Summary by Version	1
Version 2.8 (R2011a) Filter Design HDL Coder Software	4
Version 2.7 (R2010b) Filter Design HDL Coder Software	7
Version 2.6 (R2010a) Filter Design HDL Coder Software	14
Version 2.5 (R2009b) Filter Design HDL Coder Software	22
Version 2.4 (R2009a) Filter Design HDL Coder Software	30
Version 2.3 (R2008b) Filter Design HDL Coder Software	34
Version 2.2 (R2008a) Filter Design HDL Coder Software	38
Compatibility Summary for Filter Design HDL Coder Software	48

Summary by Version

This table provides quick access to what's new in each version. For clarification, see "Using Release Notes" on page 1.

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Latest Version V2.8 (R2011a)	Yes Details	Yes Summary	No
V2.7 (R2010b)	Yes Details	No	No
V2.6 (R2010a)	Yes Details	Yes Summary	No
V2.5 (R2009b)	Yes Details	Yes Summary	No
V2.4 (R2009a)	Yes Details	Yes Summary	No
V2.3 (R2008b)	Yes Details	Yes Summary	No
V2.2 (R2008a)	Yes Details	Yes Summary	No

Using Release Notes

Use release notes when upgrading to a newer version to learn about:

- New features
- Changes
- Potential impact on your existing files and practices

Review the release notes for other MathWorks® products required for this product (for example, MATLAB® or Simulink®). Determine if enhancements, bugs, or compatibility considerations in other products impact you.

If you are upgrading from a software version other than the most recent one, review the current release notes and all interim versions. For example, when you upgrade from V1.0 to V1.2, review the release notes for V1.1 and V1.2.

What Is in the Release Notes

New Features and Changes

- New functionality
- Changes to existing functionality

Version Compatibility Considerations

When a new feature or change introduces a reported incompatibility between versions, the **Compatibility Considerations** subsection explains the impact.

Compatibility issues reported after the product release appear under Bug Reports at the MathWorks Web site. Bug fixes can sometimes result in incompatibilities, so review the fixed bugs in Bug Reports for any compatibility impact.

Fixed Bugs and Known Problems

MathWorks offers a user-searchable Bug Reports database so you can view Bug Reports. The development team updates this database at release time and as more information becomes available. Bug Reports include provisions for any known workarounds or file replacements. Information is available for bugs existing in or fixed in Release 14SP2 or later. Information is not available for all bugs in earlier releases.

Access Bug Reports using your MathWorks Account.

Documentation on the MathWorks Web Site

Related documentation is available on ${\tt mathworks.com}$ for the latest release and for previous releases:

- Latest product documentation
- Archived documentation

Version 2.8 (R2011a) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.8 (R2011a)

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations, below. See also Summary.	No

New features and changes introduced in this version are:

- "Distributed Arithmetic and Serial Architectures Supported for Cascaded Filters" on page 4
- "generatetb Function Removed" on page 5
- $\bullet\,$ "Support for Serial Architectures for IIR SOS Filters" on page $5\,$
- "Support for Partly Serial Architecture for FIR Interpolators" on page $5\,$
- "Enhanced Synthesis Script Generation Options" on page 6

Distributed Arithmetic and Serial Architectures Supported for Cascaded Filters

The coder now supports Distributed Arithmetic (DA) and serial architectures for cascade filters. You can use this feature only with the command-line interface (generatehdl). See "Architecture Options for Cascaded Filters" for more details and some examples.

generatetb Function Removed

R2011a removes the generateth function. To generate a test bench for your HDL filter code, you should instead use the generatehol function. Set the GenerateHDLTestbench property to 'on', as shown in the following example.

```
generatehdl(Hlp, 'GenerateHDLTestbench', 'on');
```

See the GenerateHDLTestbench reference page for details.

Compatibility Considerations

In Release R2011a, the generateth function will continue to operate, but it will display a warning message when called.

You should replace all calls to generatetb in your scripts with calls to generatehdl. When you do so, enable test bench generation with the GenerateHDLTestbench property, as shown in the preceding example.

See also "Enabling Test Bench Generation".

Support for Serial Architectures for IIR SOS Filters

Effective with R2011a, you can specify a partly or fully serial architecture for IIR SOS filter structures. At this time, Filter Design HDL CoderTM supports only Direct Form I SOS filters (df1sos).

You can specify serial architecture using generatehdl or through the Generate HDL dialog box (on the **Filter Architecture** tab). For more details, see "Serial Architectures for IIR SOS Filters" and "Specifying Serial Architectures for IIR SOS Filters".

Support for Partly Serial Architecture for FIR Interpolators

Effective with R2011a, you can specify a partly serial architecture for FIR interpolator filters (mfilt.firinterp). See "Speed vs. Area Optimizations for HDL Filter Realizations" for detailed information about parallel and serial architectures supported for HDL code generation.

Enhanced Synthesis Script Generation Options

The **Synthesis script** options in the **EDA Tool Scripts** pane now includes the options **Choose synthesis tool** and **Synthesis file postfix**.

These options let you specify generation of a tool-specific synthesis script. See "Automation Scripts for Third-Party Synthesis Tools" for details.

Version 2.7 (R2010b) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.7 (R2010b)

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	No

New features and changes introduced in this version are:

- "Improved GUI Support for Distributed Arithmetic Architectures" on page 7
- "Enhanced Information Display for Serial Architectures" on page 11
- "Support for Variable Rate CIC Filters" on page 13

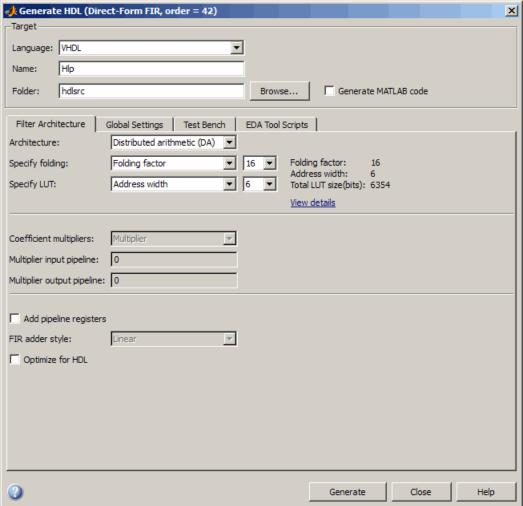

Improved GUI Support for Distributed Arithmetic Architectures

The coder now lets you specify Distributed Arithmetic (DA) architectures for FIR filters more flexibly. In addition, the Generate HDL dialog box now includes informational displays and a hyperlink that lets you display a report showing DA architectural details

In previous releases, you defined a DA architecture in terms of two parameters:

- LUT Partition: a vector specifying the number and size of LUT partitions.
- **DA Radix**: the number of bits processed simultaneously, expressed as a power of 2.

In release 2010b you can choose from an expanded set of DA architecture options. The following figure shows the default options.

The **Specify folding** pulldown menu lets you select one of:

- Folding factor (default): Select from the pulldown menu to the right of **Specify folding**. The menu contains an exhaustive list of possible folding factors for the filter.
- DA radix: Select the number of bits processed simultaneously, expressed as a power of 2.

The **Specify LUT** pulldown menu lets you select one of:

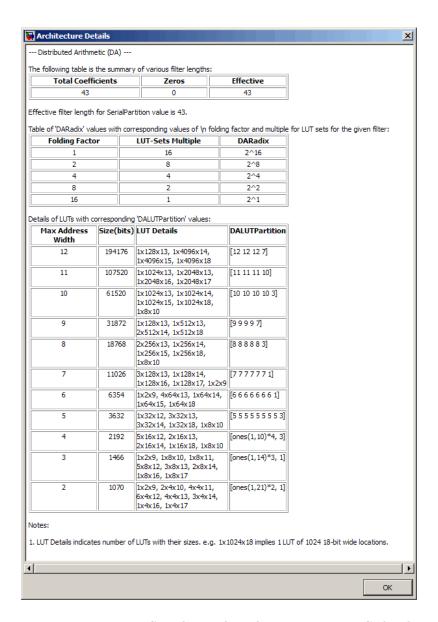

- Address width (default): Select from the pulldown menu to the right of **Specify LUT**. The menu contains an exhaustive list of LUT address widths for the filter.
- Partition: Enter a vector specifying the number and size of LUT partitions

As you interact with the **Specify folding** and **Specify LUT** options you can see the results of your choice in three display-only fields: Folding factor,, Address width, and Total LUT size (bits).

In addition, when you click on the **View details** hyperlink, the coder displays a report showing complete DA architectural details for the current filter, including:

- Filter lengths.
- Complete list of applicable folding factors and their effect on the sets of LUTs
- Tabulation of all possible configurations of LUTs with total LUT Size and LUT details.

The following figure shows a typical report.

See also in the Filter Design HDL Coder documentation.

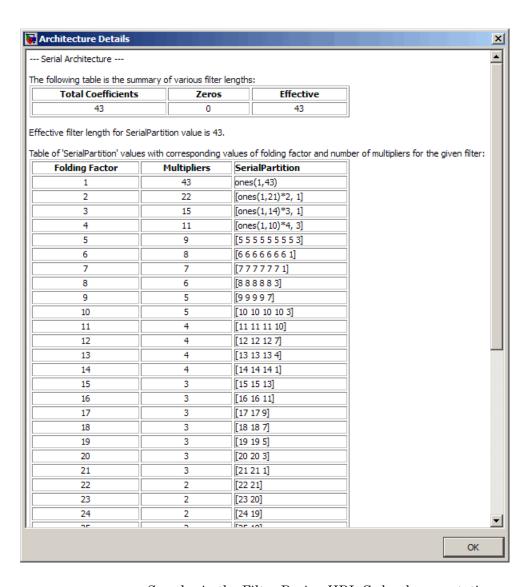

Enhanced Information Display for Serial Architectures

When you select the Fully serial or Partly serial **Architecture** options, the Generate HDL dialog box now displays a **View details** hyperlink, as shown in the following figures.

Filter Architecture	Global Settings	Test Bench	EDA Tool Script	s		
Architecture:	Partly serial	V		ding factor:		
Specified by:	Folding factor	T		upiler: ial partition:	2 [26 25]	
			<u>Vie</u>	w details:		
						'
Filter Architecture	Global Settings	Test Bench	EDA Tool Script	s		
Architecture:	Fully serial	•	Folding factor Multiplier:	: 51 1		
			Serial partition	: [51]		
			View detailer			

When you click on the **View details** link, the coder displays an HTML report in a separate window. The report displays an exhaustive table of possible folding factor, multiplier, and serial partition settings for the current filter. You can use the table to help you choose optimal settings for your design.

The following figure shows a partial view of typical report for a FIR filter of length 51.

See also in the Filter Design HDL Coder documentation.

Support for Variable Rate CIC Filters

Release R2010b supports HDL code generation for variable rate CIC filters, including the following filter types:

- CIC Decimators (mfilt.cicdecim)
- CIC Interpolators(mfilt.cicinterp)
- Multi-rate cascade with one CIC stage. (mfilt.cascade)

A variable rate CIC filter has a programmable rate change factor. It is assumed that the filter is designed with the maximum rate expected, and that the Decimation Factor (for CIC Decimators) or Interpolation Factor (for CIC Interpolators) is set to this maximum rate change factor.

Two new options support variable rate CIC filters:

- Add rate port: enables generation of rate and load_rate ports. When the load rate signal is asserted, the rate port loads in a rate factor.
- **Testbench rate stimulus** lets you specify a stimulus applied to the rate port.

See also

Version 2.6 (R2010a) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.6 (R2010a).

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations, below. See also Summary.	No

New features and changes introduced in this version are:

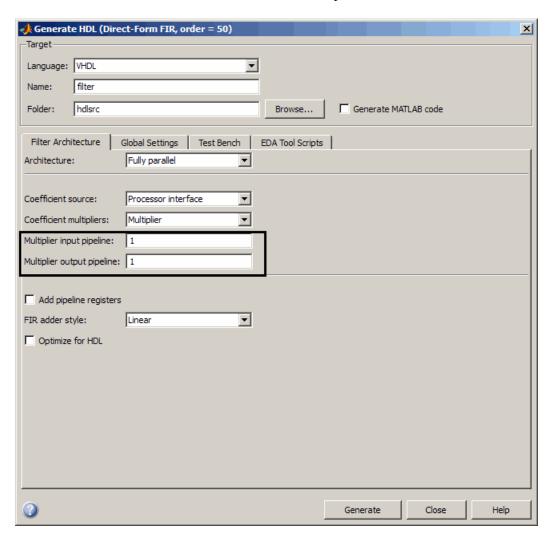

- "Multiplier Input and Output Pipelining for FIR Filters" on page 14
- "Support for Partly Serial Architecture for FIR Decimators" on page 16
- "Enhancements for Serial Architectures" on page 16
- "GUI Support for Programmable FIR FIlter Coefficients" on page 18
- "Option to Suppress Reset Logic Generation for Shift Registers" on page 19
- "GenerateCosimModel 'IN' and 'MQ' Property Values Removed" on page 21

Multiplier Input and Output Pipelining for FIR Filters

Release R2010a lets you specify generation of pipeline stages at multiplier inputs or outputs for all FIR filter structures. Multiplier pipelining can help you achieve significantly higher clock rates. You can select input pipelining, output pipelining, or both. You can also specify the desired number of pipeline stages.

The following figure shows the new GUI options for multiplier pipelining options. These are:

- Multiplier input pipeline: Enter the desired number of pipeline stages to be added before each multiplier.
- Multiplier output pipeline: Enter the desired number of pipeline stages to be added after each multiplier.

The coder enables the **Multiplier input pipeline** and **Multiplier output pipeline** options when **Coefficient multipliers** is set to Multiplier.

Alternatively, you can specify the desired number of pipeline stages as generatehal property/value pairs as follows:

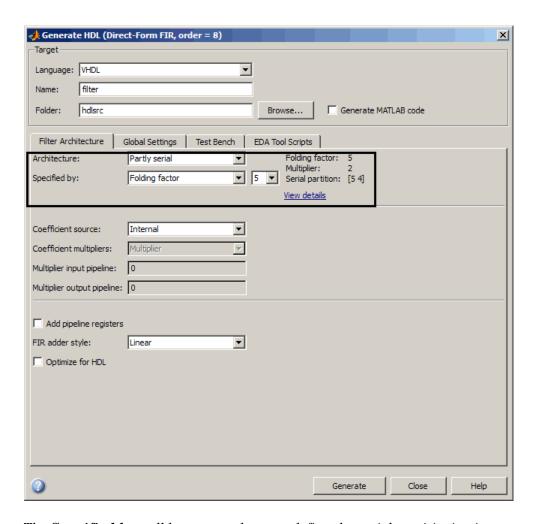

- 'MultiplierInputPipeline', nStages
- 'MultiplierOutputPipeline', nStages

Support for Partly Serial Architecture for FIR Decimators

Release R2010a lets you specify a partly serial architecture for FIR decimator filters (mfilt.firdecim). See for detailed information about parallel and serial architectures supported for HDL code generation.

Enhancements for Serial Architectures

When you select the Partly serial Architecture option, the Generate HDL dialog box now displays additional information and data entry fields related to serial partitioning, as shown in the following figure.

The **Specified by** pulldown menu lets you define the serial partitioning in any the following ways:

• Directly specify a vector of integers having N elements, where N is the number of serial partitions. Each element of the vector specifies the length of the corresponding partition.

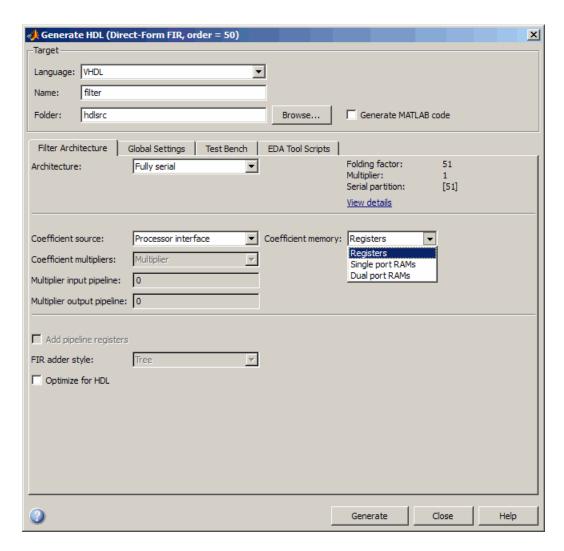

- Specify the desired hardware folding factor ff, an integer greater than 1. Given the folding factor, the coder computes the serial partition and the number of multipliers.
- Specify the desired number of multipliers *nmults*, an integer greater than 1. Given the number of multipliers, the coder computes the serial partition and the folding factor.

See for detailed information about parallel and serial architectures supported for HDL code generation.

The coder also provides the new hdlgetserialpartition function to help you define an optimal serial partition for your filter. hdlgetserialpartition calculates and displays an exhaustive table of SerialPartition values for a given filter, with corresponding values of folding factor and number of multipliers. See hdlfilterserialinfo for further information.

GUI Support for Programmable FIR Filter Coefficients

For FIR filters with serial architectures, the **Coefficient memory** pulldown menu now supports generation of a register or RAM based interface for loading coefficients. The following figure shows the **Coefficient memory** pulldown menu.

For detailed information, see in the Filter Design HDL Coder documentation.

Option to Suppress Reset Logic Generation for Shift Registers

R2010a lets you suppress generation of reset logic for shift registers. To suppress reset logic, select Shift register from the **Remove reset from**

Generate HDL (Direct-Form FIR, order = 42) X Target -Language: VHDL ▼| Name: Hlp Generate M-file hdlsrc Folder: Browse... pulldown in the **Global Settings** pane of the Generate HDL dialog box, as shown in the following figure.

You can also use generatehdl function with the property RemoveResetFrom to suppress generation of resets from shift registers.

Generate

Close

Help

GenerateCosimModel 'IN' and 'MQ' Property Values Removed

Release R2010a no longer supports the 'IN' and 'MQ' property values. Use the equivalent property values 'Incisive' and 'ModelSim', as summarized in the following table.

Current Property Value	Deprecated Property Value
<pre>generatehdl(filterObj, 'GenerateCosimModel',' Incisive');</pre>	generatehdl(filterObj, 'GenerateCosimModel',' IN ');
<pre>generatehdl(filterObj, 'GenerateCosimModel',' ModelSim');</pre>	generatehdl(filterObj, 'GenerateCosimModel',' MQ^{\prime});

Compatibility Considerations

Replace any occurrences of 'IN' and 'MQ' in your control files and scripts with the new property values 'Incisive' and 'ModelSim'. In R2010a, the coder raises an error a warning if it encounters the old property values during code generation.

Version 2.5 (R2009b) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.5 (R2009b).

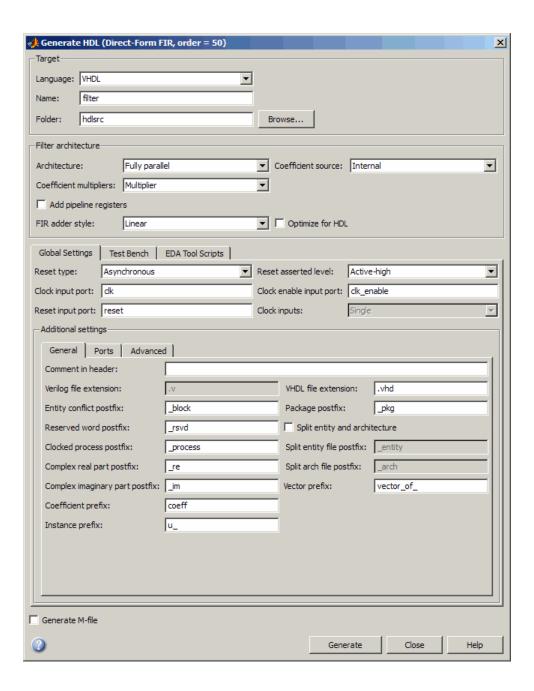

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations, below. See also Summary.	No

New features and changes introduced in this version are:

- "Graphical User Interface Improved and Revised" on page 22
- "Test Bench GUI Reorganized" on page 24
- "GenerateCosimModel 'IN' and 'MQ' Property Values Replaced" on page 26
- "Extended Complex Data Type Support" on page 27
- "Generation of Model for Cosimulation Now Supports Multirate Filters" on page 28
- "RAM Based Programmable Coefficients Supported for FIR Filters with Serial Architectures" on page 28

Graphical User Interface Improved and Revised

R2009b includes an improved and revised Filter Design HDL Coder graphical user interface (GUI). The GUI now supports all functions within a single dialog box. The following figure shows the Generate HDL dialog box.

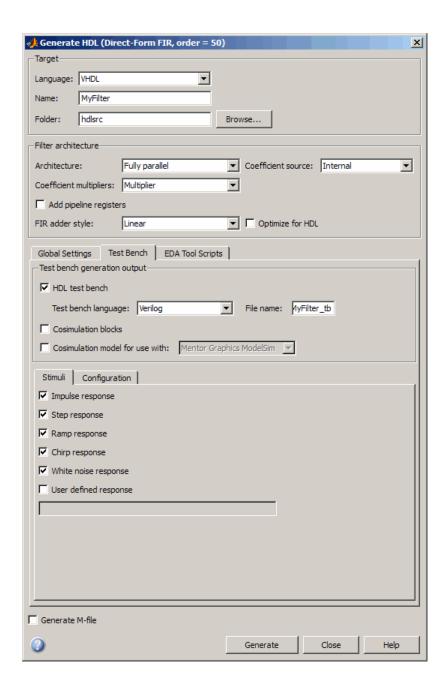

Compatibility Considerations

Some property labels have changed in the new GUI. The following tale lists the previous and current property labels.

Previous Property Label	Current Property Label
Language	Filter target language
Folder	Target directory

Test Bench GUI Reorganized

The following figure shows the reorganized **Test bench** pane of the Generate HDL dialog box.

The new **Testbench generation output** section contains three options:

- **HDL test bench**: Selecting this option enables generation of an HDL test bench, and also enables all options in the **Configuration** section of the **Test Bench** pane.
- Cosimulation blocks: Selecting this option enables Generate a model containing HDL Cosimulation block(s) for use in testing the DUT. Selecting this option also enables all options in the Configuration section of the Test Bench pane.
- Cosimulation model for use with: Selecting this option enables generation of a model containing an HDL Cosimulation block for use in testing the DUT, and lets you select the desired cosimulation tool. Selecting this option also enables all options in the Configuration section of the Test Bench pane.

To configure test bench options and generate test bench code, you must select one or more of the options of the **Testbench generation output** section. If you deselect all three options of the **Testbench generation output** section, the coder disables all options in the **Configuration** section of the **Test Bench** pane.

GenerateCosimModel 'IN' and 'MQ' Property Values Replaced

Release R2009b deprecates the 'IN' and 'MQ' property values. Use the equivalent property values 'Incisive' and 'ModelSim', as summarized in the following table.

Current Property Value	Deprecated Property Value
<pre>generatehdl(filterObj, 'GenerateCosimModel',' Incisive');</pre>	generatehdl(filterObj, 'GenerateCosimModel',' IN ');
<pre>generatehdl(filterObj, 'GenerateCosimModel',' ModelSim');</pre>	generatehdl(filterObj, 'GenerateCosimModel',' MQ^{\prime});

Compatibility Considerations

Replace any occurrences of 'IN' and 'MQ' in your control files and scripts with the new property values 'Incisive' and 'ModelSim'. In R2009b, the coder issues a warning if it encounters the old property values during code generation. In subsequent releases, use of the old property values will raise an error.

Extended Complex Data Type Support

The coder now supports use of complex coefficients and complex input signals for additional filter structures. In many cases, you can use complex data and complex coefficients in combination. The following table shows the added filter structures that support complex data and/or coefficients, and the permitted combinations.

Filter Structure	Complex Data	Complex Coefficients	Complex Data and Coefficients
dfilt.df1sos	Y	Y	Y
dfilt.df1tsos	Y	Y	Y
dfilt.df2sos	Y	Y	Y
dfilt.df2tsos	Y	Y	Y
mfilt.holdinterp	Y	Y	N/A
mfilt.firsrc	Y	Y	Y
mfilt.firtdecim	Y	Y	Y

The coder also supports use of complex data and complex coefficients in combination for the mfilt.firdecim and mfilt.firinterp filter structures. The following table summarizes complex data type support for these filter structures.

Filter Structure	Complex Data	Complex Coefficients	Complex Data and Coefficients
mfilt.firdecim	Y	Y	Y (newly supported)
mfilt.firinterp	Y	Y	Y (newly supported)

For a list of filter structures supporting complex data, coefficients or both, see in the Filter Design HDL Coder documentation.

Additional GUI Support for Complex Data

R2009b adds the following GUI options supporting use of complex data and coefficients.

- The **Input complexity** menu lets you select or disable generation of ports and signal paths for the real and imaginary components of a complex signal. The **Input complexity** setting defaults to Real, disabling generation of ports for complex input data. To enable generation of ports for complex input data, set **Input complexity** to Complex.
- The Complex real part postfix option (corresponding to the ComplexRealPostfix command-line property) specifies a string appended to names generated for the real part of complex signals. The default postfix is '_re'.
- The Complex imaginary part postfix option (corresponding to the ComplexImagPostfix command-line line property) specifies a string appended to names generated for the imaginary part of complex signals. The default postfix is ' im'.

See also in the Filter Design HDL Coder documentation.

Generation of Model for Cosimulation Now Supports Multirate Filters

The coder now supports generation of cosimulation models for multirate filters. In previous releases, the coder supported generation of cosimulaton models for single-rate models only.

See for further information.

RAM Based Programmable Coefficients Supported for FIR Filters with Serial Architectures

For FIR filters with serial architectures, the coder now supports generation of a single-port or dual-port RAM interface for loading coefficients. Previous releases supported programmable coefficients stored in a register file.

For detailed information, see in the Filter Design HDL Coder documentation.

Version 2.4 (R2009a) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.4 (R2009a).

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations, below. See also Summary.	No

New features and changes introduced in this version are:

- "Complex Data Type Support for FIR, CIC, and Other Filter Structures" on page 30
- "Generation of Simulink Model for Cosimulation of Generated HDL Code" on page 32
- "Support for Programmable Coefficients for FIR Filters with Serial Architectures" on page 32
- "Support for Programmable Coefficients for IIR Filters" on page 33
- "Default Entity Conflict Postfix Changed" on page 33

Complex Data Type Support for FIR, CIC, and Other Filter Structures

The coder now supports use of complex coefficients and complex input signals for fully parallel FIR, CIC, and some other filter structures. In many cases, you can use complex data and complex coefficients in combination. The following table shows the filter structures that support complex data and/or coefficients, and the permitted combinations.

Filter Structure	Complex Data	Complex Coefficients	Complex Data and Coefficients
dfilt.dffir	Y	Y	Y
dfilt.dfsymfir	Y	Y	Υ

Filter Structure	Complex Data	Complex Coefficients	Complex Data and Coefficients
dfilt.dfasymfir	Y	Y	Y
dfilt.dffirt	Y	Y	Y
dfilt.scalar	Y	Y	Y
dfilt.delay	Y	N/A	N/A
mfilt.cicdecim	Y	N/A	N/A
mfilt.cicinterp	Y	N/A	N/A
mfilt.firdecim	Y	Y	N
mfilt.firinterp	Y	Y	N
mfilt.linearinterp	Y	N/A	N/A

Properties Supporting Complex Data Types

The new InputComplex code generation property instructs the coder whether or not to generate the appropriate ports and signal paths for the real and imaginary components of a complex signal. To enable generation of ports for complex input data, set InputComplex 'on', as in the following code example:

```
Hd = design(fdesign.lowpass,'equiripple','Filterstructure','dffir');
generatehdl(Hd, 'InputComplex', 'on');
```

Two new code generation properties have been added to help you customize naming conventions for the real and imaginary components of complex signals in generated HDL code. The new properties are:

- The ComplexRealPostfix property specifies a string to be appended to the names generated for the real part of complex signals. The default postfix is 're'. See also ComplexRealPostfix.
- The ComplexImagPostfix property specifies a string to be appended to the names generated for the imaginary part of complex signals. The default postfix is '_im'. See also ComplexImagPostfix.

See in the Filter Design HDL Coder User's Guide for complete details on complex data type support.

Generation of Simulink Model for Cosimulation of Generated HDL Code

The coder supports generation of a Simulink model that is configured for:

- Simulink simulation of your filter design
- Cosimulation of your design with an HDL simulator

The generated model includes a behavioral model of the filter design, realized in a Simulink subsystem, and a corresponding HDL Cosimulation block, configured to cosimulate the filter design using Simulink. You can generate an HDL Cosimulation block for either of the following EDA Simulator Link™ products:

- EDA Simulator Link (default)
- EDA Simulator Link

See for further information.

Support for Programmable Coefficients for FIR Filters with Serial Architectures

For FIR filters with serial architectures, the coder now supports generation of a memory interface for loading coefficients, and generation of testbench coefficients to test the interface. In previous releases, these options were supported only for fully parallel FIR filters.

Programmable coefficients are supported for all serial architecture options (fully serial, partly serial, and cascade serial) of the following direct-form FIR filter types:

- dfilt.dffir
- dfilt.dfsymfir
- dfilt.dfasymfir

For detailed information, see in the Filter Design HDL Coder User's Guide.

Support for Programmable Coefficients for IIR Filters

For IIR filters, the coder now supports generation of a memory interface for loading coefficients, and generation of testbench coefficients to test the interface. In previous releases, this option was supported only for FIR filters.

The following IIR filter types support programmable filter coefficients:

- Second-order section (SOS) infinite impulse response (IIR) Direct Form I (dfilt.df1sos)
- SOS IIR Direct Form I transposed (dfilt.df1tsos)
- SOS IIR Direct Form II (dfilt.df2sos)
- SOS IIR Direct Form II transposed (dfilt.df2tsos)

For detailed information, see in the Filter Design HDL Coder documentation.

Default Entity Conflict Postfix Changed

The default value for the **Entity conflict postfix** property (and the corresponding CLI property, EntityConflictPostfix) has been changed from 'entity' to 'block'.

Compatibility Considerations

If your scripts rely on the previous default value ('_entity') for the **Entity conflict postfix** property, you will need to explicitly set the property value to '_entity'.

Version 2.3 (R2008b) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.3 (R2008b).

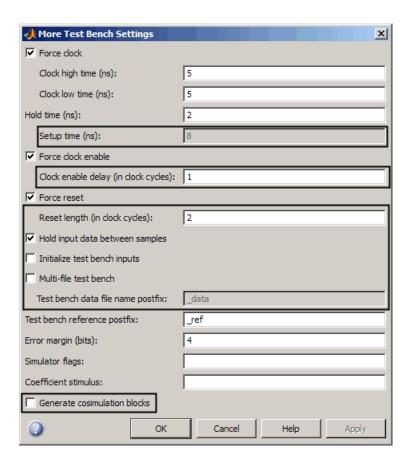

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations, below. See also Summary.	No

New features and changes introduced in this version are:

- "Test Bench Enhancements" on page 34
- "Distributed Arithmetic Restriction Removed for Symmetrical and Asymmetrical FIR Filters" on page 36
- "-novopt Flag Added to the Default Simulation Command in Generated Compilation Scripts" on page 36
- "ModelSim .do Test Bench Option Removed" on page 37

Test Bench Enhancements

The appearance of the More Test Bench Settings dialog box has been revised, and a number of options have been added. The following figure shows the default set of options in the More Test Bench Settings dialog box. Options that have been added to the GUI are highlighted.

Each new option (except **Setup time (ns)**) has a corresponding command-line property. The following table lists the new options and their corresponding command-line properties, and provides hyperlinks to the relevant documentation.

GUI Option	Command-Line Property
Setup time (ns): See and .	This display-only field does not have a corresponding user-settable command-line property.
Clock enable delay (in clock cycles): See .	TestBenchClockEnableDelay

GUI Option	Command-Line Property
Reset length: See .	ResetLength
Hold input data between samples: See .	HoldInputDataBetweenSamples
Initialize test bench inputs: See .	InitializeTestBenchInputs
Multi-file test bench: See .	MultifileTestBench
Test bench data file name postfix: See .	TestBenchDataPostFix
Test bench reference postfix: See .	TestBenchReferencePostFix
Generate cosimulation blocks: See .	GenerateCoSimBlock

Distributed Arithmetic Restriction Removed for Symmetrical and Asymmetrical FIR Filters

The DARadix property specifies the number of bits processed simultaneously in a distributed arithmetic architecture. In previous releases, when generating code for symmetrical (dfilt.dfsymfir) or asymmetrical (dfilt.dfasymfir) FIR filters, the DARadix value was required to be less than or equal to 2. Specification of a DARadix value greater than 2 for these filter types caused a warning to be issued during code generation.

In Release 2008b, the coder permits use of DARadix values greater than 2 for these filter types. Other requirements for setting the DARadix property still apply. For details, see and in the Filter Design HDL Coder documentation.

For general information on distributed arithmetic support, see in the Filter Design HDL Coder documentation.

-novopt Flag Added to the Default Simulation Command in Generated Compilation Scripts

For improved operation with the ModelSim® (Version 6.2 and later) simulator, the default values of the HDLSimCmd property string (and the **Simulation Command** GUI option) now includes the -novopt flag, as follows:

^{&#}x27;vsim -novopt work.%s\n'

The -novopt flag directs the ModelSim simulator not to perform optimizations that remove signals from the simulation view.

Compatibility Considerations

If you are using ModelSim 6.0 or an earlier version, you should set the HDLSimCmd property string (or the **Simulation Command** GUI option) to omit the -novopt option, as follows:

'vsim work.%s\n'

ModelSim .do Test Bench Option Removed

The **Modelsim** .do file test bench generation option, and the corresponding 'Modelsim' test bench type argument for the generatetb function, are no longer supported and have been removed from the current release.

In the current release, generatetb displays an error message and terminates test bench generation if the 'Modelsim' test bench type option is specified.

Compatibility Considerations

If your scripts use the 'Modelsim' test bench type argument for the generatetb function, you should remove the 'Modelsim' argument. The test bench type will then default to the current setting of the TargetLanguage property ('VHDL' or 'Verilog').

See also generatetb.

Version 2.2 (R2008a) Filter Design HDL Coder Software

This table summarizes what's new in Version 2.2 (R2008a).

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations, below. See also Summary.	No

New features and changes introduced in this version are:

- "Code Generation Support for Multirate Farrow Sample Rate Converter Filters" on page 38
- "Multifile Test Bench Generation" on page 39
- "Additional command-line Properties Supported" on page 39
- "GUI Support for Processor Interface for FIR Filter Coefficients" on page 39

Code Generation Support for Multirate Farrow Sample Rate Converter Filters

The coder now supports HDL code generation for multirate Farrow sample rate converter (mfilt.farrowsrc) filters.

The coder also supports code generation for cascades that include a mfilt.farrowsrc filter, provided that the mfilt.farrowsrc filter is in the last position of the cascade.

See for further information.

Multifile Test Bench Generation

You can now direct the coder to generate separate files for test bench code, helper functions, and test bench data using the following command—line properties:

- MultifileTestBench: This property lets you divide the generated test bench into separate files containing helper functions, data, and HDL test bench code. See MultifileTestBench for details.
- TestbenchDataPostfix: This property lets you specify a suffix added to the test bench data file name when generating a multi-file test bench. See TestBenchDataPostFix for details.

Additional command-line Properties Supported

The following command-line properties are supported in the current release:

- HoldInputDataBetweenSamples: You can apply this property to filters that do not have parallel architectures. In such filters, data can be delivered to the outputs N cycles (N >= 2) later than the inputs. The HoldInputDataBetweenSamples property determines how long (in terms of clock cycles) input data values for these signals are held in a valid state. See HoldInputDataBetweenSamples for details.
- TestBenchReferencePostFix: This property lets you specify a string appended to the names of reference signals generated in test bench code. See TestBenchReferencePostFix for details.

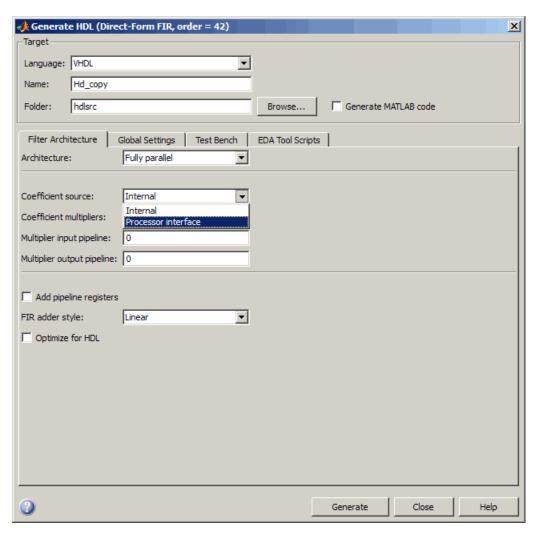

GUI Support for Processor Interface for FIR Filter Coefficients

For direct-form FIR filters, the coder now provides two GUI options that let you generate a processor interface for loading coefficients, and test the interface. These options correspond to the CoefficientSource and TestbenchCoeffStimulus properties, introduced in the previous release.

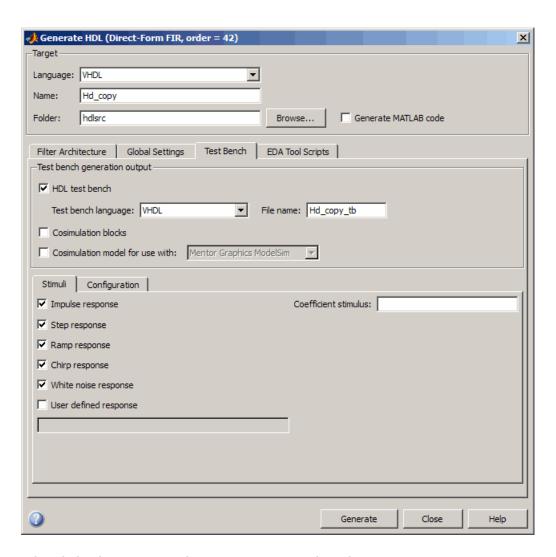

The new GUI options are:

• The **Coefficient source** menu on the Generate HDL dialog box (shown in the following figure) lets you select whether coefficients are obtained from the filter object and hard-coded (Internal), or from a generated interface

(Processor interface). The corresponding command-line property is CoefficientSource.

• The **Coefficient stimulus** option on the More Test Bench Settings dialog box lets you specify how the test bench tests the generated processor interface. The corresponding command-line property is TestbenchCoeffStimulus.

For detailed information on these options, see in the Filter Design HDL Coder User's Guide.

generatetb Supports Default Specification of Test Bench Type

In previous releases, the generatetb function required an explicit argument specifying the test bench type.

In the current release, you can optionally omit the test bench type argument. In this case, the test bench type defaults to the current setting of the TargetLanguage property ('VHDL' or 'Verilog'). The TargetLanguage property is set by the most recent execution of the generatehol command.

In the following example, TargetLanguage is set to 'Verilog' by the generatehdl command. Then, generatetb generates a Verilog test bench, by default.

```
>> generatehdl(my_filter,'TargetLanguage','Verilog')
### Starting Verilog code generation process for filter: my_filter
### Starting Verilog code generation process for filter: my_filter
### Generating: H:\hdlsrc\my_filter.v
### Starting generation of my_filter Verilog module
### Starting generation of my_filter Verilog module body
### HDL latency is 2 samples
### Successful completion of Verilog code generation process for filter: my_filter
>> generatetb(my_filter, 'TestBenchName', 'MyFilterTB_V')
### Starting generation of VERILOG Test Bench
### Generating input stimulus
### Done generating input stimulus; length 3312 samples.
### Generating Test bench: H:\hdlsrc\MyFilterTB_V.v
### Please wait ......
### Done generating VERILOG Test Bench
```

See also generatetb.

Functions and Properties Being Removed

For more information about the process of removing functions and properties, see "About Functions and Properties Being Removed" in "What Is in the Release Notes" on page 2.

Function or Property Name	What Happens When You Use Function or Property?	Use This Instead	Compatibility Considerations
'Modelsim' test bench type argument for generatetb function	Warns	No replacement	See "ModelSim .do Test Bench Option Deprecated" on page 43.
ScaleWarnBits property	Property is ignored	No replacement	See "ScaleWarnBits Property No Longer Supported" on page 44.

ModelSim .do Test Bench Option Deprecated

The **Modelsim** .do file test bench generation option, and the corresponding 'Modelsim' test bench type argument for the generatetb function, are deprecated in the current release and will not be supported in future releases.

In the current release, the coder displays a warning during test bench generation if this option is specified.

Compatibility Considerations

If your scripts use the 'Modelsim' test bench type argument for the generatetb function, you should remove the 'Modelsim' argument. The test bench type will then take a default value as described in "generatetb Supports Default Specification of Test Bench Type" on page 42.

See also generatetb.

ScaleWarnBits Property No Longer Supported

The ScaleWarnBits property is no longer supported. The corresponding GUI option, **Minimum overlap of scale values (bits)**, has been removed from the **Advanced** pane of the More HDL Settings dialog box.

Compatibility Considerations

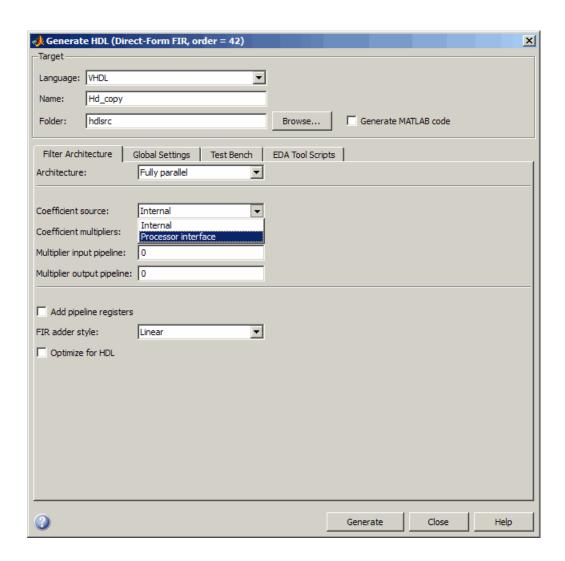

If you have files that contain commands that reference the ScaleWarnBits property, such references are ignored. Remove references to ScaleWarnBits from your code.

Summary of GUI Enhancements and Revisions

This section summarizes revisions and enhancements that have been made to the Filter Design HDL Coder GUI.

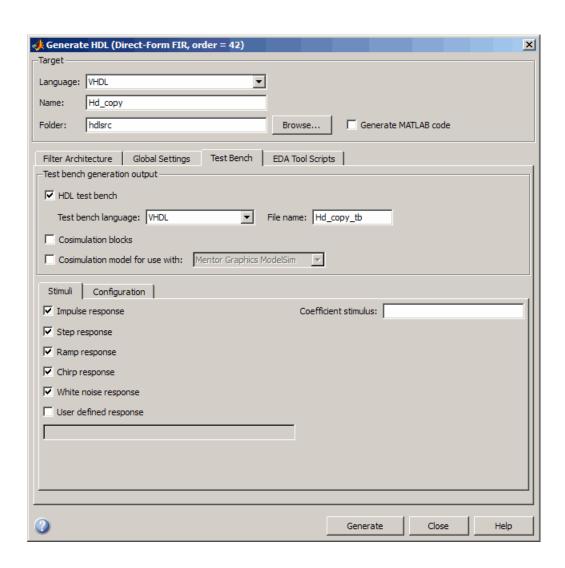

Generate HDL Dialog Box

The Generate HDL dialog box now includes the **Coefficient source** menu. See "GUI Support for Processor Interface for FIR Filter Coefficients" on page 39.

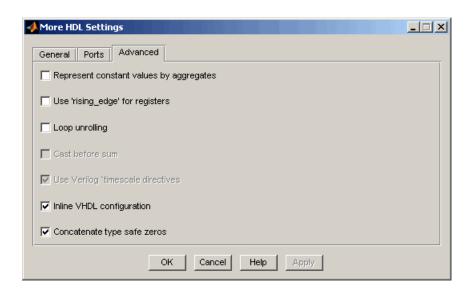

More Test Bench Settings Dialog Box

The More Test Bench Settings dialog box now includes the **Coefficient stimulus** option. See "GUI Support for Processor Interface for FIR Filter Coefficients" on page 39.

More HDL Settings Dialog Box

The **Minimum overlap of scale values (bits)** option has been removed from the **Advanced** pane of the More HDL Settings dialog box. (See "ScaleWarnBits Property No Longer Supported" on page 44.) The following figure shows the default settings for the **Advanced** pane.

Compatibility Summary for Filter Design HDL Coder Software

This table summarizes new features and changes that might cause incompatibilities when you upgrade from an earlier version, or when you use files on multiple versions. Details are provided in the description of the new feature or change.

Version (Release)	New Features and Changes with Version Compatibility Impact
Latest Version V2.8 (R2011a)	See the Compatibility Considerations subheading for this new feature or change: • "generatetb Function Removed" on page 5
V2.7 (R2010b)	None
V2.6 (R2010a)	See the Compatibility Considerations subheading for this new feature or change: • "GenerateCosimModel 'IN' and 'MQ' Property Values Removed" on page 21
V2.5 (R2009b)	See the Compatibility Considerations subheading for this new feature or change: • "Graphical User Interface Improved and Revised" on page 22 • "GenerateCosimModel 'IN' and 'MQ' Property Values Replaced" on page 26

Version (Release)	New Features and Changes with Version Compatibility Impact
V2.4 (R2009a)	See the Compatibility Considerations subheading for this new feature or change:
	• "Default Entity Conflict Postfix Changed" on page 33
V2.3 (R2008b)	See the Compatibility Considerations subheading for this new feature or change: • "-novopt Flag Added to the Default Simulation Command in Generated Compilation Scripts" on page 36 • "ModelSim .do Test Bench Option
V2.2 (R2008a)	Removed" on page 37 See the Compatibility
	Considerations subheading for this new feature or change: • "ScaleWarnBits Property No
	 Longer Supported" on page 44 "ModelSim .do Test Bench Option Deprecated" on page 43
