© COPYRIGHT 2000–2008 by The MathWorks, Inc.

The software described in this document is furnished under a license agreement. The software may be used or copied only under the terms of the license agreement. No part of this manual may be photocopied or reproduced in any form without prior written consent from The MathWorks, Inc.

FEDERAL ACQUISITION: This provision applies to all acquisitions of the Program and Documentation by, for, or through the federal government of the United States. By accepting delivery of the Program or Documentation, the government hereby agrees that this software or documentation qualifies as commercial computer software or commercial computer software documentation as such terms are used or defined in FAR 12.212, DFARS Part 227.72, and DFARS 252.227-7014. Accordingly, the terms and conditions of this Agreement and only those rights specified in this Agreement, shall pertain to and govern the use, modification, reproduction, release, performance, display, and disclosure of the Program and Documentation by the federal government (or other entity acquiring for or through the federal government) and shall supersede any conflicting contractual terms or conditions. If this License fails to meet the government's needs or is inconsistent in any respect with federal procurement law, the government agrees to return the Program and Documentation, unused, to The MathWorks, Inc.

### Trademarks

MATLAB and Simulink are registered trademarks of The MathWorks, Inc. See [www.mathworks.com/trademarks](http://www.mathworks.com/trademarks) for a list of additional trademarks. Other product or brand names may be trademarks or registered trademarks of their respective holders.

### Patents

The MathWorks products are protected by one or more U.S. patents. Please see [www.mathworks.com/patents](http://www.mathworks.com/patents) for more information.

## Using Release Notes

Use release notes when upgrading to a newer version to learn about:

- New features
- Changes
- Potential impact on your existing files and practices

Review the release notes for other MathWorks™ products required for this product (for example, MATLAB® or Simulink®) for enhancements, bugs, and compatibility considerations that also might impact you.

If you are upgrading from a software version other than the most recent one, review the release notes for all interim versions, not just for the version you are installing. For example, when upgrading from V1.0 to V1.2, review the release notes for V1.1 and V1.2.

## What's in the Release Notes

### New Features and Changes

- New functionality
- Changes to existing functionality

## **Version Compatibility Considerations**

When a new feature or change introduces a reported incompatibility between versions, the **Compatibility Considerations** subsection explains the impact.

Compatibility issues reported after the product is released appear under Bug Reports at the MathWorks Web site. Bug fixes can sometimes result in incompatibilities, so you should also review the fixed bugs in Bug Reports for any compatibility impact.

## **Fixed Bugs and Known Problems**

The MathWorks offers a user-searchable Bug Reports database so you can view Bug Reports. The development team updates this database at release time and as more information becomes available. This includes provisions for any known workarounds or file replacements. Information is available for bugs existing in or fixed in Release 14SP2 or later. Information is not available for all bugs in earlier releases.

Access Bug Reports using your MathWorks Account.

## Version 4.2 (R2008b) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 4.2 (R2008b):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems  | Related Documentation at Web Site                                 |
|--------------------------|--------------------------------------|--------------------------------|---|
| Yes<br>Details below     | No                                   | Bug Reports<br>Includes fixes. | Printable Release Notes: PDF<br><br>Current product documentation |

New features and changes introduced in this version are

- “Pattern Generator” on page 4
- “EyeScope Compare Measurement Results View” on page 4
- “New Demos” on page 4

### Pattern Generator

Communications Toolbox software now includes Pattern Generator object. You can use this object to generate NRZ or RZ signals and inject jitter, which enables stress tests for high speed communications systems. For more information, refer to the `commsrc.pattern` help page.

### EyeScope Compare Measurement Results View

EyeScope now supports the ability to import multiple eye diagram objects. Additionally, EyeScope now contains a **View** menu, which you can use to compare measurement results from multiple eye diagram objects.

### New Demos

New demos and demos containing updates for this release:

- New Multipath Fading Channel Modeling demo.

- Updates to Eye Diagram Measurements demo include use of pattern generator, importing multiple eye diagram objects, and comparing measurement results.

## Version 4.1 (R2008a) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 4.1 (R2008a):

| <b>New Features and Changes</b> | <b>Version Compatibility Considerations</b> | <b>Fixed Bugs and Known Problems</b> | <b>Related Documentation at Web Site</b>                          |
|---------------------------------|---|--------------------------------------|---|
| Yes<br>Details below            | No  | Bug Reports<br>Includes fixes.       | Printable Release Notes: PDF<br><br>Current product documentation |

New features and changes introduced in this version are

- “Cyclic Redundancy Checking (CRC)” on page 6
- “Eye Diagram Measurements” on page 6
- “EyeScope Functionality” on page 7
- “New BCH and Reed Solomon Objects” on page 7
- “New Demos” on page 8

### **Cyclic Redundancy Checking (CRC)**

New CRC generator and detector objects have been added to the Communications Toolbox software.

### **Eye Diagram Measurements**

Communications Toolbox product now provides eye diagram measurements, generated from the histogram data of eye diagram objects. This feature will be helpful for signal integrity analysis, a major focus of backplane and optical communications development.

You can obtain the following measurements on an eye diagram:

- Eye Crossing Times

- Eye Crossing Amplitude
- Eye Delay
- Eye Level
- Eye Amplitude
- Eye Height
- Eye Width
- Vertical Eye Opening
- Eye Crossing Percentage
- Eye SNR
- Quality Factor
- Random Jitter
- Deterministic Jitter
- Total Jitter
- RMS Jitter
- Peak-to-Peak Jitter
- Horizontal Eye Opening
- Eye Rise Time
- Eye Fall Time

## **EyeScope Functionality**

EyeScope can be used to examine eye diagram results in a user-friendly, graphical environment. EyeScope shows both the eye diagram figure and measurement results in a unified GUI, providing a more efficient means for viewing results.

## **New BCH and Reed Solomon Objects**

Communications Toolbox software now contains BCH and Reed Solomon objects. These objects extend the capabilities of existing BCH and Reed Solomon functions by enabling punctures and erasure coding. Refer to the following reference pages for more information:

- `bchdec`
- `bchenc`
- `fec.rsdec`
- `fec.rsenc`

## **New Demos**

New demos have been added for spatial multiplexing and Eye Diagram Measurements.

- The spatial multiplexing demo illustrates how to perform spatial multiplexing using Successive Interference Cancellation (SIC) detection schemes.
- The Eye Diagram Measurements demo illustrates how to use the `commscope.eyediagram` object to perform eye diagram measurements on simulated signals.

## Version 4.0 (R2007b) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 4.0 (R2007b):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems  | Related Documentation at Web Site                                 |
|--------------------------|--------------------------------------|--------------------------------|---|
| Yes<br>Details below     | No                                   | Bug Reports<br>Includes fixes. | Printable Release Notes: PDF<br><br>Current product documentation |

New features and changes introduced in this version are

- “Bi-Gaussian Doppler and Asymmetrical Jakes Doppler Spectra Objects Added” on page 9
- “Channel Objects and Channel Visualization Tool Enhanced” on page 10
- “ricianchan Object Enhanced” on page 10
- “Demos Modeling Various Channels Added” on page 10
- “Eye Diagram Object Added” on page 10
- “Modem Objects Added” on page 10
- “Theoretical BERs Added to BERTool and Enhanced in bercoding” on page 10
- “New stdchan Object” on page 11
- “bchenc Enhanced” on page 11

### Bi-Gaussian Doppler and Asymmetrical Jakes Doppler Spectra Objects Added

The `doppler.bigaussian` function creates a bivariate Gaussian Doppler spectrum object, which is used in the `DopplerSpectrum` property of a channel object.

## **Channel Objects and Channel Visualization Tool Enhanced**

Channel objects and channel visualization tool are enhanced to support different Doppler spectra per path.

## **ricianchan Object Enhanced**

All paths now have the option of being Rician-faded (previously only the first path of a Rician multipath fading channel could be Rician-faded).

Each path can be assigned different values for the K and fdLOS parameters.

See the `ricianchan` reference page for details.

## **Demos Modeling Various Channels Added**

New demos modeling COST 207, GSM/EDGE, and HF are added.

These can be accessed through the demos pane of the Help browser, or by typing `chandemo_cost207` and `chandemo_hf` at the command line.

## **Eye Diagram Object Added**

New eye diagram object is added, that uses color to convey how often a trace traverses a point.

## **Modem Objects Added**

New PAM, OQPSK, DPSK, MSK, and General QAM modem objects are added.

## **Theoretical BERs Added to BERTool and Enhanced in `bercoding`**

Theoretical BERs added to BERTool for hard-decision and soft-decision decoding with AWGN. Existing results in `bercoding` are made more precise.

## **New stdchan Object**

The new `stdchan` object constructs channel objects according to standardized channel models, including COST 207, GSM/EDGE, 3GPP, and ITU-R.

## **bchenc Enhanced**

The `bchenc` function now runs faster, especially for longer codeword lengths.

## Version 3.5 (R2007a) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.5 (R2007a):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems  | Related Documentation at Web Site |
|--------------------------|--------------------------------------|--------------------------------|-----------------------------------|
| Yes<br>Details below     | Yes<br>Summary                       | Bug Reports<br>Includes fixes. | No                                |

New features and changes introduced in this version are

- “Added Support for Different Doppler Spectra to Channel Objects” on page 12
- “Theoretical Results Refined for berawgn, berfading, and BERTool” on page 13
- “Various Enhancements Made to BERTool” on page 13
- “New Demo on MIMO Systems Showcasing Space-Time Block Coding” on page 14
- “New PN Sequence Generator Object” on page 14
- “New dvbs2ldpc Function” on page 14
- “New finddelay Function” on page 14
- “New alignsignals Function” on page 14
- “Enhanced Speed of rsdec and bchdec Functions” on page 14

### Added Support for Different Doppler Spectra to Channel Objects

A package of Doppler classes is added. These classes are used to instantiate Doppler objects to be used with the Rayleigh and Rician channel objects:

- `doppler.flat`
- `doppler.gaussian`

- `doppler.jakes`
- `doppler.rjakes`
- `doppler.rounded`

See individual reference pages for details.

## **Theoretical Results Refined for `berawgn`, `berfading`, and `BERTool`**

Many of the previous theoretical results are now more accurate.

The functions `berawgn` and `berfading` can now return the symbol error rate in addition to the bit error rate.

Several new theoretical results have been added.

### **Compatibility Considerations**

The results from these functions may be different from those of previous releases as they are now more accurate.

## **Various Enhancements Made to `BERTool`**

When performing Monte Carlo simulations using `BERTool`, the BER plot is now updated every time a new data point is calculated. This allows the user to see whether the calculation is on the right track, and possibly start using the results while the calculation is in progress.

Theoretical BER plots are now shown to be one of exact, approximate, lower bounds, or upper bounds.

Theoretical error control coding BER results for Hamming, Golay, and Reed Solomon codes are now available in the `BERTool`.

See “`BERTool`: A Bit Error Rate Analysis GUI” in the *Communications Toolbox User’s Guide* for details.

## **New Demo on MIMO Systems Showcasing Space-Time Block Coding**

A new demo on MIMO systems is added, illustrating orthogonal space-time block coding. You can open this demo by typing `showdemo('introMIMOSystems')` at the command line.

## **New PN Sequence Generator Object**

The object `seqgen.pn` produces a pseudorandom noise sequence using a linear-feedback shift register that is implemented using a simple shift register generator (SSRG, or Fibonacci). See reference page for details.

## **New `dvbs21dpc` Function**

The function `dvbs21dpc` returns the parity-check matrix of an LDPC code from the DVB-S.2 standard.

## **New `finddelay` Function**

The function `finddelay` estimates delays between signals.

## **New `alignsignals` Function**

The function `alignsignals` aligns two signals by delaying the earlier signal.

## **Enhanced Speed of `rsdec` and `bchdec` Functions**

The functions `rsdec` and `bchdec` are enhanced to run significantly faster.

## Version 3.4 (R2006b) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.4 (R2006b):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems | Related Documentation at Web Site |
|--------------------------|--------------------------------------|-------------------------------|-----------------------------------|
| Yes<br>Details below     | Yes<br>Summary                       | Bug Reports                   | No                                |

New features and changes introduced in this version are

### Theoretical BER Results Added

Theoretical error control coding BER results for Hamming, Golay, and Reed Solomon codes are now available in the function `bercoding`.

### Bitwise Soft-Decision Outputs for PSK and QAM Demodulators

Bitwise soft-decision outputs are enabled for the PSK and QAM demodulation through the use of new PSK and QAM modem objects. See “Object-Based PSK and QAM Modulation and Demodulation” on page 16.

### Added LDPC Encoder and Decoder Objects

The objects `fec.ldpcenc` and `fec.ldpcdec` respectively encode and decode LDPC codes.

### Line-of-Sight Doppler Shift Added to Rician Channel

The property `DirectPathDopplerShift`, which specifies the maximum Doppler shift of the line-of-sight path, is added to the Rician channel object.

## **Object-Based PSK and QAM Modulation and Demodulation**

PSK and QAM modulation and demodulation is now done using the new classes `modem.pskmod`, `modem.pskdemod`, `modem.qammod`, and `modem.qamdemod`.

### **Compatibility Considerations**

See “Using Modem Objects” and individual reference pages for details.

## **QAM and PSK Modulation and Demodulation Functions Obsolete**

The functions `pskmod`, `pskdemod`, `qammod`, and `qamdemod` are obsolete and may be removed in the future.

### **Compatibility Considerations**

Use the new object based PSK and QAM modulation and demodulation objects instead. See “Object-Based PSK and QAM Modulation and Demodulation” on page 16.

## Version 3.3 (R2006a) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.3 (R2006a):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems  | Related Documentation at Web Site |
|--------------------------|--------------------------------------|--------------------------------|-----------------------------------|
| Yes<br>Details below     | No                                   | Bug Reports<br>Includes fixes. | No                                |

New features and changes introduced in this version are

### **convenc and vitdec Updated with Puncturing and Erasing**

The function `convenc` is updated with puncturing capabilities. The function `vitdec` now decodes codewords with punctures and erasures. Note that their function syntax have also changed.

### **Enhanced pamdemod, pskdemod, and qamdemod Functions**

The `pamdemod`, `pskdemod`, and `qamdemod` functions are enhanced to run significantly faster.

## Version 3.2 (R14SP3) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.2 (R14SP3):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems | Related Documentation at Web Site |
|--------------------------|--------------------------------------|-------------------------------|-----------------------------------|
| Yes<br>Details below     | No                                   | Bug Reports                   | No                                |

New features and changes introduced in this version are

### Added function `bchnumerr`

`bchnumerr` returns all the possible combinations of message lengths and number of correctable errors for a BCH code of given length.

### Speed increase in `bchgenpoly`, `bchenc`, and `bchdec` functions

`bchgenpoly`, `bchenc`, and `bchdec` function have been enhanced to run more rapidly.

## Version 3.1 (R14SP2Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.1 (R14SP2):

| New Features and Changes | Version Compatibility Considerations  | Fixed Bugs and Known Problems  | Related Documentation at Web Site |
|--------------------------|---|--------------------------------|-----------------------------------|
| Yes<br>Details below     | Yes—Details labeled as <b>Compatibility Considerations</b> , below. See also Summary. | Bug Reports<br>Includes fixes. | No                                |

New features and changes introduced in this version are

### Channel Visualization Tool

A new channel visualization tool allows you to plot various channel characteristics.

### Improved Rayleigh Fading Channel

Increased the signal processing speed of the Rayleigh Fading channel, `rayleighchan`, by up to a factor of two.

### Gray Coding Functionality

Added the functions `bin2gray` and `gray2bin` to convert between Gray decoded and encoded integers.

Added Gray symbol ordering to the functions `pskmod`, `pammod`, `dpskmod`, `qammod`, `fskmod`, `pskdemod`, `pamdemod`, `dpskdemod`, `qamdemod`, and `fskdemod`.

### Rician Channel Enhancement to the BERTool

The `bertool` now has theoretical BER results for a Rician channel.

## **gfrank**

### **Compatibility Considerations**

The function `gfrank` now returns 0, instead of `[]`, on a zero matrix input.

## **encode, decode, and quantiz**

### **Compatibility Considerations**

The outputs of the `encode`, `decode`, and `quantiz` functions now match the input vector's orientation.

## Version 3.0.1 (R14SP1) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.0.1 (R14SP1):

| New Features and Changes | Version Compatibility Considerations | Fixed Bugs and Known Problems | Related Documentation at Web Site |
|--------------------------|--------------------------------------|-------------------------------|-----------------------------------|
| Yes<br>Details below     | No                                   | Fixed bugs                    | No                                |

New features and changes introduced in this version are

### Rician Channel BER Calculations

The BERTool is enhanced to allow for Rician channel BER calculations. For details, see Available Sets of Theoretical BER Data in the Communications Toolbox documentation.

### berfading Updated for Rician Channel

berfading is enhanced to return the BER of BPSK over uncoded flat Rician fading channels. For details, see the Communications Toolbox documentation for berfading.

### New Adaptive Equalization Demo

A new demo illustrates adaptive equalization using Embedded MATLAB. To open the demo, type `equalizer_eml` at the MATLAB command line.

## Version 3.0 (R14) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 3.0 (R14):

| <b>New Features and Changes</b> | <b>Version Compatibility Considerations</b>   | <b>Fixed Bugs and Known Problems</b> | <b>Related Documentation at Web Site</b> |
|---------------------------------|---|--------------------------------------|--|
| Yes<br>Details below            | Yes—Details labeled as <b>Compatibility Considerations</b> , below. See also Summary. | Fixed bugs                           | No                                       |

New features and changes introduced in this version are

- “Bit Error Rate Analysis GUI” on page 23
- “Performance Evaluation” on page 23
- “Equalizers” on page 23
- “Fading Channels and Binary Symmetric Channel” on page 24
- “Interleavers” on page 25
- “Huffman Coding” on page 26
- “Pulse Shaping” on page 26
- “Utility Functions” on page 26
- “Enhancements for Modulation” on page 27
- “Enhancements for BCH Coding” on page 28
- “Updating Existing Modulation M-Code” on page 29
- “Updating Existing BCH M-Code” on page 30
- “Changes in Functionality” on page 31
- “Obsolete Functions” on page 31

## Bit Error Rate Analysis GUI

Communications Toolbox has a graphical user interface (GUI) called BERTool that helps you analyze communication systems' bit error rate (BER) performance. To invoke the GUI, type

```
bertool
```

in the MATLAB Command Window.

## Performance Evaluation

The functions in the table below enable you to measure or visualize the bit error rate performance of a communication system.

| Function     | Purpose   |
|--------------|---|
| berawgn      | Error probability for uncoded AWGN channels               |
| bercoding    | Error probability for coded AWGN channels                 |
| berconfint   | BER and confidence interval of Monte Carlo simulation     |
| berfading    | Error probability for Rayleigh fading channels            |
| berfit       | Fit a curve to nonsmooth empirical BER data               |
| bersync      | Bit error rate for imperfect synchronization              |
| distspec     | Compute the distance spectrum of a convolutional code     |
| semianalytic | Calculate bit error rate using the semianalytic technique |

## Equalizers

The functions in the table below enable you to equalize a signal using a linear equalizer, a decision feedback equalizer, or a maximum-likelihood sequence estimation equalizer based on the Viterbi algorithm.

| <b>Function</b>       | <b>Purpose</b>   |
|-----------------------|--|
| <code>cma</code>      | Construct a constant modulus algorithm (CMA) object                              |
| <code>dfe</code>      | Construct a decision feedback equalizer object                                   |
| <code>equalize</code> | Equalize a signal using an equalizer object                                      |
| <code>lineareq</code> | Construct a linear equalizer object  |
| <code>lms</code>      | Construct a least mean square (LMS) adaptive algorithm object                    |
| <code>mlseq</code>    | Equalize a linearly modulated signal using the Viterbi algorithm                 |
| <code>normlms</code>  | Construct a normalized least mean square (LMS) adaptive algorithm object         |
| <code>rls</code>      | Construct a recursive least squares (RLS) adaptive algorithm object              |
| <code>signlms</code>  | Construct a signed least mean square (LMS) adaptive algorithm object             |
| <code>varlms</code>   | Construct a variable step size least mean square (LMS) adaptive algorithm object |

## Fading Channels and Binary Symmetric Channel

The functions in the tables below enable you to model a Rayleigh fading channel, Rician fading channel, and binary symmetric channel.

| <b>Function</b>                           | <b>Purpose</b>                             |
|---|--|
| <code>bsc</code>                          | Model a binary symmetric channel           |
| <code>filter</code> (for channel objects) | Filter signal with channel object          |
| <code>rayleighchan</code>                 | Construct a Rayleigh fading channel object |
| <code>reset</code>                        | Reset channel object                       |
| <code>ricianchan</code>                   | Construct a Rician fading channel object   |

## Interleavers

The functions in the tables below enable you to perform block interleaving and convolutional interleaving, respectively.

### Block Interleaving

| Function                    | Purpose  |
|-----------------------------|--|
| <code>algdeintrlv</code>    | Restore ordering of symbols, using algebraically derived permutation table         |
| <code>algintrlv</code>      | Reorder symbols, using algebraically derived permutation table                     |
| <code>deintrlv</code>       | Restore ordering of symbols  |
| <code>helscandintrlv</code> | Restore ordering of symbols in a helical pattern                                   |
| <code>helscanintrlv</code>  | Reorder symbols in a helical pattern   |
| <code>intrlv</code>         | Reorder sequence of symbols  |
| <code>matdeintrlv</code>    | Restore ordering of symbols by filling a matrix by columns and emptying it by rows |
| <code>matintrlv</code>      | Reorder symbols by filling a matrix by rows and emptying it by columns             |
| <code>randdeintrlv</code>   | Restore ordering of symbols, using a random permutation                            |
| <code>randintrlv</code>     | Reorder symbols, using a random permutation  |

### Convolutional Interleaving

| Function                  | Purpose   |
|---------------------------|---|
| <code>convdeintrlv</code> | Restore ordering of symbols, using shift registers                |
| <code>convintrlv</code>   | Permute symbols, using shift registers                            |
| <code>heldeintrlv</code>  | Restore ordering of symbols permuted using <code>helintrlv</code> |
| <code>helintrlv</code>    | Permute symbols, using a helical array                            |

## Convolutional Interleaving (Continued)

| Function                 | Purpose  |
|--------------------------|--|
| <code>muxdeintrlv</code> | Restore ordering of symbols, using specified shift registers |
| <code>muxintrlv</code>   | Permute symbols, using shift registers with specified delays |

## Huffman Coding

The functions in the table below enable you to perform Huffman coding.

| Function                 | Purpose  |
|--------------------------|--|
| <code>huffmandeco</code> | Huffman decoder  |
| <code>huffmandict</code> | Generate Huffman code dictionary for a source with known probability model |
| <code>huffmanenco</code> | Huffman encoder  |

## Pulse Shaping

The functions in the table below enable you to perform rectangular pulse shaping at a transmitter and matched filtering at the corresponding receiver.

| Function               | Purpose                   |
|------------------------|---------------------------|
| <code>intdump</code>   | Integrate and dump        |
| <code>rectpulse</code> | Rectangular pulse shaping |

These functions can be useful in conjunction with the modulation functions listed below.

## Utility Functions

The toolbox now includes the following utility functions, details of which are on the corresponding reference pages.

| Function | Purpose                                |
|----------|--|
| noisebw  | Equivalent noise bandwidth of a filter |
| qfunc    | Q function                             |
| qfuncinv | Inverse Q function                     |

## Enhancements for Modulation

The functions in the tables below enable you to perform modulation and demodulation using analog and digital methods. Some of the functions support modulation types that Communications Toolbox did not previously support (DPSK and OQPSK). Other functions enhance and replace the older modulation and demodulation functions in Communications Toolbox. The new modulation and demodulation functions are designed to be easier to use than the older ones. Note, however, that the current set of modulation functions supports only analog passband and digital baseband modulation.

### Analog Passband Modulation

| Function | Purpose                                |
|----------|--|
| amdemod  | Amplitude demodulation                 |
| ammod    | Amplitude modulation                   |
| fmdemod  | Frequency demodulation                 |
| fmod     | Frequency modulation                   |
| pmdemod  | Phase demodulation                     |
| pmod     | Phase modulation                       |
| ssbdemod | Single sideband amplitude demodulation |
| ssbmod   | Single sideband amplitude modulation   |

### Digital Baseband Modulation

| Function  | Purpose                                      |
|-----------|--|
| dpskdemod | Differential phase shift keying demodulation |

## Digital Baseband Modulation (Continued)

| Function    | Purpose   |
|-------------|---|
| dpskmod     | Differential phase shift keying modulation        |
| fskdemod    | Frequency shift keying demodulation               |
| fskmod      | Frequency shift keying modulation                 |
| genqamdemod | General quadrature amplitude demodulation         |
| genqammod   | General quadrature amplitude modulation           |
| modnorm     | Scaling factor for normalizing modulation output  |
| oqpskdemod  | Offset quadrature phase shift keying demodulation |
| oqpskmod    | Offset quadrature phase shift keying modulation   |
| pamdemod    | Pulse amplitude demodulation                      |
| pammod      | Pulse amplitude modulation                        |
| pskdemod    | Phase shift keying demodulation                   |
| pskmod      | Phase shift keying modulation                     |
| qamdemod    | Quadrature amplitude demodulation                 |
| qammod      | Quadrature amplitude modulation                   |

## Enhancements for BCH Coding

The functions in the table below enable you to encode and decode BCH codes. These functions enhance and replace the older BCH coding functions in Communications Toolbox.

| Function   | Purpose                          |
|------------|----------------------------------|
| bchdec     | BCH decoder                      |
| bchenc     | BCH encoder                      |
| bchgenpoly | Generator polynomial of BCH code |

When processing codes using these functions, you can control the primitive polynomial used to describe the Galois field containing the code symbols and the position of the parity symbols.

## Updating Existing Modulation M-Code

### Compatibility Considerations

If your existing M-code performs modulation or demodulation, then you might want to update it to use the enhanced modulation or demodulation capabilities. Here are some important points to keep in mind:

- The toolbox no longer supports digital passband modulation/demodulation. However, it supports digital baseband modulation/demodulation, which is usually preferable.
- The toolbox no longer supports analog baseband modulation/demodulation. However, it supports analog passband modulation/demodulation.
- The new suite of functions includes a different function for each supported modulation type, whereas the old suite of functions included a smaller number of functions that each supported many modulation types.
- The new modulation/demodulation functions do not apply rectangular pulse shaping when modulating, and do not downsample when demodulating. Also, the new functions' syntax does not involve  $F_d$ , the sampling rate of the modulator input. To imitate the old functions' behavior, see the new `rectpulse` and `intdump` functions.
- In most cases, the new functions use different kinds of input arguments to describe parameters of the modulation or demodulation scheme. The new sets of arguments are meant to be easier to use, but determining how to update code might not be obvious. To make the task easier, compare the documentation for the old and new functions and compare the functions' outputs for small or well-understood data sets.

## Updating Existing BCH M-Code

### Compatibility Considerations

If your existing M-code processes BCH codes, then you might want to update it to use the enhanced BCH capabilities. Here are some important points to keep in mind:

- Use `bchenc` instead of `bchenco` and `encode(..., 'bch')`.
- Use `bchdec` instead of `bchdeco` and `decode(..., 'bch')`.
- Use `bchgenpoly` instead of `bchpoly`.
- `bchenc` and `bchdec` use Galois arrays for the messages and codewords. To learn more about Galois arrays, see “Representing Elements of Galois Fields” in the Communications Toolbox User’s Guide.
- `bchenc` places (and `bchdec` expects to find) the parity symbols at the *end* of each word by default. To process codes in which the parity symbols are at the beginning of each word, use the string `'beginning'` as the last input argument when you invoke `bchenc` and `bchdec`.

**Converting Between Release 13 and Release 14 Representations of Code Data.** To help you update your existing M-code that processes BCH codes, the example below illustrates how to encode data using the new `bchenc` function and the earlier `encode` and `bchenco` functions.

```
% Basic parameters for coding
n = 15; k = 11; % Message length and codeword length
w = 10; % Number of words to encode in this example

% R13 binary vector format
mydata_r13 = randint(w*k,1); % Long vector
% R13 binary matrix format
mydata_r13_mat = reshape(mydata_r13,k,w)'; % One message per row
% R13 decimal format
mydata_r13_dec = bi2de(mydata_r13_mat); % Convert to decimal.

% Equivalent R14 Galois array format
mydata_r14 = fliplr(gf(mydata_r13_mat));
```

```

% Encode the data using R13 methods.
code_r13 = encode(mydata_r13,n,k,'bch');
code_r13_mat = encode(mydata_r13_mat,n,k,'bch');
code_r13_dec = encode(mydata_r13_dec,n,k,'bch/decimal');
code_r13_bchenco = bchenco(mydata_r13_mat,n,k);

% Encode the data using R14 method.
code_r14 = bchenc(mydata_r14,n,k);
codeX = fliplr(double(code_r14.x)); % Retrieve from Galois array.

% Check that all resulting codes are the same.
% c1, c2, c3, and c4 should all be true.
c1 = isequal(de2bi(code_r13_dec),code_r13_mat);
c2 = isequal(reshape(code_r13,n,w)',code_r13_mat);
c3 = isequal(code_r13_bchenco,code_r13_mat);
c4 = isequal(code_r13_mat,codeX); % Compare R13 with R14.

```

## Changes in Functionality

### Compatibility Considerations

The encode and decode functions no longer perform BCH encoding and decoding. Use the bchenc and bchdec functions instead.

### Obsolete Functions

#### Compatibility Considerations

The table below lists functions that are obsolete. Although they are included in Release 13 for backward compatibility, they might be removed in a future release. The second column lists functions that provide similar functionality. In some cases, the similar function requires different input arguments or produces different output arguments, compared to the original function.

| Obsolete Function | Similar Function in R14             |
|-------------------|-------------------------------------|
| ademod            | amdemod, fmdemod, pmdemod, ssbdemod |

| <b>Obsolete Function</b> | <b>Similar Function in R14</b>   |
|--------------------------|--|
| ademodce                 | Use passband demodulation instead: amdemod, fmdemod, pmdemod, ssbdemod                 |
| amod                     | ammod, fmod, pmod, ssbmod  |
| amodce                   | Use passband modulation instead: ammod, fmod, pmod, ssbmod                             |
| apkconst                 | genqammod or pskmod for mapping; scatterplot for plotting                              |
| bchdeco                  | bchdec   |
| bchenco                  | bchenc   |
| bchpoly                  | bchgenpoly   |
| ddemod                   | Use baseband demodulation instead: genqamdemod, pamdemod, pskdemod, qamdemod, fskdemod |
| ddemodce                 | genqamdemod, pamdemod, pskdemod, qamdemod, fskdemod                                    |
| demodmap                 | genqamdemod, pamdemod, pskdemod, qamdemod  |
| dmod                     | Use baseband modulation instead: genqammod, pammod, pskmod, qammod, fskmod             |
| dmodce                   | genqammod, pammod, pskmod, qammod, fskmod  |
| modmap                   | genqammod, pammod, pskmod, qammod for mapping; scatterplot for plotting                |
| qaskdeco                 | qamdemod   |
| qaskenco                 | qammod for mapping; scatterplot for plotting   |

## Version 2.1 (R13) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 2.1 (R13):

| New Features and Changes | Version Compatibility Considerations  | Fixed Bugs and Known Problems | Related Documentation at Web Site |
|--------------------------|---|-------------------------------|-----------------------------------|
| Yes<br>Details below     | Yes—Details labeled as <b>Compatibility Considerations</b> , below. See also Summary. | Fixed bugs and known problems | No                                |

New features and changes introduced in this version are

- “Galois Field Computations” on page 33
- “Enhancements for Reed-Solomon Codes” on page 34
- “Arithmetic Coding” on page 34
- “Fixed Bugs” on page 34
- “Known Problems” on page 35
- “Updating Existing Galois Field Code” on page 35
- “Updating Existing Reed-Solomon M-Code” on page 41
- “Changes in Functionality” on page 43
- “Obsolete Functions” on page 44

### Galois Field Computations

Communications Toolbox supports a new data type that allows you to manipulate arrays of elements of a Galois field having  $2^m$  elements, where  $m$  is an integer between 1 and 16. When you use this data type, most computations have the same syntax that you would use to manipulate ordinary MATLAB arrays of real numbers. The consistency with MATLAB syntax makes the new Galois field capabilities easier to use than the analogous Release 12 capabilities.

## Enhancements for Reed-Solomon Codes

The functions in the table below allow you to encode and decode Reed-Solomon codes, including shortened Reed-Solomon codes. These functions enhance and replace the older Reed-Solomon coding functions in Communications Toolbox.

| Function  | Purpose                                   |
|-----------|---|
| rsdec     | Reed-Solomon decoder                      |
| rsenc     | Reed-Solomon encoder                      |
| rsgenpoly | Generator polynomial of Reed-Solomon code |

When processing codes using these functions, you can control the generator polynomial, the primitive polynomial used to describe the Galois field containing the code symbols, and the position of the parity symbols.

## Arithmetic Coding

The functions in the table below allow you to perform arithmetic coding.

| Function  | Purpose  |
|-----------|--|
| arithdeco | Decode binary code using arithmetic decoding         |
| arithenco | Encode a sequence of symbols using arithmetic coding |

## Fixed Bugs

### Reed-Solomon decoder corrects up to $t$ errors

The new function `rsdec` accurately decodes Reed-Solomon codes containing up to  $t$  errors in each codeword. This new function replaces the earlier functions `rsdeco` and `rsdecode`.

## Reed-Solomon encoder and decoder use more conventional format for data

The new functions `rsenc` and `rsdec` operate on the new Galois data type, which represents symbols using a decimal format.

The new functions enable you to choose whether parity bits appear at the beginning or end of each codeword.

## Known Problems

### Galois field manipulations cannot be compiled

The Galois field data type is not compatible with the MATLAB Compiler.

### Incorrect name of data file in printed documentation

The section "Speed and Nondefault Primitive Polynomials" in the printed manual refers to a MAT-file called `gftable.mat`. It should say `userGftable.mat`.

## Updating Existing Galois Field Code

### Compatibility Considerations

If your existing code performs computations in Galois fields having  $2^m$  elements, where  $m$  is an integer between 1 and 16, then you might want to update your code to use the new Galois field capabilities.

**Replacing Functions.** The table below lists Release 12 functions that correspond to Release 13 functions or operators acting on the new Galois field data type. Compared to the syntax of their Release 12 counterparts, the syntaxes of the Release 13 functions are different, but generally easier to use.

| Release 12 Function | Release 13 Function or Operator | Comments |
|---------------------|---------------------------------|----------|
| <code>gfadd</code>  | <code>+</code>                  |          |
| <code>gfconv</code> | <code>conv</code>               |          |

| Release 12 Function | Release 13 Function or Operator | Comments  |
|---------------------|---------------------------------|---|
| gfcosets            | cosets                          | cosets returns a cell array, whereas gfcosets returns a NaN-padded matrix.                                |
| gfdeconv            | deconv                          |   |
| gfdiv               | ./                              |   |
| gffilter            | filter                          | Unlike gffilter, filter also returns the final states.  |
| gflineq             | \                               |   |
| gfplus              | +                               |   |
| gfprimck            | isprimitive                     | isprimitive detects primitivity but not reducibility.   |
| gfprimdf            | primpoly                        |   |
| gfprimfd            | primpoly                        |   |
| gfrank              | rank                            |   |
| gfroots             | roots                           | Unlike gfroots, roots indicates multiplicities of roots and can process polynomials in an extension field |
| gfsub               | -                               |   |
| gftuple             | .^, log, polyval                | See “Converting and Simplifying Formats Using R13 Galois Arrays” on page 39 for more details.             |

### Converting Between Release 12 and Release 13 Representations of Field Elements.

In some parts of your existing code, you might need to convert data between the exponential format supported in Release 12 and the new Galois array. The code example below performs such conversions on a sample vector that represents elements of GF(16).

```
% Sample data
m = 4; % For example, work in GF(2^4) = GF(16).
a_r12 = [2 5 0 -Inf]; % GF(16) elements in exponential format

% 1. Convert to the Release 13 Galois array.
A = gf(2,m); % Primitive element of the field
a_r13 = A.^(a_r12); % Positive exponents mean A to that power.
a_r13(find(a_r12 < 0)) = 0; % Negative exponents mean zero.

% 2. Convert back to the Release 12 exponential format.
m = a_r13.m; A = gf(2,m);
a_r12again = zeros(size(a_r13)); % Preallocate space in a matrix.
zerolocations = find(a_r13 == 0);
nonzerolocations = find(a_r13 ~= 0);
a_r12again(zerolocations) = -Inf; % Map 0 to negative exponent.
a_r12again(nonzerolocations) = log(a_r13(nonzerolocations));

% Check that the two conversions are inverses.
ck = isequal(a_r12,a_r12again)

ck =
```

1

### Converting Between Release 12 and Release 13 Representations of Polynomials.

Release 12 and Release 13 use different formats for representing polynomials over GF(2<sup>m</sup>). Release 12 represents a polynomial as a vector of coefficients in order of *ascending* powers. Depending on the context, each coefficient listed in the vector represents either an element in a prime field or the exponential format of an element in an extension field. Release 13 uses the conventions described below.

## Primitive Polynomials

The functions `gf`, `isprimitive`, and `primpoly` represent a primitive polynomial using an integer scalar whose binary representation lists the coefficients of the polynomial. The least significant bit is the constant term.

For example, the scalar 13 has binary representation 1101 and represents the polynomial  $D^3 + D^2 + 1$ .

## Other Polynomials

When performing arithmetic with, evaluating, or finding roots of a polynomial, or when finding a minimal polynomial of a field element, you represent the polynomial using a Galois vector of coefficients in order of *descending* powers. Each coefficient listed in the vector represents an element in the field using the representation described in “How Integers Correspond to Galois Field Elements”.

For example, the Galois vector `gf([1 1 0 1],1)` represents the polynomial  $x^3 + x^2 + 1$ . Also, the Galois vector `gf([1 2 3],3)` represents the polynomial  $x^2 + Ax + (A+1)$ , where  $A$  is a root of the default primitive polynomial for  $GF(2^3)$ . The coefficient of  $A+1$  corresponds to the vector entry of 3 because the binary representation of 3 is 11.

## Example Showing Conversions

The code example below might help you determine how to convert between the Release 12 and Release 13 formats for polynomials.

```
m = 3; % Work in GF(8).

poly_r12 = [1 1 0 1]; % 1+x+x^3, ascending order
poly_r13 = gf([1 0 1 1],m); % x^3+x+1 in GF(8), descending order

% R12 polynomials
pp_r12 = gfprimdf(m); % A primitive polynomial
mp_r12 = gfminpol(4,m); % The minimal polynomial of an element
rts_r12 = gfroots(poly_r12); % Find roots.
```

```

% R13 polynomials
pp_r13 = primpoly(m,'nodisplay'); % A primitive polynomial
mp_r13 = minpol(gf(4,m)); % The minimal polynomial of an element
rts_r13 = roots(poly_r13); % Find roots.

% R12 polynomials converted to R13 formats
% For primitive poly, change binary vector to decimal scalar.
pp_r12_conv = bi2de(pp_r12);
% For minimal poly, change ordering and make it a Galois array.
mp_r12_conv = gf(fliplr(mp_r12));
% For roots of polynomial, note that R12 answers are in
% exponential format. Convert to Galois array format.
rts_r12_conv = gf(2,m) .^ rts_r12;

% Check that R12 and R13 yield the same answers.
c1 = isequal(pp_r13,pp_r12_conv); % True.
c2 = isequal(mp_r13,mp_r12_conv); % True.
c3 = isequal(rts_r13,rts_r12_conv); % True.

```

**Converting and Simplifying Formats Using R13 Galois Arrays.** If your existing code uses `gftuple` to convert between exponential and polynomial formats, or to simplify one of these formats, then the code example below might help you determine how to perform those tasks using the Release 13 Galois array.

```

% First define key characteristics of the field.
m = 4; % For example, work in GF(2^4) = GF(16).
A = gf(2,m); % Primitive element of the field

% 1. Simplifying a Polynomial Format
poly_big = 2^10 + 2^7;
% Want to refer to the element A^10 + A^7. However,
% cannot use gf(poly_big,m) because poly_big is too large.
poly1 = A.^10 + A.^7 % One way to define the element.
poly2 = polyval(de2bi(poly_big,'left-msb'),A); % Another way.
% The results show that A^10 + A^7 equals A^3 + A^2 in this
% field, using the binary representation of 12 as 1100.

% 2. Simplifying an Exponential Format

```

```

exp_big = 39;
exp_simple = log(A.^exp_big) % Simplest exponential format.
% The results show that A^39 equals A^9 in this field.

% 3. Converting from Exponential to Polynomial Format
expf1 = 7;
pf1 = A.^expf1
% The results show that A^7 equals A^3 + A + 1 in this
% field, using the binary representation of 11 as 1011.

% 4. Converting from Polynomial to Exponential Format
pf2 = 11; % Represents the element A^3 + A + 1
expf2 = log(gf(pf2,m))
% The results show that A^3 + A + 1 equals A^7 in this field.
    
```

The output is below.

```

poly1 = GF(2^4) array. Primitive polynomial = D^4+D+1 (19 decimal)

Array elements =

    12

exp_simple =

    9

pf1 = GF(2^4) array. Primitive polynomial = D^4+D+1 (19 decimal)

Array elements =

    11

expf2 =

    7
    
```

## Updating Existing Reed-Solomon M-Code

### Compatibility Considerations

If your existing M-code processes Reed-Solomon codes, then you might want to update it to use the enhanced Reed-Solomon capabilities. Below are some important points to keep in mind:

- Use `rsenc` instead of `rsenco`, `rsencode`, and `encode(..., 'rs')`.
- Use `rsdec` instead of `rsdeco`, `rsdecode`, and `decode(..., 'rs')`.
- Use `rsgenpoly` instead of `rspoly`.
- `rsenc` and `rsdec` use Galois arrays for the messages and codewords. To learn more about Galois arrays, see “Representing Elements of Galois Fields”.
- `rsenc` and `rsdec` interpret symbols in a different way compared to the Release 12 functions. For an example showing how to convert between Release 12 and Release 13 interpretations, see “Converting Between Release 12 and Release 13 Representations of Code Data” on page 42.
- The Release 12 functions support three different data formats. The exponential format is most easily converted to the Release 13 format. To convert your data among the various Release 12 formats as you prepare to upgrade to the new Release 13 functions, see “Converting Among Various Release 12 Representations of Coding Data” on page 43.
- `rsenc`, `rsdec`, and `rsgenpoly` use a Galois array in *descending* order to represent the generator polynomial argument. The commands below indicate how to convert generator polynomials from the Release 12 format to the Release 13 format.

```
n = 7; k = 3; % Examples of code parameters
m = log2(n+1); % Number of bits in each symbol
gp_r12 = rspoly(n,k); % R12 exponential format, ascending order
gp_r13 = gf(2,m).^fliplr(gp_r12); % Convert to R13 format.
```

- `rsenc` places (and `rsdec` expects to find) the parity symbols at the *end* of each word by default. To process codes in which the parity symbols are at the beginning of each word, use the string 'beginning' as the last input argument when you invoke `rsenc` and `rsdec`.

## Converting Between Release 12 and Release 13 Representations of Code Data.

To help you update your existing M-code that processes Reed-Solomon codes, the example below illustrates how to encode data using the new `rsenc` function and the earlier `rsenco` function.

```
% Basic parameters for coding
m = 4; % Number of bits per symbol in each codeword
t = 2; % Error-correction capability
n = 2^m-1; k = n-2*t; % Message length and codeword length
w = 10; % Number of words to encode in this example

% Lookup tables to translate formats between rsenco and rsenc
p2i = [0 gf(2,m).^[0:2^m-2]]; % Galois vector listing powers
i2p = [-1 log(gf(1:2^m-1,m))]; % Integer vector listing logs

% R12 method, exponential format
% Exponential format uses integers between -1 and 2^m-2.
mydata_r12 = randint(w,k,2^m)-1;
code_r12 = rsenco(mydata_r12,n,k,'power'); % * Encode the data. *
% Convert any -Inf values to -1 to facilitate comparisons.
code_r12(isinf(code_r12)) = -1;
code_r12 = reshape(code_r12,n,w)'; % One codeword per row

% R12 method, decimal format
% This yields same results as R12 exponential format.
mydata_r12_dec = mydata_r12 + 1; % Convert to decimal.
code_r12_dec = rsenco(mydata_r12_dec,n,k,'decimal'); % Encode.
code_r12_dectoexp = code_r12_dec - 1; % Convert to exponential.
c1 = isequal(code_r12,code_r12_dectoexp); % True.

% R12 method, binary format
% This yields same results as R12 exponential format.
mydata_r12_bin = de2bi(mydata_r12_dec',m); % Convert to binary.
code_r12_bin = rsenco(mydata_r12_bin,n,k,'binary'); % Encode.
code_r12_bintoexp = reshape(bi2de(code_r12_bin),n,w)' - 1;
c2 = isequal(code_r12,code_r12_bintoexp); % True.

% R13 method
mydata_r13 = fliplr(mydata_r12); % Reverse the order.
% Convert format, using +2 to get in the right range for indexing.
```

```

mydata_r13 = p2i(mydata_r13+2);
code_r13 = rsenc(mydata_r13,n,k); % * Encode the data. *
codeX = double(code_r13.x); % Retrieve data from Galois array.
% Convert format, using +1 to get in the right range for indexing.
codelogX = i2p(codeX+1);
codelogX = fliplr(codelogX); % Reverse the order again.

c3 = isequal(code_r12,codelogX) % True.

c3 =

     1

```

**Converting Among Various Release 12 Representations of Coding Data.** These rules indicate how to convert among the exponential, decimal, and binary formats that the Release 12 Reed-Solomon functions support:

- To convert from decimal format to exponential format, subtract one.
- To convert from exponential format to decimal format, replace any negative values by -1 and then add one.
- To convert between decimal and binary formats, use `de2bi` and `bi2de`. The right-most bit is the most significant bit in this context.

The commands below illustrate these conversions.

```

msgbin = randint(11,4); % Message for a (15,11) = (2^4-1, 11) code
msgdec = bi2de(msgbin)'; % Binary to decimal
msgexp = msgdec - 1; % Decimal to exponential
codeexp = rsenco(msgexp,15,11,'power');
codeexp(find(codeexp < 0)) = -1; % Use -1 consistently.
codedec = codeexp + 1; % Exponential to decimal
codebin = de2bi(codedec); % Decimal to binary

```

## Changes in Functionality

### Compatibility Considerations

The table below lists functions whose behavior has changed.

| Function | Change in Functionality   |
|----------|---|
| wgn      | The default measurement unit is the dBW, formerly documented as "dB." To specify this unit explicitly in the syntax, set the <i>powertype</i> input argument to 'dBW', not 'dB'. The output of the function is unaffected by this change in syntax. |

## Obsolete Functions

### Compatibility Considerations

The table below lists functions that are obsolete. Although they are included in Release 13 for backward compatibility, they might be removed in a future release. The second column lists functions that provide similar functionality. In some cases, the similar function requires different input arguments or produces different output arguments, compared to the original function.

| Function | Similar Function             |
|----------|------------------------------|
| gfplus   | + operator for Galois arrays |
| rsdeco   | rsdec                        |
| rsdecode | rsdec                        |
| rsenco   | rsenc                        |
| rsencode | rsenc                        |
| rspoly   | rsgenpoly                    |

## Version 2.0 (R12) Communications Toolbox Software Release Notes

This table summarizes what's new in Version 2.0 (R12):

| New Features and Changes | Version Compatibility Considerations  | Fixed Bugs and Known Problems | Related Documentation at Web Site |
|--------------------------|---|-------------------------------|-----------------------------------|
| Yes<br>Details below     | Yes—Details labeled as <b>Compatibility Considerations</b> , below. See also Summary. | Fixed bugs                    | No                                |

New features and changes introduced in this version are

- “Convolutional Coding Functions” on page 45
- “Gaussian Noise Functions” on page 46
- “Other New Functions” on page 46
- “Enhancements to Existing Functions” on page 46
- “Fixed Bugs” on page 47
- “Changes in Functionality” on page 50
- “Obsolete Functions” on page 52

### Convolutional Coding Functions

Communications Toolbox processes feedforward and feedback convolutional codes that can be described by a trellis structure or a set of generator polynomials. It uses the Viterbi algorithm to implement hard-decision and soft-decision decoding. These new functions support convolutional coding:

- `convenc` creates a convolutional code from binary data.
- `vitdec` decodes convolutionally encoded data using the Viterbi algorithm.
- `poly2trellis` converts a polynomial description of a convolutional encoder to a trellis description.

- `istrellis` checks if the input is a valid trellis structure representing a convolutional encoder.

## Gaussian Noise Functions

These new functions create Gaussian noise:

- `awgn` adds white Gaussian noise to the input signal to produce a specified signal-to-noise ratio.
- `wgn` generates white Gaussian noise with a specified power, impedance, and complexity.

## Other New Functions

These functions are also new in Release 12:

- `eyediagram` plots an eye diagram.
- `marcumq` implements the generalized Marcum Q function.
- `oct2dec` converts octal numbers to decimal numbers.
- `randerr` generates bit error patterns. This is similar to the obsolete function `randbit`, but it accepts a more intuitive set of input arguments and uses an upgraded random number generator.
- `randsrc` generates random matrices using a prescribed alphabet.
- `scatterplot` produces a scatter plot.
- `syndtable` generates syndrome decoding tables. This is similar to the obsolete function `htruthb`, but it is not limited to single-error-correction codes.

## Enhancements to Existing Functions

The following functions have been enhanced in Release 12:

- `biterr` and `symerr` provide a third output argument that indicates the results of individual comparisons. These functions also provide more comprehensive support for comparisons between a vector and a matrix.

- `de2bi` and `bi2de` use an optional input flag to indicate the ordering of bits. If you omit the flag from the list of input arguments, then the default behavior matches that of Release 11.
- `randint` can operate without input arguments. Also, it can accept a negative value for the optional third input argument.

## Fixed Bugs

### **VITERBI is slow and does not decode correctly**

VITERBI has been replaced by a new function, VITDEC, which is much faster and decodes correctly.

### **DDEMOD and DDEMOCCE do not produce correct symbol error rates**

DDEMOD and DDEMOCCE now produce the optimal symbol error rate in AWGN for PSK, ASK, QASK (QAM), FSK, and noncoherent FSK.

### **DMOD and DMOCCE generate incorrect waveform for MSK and FSK**

DMOD and DMOCCE now generate the correct waveform for MSK and FSK.

### **GFADD, GFSUB, GFDIV, GFMUL, GFCONV and GFDECONV return incorrect answers**

GFADD, GFSUB, GFDIV, GFMUL, GFCONV and GFDECONV have been improved in the following ways:

- Correct answers for prime and extension Galois fields, including prime fields,  $GF(p)$ , where  $p > 2$ .
- Correct handling of `-Inf` and negative values for extension Galois fields.
- Enhanced help descriptions to better distinguish the purposes of the functions.
- Improved input parameter checking.

**GFMINPOL returns incorrect answers when first input is -Inf or when p>2. The function also sometimes crashes**

GFMINPOL now returns the correct answers and does not crash.

**GFPLUS and RSENCODE returns incorrect answers for negative inputs**

GFPLUS now returns correct answers for negative inputs. This fix also allows RSENCODE to return correct results.

**GFLINEQ returns incorrect answers in prime Galois fields of order greater than 2**

GFLINEQ now solves linear equations in prime Galois fields of order greater than 2.

**GFPRIMDF produces "out of memory" messages for degrees higher than 24**

GFPRIMDF now uses less memory and can find primitives of degrees greater than 24. However, this calculation will take considerable time.

**DECODE using the cyclic decoder option does not decode (23,12) Golay code correctly**

The cyclic decoder now decodes the (23,12) Golay code correctly.

**GFPRIMFD finds incorrect primitive polynomial**

GFPRIMFD finds the correct primitive polynomial for the given Galois field.

**GFTUPLE returns incorrect answers when m=1**

GFTUPLE now returns the correct answers when m=1.

**GFPRIMCK, GFTRUNC, GFADD and GFFILTER causes segmentation violations**

GFPRIMCK, GFTRUNC, GFADD and GFFILTER do not cause segmentation violations.

**GFPRIMCK returns incorrect answers if  $p > 2$  or inputs are large.**

GFPRIMCK correctly determines if a polynomial is irreducible and/or primitive.

**DECODE incorrectly decodes block codes**

DECODE now correctly decodes block codes using either the [I P] or [P I] standard forms of the generator and parity-check matrices.

**RCOSFLT does not correctly filter and upsample the input signal**

RCOSFLT now applies the correct raised-cosine filter type and fully filters and upsamples the input signal.

**EYESCAT is difficult to use and plots I and Q components together**

EYESCAT has been replaced by new functions, EYEDIAGRAM and SCATTERPLOT, which are easier to use, plot I and Q components separately, and allow X-Y plots.

**ADEMODO ignores the phase offset parameter under the 'pm' option and has no sensitivity parameter under the 'fm' option**

The phase offset now causes the correct phase offset in the demodulator. New parameters were introduced to allow the sensitivity to be changed.

**ADEMODO 'pm' option - sensitivity parameter is required and causes a dc offset**

ADEMODO now has an optional parameter called 'VCOconst' that replaces sensitivity and does not cause a dc offset.

**RANDINT hangs when the range is large**

RANDINT no longer hangs for large numbers.

## RANDBIT output is not random

RANDBIT has been replaced by a new function, RANDERR, which generates random output and supports for seeding.

## Changes in Functionality

### Compatibility Considerations

The table below lists functions whose behavior has changed.

| Function                                  | Change in Functionality  |
|---|--|
| <code>bi2de</code>                        | Distinguishes between rows and columns as input vectors. Treats column vector as separate numbers, not as digits of a single number. To adapt your existing code, transpose the input vector if necessary. |
| <code>biterr</code>                       | Input argument <code>k</code> must be large enough to represent all elements of the input arguments <code>x</code> and <code>y</code> .  |
| <code>biterr</code> , <code>symerr</code> | Distinguish between rows and columns as input vectors. To adapt your existing code, transpose the input vector if necessary.   |
|   | Use different strings for the input argument that controls row-wise and column-wise comparisons.   |
|   | Produce vector, not scalar, output if one input is a vector. See these functions' reference pages for more information.  |

| Function   | Change in Functionality  |
|--|--|
| de2bi  | Second input argument, if it appears, must not be smaller than the number of bits in any element of the first input argument. Previously, the function produced a truncated binary representation instead of an error. To adapt your existing code, specify a sufficiently large number for the second input argument and then truncate the answer manually. |
| ddemod   | Default behavior uses no filter, not a Butterworth filter. Regardless of filtering, the function uses an integrator to perform demodulation.   |
| dmod, ddemod, dmodce, ddemodce, modmap, demodmap | For frequency shift keying method, the default separation between successive frequencies is $F_d$ , not $2 \cdot F_d / M$ . For minimum shift keying method, the separation between frequencies is $F_d / 2$ , not $F_d$ .   |
| encode, decode                                   | No longer support convolutional coding. Use <code>convenc</code> and <code>vitdec</code> instead.  |
| gflinseq   | If the equation has no solutions, then the function returns an empty matrix, not a matrix of zeros.  |
| randint  | Uses state instead of seed to initialize random number generator. See <code>rand</code> for more information about initializing random number generators.  |
| rcosflt  | The 'wdelay' flag is superfluous. The function now behaves as the Release 11 function behaved with the 'wdelay' flag.  |

## Obsolete Functions

### Compatibility Considerations

The table below lists functions that are obsolete. Although they are included in Release 12 for backward compatibility, they might be removed in a future release. Where applicable, the second column lists functions that provide similar functionality. In some cases, the similar function requires different arguments or produces different results compared to the original function.

| Function | Similar Function, if Any |
|----------|--------------------------|
| commgui  |                          |
| convdeco | vitdec                   |
| convenco | convenc                  |
| eyescat  | eyediagram, scatterplot  |
| flxor    | bitxor                   |
| gen2abcd |                          |
| htruthtb | syndtable                |
| imp2sys  |                          |
| oct2gen  |                          |
| randbit  | randerr                  |
| sim2gen  |                          |
| sim2logi |                          |
| sim2tran |                          |
| viterbi  | vitdec                   |

## Communications Toolbox Release Notes Compatibility Summary

This table summarizes new features and changes that might cause incompatibilities when you upgrade from an earlier version, or when you use files on multiple versions. Details are provided in the description of the new feature or change.

| Version (Release)               | New Features and Changes with Version Compatibility Impact  |
|---------------------------------|---|
| Latest Version<br>V4.2 (R2008b) | None  |
| V4.1 (R2008a)                   | None  |
| V4.0 (R2007b)                   | None  |
| V3.5 (R2007a)                   | <p>See the <b>Compatibility Considerations</b> subheading for each of these new features or changes:</p> <ul style="list-style-type: none"> <li>• “Theoretical Results Refined for berawgn, berfading, and BERTool” on page 13</li> </ul>   |
