Check for incorrect file names	5-119
Check folder names	5-120
Check for prohibited blocks in discrete controllers	5-121
Check for prohibited sink blocks	5-122
Check positioning and configuration of ports	5-123
Check for matching port and signal names	5-125
Check whether block names appear below blocks	5-126
Check for mixing basic blocks and subsystems	5-127
Check for unconnected ports and signal lines	5-128
Check for incorrect position of Trigger and Enable blocks	5-129
Check for annotations with drop shadows	5-130
Check use of tunable parameters in blocks	5-131
Check whether Stateflow events are defined at the chart level or below	5-132
Check Stateflow data objects with local scope	5-133
Check for Strong Data Typing with Simulink I/O	5-134
Check for exclusive and default states and substate correctness	5-135
Check Implement logic signals as Boolean data (vs. double)	5-137
Check model diagnostic parameters	5-138
Check the display attributes of block names	5-141
Check display for port blocks	5-142
Check subsystem names	5-143
Check port block names	5-144
Check signal labels for incorrect characters	5-145
Check block names for incorrect characters	5-147
Check Trigger and Enable block names	5-148
Check for Simulink diagrams using nonstandard display attributes	5-149

Check visibility of block port names	5-151
Check orientation of Subsystem blocks	5-153
Check configuration of Relational Operator blocks	5-154
Check for tunable parameters in Stateflow charts	5-155
Check use of Switch blocks	5-156
Check for signal bus and Mux block usage	5-157
Check for bitwise operations in Stateflow charts	5-158
Check for comparison operations in Stateflow charts	5-160
Check for unary minus operations on unsigned integers in Stateflow charts	5-161
Check for equality operations between floating-point expressions in Stateflow charts	5-162
Check for mismatches between names of Stateflow ports and associated signals	5-163
Check scope of From and Goto blocks	5-164
Requirements Consistency Checks	5-165
Identify requirement links with missing documents	5-166
Identify requirement links that specify invalid locations within documents	5-167
Identify selection-based links having descriptions that do not match their requirements document text	5-168
Identify requirement links with path type inconsistent with preferences	5-170

Index

Function Reference

Requirements Management
Interface (p. 1-2)

Manage links between requirements
documents and Simulink® objects

Model Coverage (p. 1-3)

Configure and execute model
coverage tests; store and report test
results

Component Analysis and
Verification (p. 1-5)

Define workflows for testing models,
subsystems, and atomic subcharts

Model Checking (p. 1-6)

Check systems by running Model
Advisor checks; view results in
Command Window, web browser, or
Model Advisor window

Model Advisor Customization API
(p. 1-7)

Customize the Model Advisor tree;
create new checks and folders

Model Advisor Result Template API
(p. 1-9)

Template for formatting Model
Advisor results

Model Advisor Formatting API
(p. 1-10)

Format Model Advisor outputs

Requirements Management Interface

<code>rmi</code>	Interact programmatically with Requirements Management Interface
<code>rmi.doorssync</code>	Synchronize model with DOORS® surrogate module
<code>rmi.objinfo</code>	Return navigation information for model object
<code>rmidata.default</code>	Specify default requirements storage location for new models
<code>rmidata.export</code>	Move requirements information to external file
<code>rmidata.map</code>	Associate external requirements information with model
<code>rmidocrename</code>	Update model requirements document paths and file names
<code>rmiobjnavigate</code>	Navigate to model objects using unique Requirements Management Interface identifiers
<code>rmiref.insertRefs</code>	Insert links to models into requirements documents
<code>rmiref.removeRefs</code>	Remove links to models from requirements documents
<code>rmitag</code>	Manage user tags for requirements links
<code>RptgenRMI.doorsAttribs</code>	IBM® Rational® DOORS attributes in requirements report

Model Coverage

<code>add (cv.cvtestgroup)</code>	Add <code>cvtest</code> objects
<code>allNames (cv.cvdatagroup)</code>	Get names of all models associated with <code>cvdata</code> objects in <code>cv.cvdatagroup</code>
<code>allNames (cv.cvtestgroup)</code>	Get names of all models associated with <code>cvtest</code> objects in <code>cv.cvtestgroup</code>
<code>complexityinfo</code>	Cyclomatic complexity coverage information
<code>conditioninfo</code>	Collect condition coverage information for model object
<code>cv.cvdatagroup</code>	Create collection of <code>cvdata</code> objects for model reference hierarchy
<code>cv.cvtestgroup</code>	Create collection of <code>cvtest</code> objects for model reference hierarchy
<code>cvexit</code>	Exit model coverage environment
<code>cvhtml</code>	Produce HTML report from model coverage objects
<code>cvload</code>	Load coverage tests and stored results into memory
<code>cvmodelview</code>	Display model coverage results with model coloring
<code>cvsave</code>	Save coverage tests and results to file
<code>cvsim</code>	Simulate and return model coverage results for test objects
<code>cvsimref</code>	Simulate and return model coverage results for referenced models
<code>cvtest</code>	Create model coverage test specification object

<code>decisioninfo</code>	Display decision coverage information for model object
<code>get (cv.cvdatagroup)</code>	Get <code>cvdata</code> object
<code>get (cv.cvtestgroup)</code>	Get <code>cvtest</code> objects
<code>getAll (cv.cvdatagroup)</code>	Get all <code>cvdata</code> objects
<code>getCoverageInfo</code>	Coverage information for Simulink® Design Verifier™ blocks
<code>mcdcinfo</code>	Collect modified condition/decision coverage information for model object
<code>sigrangeinfo</code>	Collect signal range coverage information for model object
<code>sigsizeinfo</code>	Collect signal size coverage information for model object
<code>tableinfo</code>	Display lookup table coverage information for model object

Component Analysis and Verification

Model Preparation (p. 1-5)

Test Execution (p. 1-5)

Analysis Results (p. 1-5)

Model Preparation

`slvnvextract`

Extract subsystem or subchart contents into new model for analysis

`slvnvlogsignals`

Log simulation input port values

Test Execution

`slvnvruncgvtest`

Invoke Code Generation Verification (CGV) API and execute model

`slvnvruntest`

Simulate model using input data

`slvnvruntestopts`

Generate simulation or execution options for `slvnvruntest` or `slvnvruncgvtest`

Analysis Results

`slnvvharnessopts`

Generate default options for `slvnvmakeharness`

`slvnvmakeharness`

Generate Simulink® Verification and Validation™ harness model

`slvnvmergedata`

Merge test case data

`slvnvmergeharness`

Merge test cases and initializations into one model

Model Checking

ModelAdvisor.lookupCheckID	Look up Model Advisor check ID
ModelAdvisor.run	Run Model Advisor checks on systems
ModelAdvisor.summaryReport	Open Model Advisor Command-Line Summary report
view	View Model Advisor run results for checks
viewReport	View Model Advisor run results for systems

Model Advisor Customization API

addCheck (ModelAdvisor.FactoryGroup)	Add check to folder
addGroup (ModelAdvisor.Group)	Add subfolder to folder
addProcedure (ModelAdvisor.Group)	Add procedure to folder
addProcedure (ModelAdvisor.Procedure)	Add subprocedure to procedure
addTask (ModelAdvisor.Group)	Add task to folder
addTask (ModelAdvisor.Procedure)	Add task to procedure
getID (ModelAdvisor.Check)	Return check identifier
ModelAdvisor.Action	Add actions to custom checks
ModelAdvisor.Check	Create custom checks
ModelAdvisor.FactoryGroup	Define subfolder in By Task folder
ModelAdvisor.Group	Define custom folder
ModelAdvisor.InputParameter	Add input parameters to custom checks
ModelAdvisor.ListViewParameter	Add list view parameters to custom checks
ModelAdvisor.Procedure	Define custom procedures
ModelAdvisor.Root	Identify root node
ModelAdvisor.Task	Define custom tasks
publish (ModelAdvisor.Root)	Publish object in Model Advisor root
register (ModelAdvisor.Root)	Register object in Model Advisor root
setAction (ModelAdvisor.Check)	Specify action for check
setCallbackFcn (ModelAdvisor.Action)	Specify action callback function
setCallbackFcn (ModelAdvisor.Check)	Specify callback function for check
setCheck (ModelAdvisor.Task)	Specify check used in task

setColSpan (ModelAdvisor.InputParameter)	Specify number of columns for input parameter
setInputParameters (ModelAdvisor.Check)	Specify input parameters for check
setInputParametersLayoutGrid (ModelAdvisor.Check)	Specify layout grid for input parameters
setRowSpan (ModelAdvisor.InputParameter)	Specify rows for input parameter

Model Advisor Result Template API

<code>addRow</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add row to table
<code>ModelAdvisor.FormatTemplate</code>	Construct template object for formatting Model Advisor analysis results
<code>setCheckText</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add description of check to result
<code>setColTitles</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add column titles to table
<code>setInformation</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add description of subcheck to result
<code>setListObj</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add list of hyperlinks to model objects
<code>setRecAction</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add Recommended Action section and text
<code>setRefLink</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add See Also section and links
<code>setSubBar</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add line between subcheck results
<code>setSubResultStatus</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add status to check or subcheck result
<code>setSubResultStatusText</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add text below status in result
<code>setSubTitle</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add title for subcheck in result
<code>setTableInfo</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add data to table
<code>setTableTitle</code> (<code>ModelAdvisor.FormatTemplate</code>)	Add title to table

Model Advisor Formatting API

<code>addItem (ModelAdvisor.List)</code>	Add item to list
<code>addItem (ModelAdvisor.Paragraph)</code>	Add item to paragraph
<code>getEntry (ModelAdvisor.Table)</code>	Get table cell contents
<code>ModelAdvisor.Image</code>	Include image in Model Advisor output
<code>ModelAdvisor.LineBreak</code>	Insert line break
<code>ModelAdvisor.List</code>	Create list class
<code>ModelAdvisor.Paragraph</code>	Create and format paragraph
<code>ModelAdvisor.Table</code>	Create table
<code>ModelAdvisor.Text</code>	Create Model Advisor text output
<code>setAlign (ModelAdvisor.Paragraph)</code>	Specify paragraph alignment
<code>setBold (ModelAdvisor.Text)</code>	Specify bold text
<code>setColHeading (ModelAdvisor.Table)</code>	Specify table column title
<code>setColHeadingAlign (ModelAdvisor.Table)</code>	Specify column title alignment
<code>setColor (ModelAdvisor.Text)</code>	Specify text color
<code>setColWidth (ModelAdvisor.Table)</code>	Specify column widths
<code>setEntries (ModelAdvisor.Table)</code>	Set contents of table
<code>setEntry (ModelAdvisor.Table)</code>	Add cell to table
<code>setEntryAlign (ModelAdvisor.Table)</code>	Specify table cell alignment
<code>setHeading (ModelAdvisor.Table)</code>	Specify table title
<code>setHeadingAlign (ModelAdvisor.Table)</code>	Specify table title alignment
<code>setHyperlink (ModelAdvisor.Image)</code>	Specify hyperlink location
<code>setHyperlink (ModelAdvisor.Text)</code>	Specify hyperlinked text
<code>setImageSource (ModelAdvisor.Image)</code>	Specify image location

<code>setItalic (ModelAdvisor.Text)</code>	Italicize text
<code>setRetainSpaceReturn (ModelAdvisor.Text)</code>	Retain spacing and returns in text
<code>setRowHeading (ModelAdvisor.Table)</code>	Specify table row title
<code>setRowHeadingAlign (ModelAdvisor.Table)</code>	Specify table row title alignment
<code>setSubscript (ModelAdvisor.Text)</code>	Specify subscripted text
<code>setSuperscript (ModelAdvisor.Text)</code>	Specify superscripted text
<code>setType (ModelAdvisor.List)</code>	Specify list type
<code>setUnderlined (ModelAdvisor.Text)</code>	Underline text

Model Coverage

cv.cvdatagroup

Collection of cvdata objects

cv.cvtestgroup

Collection of cvtest objects

Model Advisor Customization API

ModelAdvisor.Action	Add actions to custom checks
ModelAdvisor.Check	Create custom checks
ModelAdvisor.FactoryGroup	Define subfolder in By Task folder
ModelAdvisor.Group	Define custom folder
ModelAdvisor.InputParameter	Add input parameters to custom checks
ModelAdvisor.ListViewParameter	Add list view parameters to custom checks
ModelAdvisor.Procedure	Define custom procedures
ModelAdvisor.Root	Identify root node
ModelAdvisor.Task	Define custom tasks

Model Advisor Result Template API

ModelAdvisor.FormatTemplate

Template for formatting Model
Advisor analysis results

Model Advisor Formatting API

ModelAdvisor.Image	Include image in Model Advisor output
ModelAdvisor.LineBreak	Insert line break
ModelAdvisor.List	Create list class
ModelAdvisor.Paragraph	Create and format paragraph
ModelAdvisor.Table	Create table
ModelAdvisor.Text	Create Model Advisor text output

Functions — Alphabetical List

cv.cvtestgroup.add

Purpose Add cvtest objects

Syntax `add(cvtg, cvto1, cvto2, ...)`

Description `add(cvtg, cvto1, cvto2, ...)` adds the cvtest objects specified by the strings `cvto1`, `cvto2`, etc. to `cvtg`, which is an instantiation of the `cv.cvtestgroup` class.

Examples Create two cvtest objects and add them to a newly created `cv.cvtestgroup` object:

```
cvto1 = cvtest;
cvto2 = cvtest;
cvtg = cv.cvtestgroup;
add(cvtg, cvto1, cvto2);
```

ModelAdvisor.FactoryGroup.addCheck

Purpose Add check to folder

Syntax addCheck(fg_obj, check_ID)

Description addCheck(fg_obj, check_ID) adds checks, identified by check_ID, to the folder specified by fg_obj, which is an instantiation of the ModelAdvisor.FactoryGroup class.

Examples Add three checks to rec:

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
.
.
.
addCheck(rec, 'com.mathworks.sample.Check1');
addCheck(rec, 'com.mathworks.sample.Check2');
addCheck(rec, 'com.mathworks.sample.Check3');
```

ModelAdvisor.Group.addGroup

Purpose Add subfolder to folder

Syntax `addGroup(group_obj, child_obj)`

Description `addGroup(group_obj, child_obj)` adds a new subfolder, identified by `child_obj`, to the folder specified by `group_obj`, which is an instantiation of the `ModelAdvisor.Group` class.

Examples Add three checks to rec:

```
group_obj = ModelAdvisor.Group('com.mathworks.sample.group');  
.br/>.br/>.br/>addGroup(group_obj, 'com.mathworks.sample.subgroup1');  
addGroup(group_obj, 'com.mathworks.sample.subgroup2');  
addGroup(group_obj, 'com.mathworks.sample.subgroup3');
```

Purpose Add item to list

Syntax `addItem(element)`

Description `addItem(element)` adds items to the list created by the `ModelAdvisor.List` constructor.

Input Arguments *element* Specifies an element to be added to a list in one of the following:

- Element
- Cell array of elements. When you add a cell array to a list, they form different rows in the list.
- String

Examples

```
subList = ModelAdvisor.List();
setType(subList, 'numbered')
addItem(subList, ModelAdvisor.Text('Sub entry 1', {'pass', 'bold'}));
addItem(subList, ModelAdvisor.Text('Sub entry 2', {'pass', 'bold'}));
```

How To

- “Customizing the Model Advisor”

ModelAdvisor.Paragraph.addItem

Purpose Add item to paragraph

Syntax addItem(text, element)

Description addItem(text, element) adds an element to text. element is one of the following:

- String
- Element
- Cell array of elements

Examples Add two lines of text:

```
result = ModelAdvisor.Paragraph;  
addItem(result, [resultText1 ModelAdvisor.LineBreak resultText2]);
```

How To • “Customizing the Model Advisor”

ModelAdvisor.Group.addProcedure

Purpose Add procedure to folder

Syntax `addProcedure(group_obj, procedure_obj)`

Description `addProcedure(group_obj, procedure_obj)` adds a procedure, specified by `procedure_obj`, to the folder `group_obj`. `group_obj` is an instantiation of the `ModelAdvisor.Group` class.

Examples Add three procedures to MAG.

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');

MAP1=ModelAdvisor.Procedure('com.mathworks.sample.procedure1');
MAP2=ModelAdvisor.Procedure('com.mathworks.sample.procedure2');
MAP3=ModelAdvisor.Procedure('com.mathworks.sample.procedure3');

addProcedure(MAG, MAP1);
addProcedure(MAG, MAP2);
addProcedure(MAG, MAP3);
```

ModelAdvisor.Procedure.addProcedure

Purpose Add subprocedure to procedure

Syntax `addProcedure(procedure1_obj, procedure2_obj)`

Description `addProcedure(procedure1_obj, procedure2_obj)` adds a procedure, specified by `procedure2_obj`, to the procedure `procedure1_obj`. `procedure2_obj` and `procedure1_obj` are instantiations of the `ModelAdvisor.Procedure` class.

Examples Add three procedures to MAP.

```
MAP = ModelAdvisor.Procedure('com.mathworks.sample.ProcedureSample');

MAP1=ModelAdvisor.Procedure('com.mathworks.sample.procedure1');
MAP2=ModelAdvisor.Procedure('com.mathworks.sample.procedure2');
MAP3=ModelAdvisor.Procedure('com.mathworks.sample.procedure3');

addProcedure(MAP, MAP1);
addProcedure(MAP, MAP2);
addProcedure(MAP, MAP3);
```

ModelAdvisor.FormatTemplate.addRow

Purpose Add row to table

Syntax `addRow(ft_obj, {item1, item2, ..., itemn})`

Description `addRow(ft_obj, {item1, item2, ..., itemn})` is an optional method that adds a row to the end of a table in the result. `ft_obj` is a handle to the template object previously created. `{item1, item2, ..., itemn}` is a cell array of strings and objects to add to the table. The order of the items in the array determines which column the item is in. If you do not add data to the table, the Model Advisor does not display the table in the result.

Note Before adding rows to a table, you must specify column titles using the `setColTitle` method.

Examples Find all of the blocks in the model and create a table of the blocks:

```
% Create FormatTemplate object, specify table format
ft = ModelAdvisor.FormatTemplate('TableTemplate');

% Add information to the table
setTableTitle(ft, {'Blocks in Model'});
setColTitles(ft, {'Index', 'Block Name'});
% Find all the blocks in the system and add them to a table.
allBlocks = find_system(system);
for inx = 2 : length(allBlocks)
    % Add information to the table
    addRow(ft, {inx-1,allBlocks(inx)});
end
```

How To

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

ModelAdvisor.Group.addTask

Purpose Add task to folder

Syntax `addTask(group_obj, task_obj)`

Description `addTask(group_obj, task_obj)` adds a task, specified by `task_obj`, to the folder `group_obj.group_obj` is an instantiation of the `ModelAdvisor.Group` class.

Examples Add three tasks to MAG.

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');  
addTask(MAG, MAT1);  
addTask(MAG, MAT2);  
addTask(MAG, MAT3);
```

Purpose

Add task to procedure

Syntax

```
addTask(procedure_obj, task_obj)
```

Description

`addTask(procedure_obj, task_obj)` adds a task, specified by `task_obj`, to `procedure_obj`. `procedure_obj` is an instantiation of the `ModelAdvisor.Procedure` class.

Examples

Add three tasks to MAP.

```
MAP = ModelAdvisor.Procedure('com.mathworks.sample.ProcedureSample');
```

```
MAT1=ModelAdvisor.Task('com.mathworks.sample.task1');
```

```
MAT2=ModelAdvisor.Task('com.mathworks.sample.task2');
```

```
MAT3=ModelAdvisor.Task('com.mathworks.sample.task3');
```

```
addTask(MAP, MAT1);
```

```
addTask(MAP, MAT2);
```

```
addTask(MAP, MAT3);
```

cv.cvdatagroup.allNames

Purpose Get names of all models associated with cvdata objects in cv.cvdatagroup

Syntax models = allNames(cvdg)

Description models = allNames(cvdg) returns a cell array of strings identifying all model names associated with the cvdata objects in cvdg, an instantiation of the cv.cvdatagroup class.

Examples Add three cvdata objects to cvdg and return a cell array of model names:

```
a = cvdata;  
b = cvdata;  
c = cvdata;  
cvdg = cv.cvdatagroup;  
add (cvdg, a, b, c);  
model_names = allNames(cvdg)
```

- Purpose** Get names of all models associated with `cvtest` objects in `cv.cvtestgroup`
- Syntax** `models = allNames(cvtg)`
- Description** `models = allNames(cvtg)` returns a cell array of strings identifying all model names associated with the `cvtest` objects in `cvtg`, an instantiation of the `cv.cvtestgroup` class.
- Examples** Add three `cvtest` objects to `cvtg` and return a cell array of model names:
- ```
d = cvtest;
e = cvtest;
f = cvtes;
cvtg = cv.cvtestgroup;
add (cvtg, d, e, f);
model_names = allNames(cvtg)
```

# complexityinfo

---

**Purpose** Cyclomatic complexity coverage information

**Syntax** `complexity = complexityinfo(cvdo, object)`

**Description** `complexity = complexityinfo(cvdo, object)` returns complexity coverage results from the cvdata object `cvdo` for the model component `object`.

**Input Arguments**

`cvdo`  
cvdata object

`object`

The `object` argument specifies an object in the model or Stateflow® chart that received decision coverage. Valid values for `object` include the following:

| <b>Object Specification</b>    | <b>Description</b>                                                                                                           |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>BlockPath</code>         | Full path to a model or block                                                                                                |
| <code>BlockHandle</code>       | Handle to a model or block                                                                                                   |
| <code>s1Obj</code>             | Handle to a Simulink API object                                                                                              |
| <code>sfID</code>              | Stateflow ID                                                                                                                 |
| <code>sfObj</code>             | Handle to a Stateflow API object from a singly instantiated Stateflow chart                                                  |
| <code>{BlockPath, sfID}</code> | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart |

## Object Specification

{BlockPath, sfObj}

[BlockHandle, sfID]

## Description

Cell array with the path to a Stateflow chart or subchart and a Stateflow object API handle contained in that chart or subchart

Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart

## Output Arguments

complexity

If `cvdo` does not contain cyclomatic complexity coverage results for `object`, `complexity` is empty.

If `cvdo` contains cyclomatic complexity coverage results for `object`, `complexity` is a two-element vector of the form `[total_complexity local_complexity]`:

|                               |                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------|
| <code>total_complexity</code> | Cyclomatic complexity coverage for <code>object</code> and its descendants (if any) |
| <code>local_complexity</code> | Cyclomatic complexity coverage for <code>object</code>                              |

If `object` has variable-size signals, `complexity` also contains the variable complexity.

## Examples

Open the `sldemo_fuelsys` model and create the test specification object `testObj`. Enable decision, condition, and MCDC coverage for `sldemo_fuelsys` and execute `testObj` using `cvsim`. Use `complexityinfo` to retrieve cyclomatic complexity results for the Throttle subsystem. The Throttle subsystem itself does not record cyclomatic complexity coverage results, but the contents of the subsystem do record cyclomatic complexity coverage.

```
mdl = 'sldemo_fuelsys';
open_system(mdl);
testObj = cvtest(mdl)
testObj.settings.decision = 1;
testObj.settings.condition = 1;
testObj.settings.mcdc = 1;
data = cvsim(testObj);
blk_handle = get_param([mdl, ...
 '/Engine Gas Dynamics/Throttle & Manifold/Throttle'],...
 'Handle');
coverage = complexityinfo(data, blk_handle);
coverage
```

## Alternatives

To collect and display cyclomatic complexity coverage results in the coverage report:

- 1 Open the model.
- 2 In the Model Editor, select **Tools > Coverage Settings**.
- 3 On the **Coverage** tab, under **Coverage Metrics**, select:
  - **Decision**
  - **Condition**
  - **MCDC**
- 4 On the **Reporting** tab, click **HTML Settings**.
- 5 On the HTML Settings dialog box, select:
  - **Include cyclomatic complexity numbers in summary**
  - **Include cyclomatic complexity numbers in block details**
- 6 Click **OK** to close the HTML Settings dialog box and save your changes.

**7** Click **OK** to close the Coverage Settings dialog box and save your changes.

**8** Simulate the model and review the results in the HTML report.

## How To

- “Cyclomatic Complexity”

# conditioninfo

---

## Purpose

Collect condition coverage information for model object

## Syntax

```
coverage = conditioninfo(cvdo, object)
coverage = conditioninfo(cvdo, object, ignore_descendants)
[coverage, description] = conditioninfo(cvdo, object)
```

## Description

`coverage = conditioninfo(cvdo, object)` returns condition coverage results from the cvdata object `cvdo` for the model component specified by `object`.

`coverage = conditioninfo(cvdo, object, ignore_descendants)` returns condition coverage results for `object`, depending on the value of `ignore_descendants`.

`[coverage, description] = conditioninfo(cvdo, object)` returns condition coverage results and textual descriptions of each condition in `object`.

## Input Arguments

`cvdo`

cvdata object

`ignore_descendants`

Logical value that specifies whether to ignore the coverage of descendant objects

1 to ignore coverage of descendant objects

0 (default) to collect coverage of descendant objects

`object`

An object in the Simulink model or Stateflow diagram that receives decision coverage. Valid values for `object` are as follows:

`BlockPath`

Full path to a Simulink model or block

`BlockHandle`

Handle to a Simulink model or block

|                                  |                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <code>s1Obj</code>               | Handle to a Simulink API object                                                                                                        |
| <code>sfID</code>                | Stateflow ID                                                                                                                           |
| <code>sfObj</code>               | Handle to a Stateflow API object                                                                                                       |
| <code>{BlockPath, sfID}</code>   | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart           |
| <code>{BlockPath, sfObj}</code>  | Cell array with the path to a Stateflow chart or atomic subchart and a Stateflow object API handle contained in that chart or subchart |
| <code>[BlockHandle, sfID]</code> | Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart                |

## Output Arguments

`coverage`

The value of `coverage` is a two-element vector of form `[covered_outcomes total_outcomes]`. `coverage` is empty if `cvdo` does not contain condition coverage results for `object`. The two elements are:

|                               |                                                                |
|-------------------------------|----------------------------------------------------------------|
| <code>covered_outcomes</code> | Number of condition outcomes satisfied for <code>object</code> |
| <code>total_outcomes</code>   | Total number of condition outcomes for <code>object</code>     |

`description`

# conditioninfo

---

A structure array with the following fields:

|           |                                                                     |
|-----------|---------------------------------------------------------------------|
| text      | String describing a condition or the block port to which it applies |
| trueCnts  | Number of times the condition was true in a simulation              |
| falseCnts | Number of times the condition was false in a simulation             |

## Examples

The following example opens the `slvndemo_cv_small_controller` demo model, creates the test specification object `testObj`, enables condition coverage for `testObj`, and executes `testObj`. Then retrieve the condition coverage results for the Logic block (in the Gain subsystem) and determine its percentage of condition outcomes covered:

```
mdl = 'slvndemo_cv_small_controller';
open_system(mdl)
testObj = cvtest(mdl)
testObj.settings.condition = 1;
data = cvsim(testObj)
blk_handle = get_param([mdl, '/Gain/Logic'], 'Handle');
cov = conditioninfo(data, blk_handle)
percent_cov = 100 * cov(1) / cov(2)
```

## Alternatives

To collect condition coverage for a model using the GUI:

- 1 Open the model for which you want condition coverage.
- 2 In the Model Editor, select **Tools > Coverage Settings**.
- 3 On the **Coverage** tab, under **Coverage Metrics**, select **Condition Coverage**.
- 4 View the **Results** and **Report** tab to specify the type of output you need.

**5** Click **OK**.

**6** Simulate the model.

| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB® Programming Fundamentals documentation.                                                                                                    |

**Purpose** Create collection of cvdata objects for model reference hierarchy

**Syntax** `cvdg = cv.cvdatagroup(cvdo1, cvdo2, ...)`

**Description** `cvdg = cv.cvdatagroup(cvdo1, cvdo2, ...)` creates an instantiation of the `cv.cvdatagroup` class (`cvdg`) that contains the `cvdata` objects `cvdo1`, `cvdo2`, etc. A `cvdata` object contains results of the simulation runs.

**Examples** Create an instantiation of the `cv.cvdatagroup` class and add two `cvdata` objects to it:

```
a = cvdata;
b = cvdata;
cvdg = cv.cvdatagroup(a, b);
```

# cv.cvtestgroup

---

| <b>Properties</b>     | <code>name</code> <code>cv.cvtestgroup</code> object name                                                                                                                                                                        |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.                                                                                               |

**Purpose** Create collection of `cvtest` objects for model reference hierarchy

**Syntax** `cvtg = cv.cvtestgroup(cvto1, cvto2, ...)`

**Description** `cvtg = cv.cvtestgroup(cvto1, cvto2, ...)` creates an instantiation of the `cv.cvtestgroup` class (`cvtg`) that contains the `cvtest` objects `cvto1`, `cvto2`, etc. A `cvtest` object is a test specification object for a Simulink model.

**Examples** Create an instantiation of the `cv.cvtestgroup` class and add two `cvtest` objects to it:

```
a = cvtest;
b = cvtest;
cvtg = cv.cvtestgroup(a, b);
```

**See Also** `cvtest`

## cvexit

---

|                    |                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Exit model coverage environment                                                                                                                                                                       |
| <b>Syntax</b>      | <code>cvexit</code>                                                                                                                                                                                   |
| <b>Description</b> | <code>cvexit</code> exits the model coverage environment. Issuing this command closes the Coverage Display window and removes coloring from a block diagram that displays its model coverage results. |

**Purpose**

Produce HTML report from model coverage objects

**Syntax**

```
cvhtml(file, cvdo)
cvhtml(file, cvdo1, cvdo2, ...)
cvhtml(file, cvdo1, cvdo2, ..., options)
cvhtml(file, cvdo1, cvdo2, ..., options, detail)
```

**Description**

`cvhtml(file, cvdo)` creates an HTML report of the coverage results in the `cvdata` or `cv.cvdatagroup` object `cvdo` when you run model coverage in simulation. `cvhtml` saves the coverage results in `file`. The model must be open when you use `cvhtml` to generate its coverage report.

`cvhtml(file, cvdo1, cvdo2, ...)` creates a combined report of several `cvdata` objects. The results from each object appear in a separate column of the HTML report. Each `cvdata` object must correspond to the same root model or subsystem. Otherwise, the function fails.

`cvhtml(file, cvdo1, cvdo2, ..., options)` creates a combined report of several `cvdata` objects using the report options specified by `options`.

`cvhtml(file, cvdo1, cvdo2, ..., options, detail)` creates a combined coverage report for several `cvdata` objects and specifies the detail level of the report with the value of `detail`.

**Input Arguments**

`cvdo`

A `cv.cvdatagroup` object

`detail`

Specifies the level of detail in the report. Set `detail` to an integer from 0 to 3. Greater numbers for `detail` indicate greater detail.

**Default:** 2

`file`

String specifying the HTML file in the MATLAB current folder where cvhtml stores the results

**Default:** []

## options

Specify the report options that you specify in options:

- To enable an option, set it to 1 (e.g., '-hTR=1').
- To disable an option, set it to 0 (e.g., '-bRG=0').
- To specify multiple report options, list individual options in a single options string separated by commas or spaces (e.g., '-hTR=1 -bRG=0 -scm=0').

The following table lists all the options:

| <b>Option</b> | <b>Description</b>                                     | <b>Default</b> |
|---------------|--------------------------------------------------------|----------------|
| -aTS          | Include each test in the model summary                 | on             |
| -bRG          | Produce bar graphs in the model summary                | on             |
| -bTC          | Use two color bar graphs (red, blue)                   | off            |
| -hTR          | Display hit/count ratio in the model summary           | off            |
| -nFC          | Do not report fully covered model objects              | off            |
| -scm          | Include cyclomatic complexity numbers in summary       | on             |
| -bcm          | Include cyclomatic complexity numbers in block details | on             |
| -xEv          | Filter Stateflow events from report                    | off            |

## Examples

Make sure you have write access to the default MATLAB folder. Create a cumulative coverage report for the `slvndemo_cv_small_controller` mode and save it as `ratelim_coverage.html`:

```
model = 'slvndemo_cv_small_controller';
open_system(model);
cvt = cvtest(model);
cvd = cvsim(cvt);
outfile = 'ratelim_coverage.html';
cvhtml(outfile, cvd);
```

## Alternatives

To create an HTML model coverage report:

- 1** Open the model for which you want model coverage.
- 2** In the Model Editor, select **Tools > Coverage Settings**.
- 3** On the **Report** tab of the Coverage Settings dialog box, select **Generate HTML report**.
- 4** Click **OK**.

## How To

- “Creating HTML Reports with `cvhtml`”

# cvload

---

**Purpose** Load coverage tests and stored results into memory

**Syntax** `[cvtos, cvdos] = cvload(filename)`  
`[cvtos, cvdos] = cvload(filename, restoretotal)`

**Description** `[cvtos, cvdos] = cvload(filename)` loads the tests and data stored in the text file `filename.cvt`. `cvtos` is a cell array of `cvtest` objects that are successfully loaded. `cvdos` is a cell array of `cvdata` objects that are successfully loaded. `cvdos` has the same size as `cvtos`, but if a particular test has no results, `cvdos` can contain empty elements.

`[cvtos, cvdos] = cvload(filename, restoretotal)` restores or clears the cumulative results from prior runs, depending on the value of `restoretotal`. If `restoretotal` is 1, `cvload` restores the cumulative results from prior runs. If `restoretotal` is unspecified or 0, `cvload` clears the model's cumulative results.

The following are special considerations for using the `cvload` command:

- If a model with the same name exists in the coverage database, the software loads only the compatible results that reference the existing model to prevent duplication.
- If the Simulink models referenced from the file are open but do not exist in the coverage database, the coverage tool resolves the links to the existing models.
- When you are loading several files that reference the same model, the software loads only the results that are consistent with the earlier files.

**Examples** Store coverage results in `cvtest` and `cvdata` objects:

```
[test_objects, data_objects] = cvload(test_results, 1);
```

**See Also** `cvsave`

**How To** • “Loading Stored Coverage Test Results with `cvload`”

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>      | Display model coverage results with model coloring                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>       | <code>cvmodelview(cvdo)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>  | <code>cvmodelview(cvdo)</code> displays coverage results from the <code>cvdata</code> object <code>cvdo</code> by coloring the objects in the model that have model coverage results.                                                                                                                                                                                                                                                                                          |
| <b>Examples</b>     | <p>Open the <code>slvndemo_cv_small_controller</code> demo model, create the test specification object <code>testObj</code>, and execute <code>testObj</code> to collect model coverage. Run <code>cvmodelview</code> to color the model objects for which you collect model coverage information:</p> <pre>mdl = 'slvndemo_cv_small_controller'; open_system(mdl) testObj = cvtest(mdl) data = cvsim(testObj) cvmodelview(data)</pre>                                         |
| <b>Alternatives</b> | <p>To display model coverage results by coloring objects:</p> <ol style="list-style-type: none"> <li>1 Open the model.</li> <li>2 Select <b>Tools &gt; Coverage Settings</b>.</li> <li>3 On the <b>Coverage</b> tab, select <b>Coverage for this model</b>.</li> <li>4 On the <b>Results</b> tab, select <b>Display coverage results using model coloring</b>.</li> <li>5 Click <b>OK</b> to close the Coverage Settings dialog box.</li> <li>6 Simulate the model.</li> </ol> |
| <b>See Also</b>     | <code>cvhtml</code>   <code>cvsim</code>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>How To</b>       | <ul style="list-style-type: none"> <li>• “Enabling Coverage Highlighting”</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                           |

- “Examples: Model Coverage Coloring”

**Purpose** Save coverage tests and results to file

**Syntax**

```
cvsave(filename, model)
cvsave(filename, cvto1, cvto2, ...)
cvsave(filename, cell_array{ :})
```

**Description** `cvsave(filename, model)` saves all the tests (cvtest objects) and results (cvdata objects) related to `model` in the text file `filename.cvt`. `model` is a handle to or name of a Simulink model.

`cvsave(filename, cvto1, cvto2, ...)` saves multiple cvtest objects in the text file `filename.cvt`. `cvsave` also saves information about any referenced models.

`cvsave(filename, cell_array{ :})` saves the test results stored in each element of `cell_array` to the file `filename.cvt`. Each element in `cell_array` contains test results for a cvdata object.

**Input Arguments**

`filename`

String containing the name of the file in which to save the data. `cvsave` appends the extension `.cvt` to the string when saving the file.

`model`

Handle to a Simulink model

`cvto`

cvtest object

`cell_array`

Cell array of cvtest objects

**Examples** Save coverage results for the `slvndemo_cv_small_controller` model in `ratelim_testdata.cvt`:

```
model = 'slvndemo_cv_small_controller';
open_system(model);
```

```
cvt = cvtest(model);
cvd = cvsim(cvt);
cvsave('ratelim_testdata', model);
```

---

Save cumulative coverage results for the Adjustable Rate Limiter subsystem in the `slvndemo_ratelim_harness` model from two simulations:

```
% Open model and subsystem
mdl = 'slvndemo_ratelim_harness';
mdl_subsys = 'slvndemo_ratelim_harness/Adjustable Rate Limiter';
open_system(mdl);
open_system(mdl_subsys);

% Create data files
t_gain = (0:0.02:2.0)';
u_gain = sin(2*pi*t_gain);
t_pos = [0;2];
u_pos = [1;1];
t_neg = [0;2];
u_neg = [-1;-1];
save('within_lim.mat', 't_gain', 'u_gain', 't_pos', 'u_pos', ...
 't_neg', 'u_neg');

t_gain = [0;2];
u_gain = [0;4];
t_pos = [0;1;1;2];
u_pos = [1;1;5;5]*0.02;
t_neg = [0;2];
u_neg = [0;0];
save('rising_gain.mat', 't_gain', 'u_gain', 't_pos', 'u_pos', ...
 't_neg', 'u_neg');

% Specify coverage options in cvtest object
testObj1 = cvtest(mdl_subsys);
testObj1.label = 'Gain within slew limits';
```

```

testObj1.setupCmd = 'load(''within_lim.mat'');';
testObj1.settings.mcdc = 1;
testObj1.settings.condition = 1;
testObj1.settings.decision = 1;

testObj2 = cvtest mdl_subsys);
testObj2.label = 'Rising gain that temporarily exceeds slew limit';
testObj2.setupCmd = 'load(''rising_gain.mat'');';
testObj2.settings.mcdc = 1;
testObj2.settings.condition = 1;
testObj2.settings.decision = 1;

% Simulate the model with both cvtest objects
[dataObj1,simOut1] = cvsim(testObj1);
[dataObj2,simOut2] = cvsim(testObj2,[0 2]);

cumulative = dataObj1+dataObj2;
cvsave('ratelim_testdata',cumulative);

```

As in the preceding example, save cumulative coverage results for the Adjustable Rate Limiter subsystem in the `slvndemo_ratelim_harness` model from two simulations. Save the results in a cell array and then save the data to a file:

```

% Open model and subsystem
mdl = 'slvndemo_ratelim_harness';
mdl_subsys = 'slvndemo_ratelim_harness/Adjustable Rate Limiter';
open_system(mdl);
open_system(mdl_subsys);

% Create data files
t_gain = (0:0.02:2.0)';
u_gain = sin(2*pi*t_gain);
t_pos = [0;2];
u_pos = [1;1];
t_neg = [0;2];

```

```
u_neg = [-1;-1];
save('within_lim.mat','t_gain','u_gain','t_pos','u_pos', ...
't_neg', 'u_neg');

t_gain = [0;2];
u_gain = [0;4];
t_pos = [0;1;1;2];
u_pos = [1;1;5;5]*0.02;
t_neg = [0;2];
u_neg = [0;0];
save('rising_gain.mat','t_gain','u_gain','t_pos','u_pos', ...
't_neg', 'u_neg');

% Specify coverage options in cvtest object
testObj1 = cvtest mdl_subsys);
testObj1.label = 'Gain within slew limits';
testObj1.setupCmd = 'load(''within_lim.mat'');';
testObj1.settings.mcdc = 1;
testObj1.settings.condition = 1;
testObj1.settings.decision = 1;

testObj2 = cvtest mdl_subsys);
testObj2.label = 'Rising gain that temporarily exceeds slew limit';
testObj2.setupCmd = 'load(''rising_gain.mat'');';
testObj2.settings.mcdc = 1;
testObj2.settings.condition = 1;
testObj2.settings.decision = 1;

% Simulate the model with both cvtest objects
[dataObj1,simOut1] = cvsim(testObj1);
[dataObj2,simOut2] = cvsim(testObj2,[0 2]);

% Save the results in the cell array
cov_results{1} = dataObj1;
cov_results{2} = dataObj2;

% Save the results to a file
```

```
cvsave('ratelim_testdata', cov_results{ :});
```

**Alternatives**

To save cumulative coverage results:

- 1** In the Model Editor, select **Tools > Coverage Settings**.
- 2** On the **Results** tab:
  - a** Select **Save cumulative results in workspace variable**.
  - b** Select **Save last run in workspace variable**.
- 3** Click OK to close the Coverage Settings dialog box.
- 4** Simulate the model.

**See Also**

cvload

**How To**

- “Saving Test Runs to a File with cvsave”

**Purpose** Simulate and return model coverage results for test objects

**Syntax**

```
cvdo = cvsim(cvto)
[cvdo,simOut] = cvsim(cvto,Name1,Value1,Name2,Value2,...)
[cvdo,simOut] = cvsim(cvto,ParameterStruct)
[cvdo1,cvdo2,...,simOut] = cvsim(cvto1,cvto2,...)
```

**Description**

`cvdo = cvsim(cvto)` simulates the model and returns the coverage results for the `cvtest` object, `cvto`. `cvsim` saves the coverage results in the `cvdata` object, `cvdo`. However, when recording coverage for multiple models in a hierarchy, `cvsim` returns the coverage results in a `cv.cvdatalog` object.

`[cvdo,simOut] = cvsim(cvto,Name1,Value1,Name2,Value2,...)` specifies the model parameters and simulates the model. `cvsim` returns the coverage results in the `cvdata` object, `cvdo`, and returns the simulation outputs in the `Simulink.SimulationOutput` object, `simOut`.

`[cvdo,simOut] = cvsim(cvto,ParameterStruct)` sets the model parameters specified in a structure `ParameterStruct`, simulates the model, returns the coverage results in `cvdo`, and returns the simulation outputs in `simOut`.

`[cvdo1,cvdo2,...,simOut] = cvsim(cvto1,cvto2,...)` simulates the model and returns the coverage results for the test objects, `cvto1`, `cvto2`, .... `cvdo1` contains the coverage results for `cvto1`, `cvdo2` contains the coverage results for `cvto2`, and so on.

---

**Note** Even if you have not enabled coverage recording for the model, you can execute the `cvsim` command to record coverage for your model.

---

**Input Arguments**

`cvto`

cvtest object that specifies coverage options for the simulation

## Name-Value Pair Arguments

Optional comma-separated pairs of `Name`, `Value` arguments, where `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes ( `'` ). You can specify several name-value pair arguments in any order as `Name1, Value1, , NameN, ValueN`.

`ParameterName`

Name of the model parameter to be specified for simulation

`ParameterValue`

Value of the model parameter

---

**Note** For a complete list of model parameters, see “Model Parameters” in the Simulink documentation.

---

## Output Arguments

`cvdo`

`cvdata` object

`simOut`

A `Simulink.SimulationOutput` object that contains the simulation outputs.

## Examples

Open the `vdp` model, create the test object, set the model parameters, and simulate the model. `cvsim` returns the coverage data in `cvdo` and the simulation outputs in the `Simulink.SimulationOutput` object, `simOut`:

```
model = 'sldemo_fuelsys';
open_system(model);
testObj = cvtest(model); % Get test data
paramStruct.CovMetricSettings = 'dcm';
paramStruct.AbsTol = '1e-5';
paramStruct.SaveState = 'on';
```

# cvsim

---

```
paramStruct.StateSaveName = 'xoutNew';
paramStruct.SaveOutput = 'on';
paramStruct.OutputSaveName = 'youtNew';
[cvdo,simOut] = cvsim(testObj,paramStruct); % Get coverage
```

## See Also

[cv.cvdatabgroup](#) | [cvtest](#) | [sim](#)

**Purpose**

Simulate and return model coverage results for referenced models

**Syntax**

```
cvdg = cvsimref(topModelName)
cvdg = cvsimref(topModelName, cvtg)
[cvdg,t,x,y] = cvsimref(topModelName, cvtg)
[cvdg,t,x,y] = cvsimref(topModelName, cvtg, timespan,
 options)
[cvdg1, cvdg2, ...] = cvsimref(topModelName, cvtg1, cvtg2,
 ...)
```

**Description**

`cvdg = cvsimref(topModelName)` simulates the top model and all referenced models in the hierarchy, collects model coverage data, and returns the results in the `cv.cvdagroup` object `cvdg`. You do not have to enable model coverage reporting for any of the models in a model hierarchy to use the `cvsimref` command.

`cvdg = cvsimref(topModelName, cvtg)` simulates `topModelName` and collects model coverage data by executing the `cv.cvtestgroup` object `cvtg`. `cvtg` contains `cvtest` specifications for the top-level model and all the referenced models in the hierarchy. `cvsimref` returns the model coverage results in `cvdg`.

`[cvdg,t,x,y] = cvsimref(topModelName, cvtg)` returns the time vector `t`, matrix of state values `x`, and matrix of output values `y` from the simulation.

`[cvdg,t,x,y] = cvsimref(topModelName, cvtg, timespan, options)` overrides default simulation values with the values in `timespan` and `options`.

`[cvdg1, cvdg2, ...] = cvsimref(topModelName, cvtg1, cvtg2, ...)` executes multiple `cv.cvtestgroup` objects and returns the results in a set of `cv.cvdagroup` objects.

**Input Arguments**

`cvtg`

`cv.cvtestgroup` object that contains test specifications for the referenced models in the hierarchy

options

Optional simulation parameters specified as a structure.

timespan

Simulation start and stop time:

|                             |                                                                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tFinal                      | Specify the stop time. The start time is 0.                                                                                                                                                                                                                                 |
| [tStart tFinal]             | Specify the start and stop times.                                                                                                                                                                                                                                           |
| [tStart OutputTimes tFinal] | Specify that cvsimref return the start and stop times and time points in t. Generally, t includes more time points. OutputTimes is equivalent to specifying <b>Configuration Parameters &gt; Data Import/Export &gt; Output options &gt; Produce specified output only.</b> |

topModelName

Name of the top-level model in the hierarchy

## Output Arguments

cvdg

cv.cvdatalog object

t

The simulation time vector

x

The simulation state matrix consisting of continuous states followed by discrete states

y

The simulation output matrix. Each column contains the output of a root-level Outport block, in port number order. If any Outport block has a vector input, its output takes the appropriate number of columns.

## Examples

Open and simulate the `slvndemo_ratelim_harness` model and its two subsystems:

```
topModel = 'slvndemo_cv_mutual_exclusion';
load_system(topModel);
% Make sure coverage is off for this run for the entire tree
set_param(topModel, 'RecordCoverage', 'off');
set_param(topModel, 'CovModelRefEnable', 'Off');
simObj = sim(topModel); % Normal data
allData = cvsimref(topModel); % cvsimref data
```

## How To

- “Creating and Running Test Cases”
- “Using Model Coverage Commands for Referenced Models”

# cvtest

---

**Purpose** Create model coverage test specification object

**Syntax**

```
cvto = cvtest(root)
cvto = cvtest(root, label)
cvto = cvtest(root, label, setupcmd)
```

**Description**

`cvto = cvtest(root)` creates a test specification object with the handle `cvto`. Simulate `cvto` with the `cvsim` command.

`cvto = cvtest(root, label)` creates a test object with the label `label`, which is used for reporting results.

`cvto = cvtest(root, label, setupcmd)` creates a test object with the setup command `setupcmd`.

**Input Arguments**

`root`  
Name or handle for a Simulink model or a subsystem. Only the specified model or subsystem and its descendants are subject to model coverage testing.

`label`  
Label for test object

`setupcmd`  
Setup command for creating test object. The setup command is executed in the base MATLAB workspace just prior to running the simulation. This command is useful for loading data prior to a test.

**Output Arguments**

`cvto`  
A test specification object with the following structure.

| Field                 | Description           |
|-----------------------|-----------------------|
| <code>id</code>       | Read-only internal ID |
| <code>modelcov</code> | Read-only internal ID |

| Field                            | Description                                                                                                                                                                                                                                                                                               |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rootPath                         | Name of system or subsystem for analysis                                                                                                                                                                                                                                                                  |
| label                            | String used when reporting results                                                                                                                                                                                                                                                                        |
| setupCmd                         | Command executed in base workspace prior to simulation                                                                                                                                                                                                                                                    |
| settings.condition               | Set to 1 for condition coverage.                                                                                                                                                                                                                                                                          |
| settings.decision                | Set to 1 for decision coverage.                                                                                                                                                                                                                                                                           |
| settings.designverifier          | Set to 1 for coverage for Simulink Design Verifier blocks.                                                                                                                                                                                                                                                |
| settings.mcdc                    | Set to 1 for MCDC coverage.                                                                                                                                                                                                                                                                               |
| settings.sigrange                | Set to 1 for signal range coverage.                                                                                                                                                                                                                                                                       |
| settings.sigsize                 | Set to 1 for signal size coverage.                                                                                                                                                                                                                                                                        |
| settings.tableExec               | Set to 1 for lookup table coverage.                                                                                                                                                                                                                                                                       |
| modelRefSettings.enable          | <ul style="list-style-type: none"> <li>• 'off' — Disables coverage for all referenced models.</li> <li>• 'all' or on — Enables coverage for all referenced models.</li> <li>• 'filtered' — Enables coverage only for referenced models not listed in the <code>excludedModels</code> subfield.</li> </ul> |
| modelRefSettings.excludeTopModel | Set to 1 to exclude coverage for the top model                                                                                                                                                                                                                                                            |
| modelRefSettings.excludedModels  | String specifying a comma-separated list of referenced models for which coverage is disabled.                                                                                                                                                                                                             |

| Field                           | Description                                                                                      |
|---------------------------------|--------------------------------------------------------------------------------------------------|
| emlSettings.<br>enableExternal  | Set to 1 to enable coverage for external program files called by MATLAB functions in your model. |
| options.<br>forceBlockReduction | Set to 1 to override the Simulink <b>Block reduction</b> parameter if it is enabled.             |

## Examples

Create a `cvtest` object for the Adjustable Rate Limiter block in the `slvndemo_ratelim_harness` model and display its contents:

```
open_system('slvndemo_ratelim_harness');
testObj1 = cvtest(['slvndemo_ratelim_harness', ...
 '/Adjustable Rate Limiter']);
testObj1.label = 'Gain within slew limits';
testObj1.setupCmd = 'load(''within_lim.mat'');';
testObj1.settings.mcdc = 1;
testObj1 % Display content of test object
```

## See Also

`cv.cvtestgroup`

## How To

- “Creating Tests with `cvtest`”
- “Creating a Test Group with `cv.cvtestgroup`”

## Purpose

Display decision coverage information for model object

## Syntax

```
coverage = decisioninfo(cvdo, object)
coverage = decisioninfo(cvdo, object, ignore_descendants)
[coverage, description] = decisioninfo(cvdo, object)
```

## Description

`coverage = decisioninfo(cvdo, object)` returns decision coverage results from the `cvdata` object `cvdo` for the model component specified by `object`.

`coverage = decisioninfo(cvdo, object, ignore_descendants)` returns decision coverage results for `object`, depending on the value of `ignore_descendants`.

`[coverage, description] = decisioninfo(cvdo, object)` returns decision coverage results and text descriptions of decision points associated with `object`.

## Input Arguments

`cvdo`

`cvdata` object

`ignore_descendants`

Specifies to ignore the coverage of descendant objects if `ignore_descendants` is set to 1.

`object`

The `object` argument specifies an object in the model or Stateflow chart that received decision coverage. Valid values for `object` include the following:

### Object Specification

`BlockPath`

`BlockHandle`

`s1Obj`

`sfID`

### Description

Full path to a model or block

Handle to a model or block

Handle to a Simulink API object

Stateflow ID

| <b>Object Specification</b>      | <b>Description</b>                                                                                                              |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>sfObj</code>               | Handle to a Stateflow API object from a singly instantiated Stateflow chart                                                     |
| <code>{BlockPath, sfID}</code>   | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart    |
| <code>{BlockPath, sfObj}</code>  | Cell array with the path to a Stateflow chart or subchart and a Stateflow object API handle contained in that chart or subchart |
| <code>[BlockHandle, sfID]</code> | Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart         |

## Output Arguments

|                               |                                                                                                                                                                                                                                                          |                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| <code>coverage</code>         | The value of <code>coverage</code> is a two-element vector of the form <code>[covered_outcomes total_outcomes]</code> . <code>coverage</code> is empty if <code>cvdo</code> does not contain decision coverage results for object. The two elements are: |                                                  |
| <code>covered_outcomes</code> |                                                                                                                                                                                                                                                          | Number of decision outcomes satisfied for object |
| <code>total_outcomes</code>   |                                                                                                                                                                                                                                                          | Number of decision outcomes for object           |
| <code>description</code>      | <code>description</code> is a structure array containing the following fields:                                                                                                                                                                           |                                                  |

|                                              |                                                               |
|----------------------------------------------|---------------------------------------------------------------|
| <code>decision.text</code>                   | String describing a decision point, e.g., 'U > LL'            |
| <code>decision.outcome.text</code>           | String describing a decision outcome, i.e., 'true' or 'false' |
| <code>decision.outcome.executionCount</code> | Number of times a decision outcome occurred in a simulation   |

## Examples

Open the `slvndemo_cv_small_controller` model and create the test specification object `testObj`. Enable decision coverage for `slvndemo_cv_small_controller` and execute `testObj` using `cvsim`. Use `decisioninfo` to retrieve the decision coverage results for the Saturation block and determine the percentage of decision outcomes covered:

```
mdl = 'slvndemo_cv_small_controller';
open_system(mdl)
testObj = cvtest(mdl)
testObj.settings.decision = 1;
data = cvsim(testObj)
blk_handle = get_param([mdl, '/Saturation'], 'Handle');
cov = decisioninfo(data, blk_handle)
percent_cov = 100 * cov(1) / cov(2)
```

## Alternatives

To collect and display decision coverage results:

- 1 Open the model.
- 2 In the Model Editor, select **Tools > Coverage Settings**.
- 3 On the **Coverage** tab, under **Coverage Metrics**, select **Decision**.
- 4 Click **OK** to close the Coverage Settings dialog box and save your changes.

# decisioninfo

---

**5** Simulate the model and review the results.

`complexityinfo` | `conditioninfo` | `cvsim` | `getCoverageInfo` | `mcdcinfo` | `sigrangeinfo` | `sigsizeinfo` | `tableinfo`

## **How To**

- “Condition Coverage (CC)”

**Purpose** Get cvdata object

**Syntax** `get(cvdg, model_name)`

**Description** `get(cvdg, model_name)` returns the cvdata object in the `cv.cvdatagroup` object `cvdg` that corresponds to the model specified in `model_name`.

**Examples** Get a cvdata object from the specified Simulink model:

```
get(cvdg, 'slvndemo_cv_small_controller');
```

## cv.cvtestgroup.get

|                    |                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Get cvtest objects                                                                                                                                                                            |
| <b>Syntax</b>      | <code>get(cvtg, model_name)</code>                                                                                                                                                            |
| <b>Description</b> | <code>get(cvtg, model_name)</code> returns the cvtest object in the <code>cv.cvtestgroup</code> object <code>cvtg</code> that corresponds to the model specified in <code>model_name</code> . |
| <b>Examples</b>    | Get a cvtest object from the specified Simulink model:<br><pre>get(cvtg, 'slvndemo_cv_small_controller');</pre>                                                                               |
| <b>See Also</b>    | <code>cvsimref</code>   <code>cvtest</code>                                                                                                                                                   |

|                    |                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Get all cvdata objects                                                                                                  |
| <b>Syntax</b>      | <code>getAll(cvdo)</code>                                                                                               |
| <b>Description</b> | <code>getAll(cvdo)</code> returns all cvdata objects in the <code>cv.cvdatagroup</code> object <code>cvdo</code> .      |
| <b>Examples</b>    | Return all cvdata object from the specified Simulink model:<br><pre>getAll(cvdg, 'slvndemo_cv_small_controller');</pre> |

# getCoverageInfo

---

**Purpose** Coverage information for Simulink Design Verifier blocks

**Syntax**

```
[coverage, description] = getCoverageInfo(cvdo, object)
[coverage, description] = getCoverageInfo(cvdo, object,
 metric)
[coverage, description] = getCoverageInfo(cvdo, object,
 metric, ignore_descendants)
```

**Description**

[coverage, description] = getCoverageInfo(cvdo, object) collects Simulink Design Verifier coverage for *object*, based on coverage results in *cvdo*. *object* can be a handle to any block, subsystem, or Stateflow chart. `getCoverageData` returns coverage data only for Simulink Design Verifier library blocks in *object*'s hierarchy.

[coverage, description] = getCoverageInfo(cvdo, object, *metric*) returns coverage data for the block type specified in *metric*. If *object* does not match the block type, `getCoverageInfo` does not return any data.

[coverage, description] = getCoverageInfo(cvdo, object, *metric*, *ignore\_descendants*) returns coverage data about *object*, omitting coverage data for its descendant objects if *ignore\_descendants* equals 1.

## Input Arguments

cvdo

cvdata object

object

In the model or Stateflow chart, object that received Simulink Design Verifier coverage. The following are valid values for *object*.

|             |                                 |
|-------------|---------------------------------|
| BlockPath   | Full path to a model or block   |
| BlockHandle | Handle to a model or block      |
| s1obj       | Handle to a Simulink API object |

|                                  |                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <code>sfID</code>                | Stateflow ID from a singly instantiated Stateflow chart                                                                                |
| <code>sfObj</code>               | Handle to a Stateflow API object from a singly instantiated Stateflow chart                                                            |
| <code>{BlockPath, sfID}</code>   | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart           |
| <code>{BlockPath, sfObj}</code>  | Cell array with the path to a Stateflow chart or atomic subchart and a Stateflow object API handle contained in that chart or subchart |
| <code>[BlockHandle, sfID]</code> | Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart                |
| <br>                             |                                                                                                                                        |
| <code>metric</code>              |                                                                                                                                        |
|                                  | <code>cvmetric.Sldv</code> enumeration object with values that correspond to Simulink Design Verifier library blocks.                  |
| <code>test</code>                | Test Objective block                                                                                                                   |
| <code>proof</code>               | Proof Objective block                                                                                                                  |
| <code>condition</code>           | Test Condition block                                                                                                                   |
| <code>assumption</code>          | Proof Assumption block                                                                                                                 |
| <br>                             |                                                                                                                                        |
| <code>ignore_descendants</code>  |                                                                                                                                        |
|                                  | Boolean value that specifies to ignore the coverage of descendant objects if set to 1.                                                 |

# getCoverageInfo

---

## Output Arguments

coverage

Two-element vector of the form [*covered\_outcomes* *total\_outcomes*].

*covered\_outcomes*

Number of test objectives satisfied for *object*

*total\_outcomes*

Total number of test objectives for *object*

*coverage* is empty if *cvdo* does not contain decision coverage results for *object*.

description

Structure array containing descriptions of each test objective, and descriptions and execution counts for each outcome within *object*.

## Examples

Collect and display coverage data for the Test Objective block named True in the `sldvdemo_debounce_testobjblks` model:

```
mdl = 'sldvdemo_debounce_testobjblks';
open_system(mdl)
testObj = cvtest(mdl)
testObj.settings.designverifier = 1;
data = cvsim(testObj)
blk_handle = get_param([mdl, '/True'], 'Handle');
getCoverageInfo(data, blk_handle)
```

## Alternatives

To collect and display coverage results for Simulink Design Verifier library blocks using the Coverage Settings dialog box:

- 1 Open the model.
- 2 In the Model Editor, select **Tools > Coverage Settings**.
- 3 On the **Coverage** tab, under **Coverage Metrics**, select **Simulink Design Verifier**.

**4** Click **OK**.

**5** Simulate the model and review the results.

|                         | <code>column</code>                                                                                                                                                        | An integer specifying the column                                            |
| <b>Output Arguments</b> | <code>content</code>                                                                                                                                                       | An element object or object array specifying the content of the table entry |
| <b>Examples</b>         | Get the content of the table cell in the third column, third row:<br><pre>table1 = ModelAdvisor.Table(4, 4);<br/>.<br/>.<br/>.<br/>content = getEntry(table1, 3, 3);</pre> |                                                                             |
| <b>How To</b>           | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                                                          |                                                                             |

**Purpose**

Return check identifier

**Syntax**

```
id = getID(check_obj)
```

**Description**

`id = getID(check_obj)` returns the ID of the check `check_obj`. `id` is a unique string that identifies the check.

You create this unique identifier when you create the check. This unique identifier is the equivalent of the `ModelAdvisor.Check ID` property.

**How To**

- “Defining Custom Checks”
- “Customizing the Model Advisor”

# mcdcinfo

---

## Purpose

Collect modified condition/decision coverage information for model object

## Syntax

```
coverage = mcdcinfo(cvdo, object)
coverage = mcdcinfo(cvdo, object, ignore_descendants)
[coverage, description] = mcdcinfo(cvdo, object)
```

## Description

`coverage = mcdcinfo(cvdo, object)` returns modified condition/decision coverage (MCDC) results from the `cvdata` object `cvdo` for the model component specified by `object`.

`coverage = mcdcinfo(cvdo, object, ignore_descendants)` returns MCDC results for `object`, depending on the value of `ignore_descendants`.

`[coverage, description] = mcdcinfo(cvdo, object)` returns MCDC results and text descriptions of each condition/decision in `object`.

## Input Arguments

`cvdo`

cvdata object

`ignore_descendants`

Logical value specifying whether to ignore the coverage of descendant objects

1 — Ignore coverage of descendant objects

0 — Collect coverage for descendant objects

`object`

The `object` argument specifies an object in the Simulink model or Stateflow diagram that receives decision coverage. Valid values for `object` include the following:

| Object Specification | Description                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| BlockPath            | Full path to a model or block                                                                                                          |
| BlockHandle          | Handle to a model or block                                                                                                             |
| sObj                 | Handle to a Simulink API object                                                                                                        |
| sfID                 | Stateflow ID                                                                                                                           |
| sfObj                | Handle to a Stateflow API object                                                                                                       |
| {BlockPath, sfID}    | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart           |
| {BlockPath, sfObj}   | Cell array with the path to a Stateflow chart or atomic subchart and a Stateflow object API handle contained in that chart or subchart |
| [BlockHandle, sfID]  | Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart                |

## Output Arguments

coverage

Two-element vector of the form [covered\_outcomes total\_outcomes]. `coverage` is empty if `cvdo` does not contain modified condition/decision coverage results for `object`. The two elements are:

|                  |                                                                         |
|------------------|-------------------------------------------------------------------------|
| covered_outcomes | Number of condition/decision outcomes satisfied for <code>object</code> |
| total_outcomes   | Total number of condition/decision outcomes for <code>object</code>     |

description

A structure array containing the following fields:

|                                  |                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------|
| <code>text</code>                | String denoting whether the condition/decision is associated with a block output or Stateflow transition |
| <code>condition.text</code>      | String describing a condition/decision or the block port to which it applies                             |
| <code>condition.achieved</code>  | Logical array indicating whether a condition case has been fully covered                                 |
| <code>condition.trueRslt</code>  | String representing a condition case expression that produces a true result                              |
| <code>condition.falseRslt</code> | String representing a condition case expression that produces a false result                             |

## Examples

Collect MCDC coverage for the `slvndemo_cv_small_controller` model and determine the percentage of MCDC coverage collected for the Logic block in the Gain subsystem:

```
mdl = 'slvndemo_cv_small_controller';
open_system(mdl)
testObj = cvtest(mdl) %Create test specification object
testObj.settings.mcdc = 1; %Enable MCDC coverage
data = cvsim(testObj) %Simulate model
blk_handle = get_param([mdl, '/Gain/Logic'], 'Handle');
cov = mcdcinfo(data, blk_handle) %Retrieve MCDC results for Logic block
percent_cov = 100 * cov(1) / cov(2) %Percentage of MCDC outcomes covered
```

## Alternatives

To collect MCDC coverage for a model:

- 1 Open the model.

- 2** In the Model Editor, select **Tools > Coverage Settings**.
- 3** On the **Coverage** tab, under **Coverage Metrics**, select **MCDC Coverage**.
- 4** On the **Results** and **Report** tabs, select the desired options.
- 5** Click **OK** to close the Coverage Settings dialog box.
- 6** Simulate the model and review the MCDC coverage in the report.

# ModelAdvisor.Action

---

|                       |                                                                                                                                                                                                       |                                  |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| <b>Purpose</b>        | Add actions to custom checks                                                                                                                                                                          |                                  |
| <b>Description</b>    | Instances of this class define actions you take when the Model Advisor checks do not pass. Users access actions by clicking the <b>Action</b> button that you define in the Model Advisor window.     |                                  |
| <b>Construction</b>   | ModelAdvisor.Action                                                                                                                                                                                   | Add actions to custom checks     |
| <b>Methods</b>        | setCallbackFcn                                                                                                                                                                                        | Specify action callback function |
| <b>Properties</b>     | Description                                                                                                                                                                                           | Message in <b>Action</b> box     |
|                       | Name                                                                                                                                                                                                  | Action button label              |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.                                                                    |                                  |
| <b>Examples</b>       | <pre>% define action (fix) operation myAction = ModelAdvisor.Action; myAction.Name='Fix block fonts'; myAction.Description=...     'Click the button to update all blocks with specified font';</pre> |                                  |
| <b>How To</b>         | • “Customizing the Model Advisor”                                                                                                                                                                     |                                  |

**Purpose**

Add actions to custom checks

**Syntax**

```
action_obj = ModelAdvisor.Action
```

**Description**

`action_obj = ModelAdvisor.Action` creates a handle to an action object.

---

**Note**

- Include an action definition in a check definition.
  - Each check can contain only one action.
- 

**Examples**

```
% define action (fix) operation
myAction = ModelAdvisor.Action;
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Check

---

**Purpose** Create custom checks

**Description** The `ModelAdvisor.Check` class creates a Model Advisor check object. All checks must have an associated `ModelAdvisor.Task` object to be displayed in the Model Advisor tree.

You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution** is displayed in the **By Product > Simulink** folder and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When you use checks in task definitions, the following rules apply:

- If you define the properties of the check in the check definition and the task definition, the task definition takes precedence. The Model Advisor displays the information contained in the task definition. For example, if you define the name of the check in the task definition using the `ModelAdvisor.Task.DisplayName` property and in the check definition using the `ModelAdvisor.Check.Title` property, the Model Advisor displays the information provided in `ModelAdvisor.Task.DisplayName`.
- If you define the properties of the check in the check definition but not the task definition, the task uses the properties from the check. For example, if you define the name of the check in the check definition using the `ModelAdvisor.Check.Title` property, and you register the check using a task definition, the Model Advisor displays the information provided in `ModelAdvisor.Check.Title`.
- If you define the properties of the check in the task definition but not the check definition, the Model Advisor displays the information correctly as long as you register the task with the Model Advisor instead of the check. For example, if you define the name of the check in the task definition using the `ModelAdvisor.Task.DisplayName` property instead of the `ModelAdvisor.Check.Title` property, and you register the check

using a task definition, the Model Advisor displays the information provided in `ModelAdvisor.Task.DisplayName`.

## Construction

|                                 |                      |
|---------------------------------|----------------------|
| <code>ModelAdvisor.Check</code> | Create custom checks |
|---------------------------------|----------------------|

## Methods

|                                           |                                          |
|-------------------------------------------|------------------------------------------|
| <code>getID</code>                        | Return check identifier                  |
| <code>setAction</code>                    | Specify action for check                 |
| <code>setCallbackFcn</code>               | Specify callback function for check      |
| <code>setInputParameters</code>           | Specify input parameters for check       |
| <code>setInputParametersLayoutGrid</code> | Specify layout grid for input parameters |

## Properties

|                                          |                                                            |
|------------------------------------------|------------------------------------------------------------|
| <code>CallbackContext</code>             | Specify when to run check                                  |
| <code>CallbackHandle</code>              | Callback function handle for check                         |
| <code>CallbackStyle</code>               | Callback function type                                     |
| <code>EmitInputParametersToReport</code> | Display check input parameters in the Model Advisor report |
| <code>Enable</code>                      | Indicate whether user can enable or disable check          |
| <code>ID</code>                          | Identifier for check                                       |
| <code>LicenseName</code>                 | Product license names required to display and run check    |
| <code>ListViewVisible</code>             | Status of button                                           |
| <code>Result</code>                      | Results cell array                                         |

# ModelAdvisor.Check

---

|           |                                   |
|-----------|-----------------------------------|
| Title     | Name of check                     |

| Value     | Status of check                   |
| Visible   | Indicate to display or hide check |

## Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.

## Examples

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
```

## How To

- “Customizing the Model Advisor”

**Purpose** Create custom checks

**Syntax** `check_obj = ModelAdvisor.Check(check_ID)`

**Description** `check_obj = ModelAdvisor.Check(check_ID)` creates a check object, `check_obj`, and assigns it a unique identifier, `check_ID`. `check_ID` must remain constant. To display checks in the Model Advisor tree, all checks must have an associated `ModelAdvisor.Task` or `ModelAdvisor.Root` object.

---

**Note** You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution appears** in the **By Product > Simulink folder** and in the **By Task > Model Referencing** folder in the Model Advisor tree.

---

**Examples** `rec = ModelAdvisor.Check('com.mathworks.sample.Check1');`

| <b>Purpose</b>        | Define subfolder in <b>By Task</b> folder                                                                                                           |                                           |
| <b>Description</b>    | The <code>ModelAdvisor.FactoryGroup</code> class defines a new subfolder to add to the <b>By Task</b> folder.                                       |                                           |
| <b>Construction</b>   | <code>ModelAdvisor.FactoryGroup</code>                                                                                                              | Define subfolder in <b>By Task</b> folder |
| <b>Methods</b>        | <code>addCheck</code>                                                                                                                               | Add check to folder                       |
| <b>Properties</b>     | <code>Description</code>                                                                                                                            | Description of folder                     |
|                       | <code>DisplayName</code>                                                                                                                            | Name of folder                            |
|                       | <code>ID</code>                                                                                                                                     | Identifier for folder                     |
|                       | <code>MAObj</code>                                                                                                                                  | Model Advisor object                      |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see <a href="#">Copying Objects in the MATLAB Programming Fundamentals documentation</a> . |                                           |
| <b>Examples</b>       | <pre>% --- sample factory group rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');</pre>                                         |                                           |
| <b>How To</b>         | • “Customizing the Model Advisor”                                                                                                                   |                                           |

**Purpose** Define subfolder in **By Task** folder

**Syntax** `fg_obj = ModelAdvisor.FactoryGroup(fg_ID)`

**Description** `fg_obj = ModelAdvisor.FactoryGroup(fg_ID)` creates a handle to a factory group object, `fg_obj`, and assigns it a unique identifier, `fg_ID`. `fg_ID` must remain constant.

**Examples**

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.FormatTemplate

---

**Purpose**            Template for formatting Model Advisor analysis results

**Description**        Use the `ModelAdvisor.FormatTemplate` class to format the result of a check in the analysis result pane of the Model Advisor for a uniform look and feel among the checks you create. There are two formats for the analysis result:

- Table
- List

**Construction**        `ModelAdvisor.FormatTemplate`        Construct template object for formatting Model Advisor analysis results

**Methods**

|                                     |                                         |
|-------------------------------------|-----------------------------------------|
| <code>addRow</code>                 | Add row to table                        |
| <code>setCheckText</code>           | Add description of check to result      |
| <code>setColTitles</code>           | Add column titles to table              |
| <code>setInformation</code>         | Add description of subcheck to result   |
| <code>setListObj</code>             | Add list of hyperlinks to model objects |
| <code>setRecAction</code>           | Add Recommended Action section and text |
| <code>setRefLink</code>             | Add See Also section and links          |
| <code>setSubBar</code>              | Add line between subcheck results       |
| <code>setSubResultStatus</code>     | Add status to check or subcheck result  |
| <code>setSubResultStatusText</code> | Add text below status in result         |

|               |                                  |
|---------------|----------------------------------|
| setSubTitle   | Add title for subcheck in result |
| setTableInfo  | Add data to table                |
| setTableTitle | Add title to table               |

## Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.

## Examples

The following code creates two template objects, `ft1` and `ft2`, and uses them to format the result of running the check in a table and a list. The result identifies the blocks in the model. The graphics following the code display the output as it appears in the Model Advisor when the check passes and fails.

```
% Sample Check With Subchecks Callback Function
function ResultDescription = SampleStyleOneCallback(system)
mdladvObj = Simulink.ModelAdvisor.getModelAdvisor(system); % get object

%Initialize variables
ResultDescription={};
ResultStatus = false; % Default check status is 'Warning'
mdladvObj.setCheckResultStatus(ResultStatus);

% Create FormatTemplate object for first subcheck, specify table format
ft1 = ModelAdvisor.FormatTemplate('TableTemplate');

% Add information describing the overall check
setCheckText(ft1, ['Find and report all blocks in the model. '...
 '(setCheckText method - Description of what the check reviews)']);

% Add information describing the subcheck
setSubTitle(ft1, 'Table of Blocks (setSubTitle method - Title of the subcheck)');
setInformation(ft1, ['Find and report all blocks in a table. '...
 '(setInformation method - Description of what the subcheck reviews)']);

% Add See Also section for references to standards
```

# ModelAdvisor.FormatTemplate

---

```
setRefLink(ft1, {'Standard 1 reference (setRefLink method)',
 {'Standard 2 reference (setRefLink method)'});

% Add information to the table
setTableTitle(ft1, {'Blocks in the Model (setTableTitle method)'});
setColTitles(ft1, {'Index (setColTitles method)',
 'Block Name (setColTitles method)'});

% Perform the check actions
allBlocks = find_system(system);
if length(find_system(system)) == 1
 % Add status for subcheck
 setSubResultStatus(ft1, 'Warn');
 setSubResultStatusText(ft1, ['The model does not contain blocks. '...
 '(setSubResultStatusText method - Description of result status)']);
 setRecAction(ft1, {'Add blocks to the model. '...
 '(setRecAction method - Description of how to fix the problem)'});
 ResultStatus = false;
else
 % Add status for subcheck
 setSubResultStatus(ft1, 'Pass');
 setSubResultStatusText(ft1, ['The model contains blocks. '...
 '(setSubResultStatusText method - Description of result status)']);
 for inx = 2 : length(allBlocks)
 % Add information to the table
 addRow(ft1, {inx-1,allBlocks(inx)});
 end
 ResultStatus = true;
end

% Pass table template object for subcheck to Model Advisor
ResultDescription{end+1} = ft1;

% Create FormatTemplate object for second subcheck, specify list format
ft2 = ModelAdvisor.FormatTemplate('ListTemplate');

% Add information describing the subcheck
```

```
setSubTitle(ft2, 'List of Blocks (setSubTitle method - Title of the subcheck)');
setInformation(ft2, ['Find and report all blocks in a list. '...
 '(setInformation method - Description of what the subcheck reviews)']);

% Add See Also section for references to standards
setRefLink(ft2, {'Standard 1 reference (setRefLink method)'},
 {'Standard 2 reference (setRefLink method)'});

% Last subcheck, suppress line
setSubBar(ft2, false);

% Perform the subcheck actions
if length(find_system(system)) == 1
 % Add status for subcheck
 setSubResultStatus(ft2, 'Warn');
 setSubResultStatusText(ft2, ['The model does not contain blocks. '...
 '(setSubResultStatusText method - Description of result status)']);
 setRecAction(ft2, {'Add blocks to the model. '...
 '(setRecAction method - Description of how to fix the problem)'});
 ResultStatus = false;
else
 % Add status for subcheck
 setSubResultStatus(ft2, 'Pass');
 setSubResultStatusText(ft2, ['The model contains blocks. '...
 '(setSubResultStatusText method - Description of result status)']);
 % Add information to the list
 setListObj(ft2, allBlocks);
end

% Pass list template object for the subcheck to Model Advisor
ResultDescription{end+1} = ft2;
% Set overall check status
mdladvObj.setCheckResultStatus(ResultStatus);
```

# ModelAdvisor.FormatTemplate

The following graphic displays the output as it appears in the Model Advisor when the check passes.

Result:  Passed

Find and report all blocks in the model. (setCheckText method - Description of what the check reviews)

**Table of Blocks (setSubTitle method - Title of the subcheck)**  
Find and report all blocks in a table. (setInformation method - Description of what the subcheck reviews)

**See Also**

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

**Passed**  
The model contains blocks. (setSubResultStatusText method - Description of result status)

Blocks in the Model (setTableTitle method)

| Index (setColTitles method) | Block Name (setColTitles method)               |
|-----------------------------|------------------------------------------------|
| 1                           | <a href="#">format template test/Constant</a>  |
| 2                           | <a href="#">format template test/Constant1</a> |
| 3                           | <a href="#">format template test/Gain</a>      |
| 4                           | <a href="#">format template test/Product</a>   |
| 5                           | <a href="#">format template test/Out1</a>      |

---

**List of Blocks (setSubTitle method - Title of the subcheck)**  
Find and report all blocks in a list. (setInformation method - Description of what the subcheck reviews)

**See Also**

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

**Passed**  
The model contains blocks. (setSubResultStatusText method - Description of result status)

- [format template test](#)
- [format template test/Constant](#)
- [format template test/Constant1](#)
- [format template test/Gain](#)
- [format template test/Product](#)
- [format template test/Out1](#)

The following graphic displays the output as it appears in the Model Advisor when the check fails.

Result:  Warning

Find and report all blocks in the model. (setCheckText method - Description of what the check reviews)

**Table of Blocks (setSubTitle method - Title of the subcheck)**  
Find and report all blocks in a table. (setInformation method - Description of what the subcheck reviews)

**See Also**

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

**Warning**  
The model does not contain blocks. (setSubResultStatusText method - Description of result status)

**Recommended Action**  
Add blocks to the model.  
(setRecAction method - Description of how to fix the problem)

---

**Warning**  
The model does not contain blocks. (setSubResultStatusText method - Description of result status)

**Recommended Action**  
Add blocks to the model.  
(setRecAction method - Description of how to fix the problem)

## Alternatives

Use the Model Advisor Formatting API to format check analysis results. However, MathWorks recommends that you use the

# ModelAdvisor.FormatTemplate

---

ModelAdvisor.FormatTemplate class for a uniform look and feel among the checks you create.

## How To

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

**Purpose** Construct template object for formatting Model Advisor analysis results

**Syntax** `obj = ModelAdvisor.FormatTemplate('type')`

**Description** `obj = ModelAdvisor.FormatTemplate('type')` creates a handle, *obj*, to an object of the `ModelAdvisor.FormatTemplate` class. *type* is a string identifying the format type of the template, either list or table. Valid values are `ListTemplate` and `TableTemplate`.

You must return the result object to the Model Advisor to display the formatted result in the analysis result pane.

---

**Note** Use the `ModelAdvisor.FormatTemplate` class in check callbacks.

---

**Examples** Create a template object, `ft`, and use it to create a list template:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.Group

---

**Purpose**

Define custom folder

**Syntax**

```
group_obj = ModelAdvisor.Group(group_ID)
```

**Description**

`group_obj = ModelAdvisor.Group(group_ID)` creates a handle to a group object, `group_obj`, and assigns it a unique identifier, `group_ID`. `group_ID` must remain constant.

**Examples**

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Image

---

| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation. |                                       |
| <b>How To</b>         | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>     |                                       |

**Purpose** Include image in Model Advisor output

**Syntax** `object = ModelAdvisor.Image`

**Description** `object = ModelAdvisor.Image` creates a handle to an image object, object, that the Model Advisor displays in the output. The Model Advisor supports many image formats, including, but not limited to, JPEG, BMP, and GIF.

**Examples** `image_obj = ModelAdvisor.Image;`

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.InputParameter

| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see <a href="#">Copying Objects in the MATLAB Programming Fundamentals documentation</a> .                                           |                                               |
| <b>How To</b>         | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                                                                             |                                               |

**Purpose** Add input parameters to custom checks

**Syntax** `input_param = ModelAdvisor.InputParameter`

**Description** `input_param = ModelAdvisor.InputParameter` creates a handle to an input parameter object, `input_param`.

---

**Note** You must include input parameter definitions in a check definition.

---

## Examples

---

**Note** The following example is a fragment of code from the `sl_customization.m` file for the demo model, `slvndemo_mdadv`. The example does not execute as shown without the additional content found in the `sl_customization.m` file.

---

# ModelAdvisor.InputParameter

---

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.setInputParametersLayoutGrid([3 2]);
% define input parameters
inputParam1 = ModelAdvisor.InputParameter;
inputParam1.Name = 'Skip font checks.';
inputParam1.Type = 'Bool';
inputParam1.Value = false;
inputParam1.Description = 'sample tooltip';
inputParam1.setRowSpan([1 1]);
inputParam1.setColSpan([1 1]);
inputParam2 = ModelAdvisor.InputParameter;
inputParam2.Name = 'Standard font size';
inputParam2.Value='12';
inputParam2.Type='String';
inputParam2.Description='sample tooltip';
inputParam2.setRowSpan([2 2]);
inputParam2.setColSpan([1 1]);
inputParam3 = ModelAdvisor.InputParameter;
inputParam3.Name='Valid font';
inputParam3.Type='Combobox';
inputParam3.Description='sample tooltip';
inputParam3.Entries={'Arial', 'Arial Black'};
inputParam3.setRowSpan([2 2]);
inputParam3.setColSpan([2 2]);
rec.setInputParameters({inputParam1,inputParam2,inputParam3});
```

## How To

- “Customizing the Model Advisor”

|                       |                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>        | Insert line break                                                                                                                  |
| <b>Description</b>    | Use instances of the <code>ModelAdvisor.LineBreak</code> class to insert line breaks in the Model Advisor outputs.                 |
| <b>Construction</b>   | <code>ModelAdvisor.LineBreak</code> Insert line break                                                                              |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation. |

# ModelAdvisor.LineBreak

---

**Purpose**            Insert line break

**Syntax**            ModelAdvisor.LineBreak

**Description**       ModelAdvisor.LineBreak inserts a line break into the Model Advisor output.

**Examples**           Add a line break between two lines of text:

```
result = ModelAdvisor.Paragraph;
addItem(result, [resultText1 ModelAdvisor.LineBreak resultText2]);
```

**How To**            • “Customizing the Model Advisor”  
                      • “Formatting Model Advisor Results”

|                       |                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>        | Create list class                                                                                                                  |
| <b>Description</b>    | Use instances of the <code>ModelAdvisor.List</code> class to create list-formatted outputs.                                        |
| <b>Construction</b>   | <code>ModelAdvisor.List</code> Create list class                                                                                   |
| <b>Methods</b>        | <code>addItem</code> Add item to list<br><code>setType</code> Specify list type                                                    |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation. |
| <b>How To</b>         | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>     |

# ModelAdvisor.List

---

**Purpose** Create list class

**Syntax** `list = ModelAdvisor.List`

**Description** `list = ModelAdvisor.List` creates a list object, `list`.

**Examples**

```
subList = ModelAdvisor.List();
setType(subList, 'numbered')
addItem(subList, ModelAdvisor.Text('Sub entry 1', {'pass', 'bold'}));
addItem(subList, ModelAdvisor.Text('Sub entry 2', {'pass', 'bold'}));
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

|                       |                                                                                                                                                                                                |                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Purpose</b>        | Add list view parameters to custom checks                                                                                                                                                      |                                                        |
| <b>Description</b>    | The Model Advisor uses list view parameters to populate the Model Advisor Result Explorer. Access the information in list views by clicking <b>Explore Result</b> in the Model Advisor window. |                                                        |
| <b>Construction</b>   | ModelAdvisor.ListViewParameter                                                                                                                                                                 | Add list view parameters to custom checks              |
| <b>Properties</b>     | Attributes                                                                                                                                                                                     | Attributes to display in Model Advisor Report Explorer |
|                       | Data                                                                                                                                                                                           | Objects in Model Advisor Result Explorer               |
|                       | Name                                                                                                                                                                                           | Drop-down list entry                                   |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.                                                             |                                                        |

## Examples

---

**Note** The following example is a fragment of code from the `sl_customization.m` file for the demo model, `slvndemo_mdadv`. The example does not execute as shown without the additional content found in the `sl_customization.m` file.

---

```
mdladvObj = Simulink.ModelAdvisor.getModelAdvisor(system);
mdladvObj.setCheckResultStatus(true);

% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
myLVParam.Data = get_param(searchResult,'object');
```

# ModelAdvisor.ListViewParameter

---

```
myLVParam.Attributes = {'FontName'}; % name is default property
mdladvObj.setListViewParameters({myLVParam});
```

## How To

- “Customizing the Model Advisor”

**Purpose** Add list view parameters to custom checks

**Syntax** `lv_param = ModelAdvisor.ListViewParameter`

**Description** `lv_param = ModelAdvisor.ListViewParameter` defines a list view, `lv_param`.

---

**Note** Include list view parameter definitions in a check definition.

---

**How To**

- “Defining Model Advisor Result Explorer Views”
- “Customizing the Model Advisor”
- “Batch-Fixing Warnings or Failures”
- “Demo and Code Example”
- “`getListViewParameters`”
- “`setListViewParameters`”

# ModelAdvisor.lookupCheckID

| <b>Examples</b>       | <pre>% Check Simulation optimization setting ResultDescription{end+1} = ModelAdvisor.Paragraph(['Check Simulation '... 'optimization settings:']);</pre> |                             |
| <b>How To</b>         | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>                           |                             |

# ModelAdvisor.Paragraph

---

**Purpose** Create and format paragraph

**Syntax** `para_obj = ModelAdvisor.Paragraph`

**Description** `para_obj = ModelAdvisor.Paragraph` defines a paragraph object `para_obj`.

**Examples**

```
% Check Simulation optimization setting
ResultDescription{end+1} = ModelAdvisor.Paragraph(['Check Simulation '...
'optimization settings:']);
```

**How To**

- “Customizing the Model Advisor”

**Purpose** Define custom procedures

**Description** The `ModelAdvisor.Procedure` class defines a procedure that is displayed in the Model Advisor tree. Use procedures to organize additional procedures or checks by functionality or usage.

**Construction** `ModelAdvisor.Procedure` Define custom procedures

**Properties** Description

Provides information about the procedure. Details about the procedure are displayed in the right pane of the Model Advisor.

**Default:** ' ' (null string)

Name

Specifies the name of the procedure that is displayed in the Model Advisor.

**Default:** ' ' (null string)

ID

Specifies a permanent, unique identifier for the procedure.

---

## Note

- You must specify this field.
  - The value of ID must remain constant.
  - The Model Advisor generates an error if ID is not unique.
  - Procedure definitions must refer to other procedures by ID.
-

# ModelAdvisor.Procedure

---

MAObj

Specifies a handle to the current Model Advisor object.

## Methods

|              |                               |
|--------------|-------------------------------|
| addProcedure | Add subprocedure to procedure |
| addTask      | Add task to procedure         |

## Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.

## How To

- “Creating Procedural-Based Model Advisor Configurations”
- “Customizing the Model Advisor”

**Purpose** Define custom procedures

**Syntax** `procedure_obj = ModelAdvisor.Procedure(procedure_ID)`

**Description** `procedure_obj = ModelAdvisor.Procedure(procedure_ID)` creates a handle to a procedure object, `procedure_obj`, and assigns it a unique identifier, `procedure_ID`. `procedure_ID` must remain constant.

**Examples** `MAP = ModelAdvisor.Procedure('com.mathworks.sample.ProcedureSample');`

**How To**

- “Creating Procedural-Based Model Advisor Configurations”
- “Customizing the Model Advisor”

# ModelAdvisor.Root

---

|                       |                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>        | Identify root node                                                                                                                 |
| <b>Description</b>    | The <code>ModelAdvisor.Root</code> class returns the root object.                                                                  |
| <b>Construction</b>   | <code>ModelAdvisor.Root</code> Identify root node                                                                                  |
| <b>Methods</b>        | <code>publish</code> Publish object in Model Advisor root<br><code>register</code> Register object in Model Advisor root           |
| <b>Copy Semantics</b> | Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation. |
| <b>How To</b>         | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                  |

|                    |                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Identify root node                                                                                     |
| <b>Syntax</b>      | <code>root_obj = ModelAdvisor.Root</code>                                                              |
| <b>Description</b> | <code>root_obj = ModelAdvisor.Root</code> creates a handle to the root object, <code>root_obj</code> . |
| <b>Examples</b>    | <code>mdladvRoot = ModelAdvisor.Root;</code>                                                           |

# ModelAdvisor.run

---

## Purpose

Run Model Advisor checks on systems

## Syntax

```
SysResultObjArray =
ModelAdvisor.run(SysList,CheckIDList,Name,
 Value)
SysResultObjArray =
ModelAdvisor.run(SysList,'Configuration',
 FileName,Name,Value)
```

## Description

`SysResultObjArray = ModelAdvisor.run(SysList,CheckIDList,Name,Value)` runs the Model Advisor on the systems provided by `SysList` with additional options specified by one or more optional `Name, Value` pair arguments. `CheckIDList` contains cell array of check IDs to run.

`SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',FileName,Name,Value)` runs the Model Advisor on the systems provided by `SysList`. The list of checks to run is specified using a Model Advisor configuration file, specified by `FileName`.

## Tips

- If you have a Parallel Computing Toolbox™ license and a multicore machine, you can run the Model Advisor on multiple systems in parallel. Start a MATLAB pool using the `matlabpool` function.

## Input Arguments

`SysList`

Cell array of systems to run.

`CheckIDList`

Cell array of check IDs to run. For details on how to find check IDs, see “Finding Check IDs”.

`CheckIDList` optionally can include input parameters for specific checks using the following syntax; `{'CheckID','InputParam',{'IP','IPV'}}`, where `IP` is the input parameter name and `IPV` is the corresponding input

parameter value. You can specify several input parameter name and value pair arguments in any order as IP1,IPV1, ,IPN,IPVN.

## FileName

Name of the Model Advisor configuration file. For details on creating a configuration file, see “Organizing Checks and Folders Using the Model Advisor Configuration Editor”.

## Name-Value Pair Arguments

Optional comma-separated pairs of Name,Value arguments, where Name is the argument name and Value is the corresponding value. Name must appear inside single quotes ( ' '). You can specify several name-value pair arguments in any order as Name1,Value1, ,NameN,ValueN.

## Force

Setting Force to 'On' removes existing `modeladvisor/system` folders. Setting Force to 'Off' prompts you before removing existing `modeladvisor/system` folders.

**Default:** 'Off'

## TempDir

Setting TempDir to 'On' runs the Model Advisor from a temporary working folder, to avoid concurrency issues when running using a MATLAB pool. For more information, see “Resolving Data Concurrency Issues”. Setting TempDir to 'Off' runs the Model Advisor in the current working folder.

**Default:** 'Off'

## DisplayResults

Setting DisplayResults to 'Summary' displays a summary of the system results in the Command Window. Setting DisplayResults to 'Details' displays the following in the Command Window:

# ModelAdvisor.run

---

- Which system the Model Advisor is checking while the run is in progress.
- For each system, the pass and fail results of each check.
- A summary of the system results.

Setting `DisplayResults` to 'None' displays no information in the Command Window.

**Default:** 'Summary'

## Output Arguments

`SysResultObjArray`

Cell array of `ModelAdvisor.SystemResult` objects, one for each model specified in `SysList`. Each `ModelAdvisor.SystemResult` object contains an array of `CheckResultObj` objects. Save `SysResultObjArray` to review results at a later time without having to rerun the Model Advisor (see “Saving and Loading Objects”).

`CheckResultObj`

Array of `ModelAdvisor.CheckResult` objects, one for each check that runs.

## Examples

Runs the Model Advisor checks **Check model diagnostic parameters** and **Check for fully defined interface** on the `sldemo_auto_climatecontrol/Heater Control` and `sldemo_auto_climatecontrol/AC Control` subsystems:

```
% Create list of checks and models to run.
CheckIDList ={'mathworks.maab.jc_0021',...
 'mathworks.iec61508.RootLevelInports'};
SysList={'sldemo_auto_climatecontrol/Heater Control',...
 'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,CheckIDList);
```

Runs the Model Advisor configuration file `slvndemo_mdladv_config.mat` on the `sldemo_auto_climatecontrol/Heater Control` and `sldemo_auto_climatecontrol/AC Control` subsystems:

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdladv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
 'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);
```

## Alternatives

- Use the Model Advisor GUI to run each system, one at a time.
- Create a script or function using the `Simulink.ModelAdvisor` class to run each system, one at a time.

To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                       |                         |                            |                            |                                 |                                |                          |                       |                         |                       |                       |                   |                            |                              |                         |                     |                              |                               |                            |                         |                                 |                                   |
| <b>How To</b>                   | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                       |                         |                            |                            |                                 |                                |                          |                       |                         |                       |                       |                   |                            |                              |                         |                     |                              |                               |                            |                         |                                 |                                   |

**Purpose** Create table

**Syntax** `table = ModelAdvisor.Table(row, column)`

**Description** `table = ModelAdvisor.Table(row, column)` creates a table object (`table`). The Model Advisor displays the table object containing the specified number of rows (`row`) and columns (`column`).

**Examples** In the following example, you create two table objects, `table1` and `table2`. The Model Advisor displays `table1` in the results as a table with 1 row and 1 column. The Model Advisor display `table2` in the results as a table with 2 rows and 3 columns.

```
table1 = ModelAdvisor.Table(1,1);
table2 = ModelAdvisor.Table(2,3);
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Task

---

**Purpose** Define custom tasks

**Description** The `ModelAdvisor.Task` class is a wrapper for a check so that you can access the check with the Model Advisor.

You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution** is displayed in the **By Product > Simulink** folder and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When adding checks as tasks, the Model Advisor uses the task properties instead of the check properties, except for `Visible` and `LicenseName`.

**Construction** `ModelAdvisor.Task` Define custom tasks

**Methods** `setCheck` Specify check used in task

**Properties**

|                          |                                                        |
|--------------------------|--------------------------------------------------------|
| <code>Description</code> | Description of task                                    |
| <code>DisplayName</code> | Name of task                                           |
| <code>Enable</code>      | Indicate if user can enable and disable task           |
| <code>ID</code>          | Identifier for task                                    |
| <code>LicenseName</code> | Product license names required to display and run task |
| <code>MAObj</code>       | Model Advisor object                                   |
| <code>Value</code>       | Status of task                                         |
| <code>Visible</code>     | Indicate to display or hide task                       |

## Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects in the MATLAB Programming Fundamentals documentation.

## Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
```

## How To

- “Authoring Custom Checks”

# ModelAdvisor.Task

---

**Purpose** Define custom tasks

**Syntax** `task_obj = ModelAdvisor.Task(task_ID)`

**Description** `task_obj = ModelAdvisor.Task(task_ID)` creates a task object, `task_obj`, with a unique identifier, `task_ID`. `task_ID` must remain constant. If you do not specify `task_ID`, the Model Advisor assigns a random `task_ID` to the task object.

You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution appears** in the **By Product > Simulink folder** and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When adding checks as tasks, the Model Advisor uses the task properties instead of the check properties, except for `Visible` and `LicenseName`.

**Examples** In the following example, you create three task objects, `MAT1`, `MAT2`, and `MAT3`.

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
```

# ModelAdvisor.Text

---

**Purpose** Create Model Advisor text output

**Syntax** `text = ModelAdvisor.Text(content, {attribute})`

**Description** `text = ModelAdvisor.Text(content, {attribute})` creates a text object for the Model Advisor output.

## Input Arguments

- |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>content</i>   | Optional string specifying the content of the text object. If <i>content</i> is empty, empty text is output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>attribute</i> | Optional cell array of strings specifying the formatting of the content. If no attribute is specified, the output text has default coloring with no formatting. Possible formatting options include: <ul style="list-style-type: none"><li>• <code>normal</code> (default) — Text is default color and style.</li><li>• <code>bold</code> — Text is bold.</li><li>• <code>italic</code> — Text is italicized.</li><li>• <code>underline</code> — Text is underlined.</li><li>• <code>pass</code> — Text is green.</li><li>• <code>warn</code> — Text is yellow.</li><li>• <code>fail</code> — Text is red.</li><li>• <code>keyword</code> — Text is blue.</li><li>• <code>subscript</code> — Text is subscripted.</li><li>• <code>superscript</code> — Text is superscripted.</li></ul> |

## Output Arguments

text                      The text object you create

## Examples

```
text = ModelAdvisor.Text('Sub entry 1', {'pass', 'bold'})
```

## How To

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.Root.publish

---

**Purpose** Publish object in Model Advisor root

**Syntax**

```
publish(root_obj, check_obj, location)
publish(root_obj, group_obj)
publish(root_obj, procedure_obj)
publish(root_obj, fg_obj)
```

**Description** `publish(root_obj, check_obj, location)` specifies where the Model Advisor places the check in the Model Advisor tree. `location` is either one of the subfolders in the **By Product** folder, or the name of a new subfolder to put in the **By Product** folder. Use a pipe-delimited string to indicate multiple subfolders. For example, to add a check to the **Simulink Verification and Validation > Modeling Standards** folder, use the following string: 'Simulink Verification and Validation|Modeling Standards'.

`publish(root_obj, group_obj)` specifies the `ModelAdvisor.Group` object to publish as a folder in the **Model Advisor Task Manager** folder.

`publish(root_obj, procedure_obj)` specifies the `ModelAdvisor.Procedure` object to publish.

`publish(root_obj, fg_obj)` specifies the `ModelAdvisor.FactoryGroup` object to publish as a subfolder in the **By Task** folder.

**Examples**

```
% publish check into By Product > Demo group.
mdladvRoot.publish(rec, 'Demo');
```

**How To**

- “Defining Where Custom Checks Appear”
- “Defining Where Tasks Appear”
- “Defining Where Custom Folders Appear”

## Purpose

Register object in Model Advisor root

## Syntax

```
register(MAobj, obj)
```

## Description

`register(MAobj, obj)` registers the object, *obj*, in the root object *MAobj*.

In the Model Advisor memory, the `register` method registers the following types of objects:

- `ModelAdvisor.Check`
- `ModelAdvisor.FactoryGroup`
- `ModelAdvisor.Group`
- `ModelAdvisor.Procedure`
- `ModelAdvisor.Task`

The `register` method places objects in the Model Advisor memory that you use in other functions. The `register` method does not place objects in the Model Advisor tree.

## Examples

```
mdladvRoot = ModelAdvisor.Root;

MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT1.DisplayName='Example task with input parameter and auto-fix ability';
MAT1.setCheck('com.mathworks.sample.Check1');
mdladvRoot.register(MAT1);

MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');
MAT2.DisplayName='Example task 2';
MAT2.setCheck('com.mathworks.sample.Check2');
mdladvRoot.register(MAT2);

MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
MAT3.DisplayName='Example task 3';
MAT3.setCheck('com.mathworks.sample.Check3');
```

# ModelAdvisor.Root.register

---

```
mdladvRoot.register(MAT3)
```

**Purpose**

Interact programmatically with Requirements Management Interface

**Syntax**

```
rmi setup
number_problems = rmi('checkdoc', reqtsDocName)
rmi('doorssync', object)
reqlinks = rmi('createempty')
reqlinks = rmi('get', object)
reqlinks = rmi('get', object, group)
rmi('report', object)
rmi('set', object, reqlinks)
rmi('set', object, reqlinks, group)
rmi('cat', object, reqlinks)
cnt = rmi('count', object)
rmi('clearall', object)
rmi('clearAll', object, 'deep')
rmi register linktypename
rmi unregister linktypename
rmi linktypelist
cmdstr = rmi('navCmd', object)
[cmdstr, objPath] = rmi('navCmd', object)
guidstr = rmi('guidget', object)
object = rmi('guidlookup', model, guidstr)
rmi('highlightModel', object)
rmi('unhighlightModel', object)
rmi('view', object, index)
dialog = rmi('edit', object)
rmi('copyObj', object)
```

**Description**

`rmi setup` configures RMI for use with your MATLAB software and installs the interface for use with the Telelogic® DOORS® software, if needed.

`number_problems = rmi('checkdoc', reqtsDocName)` validates links in a Microsoft® Word, Microsoft® Excel®, or IBM Rational DOORS requirements document to Simulink models. `rmi` returns the total count of detected problems in `number_problems` and generates an HTML report. If the `rmi` function detects a navigation object in the

requirements document that points to multiple model objects, you have the option to split the navigation object, as described in “When Multiple Objects Have Links to the Same Requirement”.

`rmi('doorssync', object)` opens the DOORS synchronization settings dialog box, where you can customize the synchronization settings and synchronize your model with an open project in an IBM Rational DOORS database. See `rmi.doorssync` for information about synchronizing your model with DOORS at the MATLAB command line.

`reqlinks = rmi('createempty')` creates an empty instance of the requirement links data structure.

`reqlinks = rmi('get', object)` returns the requirement links data structure for `object`. `object` is the name or handle of a Simulink or Stateflow object with which requirements can be associated.

`reqlinks = rmi('get', object, group)` returns the requirement links data structure for the Signal Builder group specified by the index `group`. In this case, `object` is the name or handle of a Signal Builder block whose signal groups are associated with requirements.

`rmi('report', object)` creates an HTML report that describes the requirements in `object`.

`rmi('set', object, reqlinks)` sets the requirement links data structure `reqlinks` to `object`.

`rmi('set', object, reqlinks, group)` sets the requirement links data structure `reqlinks` to the Signal Builder group specified by the index `group`. In this case, `object` is the name or handle of a Signal Builder block whose signal groups you want to associate with requirements.

`rmi('cat', object, reqlinks)` appends the requirement links data structure `reqlinks` to the end of the existing structure associated with `object`. If no structure exists, RMI sets `reqlinks` to `object`.

`cnt = rmi('count', object)` returns the number of requirement links associated with `object`.

`rmi('clearall', object)` removes the requirement links data structure associated with `object`, deleting its requirements.

`rmi('clearAll', object, 'deep')` deletes all requirements links in the model containing `object`.

`rmi register linktypename` registers the custom link type specified by the function `linktypename`.

`rmi unregister linktypename` removes the custom link type specified by the function `linktypename`.

`rmi linktypelist` displays a list of the currently registered link types. The list indicates whether each link type is built-in or custom, and provides the path to the function used for its registration.

`cmdstr = rmi('navCmd', object)` returns the MATLAB command string used to navigate to `object`.

`[cmdstr, objPath] = rmi('navCmd', object)` returns the MATLAB command string `cmdstr` and the title string `titlestr` that provides descriptive text for `object`.

`guidstr = rmi('gidget', object)` returns the globally unique identifier for `object`. A globally unique identifier is created for `object` if it lacks one.

`object = rmi('guidlookup', model, guidstr)` returns the object name in `model` that has the globally unique identifier `guidstr`.

`rmi('highlightModel', object)` highlights all of the objects in the parent model of `object` that have requirement links.

`rmi('unhighlightModel', object)` removes highlighting of objects in the parent model of `object` that have requirement links.

`rmi('view', object, index)` accesses the requirement numbered `index` in the requirements document associated with `object`. `index` is an integer that represents the  $n$ th requirement linked to `object`.

`dialog = rmi('edit', object)` displays the Requirements dialog box for `object` and returns the handle of the dialog box.

`rmi('copyObj', object)` resets the globally unique identifier for `object`, preserving its requirement links.

## Input Arguments

`group`

Signal Builder group index

`guidstr`

Globally unique model identifier

`index`

Integer that represents the  $n$ th requirement linked to `object`

`model`

Name or handle of a Simulink model

`object`

Name or handle of a Simulink or Stateflow object with which requirements can be associated.

`reqlinks`

Requirement links are represented using a MATLAB structure array with the following fields:

`doc` String identifying requirements document

`id` String defining location in requirements document. The first character specifies the identifier type:

| First Character | Identifier                                            | Example          |
|-----------------|-------------------------------------------------------|------------------|
| ?               | Search text, the first occurrence of which is located | '?Requirement 1' |

|              |    |                                                                                                             |           |
|--------------|----|-------------------------------------------------------------------------------------------------------------|-----------|
|              |    | in requirements document                                                                                    |           |
|              | @  | Named item, such as bookmark in a Microsoft Word file or an anchor in an HTML file                          | '@my_req' |
|              | #  | Page or item number                                                                                         | '#21'     |
|              | >  | Line number                                                                                                 | '>3156'   |
|              | \$ | Worksheet range in a spreadsheet                                                                            | '\$A2:C5' |
| linked       |    | Boolean value specifying whether the requirement link is accessible for report generation and highlighting: |           |
|              |    | 1 (default). Highlight model object and include requirement link in reports.                                |           |
|              |    | 0                                                                                                           |           |
| description  |    | String describing the requirement                                                                           |           |
| keywords     |    | Optional string supplementing description                                                                   |           |
| reqsys       |    | String identifying the link type registration name; 'other' for built-in link types                         |           |
| reqtsDocName |    | Path name to a Microsoft Word or IBM Rational DOORS requirements document or a DOORS module ID              |           |
| cmdstr       |    | MATLAB command string                                                                                       |           |
| cnt          |    |                                                                                                             |           |

## Output Arguments

Number of requirement links associated with object

`dialog`  
Handle for object

`guidstr`  
Globally unique model identifier

`number_problems`  
Integer representing the number of invalid links in a requirements document

`object`  
Name or handle of a Simulink or Stateflow object with which requirements can be associated.

`reqlinks`  
Requirement links are represented using a MATLAB structure array. See “Input Arguments” on page 3-122 for details.

`objPath`  
A string that identifies object

## Examples

Get a requirement associated with a block in the `slvndemo_fuelsys_htmreq` model, change its description, and save the requirement back to that block:

```
slvndemo_fuelsys_htmreq;
blk_with_req = ['slvndemo_fuelsys_htmreq/fuel rate' 10 'controller/...
 Airflow calculation'];
reqts = rmi('get', blk_with_req);
reqts.description = 'Mass airflow estimation';
rmi('set', blk_with_req, reqts);
rmi('get', blk_with_req);
```

---

---

Add a new requirement to the block in the previous example:

```
new_req = rmi('createempty');
new_req.doc = 'fuelsys_requirements2.htm';
new_req.description = 'A new requirement';
rmi('cat',blk_with_req, new_req);
```

---

Create an HTML requirements report for the slvndemo\_fuelsys\_htmreq model:

```
rmi('report', 'slvndemo_fuelsys_htmreq');
```

| <b>Examples</b>        | <p>Associate an external requirements information file with a Simulink model. After associating the information with the model, view the objects with linked requirements by highlighting the model.</p>                                                                                                                                                                                                                                                                                                                                         |

## rmidata.map

---

```
open_system('slvnvdemo_powerwindowController');
reqFile = fullfile(matlabroot, 'toolbox', 'slvkv', ...
 'rmidemos', 'powerwin_reqs', ...
 'slvnvdemo_powerwindowRequirements.req');
rmidata.map('slvnvdemo_powerwindowController', reqFile);
rmi('highlightModel', 'slvnvdemo_powerwindowController');
```

To clear the requirements you just associated with that model, run this `rmidata.map` command:

```
rmidata.map('slvnvdemo_powerwindowController', 'clear');
```

## Purpose

Update model requirements document paths and file names

## Syntax

```
rmidocrename(model_handle, old_path, new_path)
rmidocrename(model_name, old_path, new_path)
```

## Description

`rmidocrename(model_handle, old_path, new_path)` collectively updates the links from a Simulink model to requirements files whose names or locations have changed. `model_handle` is a handle to the model that contains links to the files that you have moved or renamed. `old_path` is a string that contains the existing full or partial file or path name. `new_path` is a string with the new full or partial file or path name.

`rmidocrename(model_name, old_path, new_path)` updates the links to requirements files associated with `model_name`. You can pass `rmidocrename` a model handle or a model file name.

When using the `rmidocrename` function, make sure to enter specific strings for the old document name fragments so that you do not inadvertently modify other links.

## Examples

For the current Simulink model, update all links to requirements files that contain the string 'project\_0220', replacing them with 'project\_0221':

```
rmidocrename(gcs, '00000220', '00000221')
Processed 6 objects with requirements, 5 out of 13 links were modified.
```

## Alternatives

To update the requirements links one at a time, for each model object that has a link:

- 1 For each object with requirements, open the Requirements dialog box by right-clicking and selecting **Requirements > Edit/Add Links**.
- 2 Edit the **Document** field for each requirement that points to a moved or renamed document.
- 3 Click **Apply** to save the changes.

# rmidocrename

`rmi`

**Purpose** Synchronize model with DOORS surrogate module

**Syntax**

```
rmi.doorssync(model_name)
rmi.doorssync(model_name, settings)
current_settings = rmi.doorssync(model_name, 'settings')
current_settings = rmi.doorssync(model_name, [])
default_settings = rmi.doorssync([])
```

**Description** `rmi.doorssync(model_name)` opens the DOORS synchronization settings dialog box. Select the options for synchronizing `model_name` with an IBM Rational DOORS surrogate module and click **Synchronize**.

Synchronizing a Simulink model with a DOORS surrogate module is a user-initiated process that creates or updates a surrogate module in a DOORS database. A surrogate module is a DOORS formal module that is a representation of a Simulink model hierarchy. When you first synchronize a model, the DOORS software creates a surrogate module. Depending on your synchronization settings, the surrogate module contains a representation of the model.

`rmi.doorssync(model_name, settings)` synchronizes `model_name` with a DOORS surrogate module using the options that `settings` specifies.

`current_settings = rmi.doorssync(model_name, 'settings')` returns the current settings for `model_name`, but does not synchronize the model with the DOORS surrogate module.

`current_settings = rmi.doorssync(model_name, [])` performs synchronization with current settings known for `model_name`. If the RMI has not synchronized the model previously, `rmi.doorssync` uses the default settings.

`default_settings = rmi.doorssync([])` returns a `settings` object with the default values.

# rmi.doorssync

## Input Arguments

`model_name`

Name or handle of a Simulink model

`settings`

Structure with the following fields.

| Field                      | Description                                                                                                                                                                                                               |

| purgeDoors  | Removes unmatched links in the surrogate module (ignored if slToDoors is set to 0).<br><b>Default: 0</b>                                                                                                                                                                                        |
| detailLevel | Specifies which objects with no links to DOORS to include in the surrogate module.<br>Valid values are 1 through 6. 1 includes only objects with requirements, for fast synchronization. 6 includes all model objects, for complete model representation in the surrogate.<br><b>Default: 1</b> |

## Output Arguments

current\_settings

The current values of the synchronization settings

default\_settings

The default values of the synchronization settings

## Examples

Before running this example:

- 1** Start the DOORS software.
- 2** Create a new DOORS project or open an existing DOORS project.

After you complete the preceding steps, open the slnvdemo\_fuelsys\_officereq model, specify to copy the links from the model to DOORS, and synchronize the model to create the surrogate module:

```
slnvdemo_fuelsys_officereq;
settings = rmi.doorssync('slnvdemo_fuelsys_officereq', 'settings')
```

# rmi.doorssync

---

```
settings.slToDoors = 1;
setting.purgeDoors = 1;
rmi.doorssync('slvndemo_fuelsys_officereq', settings);
```

## Alternatives

Instead of using `rmi.doorssync`, you can synchronize your Simulink model with a DOORS surrogate module from the model window:

- 1** Open the model.
- 2** Select **Tools > Requirements > Synchronize with DOORS**.
- 3** In the DOORS synchronization settings dialog box, select the desired synchronization settings.
- 4** Click **Synchronize**.

| <b>Examples</b>         | Open the <code>slvndemo_fuelsys_officereq</code> demo model, get the unique identifier for the MAP Sensor block, and navigate to that block using the <code>rmiobjnavigate</code> function:<br><pre>slvndemo_fuelsys_officereq;           % Open demo model gcb = ...     'slvndemo_fuelsys_officereq/MAP sensor'; % Make current block [navCmdString, objPath] = rmi.objinfo(gcb); % Get rmiobjnavigate command                                          % and path</pre> |
| <b>See Also</b>         | <code>rmi</code>   <code>rmiobjnavigate</code>                                                                                                                                                                                                                                                                                                                                                                                                                             |

# rmiobjnavigate

---

**Purpose** Navigate to model objects using unique Requirements Management Interface identifiers

**Syntax** `rmiobjnavigate(modelPath, guId)`  
`rmiobjnavigate(modelPath, guId, grpNum)`

**Description** `rmiobjnavigate(modelPath, guId)` navigates to and highlights the specified object in a Simulink model.  
`rmiobjnavigate(modelPath, guId, grpNum)` navigates to the signal group number `grpNum` of a Signal Builder block identified by `guId` in the model `modelPath`.

**Input Arguments**

`modelPath`  
A full path to a Simulink model file, or a Simulink model file name that can be resolved on the MATLAB path.

`guId`  
A unique string that the RMI uses to identify a Simulink or Stateflow object.

`grpNum`  
Integer indicating a signal group number in a Signal Builder block

**Examples** Open the `slvndemo_fuelsys_officereq` demo model, get the unique identifier for the MAP Sensor block:

```
slvndemo_fuelsys_officereq; % Open demo model
gcb = ...
 'slvndemo_fuelsys_officereq/MAP sensor'; % Make current block
navCmdString = rmi.objinfo(gcb) % Get rmiobjnavigate command
 % with model name and object ID
```

`rmi.objinfo` returns the following value for `navCmdString`:

```
navCmdString =
```

```
rmiobjnavigate('slvndemo_fuelsys_officereq.mdl', 'GIDa_9fc2c968_6068_49c6_968d_b08e363248b9');
```

Navigate to that block using the `rmiobjnavigate` command that `rmi.objinfo` returned:

```
eval(navCmdString); % Execute rmiobjnavigate command
```

## How To

- “Using the `rmiobjnavigate` Function”

# rmiref.insertRefs

---

**Purpose** Insert links to models into requirements documents

**Syntax**

```
[total_links, total_matches,
 total_inserted] = rmiref.insertRefs(model_name,
doc_type)
```

**Description**

```
[total_links, total_matches, total_inserted] =
rmiref.insertRefs(model_name, doc_type)
```

 inserts ActiveX® controls into the open, active requirements document of type `doc_type`. These controls correspond to any links from `model_name` to the document. With these controls, you can navigate from the requirements document to the model.

**Input Arguments**

`model_name`  
Name or handle of a Simulink model

`doc_type`  
A string that indicates the requirements document type:

- 'word'
- 'excel'

**Examples** Remove the links in a demo requirements document, and then reinsert them:

**1** Open the demo model:

```
slvndemo_fuelsys_officereq
```

**2** Open the demo requirements document:

```
open([matlabroot strcat('/toolbox/slvnv/rmidemos/fuelsys_req_docs/',...
 'slvndemo_FuelSys_DesignDescription.docx')])
```

**3** Remove the links from the requirements document:

```
rmiref.removeRefs('word')
```

**4** Enter `y` to confirm the removal.

**5** Reinsert the links from the requirements document to the model:

```
[total_links, total_matches, total_inserted] = rmiref.insertRefs(gcs, 'word')
```

|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Remove links to models from requirements documents                                                                                                                                                                     |
| <b>Syntax</b>          | <code>rmiref.removeRefs(doc_type)</code>                                                                                                                                                                               |
| <b>Description</b>     | <code>rmiref.removeRefs(doc_type)</code> removes all links to models from the open, active requirements document of type <code>doc_type</code> .                                                                       |
| <b>Input Arguments</b> | <code>doc_type</code><br>A string that indicates the requirements document type: <ul style="list-style-type: none"><li>• 'word'</li><li>• 'excel'</li><li>• 'doors'</li></ul>                                          |
| <b>Examples</b>        | Remove the links in this demo requirements document:<br><pre>open([matlabroot strcat('/toolbox/slvnv/rmidemos/fuelsys_req_docs/', ...     'slvndemo_FuelSys_DesignDescription.docx')]) rmiref.removeRefs('word')</pre> |
| <b>See Also</b>        | <code>rmiref.insertRefs</code>                                                                                                                                                                                         |

**Purpose**

Manage user tags for requirements links

**Syntax**

```
rmitag(model, 'add', tag)
rmitag(model, 'add', tag, doc_pattern)
rmitag(model, 'delete', tag)
rmitag(model, 'delete', tag, doc_pattern)
rmitag(model, 'replace', tag, new_tag)
rmitag(model, 'replace', tag, new_tag, doc_pattern)
rmitag(model, 'clear', tag)
rmitag(model, 'clear', tag, doc_pattern)
```

**Description**

`rmitag(model, 'add', tag)` adds a string `tag` as a user tag for all requirement links in `model`.

`rmitag(model, 'add', tag, doc_pattern)` adds `tag` as a user tag for all links in `model`, where the full or partial document name matches the regular expression `doc_pattern`.

`rmitag(model, 'delete', tag)` removes the user tag, `tag`, from all requirements links in `model`.

`rmitag(model, 'delete', tag, doc_pattern)` removes the user tag, `tag`, from all requirements links in `model`, where the full or partial document name matches `doc_pattern`.

`rmitag(model, 'replace', tag, new_tag)` replaces `tag` with `new_tag` for all requirements links in `model`.

`rmitag(model, 'replace', tag, new_tag, doc_pattern)` replaces `tag` with `new_tag` for links in `model`, where the full or partial document name matches the regular expression `doc_pattern`.

`rmitag(model, 'clear', tag)` deletes all requirement links that have the user tag, `tag`.

`rmitag(model, 'clear', tag, doc_pattern)` deletes all requirement links that have the user tag, `tag`, and link to the full or partial document name specified in `doc_pattern`.

# rmitag

---

## Input Arguments

|                          |                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>model</code>       | Simulink model name or handle                                                                                                                    |
| <code>tag</code>         | String                                                                                                                                           |
| <code>doc_pattern</code> | Regular expression to match in the linked requirements document name                                                                             |
| <code>new_tag</code>     | String that indicates the name of a user tag for a requirements link. Use this argument when replacing an existing user tag with a new user tag. |

## Examples

Open the `slvndemo_fuelsys_officereq` demo model; add the user tag `tmptag` to all objects with requirements links:

```
open_system('slvndemo_fuelsys_officereq');
rmitag(gcs, 'add', 'tmptag');
```

---

Remove the user tag `test` from all requirements links:

```
open_system('slvndemo_fuelsys_officereq');
rmitag(gcs, 'delete', 'test');
```

---

Delete all requirements links that have the user tag `design`:

```
open_system('slvndemo_fuelsys_officereq');
rmitag(gcs, 'clear', 'design');
```

---

Change all instances of the user tag `tmptag` to `safety requirement`, where the document filename extension is `.docx`:

```
open_system('slvnvdemo_fuelsys_officereq');
rmitag(gcs, 'replace', 'tmptag', ...
 'safety requirements', '\.docx');
```

**How To**

- “Understanding Requirements Filtering”

# RptgenRMI.doorsAttribs

---

**Purpose** IBM Rational DOORS attributes in requirements report

**Syntax** RptgenRMI.doorsAttribs (action,attribute)

**Description** RptgenRMI.doorsAttribs (action,attribute) specifies which DOORS object attributes to include in the generated requirements report.

**Input Arguments** action

String that specifies the desired action for what content to include from a DOORS record in the generated requirements report. Valid values for this argument are as follows.

| Value     | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 'default' | Restore the default settings for the DOORS system attributes to include in the report.<br><br>The default configuration includes the <b>Object Heading</b> and <b>Object Text</b> attributes, and all other attributes, except: <ul style="list-style-type: none"><li>• <b>Created Thru</b></li><li>• System attributes with empty string values</li><li>• System attributes that are false</li></ul> |
| 'show'    | Display the current settings for the DOORS attributes to include in the report.                                                                                                                                                                                                                                                                                                                       |

| Value      | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 'type'     | <p>Include or omit groups of DOORS attributes from the report.</p> <p>If you specify 'type' for the first argument, valid values for the second argument are:</p> <ul style="list-style-type: none"><li>• 'all' — Include all DOORS attributes in the report.</li><li>• 'user' — Include only user-defined DOORS in the report.</li><li>• 'none' — Omit all DOORS attributes from the report.</li></ul> |
| 'remove'   | <p>Omit specified DOORS attributes from the report.</p>                                                                                                                                                                                                                                                                                                                                                 |
| 'all'      | <p>Include specified DOORS attributes in the report, even if that attribute is currently excluded as part of a group.</p>                                                                                                                                                                                                                                                                               |
| 'nonempty' | <p>Enable or disable the empty attribute filter:</p> <ul style="list-style-type: none"><li>• Enter <code>RptgenRMI.doorsAttribs('nonempty', 'off')</code> to omit all empty attributes from the report.</li><li>• Enter <code>RptgenRMI.doorsAttribs('nonempty', 'on')</code> to include empty user-defined attributes. The report never includes empty system attributes.</li></ul>                    |

`attribute`

String that qualifies the action argument.

# RptgenRMI.doorsAttribs

---

## Output Arguments

result

- True if RptgenRMI.doorsAttribs modifies the current settings.
- For RptgenRMI.doorsAttribs('show'), this argument is a cell array of strings that indicate which DOORS attributes to include in the requirements report, for example:

```
>> RptgenRMI.doorsAttribs('show')
```

```
ans =
```

```
 'Object Heading'
 'Object Text'
 '$AllAttributes$'
 '$NonEmpty$'
 '-Created Thru'
```

- The **Object Heading** and **Object Text** attributes are included by default.
- '\$AllAttributes\$' specifies to include all attributes associated with each DOORS object.
- '\$Nonempty\$' specifies to exclude all empty attributes.
- '-Created Thru' specifies to exclude the **Created Thru** attribute for each DOORS object.

## Examples

Limit the DOORS attributes in the requirements report to user-defined attributes:

```
RptgenRMI.doorsAttribs('type', 'user');
```

---

Omit the content of the **Last Modified By** attribute from the requirements report:

```
RptgenRMI.doorsAttribs('remove', 'Last Modified By');
```

---

Include the content of the **Last Modified On** attribute in the requirements report, even if system attributes are not included as a group:

```
RptgenRMI.doorsAttribs('add', 'Last Modified On');
```

---

Include empty system attributes in the requirements report:

```
RptgenRMI.doorsAttribs('nonempty', 'off');
```

---

Omit the **Object Heading** attribute from the requirements report. Use this option when the link label is always the same as the **Object Heading** for the target DOORS object and you do not want duplicate information in the requirements report:

```
RptgenRMI.doorsAttribs('remove', 'Object Heading');
```

|                    |                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Specify paragraph alignment                                                                                                                                                                               |
| <b>Syntax</b>      | <code>setAlign(paragraph, alignment)</code>                                                                                                                                                               |
| <b>Description</b> | <code>setAlign(paragraph, alignment)</code> specifies the alignment of text. Possible values are: <ul style="list-style-type: none"><li>• 'left' (default)</li><li>• 'right'</li><li>• 'center'</li></ul> |
| <b>Examples</b>    | <pre>report_paragraph = ModelAdvisor.Paragraph;<br/>setAlign(report_paragraph, 'center');</pre>                                                                                                           |
| <b>How To</b>      | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                                                                                         |

# ModelAdvisor.Text.setBold

---

**Purpose** Specify bold text

**Syntax** `setBold(text, mode)`

**Description** `setBold(text, mode)` specifies whether text should be formatted in bold font.

**Input Arguments**

|                   |                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>text</code> | Instantiation of the <code>ModelAdvisor.Text</code> class                                                                                                                                                                   |
| <code>mode</code> | A Boolean value indicating bold formatting of text: <ul style="list-style-type: none"><li>• <code>true</code> — Format the text in bold font.</li><li>• <code>false</code> — Do not format the text in bold font.</li></ul> |

**Examples**

```
t1 = ModelAdvisor.Text('This is some text');
setBold(t1, 'true');
```

**How To**

- “Customizing the Model Advisor”

**Purpose** Specify action callback function

**Syntax** setCallbackFcn(action\_obj, @handle)

**Description** setCallbackFcn(action\_obj, @handle) specifies the handle to the callback function, handle, to use with the action object, action\_obj.

## Examples

---

**Note** The following example is a fragment of code from the sl\_customization.m file for the demo model, slvndemo\_mdldv. The example does not execute as shown without the additional content found in the sl\_customization.m file.

---

```
rec = ModelAdvisor.Check('mathworks.example.optimizationSettings');
% Define an automatic fix action for this check
modifyAction = ModelAdvisor.Action;
modifyAction.setCallbackFcn(@modifyOptimizationSetting);
modifyAction.Name = 'Modify Settings';
modifyAction.Description = ['Modify model configuration optimization' ...
 ' settings that can impact safety'];
modifyAction.Enable = true;
rec.setAction(modifyAction);
```

## How To

- “Defining Check Actions”
- “Customizing the Model Advisor”
- “setActionenable”

# ModelAdvisor.Check.setCallbackFcn

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                        |                                                            |                     |                                     |                      |                                                                                                                                                                                        |                    |                                                                                                                                                                                                                                                                                                    |

## Examples

```
% --- sample check 1
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.Title = 'Check Simulink block font';
rec.TitleTips = 'Example style three callback';
rec.setCallbackFcn(@SampleStyleThreeCallback,'None','StyleThree');
```

## How To

- “Creating Callback Functions and Results”

- “Customizing the Model Advisor”

# ModelAdvisor.Task.setCheck

---

**Purpose** Specify check used in task

**Syntax** setCheck(task, check\_ID)

**Description** setCheck(task, check\_ID) specifies the check to use in the task. You can use one ModelAdvisor.Check object in multiple ModelAdvisor.Task objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution** appears in the **By Product > Simulink folder** and in the **By Task > Model Referencing** folder in the Model Advisor tree. When adding checks as tasks, the Model Advisor uses the task properties instead of the check properties, except for Visible and LicenseName.

|                        |          |                                                              |
|------------------------|----------|--------------------------------------------------------------|
| <b>Input Arguments</b> | task     | Instantiation of the ModelAdvisor.Task class                 |
|                        | check_ID | A unique string that identifies the check to use in the task |

**Examples**

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
setCheck(MAT1, 'com.mathworks.sample.Check1');
```

# ModelAdvisor.FormatTemplate.setCheckText

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Add description of check to result                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>          | <code>setCheckText(<i>ft_obj</i>, <i>text</i>)</code>                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>     | <code>setCheckText(<i>ft_obj</i>, <i>text</i>)</code> is an optional method that adds text or a model advisor template object as the first item in the report. Use this method to add information describing the overall check.                                                                                                                                                                                                                                   |
| <b>Input Arguments</b> | <p><code>ft_obj</code><br/>A handle to a template object.</p> <p><code>text</code><br/>A string or a handle to a formatting object.<br/>Valid formatting objects are: <code>ModelAdvisor.Image</code>, <code>ModelAdvisor.LineBreak</code>, <code>ModelAdvisor.List</code>, <code>ModelAdvisor.Paragraph</code>, <code>ModelAdvisor.Table</code>, and <code>ModelAdvisor.Text</code>.<br/><code>text</code> appears as the first line in the analysis result.</p> |
| <b>Examples</b>        | <p>Create a list object, <code>ft</code>, and add a line of text to the result:</p> <pre>ft = ModelAdvisor.FormatTemplate('ListTemplate'); setCheckText(ft, ['Identify unconnected lines, input ports,'...                  'and output ports in the model']);</pre>                                                                                                                                                                                              |
| <b>How To</b>          | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>                                                                                                                                                                                                                                                                                                                                    |

# ModelAdvisor.Table.setColHeading

---

**Purpose** Specify table column title

**Syntax** `setColHeading(table, column, heading)`

**Description** `setColHeading(table, column, heading)` specifies that the column header of column is set to heading.

**Input Arguments**

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <code>table</code>   | Instantiation of the <code>ModelAdvisor.Table</code> class                  |
| <code>column</code>  | An integer specifying the column number                                     |
| <code>heading</code> | A string, element object, or object array specifying the table column title |

**Examples**

```
table1 = ModelAdvisor.Table(2, 3);
setColHeading(table1, 1, 'Header 1');
setColHeading(table1, 2, 'Header 2');
setColHeading(table1, 3, 'Header 3');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Table.setColHeadingAlign

---

**Purpose** Specify column title alignment

**Syntax** `setColHeadingAlign(table, column, alignment)`

**Description** `setColHeadingAlign(table, column, alignment)` specifies the alignment of the column heading.

## Input Arguments

|                               |                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table</code>            | Instantiation of the <code>ModelAdvisor.Table</code> class                                                                                                                                |
| <code>column</code>           | An integer specifying the column number                                                                                                                                                   |
| <code><i>alignment</i></code> | Alignment of the column heading. <i>alignment</i> can have one of the following values: <ul style="list-style-type: none"><li>• left (default)</li><li>• right</li><li>• center</li></ul> |

## Examples

```
table1 = ModelAdvisor.Table(2, 3);
setColHeading(table1, 1, 'Header 1');
setColHeadingAlign(table1, 1, 'center');
setColHeading(table1, 2, 'Header 2');
setColHeadingAlign(table1, 2, 'center');
setColHeading(table1, 3, 'Header 3');
setColHeadingAlign(table1, 3, 'center');
```

## How To

- “Customizing the Model Advisor”

# ModelAdvisor.Text.setColor

---

**Purpose** Specify text color

**Syntax** `setColor(text, color)`

**Description** `setColor(text, color)` sets the text color to *color*.

**Input Arguments**

|                    |                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>text</code>  | Instantiation of the <code>ModelAdvisor.Text</code> class                                                                                                                                                                                                                                                                                                                                 |
| <code>color</code> | An enumerated string specifying the color of the text. Possible formatting options include: <ul style="list-style-type: none"><li>• <code>normal</code> (default) — Text is default color.</li><li>• <code>pass</code> — Text is green.</li><li>• <code>warn</code> — Text is yellow.</li><li>• <code>fail</code> — Text is red.</li><li>• <code>keyword</code> — Text is blue.</li></ul> |

**Examples**

```
t1 = ModelAdvisor.Text('This is a warning');
setColor(t1, 'warn');
```

# ModelAdvisor.InputParameter.setColSpan

---

**Purpose** Specify number of columns for input parameter

**Syntax** `setColSpan(input_param, [start_col end_col])`

**Description** `setColSpan(input_param, [start_col end_col])` specifies the number of columns that the parameter occupies. Use the `setColSpan` method to specify where you want an input parameter located in the layout grid when there are multiple input parameters.

|                        |                          |                                                                                                       |
|------------------------|--------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Input Arguments</b> | <code>input_param</code> | Instantiation of the <code>ModelAdvisor.InputParameter</code> class                                   |
|                        | <code>start_col</code>   | A positive integer representing the first column that the input parameter occupies in the layout grid |
|                        | <code>end_col</code>     | A positive integer representing the last column that the input parameter occupies in the layout grid  |

**Examples**

```
inputParam2 = ModelAdvisor.InputParameter;
inputParam2.Name = 'Standard font size';
inputParam2.Value='12';
inputParam2.Type='String';
inputParam2.Description='sample tooltip';
inputParam2.setRowSpan([2 2]);
inputParam2.setColSpan([1 1]);
```

# ModelAdvisor.FormatTemplate.setColTitles

---

**Purpose** Add column titles to table

**Syntax** `setColTitles(ft_obj, {col_title_1, col_title_2, ...})`

**Description** `setColTitles(ft_obj, {col_title_1, col_title_2, ...})` is method you must use when you create a template object that is a table type. Use it to specify the titles of the columns in the table.

---

**Note** Before adding data to a table, you must specify column titles.

---

## Input Arguments

`ft_obj`

A handle to a template object.

`col_title_N`

A cell of strings or handles to formatting objects, specifying the column titles.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

The order of the `col_title_N` inputs determines which column the title is in. If you do not add data to the table, the Model Advisor does not display the table in the result.

## Examples

Create a table object, `ft`, and specify two column titles:

```
ft = ModelAdvisor.FormatTemplate('TableTemplate');
setColTitles(ft, {'Index', 'Block Name'});
```

## How To

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

**Purpose** Specify column widths

**Syntax** `setColWidth(table, column, width)`

**Description** `setColWidth(table, column, width)` specifies the column.

The `setColWidth` method specifies the table column widths relative to the entire table width. If column widths are [1 2 3], the second column is twice the width of the first column, and the third column is three times the width of the first column. Unspecified columns have a default width of 1. For example:

```
setColWidth(1, 1);
setColWidth(3, 2);
```

specifies [1 1 2] column widths.

## Input Arguments

|                     |                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------|
| <code>table</code>  | Instantiation of the <code>ModelAdvisor.Table</code> class                                       |
| <code>column</code> | An integer specifying column number                                                              |
| <code>width</code>  | An integer or array of integers specifying the column widths, relative to the entire table width |

## Examples

```
table1 = ModelAdvisor.Table(2, 3)
setColWidth(table1, 1, 1);
setColWidth(table1, 3, 2);
```

## How To

- “Customizing the Model Advisor”

# ModelAdvisor.Table.setEntries

---

**Purpose** Set contents of table

**Syntax** setEntries(content)

**Description** setEntries(content)

**Input Arguments** content A 2-D cell array containing the contents of the table. Each item of the cell array must be either a string or an instance of ModelAdvisor.Element. The size of the cell array must be equal to the size of the table specified in the ModelAdvisor.Table constructor.

## Examples

```
table = ModelAdvisor.Table(4,3);
contents = cell(4,3); % 4 by 3 table
for k=1:4
 for m=1:3
 contents{k,m} = ['Contents for row-' num2str(k) ' column-' num2str(m)];
 end
end
table.setEntries(contents);
```

## How To

- “Customizing the Model Advisor”

**Purpose**

Add cell to table

**Syntax**

```
setEntry(table, row, column, string)
setEntry(table, row, column, content)
```

**Description**

setEntry(table, row, column, string) adds a string to a cell in a table.

setEntry(table, row, column, content) adds an object specified by content to a cell in a table.

**Input Arguments**

|         |                                                                               |
|---------|-------------------------------------------------------------------------------|
| table   | Instantiation of the ModelAdvisor.Table class                                 |
| row     | An integer specifying the row                                                 |
| column  | An integer specifying the column                                              |
| string  | A string representing the contents of the entry                               |
| content | An element object or object array specifying the content of the table entries |

**Examples**

Create two tables and insert table2 into the first cell of table1:

```
table1 = ModelAdvisor.Table(1, 1);
table2 = ModelAdvisor.Table(2, 3);
.
.
.
setEntry(table1, 1, 1, table2);
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Table.setEntryAlign

---

**Purpose** Specify table cell alignment

**Syntax** `setEntryAlign(table, row, column, alignment)`

**Description** `setEntryAlign(table, row, column, alignment)` specifies the cell alignment of the designated cell.

**Input Arguments**

|                               |                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table</code>            | Instantiation of the <code>ModelAdvisor.Table</code> class                                                                                                                                            |
| <code>row</code>              | An integer specifying row number                                                                                                                                                                      |
| <code>column</code>           | An integer specifying column number                                                                                                                                                                   |
| <code><i>alignment</i></code> | A string specifying the cell alignment. Possible values are: <ul style="list-style-type: none"><li>• <code>left</code> (default)</li><li>• <code>right</code></li><li>• <code>center</code></li></ul> |

**Examples**

```
table1 = ModelAdvisor.Table(2,3);
setHeading(table1, 'New Table');
.
.
.
setEntry(table1, 1, 1, 'First Entry');
setEntryAlign(table1, 1, 1, 'center');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Table.setHeading

---

**Purpose** Specify table title

**Syntax** `setHeading(table, title)`

**Description** `setHeading(table, title)` specifies the table title.

**Input Arguments**

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| <code>table</code> | Instantiation of the <code>ModelAdvisor.Table</code> class               |
| <code>title</code> | A string, element object, or object array that specifies the table title |

**Examples**

```
table1 = ModelAdvisor.Table(2, 3);
setHeading(table1, 'New Table');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Table.setHeadingAlign

---

**Purpose** Specify table title alignment

**Syntax** `setHeadingAlign(table, alignment)`

**Description** `setHeadingAlign(table, alignment)` specifies the alignment for the table title.

**Input Arguments**

|                        |                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table</code>     | Instantiation of the <code>ModelAdvisor.Table</code> class                                                                                                            |
| <code>alignment</code> | A string specifying the table title alignment. Possible values are: <ul style="list-style-type: none"><li>• left (default)</li><li>• right</li><li>• center</li></ul> |

**Examples**

```
table1 = ModelAdvisor.Table(2, 3);
setHeading(table1, 'New Table');
setHeadingAlign(table1, 'center');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Image.setImageSource

---

**Purpose**

Specify image location

**Syntax**

```
setImageSource(image_obj, source)
```

**Description**

`setImageSource(image_obj, source)` specifies the location of the image.

**Input Arguments**

|                        |                                                            |
|------------------------|------------------------------------------------------------|
| <code>image_obj</code> | Instantiation of the <code>ModelAdvisor.Image</code> class |
| <code>source</code>    | A string specifying the location of the image file         |

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.FormatTemplate.setInformation

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Add description of subcheck to result                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Syntax</b>          | <code>setInformation(<i>ft_obj</i>, <i>text</i>)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>     | <code>setInformation(<i>ft_obj</i>, <i>text</i>)</code> is an optional method that adds <i>text</i> as the first item after the subcheck title. Use this method to add information describing the subcheck.                                                                                                                                                                                                                                                                                              |
| <b>Input Arguments</b> | <p><code>ft_obj</code><br/>A handle to a template object.</p> <p><code>text</code><br/>A string or a handle to a formatting object, that describes the subcheck.</p> <p>Valid formatting objects are: <code>ModelAdvisor.Image</code>, <code>ModelAdvisor.LineBreak</code>, <code>ModelAdvisor.List</code>, <code>ModelAdvisor.Paragraph</code>, <code>ModelAdvisor.Table</code>, and <code>ModelAdvisor.Text</code>.</p> <p>The Model Advisor displays <i>text</i> after the title of the subcheck.</p> |
| <b>Examples</b>        | <p>Create a list object, <code>ft</code>, and specify a subcheck title and description:</p> <pre>ft = ModelAdvisor.FormatTemplate('ListTemplate'); setSubTitle(ft, ['Check for constructs in the model '...     'that are not supported when generating code']); setInformation(ft, ['Identify blocks that should not '...     'be used for code generation.']);</pre>                                                                                                                                   |
| <b>How To</b>          | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>                                                                                                                                                                                                                                                                                                                                                                           |

# ModelAdvisor.Check.setInputParameters

---

**Purpose** Specify input parameters for check

**Syntax** `setInputParameters(check_obj, params)`

**Description** `setInputParameters(check_obj, params)` specifies `ModelAdvisor.InputParameter` objects (`params`) to be used as input parameters to a check (`check_obj`).

|                        |                        |                                                                   |
|------------------------|------------------------|-------------------------------------------------------------------|
| <b>Input Arguments</b> | <code>check_obj</code> | Instantiation of the <code>ModelAdvisor.Check</code> class        |
|                        | <code>params</code>    | A cell array of <code>ModelAdvisor.InputParameters</code> objects |

**Examples**

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
inputParam1 = ModelAdvisor.InputParameter;
inputParam2 = ModelAdvisor.InputParameter;
inputParam3 = ModelAdvisor.InputParameter;
setInputParameters(rec, {inputParam1,inputParam2,inputParam3});
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Check.setInputParametersLayoutGrid

---

**Purpose** Specify layout grid for input parameters

**Syntax** `setInputParametersLayoutGrid(check_obj, [row col])`

**Description** `setInputParametersLayoutGrid(check_obj, [row col])` specifies the layout grid for input parameters in the Model Advisor. Use the `setInputParametersLayoutGrid` method if there are multiple input parameters.

|------------------------|------------------------|------------------------------------------------------------|
| <b>Input Arguments</b> | <code>check_obj</code> | Instantiation of the <code>ModelAdvisor.Check</code> class |
|                        | <code>row</code>       | Number of rows in the layout grid                          |
|                        | <code>col</code>       | Number of columns in the layout grid                       |

**Examples**

```
% --- sample check 1
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.Title = 'Check Simulink block font';
rec.TitleTips = 'Example style three callback';
rec.setCallbackFcn(@SampleStyleThreeCallback, 'None', 'StyleThree');
rec.setInputParametersLayoutGrid([3 2]);
```

**How To**

- “Customizing the Model Advisor”

**Purpose** Italicize text

**Syntax** `setItalic(text, mode)`

**Description** `setItalic(text, mode)` specifies whether text should be italicized.

**Input Arguments**

|                   |                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>text</code> | Instantiation of the <code>ModelAdvisor.Text</code> class                                                                                                                                                 |
| <code>mode</code> | A Boolean value indicating italic formatting of text: <ul style="list-style-type: none"><li>• <code>true</code> — Italicize the text.</li><li>• <code>false</code> — Do not italicize the text.</li></ul> |

**Examples**

```
t1 = ModelAdvisor.Text('This is some text');
setItalic(t1, 'true');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.FormatTemplate.setListObj

---

**Purpose** Add list of hyperlinks to model objects

**Syntax** `setListObj(ft_obj, {model_obj})`

**Description** `setListObj(ft_obj, {model_obj})` is an optional method that generates a bulleted list of hyperlinks to model objects. *ft\_obj* is a handle to a list template object. *model\_obj* is a cell array of handles or full paths to blocks, or model objects that the Model Advisor displays as a bulleted list of hyperlinks in the report.

**Examples** Create a list object, `ft`, and add a list of the blocks found in the model:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');

% Find all the blocks in the system
allBlocks = find_system(system);

% Add the blocks to a list
setListObj(ft, allBlocks);
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.FormatTemplate.setRecAction

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Add Recommended Action section and text                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Syntax</b>          | <code>setRecAction(ft_obj, {text})</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>     | <code>setRecAction(ft_obj, {text})</code> is an optional method that adds a Recommended Action section to the report. Use this method to describe how to fix the check.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Input Arguments</b> | <p><code>ft_obj</code><br/>A handle to a template object.</p> <p><code>text</code><br/>A cell array of strings or handles to formatting objects, that describes the recommended action to fix the issues reported by the check.</p> <p>Valid formatting objects are: <code>ModelAdvisor.Image</code>, <code>ModelAdvisor.LineBreak</code>, <code>ModelAdvisor.List</code>, <code>ModelAdvisor.Paragraph</code>, <code>ModelAdvisor.Table</code>, and <code>ModelAdvisor.Text</code>.</p> <p>The Model Advisor displays the recommended action as a separate section below the list or table in the report.</p> |
| <b>Examples</b>        | <p>Create a list object, <code>ft</code>, find Gain blocks in the model, and recommend changing them:</p> <pre>ft = ModelAdvisor.FormatTemplate('ListTemplate'); % Find all Gain blocks gainBlocks = find_system(gcs, 'BlockType','Gain');  % Find Gain blocks with expression evaluates to 1 for idx = 1:length(gainBlocks)     gainObj = get_param(gainBlocks(idx), 'Object');     resGain = slResolve(gainObj.Gain, gainObj.getFullName);     if ~isempty(resGain)         % Find the first index that computes to 1     end end</pre>                                                                      |

# ModelAdvisor.FormatTemplate.setRecAction

---

```
 if ~isempty(find(resGain == 1, 1))
 setRecAction(ft, {'If you are using these blocks '...
 'as buffers, you should replace them with '...
 'Signal Conversion blocks'});
 end
 end
end
```

## How To

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

## Purpose

Add See Also section and links

## Syntax

```
setRefLink(ft_obj, {'standard'})
setRefLink(ft_obj, {'url', 'standard'})
```

## Description

`setRefLink(ft_obj, {'standard'})` is an optional method that adds a See Also section above the table or list in the result. Use this method to add references to standards. `ft_obj` is a handle to a template object. `standard` is a cell array of strings that you want to display in the result. If you include more than one cell, the Model Advisor displays the strings in a bulleted list.

`setRefLink(ft_obj, {'url', 'standard'})` generates a list of links in the See Also section. `url` is a string that indicates the location to link to. You must provide the full link including the protocol. For example, `http:\www.mathworks.com` is a valid link, while `www.mathworks.com` is not a valid link. You can create a link to any protocol that is valid URL, such as a web site address, a full path to a file, or a relative path to a file.

---

**Note** `setRefLink` expects a cell array of cell arrays for the second input.

---

## Examples

Create a list object, `ft`, and add a related standard:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setRefLink(ft, {'IEC 61508-3, Table A.3 (3) 'Language subset'});
```

Create a list object, `ft`, and add a list of related standards:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setRefLink(ft, {
 {'IEC 61508-3, Table A.3 (2) 'Strongly typed programming language'},...
 {'IEC 61508-3, Table A.3 (3) 'Language subset'}});
```

## How To

- “Customizing the Model Advisor”

# ModelAdvisor.FormatTemplate.setRefLink

---

- “Formatting Model Advisor Results”

# ModelAdvisor.Text.setRetainSpaceReturn

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                   |                                                           |                   |                                                                                                                                                                                                                                                                                           |

# ModelAdvisor.Table.setRowHeading

---

**Purpose** Specify table row title

**Syntax** `setRowHeading(table, row, heading)`

**Description** `setRowHeading(table, row, heading)` specifies a title for the designated table row.

|                        |                      |                                                                          |
|------------------------|----------------------|--------------------------------------------------------------------------|
| <b>Input Arguments</b> | <code>table</code>   | Instantiation of the <code>ModelAdvisor.Table</code> class               |
|                        | <code>row</code>     | An integer specifying row number                                         |
|                        | <code>heading</code> | A string, element object, or object array specifying the table row title |

**Examples**

```
table1 = ModelAdvisor.Table(2,3);
setRowHeading(table1, 1, 'Row 1 Title');
setRowHeading(table1, 2, 'Row 2 Title');
setRowHeading(table1, 3, 'Row 3 Title');
```

**How To**

| <b>Description</b>     | <code>setRowHeadingAlign(table, row, alignment)</code> specifies the alignment for the designated table row.                                                                                                                                                                                                                                                                                                     |                    |                                                            |                  |                                   |                        |                                                                                                                                                                |
| <b>Input Arguments</b> | <table><tr><td><code>table</code></td><td>Instantiation of the <code>ModelAdvisor.Table</code> class</td></tr><tr><td><code>row</code></td><td>An integer specifying row number.</td></tr><tr><td><code>alignment</code></td><td>A string specifying the cell alignment. Possible values are:<ul style="list-style-type: none"><li>• left (default)</li><li>• right</li><li>• center</li></ul></td></tr></table> | <code>table</code> | Instantiation of the <code>ModelAdvisor.Table</code> class | <code>row</code> | An integer specifying row number. | <code>alignment</code> | A string specifying the cell alignment. Possible values are: <ul style="list-style-type: none"><li>• left (default)</li><li>• right</li><li>• center</li></ul> |
| <code>table</code>     | Instantiation of the <code>ModelAdvisor.Table</code> class                                                                                                                                                                                                                                                                                                                                                       |                    |                                                            |                  |                                   |                        |                                                                                                                                                                |
| <code>row</code>       | An integer specifying row number.                                                                                                                                                                                                                                                                                                                                                                                |                    |                                                            |                  |                                   |                        |                                                                                                                                                                |
| <code>alignment</code> | A string specifying the cell alignment. Possible values are: <ul style="list-style-type: none"><li>• left (default)</li><li>• right</li><li>• center</li></ul>                                                                                                                                                                                                                                                   |                    |                                                            |                  |                                   |                        |                                                                                                                                                                |
| <b>Examples</b>        | <pre>table1 = ModelAdvisor.Table(2, 3); setRowHeading(table1, 1, 'Row 1 Title'); setRowHeadingAlign(table1, 1, 'center'); setRowHeading(table1, 2, 'Row 2 Title'); setRowHeadingAlign(table1, 2, 'center'); setRowHeading(table1, 3, 'Row 3 Title'); setRowHeadingAlign(table1, 3, 'center');</pre>                                                                                                              |                    |                                                            |                  |                                   |                        |                                                                                                                                                                |
| <b>How To</b>          | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                                                                                                                                                                                                                                                                                                |                    |                                                            |                  |                                   |                        |                                                                                                                                                                |

# ModelAdvisor.InputParameter.setRowSpan

---

**Purpose** Specify rows for input parameter

**Syntax** `setRowSpan(input_param, [start_row end_row])`

**Description** `setRowSpan(input_param, [start_row end_row])` specifies the number of rows that the parameter occupies. Specify where you want an input parameter located in the layout grid when there are multiple input parameters.

|                        |                          |                                                                                                    |
|------------------------|--------------------------|----------------------------------------------------------------------------------------------------|
| <b>Input Arguments</b> | <code>input_param</code> | The input parameter object                                                                         |
|                        | <code>start_row</code>   | A positive integer representing the first row that the input parameter occupies in the layout grid |
|                        | <code>end_row</code>     | A positive integer representing the last row that the input parameter occupies in the layout grid  |

**Examples**

```
inputParam2 = ModelAdvisor.InputParameter;
inputParam2.Name = 'Standard font size';
inputParam2.Value='12';
inputParam2.Type='String';
inputParam2.Description='sample tooltip';
inputParam2.setRowSpan([2 2]);
inputParam2.setColSpan([1 1]);
```

# ModelAdvisor.FormatTemplate.setSubBar

---

**Purpose** Add line between subcheck results

**Syntax** `setSubBar(ft_obj, value)`

**Description** `setSubBar(ft_obj, value)` is an optional method that adds lines between results for subchecks. *ft\_obj* is a handle to a template object. *value* is a boolean value that specifies when the Model Advisor includes a line between subchecks in the check results. By default, the value is `true`, and the Model Advisor displays the bar. The Model Advisor does not display the bar when you set the value to `false`.

**Examples** Create a list object, `ft`, turn off the subbar:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setSubBar(ft, false);
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.FormatTemplate.setSubResultStatus

---

**Purpose** Add status to check or subcheck result

**Syntax** `setSubResultStatus(ft_obj, 'status')`

**Description** `setSubResultStatus(ft_obj, 'status')` is an optional method that displays the status in the result. Use this method to display the status of the check or subcheck in the result. *ft\_obj* is a handle to a template object. *status* is a string identifying the status of the check. Valid strings are:

Pass  
Warn  
Fail

**Examples** Create a list object, *ft*, and add a passing status:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setSubResultStatus(ft, 'Pass');
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.FormatTemplate.setSubResultStatusText

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Add text below status in result                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Syntax</b>          | <code>setSubResultStatusText(<i>ft_obj</i>, <i>message</i>)</code>                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>     | <code>setSubResultStatusText(<i>ft_obj</i>, <i>message</i>)</code> is an optional method that displays text below the status in the result. Use this method to describe the status.                                                                                                                                                                                                                                                                            |
| <b>Input Arguments</b> | <p><code>ft_obj</code><br/>A handle to a template object.</p> <p><code>message</code><br/>A string or a handle to a formatting object that the Model Advisor displays below the status in the report.</p> <p>Valid formatting objects are: <code>ModelAdvisor.Image</code>, <code>ModelAdvisor.LineBreak</code>, <code>ModelAdvisor.List</code>, <code>ModelAdvisor.Paragraph</code>, <code>ModelAdvisor.Table</code>, and <code>ModelAdvisor.Text</code>.</p> |
| <b>Examples</b>        | <p>Create a list object, <code>ft</code>, add a passing status and a description of why the check passed:</p> <pre>ft = ModelAdvisor.FormatTemplate('ListTemplate'); setSubResultStatus(ft, 'Pass'); setSubResultStatusText(ft, ['Constructs that are not supported when '...     'generating code were not found in the model or subsystem']);</pre>                                                                                                          |
| <b>How To</b>          | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li><li>• “Formatting Model Advisor Results”</li></ul>                                                                                                                                                                                                                                                                                                                                 |

# ModelAdvisor.Text.setSubscript

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                         |                   |                                                           |                   |                                                                                                                                                                                                                          |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|-----------------------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Specify subscripted text                                                                                                                                                                                                                                                                                                                                                                |                   |                                                           |                   |                                                                                                                                                                                                                          |

| <b>Examples</b>        | <pre>t1 = ModelAdvisor.Text('This is some text'); setSubscript(t1, 'true');</pre>                                                                                                                                                                                                                                                                                                       |                   |                                                           |                   |                                                                                                                                                                                                                          |
| <b>How To</b>          | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                                                                                                                                                                                                                                                                       |                   |                                                           |                   |                                                                                                                                                                                                                          |

**Purpose** Specify superscripted text

**Syntax** `setSuperscript(text, mode)`

**Description** `setSuperscript(text, mode)` indicates whether to make text subscript.

**Input Arguments**

|                   |                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>text</code> | Instantiation of the <code>ModelAdvisor.Text</code> class                                                                                                                                                                      |
| <code>mode</code> | A Boolean value indicating superscripted formatting of text: <ul style="list-style-type: none"><li>• <code>true</code> — Make the text superscript.</li><li>• <code>false</code> — Do not make the text superscript.</li></ul> |

**Examples**

```
t1 = ModelAdvisor.Text('This is some text');
setSuperscript(t1, 'true');
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.FormatTemplate.setSubTitle

---

**Purpose** Add title for subcheck in result

**Syntax** `setSubTitle(ft_obj, title)`

**Description** `setSubTitle(ft_obj, title)` is an optional method that adds a subcheck result title. Use this method when you create subchecks to distinguish between them in the result.

**Input Arguments** `ft_obj`  
A handle to a template object.

`title`  
A string or a handle to a formatting object specifying the title of the subcheck.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

**Examples** Create a list object, `ft`, and add a subcheck title:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setSubTitle(ft, ['Check for constructs in the model '...
 'that are not supported when generating code']);
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.FormatTemplate.setTableInfo

---

**Purpose** Add data to table

**Syntax** `setTableInfo(ft_obj, {data})`

**Description** `setTableInfo(ft_obj, {data})` is an optional method that creates a table. *ft\_obj* is a handle to a table template object. *data* is a cell array of strings or objects specifying the information in the body of the table. The Model Advisor creates hyperlinks to objects. If you do not add data to the table, the Model Advisor does not display the table in the result.

---

**Note** Before creating a table, you must specify column titles using the `setColTitle` method.

---

**Examples** Create a table object, `ft`, add column titles, and add data to the table:

```
ft = ModelAdvisor.FormatTemplate('TableTemplate');
setColTitle(ft, {'Index', 'Block Name'});
setTableInfo(ft, {'1', 'Gain'});
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

# ModelAdvisor.FormatTemplate.setTableTitle

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Add title to table                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Syntax</b>          | <code>setTableTitle(<i>ft_obj</i>, <i>title</i>)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>     | <code>setTableTitle(<i>ft_obj</i>, <i>title</i>)</code> is an optional method that adds a title to a table.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Input Arguments</b> | <code>ft_obj</code><br>A handle to a template object.<br><code>title</code><br>A string or a handle to a formatting object specifying the title of the table.<br>Valid formatting objects are: <code>ModelAdvisor.Image</code> , <code>ModelAdvisor.LineBreak</code> , <code>ModelAdvisor.List</code> , <code>ModelAdvisor.Paragraph</code> , <code>ModelAdvisor.Table</code> , and <code>ModelAdvisor.Text</code> .<br>The title appears above the table. If you do not add data to the table, the Model Advisor does not display the table and title in the result. |

**Examples** Create a table object, `ft`, and add a table title:

```
ft = ModelAdvisor.FormatTemplate('TableTemplate');
setTableTitle(ft, 'Table of fonts and styles used in model');
```

**How To**

- “Customizing the Model Advisor”
- “Formatting Model Advisor Results”

**Purpose** Specify list type

**Syntax** setType(list\_obj, *listType*)

**Description** setType(list\_obj, *listType*) specifies the type of list the ModelAdvisor.List constructor creates.

**Input Arguments**

|                 |                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------|
| <i>list_obj</i> | Instantiation of the ModelAdvisor.List class                                                           |
| <i>listType</i> | Specifies the list type: <ul style="list-style-type: none"><li>• numbered</li><li>• bulleted</li></ul> |

**Examples**

```
subList = ModelAdvisor.List();
subList.setType('numbered')
subList.addItem(ModelAdvisor.Text('Sub entry 1', {'pass','bold'}));
subList.addItem(ModelAdvisor.Text('Sub entry 2', {'pass','bold'}));
```

**How To**

- “Customizing the Model Advisor”

# ModelAdvisor.Text.setUnderlined

---

| <b>Examples</b>        | <pre>t1 = ModelAdvisor.Text('This is some text'); setUnderlined(t1, 'true');</pre>                                                                                                                                                                                                                                                                                           |                   |                                                           |                   |                                                                                                                                                                                                               |
| <b>How To</b>          | <ul style="list-style-type: none"><li>• “Customizing the Model Advisor”</li></ul>                                                                                                                                                                                                                                                                                            |                   |                                                           |                   |                                                                                                                                                                                                               |

**Purpose**

Collect signal range coverage information for model object

**Syntax**

```
[min, max] = sigrangeinfo(cvdo, object)
[min, max] = sigrangeinfo(cvdo, object, portID)
```

**Description**

[min, max] = sigrangeinfo(cvdo, object) returns the minimum and maximum signal values output by the model component object within the cvdata object cvdo.

[min, max] = sigrangeinfo(cvdo, object, portID) returns the minimum and maximum signal values associated with the output port portID of the Simulink block object.

**Input Arguments**

cvdo  
     cvdata object  
 object

An object in the model or Stateflow chart that receives signal range coverage. Valid values for object include the following:

| <b>Object Specification</b> | <b>Description</b>                                                                                                           |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| BlockPath                   | Full path to a model or block                                                                                                |
| BlockHandle                 | Handle to a model or block                                                                                                   |
| s1Obj                       | Handle to a Simulink API object                                                                                              |
| sfID                        | Stateflow ID                                                                                                                 |
| sfObj                       | Handle to a Stateflow API object                                                                                             |
| {BlockPath, sfID}           | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart |

## Object Specification

{BlockPath, sfObj}

## Description

Cell array with the path to a Stateflow chart or atomic subchart and a Stateflow object API handle contained in that chart or subchart

[BlockHandle, sfID]

Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart

portID

Output port of the block object

## Output Arguments

max

Maximum signal value output by the model component object within the cvdata object, cvdo. If object outputs a vector, min and max are also vectors.

min

Minimum signal value output by the model component object within the cvdata object, cvdo. If object outputs a vector, min and max are also vectors.

## Alternatives

To collect signal range coverage for a model, using the GUI:

- 1 Open the model for which you want signal range coverage.
- 2 In the Model Editor, select **Tools > Coverage Settings**.
- 3 On the **Coverage** tab, under **Coverage Metrics**, select **Signal Range Coverage**.
- 4 Open the **Results** and **Report** tabs and specify the type of output that you need.

5 Click **OK**.

6 Simulate the model and view the results.

## Examples

Collect signal range data for the Product block in the `slvndemo_cv_small_controller` model:

```
mdl = 'slvndemo_cv_small_controller';
open_system(mdl)
testObj = cvtest(mdl) %Create test spec object
testObj.settings.sigrange = 1; %Enable signal range coverage
data = cvsim(testObj) %Simulate the model
blk_handle = get_param([mdl, '/Product'], 'Handle');
[minVal, maxVal] = sigrangeinfo(data, blk_handle) %Get signal range data
```

# sigsizeinfo

---

**Purpose** Collect signal size coverage information for model object

**Syntax** `[min, max, allocated] = sigsizeinfo(cvdo, object)`  
`[min, max] = sigsizeinfo(cvdo, object, portID)`

**Description** `[min, max, allocated] = sigsizeinfo(cvdo, object)` returns the minimum, maximum, and allocated signal sizes for the outputs of the model component object within the cvdata object cvdo.

`[min, max] = sigsizeinfo(cvdo, object, portID)` returns the minimum and maximum signal sizes associated with the output port portID of the model component object.

**Input Arguments**

cvdo  
cvdata object

object

An object in the model or Stateflow chart that receives signal size coverage. Valid values for object include the following:

| <b>Object Specification</b> | <b>Description</b>                                                                                                           |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------|
| BlockPath                   | Full path to a Simulink model or block                                                                                       |
| BlockHandle                 | Handle to a Simulink model or block                                                                                          |
| s1obj                       | Handle to a Simulink API object                                                                                              |
| sfID                        | Stateflow ID                                                                                                                 |
| sfObj                       | Handle to a Stateflow API object                                                                                             |
| {BlockPath, sfID}           | Cell array with the path to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart |

**Object Specification**`{BlockPath, sfObj}`**Description**

Cell array with the path to a Stateflow chart or atomic subchart and a Stateflow object API handle contained in that chart or subchart

`[BlockHandle, sfID]`

Array with a handle to a Stateflow chart or atomic subchart and the ID of an object contained in that chart or subchart

portID

Output port of the block object

**Output Arguments**

max

Maximum signal size output by the model component object within the cvdata object, cvdo. If object outputs a vector, min and max are also vectors.

min

Minimum signal size output by the model component object within the cvdata object, cvdo. If object outputs a vector, min and max are also vectors.

allocated

Allocated signal size output by the model component object within the cvdata object, cvdo. If object outputs a vector, min and max are also vectors.

**Examples**

Collect signal size coverage data for the Switch block in the sldemo\_varsize\_basic model:

```
mdl = 'sldemo_varsize_basic';
open_system(mdl);
testObj = cvtest(mdl);
testObj.settings.sigsize=1;
```

%Create test spec object  
%Enable signal size coverage

# sigsizeinfo

---

```
data = cvsim(testObj); %Simulate the model
blk_handle = get_param([mdl, '/Switch'], 'Handle'); %Set the block handle
[minVal, maxVal, allocVal] = sigsizeinfo(data, blk_handle); %Get signal size data
```

## Alternatives

To collect signal size coverage for a model, using the GUI:

- 1** Open the model for which you want signal size coverage.
- 2** In the Model Editor, select **Tools > Coverage Settings**.
- 3** On the **Coverage** tab, under **Coverage Metrics**, select **Signal Size Coverage**.
- 4** Open the **Results** and **Report** tabs and specify the type of output that you need.
- 5** Click **OK**.
- 6** Simulate the model and view the results.

[sigrangeinfo](#) | [tableinfo](#)

**Purpose** Extract subsystem or subchart contents into new model for analysis

**Syntax**

```
newModel = slvnvextract(subsystem)
newModel = slvnvextract(subchart)
newModel = slvnvextract(subsystem, showModel)
newModel = slvnvextract(subchart, showModel)
```

**Description**

`newModel = slvnvextract(subsystem)` extracts the contents of the Atomic Subsystem block `subsystem` and creates a new model. `slvnvextract` returns the name of the new model in `newModel`. `slvnvextract` uses the subsystem name for the model name, appending a numeral to the model name if that model name already exists.

`newModel = slvnvextract(subchart)` extracts the contents of the atomic subchart `subchart` and creates a new model. `subchart` should specify the full path of the atomic subchart. `slvnvextract` uses the subchart name for the model name, appending a numeral to the model name if that model name already exists.

---

**Note** If the atomic subchart calls an exported graphical function that is outside the subchart, `slvnvextract` creates the model, but the new model will not compile.

---

`newModel = slvnvextract(subsystem, showModel)` and `newModel = slvnvextract(subchart, showModel)` open the extracted model if you set `showModel` to true. The extracted model is only loaded if `showModel` is set to false.

**Input Arguments**

`subsystem`  
Full path to the atomic subsystem

`subchart`  
Full path to the atomic subchart

`showModel`

# slvnvextract

---

Boolean indicating whether to display the extracted model

**Default:** True

## Output Arguments

newModel

Name of the new model

## Examples

Extract the Atomic Subsystem block, Bus Counter, from the sldemo\_md1ref\_conversion model and copy it into a new model:

```
open_system('sldemo_md1ref_conversion');
newmodel = slvnvextract('sldemo_md1ref_conversion/Bus Counter', true);
```

---

Extract the Atomic Subchart block, Sensor1, from the sf\_atomic\_sensor\_pair model and copy it into a new model:

```
open_system('sf_atomic_sensor_pair');
newmodel = slvnvextract('sf_atomic_sensor_pair/RedundantSensors/Sensor1', true);
```

**Purpose** Generate default options for slvnvmakeharness

**Syntax** harnessopts = slvnharnessopts

**Description** harnessopts = slvnharnessopts generates the default configuration for running slvnvmakeharness.

**Output Arguments** harnessopts

A structure whose fields specify the default configuration for slvnvmakeharness. The harnessopts structure can have the following fields. Default values are used if not specified.

| Field           | Description                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| harnessFilePath | Specifies the file path for creating the harness model. If an invalid path is specified, slvnvmakeharness does not save the harness model, but it creates and opens the harness model. If this option is not specified, slvnvmakeharness generates a new harness model and saves it in the MATLAB current folder.<br>Default: '' |
| modelRefHarness | Generates the test harness model that includes model in a Model block. When false, the test harness model includes a copy of model.<br>Default: true                                                                                                                                                                             |

# slvnharnessopts

---

| Field             | Description                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| usedSignalsOnly   | When true, the Signal Builder block in the harness model has signals only for input signals used in the model. The Simulink Design Verifier software must be available, and model must be compatible with the Simulink Design Verifier software to detect the used input signals.<br>Default: false |
| systemTestHarness | When true, generates a SystemTest harness. This option requires dataFile path in addition to model.<br>Default: false                                                                                                                                                                               |

## Examples

Create a test harness for the `sldemo_md1ref_house` model using the default options:

```
open_system('sldemo_md1ref_house');
harnessOpts = slvnharnessopts;
[harnessfile] = slvnmakeharness('sldemo_md1ref_house',...
 '', harnessOpts);
```

## See Also

`slvnmakeharness`

## Purpose

Log simulation input port values

## Syntax

```
data = slvnlvlogsignals(model_block)
data = slvnlvlogsignals(harness_model)
data = slvnlvlogsignals(harness_model, test_case_index)
```

## Description

`data = slvnlvlogsignals(model_block)` simulates the model that contains `model_block` and logs the input signals to the `model_block` block. `model_block` must be a Simulink Model block. `slvnlvlogsignals` records the logged data in the structure `data`.

`data = slvnlvlogsignals(harness_model)` simulates every test case in `harness_model` and logs the input signals to the Test Unit block in the harness model. You must generate `harness_model` using the Simulink Design Verifier analysis, `sldvmakeharness`, or `slvnlvmakeharness`.

`data = slvnlvlogsignals(harness_model, test_case_index)` simulates every test case in the Signal Builder block of the `harness_model` specified by `test_case_index`. `slvnlvlogsignals` logs the input signals to the Test Unit block in the harness model. If you omit `test_case_index`, `slvnlvlogsignals` simulates every test case in the Signal Builder.

## Input Arguments

`model_block`

Full block path name or handle to a Simulink Model block

`harness_model`

Name or handle to a harness model that the Simulink Design Verifier software, `sldvmakeharness`, or `slvnlvmakeharness` creates

`test_case_index`

Array of integers that specifies which test cases in the Signal Builder block of the harness model to simulate

# slvnlvlogssignals

---

## Output Arguments

`data`  
Structure that contains the logged data

## Examples

Simulate the `sldemo_mdref_bus` model and log the input signals to the Model block CounterA in `logged_data`:

```
open_system('sldemo_mdref_bus')
logged_data = slvnlvlogssignals('sldemo_mdref_bus/CounterA')
```

---

Use the logged data to create a harness model in order to visualize the data:

- 1 Simulate the CounterB Model block, which references the `sldemo_mdref_counter` model, in the context of the `sldemo_mdref_basic` model and log the data:

```
open_system('sldemo_mdref_basic');
data = slvnlvlogssignals('sldemo_mdref_basic/CounterB');
```

- 2 Create a harness model for `sldemo_mdref_counter` using the logged data and the default harness options:

```
load_system('sldemo_mdref_counter');
harnessOpts = slvnlvharnessopts
[~, harnessFilePath] = ...
 slvnlvmakeharness('sldemo_mdref_counter', data, ...
 harnessOpts);
```

## See Also

`slvnlvmakeharness` | `slvnlvruncgvtest` | `slvnlvruntest` | `slvnlvmakeharness`

## Purpose

Generate Simulink Verification and Validation harness model

## Syntax

```
[harnessFilePath] = slvnvmakeharness(model)
[harnessFilePath] = slvnvmakeharness(model, dataFile)
[harnessFilePath] = slvnvmakeharness(model, dataFile,
 harnessOpts)
```

## Description

[harnessFilePath] = slvnvmakeharness(model) generates a test harness from model, which is a handle to a Simulink model or a string with the model name. slvnvmakeharness returns the path and file name of the generated harness model in harnessFilePath. slvnvmakeharness creates an empty harness model; the test harness includes one default test case that specifies the default values for all input signals.

[harnessFilePath] = slvnvmakeharness(model, dataFile) generates a test harness from the data file dataFile.

[harnessFilePath] = slvnvmakeharness(model, dataFile, harnessOpts) generates a test harness from model using the dataFile and harnessOpts, which specifies the harness creation options. Requires '' for dataFile if dataFile is not available.

## Input Arguments

model

Handle to a Simulink model or a string with the model name

dataFile

Name of the file containing the data.

**Default:** ''

harnessOpts

A structure whose fields specify the configuration for slvnvmakeharness:

# slvnvmakeharness

| Field           | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| harnessFilePath | <p>Specifies the file path for creating the harness model. If an invalid path is specified, slvnvmakeharness does not save the harness model, but it creates and opens the harness model. If this option is not specified, the slvnvoptions object is used. If this option is not specified, slvnvmakeharness generates a new harness model and saves it in the MATLAB current folder.</p> <p>Default: ''</p>                            |
| modelRefHarness | <p>Generates the test harness model that includes model in a Model block. When false, the test harness model includes a copy of model.</p> <p>Default: true</p> <hr/> <p><b>Note</b> If your model contains bus objects and you set modelRefHarness to true, in the <b>Configuration Parameters &gt; Diagnostics &gt; Connectivity</b> pane, you must set the <b>Mux blocks used to create bus signals</b> parameter to error.</p> <hr/> |

| Field             | Description                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| usedSignalsOnly   | When true, the Signal Builder block in the harness model has signals only for input signals used in the model. The Simulink Design Verifier software must be available, and model must be compatible with the Simulink Design Verifier software to detect the used input signals.<br>Default: false |
| systemTestHarness | When true, generates a SystemTest harness. This option requires dataFilePath in addition to model.<br>Default: false                                                                                                                                                                                |

---

**Note** To create a default harnessOpts object, use slvnvharnessopts.

---

## Output Arguments

harnessFilePath

String containing the path and file name of the generated harness model

## Examples

Create a test harness for the sldemo\_md1ref\_house model using the default options:

```
open_system('sldemo_md1ref_house');
[harnessfile] = slvnvmakeharness('sldemo_md1ref_house', '', harnessOpts);
```

| <b>Purpose</b>          | Merge test case data                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Syntax</b>           | <code>merged_data = slvnvmergedata(data1,data2,...)</code>                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>      | <code>merged_data = slvnvmergedata(data1,data2,...)</code> combines two or more test cases and counterexamples data into a single test case data structure <code>merged_data</code> .                                                                                                                                                                                                                                  |
| <b>Input Arguments</b>  | <code>data</code><br>Structure that contains test case or counterexample data. Generate this structure by running <code>slvnvlogsignals</code> , or by running a Simulink Design Verifier analysis.                                                                                                                                                                                                                    |
| <b>Output Arguments</b> | <code>merged_data</code><br>Structure that contains the merged test cases or counterexamples                                                                                                                                                                                                                                                                                                                           |
| <b>Examples</b>         | Open the <code>sldemo_md1ref_basic</code> model, which contains three Model blocks that reference the model <code>sldemo_md1ref_counter</code> . Log the input signals to the three Model blocks and merge the logged data using <code>slvnvmergedata</code> . Simulate the referenced model, <code>sldemo_md1ref_counter</code> , for coverage with the merged data and display the coverage results in an HTML file. |

```
sldemo_md1ref_basic;
data1 = slvnvlogsignals('sldemo_md1ref_basic/CounterA');
data2 = slvnvlogsignals('sldemo_md1ref_basic/CounterB');
data3 = slvnvlogsignals('sldemo_md1ref_basic/CounterC');
merged_data = slvnvmergedata(data1, data2, data3);
open_system('sldemo_md1ref_counter');
runOpts = slvnvruntestopts;
runOpts.coverageEnabled = true;
[outData, initialCov] = slvnvruntest('sldemo_md1ref_counter', ...
 merged_data, runOpts);
cvhtml('Initial coverage', initialCov);
```

# slvnvmergeharness

---

**Purpose** Merge test cases and initializations into one model

**Syntax** `status = slvnvmergeharness(name, models,  
initialization_commands)`

**Description** `status = slvnvmergeharness(name, models, initialization_commands)` collects the test data and initialization commands from each test harness model in `models`. `slvnvharnessmerge` saves the data and initialization commands in `name`, which is a handle to the new model.

`initialization_commands` is a cell array of strings the same length as `models`. It defines parameter settings for the test cases of each test harness model.

If `name` does not exist, `slvnvmergeharness` creates it as a copy of the first model in `models`. `slvnvmergeharness` then merges data from other models listed in `models` into this model. If you create `name` from a previous `slvnvmergeharness` run, subsequent runs of `slvnvmergeharness` for `name` maintain the correct structure and initialization from the earlier run. If `name` matches an existing Simulink model, `slvnvmergeharness` merges the test data from `models` into `name`.

`slvnvmergeharness` assumes that `name` and the rest of the models in `models` have only one Signal Builder block on the top level. If a model in `models` does not meet this restriction or its top-level Signal Builder block does not have the same number of signals as the top-level Signal Builder block in `name`, `slvnvmergeharness` does not merge that model's test data into `NAME`.

**Input Arguments**

`name`  
Name of the new harness model, to be stored in the default MATLAB folder

`models`  
A cell array of strings that represent harness model names

`initialization_commands`

A cell array of strings the same length as `models`.  
`initialization_commands` defines parameter settings for the test cases of each test harness model.

## Output Arguments

`status`

If the operation is successful, `slvnvmergeharness` returns a status of 1. Otherwise, it returns 0.

## Examples

Log the input signals to the three Model blocks in the `sldemo_md1ref_basic` demo model that all reference the same model. Make three test harnesses using the logged signals and merge the three test harnesses:

```
open_system('sldemo_md1ref_basic');
data1 = slvnvlogsignals('sldemo_md1ref_basic/CounterA');
data2 = slvnvlogsignals('sldemo_md1ref_basic/CounterB');
data3 = slvnvlogsignals('sldemo_md1ref_basic/CounterC');
open_system('sldemo_md1ref_counter');
harness1FilePath = slvnvmakeharness('sldemo_md1ref_counter', data1);
harness2FilePath = slvnvmakeharness('sldemo_md1ref_counter', data2);
harness3FilePath = slvnvmakeharness('sldemo_md1ref_counter', data3)
[-, harness1] = fileparts(harness1FilePath);
[-, harness2] = fileparts(harness2FilePath);
[-, harness3] = fileparts(harness3FilePath);
slvnvmergeharness('new_harness_model',{harness1, harness2, harness3});
```

`slvnvlogsignals` | `slvnvmakeharness`

# slvnvruncgvtest

---

**Purpose** Invoke Code Generation Verification (CGV) API and execute model

**Syntax**  
`cgvObject = slvnvruncgvtest(model, dataFile)`  
`cgvObject = slvnvruncgvtest(model, dataFile, runOpts)`

**Description** `cgvObject = slvnvruncgvtest(model, dataFile)` invokes the Code Generation Verification (CGV) API methods and executes the `model` using all test cases in `dataFile`. `cgvObject` is a `cgv.CGV` object that `slvnvruncgvtest` creates during the execution of the `model`. `slvnvruncgvtest` sets the execution mode for `cgvObject` to 'sim' by default.

`cgvObject = slvnvruncgvtest(model, dataFile, runOpts)` invokes CGV API methods and executes the `model` using test cases in `dataFile`. `runOpts` defines the options for executing the test cases. The settings in `runOpts` determine the configuration of `cgvObject`.

**Tips** To run `slvnvruncgvtest`, you must have a Embedded Coder™ license.

If your model has parameters that are not configured correctly for executing test cases with the CGV API, `slvnvruncgvtest` reports warnings about the invalid parameters. If you see these warnings, do one of the following:

- Modify the invalid parameters and rerun `slvnvruncgvtest`.
- Set `allowCopyModel` in `runOpts` to be `true` and rerun `slvnvruncgvtest`. `slvnvruncgvtest` makes a copy of your model with the correct configuration, and invokes the CGV API.

## Input Arguments

`model`

Name of the Simulink model to execute

`dataFile`

Name of the data file or a structure that contains the input data. Data can be generated either by:

- Analyzing the model using the Simulink Design Verifier software.
- Using the `slvnvlogsignals` function.

## runOpts

A structure whose fields specify the configuration of `slvnvruncgvttest`.

| Field Name                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

An error occurs.</p> <hr/> |

# slvnvruncgvttest

---

| Field Name  | Description                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cgvCompType | Defines the software-in-the-loop (SIL) or processor-in-the-loop (PIL) approach for CGV: <ul style="list-style-type: none"><li>• 'topmodel' (default)</li><li>• 'modelblock'</li></ul> |
| cgvConn     | Specifies mode of execution for CGV: <ul style="list-style-type: none"><li>• 'sim' (default)</li><li>• 'sil'</li><li>• 'pil'</li></ul>                                                |

---

**Note** runOpts = slvnvruntestopts('cgv') returns a runOpts structure with the default values for each field.

---

## Output Arguments

cgvObject

cgv.CGV object that slvnvruncgvttest creates during the execution of model.

slvnvruncgvttest saves the following data for each test case executed in an array of Simulink.SimulationOutput objects inside cgvObject.

| Field                 | Description     |
|-----------------------|-----------------|
| tout_slvnvruncgvttest | Simulation time |
| xout_slvnvruncgvttest | State data      |

| Field                     | Description                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| yout_slvnvruncgvtest      | Output signal data                                                                                                                                                        |
| logstdout_slvnvruncgvtest | Signal logging data for: <ul style="list-style-type: none"> <li>• Signals connected to outputs</li> <li>• Signals that are configured for logging on the model</li> </ul> |

## Examples

Open the `sldemo_mdref_bus` demo model and log the input signals to the CounterA Model block. Create the default configuration object for `slvnvruncgvtest`, and allow the model to be configured correctly to execute test cases with the CGV API. Using the logged signals, execute `slvnvruncgvtest`—first in simulation mode, and then in Software-in-the-Loop (SIL) mode—to invoke the CGV API and execute the specified test cases on the generated code for the model. Use the CGV API to compare the results of the first test case:

```

open_system('sldemo_mdref_bus');
load_system('sldemo_mdref_counter_bus');
loggedData = slvnvlogsignals('sldemo_mdref_bus/CounterA');
runOpts = slvnvruntestopts('cgv');
runOpts.allowCopyModel = true;
cgvObjectSim = slvnvruncgvtest('sldemo_mdref_counter_bus', ...
 loggedData, runOpts);
runOpts.cgvConn = 'sil';
cgvObjectSil = slvnvruncgvtest('sldemo_mdref_counter_bus', ...
 loggedData, runOpts);
simout = cgvObjectSim.getOutputData(1);
silout = cgvObjectSil.getOutputData(1);
[matchNames, ~, mismatchNames, ~] = ...
 cgv.CGV.compare(simout, silout);
fprintf('\nTest Case: %d Signals match, %d Signals mismatch', ...
 length(matchNames), length(mismatchNames));

```

# slvnvruncgvtest

---

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Simulate model using input data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Syntax</b>          | <pre>outData = slvnvrntest(model, dataFile) outData = slvnvrntest(model, dataFile, runOpts) [outData, covData] = slvnvrntest(model, dataFile, runOpts)</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>     | <p><code>outData = slvnvrntest(model, dataFile)</code> simulates <code>model</code> using all the test cases in <code>dataFile</code>. <code>outData</code> is an array of <code>Simulink.SimulationOutput</code> objects. Each array element contains the simulation output data of the corresponding test case.</p> <p><code>outData = slvnvrntest(model, dataFile, runOpts)</code> simulates <code>model</code> using all the test cases in <code>dataFile</code>. <code>runOpts</code> defines the options for simulating the test cases.</p> <p><code>[outData, covData] = slvnvrntest(model, dataFile, runOpts)</code> simulates <code>model</code> using the test cases in <code>dataFile</code>. When the <code>runOpts</code> field <code>coverageEnabled</code> is <code>true</code>, the Simulink Verification and Validation software collects model coverage information during the simulation. <code>slvnvrntest</code> returns the coverage data in the <code>cvdata</code> object <code>covData</code>.</p> |
| <b>Tips</b>            | <p>The <code>dataFile</code> that you create with a Simulink Design Verifier analysis or by running <code>slvnvlogs</code> contains time values and data values. When you simulate a model using these test cases, you might see missing coverage. This issue occurs when the time values in the <code>dataFile</code> are not aligned with the current simulation time step due to numeric calculation differences. You see this issue more frequently with multirate models—models that have multiple sample times.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Input Arguments</b> | <p><code>model</code></p> <p>Name or handle of the Simulink model to simulate</p> <p><code>dataFile</code></p> <p>Name of the data file or structure that contains the input data. You can generate <code>dataFile</code> using the Simulink Design Verifier software, or by running the <code>slvnvlogs</code> function.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# slvnvruntime

---

## runOpts

A structure whose fields specify the configuration of slvnvruntime.

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| testIdx                 | Test case index array to simulate from dataFile. If testIdx is [], slvnvruntime simulates all test cases.<br><br><b>Default:</b> []                                                                                                                                                                                                                                                                                                                                              |
| signalLoggingSaveFormat | Specifies signal logging data format for: <ul style="list-style-type: none"><li>• Signals connected to the outports of the model</li><li>• Intermediate signals that are already configured for logging</li></ul> Valid values are: <ul style="list-style-type: none"><li>• 'Dataset' (default) — slvnvruntime stores the data in Simulink.SimulationData.Dataset objects.</li><li>• 'ModelDataLogs' — slvnvruntime stores the data in Simulink.ModelDataLogs objects.</li></ul> |

| Field           | Description                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| coverageEnabled | If true, specifies that the Simulink Verification and Validation software collect model coverage data during simulation.<br><b>Default:</b> false |
| coverageSetting | cvtest object for collecting model coverage. If [], slvnvrntest uses the existing coverage settings for model.<br><b>Default:</b> []              |

## Output Arguments

outData

An array of Simulink.SimulationOutput objects that simulating the test cases generates. Each Simulink.SimulationOutput object has the following fields.

| Field Name            | Description                                                                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tout_slvnvrntest      | Simulation time                                                                                                                                                           |
| xout_slvnvrntest      | State data                                                                                                                                                                |
| yout_slvnvrntest      | Output signal data                                                                                                                                                        |
| logstdout_slvnvrntest | Signal logging data for: <ul style="list-style-type: none"> <li>• Signals connected to outputs</li> <li>• Signals that are configured for logging on the model</li> </ul> |

covData

cvdata object that contains the model coverage data collected during simulation.

## Examples

Analyze the `sldemo_md1ref_bus` model and log the input signals to the CounterA Model block. Then, using the logged signals, simulate the model referenced in the Counter block (`sldemo_md1ref_counter_bus`). Examine the output data from the first test case using the Simulink Data Inspector:

```
open_system('sldemo_md1ref_bus');
loggedData = slvnvlogsignals('sldemo_md1ref_bus/CounterA');
runOpts = slvnvrntestopts;
runOpts.coverageEnabled = true;
open_system('sldemo_md1ref_counter_bus');
[outData] = slvnvrntest('sldemo_md1ref_counter_bus',...
 loggedData, runOpts);
Simulink.sdi.createRun('Test Case 1 Output', 'namevalue',...
 {'output'}, {outData(1).find('logout_slvnvrntest')});
Simulink.sdi.view;
```

## See Also

`cvsim` | `cvtest` | `sim` | `slvnvrntestopts`

**Purpose** Generate simulation or execution options for `slvnvruntest` or `slvnvruncgvttest`

**Syntax**  
`runOpts = slvnvruntestopts`  
`runOpts = slvnvruntestopts('cgv')`

**Description**  
`runOpts = slvnvruntestopts` generates a `runOpts` structure for `slvnvruntest`.  
`runOpts = slvnvruntestopts('cgv')` generates a `runOpts` structure for `slvnvruncgvttest`.

**Output Arguments**  
`runOpts`  
 A structure whose fields specify the configuration of `slvnvruntest` or `slvnvruncgvttest`. `runOpts` can have the following fields. If you do not specify a field, `slvnvruncgvttest` or `slvnvruntest` uses the default value.

| Field Name                | Description                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>testIdx</code>      | Test case index array to simulate or execute from <code>dataFile</code> .<br>If <code>testIdx = []</code> (default), all test cases are simulated or executed.                                                                                                                                                                                   |
| <code>outputFormat</code> | Specifies format of output values: <ul style="list-style-type: none"> <li>'TimeSeries' (the default) — <code>slvnvruntest/slvnruncgvttest</code> stores the output values in time-series format.</li> <li>'StructureWithTime' — <code>slvnvruntest/slvnruncgvttest</code> stores the output values in the Structure with time format.</li> </ul> |

# slvnvruntestopts

---

| Field Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| coverageEnabled | <p>Available only for slvnvruntest.</p> <p>If true, slvnvruntest collects model coverage data during simulation.</p> <p><b>Default:</b> false</p>                                                                                                                                                                                                                                                                                                                                                      |
| coverageSetting | <p>Available only for slvnvruntest.</p> <p>cvtest object to use for collecting model coverage.</p> <p>If coverageSetting is [], slvnvruntest uses the coverage settings for the model specified in the call to slvnvruntest.</p> <p><b>Default:</b> []</p>                                                                                                                                                                                                                                             |
| allowCopyModel  | <p>Available only for slvnvruncgvtest.</p> <p>Specifies to create and configure the model if you have not configured it correctly for executing test cases with the CGV API.</p> <p>If true and you have not configured the model correctly for executing test cases with the CGV API, slvnvruncgvtest copies the model, corrects the configuration, and executes the test cases on the copied model.</p> <p>If false (the default), an error occurs if the tests cannot execute with the CGV API.</p> |

| Field Name              | Description                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | <p><b>Note</b> If you have not configured the top-level model or any referenced models correctly, <code>slvnvruncgvtest</code> does not copy the model, even if <code>allowCopyModel</code> is true. An error occurs.</p>                                       |
| <code>cgvComType</code> | <p>Available only for <code>slvnvruncgvtest</code>.<br/>           Defines the software-in-the-loop (SIL) or processor-in-the-loop (PIL) approach for CGV:</p> <ul style="list-style-type: none"> <li>• 'topmodel' (default)</li> <li>• 'modelblock'</li> </ul> |
| <code>cgvConn</code>    | <p>Only available for <code>slvnvruncgvtest</code>.<br/>           Specifies mode of execution for CGV:</p> <ul style="list-style-type: none"> <li>• 'sim' (default)</li> <li>• 'sil'</li> <li>• 'pil'</li> </ul>                                               |

## Examples

Create `runOpts` objects for `slvnvruntest` and `slvnvruncgvtest`:

```
runtest_opts = slvnvruntestopts; ! Create options for slvnvruntest
runcgvtest_opts = slvnvruntestopts('cgv') ! Create options for slvnvruncgvtest
```

## Alternatives

Create a `runOpts` object at the MATLAB command line.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | Display lookup table coverage information for model object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>          | <pre>coverage = tableinfo(cvdo, object) coverage = tableinfo(cvdo, object, ignore_descendants) [coverage, exeCounts] = tableinfo(cvdo, object) [coverage, exeCounts, brkEquality] = tableinfo(cvdo, object)</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>     | <p><code>coverage = tableinfo(cvdo, object)</code> returns lookup table coverage results from the cvdata object <code>cvdo</code> for the model component <code>object</code>.</p> <p><code>coverage = tableinfo(cvdo, object, ignore_descendants)</code> returns lookup table coverage results for <code>object</code>, depending on the value of <code>ignore_descendants</code>.</p> <p><code>[coverage, exeCounts] = tableinfo(cvdo, object)</code> returns lookup table coverage results and the execution count for each interpolation/extrapolation interval in the lookup table block <code>object</code>.</p> <p><code>[coverage, exeCounts, brkEquality] = tableinfo(cvdo, object)</code> returns lookup table coverage results, the execution count for each interpolation/extrapolation interval, and the execution counts for breakpoint equality.</p> |
| <b>Input Arguments</b> | <p><code>cvdo</code><br/>cvdata object</p> <p><code>ignore_descendants</code><br/>Logical value specifying whether to ignore the coverage of descendant objects</p> <ul style="list-style-type: none"><li>1 — Ignore coverage of descendant objects</li><li>0 — Collect coverage for descendant objects</li></ul> <p><code>object</code><br/>Full path or handle to a lookup table block or a model containing a lookup table block.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Output Arguments

### brkEquality

A cell array containing vectors that identify the number of times during simulation that the lookup table block input was equivalent to a breakpoint value. Each vector represents the breakpoints along a different lookup table dimension.

### coverage

The value of coverage is a two-element vector of form [covered\_intervals total\_intervals], the elements of which are:

|                   |                                                                      |
|-------------------|----------------------------------------------------------------------|
| covered_intervals | Number of interpolation/extrapolation intervals satisfied for object |
| total_intervals   | Total number of interpolation/extrapolation intervals for object     |

coverage is empty if cvdo does not contain lookup table coverage results for object.

### execounts

An array having the same dimensionality as the lookup table block; its size has been extended to allow for the lookup table extrapolation intervals.

## Examples

Collect lookup table coverage for the `slvndemo_cv_small_controller` model and determine the percentage of interpolation/extrapolation intervals coverage collected for the Gain Table block in the Gain subsystem:

```
mdl = 'slvndemo_cv_small_controller';
open_system(mdl)
testObj = cvtest(mdl) %Create test spec object
testObj.settings.tableExec = 1; %Enable lookup table coverage
data = cvsim(testObj) %Simulate the model
```

# tableinfo

---

```
blk_handle = get_param([mdl, '/Gain/Gain Table'], 'Handle');
cov = tableinfo(data, blk_handle) %Retrieve l/u table coverage
percent_cov = 100 * cov(1) / cov(2) %Percent MC/DC outcomes covered
```

## Alternatives

To collect lookup coverage for a model:

- 1** Open the model.
- 2** In the Model Editor, select **Tools > Coverage Settings**.
- 3** On the **Coverage** tab, under **Coverage Metrics**, select **Look-up Table Coverage**.
- 4** On the **Results** and **Report** tabs, select the desired options.
- 5** Click **OK** to close the Coverage Settings dialog box.
- 6** Simulate the model and review the lookup table coverage in the report.

## How To

- “Lookup Table Coverage”

# ModelAdvisor.ListViewParameter.Attributes property

---

**Purpose** Attributes to display in Model Advisor Report Explorer

**Values** Cell array

**Default:** {} (empty cell array)

**Description** The Attributes property specifies the attributes to display in the center pane of the Model Advisor Results Explorer.

## Examples

```
% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
myLVParam.Data = get_param(searchResult,'object');
myLVParam.Attributes = {'FontName'}; % name is default property
```

# ModelAdvisor.Check.CallbackContext property

---

**Purpose** Specify when to run check

**Values** 'PostCompile'  
'None' (default)

**Description** The CallbackContext property specifies the context for checking the model or subsystem.

'None' No special requirements for the model before checking.

'Postcompile' The model must be compiled.

# ModelAdvisor.Check.CallbackHandle property

---

|                    |                                                                                  |
|--------------------|----------------------------------------------------------------------------------|
| <b>Purpose</b>     | Callback function handle for check                                               |
| <b>Values</b>      | Function handle.<br>An empty handle [ ] is the default.                          |
| <b>Description</b> | The CallbackHandle property specifies the handle to the check callback function. |

# ModelAdvisor.Check.CallbackStyle property

---

**Purpose** Callback function type

**Values** 'StyleOne' (default)  
'StyleTwo'  
'StyleThree'

**Description** The CallbackStyle property specifies the type of the callback function.

|              |                                                  |
|--------------|--------------------------------------------------|
| 'StyleOne'   | Simple check callback function                   |
| 'StyleTwo'   | Detailed check callback function                 |
| 'StyleThree' | Check callback function with hyperlinked results |

# ModelAdvisor.Check.EmitInputParametersToReport property

---

**Purpose** Display check input parameters in the Model Advisor report

**Values** 'true' (default)  
'false'

**Description** The EmitInputParametersToReport property specifies the display of check input parameters in the Model Advisor report.

'true' Display check input parameters in the Model Advisor report

'false' Do not display check input parameters in the Model Advisor report

# ModelAdvisor.ListViewParameter.Data property

---

**Purpose** Objects in Model Advisor Result Explorer

**Values** Array of Simulink objects  
**Default:** [] (empty array)

**Description** The Data property specifies the objects displayed in the Model Advisor Result Explorer.

**Examples**

```
% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
myLVParam.Data = get_param(searchResult, 'object');
```

# ModelAdvisor.Action.Description property

---

## Purpose

Message in **Action** box

## Values

String

**Default:** '' (null string)

## Description

The **Description** property specifies the message displayed in the **Action** box.

## Examples

```
% define action (fix) operation
myAction = ModelAdvisor.Action;
%Specify a callback function for the action
myAction.setCallbackFcn(@sampleActionCB);
myAction.Name='Fix block fonts';
myAction.Description=...
 'Click the button to update all blocks with specified font';
```

# ModelAdvisor.FactoryGroup.Description property

---

**Purpose** Description of folder

**Values** String  
**Default:** '' (null string)

**Description** The Description property provides information about the folder. Details about the folder are displayed in the right pane of the Model Advisor.

**Examples**

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
rec.Description='Demo Factory Group';
```

# ModelAdvisor.Group.Description property

---

**Purpose** Description of folder

**Values** String

**Default:** '' (null string)

**Description** The Description property provides information about the folder. Details about the folder are displayed in the right pane of the Model Advisor.

**Examples**

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');
MAG.Description='This is my group';
```

# ModelAdvisor.InputParameter.Description property

---

**Purpose** Description of input parameter

**Values** String.

**Default:** '' (null string)

**Description** The Description property specifies a description of the input parameter. Details about the check are displayed in the right pane of the Model Advisor.

**Examples**

```
% define input parameters
inputParam2 = ModelAdvisor.InputParameter;
inputParam2.Name = 'Standard font size';
inputParam2.Value='12';
inputParam2.Type='String';
inputParam2.Description='sample tooltip';
```

# ModelAdvisor.Task.Description property

---

**Purpose** Description of task

**Values** String

**Default:** '' (null string)

**Description** The Description property is a description of the task that the Model Advisor displays in the **Analysis** box.

When adding checks as tasks, the Model Advisor uses the task Description property instead of the check TitleTips property.

## Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT1.DisplayName='Example task 1';
MAT1.Description='This is the first example task.'
```

```
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');
MAT2.DisplayName='Example task 2';
MAT2.Description='This is the second example task.'
```

```
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
MAT3.DisplayName='Example task 3';
MAT3.Description='This is the third example task.'
```

# ModelAdvisor.FactoryGroup.DisplayName property

---

**Purpose** Name of folder

**Values** String  
**Default:** '' (null string)

**Description** The DisplayName specifies the name of the folder that is displayed in the Model Advisor.

**Examples**

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
rec.DisplayName='Demo Factory Group';
```

# ModelAdvisor.Group.DisplayName property

---

|--------------------|----------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Name of folder                                                                                           |
| <b>Values</b>      | String<br><b>Default:</b> ' ' (null string)                                                              |
| <b>Description</b> | The DisplayName specifies the name of the folder that is displayed in the Model Advisor.                 |
| <b>Examples</b>    | <pre>MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');<br/>MAG.DisplayName='My Group';</pre> |

# ModelAdvisor.Task.DisplayName property

---

**Purpose** Name of task

**Values** String  
**Default:** '' (null string)

**Description** The `DisplayName` property specifies the name of the task. The Model Advisor displays each custom task in the tree using the name of the task. Therefore, you should specify a unique name for each task. When you specify the same name for multiple tasks, the Model Advisor generates a warning.

When adding checks as tasks, the Model Advisor uses the task `DisplayName` property instead of the check `Title` property.

## Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT1.DisplayName='Example task with input parameter and auto-fix ability';

MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');
MAT2.DisplayName='Example task 2';

MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
MAT3.DisplayName='Example task 3';
```

# ModelAdvisor.Check.Enable property

---

**Purpose**

Indicate whether user can enable or disable check

**Values**

true (default)  
false

**Description**

The Enable property specifies whether the user can enable or disable the check.

|       |                               |
|-------|-------------------------------|
| true  | Display the check box control |
| false | Hide the check box control    |

# ModelAdvisor.Task.Enable property

---

**Purpose** Indicate if user can enable and disable task

**Values** true (default)  
false

**Description** The Enable property specifies whether the user can enable or disable a task.

|                |                                        |
|----------------|----------------------------------------|
| true (default) | Display the check box control for task |
| false          | Hide the check box control for task    |

When adding checks as tasks, the Model Advisor uses the task Enable property instead of the check Enable property.

**Examples**

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT1.Enable = 'false';
```

# ModelAdvisor.InputParameter.Entries property

---

|                    |                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Drop-down list entries                                                                                                                                                                                                    |
| <b>Values</b>      | Depends on the value of the Type property.                                                                                                                                                                                |
| <b>Description</b> | <p>The Entries property is valid only when the Type property is one of the following:</p> <ul style="list-style-type: none"><li>• Enum</li><li>• ComboBox</li><li>• PushButton</li></ul>                                  |
| <b>Examples</b>    | <pre>inputParam3 = ModelAdvisor.InputParameter;<br/>inputParam3.Name='Valid font';<br/>inputParam3.Type='Combobox';<br/>inputParam3.Description='sample tooltip';<br/>inputParam3.Entries={'Arial', 'Arial Black'};</pre> |

# ModelAdvisor.Check.ID property

---

**Purpose** Identifier for check

**Values** String

**Default:** '' (null string)

**Description** The ID property specifies a permanent, unique identifier for the check. Note the following about the ID property:

- You must specify this property.
- The value of ID must remain constant.
- The Model Advisor generates an error if ID is not unique.
- Tasks and factory group definitions must refer to checks by ID.

# ModelAdvisor.FactoryGroup.ID property

---

**Purpose** Identifier for folder

**Values** String

**Description** The ID property specifies a permanent, unique identifier for the folder.

---

## Note

- You must specify this field.
  - The value of ID must remain constant.
  - The Model Advisor generates an error if ID is not unique.
  - Group definitions must refer to other groups by ID.
-

# ModelAdvisor.Group.ID property

---

**Purpose** Identifier for folder

**Values** String

**Description** The ID property specifies a permanent, unique identifier for the folder.

---

## Note

- You must specify this field.
  - The value of ID must remain constant.
  - The Model Advisor generates an error if ID is not unique.
  - Group definitions must refer to other groups by ID.
-

# ModelAdvisor.Task.ID property

---

**Purpose** Identifier for task

**Values** String

**Default:** '' (null string)

**Description** The ID property specifies a permanent, unique identifier for the task.

---

## Note

- The Model Advisor automatically assigns a string to ID if you do not specify it.
  - The value of ID must remain constant.
  - The Model Advisor generates an error if ID is not unique.
  - Group definitions must refer to tasks using ID.
- 

## Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT1.ID='Task_ID_1234';
```

# ModelAdvisor.Check.LicenseName property

---

**Purpose** Product license names required to display and run check

**Values** Cell array of product license names

{}(empty cell array) (default)

**Description** The `LicenseName` property specifies a cell array of names for product licenses required to display and run the check.

When the Model Advisor starts, it tests whether the product license exists. If you do not meet the license requirements, the Model Advisor does not display the check.

The Model Advisor performs a checkout of the product licenses when you run the custom check. If you do not have the product licenses available, you see an error message that the required license is not available.

---

**Tip** To find the correct text for license strings, type `help license` at the MATLAB command line.

---

# ModelAdvisor.Task.LicenseName property

---

## Purpose

Product license names required to display and run task

## Values

Cell array of product license names

**Default:** {} (empty cell array)

## Description

The `LicenseName` property specifies a cell array of names for product licenses required to display and run the check.

When the Model Advisor starts, it tests whether the product license exists. If you do not meet the license requirements, the Model Advisor does not display the check.

The Model Advisor performs a checkout of the product licenses when you run the custom check. If you do not have the product licenses available, you see an error message that the required license is not available.

If you specify `ModelAdvisor.Check.LicenseName`, the Model Advisor displays the check when the union of both properties is true.

---

**Tip** To find the correct text for license strings, type `help license` at the MATLAB command line.

---

# ModelAdvisor.Check.ListViewVisible property

---

**Purpose** Status of **Explore Result** button

**Values** false (default)  
true

**Description** The `ListViewVisible` property is a Boolean value that sets the status of the **Explore Result** button.

|       |                                           |
|-------|-------------------------------------------|
| true  | Display the <b>Explore Result</b> button. |
| false | Hide the <b>Explore Result</b> button.    |

**Examples**

```
% add 'Explore Result' button
rec.ListViewVisible = true;
```

# ModelAdvisor.FactoryGroup.MAObj property

---

|                    |                                                                            |
|--------------------|----------------------------------------------------------------------------|
| <b>Purpose</b>     | Model Advisor object                                                       |
| <b>Values</b>      | Handle to a Simulink.ModelAdvisor object                                   |
| <b>Description</b> | The MAObj property specifies a handle to the current Model Advisor object. |

# ModelAdvisor.Group.MAObj property

---

|                    |                                                                            |
|--------------------|----------------------------------------------------------------------------|
| <b>Purpose</b>     | Model Advisor object                                                       |
| <b>Values</b>      | Handle to Simulink.ModelAdvisor object                                     |
| <b>Description</b> | The MAObj property specifies a handle to the current Model Advisor object. |

# ModelAdvisor.Task.MAObj property

---

|                    |                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Model Advisor object                                                                                                                                                                          |
| <b>Values</b>      | Handle to a Simulink.ModelAdvisor object                                                                                                                                                      |
| <b>Description</b> | <p>The MAObj property specifies the current Model Advisor object.</p> <p>When adding checks as tasks, the Model Advisor uses the task MAObj property instead of the check MAObj property.</p> |

## cv.cvdatagroup.name property

---

|                    |                                                                                  |
|--------------------|----------------------------------------------------------------------------------|
| <b>Purpose</b>     | cv.cvdatagroup object name                                                       |
| <b>Values</b>      | name                                                                             |
| <b>Description</b> | The name property specifies the name of the cv.cvdatagroup object.               |
| <b>Examples</b>    | <pre>cvdg = cvsimref(topModelName, cvtg);<br/>cvdg.name = 'My_Data_Group';</pre> |

|                    |                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | cv.cvtestgroup object name                                                                                                                                                |
| <b>Value</b>       | name                                                                                                                                                                      |
| <b>Description</b> | The name property specifies the name of the cv.cvtestgroup object.                                                                                                        |
| <b>Examples</b>    | <pre>cvto1 = cvtest('TopModel'); cvto2 = cvtest('SubModel1'); cvto3 = cvtest('SubModel2'); cvtg = cv.cvtestgroup(cvto1, cvto2, cvto3); cvtg.name = 'My_Test_Group';</pre> |
| <b>See Also</b>    | cvtest                                                                                                                                                                    |

# ModelAdvisor.Action.Name property

---

**Purpose** Action button label

**Values** String  
**Default:** '' (null string)

**Description** The Name property specifies the label for the action button. This property is required.

**Examples**

```
% define action (fix) operation
myAction = ModelAdvisor.Action;
%Specify a callback function for the action
myAction.setCallbackFcn(@sampleActionCB);
myAction.Name='Fix block fonts';
```

# ModelAdvisor.InputParameter.Name property

---

|                    |                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Input parameter name                                                                                                                                                                                        |
| <b>Values</b>      | String.<br><b>Default:</b> '' (null string)                                                                                                                                                                 |
| <b>Description</b> | The Name property specifies the name of the input parameter in the custom check.                                                                                                                            |
| <b>Examples</b>    | <pre>inputParam2 = ModelAdvisor.InputParameter;<br/>inputParam2.Name = 'Standard font size';<br/>inputParam2.Value='12';<br/>inputParam2.Type='String';<br/>inputParam2.Description='sample tooltip';</pre> |

# ModelAdvisor.ListViewParameter.Name property

---

**Purpose** Drop-down list entry

**Values** String

**Default:** '' (null string)

**Description** The Name property specifies an entry in the **Show** drop-down list in the Model Advisor Result Explorer.

**Examples**

```
% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
```

# ModelAdvisor.Check.Result property

---

**Purpose** Results cell array

**Values** Cell array

**Default:** {} (empty cell array)

**Description** The `Result` property specifies the cell array for storing the results that are returned by the callback function specified in `CallbackHandle`.

---

**Tip** To set the icon associated with the check, use the `Simulink.ModelAdvisor` `setCheckResultStatus` and `setCheckErrorSeverity` methods.

---

# ModelAdvisor.Check.Title property

---

**Purpose** Name of check

**Values** String  
**Default:** '' (null string)

**Description** The Title property specifies the name of the check in the Model Advisor. The Model Advisor displays each custom check in the tree using the title of the check. Therefore, you should specify a unique title for each check. When you specify the same title for multiple checks, the Model Advisor generates a warning.

**Examples**

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.Title = 'Check Simulink block font';
```

# ModelAdvisor.Check.TitleTips property

---

**Purpose**

Description of check

**Values**

String

**Default:** '' (null string)

**Description**

The TitleTips property specifies a description of the check. Details about the check are displayed in the right pane of the Model Advisor.

**Examples**

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.Title = 'Check Simulink block font';
rec.TitleTips = 'Example style three callback';
```

# ModelAdvisor.InputParameter.Type property

---

**Purpose** Input parameter type

**Values** String.

**Default:** '' (null string)

**Description** The Type property specifies the type of input parameter.

Use the Type property with the Value and Entries properties to define input parameters.

Valid values are listed in the following table.

| Type     | Data Type  | Default Value           | Description                                                                                                                                                                                                         |
|----------|------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bool     | Boolean    | false                   | A check box                                                                                                                                                                                                         |
| ComboBox | Cell array | First entry in the list | A drop-down menu <ul style="list-style-type: none"><li>• Use Entries to define the entries in the list.</li><li>• Use Value to indicate a specific entry in the menu or to enter a value not in the list.</li></ul> |
| Enum     | Cell array | First entry in the list | A drop-down menu <ul style="list-style-type: none"><li>• Use Entries to define the entries in the list.</li><li>• Use Value to indicate a specific entry in the list.</li></ul>                                     |

# ModelAdvisor.InputParameter.Type property

| Type       | Data Type | Default Value     | Description                                                                                               |
|------------|-----------|-------------------|-----------------------------------------------------------------------------------------------------------|
| PushButton | N/A       | N/A               | A button<br>When you click the button, the callback function specified by <code>Entries</code> is called. |
| String     | String    | ' ' (null string) | A text box                                                                                                |

## Examples

```
% define input parameters
inputParam1 = ModelAdvisor.InputParameter;
inputParam1.Name = 'Skip font checks.';
inputParam1.Type = 'Bool';
inputParam1.Value = false;
```

# ModelAdvisor.Check.Value property

---

**Purpose** Status of check

**Values** 'true' (default)  
'false'

**Description** The Value property specifies the initial status of the check.

'true' Check is enabled

'false' Check is disabled

**Examples**

```
% hide all checks that do not belong to Demo group
if ~(strcmp(checkCellArray{i}.Group, 'Demo'))
 checkCellArray{i}.Visible = false;
 checkCellArray{i}.Value = false;
end
```

# ModelAdvisor.InputParameter.Value property

---

|                    |                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Value of input parameter                                                                                                                                                                                                                                                    |
| <b>Values</b>      | Depends on the Type property.                                                                                                                                                                                                                                               |
| <b>Description</b> | <p>The Value property specifies the initial value of the input parameter. This property is valid only when the Type property is one of the following:</p> <ul style="list-style-type: none"><li>• 'Bool'</li><li>• 'String'</li><li>• 'Enum'</li><li>• 'ComboBox'</li></ul> |
| <b>Examples</b>    | <pre>% define input parameters inputParam1 = ModelAdvisor.InputParameter; inputParam1.Name = 'Skip font checks.'; inputParam1.Type = 'Bool'; inputParam1.Value = false;</pre>                                                                                               |

# ModelAdvisor.Task.Value property

---

|                    |                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>     | Status of task                                                                                                                                                                                                              |
| <b>Values</b>      | 'true' (default) — Initial status of task is enabled<br>'false' — Initial status of task is disabled                                                                                                                        |
| <b>Description</b> | <p>The Value property indicates the initial status of a task—whether it is enabled or disabled.</p> <p>When adding checks as tasks, the Model Advisor uses the task Value property instead of the check Value property.</p> |
| <b>Examples</b>    | <pre>MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');<br/>MAT1.Value = 'false';</pre>                                                                                                                          |

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>         | View Model Advisor run results for checks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Syntax</b>          | <code>view(CheckResultObj)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>     | <code>view(CheckResultObj)</code> opens a web browser and displays the results of the check specified by <code>CheckResultObj</code> . <code>CheckResultObj</code> is a <code>ModelAdvisor.CheckResult</code> object returned by <code>ModelAdvisor.run</code> .                                                                                                                                                                                                                                                                                                                                                   |
| <b>Input Arguments</b> | <code>CheckResultObj</code><br><br>ModelAdvisor.CheckResult object which is a part of a <code>ModelAdvisor.SystemResult</code> object returned by <code>ModelAdvisor.run</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Examples</b>        | View the Model Advisor run results for the first check in the <code>slvndemo_mdldv_config</code> configuration file:<br><br><pre>% Identify Model Advisor configuration file.<br/>% Create list of models to run.<br/>fileName = 'slvndemo_mdldv_config.mat';<br/>SysList={'sldemo_auto_climatecontrol/Heater Control',...<br/>        'sldemo_auto_climatecontrol/AC Control'};<br/><br/>% Run the Model Advisor.<br/>SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);<br/><br/>% View the 'Identify unconnected...' check result.<br/>view(SysResultObjArray{1}.CheckResultObjs(1))</pre> |
| <b>Alternatives</b>    | “Viewing the Model Advisor Report”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## **How To**

- “Checking Systems Programmatically”
- “Archiving and Viewing Results”

## Purpose

View Model Advisor run results for systems

## Syntax

```
viewReport(SysResultObjArray)
viewReport(SysResultObjArray, 'MA')
viewReport(SysResultObjArray, 'Cmd')
```

## Description

`viewReport(SysResultObjArray)` opens the Model Advisor Report for the system specified by `SysResultObjArray`. `SysResultObjArray` is a `ModelAdvisor.SystemResult` object returned by `ModelAdvisor.run`.

`viewReport(SysResultObjArray, 'MA')` opens the Model Advisor and displays the results of the run for the system specified by `SysResultObjArray`.

`viewReport(SysResultObjArray, 'Cmd')` displays the Model Advisor run summary in the Command Window for the systems specified by `SysResultObjArray`.

## Input Arguments

`SysResultObjArray`

`ModelAdvisor.SystemResult` object returned by `ModelAdvisor.run`.

## Examples

Open the Model Advisor report for `sldemo_auto_climatecontrol/Heater Control`.

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slnvdemo_mdldadv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
 'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% Open the Model Advisor report.
viewReport(SysResultObjArray{1})
```

---

Open Model Advisor and display results for  
sldemo\_auto\_climatecontrol/Heater Control.

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
 'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% Open the Model Advisor and display results.
viewReport(SysResultObjArray{1}, 'MA')
```

---

Display results in the Command Window for  
sldemo\_auto\_climatecontrol/Heater Control.

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
 'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% Display results in the Command Window.
viewReport(SysResultObjArray{1}, 'Cmd')
```

## Alternatives

**How To**

- “Checking Systems Programmatically”
- “Archiving and Viewing Results”

# ModelAdvisor.Check.Visible property

---

**Purpose** Indicate to display or hide check

**Values** 'true' (default)  
'false'

**Description** The Visible property specifies whether the Model Advisor displays the check.

'true' Display the check

'false' Hide the check

**Examples**

```
% hide all checks that do not belong to Demo group
if ~(strcmp(checkCellArray{i}.Group, 'Demo'))
 checkCellArray{i}.Visible = false;
 checkCellArray{i}.Value = false;
end
```

# ModelAdvisor.Task.Visible property

---

**Purpose** Indicate to display or hide task

**Values** 'true' (default) — Display task in the Model Advisor  
'false' — Hide task

**Description** The `Visible` property specifies whether the Model Advisor displays the task.

---

## Caution

When adding checks as tasks, you cannot specify both the task and check `Visible` properties, you must specify one or the other. If you specify both properties, the Model Advisor generates an error when the check `Visible` property is `false`.

---

**Examples**

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');
MAT1.Visible = 'false';
```

# ModelAdvisor.Task.Visible

---

# Block Reference

---

# System Requirements

---

**Purpose** List system requirements in Simulink diagrams

**Library** Simulink Verification and Validation

**Description**

The System Requirements block lists all the system requirements associated with the model or subsystem depicted in the current diagram. It does not list requirements associated with individual blocks in the diagram.

You can place this block anywhere in a diagram. It is not connected to other Simulink blocks. You can only have one System Requirements block in a diagram.

When you drag the System Requirements block from the Library Browser into your Simulink diagram, it is automatically populated with the system requirements, as shown.

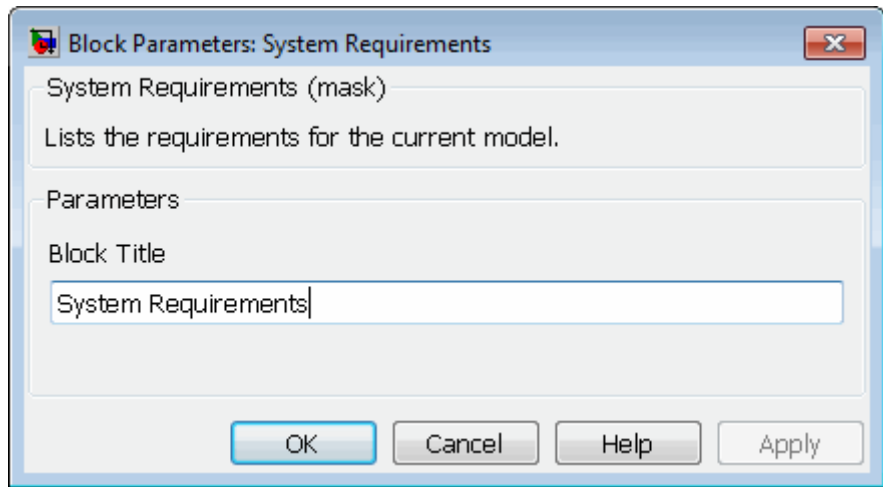

Each of the listed requirements is an active link to the actual requirements document. When you double-click on a requirement name, the associated requirements document opens in its editor window, scrolled to the target location.

If the System Requirements block exists in a diagram, it automatically updates the requirements listing as you add, modify, or delete requirements for the model or subsystem.

**Dialog Box and Parameters**

To access the Block Parameters dialog box for the System Requirements block, right-click on the System Requirements block and, from the resulting pop-up menu, select **Mask Parameters**. The Block Parameters dialog box opens, as shown.

The Block Parameters dialog box for the System Requirements block contains one parameter.

### **Block Title**

The title of the system requirements list in the diagram. The default title is **System Requirements**. You can type a customized title, for example, **Engine Requirements**.

### Simulink Verification and Validation Checks Overview

Simulink Verification and Validation checks facilitate designing and troubleshooting models from which code is generated for applications that must meet safety or mission-critical requirements, modeling guidelines, or requirements consistency.

The Model Advisor performs a checkout of the Simulink Verification and Validation license when you run the Simulink Verification and Validation checks.

For descriptions of the modeling standards checks, see

- “DO-178B Checks” on page 5-4
- “IEC 61508 and ISO 26262 Checks” on page 5-74
- “MathWorks Automotive Advisory Board Checks” on page 5-99

For descriptions of the requirements consistency checks, see “Requirements Consistency Checks” on page 5-165.

## Modeling Standards Checks Overview

Modeling standards checks facilitate designing and troubleshooting models from which code is generated for applications that must meet safety or mission-critical requirements or MathWorks® Automotive Advisory Board (MAAB) modeling guidelines.

The Model Advisor performs a checkout of the Simulink Verification and Validation license when you run the modeling standards checks.

For descriptions of the modeling standards checks, see

## Check safety-related optimization settings

Check model configuration for optimization settings that can impact safety.

### Description

This check verifies that model optimization configuration parameters are set optimally for generating code for a safety-related application. Although highly optimized code is desirable for most real-time systems, some optimizations can have undesirable side effects that impact safety.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                   | Recommended Action                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Block reduction optimization is selected. This optimization can remove blocks from generated code, resulting in requirements with no associated code and violations for traceability requirements. (See DO-178B, Section 6.3.4e—Source code is traceable to low-level requirements.)</p>                 | <p>Clear the <b>Block reduction</b> check box on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter <code>BlockReduction</code> to off.</p>                         |
| <p>Implementation of logic signals as Boolean data is cleared. Strong data typing is recommended for safety-related code. (See DO-178B, Section 6.3.1e—High-level requirements conform to standards, DO-178B, Section 6.3.2e—Low-level requirements conform to standards, and MISRA-C:2004, Rule 12.6.)</p> | <p>Select <b>Implement logic signals as boolean data (vs. double)</b> on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter <code>BooleanDataType</code> to on.</p> |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The model includes blocks that depend on elapsed or absolute time and is configured to minimize the amount of memory allocated for the timers. Such a configuration limits the number of days the application can execute before a timer overflow occurs. Many aerospace products are powered on continuously and timers should not assume a limited lifespan. (See DO-178B, Section 6.3.1g—Algorithms are accurate, DO-178B, Section 6.3.2g—Algorithms are accurate, and MISRA-C:2004, Rule 12.11.)</p> | <p>Set <b>Application lifespan (days)</b> on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter LifeSpan to inf.</p>                                                                                                                                                                                                                                                       |
| <p>The optimization that suppresses the generation of initialization code for root-level inports and outports that are set to zero is selected. For safety-related code, you should explicitly initialize all variables. (See DO-178B, Section 6.3.3b—Software architecture is consistent and MISRA-C:2004, Rule 9.1.)</p>                                                                                                                                                                                  | <p>If you have a Embedded Coder license, and you are using an ERT-based system target file, clear the <b>Remove root level I/O zero initialization</b> check box on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter ZeroExternalMemoryAtStartup to on. Alternatively, integrate external, hand-written code that initializes all I/O variables to zero explicitly.</p>  |
| <p>The optimization that suppresses the generation of initialization code for internal work structures, such as block states and block outputs that are set to zero, is selected. For safety-related code, you should explicitly initialize all variables. (See DO-178B, Section 6.3.3b—Software architecture is consistent and MISRA-C:2004, Rule 9.1.)</p>                                                                                                                                                | <p>If you have a Embedded Coder license, and you are using an ERT-based system target file, clear the <b>Remove internal data zero initialization</b> check box on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter ZeroInternalMemoryAtStartup to on. Alternatively, integrate external, hand-written code that initializes all state variables to zero explicitly.</p> |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Recommended Action                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The optimization that suppresses generation of code resulting from floating-point to integer conversions that wrap out-of-range values is cleared. You must avoid overflows for safety-related code. When this optimization is off and your model includes blocks that disable the <b>Saturate on overflow</b> parameter, the code generator wraps out-of-range values for those blocks. This can result in unreachable and, therefore, untestable code. (See DO-178B, Section 6.3.1g—Algorithms are accurate, DO-178B, Section 6.3.2g—Algorithms are accurate, and MISRA-C:2004, Rule 12.11.)</p> | <p>If you have a Simulink Coder license, select <b>Remove code from floating-point to integer conversions that wraps out-of-range values</b> on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter <code>EfficientFloat2IntCast</code> to on.</p>                                                 |
| <p>The optimization that suppresses generation of code that guards against division by zero for fixed-point data is selected. You must avoid division-by-zero exceptions in safety-related code. (See DO-178B, Section 6.3.1g—Algorithms are accurate, DO-178B, Section 6.3.2g—Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)</p>                                                                                                                                                                                                                                                             | <p>If you have a Embedded Coder license, and you are using an ERT-based system target file, clear the <b>Remove code that protects against division arithmetic exceptions</b> check box on the <b>Optimization</b> pane of the Configuration Parameters dialog box or set the parameter <code>NoFixptDivByZeroProtection</code> to off.</p> |
| <p>The optimization that uses the specified minimum and maximum values for signals and parameters to optimize the generated code is selected. This might result in requirements without traceable code. (See DO-178B Section 6.3.4e - Source code is traceable to low-level requirements.)</p>                                                                                                                                                                                                                                                                                                        | <p>If you have a Embedded Coder license, and you are using an ERT-based system target file, clear the “<b>Optimize using the specified minimum and maximum values</b>” check box on the <b>Optimization</b> pane of the Configuration Parameters dialog box.</p>                                                                            |

**Action Results**

Clicking **Modify Settings** configures model optimization settings that can impact safety.

## Check safety-related diagnostic settings for solvers

Check model configuration for diagnostic settings that apply to solvers and that can impact safety.

### Description

This check verifies that model diagnostic configuration parameters pertaining to solvers are set optimally for generating code for a safety-related application.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                             | Recommended Action                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The diagnostic for detecting automatic breakage of algebraic loops is set to none or warning. The breaking of algebraic loops can affect the predictability of the order of block execution. For safety-related applications, a model developer needs to know when such breaks occur. ## Check safety-related diagnostic settings for sample time

Check model configuration for diagnostic settings that apply to sample time and that can impact safety.

### Description

This check verifies that model diagnostic configuration parameters pertaining to sample times are set optimally for generating code for a safety-related application.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Recommended Action                                                                                                                                                                                                 |

| <p>The diagnostic for detecting when a source block, such as a Sine Wave block, inherits a sample time (specified as -1) is set to none or warning. The use of inherited sample times for a source block can result in unpredictable execution rates for the source block and blocks connected to it. For safety-related applications, source blocks should have explicit sample times to prevent incorrect execution sequencing. (See DO-178B, Section 6.3.3e – Software architecture conforms to standards.)</p> | <p>Set <b>Source block specifies -1 sample time</b> on the <b>Diagnostics &gt; Sample Time</b> pane of the Configuration Parameters dialog box or set the parameter <code>InheritedTsInSrcMsg</code> to error.</p> |
| <p>The diagnostic for detecting whether the input for a discrete block, such as the Unit Delay block, is a continuous signal is set to none or warning. Signals with continuous sample times should not be used for embedded real-time code. (See DO-178B, Section 6.3.3e – Software architecture conforms to standards.)</p>                                                                                                                                                                                      | <p>Set <b>Discrete used as continuous</b> on the <b>Diagnostics &gt; Sample Time</b> pane of the Configuration Parameters dialog box or set the parameter <code>DiscreteInheritContinuousMsg</code> to error.</p>  |

| <b>Condition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>Recommended Action</b>                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The diagnostic for detecting invalid rate transitions between two blocks operating in multitasking mode is set to none or warning. Such rate transitions should not be used for embedded real-time code. (See DO-178B, Section 6.3.3b – Software architecture is consistent.)</p>                                                                                                                                                                                              | <p>Set <b>Multitask rate transition</b> on the <b>Diagnostics &gt; Sample Time</b> pane of the Configuration Parameters dialog box or set the parameter <code>MultiTaskRateTransMsg</code> to error.</p>                                          |
| <p>The diagnostic for detecting subsystems that can cause data corruption or nondeterministic behavior is set to none or warning. This diagnostic detects whether conditionally executed multirate subsystems (enabled, triggered, or function-call subsystems) operate in multitasking mode. Such subsystems can corrupt data and behave unpredictably in real-time environments that allow preemption. (See DO-178B, Section 6.3.3b – Software architecture is consistent.)</p> | <p>Set <b>Multitask conditionally executed subsystem</b> on the <b>Diagnostics &gt; Sample Time</b> pane of the Configuration Parameters dialog box or set the parameter <code>MultiTaskCondExecSysMsg</code> to error.</p>                       |
| <p>The diagnostic for checking sample time consistency between a Signal Specification block and the connected destination block is set to none or warning. An over-specified sample time can result in an unpredictable execution rate. (See DO-178B, Section 6.3.3e – Software architecture conforms to standards.)</p>                                                                                                                                                          | <p>Set <b>Enforce sample times specified by Signal Specification blocks</b> on the <b>Diagnostics &gt; Sample Time</b> pane of the Configuration Parameters dialog box or set the parameter <code>SigSpecEnsureSampleTimeMsg</code> to error.</p> |

**Action Results**

Clicking **Modify Settings** configures model diagnostic settings that apply to sample time and that can impact safety.

## Check safety-related diagnostic settings for signal data

Check model configuration for diagnostic settings that apply to signal data and that can impact safety.

### Description

This check verifies that model diagnostic configuration parameters pertaining to signal data are set optimally for generating code for a safety-related application.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The diagnostic that specifies how the Simulink software resolves signals associated with <code>Simulink.Signal</code> objects in the MATLAB workspace is set to <code>Explicit</code> and <code>implicit</code> or <code>Explicit</code> and <code>warn implicit</code>. For safety-related applications, model developers should be required to define signal resolution explicitly. (See DO-178B, Section 6.3.3b – Software architecture is consistent.)</p> | <p>Set <b>Signal resolution</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>SignalResolutionControl</code> to <code>Explicit</code> only. This provides predictable operation by requiring users to define each signal and block setting that must resolve to <code>Simulink.Signal</code> objects in the workspace.</p> |
| <p>The Product block diagnostic that detects a singular matrix while inverting one of its inputs in matrix multiplication mode is set to <code>none</code> or <code>warning</code>. Division by a singular matrix can result in numeric exceptions when executing generated code. This is not acceptable in safety-related systems. (See DO-178B, Section 6.3.1g –</p>                                                                                            | <p>Set <b>Division by singular matrix</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>CheckMatrixSingularityMsg</code> to <code>error</code>.</p>                                                                                                                                                                        |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                       | Recommended Action                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                            |
| The diagnostic that detects when the Simulink software cannot infer the data type of a signal during data type propagation is set to none or warning. For safety-related applications, model developers must verify that all data types are specified correctly. (See DO-178B, Section 6.3.1e – High-level requirements conform to standards, DO-178B and Section 6.3.2e – Low-level requirements conform to standards.)                        | Set <b>Underspecified data types</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter UnderSpecifiedDataTypeMsg to error. |
| The diagnostic that detects whether the value of a signal or parameter is too large to be represented by the signal or parameter’s data type is set to none or warning. Undetected numeric overflows can result in unexpected application behavior. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)                                                    | Set <b>Detect overflow</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter IntegerOverflowMsg to error.                  |
| The diagnostic that detects when the value of a block output signal is Inf or NaN at the current time step is set to none or warning. When this type of block output signal condition occurs, numeric exceptions can result, and numeric exceptions are not acceptable in safety-related applications. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.) | Set <b>Inf or NaN block output</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter SignalInfNanChecking to error.        |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Recommended Action                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The diagnostic that detects Simulink object names that begin with <code>rt</code> is set to <code>none</code> or <code>warning</code>. This diagnostic prevents name clashes with generated signal names that have an <code>rt</code> prefix. (See DO-178B, Section 6.3.1e – High-level requirements conform to standards, and DO-178B, Section 6.3.2e – Low-level requirements conform to standards.)</p>                                               | <p>Set <b>"rt" prefix for identifiers</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>RTPrefix</code> to <code>error</code>.</p>          |
| <p>The diagnostic that detects simulation range checking is set to <code>none</code> or <code>warning</code>. This diagnostic detects when signals exceed their specified ranges during simulation. Simulink compares the signal values that a block outputs with the specified range and the block data type. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)</p> | <p>Set <b>Simulation range checking</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>SignalRangeChecking</code> to <code>error</code>.</p> |

**Action Results**

Clicking **Modify Settings** configures model diagnostic settings that apply to signal data and that can impact safety.

## Check safety-related diagnostic settings for parameters

Check model configuration for diagnostic settings that apply to parameters and that can impact safety.

### Description

This check verifies that model diagnostic configuration parameters pertaining to parameters are set optimally for generating code for a safety-related application.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                           | Recommended Action                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The diagnostic that detects when a parameter downcast occurs is set to none or warning. A downcast to a lower signal range can result in numeric overflows of parameters, resulting in unexpected behavior. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)</p>                                                                         | <p>Set <b>Detect downcast</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>ParameterDowncastMsg</code> to error.</p>   |
| <p>The diagnostic that detects when a parameter underflow occurs is set to none or warning. When the data type of a parameter does not have sufficient resolution, the parameter value is zero instead of the specified value. This can lead to incorrect operation of generated code. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)</p> | <p>Set <b>Detect underflow</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>ParameterUnderflowMsg</code> to error.</p> |

| <b>Condition</b>                                                                                                                                                                                                                                                                                                                                                             | <b>Recommended Action</b>                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The diagnostic that detects when a parameter overflow occurs is set to none or warning. Numeric overflows can result in unexpected application behavior and should be detected and corrected in safety-related applications. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rule 21.1.)</p> | <p>Set <b>Detect overflow</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>ParameterOverflowMsg</code> to error.</p>                 |
| <p>The diagnostic that detects when a parameter loses precision is set to none or warning. Not detecting such errors can result in a parameter being set to an incorrect value in the generated code. (See DO-178B, Section 6.3.1g – Algorithms are accurate, DO-178B, Section 6.3.2g – Algorithms are accurate, and MISRA-C:2004, Rules 10.1, 10.2, 10.3, and 10.4.)</p>    | <p>Set <b>Detect precision loss</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>ParameterPrecisionLossMsg</code> to error.</p>      |
| <p>The diagnostic that detects when an expression with tunable variables is reduced to its numerical equivalent is set to none or warning. This can result in a tunable parameter unexpectedly not being tunable in generated code. (See DO-178B, Section 6.3.1g – Algorithms are accurate and DO-178B, Section 6.3.2g – Algorithms are accurate.)</p>                       | <p>Set <b>Detect loss of tunability</b> on the <b>Diagnostics &gt; Data Validity</b> pane of the Configuration Parameters dialog box or set the parameter <code>ParameterTunabilityLossMsg</code> to error.</p> |

**Action Results**

Clicking **Modify Settings** configures model diagnostic settings that apply to parameters and that can impact safety.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>In the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Data Validity</b> pane, the “<b>Underspecified initialization detection</b>” diagnostic is set to <b>Classic</b>, ensuring compatibility with previous releases of Simulink. The “<b>Check undefined subsystem initial output</b>” diagnostic is cleared. This diagnostic specifies whether Simulink displays a warning if the model contains a conditionally executed subsystem, in which a block with a specified initial condition drives an Outport block with an undefined initial condition. A conditionally executed subsystem could have an output that is not initialized. If undetected, this condition can produce behavior that is nondeterministic.</p> | <p>Do one of the following:</p> <ul style="list-style-type: none"> <li>• In the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Data Validity</b> pane, set “<b>Underspecified initialization detection</b>” to <b>Simplified</b>.</li> <li>• In the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Data Validity</b> pane, set “<b>Underspecified initialization detection</b>” to <b>Classic</b> and select “<b>Check undefined subsystem initial output</b>”.</li> <li>• Set the parameter <code>CheckSSInitialOutputMsg</code> to on.</li> </ul> |
| <p>In the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Data Validity</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Do one of the following:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Check safety-related diagnostic settings for model referencing

Check model configuration for diagnostic settings that apply to model referencing and that can impact safety.

### Description

This check verifies that model diagnostic configuration parameters pertaining to model referencing are set optimally for generating code for a safety-related application.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Recommended Action                                                                                                                                                                                                              |

| <p>The diagnostic that detects a mismatch between the version of the model that creates or refreshes a Model block and the current version of the referenced model is set to error or warning. The detection occurs during load and update operations. When you get the latest version of the referenced model from the software configuration management system, rather than an older version that was used in a previous simulation, if this diagnostic is set to error, the simulation is aborted. If the diagnostic is set to warning, a warning message is issued. To resolve the issue, the user must resave the model being simulated, which may not be the desired action. (See DO-178B, Section 6.3.3b – Software architecture is consistent.)</p> | <p>Set <b>Model block version mismatch</b> on the <b>Diagnostics &gt; Model Referencing</b> pane of the Configuration Parameters dialog box or set the parameter <code>ModelReferenceVersionMismatchMessage</code> to none.</p> |
| <p>The diagnostic that detects port and parameter mismatches during model loading and updating is set to none or warning. If undetected, such mismatches can lead to incorrect simulation results because the parent and referenced models have different</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Set <b>Port and parameter mismatch</b> on the <b>Diagnostics &gt; Model Referencing</b> pane of the Configuration Parameters dialog box or set the parameter <code>ModelReferenceIOMismatchMessage</code> to error.</p>      |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Recommended Action                                                                                                                                                                                                                                                      |

## Check safety-related model referencing settings

Check model configuration for model referencing settings that can impact safety.

### Description

This check verifies that model configuration parameters for model referencing are set optimally for generating code for a safety-related application.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Recommended Action                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The referenced model is configured such that its target is rebuilt whenever you update, simulate, or generate code for the model, or if the Simulink software detects any changes in known dependencies. These configuration settings can result in unnecessary regeneration of the code, resulting in changing only the date of the file and slowing down the build process when using model references. (See DO-178B, Section 6.3.1b – High-level requirements are accurate and consistent and DO-178B, Section 6.3.2b – Low-level requirements are accurate and consistent.)</p> | <p>Set “Rebuild” on the <b>Model Referencing</b> pane of the Configuration Parameters dialog box or set the parameter <code>UpdateModelReferenceTargets</code> to <code>Never</code> or <code>If any changes detected</code>.</p> |
| <p>The diagnostic that detects whether a target needs to be rebuilt is set to <code>None</code> or <code>Warn if targets require rebuild</code>. For safety-related applications, an error should alert model developers that the parent and referenced models are inconsistent. This diagnostic parameter is available only if <b>Rebuild</b> is set to <code>Never</code>. (See DO-178B, Section 6.3.1b – High-level requirements are accurate and consistent and DO-178B, Section 6.3.2b – Low-level requirements are accurate and consistent.)</p>                                 | <p>Set “Never rebuild diagnostic” on the <b>Model Referencing</b> pane of the Configuration Parameters dialog box or set the parameter <code>CheckModelReferenceTargetMessage</code> to <code>error</code>.</p>                   |

| Condition                                                                                                                                                                                                                                                               | Recommended Action                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The ability to pass scalar root input by value is on. This capability should be off because scalar values can change during a time step and result in unpredictable data. (See DO-178B, Section 6.3.3b – Software architecture is consistent.)                          | Set “Pass fixed-size scalar root inputs by value for code generation” on the <b>Model Referencing</b> pane of the Configuration Parameters dialog box or set the parameter <code>ModelReferencePassRootInputsByReference</code> to off. |
| The model is configured to minimize algebraic loop occurrences. This configuration is incompatible with the recommended setting of <b>Single output/update function</b> for embedded systems code. (See DO-178B, Section 6.3.3b – Software architecture is consistent.) | Set “Minimize algebraic loop occurrences” on the <b>Model Referencing</b> pane of the Configuration Parameters dialog box or set the parameter <code>ModelReferenceMinAlgLoopOccurrences</code> to off.                                 |

### Action Results

Clicking **Modify Settings** configures model referencing settings that can impact safety.

| <p>MAT-file logging is selected. This option adds extra code for logging test points to a MAT-file, which is not supported by embedded targets. Use this option only in test harnesses. (See DO-178B, Section 6.3.1c – High-level requirements are compatible with target computer and DO-178B, Section 6.3.2c – Low-level requirements are compatible with target computer.)</p>                                                                                  | <p>Clear <b>MAT-file logging</b> on the <b>Code Generation &gt; Interface</b> pane of the Configuration Parameters dialog box or set the parameter <code>MatFileLogging</code> to off.</p>                                       |
| <p>The option that specifies the style for parenthesis usage is set to Minimum (Rely on C/C++ operators precedence) or to Nominal (Optimize for readability). For safety-related applications, explicitly specify precedence with parentheses. (See DO-178B, Section 6.3.1c – High-level requirements are compatible with target computer, DO-178B, Section 6.3.2c – Low-level requirements are compatible with target computer, and MISRA-C:2004, Rule 12.1.)</p> | <p>Set <b>Parenthesis level</b> on the <b>Code Generation &gt; Code</b> pane of the Configuration Parameters dialog box or set the parameter <code>ParenthesesLevel</code> to Maximum (Specify precedence with parentheses).</p> |
| <p>The option that specifies whether to preserve operand order is cleared. This option increases the traceability of the generated code. (See DO-178B, Section 6.3.4e – Source code is traceable to low-level requirements.)</p>                                                                                                                                                                                                                                   | <p>Select <b>Preserve operand order in expression</b> on the <b>Code Generation &gt; Code</b> pane of the Configuration Parameters dialog box or set the parameter <code>PreserveExpressionOrder</code> to on.</p>               |
| <p>The option that specifies whether to preserve empty primary condition expressions in <code>if</code> statements is cleared. This option increases the traceability of the generated code. (See DO-178B, Section 6.3.4e – Source code is traceable to low-level requirements.)</p>                                                                                                                                                                               | <p>Select <b>Preserve condition expression in if statement</b> on the <b>Code Generation &gt; Code</b> pane of the Configuration Parameters dialog box or set the parameter <code>PreserveIfCondition</code> to on.</p>          |

| Condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Recommended Action                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The option that specifies whether to generate preprocessor conditional directives is set to generate code for nonactive variants. This might result in generating code that does not trace to the active variant of a variant model block or a variant subsystem. (See DO-178B Section 6.3.4e — Source code is traceable to low-level requirements.)</p>                                                                                                                   | <p>Set “<b>Generate preprocessor conditionals</b>” on the <b>Code Generation &gt; Interface</b> pane of the Configuration Parameters dialog box to <b>Disable All</b>.</p>                                |
| <p>The minimum number of characters specified for generating name mangling strings is less than four. You can use this option to minimize the likelihood that parameter and signal names will change during code generation when the model changes. Use of this option assists with minimizing code differences between file versions, decreasing the effort to perform code reviews. (See DO-178B, Section 6.3.4e – Source code is traceable to low-level requirements.)</p> | <p>Set <b>Minimum mangle length</b> on the <b>Code Generation &gt; Symbols</b> pane of the Configuration Parameters dialog box or the parameter <code>MangleLength</code> to a value of 4 or greater.</p> |

### Action Results

Clicking **Modify Settings** configures model code generation settings that can impact safety.

### Limitations

This check requires a Embedded Coder license and an ERT-based system target file.

## Check safety-related diagnostic settings for saving

Check model configuration for diagnostic settings that apply to saving model files

### Description

This check verifies that model configuration parameters are set optimally for saving a model for a safety-related application.

See DO-178B, Section 6.3.3b - Software architecture is consistent.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                           | Recommended Action                                                                                                                                                                                                             |

## Check for model objects that do not link to requirements

Check whether Simulink blocks and Stateflow objects link to a requirements document.

### Description

This check verifies whether Simulink blocks and Stateflow objects link to a document containing engineering requirements for traceability.

See

- DO-178B, Section 6.3.1f - High-level requirements trace to system requirements
- DO-178B, Section 6.3.2f - Low-level requirements trace to high-level requirements

### Results and Recommended Actions

| Condition                                      | Recommended Action                                                                    |
|------------------------------------------------|---------------------------------------------------------------------------------------|
| Blocks do not link to a requirements document. | Link to requirements document. See “Links Between Models and Requirements Documents”. |

### Limitations

When you run this check, the Model Advisor does not follow library links or look under masks. The Model Advisor reviews all top-level blocks in the system.

### Tip

Run this check from the top model or subsystem that you want to check.

“Requirements Traceability”

## Check for proper usage of Math blocks

Check whether math operators require nonfinite number support.

### Description

This check verifies that Math Function blocks do not use math operations that need nonfinite number support with real-time embedded targets.

See

- DO-178B, Sections 6.3.1g and 6.3.2g - Algorithms are accurate.
- MISRA-C:2004, Rule 21.1

### Results and Recommended Actions

| Condition                                                                                                                                                                                         | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Math Function blocks using <code>log</code> (natural logarithm), <code>log10</code> (base 10 logarithm), and <code>rem</code> (Remainder) operators that require nonfinite number support.</p> | <p>When using the Math Function block with a <code>log</code> or <code>log10</code> function, you must protect the input to the block in the model such that it is not less than or equal to zero. Otherwise, the output can produce a NaN or <code>-Inf</code> and result in a run-time error in the generated code.</p> <p>When using the Math Function block with a <code>rem</code> function, you must protect the second input to the block such that it is not equal to zero. Otherwise the output can produce a <code>Inf</code> or <code>-Inf</code> and result in a run-time error in the generated code.</p> |

### Tips

With embedded systems, you must take care when using blocks that could produce nonfinite outputs such as NaN, Inf or -Inf. Your design must protect

the inputs to these blocks in order to avoid run-time errors in the embedded system.

## **Check state machine type of Stateflow charts**

Identify whether Stateflow charts are all Mealy or all Moore charts.

### **Description**

Compares the state machine type of all Stateflow charts to the type that you specify in the input parameters.

See

- DO-178B, Section 6.3.1b - High-level requirements are accurate and consistent
- DO-178B, Section 6.3.1e - High-level requirements conform to standards
- DO-178B, Section 6.3.2b - Low-level requirements are accurate and consistent
- DO-178B, Section 6.3.2e - Low-level requirements conform to standards
- DO-178B, Section 6.3.3b - Software architecture is consistent
- DO-178B, Section 6.3.3e - Software architecture conform to standards

### **Input Parameters**

#### **Common**

Check whether charts use the same state machine type, and are all Mealy or all Moore charts.

#### **Mealy**

Check whether all charts are Mealy charts.

#### **Moore**

Check whether all charts are Moore charts.

## Results and Recommended Actions

## Check Stateflow charts for ordering of states and transitions

Identify Stateflow charts that have **User specified state/transition execution order** cleared.

### Description

Identify Stateflow charts that have **User specified state/transition execution order** cleared, and therefore do not use explicit ordering of parallel states and transitions.

See

- DO-178B, Section 6.3.3b - Software architecture is consistent
- DO-178B, Section 6.3.3e - Software architecture conform to standards

### Results and Recommended Actions

| Condition                                                                             | Recommended Action                                                                                                            |
|---------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Stateflow charts have <b>User specified state/transition execution order</b> cleared. | For the specified charts, in the Chart Properties dialog box, select <b>User specified state/transition execution order</b> . |

### Action Results

Clicking **Modify** selects **User specified state/transition execution order** for the specified charts.

## Check Stateflow debugging settings

Identify whether Stateflow debugging options are cleared.

### Description

Identify whether the following debugging options are cleared, which might lead to unreachable code and indeterminate execution time:

- **Enable debugging/animation**
- **Enable overflow detection (with debugging)**
- **State Inconsistency**
- **Transition Conflict**
- **Data Range**
- **Detect Cycles**

See

## Check for proper usage of lookup table blocks

Check for lookup table blocks that do not generate out-of-range checking code.

### Description

This check verifies that the following blocks generate code to protect against inputs that fall outside the range of valid breakpoint values:

- 1-D Lookup Table
- 2-D Lookup Table
- n-D Lookup Table
- Prelookup

This check also verifies that all Interpolation Using Prelookup blocks generate code to protect against inputs that fall outside the range of valid index values.

### Results and Recommended Actions

| Condition                                                            | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The lookup table block does not generate out-of-range checking code. | <p>Change the setting on the block dialog box so that out-of-range checking code is generated.</p> <ul style="list-style-type: none"> <li>• For the 1-D Lookup Table, 2-D Lookup Table, n-D Lookup Table, and Prelookup blocks, clear the check box for <b>Remove protection against out-of-range input in generated code</b>.</li> <li>• For the Interpolation Using Prelookup block, clear the check box for <b>Remove protection against out-of-range index in generated code</b>.</li> </ul> |

### **Action Results**

Clicking **Modify** verifies that all lookup table blocks are set to generate out-of-range checking code.

## Check for blocks with inconsistent indexing methods

Identify blocks with inconsistent indexing method.

### Description

Using inconsistent block indexing methods can result in modeling errors. You should use a consistent vector indexing method for all blocks. This check identifies blocks with inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified.

See

- DO-178B, Section 6.3.2b 'Accuracy and Consistency of Low-Level Requirements'

### Results and Recommended Actions

| Condition                                                                                                                                    | Recommended Action                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| The model or subsystem contains blocks with inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified. | Modify the model to use a single consistent indexing method. |

## Check usage of Math Operations blocks

Identify usage of Math Operation blocks that might impact safety.

### Description

This check inspects your model for proper usage of:

- Absolute Value blocks
- Gain blocks

See

- MISRA-C:2004, Rule 14.1
- MISRA-C:2004, Rule 21.1

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                     | Recommended Action                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The model or subsystem contains an Absolute Value block that is operating on a Boolean or an unsigned input data type. This condition results in unreachable simulation pathways through the model and might result in unreachable code.</p>                                                                               | <p>For the identified block, do one of the following:</p> <ul style="list-style-type: none"> <li>• Change the input of the Absolute Value block to a signed input type.</li> <li>• Remove the Absolute Value block from the model.</li> </ul> |
| <p>The model or subsystem contains an Absolute Value block that is operating on a signed integer value, and the <b>Saturate on integer overflow</b> check box is not selected. For signed data types, the absolute value of the most negative value is problematic because it is not representable by the data type. This</p> | <p>In the <b>Block Parameters &gt; Signal Attributes</b> dialog box, select the <b>Saturate on integer overflow</b> check box.</p>                                                                                                            |

| <b>Condition</b>                                               | <b>Recommended Action</b>                                                                       |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| condition results in an overflow in the generated code.        |                                                                                                 |
| The model or subsystem contains Gain blocks with a of value 1. | If you are using Gain blocks as buffers, consider replacing them with Signal Conversion blocks. |

## Check usage of Signal Routing blocks

Identify usage of Signal Routing blocks that might impact safety.

### Description

This check identifies model or subsystem Switch blocks that might generate code with inequality operations ( $\sim=$ ) in expressions that contain a floating-point variable or constant.

See MISRA-C:2004, Rule 13.3

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                         | Recommended Action                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The model or subsystem contains a Switch block that might generate code with inequality operations (<math>\sim=</math>) in expressions where at least one side of the expression contains a floating-point variable or constant. The Switch block might cause floating-point inequality comparisons in the generated code.</p> | <p>For the identified block, do one of the following:</p> <ul style="list-style-type: none"> <li>• For the control input block, change the <b>Data type</b> parameter setting.</li> <li>• Change the Switch block <b>Criteria for passing first input</b> parameter setting. This might change the algorithm.</li> </ul> |

## Check usage of Logic and Bit Operations blocks

Identify usage of Logical Operator and Bit Operations blocks that might impact safety.

### Description

This check inspects your model for proper usage of:

- Blocks that compute relational operators, including Relational Operator, Compare To Constant, Compare To Zero, and Detect Change blocks
- Logical Operator blocks

See

- DO-178B, Sections.6.3.1g and 6.3.2g - Algorithms are accurate
- See MISRA-C:2004, Rule 13.3

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                      | Recommended Action                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The model or subsystem contains a block computing a relational operator that is operating on different data types. The condition can lead to unpredictable results in the generated code.</p>                                                                                                               | <p>On the <b>Block Parameters &gt; Signal Attributes</b> pane, set the <b>Output data type</b> to boolean for the specified blocks.</p>                                                                                                 |
| <p>The model or subsystem contains a block computing a relational operator that uses the == or ~= operator to compare floating-point signals. The use of these operators on floating-point signals is unreliable and unpredictable because of floating-point precision issues. These operators can lead to</p> | <p>For the identified block, do one of the following:</p> <ul style="list-style-type: none"> <li>• Change the signal data type.</li> <li>• Rework the model to eliminate using == or ~= operators on floating-point signals.</li> </ul> |

| Condition                                                                                                                                                                                                                             | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Check usage of Ports and Subsystems blocks

Identify usage of Ports and Subsystems blocks that might impact safety.

### Description

This check inspects your model for proper usage of:

- For Iterator blocks
- While Iterator blocks
- If blocks
- Switch Case blocks

See

- MISRA-C:2004, Rule 13.6
- MISRA-C:2004, Rule 14.10

## Display model version information

Display model version information in your report.

### Description

This check displays the following information for the current model:

- Version number
- Author
- Date
- Model checksum

### Results and Recommended Actions

| Condition                                                  | Recommended Action                                                    |

### IEC 61508 and ISO 26262 Checks Overview

IEC 61508 and ISO 26262 checks facilitate designing and troubleshooting models, subsystems, and the corresponding generated code for applications to comply with IEC 61508-3 or ISO 26262–6.

The Model Advisor performs a checkout of the Simulink Verification and Validation license when you run the IEC 61508 or ISO 26262 checks.

### Tips

If your model uses model referencing, run the IEC 61508 or ISO 26262 checks on all referenced models before running them on the top-level model.

## Display model metrics and complexity report

Display number of elements and name, level, and depth of subsystems for the model or subsystem.

### Description

The IEC 61508 and ISO 26262 standards recommend the usage of size and complexity metrics to assess the software under development. This check provides metrics information for the model. The provided information can be used to inspect whether the size or complexity of the model or subsystem exceeds given limits. The check displays:

- A block count for each Simulink block type contained in the given model.
- The maximum subsystem depth of the given model.
- A count of Stateflow constructs in the given model (if applicable).
- Name, level, and depth of the subsystems contained in the given model (if applicable).

See

- IEC 61508-3, Table A.9 (5) – Software complexity metrics
- ISO/DIS 26262-6, Table 1 (1a) - Enforcement of low complexity, Table 4 (1a) - Hierarchical structure of software components, Table 4 (1b) - Restricted size of software components, and Table 4 (1c) - Restricted size of interfaces

### Results and Recommended Actions

| Condition | Recommended Action                                                    |
|-----------|-----------------------------------------------------------------------|
| N/A       | This summary is provided for your information. No action is required. |

## Check for unconnected objects

Identify unconnected lines, input ports, and output ports in the model.

### Description

Unconnected objects are likely to cause problems propagating signal attributes such as data, type, sample time, and dimensions.

Ports connected to Ground or Terminator blocks pass this check.

See

- IEC 61508-3, Table A.3 (3) — Language subset
- ISO/DIS 26262-6, Table 1 (1b) - Use of language subsets, Table 1 (1d) - Use of defensive implementation techniques

### Results and Recommended Actions

| Condition                                                                            | Recommended Action                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| There are unconnected lines, input ports, or output ports in the model or subsystem. | <ul style="list-style-type: none"> <li>• Double-click an element in the list of unconnected items to locate the item in the model diagram.</li> <li>• Properly connect the objects identified in the results.</li> </ul> |

“Working with Signals” in the Simulink documentation

## Check for fully defined interface

Identify root model Inport blocks that do not have fully defined attributes.

### Description

Using root model Inport blocks that do not have fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink back-propagates dimensions, sample times, and data types from downstream blocks unless you explicitly assign these values.

See

- IEC 61508-3, Table B.9 (5) – Fully defined interface
- ISO/DIS 26262-6, Table 1 (1f) - Use of unambiguous graphical representation

### Results and Recommended Actions

| Condition                                                                                                                              | Recommended Action                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The model has root-level Inport blocks that have undefined attributes, such as an inherited sample time, data type, or port dimension. | Explicitly define all root-level Inport block attributes identified in the results. Double-click an element from the list of underspecified items to locate the condition. |

### Tips

The following configurations pass this check:

- Inport blocks with inherited port dimensions in conjunction with the usage of bus objects
- Inport blocks with automatically inherited data types in conjunction with bus objects
- Inport blocks with inherited sample times in conjunction with the **Periodic sample time constraint** menu set to `Ensure sample time independent`

## Check for questionable constructs

Identify blocks not supported by code generation or not recommended for deployment.

### Description

This check partially identifies model constructs that are not suited for code generation or not recommended for production code generation as identified in the Simulink Block Support tables for Simulink Coder and Embedded Coder. If you are using blocks with support notes for code generation, review the information and follow the given advice.

See

- IEC 61508-3, Table A.3 (3) – Language subset
- ISO/DIS 26262-6, Table 1 (1b) - Use of language subsets

### Results and Recommended Actions

| Condition                                                                                      | Recommended Action                                                                                                                                                               |

| The model or subsystem contains blocks that should not be used for code generation.            | Consider replacing the blocks listed in the results. Double-click an element from the list of questionable items to locate condition.                                            |
| The model or subsystem contains blocks that should not be used for production code deployment. | Consider replacing the blocks listed in the results. Double-click an element from the list of questionable items to locate condition.                                            |
| The model or subsystem contains Gain blocks whose value equals 1.                              | If you are using Gain blocks as buffers, consider replacing them with Signal Conversion blocks. Double-click an element from the list of questionable items to locate condition. |

**Limitation**

This check might not identify all instances of noncompliance with the Simulink Coder and Embedded Coder “Simulink Built-In Blocks That Support Code Generation” tables.

**See Also**

- “Simulink Built-In Blocks That Support Code Generation” tables in the Simulink Coder documentation for Simulink Coder and Embedded Coder

## Check usage of Stateflow constructs

Identify usage of Stateflow constructs that might impact safety.

### Description

This check identifies instances of Stateflow software being used in a way that can impact an application's safety, including:

- Use of strong data typing
- Port name mismatches
- Scope of data objects and events
- Formatting of state action statements
- Ordering of states and transitions
- Unreachable code
- Indeterminate execution time

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                                                                            | Recommended Action                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A Stateflow chart is not configured for strong data typing on boundaries between a Simulink model and the Stateflow chart. (See “hisf_0009: Strong data typing (Simulink and Stateflow boundary)” IEC 61508-3 Table A.3 (2) - Strongly typed programming language, ISO/DIS 26262-6, Table 1 (1c) - Enforcement of strong typing, and MISRA-C:2004, Rules 10.1, 10.2, 10.3, and 10.4) | In the Chart properties dialog box, select <b>Use Strong Data Typing with Simulink I/O</b> for the Stateflow chart. When you select this check box, the Stateflow chart accepts input signals of any data type that Simulink models support, provided that the type of the input signal matches the type of the corresponding Stateflow input data object. |
| Signals have names that differ from those of their corresponding Stateflow ports. (See IEC 61508-3, Table A.3 (3)- Language subset and                                                                                                                                                                                                                                               | <ul style="list-style-type: none"> <li>• Check whether the ports are connected properly and, if not, correct the connections.</li> </ul>                                                                                                                                                                                                                   |

## Check state machine type of Stateflow charts

Identify whether Stateflow charts are all Mealy or all Moore charts.

### Description

Compares the state machine type of all Stateflow charts to the type that you specify in the input parameters.

See

- IEC 61508-3, Table A.7 (2) - Simulation/modeling
- ISO/DIS 26262-6, Table 1 (1b) - Use of language subsets

### Input Parameters

#### Common

Check whether charts use the same state machine type, and are all Mealy or all Moore charts.

#### Mealy

Check whether all charts are Mealy charts.

#### Moore

Check whether all charts are Moore charts.

### Results and Recommended Actions

| Condition                                                                                                                                                                    | Recommended Action                                                                                              |

## Check for model objects that do not link to requirements

Check whether Simulink blocks and Stateflow objects link to a requirements document.

See

- IEC 61508-3, Table A.1 (1) - Computer-aided specification tools, Table A.2 (8) - Computer-aided specification tools, and Table A.8 (1) - Impact analysis
- ISO/DIS 26262-6, Table 8 (1a) - Documentation of the software unit design in natural language

### Description

This check verifies whether Simulink blocks and Stateflow objects link to a document containing engineering requirements for traceability.

### Results and Recommended Actions

| Condition                                      | Recommended Action                                                                    |
|------------------------------------------------|---------------------------------------------------------------------------------------|
| Blocks do not link to a requirements document. | Link to requirements document. See “Links Between Models and Requirements Documents”. |

### Limitations

When you run this check, the Model Advisor does not follow library links or look under masks. The Model Advisor reviews all top-level blocks in the system.

### Tip

Run this check from the top model or subsystem that you want to check.

“Requirements Traceability”

## Check for blocks with inconsistent indexing methods

Identify blocks with inconsistent indexing method.

### Description

Using inconsistent block indexing methods can result in modeling errors. You should use a consistent vector indexing method for all blocks. This check identifies blocks with inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                         | Recommended Action                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The model or subsystem contains an Absolute Value block that is operating on a Boolean or an unsigned input data type. This condition results in unreachable simulation pathways through the model and might result in unreachable code.                                          | For the identified block, do one of the following: <ul style="list-style-type: none"> <li>• Change the input of the Absolute Value block to a signed input type.</li> <li>• Remove the Absolute Value block from the model.</li> </ul> |
| The model or subsystem contains an Absolute Value block that is operating on a signed integer value, and the <b>Saturate on integer overflow</b> check box is not selected. For signed data types, the absolute value of the most negative value is problematic because it is not | In the <b>Block Parameters &gt; Signal Attributes</b> dialog box, select the <b>Saturate on integer overflow</b> check box.                                                                                                            |

| <b>Condition</b>                                                                             | <b>Recommended Action</b>                                                                       |
|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| representable by the data type. This condition results in an overflow in the generated code. |                                                                                                 |
| The model or subsystem contains Gain blocks with a of value 1.                               | If you are using Gain blocks as buffers, consider replacing them with Signal Conversion blocks. |

## Check usage of Signal Routing blocks

Identify usage of Signal Routing blocks that might impact safety.

### Description

This check identifies model or subsystem Switch blocks that might generate code with inequality operations ( $\sim=$ ) in expressions that contain a floating-point variable or constant.

See

- IEC 61508-3, Table A.3 (3) – Language subset, Table A.4 (3) – Defensive programming
- ISO/DIS 26262-6, Table 1 (1b) - Use of language subsets, Table 1 (1d) - Use of defensive implementation techniques
- MISRA-C:2004, Rule 13.3

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                                                                         | Recommended Action                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The model or subsystem contains a Switch block that might generate code with inequality operations (<math>\sim=</math>) in expressions where at least one side of the expression contains a floating-point variable or constant. The Switch block might cause floating-point inequality comparisons in the generated code.</p> | <p>For the identified block, do one of the following:</p> <ul style="list-style-type: none"> <li>• For the control input block, change the <b>Data type</b> parameter setting.</li> <li>• Change the Switch block <b>Criteria for passing first input</b> parameter setting. This might change the algorithm.</li> </ul> |

## Check usage of Logic and Bit Operations blocks

Identify usage of Logical Operator and Bit Operations blocks that might impact safety.

### Description

This check inspects your model for proper usage of:

- Blocks that compute relational operators, including Relational Operator, Compare To Constant, Compare To Zero, and Detect Change blocks
- Logical Operator blocks

See

- IEC 61508-3, Table A.3 (2) – Strongly typed programming language, Table A.3 (3) – Language subset, Table A.4 (3) - Defensive programming
- ISO/DIS 26262-6, Table 1 (1c) - Enforcement of strong typing, Table 1 (1b) - Use of language subsets
- MISRA-C:2004, Rule 13.3

### Results and Recommended Actions

| Condition                                                                                                                                                                                                                                                                   | Recommended Action                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The model or subsystem contains a block computing a relational operator that is operating on different data types. The condition can lead to unpredictable results in the generated code.                                                                                   | On the <b>Block Parameters &gt; Signal Attributes</b> pane, set the <b>Output data type</b> to boolean for the specified blocks.                                                                                                 |
| The model or subsystem contains a block computing a relational operator that uses the == or ~= operator to compare floating-point signals. The use of these operators on floating-point signals is unreliable and unpredictable because of floating-point precision issues. | For the identified block, do one of the following: <ul style="list-style-type: none"> <li>• Change the signal data type.</li> <li>• Rework the model to eliminate using == or ~= operators on floating-point signals.</li> </ul> |

| Condition                                                                                                                                                                                                                             | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Display configuration management data

Display model configuration and checksum information.

### Description

This informer check displays the following information for the current model:

- Model version number
- Model author
- Date
- Model checksum

See

- IEC 61508-3, Table A.8 (5) – Software configuration management
- ISO/DIS 26262-8, Clause 7.4.2

### Results and Recommended Actions

| Condition                                                  | Recommended Action                                                    |
|------------------------------------------------------------|-----------------------------------------------------------------------|
| Could not retrieve model version and checksum information. | This summary is provided for your information. No action is required. |

## **MathWorks Automotive Advisory Board Checks Overview**

MathWorks Automotive Advisory Board (MAAB) checks facilitate designing and troubleshooting models from which code is generated for automotive applications.

The Model Advisor performs a checkout of the Simulink Verification and Validation license when you run the MAAB checks.

### **See Also**

- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation
- The MathWorks Automotive Advisory Board on the MathWorks Web site, which lists downloads for the latest version of *Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow*

## Check font formatting

Check for difference in font and font sizes.

### Description

With the exception of free text annotations within a model, text elements, such as block names, block annotations, and signal labels, must have the same font style and font size. Select a font style and font size that is legible and portable (convertible between platforms), such as Arial or Helvetica 12 point.

See MAAB guideline db\_0043: Simulink font and font size.

### Input Parameters

#### Font Name

Apply the specified font to all text elements. Available fonts include Helvetica (default), Arial, Arial Black, Mangal, or Modern.

#### Font Size

Apply the specified font size to all text elements. Available sizes include -1, 6, 8, 9, 10 (default), 12, 14, 16, 18, 20, 22, and 24.

#### Font Angle

Apply the specified font angle to all text elements. Available angles include auto (default), normal, italic, and oblique.

#### Font Weight

Apply the specified font weight to all text elements. Available weights include auto (default), normal, light, demi, and bold.

### Results and Recommended Actions

| Condition                                                                              | Recommended Action                                                                                                                                                                               |
|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The fonts or font sizes for text elements in the model are not consistent or portable. | Specify values for the font parameters and click <b>Modify all Fonts</b> , or manually change the fonts and font sizes of text elements in the model such that they are consistent and portable. |

**Action Results**

Clicking **Modify all Fonts** changes the font and font size of all text elements in the model according to the values you specify for the font parameters.

**See Also**

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check Transition orientations in flowcharts

Check transition orientations in flow charts.

### Description

The following rules apply to transitions in flow charts:

- Draw transition conditions horizontally.
- Draw transitions with a condition action vertically.

Loop constructs are exceptions to these rules.

See MAAB guideline db\_0132: Transitions in Flowcharts.

### Results and Recommended Actions

| Condition                                                                                                                            | Recommended Action |
|--------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| The model includes a transition with a condition that is not drawn horizontally or a transition action that is not drawn vertically. | Modify the model.  |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for nondefault block attributes

Identify blocks that use nondefault block parameter values that are not displayed in the model diagram.

### Description

Model diagrams should display block parameters that have values other than default values. One way of displaying this information is by using the **Block Annotation** tab in the Block Properties dialog box.

See MAAB guideline db\_0140: Display of basic block parameters.

### Results and Recommended Actions

| Condition                                                                                                 | Recommended Action                                                                                      |
|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Block parameters that have values other than default values, and the values are not in the model display. | In the Block Properties dialog, use the <b>Block Annotation</b> tab to add block parameter annotations. |

### Tip

If you use the `add_block` function with `'built-in/blocktype'` as a source block path name for Simulink built-in blocks, some default parameter values of some blocks are different from the defaults that you get if you added those blocks interactively using Simulink.

### See Also

- For a list of block parameter default values, see “Block-Specific Parameters” in the Simulink documentation.
- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation
- `add_block` in the Simulink documentation

## Check for proper labeling on signal lines

Check for proper labeling on signal lines.

### Description

You should use a label to identify:

- Signals originating from the following blocks (the block icon exception noted below applies to all blocks listed except Inport, Bus Selector, Demux, and Selector):

- Bus Selector block (tool forces labeling)
- Chart block (Stateflow)
- Constant block
- Data Store Read block
- Demux block
- From block
- Inport block
- Selector block
- Subsystem block

---

**Block Icon Exception** If a signal label is visible in the display of the icon for the originating block, you do not have to display a label for the connected signal unless the signal label is needed elsewhere due to a rule for signal destinations.

---

- Signals connected to one of the following destination blocks (directly or indirectly with a basic block that performs an operation that is not transformative):

- Bus Creator block
- Chart block (Stateflow)
- Data Store Write block
- Goto block
- Mux block
- Outport block
- Subsystem block

- Any signal of interest.

See MAAB guideline na\_0008: Display of labels on signals.

## Results and Recommended Actions

| Condition                                                                                                                    | Recommended Action                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signals coming from Bus Selector, Chart, Constant, Data Store Read, Demux, From, Inport, or Selector blocks are not labeled. | Double-click the line that represents the signal. After the text cursor appears, enter a name and click anywhere outside the label to exit label editing mode. |

## See Also

- “Signal Labels” in the Simulink documentation
- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for propagated signal labels

Check for propagated labels on signal lines.

### Description

You should propagate a signal label from its source rather than enter the signal label explicitly (manually) if the signal originates from:

- An Inport block in a nested subsystem. However, if the nested subsystem is a library subsystem, you can explicitly label the signal coming from the Inport block to accommodate reuse of the library block.
- A basic block that performs a nontransformative operation.
- A Subsystem or Stateflow Chart block. However, if the connection originates from the output of an instance of the library block, you can explicitly label the signal to accommodate reuse of the library block.

See MAAB guideline na\_0009: Entry versus propagation of signal labels.

### Results and Recommended Actions

| Condition                                                                                | Recommended Action                                                                                                                           |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| The model includes signal labels that were entered explicitly, but should be propagated. | Use the open angle bracket (<) character to mark signal labels that should be propagated and remove the labels that were entered explicitly. |

### See Also

- “Signal Labels” in the Simulink documentation
- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check default transition placement in Stateflow charts

Check default transition placement in Stateflow charts.

### Description

In a Stateflow chart, you should connect the default transition at the top of the state and place the destination state of the default transition above other states in the hierarchy.

See MAAB guideline jc\_0531: Placement of the default transition.

### Results and Recommended Actions

| Condition                                                                                                         | Recommended Action                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| The default transition for a Stateflow chart is not connected at the top of the state.                            | Move the default transition to the top of the state chart.                                                                         |
| The destination state of a Stateflow chart's default transition is lower than other states in the same hierarchy. | Adjust the position of the default transition's destination state such that the state is above other states in the same hierarchy. |

### See Also

- “Defining Transitions Between States” in the Stateflow documentation

## Check return value assignments of graphical functions in Stateflow charts

Identify graphical functions with multiple assignments of return values in Stateflow charts.

### Description

The return value from a Stateflow graphical function must be set in only one place.

See MAAB guideline jc\_0511: Setting the return value from a graphical function.

### Results and Recommended Actions

| Condition                                                                            | Recommended Action                                                                    |
|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| The return value from a Stateflow graphical function is assigned in multiple places. | Modify the specified graphical function so that its return value is set in one place. |

### See Also

- “When to Use Reusable Functions in State Charts” in the Stateflow documentation
- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check entry formatting in State blocks in Stateflow charts

Identify missing line breaks between entry action (en), during action (du), and exit action (ex) entries in states. Identify missing line breaks after semicolons (;) in statements.

### Description

Start a new line after the entry, during, and exit entries, and after the completion of a statement “;”.

See MAAB guideline jc\_0501: Format of entries in a State block.

### Results and Recommended Actions

| Condition                              | Recommended Action                   |
|----------------------------------------|--------------------------------------|
| An entry (en) is not on a new line.    | Add a new line after the entry.      |
| A during (du) is not on a new line.    | Add a new line after the during.     |
| An exit (ex) is not on a new line.     | Add a new line after the exit.       |
| Multiple statements found on one line. | Add a new line after each statement. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check usage of return values from a graphical function in Stateflow charts

Identify calls to graphical functions in conditional expressions.

### Description

Do not use the return value of a graphical function in a comparison operation.

See MAAB guideline jc\_0521: Use of the return value from graphical functions.

### Results and Recommended Actions

| Condition                                                     | Recommended Action                                                                                                                                |
|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Conditional expressions contain calls to graphical functions. | Assign return values of graphical functions to intermediate variables. Use these intermediate variables in the specified conditional expressions. |

## Check for pointers in Stateflow charts

Identify pointer operations on custom code variables.

### Description

Pointers to custom code variables are not allowed.

See MAAB guideline jm\_0011: Pointers in Stateflow.

### Results and Recommended Actions

| Condition                                     | Recommended Action                                                         |
|-----------------------------------------------|----------------------------------------------------------------------------|
| Custom code variables use pointer operations. | Modify the specified chart to remove the dependency on pointer operations. |

## Check for event broadcasts in Stateflow charts

Identify undirected event broadcasts that might cause recursion during simulation and generate inefficient code.

### Description

Event broadcasts in Stateflow charts must be directed.

See MAAB guideline jm\_0012: Event broadcasts

### Results and Recommended Actions

| Condition                        | Recommended Action                                                                                                                                                                                                          |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event broadcasts are undirected. | Rearchitect the diagram to use directed event broadcasting. Use the send syntax or qualified event names to direct the event to a particular state. Use multiple send statements to direct an event to more than one state. |

## Check transition actions in Stateflow charts

Identify missing line breaks between transition actions.

### Description

For readability, start each transition action on a new line.

See MAAB guideline db\_0151: State machine patterns for transition actions.

### Results and Recommended Actions

| Condition                                    | Recommended Action                                       |
|----------------------------------------------|----------------------------------------------------------|
| Transition actions use incorrect formatting. | Verify that each transition action begins on a new line. |

### See Also

- “Using Actions in Stateflow Charts” in the Stateflow documentation

## Check for MATLAB expressions in Stateflow charts

Identify Stateflow objects that use MATLAB expressions that are not suitable for code generation.

### Description

Do not use MATLAB functions, instructions, and operators in Stateflow objects.

See MAAB guideline db\_0127: MATLAB commands in Stateflow.

### Results and Recommended Actions

| Condition                                 | Recommended Action                                   |
|-------------------------------------------|------------------------------------------------------|
| Stateflow objects use MATLAB expressions. | Replace all MATLAB expressions in Stateflow objects. |

## Check for indexing in blocks

Check for blocks that do not use one-based indexing.

### Description

One-based indexing ([1, 2, 3,...]) is used for the following:

| Product  | Items                                                                                                                                                                                                                                                                                                                                |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MATLAB   | <ul style="list-style-type: none"> <li>• Workspace variables and structures</li> <li>• Local variables of MATLAB functions</li> <li>• Global variables</li> </ul>                                                                                                                                                                    |
| Simulink | <ul style="list-style-type: none"> <li>• Signal vectors and matrices</li> <li>• Parameter vectors and matrices</li> <li>• S-function input and output signal vectors and matrices in MATLAB-code</li> <li>• S-function parameter vectors and matrices in MATLAB-code</li> <li>• S-function local variables in MATLAB-code</li> </ul> |

Zero-based indexing ([0, 1, 2, ...]) is used for the following:

| Product   | Items                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Simulink  | <ul style="list-style-type: none"> <li>• S-function input and output signal vectors and matrices in C code</li> <li>• S-function input parameters in C code</li> <li>• S-function parameter vectors and matrices in C code</li> <li>• S-function local variables in C code</li> </ul> |
| Stateflow | <ul style="list-style-type: none"> <li>• Input and output signal vectors and matrices</li> <li>• Parameter vectors and matrices</li> <li>• Local variables</li> </ul>                                                                                                                 |

| <b>Product</b> | <b>Items</b>                                                                                                |
|----------------|-------------------------------------------------------------------------------------------------------------|
|                | <ul style="list-style-type: none"><li>• Variables and structures in custom C code</li></ul>                 |
| C code         | <ul style="list-style-type: none"><li>• Local variables and structures</li><li>• Global variables</li></ul> |

See MAAB guideline db\_0112: Indexing.

### **Results and Recommended Actions**

| <b>Condition</b>                                                | <b>Recommended Action</b>                                            |
|-----------------------------------------------------------------|----------------------------------------------------------------------|
| Blocks in your model are not configured for one-based indexing. | Using block parameters, configure all blocks for one-based indexing. |

## Check for incorrect file names

Check for files residing in the same folder as the model that have incorrect file names.

### Description

See MAAB guideline ar\_0001: Filenames.

### Results and Recommended Actions

| Condition                                              | Recommended Action                                                         |
|--------------------------------------------------------|----------------------------------------------------------------------------|
| The file name contains illegal characters.             | Rename the file. Allowed characters are a–z, A–Z, 0–9, and underscore (_). |
| The file name starts with a number.                    | Rename the file.                                                           |
| The file name starts with an underscore ("_").         | Rename the file.                                                           |
| The file name ends with an underscore ("_").           | Rename the file.                                                           |
| The file extension contains one (or more) underscores. | Change the file extension.                                                 |
| The file name has consecutive underscores.             | Rename the file.                                                           |
| The file name contains more than one dot (".").        | Rename the file.                                                           |

## Check folder names

Checks model directory and subdirectory names for invalid characters.

### Description

See MAAB guideline ar\_0002: Directory names.

### Results and Recommended Actions

| Condition                                           | Recommended Action                                                              |
|-----------------------------------------------------|---------------------------------------------------------------------------------|
| The directory name contains illegal characters.     | Rename the directory. Allowed characters are a–z, A–Z, 0–9, and underscore (_). |
| The directory name starts with a number.            | Rename the directory.                                                           |
| The directory name starts with an underscore ("_"). | Rename the directory.                                                           |
| The directory name ends with an underscore ("_").   | Rename the directory.                                                           |
| The directory name has consecutive underscores.     | Rename the directory.                                                           |

## Check for prohibited blocks in discrete controllers

Check for prohibited blocks in discrete controllers.

### Description

You cannot include continuous blocks in controller models.

See MAAB guideline jm\_0001: Prohibited Simulink standard blocks inside controllers.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                            | Recommended Action                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Continuous blocks — Derivative, Integrator, State-Space, Transfer Fcn, Transfer Delay, Variable Time Delay, Variable Transport Delay, and Zero-Pole — are not permitted in models representing discrete controllers. | Replace continuous blocks with the equivalent blocks discretized in the s-domain by using the Discretizing library, as explained in “How to Discretize Blocks from the Simulink Model” in the Simulink documentation. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for prohibited sink blocks

Check for prohibited Simulink sink blocks.

### Description

You must design controller models from discrete blocks. Sink blocks, such as the Scope block, are not allowed.

See MAAB guideline hd\_0001: Prohibited Simulink sinks.

### Results and Recommended Actions

| Condition                                              | Recommended Action                 |
|--------------------------------------------------------|------------------------------------|
| Sink blocks are not permitted in discrete controllers. | Remove sink blocks from the model. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check positioning and configuration of ports

Check whether the model contains ports with invalid position and configuration.

### Description

In models, ports must comply with the following rules:

- Place Inport blocks on the left side of the diagram. Move the Inport block right only to prevent signal crossings.
- Place Outport blocks on the right side of the diagram. Move the Outport block left only to prevent signal crossings.
- Avoid using duplicate Inport blocks at the subsystem level if possible.
- Do not use duplicate Inport blocks at the root level.

See MAAB guideline db\_0042: Port block in Simulink models.

### Results and Recommended Actions

| Condition                                                                   | Recommended Action                                                                                                                                                                                               |
|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inport blocks are too far to the right and result in left-flowing signals.  | Move the specified Inport blocks to the left.                                                                                                                                                                    |
| Outport blocks are too far to the left and result in right-flowing signals. | Move the specified Output blocks to the right.                                                                                                                                                                   |
| Ports do not have the default orientation.                                  | Modify the model diagram such that signal lines for output ports enter the side of the block and signal lines for input ports exit the right side of the block.                                                  |
| Ports are duplicate Inport blocks.                                          | <ul style="list-style-type: none"> <li>• If the duplicate Inport blocks are in a subsystem, remove them where possible.</li> <li>• If the duplicate Inport blocks are at the root level, remove them.</li> </ul> |

**See Also**

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for matching port and signal names

Check for mismatches between names of ports and corresponding signals.

### Description

Use matching names for ports and their corresponding signals.

See MAAB guideline jm\_0010: Port block names in Simulink models.

### Prerequisite

Prerequisite MAAB guidelines for this check are:

- db\_0042: Port block in Simulink models
- na\_0005: Port block name visibility in Simulink models

### Results and Recommended Actions

| Condition                                                      | Recommended Action                                                                |
|----------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Ports have names that differ from their corresponding signals. | Change the port name or the signal name to match the correct name for the signal. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check whether block names appear below blocks

Check whether block names appear below blocks.

### Description

If shown, the name of all blocks should appear below the blocks.

See MAAB guideline db\_0142: Position of block names.

### Results and Recommended Actions

| Condition                                              | Recommended Action                                    |
|--------------------------------------------------------|-------------------------------------------------------|
| Blocks have names that do not appear below the blocks. | Set the name of the block to appear below the blocks. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for mixing basic blocks and subsystems

Check for systems that mix primitive blocks and subsystems.

### Description

You must design every level of a model with building blocks of the same type, for example, only subsystems or only primitive (basic) blocks.

See MAAB guideline db\_0143: Similar block types on the model levels.

### Results and Recommended Actions

| Condition                                                                 | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A level in the model includes both subsystem blocks and primitive blocks. | <ul style="list-style-type: none"> <li>• Move nonvirtual blocks into the subsystem.</li> <li>• If possible, replace blocks at the identified level of the model hierarchy with blocks that you can place at any module level. Such blocks include Inport, Outport, Enable (not at highest model level), Trigger (not at highest model level), Mux, Demux, Bus Selector, Bus Creator, Selector, Ground, Terminator, From, Goto, Switch, Multiport Switch, Merge, Unit Delay, Rate Transition, Type Conversion, Data Store Memory, If, and Switch Case.</li> </ul> |

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for unconnected ports and signal lines

Check whether model has unconnected input ports, output ports, or signal lines.

### Description

All unconnected inputs should be connected to ground blocks. All unconnected outputs should be connected to terminator blocks.

See MAAB guideline db\_0081: Unconnected signals, block inputs and block outputs.

### Results and Recommended Actions

| Condition                                  | Recommended Action                                                                             |
|--------------------------------------------|------------------------------------------------------------------------------------------------|
| Blocks have unconnected inputs or outputs. | Connect unconnected lines to blocks specified by the design or to Ground or Terminator blocks. |

## Check for incorrect position of Trigger and Enable blocks

Check for improperly positioned Trigger and Enable blocks.

### Description

Locate blocks that define subsystems as conditional or iterative at the top of the subsystem diagram.

See MAAB guideline db\_0146: Triggered, enabled, conditional Subsystems.

### Results and Recommended Actions

| Condition                                                                                          | Recommended Action                                                                         |
|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Trigger , Enable, and Action Port blocks are not centered in the upper third of the model diagram. | Move the Trigger, Enable, and Action Port blocks to the correct area of the model diagram. |

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for annotations with drop shadows

Check whether annotations have drop shadows.

### Description

Annotations should not have a drop shadow for readability.

See MAAB guideline jm\_0013: Annotations.

### Results and Recommended Actions

| Condition                         | Recommended Action                                         |
|-----------------------------------|------------------------------------------------------------|
| Annotations display drop shadows. | Clear the <b>Format &gt; Show Drop Shadow</b> menu option. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check use of tunable parameters in blocks

Check whether tunable parameters specify expressions, data type conversions, or indexing operations.

### Description

To make a parameter tunable, you must enter the basic block without the use of MATLAB calculations or scripting. For example, omit:

- Expressions
- Data type conversions
- Selections of rows or columns

See MAAB guideline db\_0110: Tunable parameters in basic blocks.

### Results and Recommended Actions

| Condition                                                                                                  | Recommended Action                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blocks have a tunable parameter that specifies an expression, data type conversion, or indexing operation. | In each case, move the calculation outside of the block, for example, by performing the calculation with a series of Simulink blocks, or precompute the value in the base workspace as a new variable. |

## Check whether Stateflow events are defined at the chart level or below

Check whether Stateflow events are defined at the chart level or below.

### Description

All events of a Stateflow chart must be defined at the chart level or lower. Events cannot be at the machine level; that is, charts cannot interact with local events.

See MAAB guideline db\_0126: Scope of events.

### Results and Recommended Actions

| Condition                                                       | Recommended Action                            |
|-----------------------------------------------------------------|-----------------------------------------------|
| An event in a chart is not defined at the chart level or below. | Define the event at the chart level or below. |

### See Also

- “Defining Events” in the Stateflow documentation.
- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check Stateflow data objects with local scope

Check whether Stateflow data objects with local scope are defined at the chart level or below.

### Description

You must define all local data of a Stateflow block on the chart level or below in the object hierarchy. You cannot define local variables on the machine level; however, parameters and constants are allowed at the machine level.

See MAAB guideline db\_0125: Scope of internal signals and local auxiliary variables.

### Results and Recommended Actions

| Condition                                                                         | Recommended Action                             |
|-----------------------------------------------------------------------------------|------------------------------------------------|
| Local data is not defined in the Stateflow hierarchy at the chart level or below. | Define local data at the chart level or below. |

## Check for Strong Data Typing with Simulink I/O

Check whether labeled Stateflow and Simulink input and output signals are strongly typed.

### Description

Strong data typing between Stateflow and Simulink input and output signals is required.

See MAAB guideline db\_0122: Stateflow and Simulink interface signals and parameters.

### Results and Recommended Actions

| Condition                                                        | Recommended Action                                                                            |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| A Stateflow chart does not use strong data typing with Simulink. | Select the <b>Use Strong Data Typing with Simulink I/O</b> check box for the specified block. |

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for exclusive and default states and substate correctness

Check states in state machines.

### Description

In state machines:

- There must be at least two exclusive states.
- A state cannot have only one substate.
- The initial state of a hierarchical level with exclusive states is clearly defined by a default transition.

See MAAB guideline db\_0137: States in state machines.

### Prerequisite

A prerequisite MAAB guideline for this check is db\_0149: Flowchart patterns for condition actions.

### Results and Recommended Actions

| Condition                                    | Recommended Action                                                                  |
|----------------------------------------------|-------------------------------------------------------------------------------------|
| A system is underspecified.                  | Validate that the intended design is properly represented in the Stateflow diagram. |
| Chart has only one exclusive (OR) state.     | Make the state a parallel state, or add another exclusive (OR) state.               |
| Chart does not have a default state defined. | Define a default state.                                                             |
| Chart has multiple default states defined.   | Define only one default state. Make the others nondefault.                          |
| State has only one exclusive (OR) substate.  | Make the state a parallel state, or add another exclusive (OR) state.               |

| <b>Condition</b>                                | <b>Recommended Action</b>                                     |
|-------------------------------------------------|---------------------------------------------------------------|
| State does not have a default substate defined. | Define a default substate.                                    |
| State has multiple default substates defined.   | Define only one default substate, make the others nondefault. |

## Check Implement logic signals as Boolean data (vs. double)

Check the optimization parameter for Boolean data types.

### Description

Optimization for Boolean data types is required

See MAAB guideline jc\_0011: Optimization parameters for Boolean data types.

### Prerequisite

A prerequisite MAAB guideline for this check is na\_0002: Appropriate implementation of fundamental logical and numerical operations.

### Results and Recommended Actions

| Condition                                                                                           | Recommended Action                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration setting for <b>Implement logic signals as boolean data (vs. double)</b> is incorrect. | Select the <b>Implement logic signals as boolean data (vs. double)</b> check box in the Configuration Parameters dialog box <b>Optimization</b> pane. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check model diagnostic parameters

Check the model diagnostics configuration parameter settings.

### Description

You should enable the following diagnostics:

- Algebraic loop**
- Minimize algebraic loop**
- Inf or NaN block output**
- Duplicate data store names**
- Unconnected block input ports**
- Unconnected block output ports**
- Unconnected line**
- Unspecified bus object at root Output block**
- Mux blocks used to create bus signals**
- Element name mismatch**
- Invalid function-call connection**

Diagnostics not listed in the Results and Recommended Actions section below can be set to any value.

See MAAB guideline jc\_0021: Model diagnostic settings.

### Results and Recommended Actions

| Condition                                      | Recommended Action                                                                                                                                                                                                                                                 |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Algebraic loop</b> is set to none.          | Set <b>Algebraic loop</b> on the <b>Diagnostics &gt; Solver</b> pane of the Configuration Parameters dialog box to error or warning. Otherwise, Simulink might attempt to automatically break the algebraic loops, which can affect execution order of the blocks. |
| <b>Minimize algebraic loop</b> is set to none. | Set <b>Minimize algebraic loop</b> on the <b>Diagnostics &gt; Solver</b> pane of the Configuration Parameters dialog box to error or warning. Otherwise, Simulink                                                                                                  |

| Condition                                                                                                                                                    | Recommended Action                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                              | might attempt to automatically break the algebraic loops for reference models and atomic subsystems, which can affect the execution order for those models or subsystems.          |
| <b>Inf or NaN block output</b> is set to none, which can result in numerical exceptions in the generated code.                                               | Set <b>Inf or NaN block output</b> on the <b>Diagnostics &gt; Data Validity &gt; Signals</b> pane of the Configuration Parameters dialog box to error or warning.                  |
| <b>Duplicate data store names</b> is set to none, which can result in nonunique variable naming in the generated code.                                       | Set <b>Duplicate data store names</b> on the <b>Diagnostics &gt; Data Validity &gt; Signals</b> pane of the Configuration Parameters dialog box to error or warning.               |
| <b>Unconnected block input ports</b> is set to none, which prevents code generation.                                                                         | Set <b>Unconnected block input ports</b> on the <b>Diagnostics &gt; Data Validity &gt; Signals</b> pane of the Configuration Parameters dialog box to error or warning.            |
| <b>Unconnected block output ports</b> is set to none, which can lead to dead code.                                                                           | Set <b>Unconnected block output ports</b> on the <b>Diagnostics &gt; Data Validity &gt; Signals</b> pane of the Configuration Parameters dialog box to error or warning.           |
| <b>Unconnected line</b> is set to none, which prevents code generation.                                                                                      | Set <b>Unconnected line</b> on the <b>Diagnostics &gt; Connectivity &gt; Signals</b> pane of the Configuration Parameters dialog box to error or warning.                          |
| <b>Unspecified bus object at root Output block</b> is set to none, which can lead to an unspecified interface if the model is referenced from another model. | Set <b>Unspecified bus object at root Output block</b> on the <b>Diagnostics &gt; Connectivity &gt; Buses</b> pane of the Configuration Parameters dialog box to error or warning. |
| <b>Mux blocks used to create bus signals</b> is set to none, which can lead to an unintended bus being created in the model.                                 | Set <b>Mux blocks used to create bus signals</b> on the <b>Diagnostics &gt; Connectivity &gt; Buses</b> pane of the Configuration Parameters dialog box to error or warning.       |

| <b>Condition</b>                                                                                                           | <b>Recommended Action</b>                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Element name mismatch</b> is set to none, which can lead to an incorrect interface in the generated code.               | Set <b>Element name mismatch</b> on the <b>Diagnostics &gt; Connectivity &gt; Buses</b> pane of the Configuration Parameters dialog box to error or warning.                                                                                                       |
| <b>Invalid function-call connection</b> is set to none, which can lead to an error in the operation of the generated code. | Set <b>Invalid function-call connection</b> on the <b>Diagnostics &gt; Connectivity &gt; Function Calls</b> pane of the Configuration Parameters dialog box to error or warning, since this condition can lead to an error in the operation of the generated code. |

## Check the display attributes of block names

Check the display attributes of block names.

### Description

Block names should be displayed when providing descriptive information. Block names should not be displayed if the block function is known from its appearance.

See MAAB guideline jc\_0061: Display of block names.

### Results and Recommended Actions

| Condition                      | Recommended Action                                                              |
|--------------------------------|---------------------------------------------------------------------------------|
| Block name is not descriptive. | These block names should be modified to be more descriptive or not be shown.    |
| Block name is not displayed.   | These block names should be shown since they appear to have a descriptive name. |
| Block name is obvious.         | These block names should not be displayed.                                      |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check display for port blocks

Check the **Icon display** setting for Inport and Outport blocks.

### Description

The **Icon display** setting is required.

See MAAB guideline jc\_0081: Icon display for Port block.

### Results and Recommended Actions

| Condition                                     | Recommended Action                                                                      |
|-----------------------------------------------|-----------------------------------------------------------------------------------------|
| The <b>Icon display</b> setting is incorrect. | Set the <b>Icon display</b> to Port number for the specified Inport and Outport blocks. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check subsystem names

Check whether subsystem block names include invalid characters.

### Description

The names of all subsystem blocks are required.

See MAAB guideline jc\_0201: Usable characters for Subsystem names.

### Results and Recommended Actions

| Condition                                           | Recommended Action                                                                              |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------|
| The subsystem name contains illegal characters.     | Rename the subsystem. Allowed characters include a–z, A–Z, 0–9, underscore (_), and period (.). |
| The subsystem name starts with a number.            | Rename the subsystem.                                                                           |
| The subsystem name starts with an underscore ("_"). | Rename the subsystem.                                                                           |
| The subsystem name ends with an underscore ("_").   | Rename the subsystem.                                                                           |
| The subsystem name has consecutive underscores.     | Rename the subsystem.                                                                           |
| The subsystem name has blank spaces.                | Rename the subsystem.                                                                           |

### Tips

Use underscores to separate parts of a subsystem name instead of spaces.

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check port block names

Check whether Inport and Outport block names include invalid characters.

### Description

The names of all Inport and Outport blocks are required.

See MAAB guideline jc\_0211: Usable characters for Inport blocks and Outport blocks.

### Results and Recommended Actions

| Condition                                       | Recommended Action                                                                          |
|-------------------------------------------------|---------------------------------------------------------------------------------------------|
| The block name contains illegal characters.     | Rename the block. Allowed characters include a–z, A–Z, 0–9, underscore (_), and period (.). |
| The block name starts with a number.            | Rename the block.                                                                           |
| The block name starts with an underscore ("_"). | Rename the block.                                                                           |
| The block name ends with an underscore ("_").   | Rename the block.                                                                           |
| The block name has consecutive underscores.     | Rename the block.                                                                           |
| The block name has blank spaces.                | Rename the block.                                                                           |

### Tips

Use underscores to separate parts of a block name instead of spaces.

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check signal labels for incorrect characters

Check whether signal line names include incorrect characters.

### Description

The names of all signal lines are required.

See MAAB guideline jc\_0221: Usable characters for signal line names.

### Results and Recommended Actions

| Condition                                             | Recommended Action                                                                                |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| The signal line name contains illegal characters.     | Rename the signal line. Allowed characters include a–z, A–Z, 0–9, underscore (_), and period (.). |
| The signal line name starts with a number.            | Rename the signal line.                                                                           |
| The signal line name starts with an underscore ("_"). | Rename the signal line.                                                                           |
| The signal line name ends with an underscore ("_").   | Rename the signal line.                                                                           |
| The signal line name has consecutive underscores.     | Rename the signal line.                                                                           |
| The signal line name has blank spaces.                | Rename the signal line.                                                                           |
| The signal line name has control characters.          | Rename the signal line.                                                                           |

### Tips

Use underscores to separate parts of a signal line name instead of spaces.

**See Also**

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check block names for incorrect characters

Check whether block names include incorrect characters.

### Description

The names of all blocks are required.

This guideline does not apply to subsystem blocks.

See MAAB guideline jc\_0231: Usable characters for block names.

### Prerequisite

A prerequisite MAAB guideline for this check is jc\_0201: Usable characters for Subsystem names.

### Results and Recommended Actions

| Condition                                   | Recommended Action                                                                          |
|---------------------------------------------|---------------------------------------------------------------------------------------------|
| The block name contains illegal characters. | Rename the block. Allowed characters include a–z, A–Z, 0–9, underscore (_), and period (.). |
| The block name starts with a number.        | Rename the block.                                                                           |
| The block name has blank spaces.            | Rename the block.                                                                           |
| The block name has double byte characters.  | Rename the block.                                                                           |

### Tips

Carriage returns are allowed in block names.

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check Trigger and Enable block names

Check Trigger and Enable block port names.

### Description

Block port names should match the name of the signal triggering the subsystem.

See MAAB guideline jc\_0281: Naming of Trigger Port block and Enable Port block.

### Results and Recommended Actions

| Condition                                                                     | Recommended Action                                  |
|-------------------------------------------------------------------------------|-----------------------------------------------------|
| Trigger block does not match the name of the signal to which it is connected. | Match Trigger block names to the connecting signal. |
| Enable block does not match the name of the signal to which it is connected.  | Match Enable block names to the connecting signal.  |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for Simulink diagrams using nonstandard display attributes

Check model appearance setting attributes.

### Description

Model appearance settings are required to conform to the guidelines when the model is released.

See MAAB guideline na\_0004: Simulink model appearance.

### Results and Recommended Actions

| Condition                                     | Recommended Action                                                                                                                                                                                    |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Diagrams do not have white backgrounds.       | Select <b>Format &gt; Screen Color &gt; Automatic</b> .                                                                                                                                               |
| Diagrams do not have zoom factor set to 100%. | Select <b>View &gt; Normal (100%)</b> .                                                                                                                                                               |
| The toolbar is not visible.                   | Select <b>View &gt; Toolbar</b> .                                                                                                                                                                     |
| The status bar is not visible.                | Select <b>View &gt; Status Bar</b> .                                                                                                                                                                  |
| Block backgrounds are not white.              | Blocks should have black foregrounds with white backgrounds. Click the specified block and select <b>Format &gt; Foreground Color &gt; Black</b> and <b>Format &gt; Background Color &gt; White</b> . |
| <b>Wide Nonscalar Lines</b> is cleared.       | Select <b>Format &gt; Port/Signal Displays &gt; Wide Nonscalar Lines</b> .                                                                                                                            |
| <b>Viewer Indicators</b> is cleared.          | Select <b>Format &gt; Port/Signal Displays &gt; Viewer Indicators</b> .                                                                                                                               |
| <b>Testpoint Indicators</b> is cleared.       | Select <b>Format &gt; Port/Signal Displays &gt; Testpoint Indicators</b> .                                                                                                                            |

| <b>Condition</b>                                                  | <b>Recommended Action</b>                                                      |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Port Data Types</b> is selected.                               | Clear <b>Format &gt; Port/Signal Displays &gt; Port Data Types</b> .           |
| <b>Storage Class</b> is selected.                                 | Clear <b>Format &gt; Port/Signal Displays &gt; Storage Class</b> .             |
| <b>Signal Dimensions</b> is selected.                             | Clear <b>Format &gt; Port/Signal Displays &gt; Signal Dimensions</b> .         |
| <b>Model Browser</b> is selected.                                 | Clear <b>View &gt; Model Browser Options &gt; Model Browser</b> .              |
| <b>Sorted Order</b> is selected.                                  | Clear <b>Format &gt; Block Displays &gt; Sorted Order</b> .                    |
| <b>Model Block Version</b> is selected.                           | Clear <b>Format &gt; Block Displays &gt; Model Block Version</b> .             |
| <b>Model Block I/O Mismatch</b> is selected.                      | Clear <b>Format &gt; Block Displays &gt; Model Block I/O Mismatch</b> .        |
| <b>Execution Context Indicator</b> is selected.                   | Clear <b>Format &gt; Block Displays &gt; Execution Context Indicator</b> .     |
| <b>Sample Time Colors</b> is selected.                            | Clear <b>Format &gt; Port/Signal Displays &gt; Sample Time Colors</b> .        |
| <b>Library Link Display</b> is set to <b>User</b> or <b>All</b> . | Select <b>Format &gt; Library Link Display &gt; None</b> .                     |
| <b>Linearization Indicators</b> is cleared.                       | Select <b>Format &gt; Port/Signal Displays &gt; Linearization Indicators</b> . |

## Check visibility of block port names

Check the visibility of port block names.

### Description

An organization applying the MAAB guidelines must select one of the following alternatives to enforce:

- The name of port blocks are not hidden.
- The name of port blocks must be hidden.

See MAAB guideline na\_0005: Port block name visibility in Simulink models.

### Input Parameters

#### All Port names should be shown (Format/Show Name)

Select this check box if all ports should show the name, including subsystems.

### Results and Recommended Actions

| Condition                                                                                                             | Recommended Action                                                                          |
|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Blocks do not show their name and the <b>All Port names should be shown (Format/Show Name)</b> check box is selected. | Change the format of the specified blocks to show names according to the input requirement. |
| Blocks show their name and the <b>All Port names should be shown (Format/Show Name)</b> check box is cleared.         | Change the format of the specified blocks to hide names according to the input requirement. |
| Subsystem blocks do not show their port names.                                                                        | Set the subsystem parameter <b>Show port labels</b> to a value other than none.             |
| Subsystem blocks show their port names.                                                                               | Set the subsystem parameter <b>Show port labels</b> to none.                                |

### **Limitations**

This check does not look in masked subsystems.

### **See Also**

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check orientation of Subsystem blocks

Check the orientation of subsystem blocks.

### Description

Subsystem inputs must be located on the left side of the block, and outputs must be located on the right side of the block.

See MAAB guideline jc\_0111: Direction of Subsystem.

### Results and Recommended Actions

| Condition                                            | Recommended Action                                                                                               |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Subsystem blocks are not in the correct orientation. | Change the subsystem blocks to have the correct orientation, with inports on the left and outports on the right. |

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check configuration of Relational Operator blocks

Check the position of Constant blocks used in Relational Operator blocks.

### Description

When the relational operator is used to compare a signal to a constant value, the constant input should be the second, lower input.

See MAAB guideline jc\_0131: Use of Relational Operator block.

### Results and Recommended Actions

| Condition                                                                   | Recommended Action                                  |
|-----------------------------------------------------------------------------|-----------------------------------------------------|
| Relational Operator blocks have a Constant block on the first, upper input. | Move the Constant block to the second, lower input. |

### See Also

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for tunable parameters in Stateflow charts

Check for use of tunable parameters in Stateflow charts.

### Description

Include tunable parameters in a Stateflow chart as inputs from the Simulink model.

See MAAB guideline jc\_0541: Use of tunable parameters in Stateflow.

### Results and Recommended Actions

| Condition                                                                                                 | Recommended Action                                                                              |
|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Stateflow charts reference Simulink data objects, which should be used as inputs from the Simulink model. | Make the Simulink data objects inputs from the Simulink model to the specified Stateflow chart. |

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check use of Switch blocks

Check for proper use of Switch blocks.

### Description

This check verifies that the Switch block's control input (the second input) is a Boolean value and that the block is configured to pass the first input when the control input is nonzero.

See MAAB guideline jc\_0141: Use of the Switch block.

### Results and Recommended Actions

| Condition                                                                                     | Recommended Action                                                                       |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| The Switch block's control input (second input) is not a Boolean value.                       | Change the data type of the control input to Boolean.                                    |
| The Switch block is not configured to pass the first input when the control input is nonzero. | Set the block parameter <b>Criteria for passing first input</b> to <code>u2 ~=0</code> . |

### See Also

- See the description of the Switch block in the Simulink documentation.
- “MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check for signal bus and Mux block usage

Check for proper use of signal busses and Mux block usage.

### Description

This check verifies whether a model is using signal buses and Mux blocks properly.

See MAAB guideline na\_0010: Grouping data flows into signals.

### Results and Recommended Actions

| Condition                                                                                                                | Recommended Action                                                    |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| The individual scalar input signals for a Mux block do not have common functionality, data types, dimensions, and units. | Modify the scalar input signals such that the specifications match.   |
| The output of a Mux block is not a vector.                                                                               | Change the output of the Mux block to a vector.                       |
| All inputs to a Mux block are not scalars.                                                                               | Make sure that all input signals to Mux blocks are scalars.           |
| The input for a Bus Selector block is not a bus signal.                                                                  | Make sure that the input for all Bus Selector blocks is a bus signal. |

## Check for bitwise operations in Stateflow charts

Identify bitwise operators (&, |, and ^) in Stateflow charts. If you select **Enable C-bit operations** for a chart, only bitwise operators in expressions containing Boolean data types are reported. Otherwise, all bitwise operators are reported for the chart.

### Description

Do not use bitwise operators in Stateflow charts, unless you enable bitwise operations.

See MAAB guideline na\_0001: Bitwise Stateflow operators.

### Results and Recommended Actions

| Condition                                                                                                                                       | Recommended Action                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stateflow charts with <b>Enable C-bit operations</b> selected use bitwise operators (&,  , and ^) in expressions containing Boolean data types. | Do not use Boolean data types in the specified expressions.                                                                                                                                                                                                                                                       |
| The Model Advisor could not determine the data types in expressions with bitwise operations.                                                    | To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.                                                                                                                                                                                                    |
| Stateflow charts with <b>Enable C-bit operations</b> cleared use bitwise operators (&,  , and ^).                                               | To fix this issue, do any of the following: <ul style="list-style-type: none"> <li>• Modify the expressions to replace bitwise operators.</li> <li>• If not using Boolean data types, consider enabling bitwise operations. In the Chart properties dialog box, select <b>Enable C-bit operations</b>.</li> </ul> |

## Check for comparison operations in Stateflow charts

Identify comparison operations with different data types in Stateflow objects.

### Description

Comparisons should be made between variables of the same data types.

See MAAB guideline na\_0013: Comparison operation in Stateflow

### Results and Recommended Actions

| Condition                                                                                       | Recommended Action                                                                                             |
|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Comparison operations with different data types were found.                                     | Revisit the specified operations to avoid comparison operations with different data types.                     |
| The Model Advisor could not determine the data types in expressions with comparison operations. | To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions. |

## Check for unary minus operations on unsigned integers in Stateflow charts

Identify unary minus operations applied to unsigned integers in Stateflow objects.

### Description

Do not perform unary minus operations on unsigned integers in Stateflow objects.

See MAAB guideline jc\_0451: Use of unary minus on unsigned integers in Stateflow

### Results and Recommended Actions

| Condition                                                                                        | Recommended Action                                                                                             |
|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Unary minus operations are applied to unsigned integers in Stateflow objects.                    | Modify the specified objects to remove dependency on unary minus operations.                                   |
| The Model Advisor could not determine the data types in expressions with unary minus operations. | To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions. |

## Check for equality operations between floating-point expressions in Stateflow charts

Identify equal to operations (==) in expressions where at least one side of the expression is a floating-point variable or constant.

### Description

Do not use equal to operations with floating-point data types. You can use equal to operations with integer data types.

See MAAB guideline jc\_0481: Use of hard equality comparisons for floating point numbers in Stateflow

### Results and Recommended Actions

| Condition                                                                                                                    | Recommended Action                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expressions use equal to operations (==) where at least one side of the expression is a floating-point variable or constant. | Modify the specified expressions to avoid equal to operations between floating-point expressions. If an equal to operation is required, a margin of error should be defined and used in the operation. |
| The Model Advisor could not determine the data types in expressions with equality operations.                                | To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.                                                                                         |

## Check for mismatches between names of Stateflow ports and associated signals

Check for mismatches between Stateflow ports and associated signal names.

### Description

The name of Stateflow input and output should be the same as the corresponding signal.

See MAAB guideline db\_0123: Stateflow port names.

### Results and Recommended Actions

| Condition                                                                         | Recommended Action                                             |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------|
| Signals have names that differ from those of their corresponding Stateflow ports. | Change the names of either the signals or the Stateflow ports. |

“MathWorks Automotive Advisory Board Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow” in the Simulink documentation

## Check scope of From and Goto blocks

Check the scope of From and Goto blocks.

### Description

You can use global scope for controlling flow. However, From and Goto blocks must use local scope for signal flows.

See MAAB guideline na\_0011: Scope of Goto and From blocks.

### Results and Recommended Actions

| Condition                                                 | Recommended Action                                                                                                                                          |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| From and Goto blocks are not configured with local scope. | <ul style="list-style-type: none"><li>• Make sure the ports are connected correctly.</li><li>• Change the scope of the specified blocks to local.</li></ul> |

## Requirements Consistency Checks

**In this section...**

“Identify requirement links with missing documents” on page 5-166

“Identify requirement links that specify invalid locations within documents” on page 5-167

“Identify selection-based links having descriptions that do not match their requirements document text” on page 5-168

“Identify requirement links with path type inconsistent with preferences” on page 5-170

## Identify requirement links with missing documents

Verify that requirements link to existing documents.

### Description

You used the Requirements Management Interface (RMI) to associate a design requirements document with a part of your model design and the interface cannot find the specified document.

### Results and Recommended Actions

| Condition                                                                                                          | Recommended Action                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| The requirements document associated with a part of your model design is not accessible at the specified location. | Open the Requirements dialog box and correct the path name of the requirements document or move the document to the specified location. |

### Tips

If your model has links to a DOORS requirements document, to run this check, the DOORS software must be open and you must be logged in.

### See Also

“Requirements Links Maintenance”

## Identify requirement links that specify invalid locations within documents

Verify that requirements link to valid locations (e.g., bookmarks, line numbers, anchors) within documents.

### Description

You used the Requirements Management Interface (RMI) to associate a location in a design requirements document (a bookmark, line number, or anchor) with a part of your model design and the interface cannot find the specified location in the specified document.

### Results and Recommended Actions

| Condition                                                                                                | Recommended Action                                                                                    |
|----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| The location in the requirements document associated with a part of your model design is not accessible. | Open the Requirements dialog box and correct the location reference within the requirements document. |

### Tips

If your model has links to a DOORS requirements document, to run this check, the DOORS software must be open and you must be logged in.

If your model has links to a Microsoft Word or Microsoft Excel document, to run this check, those applications must be closed on your computer.

### See Also

“Requirements Links Maintenance”

## Identify selection-based links having descriptions that do not match their requirements document text

Verify that descriptions of selection-based links use the same text found in their requirements documents.

### Description

You used selection-based linking of the Requirements Management Interface (RMI) to label requirements in the model's **Requirements** menu with text that appears in the corresponding requirements document. This check helps you manage traceability by identifying requirement descriptions in the menu that are not synchronized with text in the documents.

### Results and Recommended Actions

| Condition                                                                                                                     | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Selection-based links have descriptions that differ from their corresponding selections in the requirements documents.</p> | <p>If the difference reflects a change in the requirements document, click <b>Update</b> in the Model Advisor results to replace the current description in the selection-based link with the text from the requirements document (the external description). Alternatively, you can right-click the object in the model window, select <b>Edit/Add Links</b> from the <b>Requirements</b> menu, and use the Requirements dialog box that appears to synchronize the text.</p> |

### Tips

If your model has links to a DOORS requirements document, to run this check, the DOORS software must be open and you must be logged in.

If your model has links to a Microsoft Word or Microsoft Excel document, to run this check, those applications must be closed on your computer.

**See Also**

“Links Between Models and Requirements Documents”

## Identify requirement links with path type inconsistent with preferences

Check that requirement paths are of the type selected in the preferences.

### Description

You are using the Requirements Management Interface (RMI) and the paths specifying the location of your requirements documents differ from the file reference type set as your preference.

### Results and Recommended Actions

| Condition                                                                                                                                                                                                             | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The paths indicating the location of requirements documents use a file reference type that differs from the preference specified in the Requirements Settings dialog box, on the <b>Selection Linking</b> tab.</p> | <p>Change the preferred document file reference type or the specified paths by doing one of the following:</p> <ul style="list-style-type: none"> <li>• Click <b>Fix</b> to change the current path to the valid path.</li> <li>• In the model window, select <b>Tools &gt; Requirements &gt; Settings</b>, select the <b>Selection Linking</b> tab, and change the value for the <b>Document file reference</b> option.</li> </ul> |

### Linux Check for Absolute Paths

On Linux® systems, this check is named **Identify requirement links with absolute path type**. The check reports warnings for all requirements links that use an absolute path.

The recommended action is:

- 1 Right-click the model object and select **Requirements > Edit/Add Links**.
- 2 Modify the path in the Document field to use a path relative to the current working folder or the model location.
