Embarcadero Technologies, Inc. is a leading provider of award-winning tools for application developers and database professionals so they can design systems right, build them faster and run them better, regardless of their platform or programming language. Ninety of the Fortune 100 and an active community of more than three million users worldwide rely on Embarcadero products to increase productivity, reduce costs, simplify change management and compliance, and accelerate innovation. Founded in 1993, Embarcadero is headquartered in San Francisco, with offices located around the world. To learn more, please visit http://www.embarcadero.com.

# INTRODUCING DB CHANGE MANAGER

Embarcadero<sup>®</sup> DB Change Manager<sup>™</sup> helps database administrators and developers to:

- Simplify and automate database change management.
- Streamline development cycles.
- Ensure availability, performance, and compliance.

DB Change Manager provides comparison, synchronization, data masking, and auditing capabilities that let you track and report on changes, roll out new releases, and pinpoint problems resulting from changes at the data, schema, and database configuration levels.

By comparing a live database to a schema or configuration "snapshot", administrators can quickly identify changes and correct problems. By monitoring configuration settings, administrators can ensure compliance with regulatory policies and performance standards and maintain overall database performance and availability.

- Key Features of DB Change Manager
- <u>Technical Requirements</u>
- <u>Database Support</u>
- Installing and Upgrading DB Change Manager
- Key Concepts of DB Change Manager
- <u>Additional Product Information</u>

# Key Features of DB Change Manager

DB Change Manager provides features to help you manage databases from development to deployment and maintenance cycles. These features include:

- Data Comparison and Synchronization
- Schema Comparison and Synchronization
- Database Configuration Management
- <u>Reports, Notifications, and Change History</u>
- Data Masking
- Source Control System Integration

For video overviews, see the <u>DB Change Manager product demos</u>.

# DATA COMPARISON AND SYNCHRONIZATION

DB Change Manager can **analyze and compare** the data in two different data sources. It generates a SQL script that can **update one data source so that it matches** another. You can modify the SQL and run it as you wish. You can even define a comparison and synchronization process, called a **job**, and set it to run automatically. These features help you better manage common scenarios, such as:

- Keeping primary and backup data in sync
- Keeping up with data changes during the development and testing cycles, and later on to deployment environments
- Managing data migrations during upgrade activities

### SCHEMA COMPARISON AND SYNCHRONIZATION

DB Change Manager can **capture and compare** the database schema in your enterprise. Over the lifecycle of a single schema, you can capture a baseline or **archive schema** and analyze changes through time. In addition, DB Change Manager generates a SQL script that can **update a target schema** so that it matches a standard. You can modify the SQL and execute it as needed.

For more information, see the video demos <u>Schema Compare with Auto-Synchronization</u> and <u>Cross-DBMS Schema Compare</u>.

# DATABASE CONFIGURATION MANAGEMENT

In addition to schema, there are configuration settings that can vary across an enterprise. DB Change Manager can **capture the configuration settings** of a data source. You can capture a baseline or **archive configuration** and analyze changes through time. You can create a **configuration standard** that defines the norms for your enterprise and against which you can compare your databases.

For more information, see the video demo Monitoring for Change.

# REPORTS, NOTIFICATIONS, AND CHANGE HISTORY

DB Change Manager supports your data management activities with **notifications** when processes execute, **reports** that capture key information, and **change history** tracking.

For more information, see the video demo Monitoring for Change.

# DATA MASKING

There are specific scenarios when you need to hide the true values of the data in a database. For example, during development you need to protect personal or proprietary data, yet you still need to work with data that accurately represents the source. By combining data synchronization with data masking features, such as **randomization** or **shuffling**, you can duplicate source data and use the masked copies in non-production or non-secure environments.

For more information, see the video demo Data Masking.

## SOURCE CONTROL SYSTEM INTEGRATION

You can integrate DB Change Manager with source control systems such as Concurrent Versions System (CVS), Visual Source Safe (VSS), or Eclipse plugins. The **Navigator** in DB Change Manager is the interface for accessing files under source control. Job files and archive versions are stored as XML files and synchronization scripts are stored as text files. You perform all source code control actions using the source control system.

For more information, see the video demo <u>Developer Versioning Database and Code</u>.

# TECHNICAL REQUIREMENTS

Before installing DB Change Manager, verify that your environment meets the following requirements:

- Pentium 4 Level processor
- 1 GB of RAM
- 1 GB of hard disk space (more space is recommended for large data source comparisons)
- High resolution monitor (1024 x 768), 16-bit display (or greater)
- Operating systems:
  - Microsoft Windows 8, Microsoft Windows 7 (x86-32, Win32), Microsoft Windows 2008 (x86-32, Win32), Microsoft Windows XP (x86-32, Win32), Vista (x86-32, Win32), or Microsoft Windows Server 2003)

- If you choose to install the Eclipse plugin version, you need:
  - Eclipse version 3.6 or newer
  - Sun Java Standard Edition 6 Update 45 or newer

**NOTE:** Red Hat Enterprise Linux 5.0 (x86-32), GTK 2 and SuSe Linux Enterprise Server (x86) GTK+ 2.x are not supported in the 6.0/XE2 release.

# DATABASE SUPPORT

DB Change Manager supports the following database platforms:

- IBM DB2 LUW 8.0 9.5
- Oracle 9i 12c
- Microsoft SQL Server 2000, 2005, 2008, and 2012
- Sybase ASE 12.5 15, 15.0.1, 15.0.2, 15.0.3, 15.5, and 15.7
- Firebird 1.5, 2.0
- InterBase 2007, 2009, and XE

DB Change Manager supports data sources that use the Unicode format.

# INSTALLING AND UPGRADING DB CHANGE MANAGER

To install DB Change Manager, see Installing DB Change Manager.

When needed, DB Change Manager provides an upgrade process for moving jobs and other information from an existing DB Change Manager installation to the new version. For information about upgrading, see the *Read Me* file at the <u>DB Change Manager documentation</u> <u>site</u>.

# KEY CONCEPTS OF DB CHANGE MANAGER

To use DB Change Manager most effectively, first learn about how it represents and stores reusable processes that help you manage your data, and the features of its user interface.

- Understanding Jobs and Scripts in DB Change Manager
- <u>Understanding the DB Change Manager User Interface</u>

# UNDERSTANDING JOBS AND SCRIPTS IN DB CHANGE MANAGER

DB Change Manager uses the concept of a job to organize reusable processes. A job uses objects of the following types:

- Data source: A data source is a data repository or database.
- **Configuration standard**: A standard is a customized set of properties with threshold operators that help you create optimal configurations against which you can compare other data source configurations.

• Schema or configuration archive: An archive is a snapshot of a configuration or schema. You can use this archive to compare against other schemas or configurations.

There are two types of jobs in DB Change Manager:

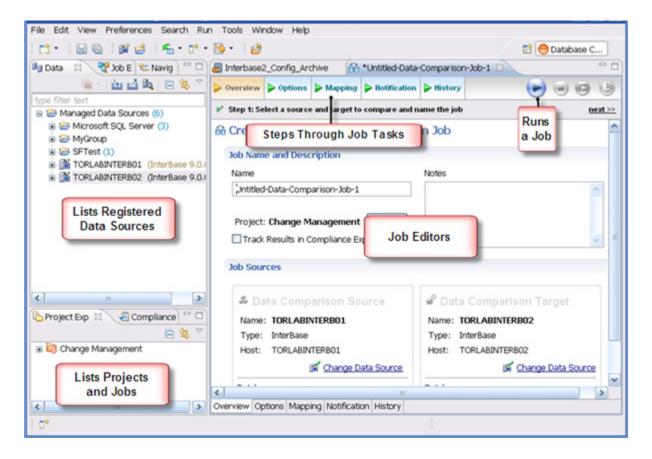

- **Object creation jobs**: Some jobs create objects that are used in other jobs. You use a job to create configuration standards and archives.
- **Comparison jobs**: A comparison job processes **source** and **target** objects and provides information describing their similarities and differences. This comparison is then used to generate SQL scripts. A comparison job can be of the following types:
  - **Data comparison**: A data comparison job looks at the data repositories of two data sources and determines their differences. You can use this information to determine whether to update a target data source.
  - **Data masking**: A data masking job is a special kind of data comparison job that creates a copy of sensitive data, which masks the true values of specified fields.
  - **Configuration comparison**: A configuration comparison job determines whether the configuration settings between a source and a target are the same. This information helps you quickly diagnose problems.
  - Schema comparison: A schema comparison job lets you compare the schemas of different data sources or archives. It helps you manage schema changes through development, testing, and production cycles.

Once it has run a comparison job, DB Change Manager can generate an **SQL synchronization script** that can update target data, configurations, or schemas. You can modify a script before you run it. For example, you can use a DB Change Manager script to synchronize data between development and testing environments. Once you are comfortable with the job's specifications, you can let it automatically run the script and synchronize the data.

You can group jobs and scripts into projects, which are visible in the **Project** explorer and in the **Navigator** view. The **Navigator** view provides a way to interact with files in a source control system.

# UNDERSTANDING THE DB CHANGE MANAGER USER INTERFACE

The **Workbench** is the DB Change Manager development environment. It provides you with an interface to create, manage, and navigate comparison jobs through interaction with views, editors, and menus. If you are familiar with Eclipse you will recognize many elements of the interface.

The **Welcome Page** is the first screen you see when you initially launch the application. The screen provides links to information that may be of value to new users.

**Views** help you navigate a hierarchy of information, open editors, or display the properties of various application elements. For example, the **Data Source Explorer** view provides a tree of all data sources in the environment and the comparison jobs associated with each. You can launch these jobs directly, modify the connection properties of data sources, or create and edit configuration archives from the view.

**Editors** help you perform various tasks, such as running a job. For example, you use the **Schema Comparison Job** editor to define and execute schema comparison jobs.

The **Menu Bar** and **Command Toolbar** options provide various functions, such as launching views and editors, navigating, and setting preferences.

# Additional Product Information

Embarcadero Technologies web sites are an excellent source for additional product information, including white papers, articles, FAQs, discussion groups. Visit these sites:

- <u>The product page</u>
- The Embarcadero Technologies Documentation site
- <u>The online demos</u>

# INSTALLING AND LICENSING DB Change Manager

This section includes:

- Technical Requirements
- Installing DB Change Manager
- Licensing DB Change Manager
  - Registering a Trial or Workstation License at Application Startup
  - <u>Registering a Workstation License after Application Startup</u>
  - <u>Registering by Phone</u>

# TECHNICAL REQUIREMENTS

Before installing DB Change Manager, verify that your environment meets the requirements listed at <u>Technical Requirements</u>.

# INSTALLING DB CHANGE MANAGER

To install DB Change Manager on a workstation, run the installer and follow the prompts provided by the Installation Wizard. When the installation is complete, see the ReadMe file for known issues or advisory notes that could affect your use of the product.

# INSTALLING DB CHANGE MANAGER IN A TOOLBOX ENVIRONMENT

If you are a DB Change Manager user and your System Administrator provides you with Embarcadero ToolBox, then your System Administrator enables DB Change Manager in your ToolBox. Consult your System Administrator and <u>ToolBox User Guide</u> for details.

# INSTALLING DB CHANGE MANAGER IN AN APPWAVE ENVIRONMENT

If you are a DB Change Manager user and your System Administrator provides you with Embarcadero AppWave, then your System Administrator enables DB Change Manager in your AppWave Browser. Consult your System Administrator and the AppWave Browser online help for details.

# LICENSING DB CHANGE MANAGER

DB Change Manager supports the following types of licenses:

- **Trial licenses**: A license for a time-limited, full-featured trial version of the product. You must register the trial license before you can use the product. For more information, see <u>Registering a Trial or Workstation License at Application Startup</u>.
- Workstation licenses: A license or set of licenses that is tied to a particular workstation. The product can only be used on that workstation. For more information, see <u>Registering a</u> <u>Workstation License after Application Startup</u>.
- **ToolCloud or AppWave licenses**: ToolCloud or AppWave licenses are normally concurrent licenses managed by your System Administrator. See your System Administrator for details.

If you have problems registering, see <u>Registering by Phone</u>.

# Registering a Trial or Workstation License at Application Startup

Shortly after downloading a trial version of an Embarcadero product, you should receive an email from Embarcadero Technologies containing a serial number, which must be registered. These instructions also apply if you have purchased a product and received a serial number prior to running the application for the first time, or if the trial period has expired.

#### To register a serial number at application startup

1 Start the application.

The Embarcadero License Registration dialog appears.

- 2 Copy the serial number from the email, and then paste it into the **Serial Number** field.
- 3 Enter your Embarcadero Developer Network (EDN) account credentials in the Login or Email and Password fields.

If you have not previously created an EDN account, or have forgotten your password, click **I need to create** ... or **I've lost my password**.

4 Click Register.

The activation file should automatically download and install. If this does not happen, click the **Trouble Connecting? Try Web Registration** link and follow the prompts. If you still have problems, see <u>Registering by Phone</u>.

# REGISTERING A WORKSTATION LICENSE AFTER APPLICATION STARTUP

The following instructions assume that you have received a workstation license by email and that you currently have a valid trial license. If you did not install a trial version or if the trial period has expired, follow the instructions in <u>Registering a Trial or Workstation License at Application</u>. <u>Startup</u> instead.

#### To register a serial number after application startup

- 1 Click Help > Launch License Manager.
- 2 In the License Manager dialog, click Serial > Add.
- 3 Copy the serial number from the email and paste it into the **Add Serial Number** dialog.
- 4 Click OK.
- 5 Expand **Unregistered Serial Numbers**, right-click the serial number just added, and then click **Register**.

A registration dialog appears.

- **NOTE:** The **Registration Code** box shows a machine-specific identifier required with other registration methods.
- 6 Ensure that **Register using Online Registration** is selected.
- 7 Provide Developer Network credentials in the Login name or Email and Password fields.
- 8 Click Register.

The activation file should download and install automatically. If this does not happen, click the **Trouble Connecting? Try Web Registration** link and follow the prompts. If you still have problems, see <u>Registering by Phone</u>.

### **REGISTERING BY PHONE**

If you have problems with either of the above procedures, you can register licenses by phone. You must provide the following information:

- Developer Network credentials
- The registration code displayed in the **Embarcadero License Registration** dialog that appears when you start an unlicensed application
- The product base license serial number
- The license serial numbers for any additional features you have purchased

For North America, Latin America, and Asia Pacific: call (415) 834-3131 option 2, and then follow the prompts. The hours are Monday to Friday, 6:00 A.M. to 6:00 P.M. Pacific time.

For Europe, Africa, and the Middle East: Call +44 (0)1628-684 494. The hours are Monday to Friday, 9 A.M. to 5:30 P.M. U.K. time.

After phoning in, you will receive an email containing an activation file to import into DB Change Manager.

#### To import an activation file

- 1 Save the activation file from the email to the desktop or to a scratch directory such as c:\temp.
- 2 From within the application, click **Help > Embarcadero Licensing > License Registration**.
- 3 Click License > Import.
- 4 Navigate to the directory where you saved the activation file and then double-click the activation file.
- 5 Click the **Import** button to import the activation file.
- 6 Click **Finish**.

# DB CHANGE MANAGER QUICK START TUTORIALS

This document guides you through the key features of DB Change Manager using these stepby-step tutorials:

- Tutorial 1: Comparing Data
- Tutorial 2: Synchronizing Data
- Tutorial 3: Comparing Configurations
- Tutorial 4: Defining a Configuration Standard
- Tutorial 5: Comparing and Synchronizing Schemas
- Tutorial 6: Defining a Schema Archive
- Tutorial 7: Masking Data
- Tutorial 8: Defining and Running Automated Scripts

Before you begin, identify two data sources that you can use in the tutorials. These data sources should not be live or mission-critical, and they should be similar in schema and data.

# **TUTORIAL 1: COMPARING DATA**

Data comparison jobs automate the process of comparing and correcting data between data sources at the database, table, and row level. You select a source and a target data source from **Data Source Explorer**, map databases and tables between the two selections, and then run the comparison job.

DB Change Manager compares the information and returns a results screen with details including:

- An overall percentage of the data that is the same between the source and target
- Discrepancies between the two databases, such as data values that exist on only one

Once a data comparison job has run, you can then correct any synchronization issues by running an automatically-generated SQL script that adds missing rows and updates out-of-sync values. You can modify the SQL script prior to running it, and store it for future use.

#### To start Change Manager

• Start Change Manager using the **Start** menu's **Embarcadero DB Change Manager** *version* item.

When DB Change Manager first starts, it displays a Welcome screen. Look over the Welcome screen options and then close it.

## ADDING DATA SOURCES

In order to define and run jobs, you first register data sources by providing connection information and other details to DB Change Manager. Once a data source has been registered, it remains stored in a catalog and does not need to be reregistered each time you open DB Change Manager. You can use a single registered data source in multiple jobs.

Data Source Explorer shows the registered data sources and their associated jobs, if any.

Before registering a data source, gather the information about the repository location and connectivity permissions.

#### To add a data source

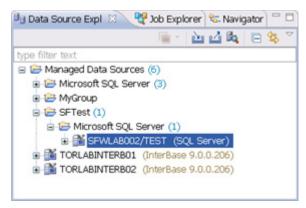

1 Click the **Discover Data Sources** icon at the top of the **Data Source Explorer** view.

2 In the **Discover Data Sources** wizard, select the locations to search for data sources and click **Next**.

Discover Data Sources	_ 🗆 🔀
Discover Data Sources Select the locations to search for data sources.	
Previously registered Embarcadero data sources (Re File system and network Eclipse Data Tools Platform (DTP) Workspace	gistry)
O File system:	Browse
Quest Software (TOAD) Workspace	
O File system:	Browse
< Back Next > Finish	Cancel

3 Select the data sources you want to add to the DB Change Manager environment and click **Finish**.

The new data source or sources appear in the **Data Source Explorer**.

TIP: An alternative to using the **Discover Data Sources** wizard is to click **File > New Data Source** and set its connection properties. 4 In the **Data Source Explorer**, right-click on a data source and select **Properties** to work with connection properties for the datasource.

# CREATING A DATA COMPARISON JOB

Prior to performing the following steps, make sure you have at least two data sources registered in DB Change Manager. Ideally these two data sources are similar in schema and content, so that the comparison is meaningful to you.

#### To create a data comparison job in the Overview tab

- 1 Click File > New > Data Comparison Job.
- 2 Use the **Select a Project** dialog's **Create New** button to open a dialog that lets you provide a name and location for a project for this exercise. Select the new project from the **Select a Project** dialog.

🔒 Untitled-Data-Cor	mparison-Job-1 🗙				- 0

Host:			Host:		
	Select	Datasource		Select Datasou	rce
		<b>~</b>			
		1			
Overview Options I	Mapping Notificati	on History			

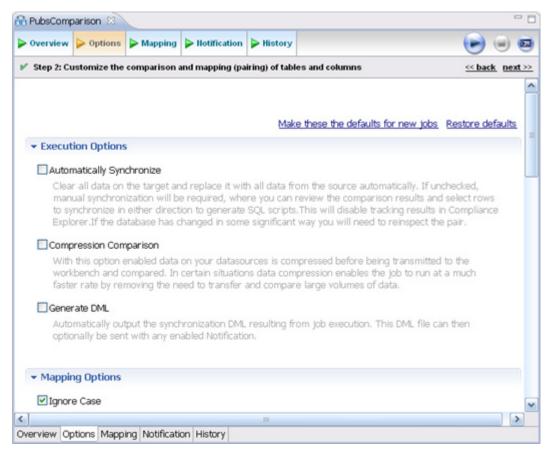

- 3 In the **Overview** tab of the **Data Comparison Job** editor, type the name of the job in the **Name** field.
- 4 Click and drag a data source from **Data Source Explorer** to the **Data Comparison Source** box.

By default, all databases in the data source are selected. If you prefer, use the menu to specify a single database.

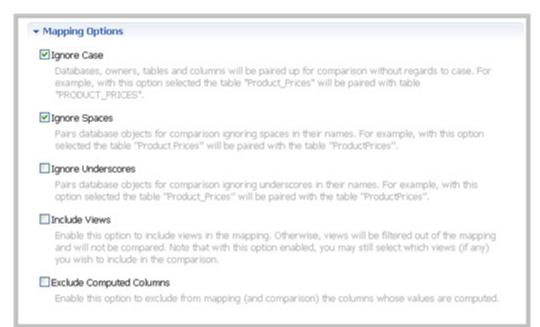

- 5 Click and drag a data source from **Data Source Explorer** to the **Data Comparison Target** box.
- 6 Click **File > Save** or type **Ctrl-S** to save the job.

#### To customize the job in the Options tab

1 Click the **Options** tab.

2 In the **Options** tab, review the various settings available to you. In particular, select or deselect the check boxes in the **Mapping Options** section.

#### To refine comparisons in the Mapping tab

- 1 Click the **Mapping** tab.
- 2 Select the databases you want to compare; usually they have the same or a similar name.

Step 3: Pair databases, schemas, owners, tables, and columns between the source and target       <       <
msdb     msdb       Northwind     Northwind       pubs     pubs       SalesDB     [Uhmapped]       tempdb     tempdb       şşşşäää     [Uhmapped]       Refresh Databases       Remap to Defaults

TIP: Use the **All** and **None** commands at the bottom of the pane to select all or none of the databases.

3 By default DB Change Manager does not show the table mappings. To see them, select the **Inspect: Checked** option on the right side of the **Database Mapping** pane. The progress bar displays in the lower right corner. The **Table Mapping** pane shows how and whether the tables map to each other in the two databases.

3 In the **Database Results** tab, review the detailed results for the tables and rows of the selected databases.

# **TUTORIAL 2: SYNCHRONIZING DATA**

#### To generate and run an SQL synchronization script

- 1 At the bottom of the **Database Results** tab of a database comparison job, click one of the radio buttons, for example, **Mismatched**, to specify the type of resolution to perform.
- 2 At the lower right, click Generate an SQL Script.

- 3 In the **SQL Editor**, click the **Execute SQL** icon, the green arrow, to synchronize the data.
  - **NOTE:** Executing an SQL script may change the data in your data sources. Be sure to review all potential changes, and read the script, before running the script.
- 4 If you want to create a report, select the **Database Results** tab and click **View Diff Report**.

# HIGHLIGHTED FEATURE: THE COMPRESSION COMPARISON OPTION

Comparing large repositories with many databases, tables, and rows can be a time consuming and tedious process, especially when you require row-level accuracy.

The **Compression Comparison** option enables an algorithm that causes the data comparison to initially execute at a table level instead of the row level. Each table in a pair is assigned a value and if the values match the comparison process moves to the next pair of tables. If the values do not match, the process performs a more detailed comparison at the row level. This allows for a faster comparison process in general, without losing any accuracy during the process.

#### Compression Comparison

With this option enabled data on your datasources is compressed before being transmitted to the workbench and compared. In certain situations data compression enables the job to run at a much faster rate by removing the need to transfer and compare large volumes of data.

To enable this feature, navigate to the **Options** tab **Execution Options** section and select **Compression Comparison**.

# **TUTORIAL 3: COMPARING CONFIGURATIONS**

Configuration comparison jobs examine the configuration settings of two specified data sources and describe the differences between them. You select a pair of data sources from **Data Source Explorer**, refine the property comparisons, run the job, and view the results. Based on the results you can correct any issues between the pair.

You can also compare a data source against a configuration archive or standard. Archives are a snapshot of the configuration settings of a data source at a point in time. Standards are customized sets of properties with threshold operators that help you create optimal configurations, against which you can compare existing data source settings.

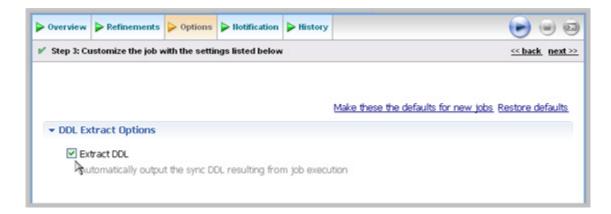

#### To define and run a configuration comparison job

- 1 Select File > New > Configuration Comparison Job. If prompted to select a project, select the project you created earlier.
- 2 Type the name of the job in the **Name** field.
- 3 Drag and drop a data source from **Data Source Explorer** to the **Configuration Comparison Source** box.
- 4 Drag and drop a data source from **Data Source Explorer** to the **Configuration Comparison Target** box.

5 Click the **Refinements** tab.

Overview	Refinements > Opt	tions 🕨 Notification	History	ی ای (ج)

	Core SQL Properties			
•				

- 6 Keep the defaults in the **Refinements** tab. Click the **Options** tab.
- 7 In the **Options** tab, select the **Extract DDL** check box.

8 Click the **Run Job** icon.

9 In the **Comparison Results** tab, the job progress bar displays and the results appear. Review the job results.

In the **Comparison Results** tab, you can generate an SQL script to synchronize the configurations just as in <u>Tutorial 2: Synchronizing Data</u>.

# HIGHLIGHTED FEATURE: COMPARING MULTIPLE TARGETS

You can compare multiple target sources against a single source. In the **Configuration Comparison Target** box of the **Overview** tab, click the **Add More Targets** option.

The box changes to a column list view, where you can drag and drop additional sources from **Data Source Explorer** to the **Configuration Comparison Target** box.

# **TUTORIAL 4: DEFINING A CONFIGURATION STANDARD**

A configuration standard is composed of properties and values that you define:

- Configuration properties (static or dynamically updated based on the source values)
- Values that include threshold comparison operators (greater than, less than, falls within or is a member of a specified set, etc.)

You can use a standard in configuration comparison jobs against data sources and archives in order to determine if the target conforms to the standard. A standard can only be used as a source in comparison jobs.

#### To define a configuration standard

- 1 Select File > New > Configuration Standard.
- 2 If prompted, select a project to use.
- 3 In the **Overview** tab, enter the name of the standard in the **Name** field.
- 4 Drag and drop a data source from **Data Source Explorer** to the **Standard Sources** table.

	son-Job-1 🎯 *TestingConfigCom	pare1 🖸 *ConfigStandard1 🛛	-
Overview Refinemen	a		
Create or Modify	a Configuration Standard		
Standard Name and De	escription		
Name		Notes	
ConfigStandard1			
Project: ConfigCompa	re1	Details	
Standard Sources			
Jrag and drop from	Version	source. TORLABSQL00_3	
of Drag and drop from		TORLABSQL00_3	
Jrag and drop from	Version		
Jrag and drop from	Version	TORLABSQL00_3 Hostname: TORLABSQL00_3	
Jrag and drop from	Version	TORLABSQL00_3 Hostname: TORLABSQL00_3	>

- 5 In the **Refinement** tab, define each listed property using the **Source**, **Operator**, and **Value** controls.
- 6 Select File > Save to save the standard. It appears in the **Project Explorer**.

You can subsequently drag and drop the new standard from **Project Explorer** to the **Comparison Source** box in the **Configuration Comparison Job** editor. You can then run a job using the standard as you would use a registered data source.

# TUTORIAL 5: COMPARING AND SYNCHRONIZING SCHEMAS

Once you create a baseline archive of your schema, you can compare it against the other schemas, even in live environments. Also, you can synchronize the schema of a data source with the archive using the **Schema Comparison Job** editor.

#### To define a schema comparison job

- 1 Select File > New > Schema Comparison Job and if prompted, select a project.
- 2 In the **Schema Comparison Job** editor, type the name of the job in the **Name** field.
- 3 Drag and drop a data source from **Data Source Explorer** to the **Schema Comparison Source** box.
- 4 Drag and drop a data source from **Data Source Explorer** to the **Schema Comparison Target** box.
- 5 Click the **Mapping** tab.
- 6 In the **Mapping** tab, review the object mappings that are already set up for you. Change the target mappings as needed.
- 7 In the **Options** tab, select or de-select the configuration properties.
- 8 Click the **Run Job** icon.
- 9 In the **Comparison Results** tab, the job progress bar displays and the results appear. Review the job results.

#### To generate and run a schema synchronization script

- 1 In the **Comparison Results** tab, click **Generate Sync Script** in the **Resolution** column of the **Comparison Results** table. DB Change Manager generates a synchronization script in the **SQL Editor**.
- 2 Modify the script as needed, and save it using the **File > Save** command.
- 3 In the **SQL Editor**, select the **Execute SQL** icon to synchronize the data.
  - **NOTE:** Executing the SQL script changes the schema in your target data source. Be sure to review all potential changes and read the script before running it.
- 4 If you want to create a report, click **Generate Report**. The **Export** dialog opens and provides additional report options.

# **TUTORIAL 6: DEFINING A SCHEMA ARCHIVE**

A schema archive contains a snapshot of the schema of a registered data source. You compare schema archives against other data sources and archives to identify possible inconsistencies.

A schema archive is generated from a single data source at a specific point in time. Like a configuration archive, a schema archive has versioning functionality and can be periodically updated with the current values of the data source. Older versions are retained and can be recalled as needed.

You create a schema archive using the **Schema Archive Job** editor. Once created and saved, it is listed in the **Data Source Explorer**.

#### To define a schema archive

- 1 Right-click on a data source in **Data Source Explorer** and select **Archive > Schema Archive Job**. Select a project, if prompted.
- 2 In the **Archive Job** editor, enter the name of the archive in the **Name** field.
- 3 In the **Refinements** tab, narrow the job down by selecting owners, object types, and specific objects to include.
- 4 Click the **Run Job** icon.
- 5 In the **New Unsaved Version** tab, the results appear. Review the job results.
- 6 Click **File > Save**. The **Unsaved Version** tab changes to **Version 1**, and **Version 1** appears in the Datasource Explorer tab under the datasource you chose.
  - **TIP:** You can create more versions by clicking the **Run Job** icon again.

You can subsequently drag and drop the new archive version from **Data Source Explorer** to the **Source** or **Target** boxes in the **Schema Comparison Job** editor. You can now run a job using the archive just as you would use a data source.

# **TUTORIAL 7: MASKING DATA**

Data masking is a way of securing sensitive data during the development or testing phases of a database development project. It is often performed as a security or compliance measure that protects important information. By masking valid production data, you can provide a copy of the data that is "scrambled" but still represents your production environment.

- 1 Select File > New > Data Comparison Job and if prompted, select a project.
- 2 Provide a name of the job in the Name field and then drag and drop datasources from the Data Source Explorer to the Data Comparison Source and Data Comparison Target boxes.
- 3 In the **Options** tab, ensure that **Automatically Synchronize** is selected and read the description shown for that option.
- 4 In the **Mapping** tab, select a row corresponding to a matching database pair in the **Database Mapping** box and then, in the **Table Mapping** box, select **Yes, retrieve the objects in this pair**.

c		>	[no filter]
			Filter: edit
			Columns: No Masking
			Apply to All
☑	🔲 dbo.Supplier	🔟 dbo.Supplier	Use Default
☑	dbo.Ref_Address_Type	dbo.Ref_Addres	
☑	dbo.Product	dbo.Product	Default Masking Rule:
☑	dbo.Customer_Order_Product	dbo.Customer_(	View Column Mapping
☑	dbo.Customer_Order	dbo.Customer_(	
☑	dbo.Customer_Address	dbo.Customer_/	Columns: 7/7 to 7/7
☑	dbo.Customer	dbo.Customer	Target: ubb.Mudiess
☑	dbo.Category	dbo.Category	Target: dbo.Address
	 dbo.Address	dbo.Address	Source: dbo.Address
	TORLABSQL05_1.FranklynA	TORLABSQL05_2.F	

1 In the **Table Mapping** box, click **View Column Mapping**.

Түре	Column	Maskin	ng Rule	Column			Түре
int	Address ID	None	*	Address	ID [	~	int
nt	Address Typ	oe ID None	*	Address	Type[	~	int
arch	ar Street 1	Rando	mize 💌	Street 1		*	varchar
varch	ar Street 2	Use De	efault 🛛 💌	Street 2	[	~	varchar
arch	ar City	Use De	efault 🛛 💌	City	[	~	varchar
thar	State	Use De	efault 🛛 💌	State	[	~	char
:har	Zip	Use De	efault 🔽	Zip	[	¥	char

- 2 Click on the data **Masking Rule** option for a column and select one of the following:
- Use Default: The default masking rule as set in the Database Mapping box.
- **None**: No masking is applied.
- Randomize: Replaces characters with other random characters.
- **Shuffle**: Reorders the values in different rows; for example, in a **First Name** column Bob, Ted, and Alice can change to Alice, Bob, and Ted.

Close the window.

- 3 Continue to experiment with selection and settings until you are comfortable with masking options.
- 4 Click **File > Save** to save the job.
- 5 Click the **Run Job** icon.

Terti	iew > Option	s Mapping	Notification	History	Results	> Datab	oase Res	ults	•	) 🔳

The **Database Results** tab shows the masked data.

# TUTORIAL 8: DEFINING AND RUNNING AUTOMATED SCRIPTS

When you need to repeatedly run the same job, you can set up automated tasks that execute the jobs on a regular schedule. DB Change Manager helps create a command line executable for any job. You can run the command line executable on an ad hoc basis. You can also group the commands into a batch file and run them.

#### To define command line syntax and generate batch files

- 1 Open the job for which you want to define an execution script.
- 2 Select the **Command Line Syntax** icon in the upper right of any tab.
- 3 In the **Script Generation Wizard**, add output report options.
- 4 Specify the **Directory** where the files are generated.

- 5 Click Next.
- 6 Specify the **Location** where the batch file is generated.
- 7 Specify the file format for the script.
- 8 Click Finish.
- 9 DB Change Manager generates the file and saves it to the location you specified.

If you want to add multiple jobs to the batch file, generate a batch file as normal, and then copy the script syntax to the clipboard for each job you want to add to the batch file. You can then add them to the existing batch file manually.

# Additional Documentation

For additional instructions and reference information about DB Change Manager, see the documentation at: <u>http://docs.embarcadero.com/products/change\_manager/.</u>
