# Functions — Alphabetical List

## sfclipboard

Purpose Get the Stateflow clipboard object

**Description** object = sfclipboard returns a handle to the Stateflow clipboard

object. Use the clipboard object to copy objects from one container object to another, as described in "Copying Objects" in the Stateflow

API Reference.

**See Also** sfgco, sfnew, sfroot, stateflow

**Purpose** Close a Stateflow chart

**Syntax** sfclose

> sfclose('Chart Name') sfclose( Chart Handle )

sfclose('All')

**Arguments** 

'Chart\_Name' Name of a Stateflow chart Chart Handle Handle to a Stateflow chart

'All' Literal string to close all open or minimized

Stateflow charts

**Description** sfclose closes the current Stateflow chart.

sfclose( 'Chart Name') closes the Stateflow chart named

Chart Name.

sfclose( Chart Handle ) closes the Stateflow chart whose handle is

Chart Handle.

sfclose('All') closes all open or minimized Stateflow charts.

See Also sfopen, sfnew, stateflow

## sfdebugger

Purpose Open the Stateflow Debugger

**Syntax** sfdebugger

sfdebugger( 'Machine\_Name' )
sfdebugger( Machine\_Handle )
sfdebugger( Machine\_Id )

**Arguments** 

'Model\_Name' String name of a Stateflow machine

Machine\_Handle Handle to a Stateflow machine

Machine\_Id ID of a Stateflow machine

**Description** stdebugger opens the Stateflow Debugger for the currently selected

Stateflow machine.

 ${\it sfdebugger}$  (  ${\it 'Machine\_Name'}$  ) opens the Stateflow Debugger for the

Stateflow machine called Machine\_Name.

sfdebugger ( Machine\_Handle ) opens the Stateflow Debugger for the

Stateflow machine whose handle is  ${\it Model\_Handle}$ .

 ${\it sfdebugger} \, (\ {\it Machine\_Id} \ )$  opens the Stateflow Debugger for the

Stateflow machine whose  ${\tt Id}$  is  ${\tt Machine\_Id}$ .

**See Also** sfexplr, sfhelp, sflib

## sfexplr

Purpose Start the Model Explorer

**Syntax** sfexplr

**Description** sfexplr opens the Model Explorer. For more information, see "The

Model Explorer" in the Simulink software documentation.

See Also sfdebugger, sfhelp, sflib

## sfgco

**Purpose** Get most recently selected objects in the Stateflow chart

**Syntax** object = sfgco

**Description** object = sfgco returns a handle or vector of handles to the most recently selected objects in a Stateflow chart, as follows.

If	sfgco returns
No Stateflow charts are open, or no open charts were edited or otherwise manipulated	Empty matrix
There is no selection list	Handle to the Stateflow chart most recently clicked
You select one object in a Stateflow chart	Handle to the selected object
You select multiple objects in a Stateflow chart	Vector of handles to the selected objects
You select multiple objects in multiple Stateflow charts	Vector of handles to the most recently selected objects in the most recently selected chart

**See Also** sfnew, stateflow

## sfhelp

Purpose Open the Stateflow software online help

Syntax sfhelp

**Description** sthelp opens the Stateflow software online help in the MATLAB® Help

browser.

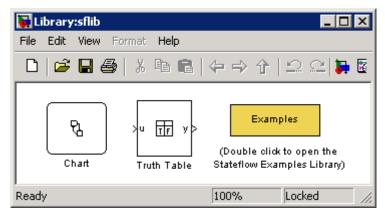

**See Also** sfexplr, sfnew, sfprint, sfsave, stateflow

## sflib

Purpose Open the Stateflow library window

Syntax sflib

**Description** sflib opens the Stateflow library window, as shown.

From this window, you can drag Stateflow charts and Truth Table blocks into Simulink models and access the Stateflow Examples Library.

**See Also** sfdebugger, sfexplr, sfhelp, sfnew

**Purpose** 

Create a Simulink model containing an empty Stateflow block

**Syntax** 

Model\_Handle = sfnew('-Chart\_Type', 'Machine\_Name')

**Arguments** 

Model Handle Handle to the new Simulink model that will

contain the Stateflow block

Chart\_Type Type of Stateflow block to add to the Simulink

model. Enter

• '-Classic' for a chart that implements full Stateflow chart semantics (default)

 '-Mealy' for a chart that implements Mealy state machine semantics

• '-Moore' for a chart that implements Moore state machine semantics

• '-TT' for a truth table

Optional.

'Machine\_Name'

Name of the Stateflow machine (also becomes the model name). Optional.

#### **Description**

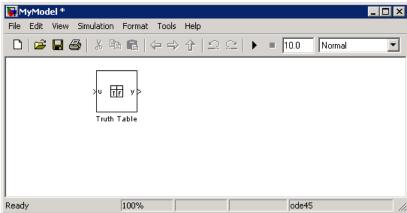

Model\_Handle = sfnew('-Chart\_Type', 'Machine\_Name') returns
the handle to a new model named Machine\_Name that contains an
empty Stateflow block of type Chart\_Type, and opens the new model
on your desktop. If Chart\_Type is not specified, the default block is
Classic. If Machine Name is not specified, the default name is untitled.

#### **Examples**

Create a Simulink model called **MyModel** that contains an empty Stateflow truth table.

m = sfnew('-TT', 'MyModel')

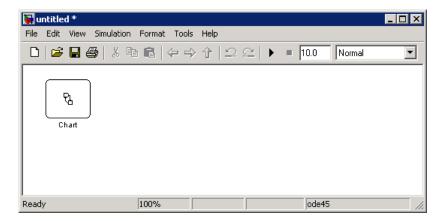

Create an untitled Simulink model that contains an empty Stateflow chart.

m = sfnew

The new model looks like this:

#### See Also

sfhelp, sfprint, sfroot, sfsave, stateflow

## sfopen

Purpose Open the Stateflow machine

Syntax sfopen

**Description** stopen prompts you for an .mdl file and opens the model that you select

from your file system.

**See Also** sfclose, sfdebugger, sfexplr, sflib, sfnew, stateflow

## sfprint

Purpose Print a graphical view of Stateflow charts

Syntax sfprint

sfprint( objects, format, outputOption, printEntireChart )

#### **Arguments**

objects

Any of these object identifiers:

- String name of a Stateflow chart, or Simulink model, system, or block
- Handle to a Stateflow chart, or Simulink model, system, or block
- Cell array of names of and/or handles to a Stateflow chart, or Simulink model, system, or block
- Vector of handles to a Stateflow chart, or Simulink model, system, or block
- Simulink model construction commands gcb, gcbh, or gcs

format

Optional literal string that specifies the print destination:

- 'default' prints to a default printer
- 'ps' generates a PostScript file
- 'psc' generates a color PostScript file
- 'eps' generates an Encapsulated PostScript file
- 'epsc' generates a color Encapsulated PostScript file
- 'tif' generates a TIFF file
- 'jpg' generates a JPEG file
- 'png' generates a PNG file
- 'meta' saves the Stateflow chart image to the clipboard as a metafile (for Windows<sup>®</sup> operating systems only)
- 'bitmap' saves the Stateflow chart image to the clipboard as a bitmap (for Windows operating systems only)

#### outputOption

Optional string that specifies an output file or printer:

- String that specifies the name of a file to which to write (file will be overwritten if more than one chart is printed)
- 'promptForFile' prompts for file name interactively
- 'printer' sends output to default printer (use only with 'default', 'ps', or 'eps' formats)
- 'file' sends output to a default file, specified as <path to object>.<device extension>
- 'clipboard' copies output to the clipboard

#### printEntireChart

Optional Boolean argument:

- 1 (default) prints complete charts
- 0 prints current view of charts

#### **Description**

sfprint prints the current Stateflow chart to a default printer.

sfprint(objects, format, outputOption, printEntireChart) prints all Stateflow charts identified in objects in the specified format to the file or printer specified in outputOption. Prints a complete or current view of charts as specified in printEntireChart. If the format argument is absent, the format defaults to 'ps' and output is sent to the default printer. If the outputOption argument is absent, the name of the Stateflow chart in the current directory is used as the output file name.

#### **Examples**

Print the complete chart whose handle is *id* to a TIFF file called **myFilename**.

```
sfprint(id, 'tif', 'myFilename')
```

Print all Stateflow charts in the current system as a PostScript file to the default printer.

```
sfprint(gcs)
```

Print the current Stateflow block to a JPEG file whose name is specified by the user interactively.

```
sfprint(gcb, 'jpg', 'promptForFile')
```

Print the current view of all Stateflow charts in the current system in PNG format using default file names.

```
sfprint(gcs, 'png', 'file', 0)
```

Assume that you loaded a Simulink model named **myModel** that has two charts named **Chart1** and **Chart2**. Further, both **Chart1** and **Chart2** are represented by the Stateflow chart objects **ch1** and **ch2**, respectively.

This command	Prints the graphical view of
sfprint('myModel')	Both Chart1 and Chart2 to the default printer
sfprint('myModel','ps')	Both Chart1 and Chart2 to a PostScript file
sfprint(ch1.Id,'psc')	Chart1 to a color PostScript file
<pre>sfprint([ch1.Id, ch2.Id])</pre>	Both Chart1 and Chart2 to the default printer

#### **See Also**

sfhelp, sfnew, sfsave, stateflow

Purpose Get the Stateflow root object

**Syntax** object = sfroot

**Description** object = sfroot returns the handle to the top-level object in the

Stateflow hierarchy of objects. Use the root object to access all other objects in Stateflow charts, as described in "Accessing the Model Object"

in the Stateflow API Reference.

**See Also** sfnew, sfgco, sfclipboard, stateflow

#### **Purpose**

Save the Stateflow machine in the current directory

#### **Syntax**

```
sfsave
sfsave( Model_Handle )
sfsave( Model_Handle, 'New_Model_Name' )
sfsave( Machine_Handle )
sfsave( 'Model_Name' )
sfsave( 'Defaults' )
```

#### **Arguments**

Model\_Handle Handle to a Simulink model that contains a Stateflow block

'New\_Model\_Name' Name to assign to the model being saved Handle to a Stateflow machine

'Model\_Name' Name of a Simulink model that contains a Stateflow block

Literal string used to save current settings as

defaults

'Defaults'

#### **Description**

sfsave saves the current Stateflow machine in the current directory.

sfsave( <code>Model\_Handle</code> ) saves the Simulink model specified by <code>Model\_Handle</code> in the current directory.

sfsave(  $Model\_Handle$ , 'New\\_Model\\_Name') saves the Simulink model specified by  $Model\_Handle$  as  $New\_Model\_Name$  in the current directory.

 ${\tt sfsave(\textit{Machine\_Handle}) saves the Simulink model that contains} \\ {\tt the Stateflow machine specified by Machine\_Handle} \\ {\tt in the current directory.} \\$ 

sfsave( 'Model\_Name') saves the Simulink model called Model\_Name in the current directory.

 ${\tt sfsave}(\ {\tt 'Defaults'}\ )$  saves the settings of the current Stateflow machine as defaults.

#### Examples

Save the model whose handle is m as MyModel in the current directory.

```
sfsave(m, 'MyModel')
```

Save the model that contains a Stateflow machine whose handle is sf in the current directory.

sfsave(sf)

#### **See Also**

sfclose, sfnew, sfopen, sfprint

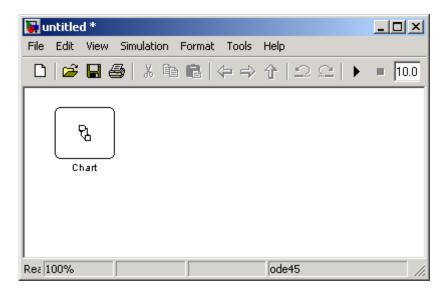

#### stateflow

Purpose Create a Simulink model containing an empty Stateflow chart, and

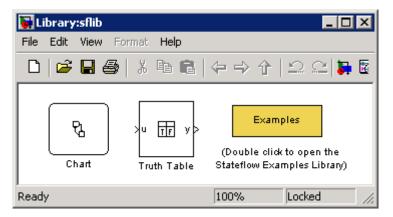

open the Stateflow library window

**Syntax** stateflow

**Description** stateflow creates a new Simulink model that is preconfigured with an empty Stateflow chart, as shown.

The function also opens the Stateflow library window.

From this window, you can drag other Stateflow charts and Truth Table blocks into Simulink models and access the Stateflow Examples Library.

#### **See Also**

sflib, sfnew, sfroot

## stateflow

# **Block Reference**

#### **Stateflow Chart**

**Purpose** 

A version of a finite state machine for controlling a physical plant

Library

Stateflow

**Description** 

Chart1

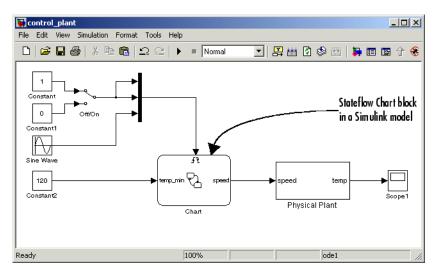

A *finite state machine* is a representation of an event-driven (reactive) system. In an event-driven system, the system responds by making a transition from one state (mode) to another prescribed state in response to an event, provided that the condition defining the change is true.

A Stateflow chart is a graphical representation of a finite state machine, where *states* and *transitions* form the basic building blocks of the system. You can also represent stateless flow graphs. To add your control logic to a Simulink model, use a Stateflow block.

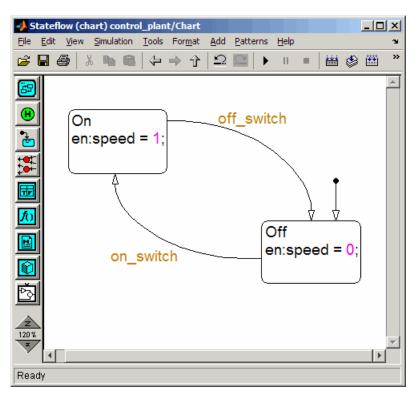

You can use Stateflow charts to control a physical plant in response to events such as a temperature or pressure sensor, or clock or user-driven events. For example, you can use a state machine to represent the automatic transmission of a car. The transmission has these operating states: park, reverse, neutral, drive, and low. As the driver shifts from one position to another, the system makes a transition from one state to another, for example, from park to reverse.

The following diagram shows a simple Simulink model that has a Stateflow block named Chart (default) that responds to input from a manual switch.

## **Stateflow Chart**

If you double-click the Stateflow block in the Simulink model, the Stateflow chart that programs the Stateflow block appears in the Stateflow Editor.

During simulation of the Simulink model, you can interactively debug Stateflow charts in animation mode. Stateflow charts generate efficient C code for simulation targets, and also for embedded targets.

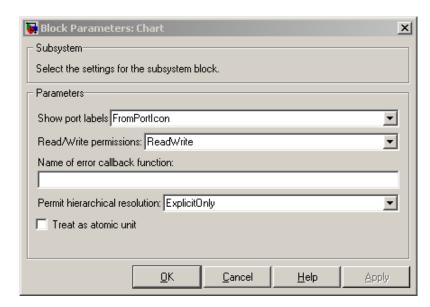

For an introduction to using Stateflow charts in Simulink models, see the Stateflow Getting Started Guide.

#### Data Type Support

The Stateflow block accepts inputs of any type including two-dimensional matrices and fixed-point data. Floating-point inputs pass through the block unchanged. Boolean inputs are treated as uint8 signals.

For a discussion on the variable types supported by Embedded MATLAB $^{\text{TM}}$  functions in Simulink models, refer to the Simulink software documentation.

You can declare local data of any type or size.

#### Parameters and Dialog Box

**Note** It is highly recommended that the default settings for the block parameters of an Embedded MATLAB Function block not be changed.

#### **Characteristics**

Direct Feedthrough	Yes
Sample Time	Specified in the Sample time parameter
Scalar Expansion	N/A

## **Stateflow Chart**

Dimensionalized	Yes
Zero Crossing	No

#### **Purpose**

Represents logical decision-making behavior with conditions, decisions, and actions.

#### Library

Stateflow

#### **Description**

The Truth Table block is an Embedded MATLAB truth table function that you can add to a Simulink model directly. The Truth Table block requires a Stateflow software license.

When you add a Truth Table block directly to a Simulink model instead of calling truth table functions from a Stateflow chart, these advantages apply:

- It is a more direct approach, especially if your model requires only a single truth table.
- You can define truth table inputs and outputs to have inherited types and sizes.

The Truth Table block supports the Embedded MATLAB language subset for programming conditions and actions, and generates content as Embedded MATLAB code. Embedded MATLAB functions work with a subset of the MATLAB language that is optimized for generating embeddable C code.

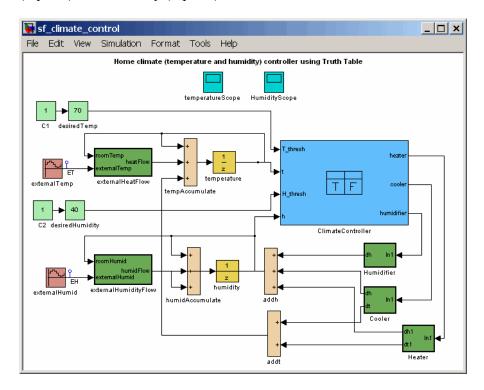

As a result, you can take advantage of Embedded MATLAB tools to debug your Truth Table block during simulation. For more information, see "Debugging an Embedded MATLAB Function".

For purely logical behavior, truth tables are easier to program and maintain than graphical functions. Truth tables also provide diagnostics that indicate whether you have too few (underspecified) or

#### **Truth Table**

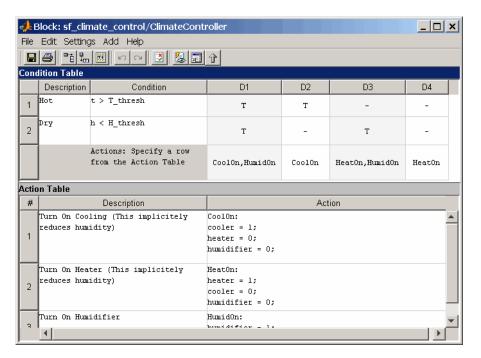

too many (overspecified) decisions for the conditions you specify. For an introduction to truth tables, see "Truth Table Functions".

This figure shows a Simulink model (sf\_climate\_control.mdl) of a home environment controller that attempts to maintain a selected temperature and humidity. The model has a Truth Table block (ClimateController) that responds to changes in room temperature (input t) and humidity (input h).

#### Truth Table Editor

If you double-click the Truth Table block in the Simulink model, the Truth Table Editor opens to display its conditions, actions, and decisions. Here is the display for the Truth Table block named ClimateController.

Note how the inputs t and h are used to define the conditions, and the outputs heater, cooler, and humidifier are used to define the actions for this Truth Table block. For more details, refer to the demo for this model.

Using the Truth Table Editor, you can:

- Enter and edit conditions, actions, and decisions
- Add or modify Stateflow data and ports using the Ports and Data Manager
- Run diagnostics to detect parser errors
- View generated content after simulation

For more information about the Truth Table Editor, see "Truth Table Editor Operations".

## **Truth Table**

#### Ports and Data Manager

If you want to add or edit data in a Truth Table block, open the Ports and Data Manager by clicking the **Edit Data/Ports** button in the Truth Table Editor toolbar:

Using the Ports and Data Manager, you can add these elements to a Truth Table block.

Element	Tool	Description
Data		You can add these types of data:
		• Local
		Constant
		Parameter
		Data store memory

Element	Tool	Description
Input trigger	4	An input trigger causes a Truth Table block to execute when a Simulink control signal changes or through a Simulink block that outputs function-call events. You can use one of these input triggers:  Rising edge Falling edge Either rising or falling edge Function call For more information, see "Defining
		Events".
Function-call output	fO	A function-call output triggers a function call to a subsystem. For more information, see "Function-Call Subsystems" in the Simulink software documentation.

#### Data Type Support

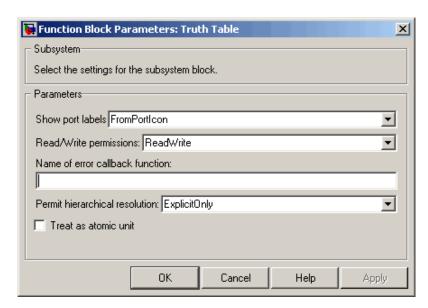

The Truth Table block accepts signals of any data type supported by Simulink models, including fixed-point data types and frame-based signals. Truth Table blocks work with frame-based signals in the same way as Embedded MATLAB Function blocks (see "Working with Frame-Based Signals" in the Simulink software documentation).

For a discussion of data types supported by Simulink models, refer to the Simulink software documentation.

## **Truth Table**

#### Parameters and Dialog Box

Right-click over a Truth Table block, and from the submenu, select **Subsystem Parameters**.

#### **Characteristics**

Direct Feedthrough	Yes
Sample Time	Specified in the Sample time parameter
Scalar Expansion	N/A
Dimensionalized	Yes
Zero Crossing	No
