action of the gas. This burner was designed to operate with compressed air. Clamond about the same time introduced a burner similar to the Bunsen type, in which he placed a mantle made of threads of magnesia. He also introduced an inverted pattern or burner in which a basket or mantle was made of magnesia threads held in a platinum basket. This burner, like the Lewis burner, was operated by compressed air, and was claimed to produce 4½ candles per foot of gas consumed, with a life of from 50 to 60 hours. Mantles in modification of the Clamond type were produced by C. B. Harris, in which he molded a refractory material into sheets, pressed into the proper shape and perforated in any desired pattern. Attempts have also been made to make a mantle of asbestos or similar non-combustible material, and saturate this with a substance giving high incandescence.

The first commercially successful results accomplished in the field of incandescent gas lighting were made by Dr. Carl Auer von Welsbach of Vienna. Welsbach's work in this field began in 1880, in Bunsen's laboratory in Heidelberg, where he was studying the rare earths from a standpoint of pure chemistry. His attention was centred on the oxide of erbium. To produce a continuous light for spectroscopic study he satuated a cotton fabric with a solution of erbium, and after burning out the cotton suspended the residual ash in the flame. This produced an intense green light. The idea occurred to Welsbach to utilize this particular method for producing an ash fabric of incandescing material in the ordinary Bunsen gas flame. When this plan was communicated to Bunsen he replied: "It appears most improbable that the oxides could be made to adhere." Welsbach, however, continued his experiments, choosing not erbium oxide, but oxides which would give a high white incandescence when heated. His researches led him through the entire field of the elements having stable oxides, and certain oxides of the so-called rare earths were found to give the most promising results. The oxide of lanthanum made a perfect mantle in appearance and produced an intense glow in the colorless flame of a Bunsen burner, but the mantle was found to crumble to a powder within a short time. Welsbach then began experiments with a view of mixing something with a lanthanum which would produce a non-slaking body. In 1886 what is known as the lanthanum-zirconium mantle was introduced. This mantle was made by saturating a closely knit cotton fabric with the proper mixture of zirconium and lanthanum nitrates, burning out the cotton and leaving a network of ash composed of the oxides of zirconium and lanthanum. These mantles gave 12 candle power per cubic foot of gas consumed, and lasted several hundred hours. To quote Welsbach: "The sum of all these results appeared encouraging, and I was audacious enough to pronounce the endeavors of the gas engineers to increase the illuminating power of the open flame, as useless and vain; for it was evident that it was much more economical to renounce the lighting power of the open flame and to transform it into a Bunsen flame, and to get those substances to incandesce in the very hot part of that Bunsen flame, by which method two or three times the amount of light of an open flame could be attained."

The invention was now called to the attention of the public, and Welsbach delivered numerous lectures before the press representatives. The invention was named the Incandescent Gas Light by Mr. Sceps, editor of the *Neue Wiener Tägeblatter*. The announcement of the Welsbach mantle was received with various comment, and many prominent engineers refused to take the matter seriously. Welsbach's confidence, however, was not shaken, and companies were formed for the development of the industry and the manufacture of the lighting fluid from the rare earths. The services of Dr. Ludwig Haitinger, an able chemical engineer, were added to those of Dr. Auer in the development of this work. The increased efficiency of this method of lighting, however, was not what had been expected, and the public refused to take it up. The mantle rapidly deteriorated and required to be rejuvenated. At that time it must also be understood that these mantles were very fragile and in the early stages of the work they were delivered in the city of Vienna by a boy carrying one in each hand, as they would not bear the ordinary handling in transportation. The usual skepticism of the public in regard to new inventions prevailed, and the commercial failure of this enterprise seemed imminent. The Vienna factory was closed and the plant and laboratory sold. The American factory, under the direction of Waldron Shapleigh, was still producing with some success the lanthanum-zirconium mantle. Welsbach, however, was not discouraged by these drawbacks, and devoted his entire attention to the development and improvement of the mantle. In the early nineties he went before the public with an entirely new mantle, which was composed of 99 per cent thorium oxide and 1 per cent cerium oxide. This mantle gave 24 candles per cubic foot of gas consumed. The present system of manufacture of mantles is entirely in accordance with this last invention of Welsbach's, which consists in saturating cotton fabric with the proper mixture of the nitrates of thorium and cerium, burning out the cotton fabric and tempering the mantle. It is then coated with collodion and packed for the market. Various improvements have been made in the Bunsen burner and a large number of designs are now on the market; but the general Bunsen principle is strictly adhered to and the present incandescent gas light is invariably produced by applying the incandescing material to the colorless Bunsen burner flame.

The first incandescent gas mantles were of approximately conical form, suspended above the upwardly directed flame from an upright burner by means of a loop in the apex of the mantle. On account of the expansion of the mantle under heat it was impracticable to secure the bottom or "skirt" of the mantle to the burner-head, and the swaying of the skirt against the burner-head with every vibration of the lamp resulted in disintegration of the lower portion of the mantle. In 1907 the inverted mantle and burner were introduced. In this type a mantle of roughly hemispherical form was suspended below the downwardly directed flame of an inverted burner. The open end of the mantle was affixed to the burner-head and thus rigidly supported. Although the inverted mantle greatly exceeded the upright in durability, the arrangement of the burner parts was unsatisfactory in that the burner being below the supporting fixture discolored the latter by the strongly heated combustion products. In 1915 an upright burner bearing inverted mantles was introduced. In this lamp was combined the strength of the inverted mantle and the structural advantages of the upwardly projecting lamp body — particularly desirable for attaching to fixtures designed for the upright open flame tips. Up to this time the development of the gas lighting industry had been much restricted by the above mentioned limitations and the lack of flexibility in the adaptation of gas lamps resulting from these limitations.

Almost coincidentally with the development of the upright inverted mantle lamp it was discovered that by conserving the kinetic energy of the gas through proper design it was possible to control the gas and air mixture so completely that practically any structural combination imposed by the requirements of fixture design or illumination requirements may be realized and the light yield much increased. Although the mantles are best suspended in an inverted position, the burner may be vertically upright or inverted, horizontal or angular. By the application of these principles, incandescent gas lamps ranging from 25 to 2,500 candle power have been successfully operated, and all of the various systems of illumination — direct, indirect and semi-indirect — successfully applied. In connection with other development, refinements in ignition and control have been so elaborated that any desired condition of operation may be met.

Gas for lighting is usually distributed at a pressure of from two to three inches of water column. At these pressures the most recent incandescent gas lamps give from 28 to 30 candle power per cubic foot of gas consumed. For street and factory lighting, higher pressures are coming into use, and at a pressure of three pounds per square inch a yield of from 50 to 60 candle power per cubic foot is obtained.

The wonderful ability of Auer von Welsbach as a chemist and inventor should also be noted, from the fact that the chemicals used in the production of the mantles were very rare and almost unknown, and that he was called upon to find the raw material for the production of these chemicals, and to invent processes for their extraction in a sufficiently pure state for use. All of this work was accomplished successfully after years of patient, painstaking endeavor. Within the past decade the decorative side of gas lighting has been all-appealing. The primary idea of gas lighting was illumination, but with a desire for greater comforts and more luxuries in everyday life has come the desire for decorative effects. Globes, shades and domes are now made in many varieties. Color schemes of beauty are evolved, and artist and artisan combine to lend decorative worth to shape, color and treatment of the globe or shade, which is destined to add to the bare illumination of the gas jet or the incandescent mantle.

In 1917 the entrance of the United States into the Great War imposed radical changes upon the gas practice of the country. The entire production of benzol and toluol (the basis of the most efficient high explosives) from the by-product coke oven plants — the principal source — was under contract to the Entente Allies, and the United States government had recourse to the plants furnishing illuminating gas to obtain its own supply of these needed chemicals. Benzol and toluol are largely responsible for the luminosity of the open-flame gas burner, and the necessity for removing these substances from illuminating gas made the incandescent mantle almost an universal necessity wherever gas was employed for lighting. The mantle burners in use before this time were relatively expensive (when of good quality) and had been restricted to the more important uses, the open-flame burner being used for occasional and intermittent service. In many cities more than one-half of the gas used for lighting was burned in open-flame tips.

In order to make the needed conversion of these less-frequently-used burners to mantle lamps without imposing undue burden upon the consumer, a small, relatively inexpensive mantle burner, of substantially the same light-giving power as the previous open-flame burner was developed. This effects a saving of about two-thirds in gas consumption and permits all the toluol and benzol to be removed from the gas without impairing its light-giving power.

Table showing efficiency of various systems of gas lighting in use at the present time:

System	Candles per cubic foot of gas consumed
Welsbach Incandescent High Pressure (1915)	50 to 60
Welsbach Incandescent Low Pressure (1915)	28 to 30
Welsbach Incandescent thorium-cerium mantle (1907)	22 to 24
Welsbach Incandescent lanthanum-zirconium mantle (1888)	11 to 12
Siemens-Lungren burner	5 to 6
Argand flame	3 to 4
Bray burner	3 to 4
Fish-tail flame	1½ to 3

SIDNEY MASON,
President Welsbach Company.

GAS LIGHTING, High Pressure. High pressure gas lighting represents the most efficient application of the energy in illuminating gas to the production of light, and is the highest development of the use of the Bunsen burner in connection with the Welsbach incandescent mantle. The principle involved is simply the production of high flame temperature within or on a mantle of highly refractory and radioactive elements by the complete combustion of gas in a concentrated flame volume. This principle was first demonstrated before the Philadelphia Chemical Society in 1801 by Dr. Robert Hare, by exhibiting the effect of concentrating the oxy-hydrogen flame on a refractory substance. The term "high pressure" is recognized as distinguishing it from ordinary incandescent gas lighting, because of the fact that the greatest number of lighting appliances coming within this class depend on the gas being supplied at higher pressures than are common in the ordinary distribution of illuminating gas from the works to the consumer. There are other types of units, however, of equally high luminous efficiency which come within this class, but which use the gas at the ordinary pressures, complete and high temperature combustion of which is effected by supplying the air at pressures ranging from one to two pounds above the atmosphere. These types have not met with such general favor as the other, on account of requiring a double pipe line system, one to carry the gas and the other to carry the air under pressure, and also because of the greater amount of compression needed to supply the large quantities of air used.

The lamps of the first type mentioned use gas at two to three pounds pressure per square inch (54 to 81 inches water column). The ordinary pressures at which gas is distributed range from one to four inches water column. These lamps use the energy of the gas under pressure flowing from a small orifice at high velocity to entrain from four to six volumes of air per volume of gas by simple injector action into the Bunsen tube and before being burned the gas and air are thoroughly mixed and pre-heated in the extending chamber from the Bunsen tube. At first high pressure lamps were designed to use the upright mantle, but later developments of the inverted mantle recommend it particularly for this class of lighting, because of the fact that the best incandescent results are obtained by having the mantle conform as closely to the flame as is possible, in order to have all its fibres in the zone of the highest temperature. Inverted mantles for high pressure units are applied to the burners in a soft state, so that in burning off and hardening they assume the exact form of the flame on which they are used. This factor is one of the important elements in the luminous efficiency of high pressure units. For low pressure lighting mantles are furnished which have been shaped and hardened in a pressure Bunsen furnace to a length approximating the size of a low pressure gas flame. It is impossible with gas at low or ordinary distribution pressure to completely burn out and properly shape the mantle fabric.

The increase in efficiency of gas lighting by the use of high pressure gas can be seen from the following comparisons:

Burner	Single unit	Candle power per foot of gas consumed
Flat flame (coal gas)	12 to 16 c. p.	2.4 to 3.2
Flat flame (water gas)	18 to 22 c. p.	3.6 to 4.4
Low pressure incandescent Welsbach burners	60 to 100 c. p.	20 to 22
High pressure gas lamps	250 to 1500 c. p.	50 to 60

The candle-power values of the limits given above are horizontal or maximum candle-power intensities. In the utilization of the heat energy in gas for the production of light, which is really the proper measure of efficiency and energy transferred, we have the following:

Flat flame burner, coal gas:
200 British thermal units per candle power.
Flat flame burner, water gas:
150 British thermal units per candle power.
Low pressure incandescent Welsbach burners:
35 to 30 British thermal units per candle power.
High pressure gas units:
15 to 10 British thermal units per candle power.

From this it is seen that with high pressure gas the ratio of energy input in the form of heat to light output measured as candle power is 20 times that of flat flame gas lighting and three times more efficient than Welsbach burners using gas at low pressures.

High pressure lighting units are supplied with gas by pipe lines connected with a compressor, which by automatic control delivers the gas at the pressure required, or they may be connected direct with mains carrying gas at considerably higher pressure, the pressure in the lines leading to the lamps being controlled by individual reducing governors. High pressure gas lighting has been extensively used abroad for street and ornamental lighting wherever high power units are required. The principal streets of London, Paris, Vienna and Berlin are so lighted with units ranging from 250 to 4,500 candle power each. These lamps are supplied by special steel mains from central compressor stations and as they are independent of the regular distribution gas mains, are lighted automatically from these central stations. A large section of the grounds of the Panama-Pacific Exposition in 1915 at San Francisco was lighted by over 300 1000-candle-power units of ornamental design. These units were equipped with automatic regulators, which delivered the gas at three pounds pressure per square inch, taken from the main distribution system, which carried gas into the grounds for all purposes at 35 pounds per square inch. The general use of high pressure gas for lighting and heating will necessarily be a gradual process on account of the conditions and legal regulations imposed upon the gas industry since its inception when gas was used only for lighting with the appliances then known. The Welsbach mantle was invented in 1886 and soon afterward came into general use, rapidly displacing the flat flame burners, as its superiority was appreciated and recognized. Notwithstanding this radical change in the use of gas for illumination, the old legal regulations restricting gas pressure and specifying the illuminating power of the gas to meet the requirements of an obsolete appliance still are enforced, thereby seriously deterring the advancement of the use of gas for lighting, as well as heating. The same principles which make gas valuable as an illuminating agent apply to its use for heating purposes. Many industrial establishments utilize the advantages of high pressure gas for fuel by installing individual compressor outfits. High pressure lighting may be termed an advance of the art years ahead of the physical condition of the industry. When the legal restrictions referred to are removed, gas will be supplied on the basis of its heating value and at pressures which will ensure the general enjoyment of its latent qualities as demonstrated by high pressure lighting.

F. V. Westermaier.

GAS POISONING, poisoning vapors of various substances when taken into the body through the air passages. Theoretically, a large number of substances used in the arts may cause gas poisoning; practically, there are only a few that seriously endanger health or life.

In general, gaseous substances must reach a certain percentage in a mixture with respirable air before they become poisonous. This percentage varies with each gas. Forms of gas poisoning most commonly met are those incidental to certain of the industrial trades, arising from the inhalation of poisonous gases, or of the fumes of volatile liquids. It is not to be supposed that such poison gases and vapors are allowed to work harm to employees unopposed. On the contrary every effort is made to prevent danger from this cause, and the cases of industrial poisoning by inhalation are very few.

Following is a list of the vaporous poisons against which precautions have to be taken, and a note of the industrial occupations in which they are met with:

Acetaldehyde fumes — in the vinegar industry.

Acrolein vapors — in fat-reducing establishments, oilcloth works, soap and candle factories.

Ammonia — around coke ovens; in the manufacture of ammonia salts; in the making of dyes, varnishes and lacquers; about ice making and refrigerating plants.

Amyl acetate fumes — from Zapone lacquer in several industries; in jewelry manufacture; and in the oilcloth process.

Amyl alcohol fumes — in the manufacture of fruit essences, valeric acid, and in the making of aniline dyes.

Carbon dioxide — in mines; in lime and brick kilns, tanneries and sugar mills; and in breweries and mineral water bottling establishments.

Carbon disulphide fumes — in the manufacture of calcium sulphide; in imitation silk making; and in many industries where it is used as a solvent, as for rubber, resins, fats, oils, etc.

Carbon monoxide — leakage from defective flues in all industries; around coke ovens; in the exhaust and leakage from gas engines; in metal foundries, from drying molds; in charcoal burning; and about lime and brick kilns.

Chlorine — in laundries, bleacheries, paper mills and in the manufacture of organic chlorine products.

Cyanogen (prussic acid) — in the extracting of gold from ores; in silver and gold plating; in dye works; in the manufacture of celluloid; in certain photographic processes.

Diazomethane — in methylizing processes of all kinds.

Dimethyl sulphate — in the production of methyl ethers, methyl esters and methyl amines; in the manufacture of artificial perfumes.

Formaldehyde — in disinfecting processes, and in the manufacture of coal-tar colors.

Hydrofluoric acid — in glass factories, glass etching works, potteries, dye works and fertilizer factories.

Methyl alcohol (wood alcohol) fumes — in the manufacture of varnishes, lacquers and polishes; in the making of perfumes; in furniture polishing; in the production of coal-tar colors; in calico printing.

Methylic bromide fumes — in aniline dye works.

Nitro-benzol fumes — in the making of perfumes, fine soaps and pharmaceutical preparations; in making coal-tar colors; in the manufacture of explosives.

Nitroglycerine fumes — in making explosives.

Nitrous gases — in numberless industries in which nitric acid comes in contact with deoxidizing substances; in chemical works; in the manufacture of celluloid, aniline colors, bleaching materials and dynamite; in dyeing and calico printing.

Phosphuretted hydrogen — in the extraction of phosphorus; in the reduction of iron silicate; in the production of acetylene.

Sulphur chloride fumes — in the rubber industry, and wherever it is used as a solvent for rubber, resins and fats; in making solutions of sulphur.

Sulphur dioxide — in the reduction of sulphurous ores; in potteries and the ceramic industry; in refining petroleum; and extensively in the bleaching of wax, silk and wool, dried fruits, hops, straw hats and bristles; in the fuming of wine casks, etc.

Sulphuretted hydrogen — around blast furnaces; in ultramine works; in soda factories (Leblanc process); in extracting cellulose; in tanneries; in making illuminating gas.

Sulphuric acid fumes — in hat factories; in petroleum refining; in fertilizer factories; in making and caring for storage batteries.

Turpentine oil fumes — in the making of lacquers, varnishes and cements; in tapestry printing; in house painting.

Outside of industrial gas poisonings there has been a number of cases of poisoning by carbon monoxide (CO) both through the medium of illuminating gas, of which it is an important constituent, and also where old-fashioned gas stoves without flues are used, and where there is insufficient air to convert the CO to CO_2. See Carbon Monoxide.

Poisoning by illuminating gas is extremely common, occurring both by intent and accidentally. The character of the poisoning and its mode of treatment will vary with the composition of the particular variety of illuminating gas that may be inhaled. The so-called «water-gas» is particularly rich in CO. The leading symptoms of this form of poisoning are, in the beginning, headache, with sense of pressure in the temples, ringing in the ears, flashes before the eyes, beating of the temporal arteries, dizziness and perhaps unconsciousness. If the breathing of the gas continues, dangerous symptoms develop. There is marked redness of the skin, with unconsciousness; the blood is bright-red — a marked contrast to the dark blood with blueness of the skin seen in carbon-dioxide poisoning. Occasionally there are cramp-like convulsions. The pulse is at first full and strong; later it is thin and small. The breathing is slowed, and becomes a kind of snoring. Vomiting is common, and occasionally the vomit is drawn into the lungs and causes the additional symptoms of suffocation. The patient may die in deep slumber. The diagnosis is not simple, but the chief signs are the reddish face, the snoring breathing, the absence of alcoholic breath and perhaps the slight odor of gas in the room. The treatment should be energetic. The patient should be brought into fresh air at once, the clothing loosened and hot bottles applied to the extremities. Active rubbing of the skin with coarse towels, mustard-water applications to the extremities and artificial respiration should be instituted. The breathing of camphor vapor or well-diluted ammonia gas may stimulate the breathing. So long at the heart beats there are hopes of reviving the patient. The injection into the rectum of large quantities (2 quarts) of hot salt solution (110°–118° F.), a teaspoonful of salt to a pint of water, is of great service. Small quantities of whisky (½ ounce) may be added to this. The transfusion of salt solution into the veins is sometimes necessary, but should be performed only by the medical practitioner.

Where the pulmotor (q.v.) is available it is used almost exclusively in the resuscitation of persons overcome by the inhalation of poisonous gases, and has been successful in cases where the beating of the heart has been suspended for five minutes. Persistence in the operation is required; two or even three hours having been necessary in some cases. The difficulty of carrying it about on account of its weight led to the invention of the respirator (q.v.), similar to the pulmotor, but using ordinary air instead of oxygen, which is not always obtainable in an emergency. The record of the respirator is quite as satisfactory as that of the pulmotor.

In the European War poison gases have been used freely, first by the German army and later by their foes. The German gases were at first a mixture of chlorine and sulphur dioxide, which rolled along the ground to a height of about seven feet and filled the trenches. In one recorded instance the cloud of gas rose to a height of 40 feet, and this was maintained along a stretch of five miles for the space of four hours. The effect upon those not immediately killed by the inhalation of this mixture was to produce irritation and swelling in the bronchial tubes, with many of the symptoms of acute bronchitis. The inhalation of ammonia gas gave relief, but most cases became speedily worse on the third day, and succumbed. Nitrous acid gas has also been used alone and in mixture, both in the clouds of gas sent rolling over the ground, and in the gas shells dropped into trenches and gas bombs dropped from aeroplanes. Bromine has also been used. To protect the soldiers from these attacks gas masks were devised. They consist of a face piece in which is placed an absorbent filling containing a mixture of sodium thiosulphate, 72 per cent; and sodium bicarbonate, 28 per cent and 2 to 3 per cent of glycerine to keep them moist. These masks are effective for two and a half minutes in air containing 10 per cent of chlorine, and twice as long if the chlorine content is only 5 per cent. One part of chlorine in 1,000 parts of air is instantly fatal when inhaled. One part in 100,000 of air, if inhaled for any length of time, is highly injurious. The German treatment of their own gassed men is by hypodermic injection of atropine.

A., 'The Poison War' (London 1915); United States Bureau of Labor Bulletin 100, 'List of Industrial Poisons and Other Substances Injurious to Health Found in Industrial Processes' (Washington 1912), and Bulletin 179, 'Industrial Poisons Used in the Rubber Industry' (1915).

GAS PRODUCER. The preliminary requirement in using any form of fuel is its conversion into a gas in order that it may combine more readily with the oxygen in the combustion process. Whether the gas thus obtained is combustible, i.e., whether it enters into combination with oxygen with the production of heat, or otherwise, depends upon the nature of the fuel from which it is derived and upon the method of gasification employed.

In most fuels, the chief combustible elements are carbon (C) and hydrogen (H), which are present in a great variety of chemical combinations with varying physical characteristics. When these fuels are completely burned, the products of combustion contain only carbonic acid (CO_2) and water (H_2O), with nitrogen (N) and some of the oxygen (O) of the air supplied for combustion, all of which are incombustible. But when the fuel is incompletely or partially burned, the products of combustion will also contain varying quantities of carbon monoxide (CO), various forms of hydrocarbons (CH_n), hydrogen, and sometimes tar and smoke as the products of distillation, all of which are combustible or have a heating value, which is wasted if not oxidized in the combustion processes.

Fuels may be burned by either direct firing on a grate or after conversion into gaseous form. The ultimate object of direct firing is the attainment of complete combustion in close proximity to the fuel bed, by vaporizing, distilling, gasifying and completely burning the fuel elements within the same chamber. It is well known, however, that the processes of vaporization and distillation do not produce heat but, on the contrary, absorb it, and, therefore, it is advantageous to separate them from the point at which the combustion of the gases takes place, and where high temperatures are developed by the heat evolved, as is accomplished by the use of a gas producer or generator.

Generation of Producer Gas.— In the gas producer, the processes of vaporization, distillation and gasification result in the generation of combustible gas, which is led away to a separate combustion chamber in which it is subsequently burned under conditions more favorable to a full realization of the heat value of the fuel, and the high temperatures absolutely unattainable by any other method of firing.

It should be clearly understood, however, that the use of a gas producer does not enable the generation of a greater quantity of heat than may be obtained by direct firing. Even when the producer is closely connected to the furnace so as to utilize the sensible heat of the gas, a loss of energy of from 15 to 20 per cent of the calorific value of the fuel is sustained; but notwithstanding this loss, practical experience has demonstrated that the gas producer accomplishes, with much less fuel, practical results equal to those obtained by direct firing and has made possible metallurgical operations impracticable by the latter method.

The advantages of gas firing over direct firing will be better understood by a brief discussion of the manner in which producer gas is generated.

As already stated, the products of the incomplete combustion of a fuel contain various combustible elements which are susceptible of being burned at a higher temperature than that of the original combustion, and producer gas is simply the product of an incomplete combustion or, more exactly, a distillation of a fuel in the generator.

The oxygen of the air admitted to the producer comes in contact with the incandescent carbon of the fuel and forms a certain amount of incombustible carbonic acid gas or carbon dioxide (CO_2). The heat evolved by this reaction is absorbed by the CO_2 thus formed and by the nitrogen of the air supplied. These gases ascend and yield their heat to the fuel above and bring it to the point of incandescence, so that the CO_2 first formed is brought in contact with this glowing carbon, and taking up an additional quantity of carbon is converted into the combustible carbon monoxide (CO). In a word, then, the primary object of the gas producer is to convert carbonaceous fuel into carbon monoxide gas.

If this gas is generated with dry air in contact with fuel free from impurities, it will still contain all the nitrogen of the air and will be composed approximately of carbon monoxide (CO), 34.7 per cent; nitrogen (N), 65.3 per cent by volume, and will possess a heating value of about 118 British thermal units per cubic foot.

In actual practice, however, it usually contains also a certain amount of carbon dioxide CO_2 and a little hydrogen (H), the H being derived from the fuel and the decomposition of the moisture in the air supply when it comes in contact with the glowing carbon.

When fuels such as soft coals are used, the products of distillation of the raw fuel in the upper zone of combustion, consisting chiefly of hydrogen and the hydrocarbons — marsh gas (CH_4) and olefiant gas (C_2H_4) will become mixed with the products of gasification in the zone below.

Air when passed over incandescent carbon maintain a given quality of gas with a minimum percentage of CO_2. Practically, however, the heat employed must not be so great as to destroy the producer, and the lower the exit temperature of the gases the better.

It is important to note that wet coals retard the development of high temperature in a gas producer, on account of the great heat expenditure required for the vaporization of such water; and also, that for like reasons, carbonized fuels work at a higher temperature than uncarbonized fuels.

A condition which affects favorably the percentage of combustibles in the gas is the presence of steam in the air supply. Blowing with air alone introduces a large amount of inert nitrogen which dilutes the gas and reduces its calorific value. On the other hand, the use of steam increases the percentage of combustibles by adding hydrogen and supplying in its dissociation a quantity of oxygen which is not diluted with nitrogen, thus increasing the calorific value of the gas, reducing its exit temperature and preventing clinkering.

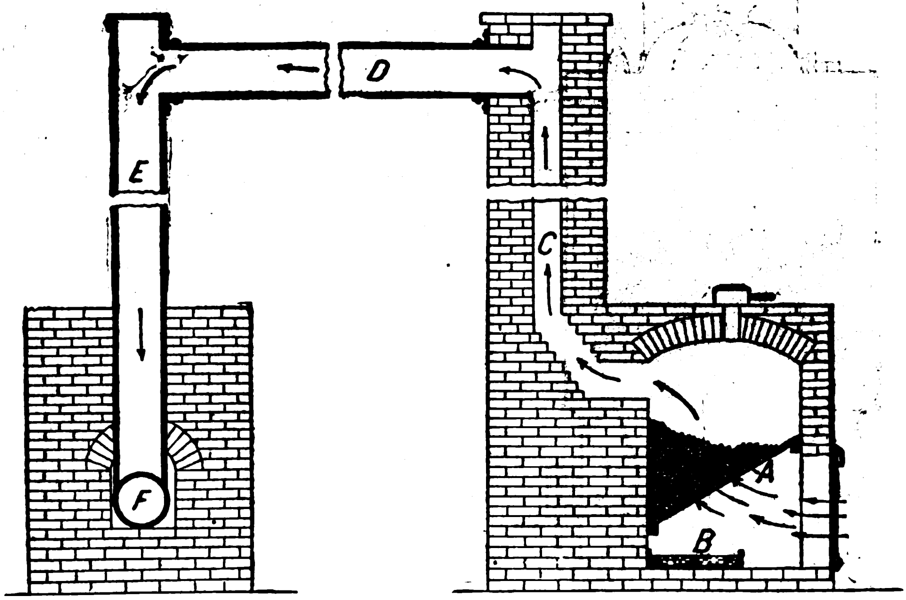

Fig. 1.—Sectional Diagram, Siemens Gas Producer.

(C) gives minimum CO_2 at a temperature of 2000 F., therefore, the temperature of the producer should be kept above this point. Furthermore, the formation of CO is greatly affected by the character of the fuel and the depth of the fuel bed, so that the greater the depth of the fuel bed and the more finely divided the fuel, provided it does not offer too much resistance to the passage of the air and gases, the greater will be the percentage of CO formed.

Other things being equal, the higher the temperature of the producer the greater will be the amount of fuel gasified per unit of time, but as this depends largely upon the air supply, an increased air supply signifies more rapid combustion, greater velocity of the gases through the fuel bed, briefer contact of the gases with the fuel, and, therefore, indicates that a greater depth of contact is required if it is desired to

The use of steam does not, however, result in the production of a greater amount of heat in the producer. The heat is simply transferred from the generator to the furnace by the higher potential heat value of H, instead of the less efficient, though greater sensible, heat in the gas itself. In practice it is found that not all of the water content of the air-blast is converted into hydrogen and oxygen. A small percentage slips through unchanged, and in the combustion chamber of the furnace absorbs heat in its dissociation, and, to that degree, reduces the temperature of the furnace. For this reason the amount of water supplied (as steam) must be carefully regulated according to the amount of moisture present in the fuel. When the fuel is dry and highly carbonized the equivalent of one pound of water may be injected with each 80 cubic feet of air at ordinary temperatures. If the air-blast and steam are preheated, say to 1000° F., one pound of water may be injected with each 40 cubic feet of air. With fuel of the composition of bituminous coal one pound of water is supplied with each 85 feet of air.

It is apparent, therefore, that the composition of producer gas is likely to be very variable, owing in the first place to the lack of uniformity in the fuel, and secondarily to the varying adjustments of the air and steam supplies and the degree of heat at which the gas is produced. An analysis of producer gas made from Illinois bituminous coal showed, in combustible constitutents: Carbon monoxide, 15.12 per cent; hydrogen, 9.98 per cent; methane (marsh gas),

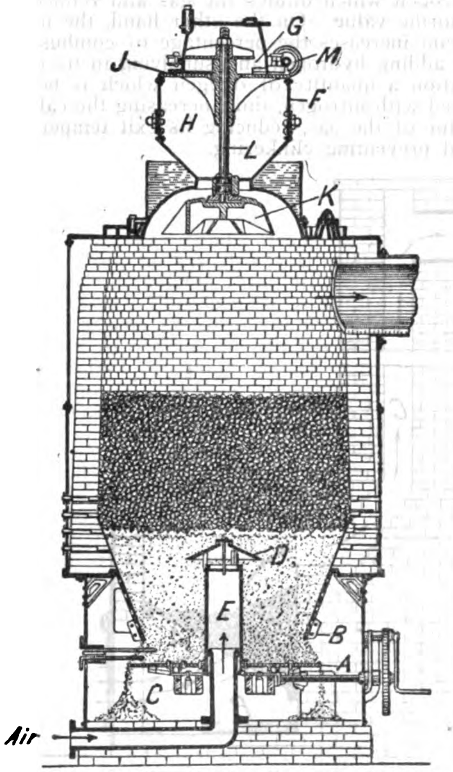

Fig. 2.—Vertical Cross-Section, Taylor Gas Producer.

6 per cent; and of incombustible constituents: nitrogen, 59.06 per cent; carbon dioxide, 9.72 per cent; and oxygen, 0.12 per cent. Where the gas is not used directly as it comes from the producer, but is cooled and the moisture content condensed, a larger quantity of water may be used during gasification, with the beneficial effect of reducing the nitrogen content to or slightly below 50 per cent, and replacing the 9 or 10 per cent thus eliminated with hydrogen. The percentage of carbon dioxide will be larger in the case of fuels with a low melting slag, as in such cases the temperature of the producer must be kept so low that not all of the dioxide is transformed into monoxide. A higher percentage of dioxide than 4 or at most 5 per cent is objectionable and indicates that the producer is not working properly, or that its fuel is not suitable for making profitable producer gas.

Types of Gas Producer.— Gas producers have been developed after two general types: (1) The Siemens gas producer, which operates without artificial blast and is typical of the older producers; and (2) the Taylor producer on the plan of the blast furnace, equipped with a rotative ash table and operating with a forced steam-blast, and representing the later developments in this line.

Fig. 1 shows a vertical section through a Siemens gas producer and regenerator furnace. It consists of two essential parts — the gas producer proper in which the raw fuel is converted into a combustible gas and the furnace with its regenerators or chambers for storing the waste heat of the flame, given up to the incoming air and gas. As the air is drawn into the producer through the firebars *A*, a certain quantity of the water contained in the trough *B* is vaporized by the heat of the fire above, and mixing with the air is drawn with it into the fire. The necessary indraught of air, and the pressure required to cause the gas generated in the producer to flow into the furnace, is obtained by means of the vertical uptake *C*, usually built of brick; the horizontal iron tube *D*, of relatively large diameter; and the vertical tube *E*, leading to the gas flue *F* of the furnace. By this arrangement, as the hot gas rises from the producer and passes through the tubes, it is considerably reduced in temperature, thus rendering its density much greater at the furnace end than at the producer, and thereby causing a suction and an indraught of air at the latter. This type is practically the one used in all plants making illuminating gas.

Fig. 2 shows a vertical cross-section of a Taylor producer charged with anthracite coal. The incandescent fuel is supported by the bed of ash put upon the rotative ash table *A*, before firing, and kept there constantly as an essential feature in the successful operation of the producer. The rotative ash table has a greater diameter than the bosh *B*, and is placed at such a distance below the latter that upon being revolved, the descending ash forms its own slope at an angle of about 55°, and is discharged uniformly by gravity over the periphery of the ash table into the sealed ash pit *C*.

When operated regularly, the line between the ash and the fuel is kept always about six inches above the cap *D* of the central air pipe *E*, thus allowing the fire to come in contact only with the brick lining, so that all the iron work is protected from the heat. The height of the fire line is maintained by grinding or revolving the ash table once every 6 or 24 hours, according to the rate at which the producer is worked.

The air blast is furnished, usually, by a steam jet blower, but a fan blower may be used if more convenient, and a pipe from some auxiliary source of steam run into the vertical air pipe to supply the steam required for softening. the clinkers and maintaining the proper temperature of the producer.

The producer as shown is equipped with a Bildt continuous automatic feed device *F*, consisting of a receiving hopper *G*, which surmounts the main storage magazine *H*, the communication between the two being regulated by a horizontal rotary register *J*, operated by a lever. The distributor plate *K* is suspended below the main magazine, and supported by a steel shaft *L*, which passes upward through the storage cylinder. Both the hood of the distributor plate and the inverted conical base of the magazine are water-cooled, the tendency of the cooling water and the location of the plate above the gaseous current tending to facilitate the discharge when using strongly caking coals. The receiving hopper is rotated by means of a worm wheel and worm-drive attached to the upper end of the shaft, and the distributor plate is rotated by means of the radical arms and hub of the receiving hopper, which are also keyed to the steel shaft. A hand-wheel nut upon the threaded end of the axis affords means for adjusting the distance between the distributor plate and the coal reservoir, and this adjustment, together with the variable speed secured by means of the stepped cone pulley *M*, permits of a ready control of the rate of coal discharge. Experience shows that the use of feeders equipped with distributing plates not only tends to reduce the amount of furnace wear, labor and repairs, but also results in a great reduction in the coal consumption.

of the producer gas into the cylinder of the engine, are effected by the suction or aspiration caused by the forward stroke of the piston.

Although the pressure system is composed, usually, of more cumbrous apparatus, and requires more space, it possesses greater elasticity than the suction system for meeting variations in the quality of fuel and greater capability for utilizing different kinds and cheaper grades of fuel. It is also the better for use with large power-producing units, or where several gas engines receive gas from the same producer plant.

On the other hand, for isolated plants of small capacity, or where only a single gas engine is used intermittently, the application of the suction system not only simplifies the bulk and reduces the cost of the plant, but what is more important, it makes the demand of the engine for gas the controlling factor of its generation from solid fuel.

Pressure Gas Producer System.— Fig. 3 shows the general arrangement of a pressure gas producer system. Usually it consists of a

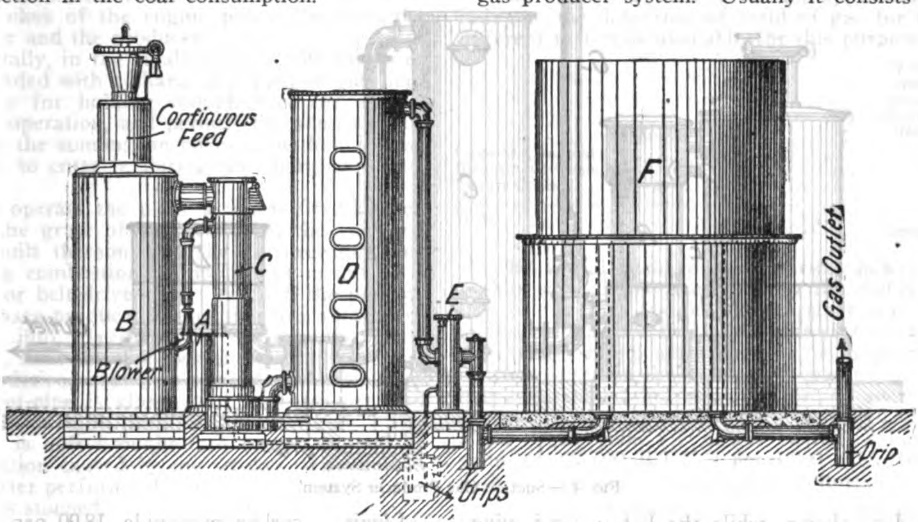

FIG. 3.—Pressure Gas Producer System.

The following table gives the average analyses by volume of the gas produced by the two types of producers:

CONSTITUENT	Siemens Gas	Taylor Gas
Carbon monoxide (CO)	23.7	27.0
Hydrogen (H)	8.0	12.0
Marsh gas (CH_4)	2.2	2.5
Carbonic acid (CO_2)	4.1	2.0
Nitrogen	62.0	56.5
	100.0	100.0

Gas Producer Systems.— Through the methods of operating gas producers of all types have sprung two general but well-defined systems of gas production for power purposes — the pressure system and the suction system.

In the pressure system, the air required for combustion and for the generation of the gas is supplied to the gas producer under pressure, and the gas generated is delivered under pressure to the engine using it.

In the suction system, both the passage of the air through the producer, and the introduction

small steam boiler *A*, for making steam, or producing the necessary air pressure; a gas producer *B*, with a continuous-feed arrangement; an economizer *C*, with superheater and washbox; a scrubber *D*; a purifier *E*; a gas holder *F*, consisting of a steel tank; and suitable drips and connections.

The details of the several organs may be modified to adapt them to varying conditions. For example, the boiler may be omitted where steam can be obtained from some other convenient source of supply, and in some cases a separate steam generator is not absolutely necessary.

For smaller equipments, or those employed for operating engines up to 500 horse power, single producers are generally considered sufficient, but the larger equipments require two or more producers, which may be varied in design and arrangement.

In the operation of a plant of this type, the gases generated in the producer enter the superheater and economizer. In the latter, the air blast of the producer travels in a direction opposite to that of the blower, and the gas passing through the wash-box deposits a large portion of its extraneous matter. The economizer also contains the seal arrangement against the gases stored in the holder and present in the other organs of the plant. From the wash-box the gas passes into the scrubber, the compartments of which are filled with coke. Here the gas is showered by water sprays, and still further purified by the removal of any tar, sulphur or ammonia that may be present prior to its introduction into the purifier where the final purifying operations are performed. From the purifier the gas passes into the holder, which stores a supply sufficient to start and run the plant for several minutes, but the main function of the holder is to regulate the pressure, and care for variations in the consumption and mixture of the gases.

The drip pots and drainage pipes are very essential parts of the plant and are suitably placed as shown, while the hot water issuing from the top of the producer is carried by suitable pipes to the holder.

In the pressure systems all of the following named or similar materials may be used for fuel: Anthracite and bituminous coals, lignites, coke, charcoal, wood, peat and tanbark. Good anthracite coal is the best when convenience of operation is the primary consideration. When bituminous coals are used, preference should be given to those of the semi-bituminous class. According to general experience, soft-coal plants appear to be more expensive than those operated with hard coal, and when the price of anthracite does not exceed that of soft coal more than $1 per ton, it is advisable to employ a hard-coal plant. When coke is used it should be in small pieces of about one cubic inch; as the tendency of large-size coke is to give a weak gas. When coke is used instead of anthracite, one-third more, by weight, of the former should be taken as the fuel consumption.

A variation of the pressure producer is the down-draught apparatus, used for lignite and similar low-grade fuels. The tarry gases are driven down through the incandescent fuel, and the tar is thus split up into its gaseous constituents. The gas outlet for producers of this type is near the grate. Another device to accomplish the same result conducts the tarry gases from the top of the producer by an outside pipe downward to the base of the producer whence they pass again through the fire. A still more successful type has two fire zones, one at the top of the fuel mass and the other at the bottom, the gas outlet being between the two. Doubling the producer is also effective, one of the two being fired with anthracite, and the gases from the low-grade fuel in the other being passed through its fire.

The constitution of producer gases from various fuels as made in a pressure plant is as follows:

Coke — carbon monoxide, 27.6 per cent; hydrogen, 7 per cent; methane, 2 per cent; carbon dioxide, 4.2 per cent; nitrogen, 58.6 per cent.
