Compatibility Summary for Polyspace Software	198

Summary by Version

This table provides quick access to what's new in each version. For clarification, see "Using Release Notes" on page 7.

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Latest Version for C/C++ Products: V8.3 (R2012a)	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports
Latest Version for Ada Products: V6.3 (R2012a)	Yes Details	Yes Summary	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports
Latest Version for Model Link Products: V5.9 (R2012a)	Yes Details	No	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace UML Link RH Bug Reports
V8.2 (R2011b) for C/C++ Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
V6.2 (R2011b) for Ada Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports
V5.8 (R2011b) for Model Link Products	Yes Details	No	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports
V8.1 (R2011a) for C/C++ Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports
V6.1 (R2011a) for Ada Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports
V5.7 (R2011a) for Model Link Products	Yes Details	Yes Summary	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
V8.0 (R2010b) for C/C++ Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports
V6.0 (R2010b) for Ada Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports
V5.6 (R2010b) for Model Link Products	Yes Details	Yes Summary	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports
V7.2 (R2010a) for C/C++ Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
V5.5 (R2010a) for Ada and Model Link Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports
V7.1 (R2009b) for C/C++ Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports
V5.4 (R2009b) for Ada and Model Link Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
V7.0 (R2009a) for C/C++ Products	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports
V5.3 (R2009a) for Ada and Model Link Products	Yes Details	No	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports
V6.0 (R2008b) for C/C++ Products	Yes Details	No	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports
V5.2 (R2008b) for Ada and Model Link Products	Yes Details	No	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
V5.1 (R2008a)	Yes Details	Yes Summary	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports
Previous Versions			Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports

Using Release Notes

Use release notes when upgrading to a newer version to learn about:

- New features
- Changes
- Potential impact on your existing files and practices

Review the release notes for other MathWorks® products required for this product (for example, MATLAB® or Simulink®). Determine if enhancements, bugs, or compatibility considerations in other products impact you.

If you are upgrading from a software version other than the most recent one, review the current release notes and all interim versions. For example, when you upgrade from V1.0 to V1.2, review the release notes for V1.1 and V1.2.

What Is in the Release Notes

New Features and Changes

- New functionality
- Changes to existing functionality

Version Compatibility Considerations

When a new feature or change introduces a reported incompatibility between versions, the **Compatibility Considerations** subsection explains the impact.

Compatibility issues reported after the product release appear under Bug Reports at the MathWorks Web site. Bug fixes can sometimes result in incompatibilities, so review the fixed bugs in Bug Reports for any compatibility impact.

Fixed Bugs and Known Problems

MathWorks offers a user-searchable Bug Reports database so you can view Bug Reports. The development team updates this database at release time

and as more information becomes available. Bug Reports include provisions for any known workarounds or file replacements. Information is available for bugs existing in or fixed in Release 14SP2 or later. Information is not available for all bugs in earlier releases.

Access Bug Reports using your MathWorks Account.

Documentation on the MathWorks Web Site

Related documentation is available on mathworks.com for the latest release and for previous releases:

- Latest product documentation
- Archived documentation

Version 8.3 (R2012a) Polyspace for C/C++ Products

This table summarizes what's new in V8.3 (R2012a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes — Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 9
- “Polyspace® Server™ for C/C++ Product” on page 20

Polyspace Client for C/C++ Product

Single Perspective for Coding Rule Violations and Run-Time Checks

The software now provides, by default, a single Results Manager perspective for coding rule violations and run-time checks.

This single perspective provides the following benefits:

- Easier review of coding rule violations due to better navigation and display functionality, which previously were available for only run-time checks.
- Viewing of coding rules violations with run-time checks, which facilitates analysis of some run-time checks.

You can revert to the previous display format with separate perspectives for Coding Rules and Run-Time Checks:

- 1 In the Polyspace® verification environment, select the **Options > Preferences > Miscellaneous** tab.

- 2** Select the **Show coding rule violations and run-time checks as separate perspectives** check box.
- 3** Click **OK**. The software displays a message asking you to restart Polyspace for the change to take effect.

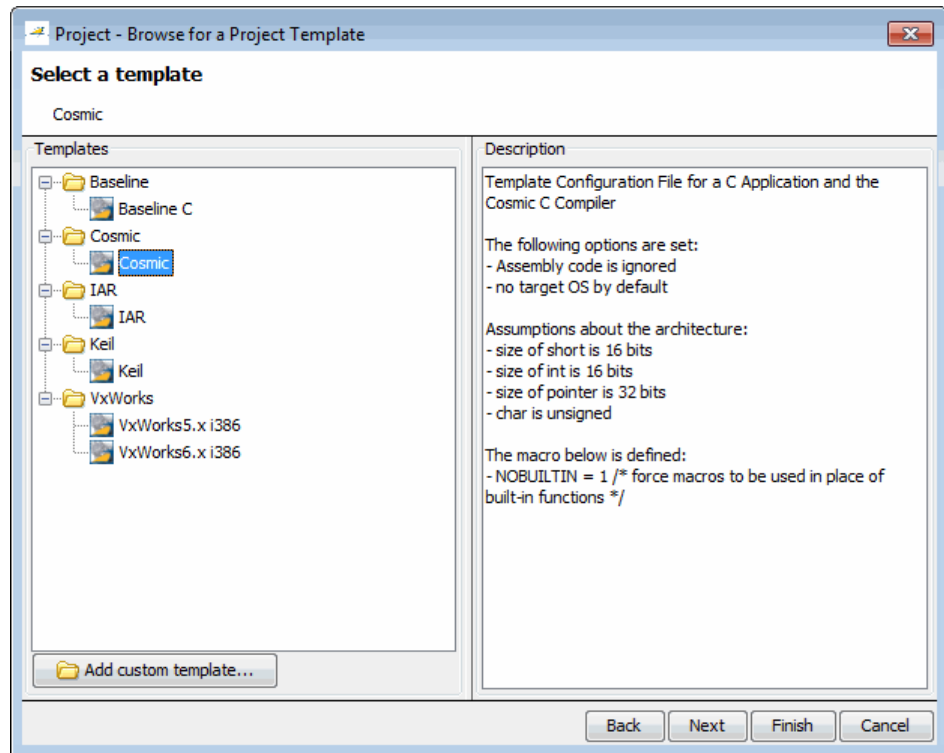

For more information, see “Examining Rule Violations”.

Compilation Environment Templates

Polyspace software now provides predefined compilation environment templates to help you configure verification projects.

These templates automatically set analysis options for the selected compiler, and help you locate the required include folders.

When creating a new project, you can select a template for your compiler.

For more information, see “Creating a Project”.

Predefined Templates. Predefined C templates are available for:

- **Baseline C** – Generic C application targeting the i386 architecture
- **Cosmic** – Cosmic C compiler
- **IAR** – IAR compiler
- **Keil** – Keil compiler
- **VxWorks5.x i386** – VxWorks 5.x compiler targeting an i386 architecture
- **VxWorks6.x i386** – VxWorks 6.x compiler targeting an i386 architecture

Predefined C++ templates are available for:

- **Baseline C++** – Generic C++ application targeting the i386 architecture
- **Visual8.0 i386** – C++ Visual 8.0 application and the i386 target
- **Visual8.0 x86_64** – C++ Visual 8.0 application and the x86_64 target
- **Visual9.0 i386** – C++ Visual 9.0 application and the i386 target
- **Visual9.0 x86_64** – C++ Visual 9.0 application and the x86_64 target

Custom Templates. You can also create custom templates from existing Project configurations, and use them to configure future projects.

For more information, see “Creating Custom Project Templates”.

Suppression of NTC, NTL and UNR Checks Caused by Red Checks

Previously, the software would generate red NTC and NTL checks that were a consequence of other red checks. Now, the software does not generate these red checks. However, the software still gives the information that these red checks provided. The software highlights the corresponding call or loop identifier by applying a dashed underline to the identifier.

If the cause of the problem is known, the software provides this information in a tooltip for the underlined call or loop identifier. In addition, when you right-click the identifier, the context menu provides a **Go to Cause** item. Selecting this item takes you to the red check that is the cause.

The software:

- Does not generate gray UNR checks if the cause is a red check
- Still generates red NTC, NTL, and K-NTC checks for a call or loop identifier if the corresponding code contains orange checks.
- Does not generate NTC checks for the functions `exit()` and `abort()`, but provides tooltips for these functions. For example, `exit()`, which does not correspond to an error, terminates the program.

Consider the following code.

```
1   int divide(int x, int y) {
```

```

2     return x / y;
3 }
4
5 int f(void) {
6     int result;
7     result = divide(4, 0);
8     return result;
9 }

```

In R2011b, verification of this code produced the following:

```

1 int divide(int x, int y) {
2     return x / y;
3 }
4
5 int f(void) {
6     int result;
7     result = divide(4, 0);
8     return result;
9 }

```

The red NTC check for the call of the function `divide` (line 7) was a consequence of the red ZDV check for the division operator `/` (line2).

In R2012a, verification of the same code produces the following:

```

1 int divide(int x, int y) {
2     return x / y;
3 }
4
5 int f(void) {
6     int result;
7     result = divide(4, 0);
8     return result;
9 }

```

A problem occurs during the execution of call to function file.divide.
See check ZDV at file.c line 2

return x / y;

(Select 'Go To Cause' in the contextual menu to navigate to this check).

The software does not generate an NTC check, but underlines `divide`. In addition, the tooltip provides information about the problem. If you right-click `divide` and select **Go to Cause** from the context menu, the software takes you to the division operator. This operator has a red ZDV check.

```
1   int divide(int x, int y) {  
2       return x / y;
```

Compatibility Considerations. As a result of this new feature, you might observe a significant reduction in the total number of red and gray checks when compared to previous versions of the software.

Probable Cause Information About Red and Orange Checks

With some red and orange checks, the software now provides information about the probable cause of the check. At a certain point in the code, a value is generated that results in a red or orange check at another point in the code. For example:

```
int f() {  
    if (..)   
        return 0 ;           // This should be the cause of the orange division by zero  
        return 1 ;  
}  
void g() {  
    int x = f() ;  
    int y = 360 / x ; // Orange check for division by zero  
}
```

For this check, in the **Check Details** view, the software lists the probable cause, intermediate events, and the orange check.

For more information, see “Viewing Probable Cause Information”.

Enhanced MISRA-C Coding Rules Checker

The following improvements have been made:

- Support for the OBL (obligatory) category specified by MISRA AC AGC Guidelines for the Application of MISRA-C:2004 in the Context of Automatic Code Generation:
 - Includes new support for rules 3.4, 12.11, 16.10, and 17.1.
 - To check for compliance with the OBL category, specify option `-misra2` with the new value `AC-AGC-OBL-subset`. See “MISRA C rules configuration (`-misra2`)”.
 - Rule 3.4 requires checking that all pragma directives are documented within the documentation of the compiler. However, you can allow undocumented pragma directives by specifying `-misra2` with the new option `-allowed-pragma`s. For example:

```
polyspace-c -misra2 AC-AGC-OBL-subset -allowed-pragma pragma1,pragma2,pragma3
```

 See “MISRA C rules configuration (`-misra2`)”.
 - With coding rule 16.10, the software does not indicate a violation when the function is `memcpy`, `memmove`, `memset`, `strcpy`, `strncpy`, `strcat`, or `strncat`.
- Enhanced support for rules 16.7 and 19.10:
 - Rule 16.7 — The software generates a warning if a non-const pointer parameter is passed to a call of a function that is declared with a const pointer parameter.
 - Rule 19.10 — The software does not generate a warning if a parameter is reused as an argument of a function or function-like macro. For example, consider a parameter `x`. The software does not generate a warning if `x` appears as `(x)` or `(x, or ,x)` or `,x,`.
- Enhanced format for XML report files (`MISRA-C-report.xml`, `MISRA-CPP-report.xml`, and `JSF-report.xml`).

For more information, see “MISRA C® Rules Supported”.

Integrated Compilation Assistant

The Compilation Assistant is now enabled by default. During a verification, if the Compilation Assistant detects compilation errors, the verification stops and the software displays errors and possible solutions on the **Output Summary tab**.

To disable the Compilation Assistant, select **Options > Preferences**, which opens the Polyspace Preferences dialog box. Then, on the **Project and result folder** tab, clear the **Compilation Assistant** check box and click **OK**.

The **Configuration** pane has a new tab, **Compiler Settings**, which replaces the **Compilation Assistant** view.

For more information, see “Checking for Compilation Problems”.

Data Range Specification Enhancements

Previously, a wizard was provided for data range specification (DRS). Now, you can specify data ranges through the Polyspace DRS configuration dialog box, which provides toolbar buttons to:

- Generate a DRS configuration file.
- Update an existing file.
- Convert a DRS text file to an XML file.

For more information, see “Specifying Data Ranges for Variables and Functions (Contextual Verification)”.

Redefinition of Successful Verification

Previously, if a Polyspace verification failed, for example, during `pass1` (`Software Safety Analysis level 1`), the software communicated the failure through log messages and the **Project Browser**. However, if you clicked the `xx_LAST_RESULTS.exe` file within the **Project Browser**, the software displayed any results (colored checks) that had been generated by the verification. Now, the software deems a verification successful provided some results have been generated.

Polyspace Report Generator Enhancements

You can:

- Generate multiple reports in the Results Manager perspective. See “Generating Verification Reports”.

- Customize report templates with MATLAB Report Generator™ software, which allows you to filter results by:
 - Justification status — Display all, justified, or unjustified checks.
 - Type — Display only listed types of run-time checks.
 - Function — Display only run-time checks from specified functions.For more information, see “Customizing Verification Reports”.

Polyspace In One Click (POC) Enhancement

The POC software has been rewritten. The software that replaces the previous **Send To** functionality now runs verifications without requesting additional settings. See “Using Polyspace In One Click”.

Note Support for the **Send To** feature will be removed in a future release.

Absolute Addresses

Polyspace supports a new check category, ABS_ADDR. The software generates an orange ABS_ADDR check when an absolute address is assigned to a pointer. The software has no information about the absolute address and therefore cannot verify, for example, the address, availability of memory, and initialization of memory.

After generating the orange ABS_ADDR check for the first assignment operation, the software permits memory access to the absolute address. This new behavior produces fewer orange checks in code that contains absolute addresses. After the first assignment operation, IDP and NIV checks for memory access operations are now green. Previously these checks were orange.

A new option, `-green-absolute-address-checks`, is also available. If you know that the absolute addresses in your code are valid, you can specify this option which makes all ABS_ADDR checks green.

For more information, see “Absolute Addresses: ABS_ADDR” and “Green absolute address checks (`-green-absolute-address-checks`)”.

Compatibility Considerations. Because of this new check, verification results might change when compared to previous versions of the software. The total number of checks might change as the software now generates an ABS_ADDR check for each conversion of an integer to a pointer.

If you previously created a comment for an orange IDP or NIV check (for example, to explain the check), the comment continues to appear although the check may now be green. In addition, the new ABS_ADDR check does not have a comment. In Polyspace Metrics, information about justifications for the previously orange IDP or NIV checks is lost.

Header Files Without Run-Time Checks and Coding Rule Violations

It is quite common for code to contain header files with library inline functions that are never called. Previously, these files were listed in the **Results Explorer** view, which could slow down your review of results. Now, if header files do not contain run-time checks or coding rule violations, the software does not list these header files in the **Results Explorer** view.

Improved Access to Polyspace Demos

In the Polyspace verification environment, you can now open supplied Demo projects through the **Help** menu.

Changes to Verification Results

- “Compatibility Considerations” on page 18
- “NTC and NTL Checks” on page 18
- “ABS_ADDR Check” on page 18

Compatibility Considerations. Verification results might change when compared to previous versions of the software. Some checks might change color, and the Selectivity rate of your results might change.

NTC and NTL Checks. See “Suppression of NTC, NTL and UNR Checks Caused by Red Checks” on page 12.

ABS_ADDR Check. See new “Absolute Addresses” on page 17.

Changes to Coding Rules Checker Results

- “Compatibility Considerations” on page 19
- “New MISRA-C Rules Supported” on page 19
- “MISRA-C: Rule Improvements” on page 19

Compatibility Considerations. Due to changes in the coding rules checker, the number of coding rule violations might change when compared to previous versions of the software.

New MISRA-C Rules Supported. The coding rules checker now supports the following MISRA-C Rules:

- Rule 3.4
- Rule 12.11
- Rule 16.10
- Rule 17.1

See “Enhanced MISRA-C Coding Rules Checker” on page 14.

MISRA-C: Rule Improvements. Support for the following rules is enhanced:

- Rule 16.7
- Rule 19.10

See “Enhanced MISRA-C Coding Rules Checker” on page 14.

Changes to Analysis Options

New Options.

Option	For more information
Allowed pragmas (-allowed-pragmas)	“Enhanced MISRA-C Coding Rules Checker” on page 14
Green absolute address checks (-green-absolute-address-checks)	“Absolute Addresses” on page 17

Changes to Existing Options. No name changes to existing options.

Options Removed

None

Polyspace Server for C/C++ Product

Enhanced Polyspace Metrics Project Index

The enhanced project index enables you to display projects as categories, which is useful when you have a large number of projects to manage. Now, you can:

- Create multiple-level project categories.
- Move projects between categories by dragging and dropping projects.
- Rename and remove categories. You can remove categories without deleting the projects within the categories. The software moves these projects back to the root level.

For more information, see “Organizing Polyspace Metrics Projects”.

Redefinition of Successful Verification

Previously, if a Polyspace verification failed, for example, during pass1 (Software Safety Analysis level 1), the software communicated the failure through log messages and the **Project Browser**. However, if you clicked the `xx_LAST_RESULTS.exe` file within the **Project Browser**, the software displayed any results (colored checks) that had been generated by the verification. Now, the software deems a verification successful provided some results have been generated.

Version 6.3 (R2012a) Polyspace for Ada Products

This table summarizes what's new in V6.3 (R2012a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes — Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 21
- “Polyspace® Server™ for Ada Product” on page 25

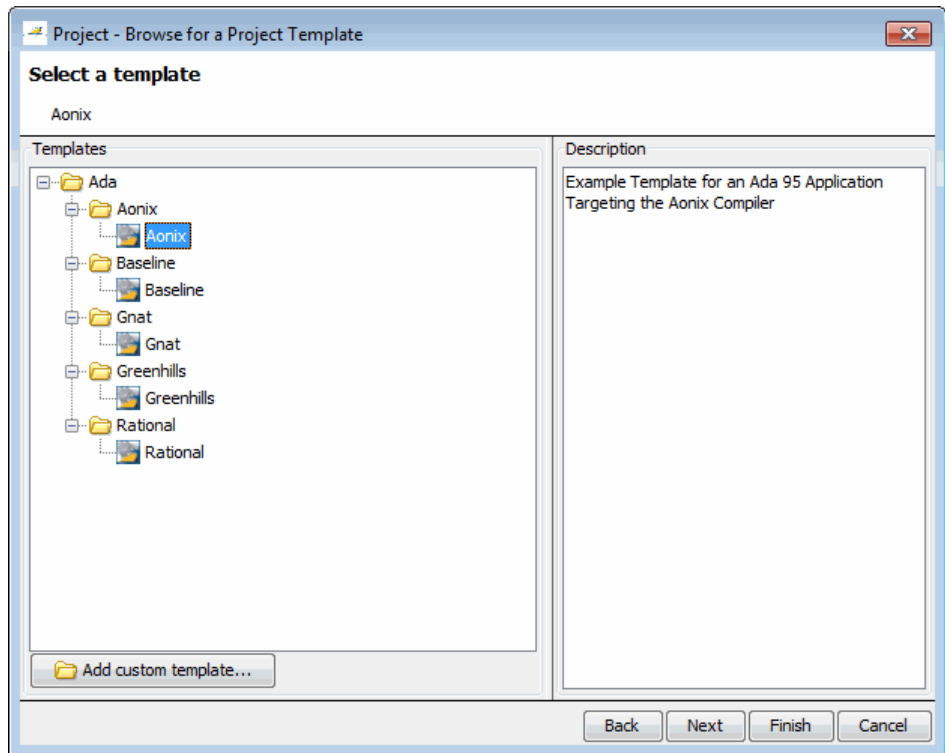

Polyspace Client for Ada Product

Compilation Environment Templates

Polyspace software now provides predefined compilation environment templates to help you configure verification projects.

These templates automatically set analysis options for the selected compiler, and help you locate the required include folders.

When creating a new project, you can select a template for your compiler.

For more information, see “Creating a Project”.

Predefined Templates. Predefined templates are available for:

- **Aonix** – Ada 95 Application Targeting the Aonix Compiler
- **Baseline** – Generic Ada95 application
- **Gnat** – Ada 95 Application Targeting the Gnat Compiler
- **Greenhills** – Ada 95 Application Targeting the Greenhills Compiler
- **Rational** – Ada 95 Application Targeting the Rational Compiler

Custom Templates. You can also create custom templates from existing Project configurations, and use them to configure future projects.

For more information, see “Creating Custom Project Templates”.

Suppression of NTC, NTL and UNR Checks Caused by Red Checks

Previously, the software would generate red NTC and NTL checks that were a consequence of other red checks. Now, the software does not generate these red checks. However, the software still gives the information that these red checks provided. The software highlights the corresponding call or loop identifier by applying a dashed underline to the identifier.

If the cause of the problem is known, the software provides this information in a tooltip for the underlined call or loop identifier. In addition, when you right-click the identifier, the context menu provides a **Go to Cause** item. Selecting this item takes you to the red check that is the cause.

The software:

- Does not generate gray UNR checks if the cause is a red check
- Still generates red NTC, NTL, and K-NTC checks for a call or loop identifier if the corresponding code contains orange checks.
- Does not generate NTC checks for the statements `exit` and `abort`, but provides tooltips for these statements. For example, `abort`, which does not correspond to an error, prevents the execution of a sequence of statements.

Compatibility Considerations. As a result of this new feature, you might observe a significant reduction in the total number of red and gray checks when compared to previous versions of the software.

Redefinition of Successful Verification

Previously, if a Polyspace verification failed, for example, during `pass1` (Software Safety Analysis level 1), the software communicated the failure through log messages and the **Project Browser**. However, if you clicked the `xx_LAST_RESULTS.exe` file within the **Project Browser**, the software displayed any results (colored checks) that had been generated by the verification. Now, the software deems a verification successful provided some results have been generated.

Polyspace Report Generator Enhancements

You can:

- Generate multiple reports in the Results Manager perspective. See “Generating Verification Reports”.
- Customize report templates with MATLAB Report Generator software, which allows you to filter results by:
 - Justification status — Display all, justified, or unjustified checks.
 - Type — Display only listed types of run-time checks.
 - Function — Display only run-time checks from specified functions.For more information, see “Customizing Verification Reports”.

Polyspace In One Click (POC) Enhancement

The POC software has been rewritten. The software that replaces the previous **Send To** functionality now runs verifications without requesting additional settings. See “Using Polyspace In One Click”.

Note Support for the **Send To** feature will be removed in a future release.

Header Files Without Run-Time Checks

It is quite common for code to contain header files with library inline functions that are never called. Enhanced Polyspace Metrics Project Index

The enhanced project index enables you to display projects as categories, which is useful when you have a large number of projects to manage. Now, you can:

- Create multiple-level project categories.
- Move projects between categories by dragging and dropping projects.
- Rename and remove categories. You can remove categories without deleting the projects within the categories. The software moves these projects back to the root level.

For more information, see “Organizing Polyspace Metrics Projects”.

Redefinition of Successful Verification

Previously, if a Polyspace verification failed, for example, during pass1 (Software Safety Analysis level 1), the software communicated the failure through log messages and the **Project Browser**. However, if you clicked the `xx_LAST_RESULTS.exe` file within the **Project Browser**, the software displayed any results (colored checks) that had been generated by the verification. Now, the software deems a verification successful provided some results have been generated.

Version 5.9 (R2012a) Polyspace Model Link Products

This table summarizes what's new in V5.9 (R2012a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

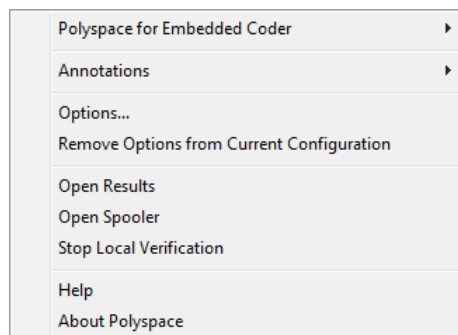

- “Polyspace® Model Link™ SL Product” on page 27
- “Polyspace® UML Link™ RH Product” on page 29

Polyspace Model Link SL Product

GUI Enhancements

The following enhancements are available:

- Updated Simulink **Tools** > **Polyspace** menu.

- Option on **Configuration Parameters** > **Model Link** pane to specify the automatic creation of a new folder for verification results.

- Subsystem (right-click) context menu with similar items as the **Tools > Polyspace** menu, for example **Options** for project configuration and **Open Results** for downloading of verification results. Previously, you could start verifications only through the subsystem context menu.

New Commands to Replace PolySpaceForEmbeddedCoder and PolySpaceForTargetLink

R2012a provides the new commands `pslinkrun` and `pslinkoptions` to replace `PolySpaceForEmbeddedCoder` and `PolySpaceForTargetLink`.

Note Support for `PolySpaceForEmbeddedCoder` and `PolySpaceForTargetLink` will cease in a future release.

For information about the new commands, see *Polyspace Model Link Products User's Guide*.

Automatic Import of Target Hardware Attributes

The software now automatically imports target word lengths and byte ordering (endianess) from Simulink model hardware configuration settings. The software maps **Device vendor** and **Device type** settings on the Simulink **Configuration Parameters > Hardware Implementation** pane to **Target processor type** settings on the Polyspace **Configuration** pane. For more information, see “Hardware Mapping Between Simulink and Polyspace”.

Data Range Specification Enhancements

The software now provides Data Range Specification (DRS) support for:

- More signal and parameter storage classes in the base workspace
- Code generated from configured function prototypes

- Reusable code
- Code generated from referenced models and submodels

For more information, see “Data Range Specification”.

Verification of Model Reference Code

The following features are available:

- Client verification — Previously, verification of model reference code was possible only on the Polyspace server. Now, you can run a client verification on model reference code.
- Verification from top model — To verify generated model reference code, select **Tools > Polyspace > Polyspace for Embedded Coder > Verify Generated Model Reference Code**.

Polyspace UML Link RH Product

Back-to-Model Enhancement

The back-to-model functionality has been enhanced:

- Previously, if a source code line contained a macro with a Polyspace check, you could not use the right-click context menu item **Back to Model**. This limitation has been removed.
- Previously, the context menu item **Back To Model** would work only if the Polyspace check was enclosed by the tags `//#[` and `]#//`. This restriction has been removed.

Version 8.2 (R2011b) Polyspace for C/C++ Products

This table summarizes what's new in V8.2 (R2011b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 30
- “Polyspace® Server™ for C/C++ Product” on page 41

Polyspace Client for C/C++ Product

STD_LIB Check

Previously, if the arguments of a function that belonged to the C standard library were not valid, the software would generate a check within the corresponding stub in `__polyspace_stdstubs.c`. In addition, the check category (visible in the procedural entities view) did not indicate a link to the standard library.

Now, Polyspace supports a new check category `STD_LIB`, which allows easier review of run-time errors arising from standard library calls. For example, if a standard library function call does not contain valid arguments, the software generates a red `STD_LIB` check at the function call in your code. The check does not appear in `__polyspace_stdstubs.c`.

For more information, see “Stubbing Standard Library Functions”.

Compatibility Considerations. Due to the introduction of the `STD_LIB` check, verification results may change when compared to previous versions of the software.

In addition, since the `STD_LIB` check has a different location and aggregates information from multiple checks, you cannot import review comments on standard library checks from previous releases.

For example, if you commented a check in the standard stubs using R2011a results, that comment is lost when you import comments from the R2011a results into R2011b results.

Enhanced MISRA-C Coding Rules Checker

The following improvements have been made:

- Compliance with MISRA-C:2004 Technical Corrigendum 1 — For rules 4.1, 5.1, 5.3, 6.1, 6.3, 7.1, 9.2, 10.5, 12.6, 13.5
- New support for rules 6.2, 14.1, and 17.2
- New option `-boolean-types`, which supports rules 12.6, 13.2, and 15.4
- Enhanced support for rules 1.1, 2.3, 5.2, 5.4, 5.5, 5.6, 5.7, 6.4, 8.1, 8.5, 11.1, 11.2, 11.4, 12.3, 12.4, 13.1, 13.7, 15.2, 16.8, 17.3, 17.6, 19.4, 19.15, and 20.1

For more information, see “Checking Coding Rules”.

Compatibility Considerations. Due to the improvements to the MISRA C coding rules checker, verification results may change when compared to previous versions of the software.

Review Orange Checks that are Potential Run-Time Errors

Previously, there were two modes in which you could review verification results — manual and assistant. For the manual mode, you set the Assistant slider to `Off` and the software displayed all orange checks (in addition to the red and green checks) . With the assistant mode, there were three levels of review — corresponding to settings 1, 2, and 3 of the Assistant slider. You could specify the number of orange checks to display through the **Assistant Configuration** tab in the Polyspace Preference dialog box.

Now, Polyspace allows you to review results at five different levels. You can set the Review slider to 0, 1, 2, 3, or All:

- 0 — Display red and gray checks. In addition, display orange checks that are potential run-time errors. On the **Polyspace Preference > Review Configuration** tab, you can specify the type of potential run-time errors that you are interested in. You have the option of not displaying any orange checks.
- 1, 2, and 3 — This functionality is unchanged. Display red, gray, and green checks. In addition, display orange checks according to values specified on the **Polyspace Preference > Review Configuration** tab.
- All — Display red, gray, green, and all orange checks.

The **Assistant Configuration** tab is renamed the **Review Configuration** tab.

For more information, see “Reviewing Results Systematically” and “Reviewing All Checks”.

Display Sources of Orange Checks

The software identifies, where possible, code that is the source of orange checks and provides information about this code on the new **Orange Sources** tab. You can display this tab in the Run-Time Checks perspective, and see the following columns of information:

- **Type** — Type of code element that causes orange check
- **Name** — Name of code element
- **File** — Name of source file
- **Line** — Line number in source file
- **Max Oranges** — Maximum number of orange checks arising from code element
- **Suggestion** — How you can resolve the orange check

For more information, see “Viewing Sources of Orange Checks”.

With some orange checks, through this new tab, you can add or modify data range specifications to resolve the checks. See “Refining Data Range Specifications”.

Enhanced Automatic Orange Tester

Previously, you had to run the Automatic Orange Tester manually after the completion of a verification. Now, when you select the Automatic Orange Tester option

- You specify the new option `-automatic-orange-tester`. Polyspace still supports the previous option `-prepare-automatic-tests` in R2011b. However, `-prepare-automatic-tests` will be removed from a future release.
- The software runs dynamic tests on the orange code automatically at the end of the verification.
- You can specify test parameters when you configure your verification. If you do not specify test parameters, the software uses default test parameter values.
- If you run a server verification, the software will run the dynamic tests on the server.

The Automatic Orange Tester now also supports the following options:

- `-ignore-float-rounding`
- `-respect-types-in-globals`
- `-respect-types-in-fields`
- `-entry-points`

For more information, see “Automatically Testing Orange Code”.

No Gray Checks in Unreachable Code

The only gray checks that Polyspace generates now are UNR checks for unreachable branches of code. In addition, Polyspace generates the UNR check only at the highest level of a branch. You no longer see nested UNR checks, that is, UNR checks in sub-branches.

In addition, the software displays two new metrics for the project in the procedural entities view:

- `unp` — Number of unreachable procedures (functions) as a fraction of the total number of procedures (functions)
- `cov` — Percentage of elementary operations in executable procedures (functions) covered by verification

These metrics provide:

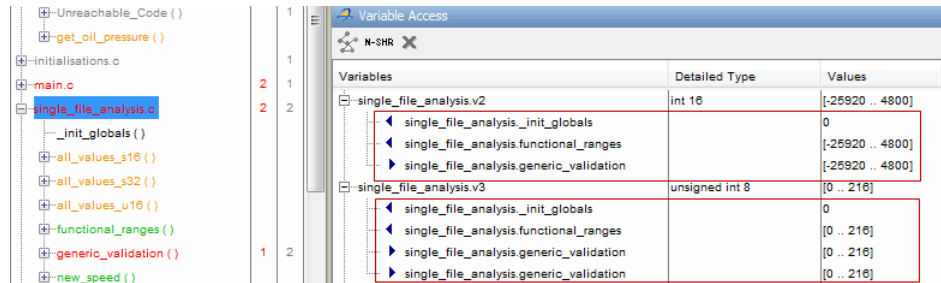

- A measure of the code coverage achieved by the Polyspace verification.
- Indicators about the validity of your Polyspace configuration. For example, a large `unp` value and a low `cov` value may indicate an early red check or missing function call.

See “Results Explorer Tab”.

Compatibility Considerations. Due to the removal of non-UNR gray checks and nested UNR checks, verification results may change when compared to previous versions of the software.

Global Variable Range Information

In the **Variable Access** pane, Polyspace displays range information for read and write access operations on global variables within each source file. Previously, the displayed value was the union of all access operations on the global variable within a file. The software did not display range information for individual operations. Now, for global variables that are integers (signed and unsigned) or floating point variables (`float` and `double`), Polyspace also provides range information for the individual access operations from which the union value is obtained.

See “Variable Access Pane”.

Read and Write Access in Dead Code

If a read or write access operation on a global variable lies within dead code, then Polyspace colors the operation gray in the **Variable Access** pane. When you examine verification results, you can hide these operations by clicking the new filter button . See “Variable Access Pane”.

Run All Verifications in Project

You can have many verifications within a project, each verification being associated with an active configuration. Previously, you could only run one verification at a time from the Polyspace verification environment (PVE).

Now, if you select a project and click the button , Polyspace will run all verifications in the project. See “Running a Verification”.

Specifying Functions Not Called by Generated Main

You can now specify source files in your project that the main generator will ignore. Functions defined in these source files are not called by the automatically generated main.

Use this option for files containing function bodies, so that the verification looks for the function body only when the function is called by a primary source file and no body is found.

For more information, see “Verifying a C Application Without a “Main”” in the *.Polyspace Products for C/C++ User’s Guide*.

Stubbing Specific Functions

You can now specify specific functions that you want the software to stub using the option **Functions to stub** (-functions-to-stub).

For more information, see “Stubbing” in the *.Polyspace Products for C/C++ User’s Guide*.

Changes to Verification Results

- “Compatibility Considerations” on page 36
- “Cross-block Critical Sections” on page 36
- “Function Pointers in extern const Structure Stubbed” on page 37
- “Pointers point to the Beginning of Allocated Objects” on page 37

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Refer to the following sections for information on the specific changes.

Cross-block Critical Sections. In previous releases, the beginning and the end of a critical section must be in same block.

In R2011b, every kind of cross block critical section is supported. However, some constructs may raise a warning.

For example:

```
void foo(void) {
    BEGIN_CS();

    for (;;) {
        END_CS();
    }
}
```

Warning: Ending critical section cs in a loop in test.foo

Function Pointers in extern const Structure Stubbed. In previous releases, function pointers in extern const structures were not always stubbed, and could result in a COR error.

For example:

```
typedef struct {
int a;
void (*foo)(void);
} AA;

extern const AA aaa;
extern AA aaaa;

extern const a;
const b;

void foo(void)
{
int bb;
bb = a;
bb = b;

bb = aaa.a;
aaaa.foo();
aaa.foo(); //COR Error in previous releases
}
```

In R2011b, every extern variable will be stubbed regardless of its qualifiers.

Pointers point to the Beginning of Allocated Objects. In previous releases, a pointer in the generated main points anywhere in the allocated buffer, which could cause problems when using DRS.

Allocated objects now point at the beginning of the object.

Changes to Coding Rules Checker Results

- “Compatibility Considerations” on page 38

- “New MISRA-C Rules Supported” on page 38
- “MISRA-C: Rule 1.1 Messages” on page 38
- “MISRA-C: Rule 6.3 Improvements” on page 38
- “MISRA-C: Rule 17.6 Improvements” on page 39

Compatibility Considerations. Due to changes in the coding rules checker, the number of coding rule violations may change when compared to previous versions of the software.

Refer to the following sections for information on the specific changes.

New MISRA-C Rules Supported. The coding rules checker now supports the following MISRA-C Rules:

- Rule 1.2
- Rule 3.1
- Rule 3.4
- Rule 6.2
- Rule 12.11
- Rule 14.1
- Rule 16.10

MISRA-C: Rule 1.1 Messages. Message reported for violations of MISRA-C: Rule 1.1 has been improved.

MISRA-C: Rule 6.3 Improvements. Enforcement of MISRA-C Rule 6.3 has been improved:

- no more violations when the plain char is used
- no more violations when basic types are used for bitfields declarations

In previous releases, the coding rules checker reported a violation on the following code:

```
typedef struct TestData_tag {
```

```
unsigned int  IsOK           :1;
unsigned int  IsCounterOK    :1;
unsigned int  IsNew          :1;
unsigned int  UnusedBytes    :13;

} TestData;

void main(void) {

TestData c;

c.IsOK = 1;
}
```

In R2011b, this syntax is allowed.

MISRA-C: Rule 17.6 Improvements. Enforcement of MISRA-C: Rule 17.6 has been improved.

If the address of an object is assigned to another object that may persist after the first object has ceased to exist, a runtime error may occur.

In previous releases, the coding rules checker did not detect a violation in the following example:

```
extern int *vg;
void provide( short int a )
{
    int v1;
    v1 = a;
    vg = &v1;
}
```

Changes to Analysis Options

New Options.

Option	For more information
Functions to stub (-functions-to-stub)	“Stubbing Specific Functions” on page 36
-main-generator-files-to-ignore	“Specifying Functions Not Called by Generated Main” on page 35
Maximum test time -dynamic-execution-test-timeout	“Enhanced Automatic Orange Tester” on page 33
Maximum loop iterations -dynamic-execution-loop-max-iteration	“Enhanced Automatic Orange Tester” on page 33
Number of automatic tests -dynamic-execution-tests-number	“Enhanced Automatic Orange Tester” on page 33

Changes to Existing Options. The following options have been renamed in R2011a.

New Name (R2011b)	Previous Name (R2011a)	Change
Stub complex functions	Stub all functions	GUI name only
Dialect support	Keil/IAR support	GUI name only
-automatic-orange-tester	-prepare-automatic-test	Command-line name and enhanced functionality

Deprecated Options

- **Launch code verification from beginning of (-from)**

Note The -from option is still accepted when launching a verification in batch mode.

Polyspace Server for C/C++ Product

Running Multiple Verifications Simultaneously

If you purchase more than one license for a Polyspace server, you can now configure the server to run multiple verifications at the same time. This can improve the performance of server verifications.

To configure your server to run multiple verifications, open the Remote Launcher Manager, then set the **Number of Polyspace verifications that can run simultaneously on this server** to the number of licenses you have activated for your server.

For more information, see “Configuring Polyspace Server Software” in the *Polyspace Installation Guide*.

Compatibility Considerations. If you configure your server to run more than one verification simultaneously, the server will not be able to run verifications using older versions of the software.

For example, if your server has both R2011a and R2011b software installed, you cannot run a verification using the R2011a software.

Polyspace Metrics

Review Changes between Results of Successive Verifications. You can specify a version of a project and review only the differences between verification results of the specified version and the previous verification. See “Review New Findings”.

File Modules with Quality Levels. If you have projects with two or more file modules in the Polyspace verification environment, by default Polyspace Metrics displays verification results using the same module structure. However, Polyspace Metrics also allows you to create or delete file modules. You can group files into a module and specify a quality level for the module, which applies to all files within the module. This feature allows you to specify different quality levels for your files in the review of verification results. See “Creating a File Module and Specifying Quality Level”.

Enhanced Graphs and Charts. Polyspace Metrics displays enhanced graphs and charts.

If you specify a range of project versions:

- On the **Summary** tab, **Run-Time Defects** are plotted as separate categories, High, Medium, and Low.
- On the Run-Time Checks tab:
 - Under **Confirmed Defects**, you see separate plots for the defect categories, High, Medium, and Low.
 - Under **Run-Time Findings**, you see separate plots for red checks, NTC checks, and gray checks.

If you specify a single version of a project, Polyspace Metrics displays file defect information, ordering the files according to the number of defects in each file. Use the new **# items** field to specify the maximum number of files for which information is displayed. See “Displaying Metrics for Single Project Version”.

Version 6.2 (R2011b) Polyspace for Ada Products

This table summarizes what's new in V6.2 (R2011b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 43
- “Polyspace® Server™ for Ada Product” on page 46

Polyspace Client for Ada Product

Review Orange Checks that are Potential Run-Time Errors

Previously, there were two modes in which you could review verification results — manual and assistant. For the manual mode, you set the Assistant slider to `Off` and the software displayed all orange checks (in addition to the red and green checks) . With the assistant mode, there were three levels of review — corresponding to settings 1, 2, and 3 of the Assistant slider. You could specify the number of orange checks to display through the **Assistant Configuration** tab in the Polyspace Preference dialog box.

Now, Polyspace allows you to review results at five different levels. You can set the Review slider to 0, 1, 2, 3, or All:

- 0 — Display red and gray checks. In addition, display orange checks that are potential run-time errors. On the **Polyspace Preference > Review Configuration** tab, you can specify the type of potential run-time errors that you are interested in. You have the option of not displaying any orange checks.

- 1, 2, and 3 — This functionality is unchanged. Display red, gray, and green checks. In addition, display orange checks according to values specified on the **Polyspace Preference > Review Configuration** tab.
- All — Display red, gray, green, and all orange checks.

The **Assistant Configuration** tab is renamed the **Review Configuration** tab.

No Gray Checks in Unreachable Code

The only gray checks that Polyspace generates now are UNR checks for unreachable branches of code. In addition, Polyspace generates the UNR check only at the highest level of a branch. You no longer see nested UNR checks , that is, UNR checks in sub-branches.

In addition, the software displays two new metrics for the project in the procedural entities view:

- `unp` — Number of unreachable procedures (functions) as a fraction of the total number of procedures (functions)
- `cov` — Percentage of elementary operations in executable procedures (functions) covered by verification

These metrics provide:

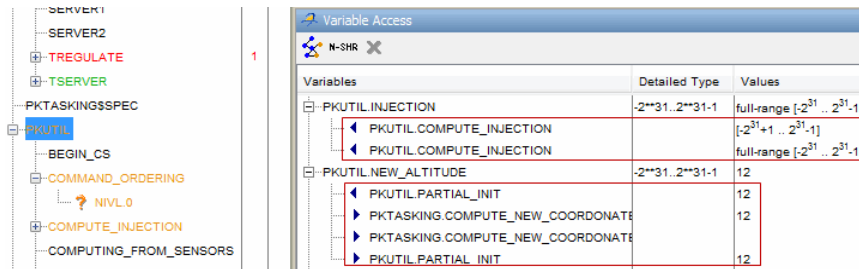

- A measure of the code coverage achieved by the Polyspace verification.
- Indicators about the validity of your Polyspace configuration. For example, a large `unp` value and a low `cov` value may indicate an early red check or missing function call.

See “Results Explorer Tab”.

Compatibility Considerations. Due to the removal of non-UNR gray checks and nested UNR checks, verification results may change when compared to previous versions of the software.

Global Variable Range Information

In the **Variable Access** pane, Polyspace displays range information for read and write access operations on global variables within each source file. Previously, the displayed value was the union of all access operations on the global variable within a file. The software did not display range information for individual operations. Now, for global variables that are signed or unsigned integers, Polyspace also provides range information for the individual access operations from which the union value is obtained.

See “Variable Access Pane”.

Read and Write Access in Dead Code

If a read or write access operation on a global variable lies within dead code, then Polyspace colors the operation gray in the **Variable Access** pane. When you examine verification results, you can hide these operations by clicking the new filter button . See “Variable Access Pane”.

Run All Verifications in Project

You can have many verifications within a project, each verification being associated with an active configuration. Previously, you could only run one verification at a time from the Polyspace verification environment (PVE).

Now, if you select a project and click the button , Polyspace will run all verifications in the project. See “Running a Verification”.

Green NIV check for Unchecked_Conversion Function

Previously, the software produced an orange NIV check for each call to an instance of the Ada generic library function `Unchecked_Conversion`. Now by default, the software produces a green NIV check for each call. If you want to revert to the previous behavior, run your verification with the option `-D POLYSPACE_UNCHECKED_CONVERSION_NO_INIT`.

Polyspace Server for Ada Product

Running Multiple Verifications Simultaneously

If you purchase more than one license for a Polyspace server, you can now configure the server to run multiple verifications at the same time. This can improve the performance of server verifications.

To configure your server to run multiple verifications, open the Remote Launcher Manager, then set the **Number of Polyspace verifications that can run simultaneously on this server** to the number of licenses you have activated for your server.

For more information, see “Configuring Polyspace Server Software” in the *Polyspace Installation Guide*.

Compatibility Considerations. If you configure your server to run more than one verification simultaneously, the server will not be able to run verifications using older versions of the software.

For example, if your server has both R2011a and R2011b software installed, you cannot run a verification using the R2011a software.

Polyspace Metrics

Review Changes between Results of Successive Verifications. You can specify a version of a project and review only the differences between verification results of the specified version and the previous verification. See “Review New Findings”.

File Modules with Quality Levels. If you have projects with two or more file modules in the Polyspace verification environment, by default Polyspace Metrics displays verification results using the same module structure. However, Polyspace Metrics also allows you to create or delete file modules. You can group files into a module and specify a quality level for the module, which applies to all files within the module. This feature allows you to specify different quality levels for your files in the review of verification results. See “Creating a File Module and Specifying Quality Level”.

Enhanced Graphs and Charts. Polyspace Metrics displays enhanced graphs and charts.

If you specify a range of project versions:

- On the **Summary** tab, **Run-Time Defects** are plotted as separate categories, High, Medium, and Low.
- On the Run-Time Checks tab:
 - Under **Confirmed Defects**, you see separate plots for the defect categories, High, Medium, and Low.
 - Under **Run-Time Findings**, you see separate plots for red checks, NTC checks, and gray checks.

If you specify a single version of a project, Polyspace Metrics displays file defect information, ordering the files according to the number of defects in each file. Use the new **# items** field to specify the maximum number of files for which information is displayed. See “Displaying Metrics for Single Project Version”.

Version 5.8 (R2011b) Polyspace Model Link Products

This table summarizes what's new in V5.8 (R2011b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Model Link™ SL Product” on page 48
- “Polyspace® UML Link™ RH Product” on page 50

Polyspace Model Link SL Product

Polyspace Verification Pane in Simulink Configuration Tree

The software provides a new pane **Polyspace Model Link** that allows you to check your Simulink model settings and configure and start your Polyspace verification within the Configuration Parameters dialog box.

After you create your Simulink model, from the model window, select **Tools > Polyspace > Options**. The software opens the Configuration Parameters dialog box with the new **Polyspace Model Link** pane displayed.

To remove the pane and Polyspace configuration information from your model, select **Tools > Polyspace > Remove Polyspace settings from model**.

For more information, see the *Polyspace Model Link Products User's Guide* .

Support for 16-Bit Cross Compiler

Previously, if you wanted to verify code generated for a 16-bit target processor, you had to perform command line actions to specify header files for the 16-bit compiler. Furthermore, the software could not automatically identify the specified compiler from the Simulink model.

Now, through the **Include** (-include) and **Include Folders** (-I) options on the **Configuration** pane, you can specify header files for your 16-bit compiler. In addition, the software automatically identifies the compiler from the Simulink model. If the compiler is 16-bit and you do not specify the necessary header files, the software produces an error when you try to run a verification.

For more information, see “Specifying Header Files for Target Compiler” in the *Polyspace Model Link Products User’s Guide*.

Enforcement of Modeling rules for Optimal Verification Results

Before you start a Polyspace verification, you can now check that your Simulink model is configured to generate code that yields optimal verification results: in the **Configuration Parameters > Polyspace Model Link** pane, click **Check Configuration**. In addition, if you try to run a verification without selecting the correct options, the software generates warnings or errors. The software checks settings for the following model parameters .

Parameter	Recommended Setting
MultiInstanceERTCode	'off'
MatFileLogging	'off'
InlineParams	'off'
ZeroExternalMemoryAtStartup	'off' when Configuration Parameters > Polyspace Model Link > Data Range Management > Output is Global assert
InitFltsAndDblsToZero	'on'

For more information, see “Run Polyspace Verification” in the *Polyspace Model Link Products User’s Guide*.

Simulink Software Support

Added support for Simulink Version 7.8 (R2011b).

Polyspace UML Link RH Product

Product Rewritten in Java

To rectify previously encountered installation issues, the product has been rewritten in Java™, supporting versions 7.4 and 7.5. See updated documentation in the *Polyspace UML Link™ RH User's Guide*.

Version 8.1 (R2011a) Polyspace for C/C++ Products

This table summarizes what's new in V8.1 (R2011a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 51
- “Polyspace® Server™ for C/C++ Product” on page 67

Polyspace Client for C/C++ Product

Code Metrics (New for C++)

Code metric support, including cyclomatic number and other HIS metrics.

Polyspace verification can now generate metrics about code complexity, which are based on the Hersteller Initiative Software (HIS) standard.

These metrics include:

- **Project metrics** – including number of recursions, number of include headers, and number of files.
- **File metrics** – including comment density, and number of lines.
- **Function metrics** – including cyclomatic number, number of static paths, number of calls, and Language scope.

When you run a verification with the `-code-metrics` option enabled, you can view software quality metrics data in the Polyspace Metrics Web interface

(**Code Metrics** view), or by running a Software Quality Objectives report from the Polyspace verification environment.

Verification	Project Metrics				File Metrics				Function Metrics								Software Quality Objectives		
	Files	Header Files	Recursion	Direct Recursion	Lines	Lines without Comments	Comment Density	Cyclomatic Complexity	Language Scope	Paths	Calling Functions	Called Functions	Instructions	Call Levels	Function Parameters	Goto Statements	Return Points	Quality Status	Level
V4	6	7	1	1	755	463	FAIL	PASS	PASS	112	PASS	PASS	186	PASS	PASS	0	PASS	FAIL	SQO-1
@_polysp																			SQO-1
@example					248	136	16.0%	PASS	PASS	45	PASS	PASS	61	PASS	PASS	0	PASS	FAIL	SQO-1
@initialisat					108	71	4.0%	PASS	PASS	13	PASS	PASS	20	PASS	PASS	0	PASS	FAIL	SQO-1
@main.c					58	45	4.0%	PASS	PASS	6	PASS	PASS	22	PASS	PASS	0	PASS	FAIL	SQO-1
@single_fi					140	80	19.0%	PASS	PASS	23	PASS	PASS	36	PASS	PASS	0	PASS	FAIL	SQO-1
@tasks1.c					117	82	7.0%	PASS	PASS	13	PASS	PASS	32	PASS	PASS	0	PASS	FAIL	SQO-1
@tasks2.c					84	49	11.0%	PASS	PASS	12	PASS	PASS	15	PASS	PASS	0	PASS	FAIL	SQO-1

The software generates numeric values or pass/fail results for various metrics.

For more information, see “Software Quality with Polyspace Metrics” in the *Polyspace Products for C/C++ User’s Guide*.

Saving Polyspace Metrics Review

Previously, when you saved your project (**Ctrl+S**) after a review of results from Polyspace Metrics, the software would save your comments and justifications both locally and in the Polyspace Metrics repository.

Now, if you save your project (**Ctrl+S**), the software saves your review to a local folder only. A new button  is available on the Run-Time Checks toolbar. If you click this button, the software saves your comments and justifications to a local folder *and* the Polyspace Metrics repository.

This feature allows you to upload your review to the repository only when you are satisfied that your review is, for example, correct and complete.

You can still configure your software to display the previous behavior.

For more information, see “Saving Review Comments and Justifications” in the *Polyspace Products for C/C++ User’s Guide*.

Compilation Assistant

New Compilation Assistant to ease project configuration (cross-compiler settings).

The Compilation Assistant allows you to check your project for compilation problems before launching a verification. The Compilation Assistant then:

- Automatically detects pre-processing, compilation, and dialect options required for your code (for example, `-I` and `-D`).
- Provides suggestions to solve compilation problems.

For more information, see “Checking for Compilation Problems” in the *Polyspace Products for C/C++ User’s Guide*.

Improved Search Function

Enhanced search functionality in the Run-Time Checks perspective allows you to perform a search in several views at once (call hierarchy, variable access, run-time checks and source code), and provides search results in a single “Search” view.

For more information, see “Searching Results in Results Manager Perspective” in the *Polyspace Products for C/C++ User’s Guide*.

Back to Source Function in Run-Time Checks Perspective

Improved navigation from the Run-Time Checks perspective to the source code containing a check.

You can now right-click a check in your verification results, and open the source file containing that check.

You can configure the software to open source files in either a text editor, or your IDE.

For more information, see “Configuring Text and XML Editors” in the *Polyspace Products for C/C++ User’s Guide*.

Structure Fields in Data Dictionary

Distinction of variable fields in the Data Dictionary provides a more accurate Data Dictionary.

The enhanced Data Dictionary:

- Helps locate specific field accesses.
- Provides more information on fields (number of read/write accesses, field type).
- Provides a hierarchical view of structured variables.

For more information, see “Variable Access Pane” in the *Polyspace Products for C/C++ User’s Guide*.

Overflow Check Customization

New options allow you to customize how OVFL checks are handled during verification. You can customize computation through overflow constructions, control the presence of overflow checks, and the dynamic behavior in case of a run-time error.

These options allow you to:

- Not generate OVFL checks on all computations (values are computed the same way processors do).
- Not truncate the value after an OVFL check, and carry on with wrapped values (OVFL check does not impact values during verification).

For more information, see “Detect overflows on (-scalar-overflows-checks)” and “Overflows computation mode (-scalar-overflows-behavior)” in the *Polyspace Products for C/C++ Reference*.

Compatibility Considerations. The option `-detect-unsigned-overflows` (available in previous releases) has been renamed. To achieve the same behavior as the previous option, specify the new option `-scalar-overflows-checks signed-and-unsigned`.

When using the new options, your verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Main Generator Improvements

Enhanced main-generator to improve verification results for generated code.

The new main-generator allows you greater control over the behavior of the generated main. New options allow you to generate a main specifically designed for cyclic programs, to support generated code and Model-Based Design. This improves verification results at the subsystem level.

The generated main now has the following behavior:

- 1** It initializes any variables identified by the option `-variables-written-before-loop`.
- 2** It calls any functions specified by the option `-functions-called-before-loop`. This could be considered an initialization function.
- 3** It initializes any variables identified by the option `-variables-written-in-loop`.
- 4** It calls any functions specified by the option `-functions-called-in-loop`.
- 5** It calls any functions specified by the option `-functions-called-after-loop`. This could be a terminate function for a cyclic program.

For more information, see “Automatically Generating a Main” in the *Polyspace Products for C/C++ User’s Guide*.

Compatibility Considerations. Due to precision improvements, verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

In addition, several Analysis options have been renamed to support the new main generator.

Previous Name (R2010b)	New Name (R2011a)
-main-generator-writes-variables	-variables-written-before-loop
-function-called-before-main	-function-called-before-loop
-main-generator-calls	-functions-called-in-loop

If you have any scripts that use the old options, update them to reflect the new names.

Verification Time Limit

You can now specify a time limit for verifications using the `-timeout` option. If the verification does not complete within the specified time, the verification fails.

For more information, see “Verification time limit (`-timeout`)” in the *Polyspace Products for C/C++ Reference*.

Continue Verification with Compile Errors

You can now specify that a verification continues even if some source files do not compile, using the option `-continue-with-compile-error`.

Functions that are used but not specified are stubbed automatically.

If a source file contains global variables, you may also need to select the option `-allow-undef-variables` to enable verification.

For more information, see “Continue with compile error (`-continue-with-compile-error`)” in the *Polyspace Products for C/C++ Reference*.

Precision Improvements

Improved precision on arrays and functions, resulting in less orange checks.

The precision improvements effect:

- NIV, NIVL, NIP, and IRV checks
- array cells
- boolean decision graphs
- various other constructs

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Permissive Mode Set By Default

Permissive verification mode is now set by default for new projects. This reduces the number of compilation errors for verifications launched with default settings.

The following options are now set by default:

- `-discard-asm`
- `-allow-non-in-bitfields`
- `-permissive-link`
- `-allow-undef-variables`
- `-allow-unnamed-fields`
- `-allow-negative-operand-in-shift`
- `-allow-language-extensions`

If you want to use stricter compilation settings, you can select them in the project configuration.

Compatibility Considerations. When using the default options, your results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Default Project Location

On Windows systems, the default project location has changed.

The default project location is now in My Documents. Previously, the default location was defined in the user profile.

Variable Range Inconsistency between Variable Access Pane and Tooltips

The range given for a variable in the Variable Access Pane (Variables View) can differ from the range given by tooltips on the reads of a variable in the Source code view. The range provided by the tooltip will be wider than the range given in the Variables View.

This difference is due to imprecision in the tooltip. The Variables View provides the correct range for the variable.

For example:

- Variables View states that variable X is in range $[0 . . 4000]$
- Tooltip on a read of X states that the range is $[0, 7000]$.

In this case, $[0 . . 4000]$ is the correct range. The tooltip range is caused by imprecision that may be fixed in future releases.

Visual Studio Integration

New Visual Studio® import tool allows you to automatically extract some Polyspace settings from a Visual Studio project file.

This tool can help you:

- Locate source files, include folders and preprocessing directives
- Set some Polyspace Visual Studio specific options

For more information, see *Importing Visual Studio Project Information into Polyspace Project* in the *PolySpace® Products for C++ User's Guide*.

Product Name Change in Files and Folders

The Polyspace product name has changed from “PolySpace” to “Polyspace” in R2011a. This change impacts the name of all files and folders created by the software.

For example:

- PolySpace-Doc folder has changed to Polyspace-Doc
- PolySpace_XXXX.log file has changed to Polyspace_XXXX.log

Compatibility Considerations. If you have existing folders that use the previous product name (for example, PolySpace/PolySpace_Common) the R2011a installation will continue to use these existing folders. However, any files or folders created during or after installation will use the new name.

If you have any shortcuts or scripts that are case-sensitive, you should update them to use the correct name.

Visual Studio Support

Added support for Microsoft® Visual Studio 2010.

For more information, see the *Polyspace Installation Guide*.

Eclipse IDE Support

Added support for Version 3.6 of the Eclipse IDE.

For more information, see the *Polyspace Installation Guide*.

License Manager Support

The License Manager for Polyspace products has been upgraded to FLEXnet® 11.9.

You may need to upgrade your FLEXnet server and daemon.

For more information, see “Polyspace License Installation” in the *Polyspace Installation Guide*.

Changes to Verification Results

- “Compatibility Considerations” on page 61
- “Certain COR Checks Changing to OVFL” on page 61
- “COR Checks on Function Pointer” on page 62
- “NIV Check on Local Volatile Variables” on page 62
- “OVFL Checks on Assignment” on page 62
- “Precision Improvements for NIV Checks” on page 63
- “Precision Improvements on Arrays and Functions” on page 63
- “Compilation Errors for Classes without Constructors” on page 63

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Refer to the following sections for information on the specific changes.

Certain COR Checks Changing to OVFL. In previous releases, certain types of overflow errors were reported as COR checks instead of OVFL checks. For example:

```
typedef long int32;
extern int32 random(void);

int32 func(int32 a, int32 b)
{
  int32 res = 0;
  if (random()) {
    res = a/b;    // COR changing to OVFL in R2011a
  }
  return res;
}
```

These checks are now reported as OVFL, which will impact check statistics when compared to previous releases.

COR Checks on Function Pointer. In previous releases, verification reported a COR check on function pointer when the parameter type of function pointer is `void*`. For example:

```
typedef void (*func)(void*);

void foo(int *p) { *p=1; }

void bar(void)
{
  int a;
  func A = foo;
  A(&a);
}
```

In R2011a, verification considers that type `void *` is compatible with all other pointer types.

This may result in changes to the color of COR checks. The Call graph may also be impacted. It can also have an impact on performance and precision (more calls considered).

NIV Check on Local Volatile Variables. The behavior of NIV checks for local volatile variables has changed.

In previous releases, the NIV for a local volatile variable was always orange. In R2011a, verification allows local volatile variables to behave just like other variables – if they are initialized in the code, the NIV is green.

Polyspace verification considers that the hardware can bring a value (so NIV cannot be red) but will not de-initialize. Therefore, if the variable is initialized by the code, it is green.

OVFL Checks on Assignment. By default, verification no longer reports OVFL checks on assignment, for example:

```
uc = ~uc;
```

The total number of checks in your results may change when compared to previous releases.

If you want the verification to report these types of checks, you can use the option `-detect-overflows-on-operator-not` to retain the previous behavior.

Precision Improvements for NIV Checks. Improved precision on NIV, NIVL, NIP, and IRV checks.

Precision Improvements on Arrays and Functions. Improved precision on arrays and functions.

Compilation Errors for Classes without Constructors. In previous releases, a compilation error occurs when you use the options `-unit-by-unit` or `-class-analyzer all` on source code containing classes with no user defined or compiler generated constructor.

In R2011a, this behavior changes as follows:

- No compilation error occurs.
- When using the options `-unit-by-unit` or `-class-analyzer all`, if a class has no constructor, all of its members are randomly initialized to the full range.
- When using the option `-class-analyzer custom-class-list`, if a class among the `custom-class-list` has no constructor, the verification does not initialize the class members in order to highlight NIV/NIP on accessing the class members (which mean that this class instance can never be correctly constructed).
- A warning is displayed in the log file.

Changes to Coding Rules Checker Results

- “Compatibility Considerations” on page 64
- “MISRA C Rule 12.1 – Parentheses for Operand of Unary Operator.” on page 64

- “Single Rule Violation Reported Multiple Times” on page 64

Compatibility Considerations. Due to changes in the coding rules checker, the number of coding rule violations may change when compared to previous versions of the software.

Refer to the following sections for information on the specific changes.

MISRA C Rule 12.1 – Parentheses for Operand of Unary Operator.. In previous releases, the coding rules checker could incorrectly report a violation of MISRA C Rule 12.1 for the operand of a unary operator. For example:

```
Y1 = (U1 * U2) -0.366;      // Passes 12.1
Y2 = (-1 * (0.366)) + (U1 * U2); // Fails 12.1
Y3 = -0.366 + (U1 * U2);   // Fails 12.1
4 = 0.366 + (U1 * U2);     // Passes 12.1
```

The MISRA rule states that parentheses are not required for the operand of a unary operator.

The number of violations of Rule 12.1 may decrease when compared to previous releases.

Single Rule Violation Reported Multiple Times. In previous releases, Polyspace Metrics could report more than one violation of a single coding rule in the same location. This occurred when the message of a rule violation was modified, and the same results were uploaded to the Metrics database multiple times.

In R2011a, messages for rule violations that have the same ID and the same location are merged into a single message of only one rule violation

Therefore, the total number of rule violations may be lower in R2011a than in previous releases.

Changes to Analysis Options

New Options.

Option	For more information
Variables written in loop (-variables-written-in-loop)	“Main Generator Improvements” on page 56
Functions called after loop (-functions-called-after-loop)	“Main Generator Improvements” on page 56
Overflow computation mode (-scalar overflows-behavior)	“Overflow Check Customization” on page 55
Continue with compile error (-continue-with-compile-error)	“Continue Verification with Compile Errors” on page 57
Verification time limit (-timeout)	“Verification Time Limit” on page 57

Changes to Existing Options. The following options have been renamed in R2011a.

New Name (R2011a)	Previous Name (R2010b)	Change
Target operating system	Operating system target for PolySpace stubs	GUI name only
Ignore assembly code	Discard Assembly code	GUI name only
Allow non int types for bitfields	Allow non-ANSI/ISO C-90 types of bitfields	GUI name only
Allow undefined global variables	Continue even with undefined global variables	GUI name only
Ignore overflowing computations on constants	Permits overflowing computations on constants	GUI name only
Allow anonymous unions/structure fields	Allow un-named Unions/Structures	GUI name only
Allow negative operand for left shifts	Do not check the sign of operand in left shifts	GUI name only

New Name (R2011a)	Previous Name (R2010b)	Change
Ignore missing header files	No error on missing header file	GUI name only
Variables written before loop (-variables-written-before-loop)	Write accesses to global variables (-main-generator-writes-variables)	GUI and command-line name See “Main Generator Improvements” on page 56
Functions called before loop (-functions-called-before-loop)	First functions to call (-function-called-before-main)	GUI and command-line name See “Main Generator Improvements” on page 56
Functions called in loop (-functions-called-in-loop)	Function calls (-main-generator-calls)	GUI and command-line name See “Main Generator Improvements” on page 56
Detect overflows on (-scalar-overflows-checks)	Detect overflows on unsigned integers (-detect-unsigned-overflows)	Functionality change GUI and command line name See “Overflow Check Customization” on page 55

In addition, the default settings for some **Permissive** options have changed.

Deprecated Options. None.

Polyspace Server for C/C++ Product

Code Metrics (New for C++)

Code metric support, including cyclomatic number and other HIS metrics.

Polyspace verification can now generate metrics about code complexity, which are based on the Hersteller Initiative Software (HIS) standard.

These metrics include:

- **Project metrics** – including number of recursions, number of include headers, and number of files.
- **File metrics** – including comment density, and number of lines.
- **Function metrics** – including cyclomatic number, number of static paths, number of calls, and Language scope.

When you run a verification with the `-code-metrics` option enabled, you can view software quality metrics data in the Polyspace Metrics Web interface (**Code Metrics** view), or by running a Software Quality Objectives report from the Polyspace verification environment.

Verification	Project Metrics				File Metrics					Function Metrics							Software Quality Objectives		
	Files	Header Files	Recursion	Direct Recursion	Lines	Lines without Comments	Comment Density	Cyclomatic Complexity	Language Scope	Paths	Calling Functions	Called Functions	Instructions	Call Levels	Function Parameters	Goto Statements	Return Points	Quality Status	Level
V4	6	7	1	1	755	463	FAIL	PASS	PASS	112	PASS	PASS	186	PASS	PASS	0	PASS	FAIL	SQO-1
@ _polysp																			SQO-1
@ example					248	136	16.0%	PASS	PASS	45	PASS	PASS	61	PASS	PASS	0	PASS	FAIL	SQO-1
@ imbalisat					108	71	4.0%	PASS	PASS	13	PASS	PASS	20	PASS	PASS	0	PASS	FAIL	SQO-1
@ main.c					58	45	4.0%	PASS	PASS	6	PASS	PASS	22	PASS	PASS	0	PASS	FAIL	SQO-1
@ single_file					140	80	19.0%	PASS	PASS	23	PASS	PASS	36	PASS	PASS	0	PASS	FAIL	SQO-1
@ itasks1.c					117	82	7.0%	PASS	PASS	13	PASS	PASS	32	PASS	PASS	0	PASS	FAIL	SQO-1
@ itasks2.c					84	49	11.0%	PASS	PASS	12	PASS	PASS	15	PASS	PASS	0	PASS	FAIL	SQO-1

The software generates numeric values or pass/fail results for various metrics.

For more information, see “Software Quality with Polyspace Metrics” in the *PolySpace Products for C++ User’s Guide*.

Saving Polyspace Metrics Review

Previously, when you saved your project (**Ctrl+S**) after a review of results from Polyspace Metrics, the software would save your comments and justifications both locally and in the Polyspace Metrics repository.

Now, if you save your project (**Ctrl+S**), the software saves your review to a local folder only. A new button  is available on the Run-Time Checks toolbar. If you click this button, the software saves your comments and justifications to a local folder *and* the Polyspace Metrics repository.

This feature allows you to upload your review to the repository only when you are satisfied that your review is, for example, correct and complete.

You can still configure your software to display the previous behavior.

For more information, see “Saving Review Comments and Justifications” in the *Polyspace Products for C/C++ User’s Guide*.

Automatic Comment Import for Server Verifications

When you download results from the Polyspace server, the software now automatically imports any comments from results in the destination folder into the downloaded results (except for verifications using the option `-add-to-results-repository`).

As a result of this change, you can now download intermediate results for a verification running on the Polyspace server, and add or edit comments on those results. When you later download the final results, your comments are preserved.

You can also download and comment on a single unit of a unit-by-unit verification, even if other units are still pending in the server queue. When you download the final results (which overwrites the earlier results), your comments are preserved.

License Manager Support

The License Manager for Polyspace products has been upgraded to FLEXnet 11.9.

You may need to upgrade your FLEXnet server and daemon.

For more information, see “Polyspace License Installation” in the *Polyspace Installation Guide*.

Version 6.1 (R2011a) Polyspace for Ada Products

This table summarizes what's new in V6.1 (R2011a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 70
- “Polyspace® Server™ for Ada Product” on page 78

Polyspace Client for Ada Product

Code Metrics

Polyspace Metrics now generates Ada code metrics, giving you the number of:

- Protected shared variables
- Unprotected shared variables
- Files
- Lines of code
- Packages
- Packages that appear in with statements
- Subprograms that appear in with statements

You can view the metrics by:

- Using a Web browser to access the **Code Metrics** view of your project in Polyspace Metrics
- Examining the XML file that the software generates

For more information, see “Setting Up Verification to Generate Metrics” and “Review Code Metrics” in the *Polyspace Products for Ada User’s Guide*.

Saving Polyspace Metrics Review

Previously, when you saved your project (**Ctrl+S**) after a review of results from Polyspace Metrics, the software would save your comments and justifications both locally and in the Polyspace Metrics repository.

Now, if you save your project (**Ctrl+S**), the software saves your review to a local folder only. A new button  is available on the Run-Time Checks toolbar. If you click this button, the software saves your comments and justifications to a local folder *and* the Polyspace Metrics repository.

This feature allows you to upload your review to the repository only when you are satisfied that your review is, for example, correct and complete.

You can still configure your software to display the previous behavior.

For more information, see “Saving Review Comments and Justifications” in the *Polyspace Products for Ada User’s Guide*.

Support for Rational and Aonix Compilers

The software now provides support for the IBM® Rational® Apex and Aonix® compilers. For more information, see “Operating system target for Standard Libraries compatibility” in the *Polyspace Products for Ada Reference*.

Multi-Core Support

On multi-core computers, you can reduce verification time by specifying the use of core processors simultaneously to perform the verification. The software provides a new command line option `max-processes`, which uses a default value of 4. You can specify any value between 1 and 128. For more information, see “Number of processes for multiple CPU core systems” in the *Polyspace Products for Ada Reference*.

Generated Main with Explicit Tasks and Accept Statements

If you select the option `Generate a main` and there are explicit tasks in the source code, then task bodies are verified like subprograms and `accept` statements are not executed. After verification, code associated with the `accept` statements is gray. For more information, see “Generate a main” in the *Polyspace Products for Ada Reference*.

Compatibility Considerations. Previously, if there were explicit tasks and `accept` statements in the source code, a verification run could have generated red, green, or orange checks for code within the `accept` statements. Now, verification colors the code within these `accept` statements gray.

Enhancements in Run-Time Checks Perspective

Within the source code view, you can investigate checks with tooltips that provide range information about variables.

In addition, when you click a check, the software provides information about the check in the Review Details pane.

For more information, see “Using Range Information in Results Manager Perspective” and “Selecting a Check to Review” in the *Polyspace Products for Ada User’s Guide*.

Compatibility Considerations. Because of these enhancements, the IPT and VOA checks are no longer required, and the software does not generate these checks anymore.

UOVFL and UNFL Checks Removed

The software no longer generates UOVFL and UNFL checks, but generates OVFL checks in place of these checks.

Compatibility Considerations. Due to the replacement of UOVFL and UNFL checks by the OVFL check, the number of green checks may decrease when compared with previous versions of the software. For example, a combination of an orange OVFL and a green UNFL generated by a previous version may be replaced by a single orange OVFL.

NIV Checks for Universal Constants

The software now generates NIV checks for read operations on universal constants. If the constants are used in your code, the NIV checks are green. If the constants are in unreachable code, the NIV checks are gray.

Compatibility Considerations. This enhancement may change the check metrics and selectivity of the verification. The number of green and gray checks may be higher compared to the number generated by previous versions of the software.

Variable Range Inconsistency between Variable Access Pane and Tooltips

The range given for a variable in the Variable Access Pane (Variables View) can differ from the range given by tooltips on the reads of a variable in the Source code view. The range provided by the tooltip will be wider than the range given in the Variables View.

This difference is due to imprecision in the tooltip. The Variables View provides the correct range for the variable.

For example:

- Variables View states that variable *X* is in range [0..4000]
- Tooltip on a read of *X* states that the range is [0,7000].

In this case, [0..4000] is the correct range. The tooltip range is caused by imprecision that may be fixed in future releases.

Verification Time Limit

You can now specify a time limit for verifications using the `-timeout` option. If the verification does not complete within the specified time, the verification fails.

For more information, see “Verification Time Limit” in the *Polyspace Products for Ada Reference*.

Automatic Addition of Specifications for Selected Source Files

When launching a verification from the Eclipse IDE or the Polyspace Verification Environment, the software automatically searches for the package specifications associated with the selected source files, and adds them to the set of sources to verify.

As a result, the verification may contain more source files than you select.

Stubbed Tasks

Programs with stubbed tasks, such as those using Ada rendezvous, previously caused compilation errors. These programs can now be verified.

Scaling Issue for Large Applications with Nested Structures/Arrays

With R2011a, you may experience scaling problems for large applications that manipulate strongly nested structures or arrays. When verifying such applications, the verification may fail during the “Software Safety Analysis Level 0” phase. No verification results are generated, although the data dictionaries (Variable View and Call-Graph View) are accessible.

With previous releases, such applications could be verified, but the verification required several days to complete, and produced results with very low selectivity.

If you experience this problem, MathWorks recommends performing a unit-by-unit verification. For more information, see “Running Verification Unit-by-Unit” in the *Polyspace Products for Ada User’s Guide*.

Compatibility Considerations. Verification may fail for code that was previously verified with an earlier version of the product.

Product Name Change in Files and Folders

The Polyspace product name has changed from “PolySpace” to “Polyspace” in R2011a. This change impacts the name of all files and folders created by the software.

For example:

- PolySpace-Doc folder has changed to Polyspace-Doc
- PolySpace_XXXX.log file has changed to Polyspace_XXXX.log

Compatibility Considerations. If you have existing folders that use the previous product name (for example, PolySpace/PolySpace_Common) the R2011a installation will continue to use these existing folders. However, any files or folders created during or after installation will use the new name.

If you have any shortcuts or scripts that are case-sensitive, you should update them to use the correct name.

License Manager Support

The License Manager for Polyspace products has been upgraded to FLEXnet 11.9.

You may need to upgrade your FLEXnet server and daemon.

For more information, see “Polyspace License Installation” in the *Polyspace Installation Guide*.

Changes to Verification Results

- “Compatibility Considerations” on page 76
- “Write Access in Data Table with Main Generator and Protected Objects” on page 76
- “NIV for Variables Initialized at Declaration” on page 76
- “Range Error with greenhills OS Target” on page 76
- “UOVFL and UNFL Checks Removed” on page 77
- “NIV Checks for Universal Constants” on page 77
- “Constants Defined in Package System” on page 77
- “Initialization of Variables Declared and Assigned in Specs” on page 77
- “Parameterless Protected Procedure as Entry Point” on page 78

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Refer to the following sections for information on the specific changes.

Write Access in Data Table with Main Generator and Protected Objects. In previous releases, when using the `-main-generator` option, an incorrect write access could appear in the data-table when entries of protected objects were called.

In R2011a, the data-table no longer includes locations with critical section names.

There may be less write accesses with protected objects that have defined entries when you use the option `-main-generator`.

NIV for Variables Initialized at Declaration. In previous releases, there is no NIV check when a variable is initialized at the declaration.

In R2011a, verification always puts NIV checks on variables and constants. OVFL checks are not put on constants.

The total number of checks may change when compared with previous releases.

Range Error with greenhills OS Target. In previous releases, verification could report a false red when using `Ada.interrupts.Interrupt_ID` in source code designed for the greenhills compiler.

In R2011a, when you use the type `Ada.interrupts.Interrupt_ID`, and set the `-OS-target` to `greenhills`, the bounds of the type `Interrupt_ID` have changed.

Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

UOVFL and UNFL Checks Removed. The software no longer generates UOVFL and UNFL checks, but generates OVFL checks in place of these checks.

The number of checks may decrease compared to previous versions of the software.

NIV Checks for Universal Constants. The software now generates NIV checks for read operations on universal constants. If the constants are used in your code, the NIV checks are green. If the constants are in unreachable code, the NIV checks are gray.

Verification results may change when compared to previous versions of the software. The number of green and gray checks may be higher compared to the number generated by previous versions of the software.

Constants Defined in Package System. In previous releases, constants defined in package system were ignored.

For example:

```
Max_Binary_Modulus      : constant := 16#100000000#;  
Max_Nonbinary_Modulus  : constant := 16#FFFFFFFF#;
```

In R2011a, values of constants defined in the package system that are used in the program to be verified are taken into account for the verification. This may impact the results.

Initialization of Variables Declared and Assigned in Specs. In previous releases, verification could incorrectly report a red ZDV check for a variable of a type with default values, when the variable is global.

In R2011a, when using the option `-main-generator`, components with initial values of global variables of composite types that are not initialized are considered full range.

Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Parameterless Protected Procedure as Entry Point. In previous releases, when a parameterless protected procedure is used as an entry point via the option `-entry-points`, the verification fails.

In R2011a, parameterless protected procedures applied to a global object are now accepted as values of the option `-entry-points`.

Changes to Analysis Options

New Options.

- **Calculate code metrics** (`-code metrics`) – See “Code Metrics” on page 70.
- **Verification time limit** (`-timeout`) – See “Verification Time Limit” on page 73.
- **Number of processes for multiple CPU core systems** (`-max-processes`) – See “Multi-Core Support” on page 71.
- **Less range information** (`-less-range-information`) – See “Enhancements in Run-Time Checks Perspective” on page 72.

Changes to Existing Options. None.

Deprecated Options. None.

Polyspace Server for Ada Product

Code Metrics

Polyspace Metrics now generates Ada code metrics, giving you the number of:

- Protected shared variables
- Unprotected shared variables
- Files
- Lines of code
- Packages

- Packages that appear in with statements
- Subprograms that appear in with statements

You can view the metrics by:

- Using a Web browser to access the **Code Metrics** view of your project in Polyspace Metrics
- Examining the XML file that the software generates

For more information, see “Setting Up Verification to Generate Metrics” and “Review Code Metrics” in the *Polyspace Products for Ada User’s Guide*.

Saving Polyspace Metrics Review

Previously, when you saved your project (**Ctrl+S**) after a review of results from Polyspace Metrics, the software would save your comments and justifications both locally and in the Polyspace Metrics repository.

Now, if you save your project (**Ctrl+S**), the software saves your review to a local folder only. A new button  is available on the Run-Time Checks toolbar. If you click this button, the software saves your comments and justifications to a local folder *and* the Polyspace Metrics repository.

This feature allows you to upload your review to the repository only when you are satisfied that your review is, for example, correct and complete.

You can still configure your software to display the previous behavior.

For more information, see “Saving Review Comments and Justifications” in the *Polyspace Products for Ada User’s Guide*.

Multi-Core Support

On multi-core computers, you can reduce verification time by specifying the use of core processors simultaneously to perform the verification. The software provides a new command line option `–max-processes`, which uses a default value of 4. You can specify any value between 1 and 128.

For more information, see “Number of processes for multiple CPU core systems” in the *Polyspace Products for Ada Reference*.

Generated Main with Explicit Tasks and Accept Statements

If you select the option `Generate a main` and there are explicit tasks in the source code, then task bodies are verified like subprograms and `accept` statements are not executed. After verification, code associated with the `accept` statements is gray. For more information, see “Generate a main” in the *Polyspace Products for Ada Reference*.

Compatibility Considerations. Previously, if there were explicit tasks and `accept` statements in the source code, a verification run could have generated red, green, or orange checks for code within the `accept` statements. Now, verification colors the code within these `accept` statements gray.

Automatic Comment Import for Server Verifications

When you download results from the Polyspace server, the software now automatically imports any comments from results in the destination folder into the downloaded results (except for verifications using the option `-add-to-results-repository`).

As a result of this change, you can now download intermediate results for a verification running on the Polyspace server, and add or edit comments on those results. When you later download the final results, your comments are preserved.

You can also download and comment on a single unit of a unit-by-unit verification, even if other units are still pending in the server queue. When you download the final results (which overwrites the earlier results), your comments are preserved.

License Manager Support

The License Manager for Polyspace products has been upgraded to FLEXnet 11.9.

You may need to upgrade your FLEXnet server and daemon.

For more information, see “Polyspace License Installation” in the *Polyspace Installation Guide*.

Version 5.7 (R2011a) Polyspace Model Link Products

This table summarizes what's new in V5.7 (R2011a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

Polyspace Model Link SL Product

Overflow Check Customization

New options allow you to customize how OVFL checks are handled during verification. You can customize computation through overflow constructions, control the presence of overflow checks, and the dynamic behavior in case of a run-time error.

These options allow you to:

- Not generate OVFL checks on all computations (values are computed the same way processors do).
- Not truncate the value after an OVFL check, and carry on with wrapped values (OVFL check does not impact values during verification).

For more information, see “Detect overflows on (-scalar-overflows-checks)” and “Overflows computation mode (-scalar-overflows-behavior)” in the *Polyspace Products for C/C++ Reference*.

Compatibility Considerations. When using the new options, verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Main Generator Improvements

Enhanced main-generator to improve verification results for generated code.

The new main-generator is specifically designed for cyclic programs, to support generated code and Model-Based Design. The main generator considers the scope of:

- `_step`
- initialization functions
- calibrations

This improves verification results at the subsystem level.

Sample main:

```
initialize_parameters
call_initialization_functions
while (1){
    initialize_inputs
    call_step_functions
}
call_terminate_functions
```

For more information, see “Main Generation for Model Verification” in the *Polyspace Model Link Products User’s Guide*, and “Automatically Generating a Main” in the *Polyspace Products for C/C++ User’s Guide*.

Compatibility Considerations. Due to precision improvements, verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Data Range Management

Polyspace Model Link™ SL software now allows you to run different modes of verification, such as robustness vs. contextual, by specifying how the verification handles data ranges on model inputs, outputs, and tunable parameters within the model

Note The new Data Range Management settings require Simulink Version 7.4 (R2009b) or later.

For more information, see “Configuring Data Range Settings” in the *Polyspace Model Link Products User’s Guide*.

Block Annotation

You can now annotate blocks in your Simulink model to justify known run-time checks or coding-rule violations.

Annotating a block allows you to highlight and categorize checks identified in previous verifications, so that you can focus on new checks when reviewing your verification results.

The Polyspace Run-Time Checks perspective displays the information that you provide, and marks the checks as Justified.

For more information, see “Annotating Blocks to Justify Known Checks or Coding-Rules Violations” in the *Polyspace Model Link Products User’s Guide*.

Precision Improvements

Precision enhancements on arrays and functions provide improved Selectivity (less orange) in your verification results.

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Simulink Software Support

Added support for Simulink Version 7.7 (R2011a).

Version 8.0 (R2010b) Polyspace for C/C++ Products

This table summarizes what's new in V8.0 (R2010b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 86
- “Polyspace® Server™ for C/C++ Product” on page 110

Polyspace Client for C/C++ Product

Polyspace Graphical User Interface

Redesigned Polyspace graphical user interface replaces the Launcher and Viewer modules with a single, unified interface called the Polyspace verification environment (PVE).

You use the Polyspace verification environment to create Polyspace projects, launch verifications, and review verification results. The new interface also enables you to provide comments in the source code or in the results.

The Polyspace verification environment consists of three perspectives:

- “Project Manager Perspective” on page 87
- “Coding Rules Perspective” on page 88
- “Run-Time Checks Perspective” on page 89

Project Manager Perspective. The Project Manager perspective allows you to create projects, set verification parameters, and launch verifications.

Specify source files
and include folders

Specify
analysis options

The screenshot displays the Polyspace Project Manager interface. On the left, the Project Browser shows a tree view of the project structure, including source files and include folders. The main window is divided into two panes. The top pane shows the Configuration View for the project, with a search bar and a dropdown menu. The bottom pane shows the Configuration - [Training_Project / Verification (1) / Configuration / Training_Project] window, which contains a table of analysis options.

Name	Value	Internal name
Analysis options		
[-] General		
Send to PolySpace Server	<input checked="" type="checkbox"/>	-server
Add to results repository	<input type="checkbox"/>	-add-to-results-repository
Keep all preliminary results files	<input type="checkbox"/>	-keep-all-files
Calculate code metrics	<input type="checkbox"/>	-code-metrics
[-] Report Generation		
Report template name	C:\PolySpace\PolySpace_Common\...	-report-template
Output format	RTF	-report-output-format
[-] Target/Compilation		
[-] Compliance with standards		
[-] PolySpace inner settings		
[-] Precision/Scaling		
[-] Multitasking		

Below the configuration window, the Output Summary window is visible, showing a table of results:

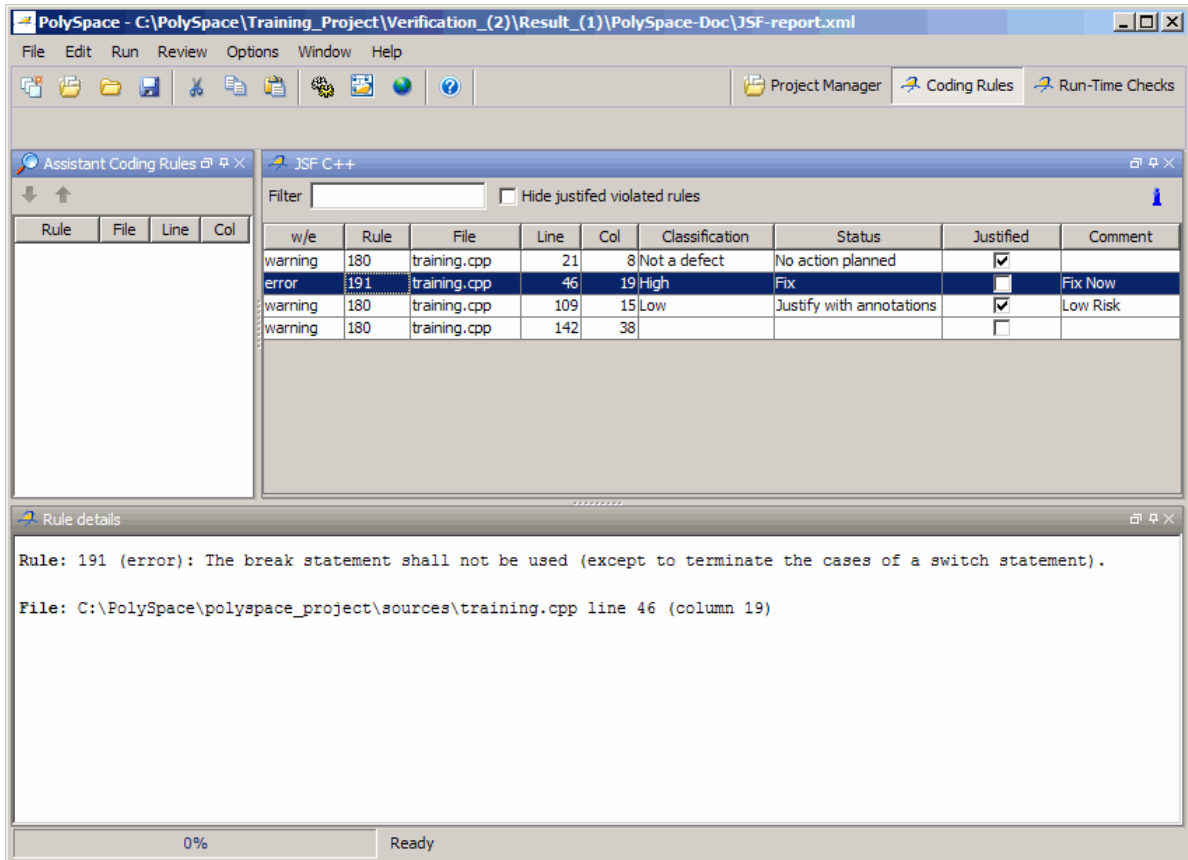

Class	Description	File	Line	Col
[Training_Project for C++ verification start at Jun 29, 2010...				
?	macro expansion depends on preprocessing directives.	mathcalls.h	55	
?	macro expansion depends on preprocessing directives.	mathcalls.h	57	

The bottom status bar shows the progress of the verification, currently at 0% and Ready.

Monitor progress and view logs

For information on using the Project Manager perspective, see “Setting Up a Verification Project” in the [Polyspace® Products for C User’s Guide](#) or *Polyspace Products for C++ User’s Guide*.

Coding Rules Perspective. The Coding Rules perspective allows you to review results from the Polyspace coding rules checker, to ensure compliance with established coding standards.

For information on using the Coding Rules perspective, see “Checking Coding Rules” in the *Polyspace Products for C/C++ User’s Guide* or “Checking Coding Rules” in the *Polyspace Products for C++ User’s Guide*.

Run-Time Checks Perspective. The Run-Time Checks perspective allows you to review verification results, comment individual checks, and track review progress.

Review Details
Review Statistics

The screenshot displays the Polyspace interface with the following components:

- Run-Time Checks:** A tree view on the left showing various checks (e.g., NNT, EXC) with their status (Justified, Fix Now, etc.).
- Review Details:** A central window showing the source code for `training.cpp / MathUtils::Recursion_caller()` at line 124, column 13. It includes a classification (High), status (Fix), and a comment: "the training.MathUtils::Recursion(int*) call never terminates".
- Review Statistics:** A table in the top right showing the progress of various checks:

Checking progress	Count	Progress
Red NTC justified / to justify	0/1	0
Red justified / to justify	0/2	0
Gray justified / to justify	0/1	0
Orange justified / to justify	1/6	16
Software reliability indicator	79/88	89
- Source:** A window showing the source code for `_polyspace_main.cpp`, including the `Recursion_caller()` function.
- Call Hierarchy:** A tree view showing the call stack, including `training.MathUtils::Recursion_caller()` and `_polyspace_main::main`.
- Variable Access:** A window showing the variables used in the current scope, such as `polyspace_main::polyspace_0`.

Run-Time Checks
Source code
Variable Access
Call Hierarchy

For information on using the Run-Time Checks perspective, see “Reviewing Verification Results” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Permissiveness on File and Folder Names

Polyspace software now allows space characters in the names of Projects, source files, and folders, as well as in option arguments.

In addition, multiple source files with the same name are now allowed.

Note Non-ASCII characters in file names are not supported.

MISRA C++ Coding Rules Support

Enhanced MISRA C++ checker supports all statically enforceable MISRA-C++ coding rules.

Polyspace software can now check all possible C++ programming rules defined by the MISRA® C++ coding standard. The Polyspace MISRA C++ checker provides messages when MISRA C++ rules are not respected. Most messages are reported during the compile phase of a verification.

Note The Polyspace MISRA C++ checker is based on MISRA C++:2008 – “Guidelines for the use of the C++ language in critical systems.” For more information on these coding standards, see <http://www.misra-cpp.com>.

For more information, see “Checking Coding Rules”, in the *Polyspace Products for C++ User’s Guide*.

Coding Rules Checker Enhancements

The coding rules checker for MISRA C, MISRA C++, and JSF C++ coding standards has been enhanced as follows:

- You can now set all supported coding rules to any state: Error, Warning, or Off.
- The **Files and Folders to ignore** (-includes-to-ignore) option now supports the keyword “all,” allowing you to exclude all included files from coding rules checking.

- The new Coding Rules perspective allows you to review and categorize coding rule violations, and provide comments in the results to justify violations.
- The MISRA C checker now allows you to automatically select two recommended subsets of coding rules (SQ0-subset1, and SQ0-subset2), in addition to creating a custom subset.

For more information, see “Checking Coding Rules” in the *Polyspace Products for C/C++ User’s Guide* or “Checking Coding Rules”, in the *Polyspace Products for C++ User’s Guide*.

Code Metrics (for C)

Code metric support, including cyclomatic number and other HIS metrics.

Polyspace verification can now generate metrics about code complexity, which are based on the Hersteller Initiative Software (HIS) standard.

These metrics include:

- **Project metrics** – including number of recursions, number of include headers, and number of files.
- **File metrics** – including comment density, and number of lines.
- **Function metrics** – including cyclomatic number, number of static paths, number of calls, and Language scope.

When you run a verification with the `-calculate-code-metrics` option enabled, you can view software quality metrics data in the Polyspace Metrics Web interface (**Code Metrics** view), or by running a Software Quality Objectives report from the Polyspace verification environment.

Verification	Project Metrics				File Metrics				Function Metrics								Software Quality Objectives		
	Files	Header Files	Recursion	Direct Recursion	Lines	Lines without Comments	Comment Density	Cyclomatic Complexity	Language Scope	Paths	Calling Functions	Called Functions	Instructions	Call Levels	Function Parameters	Goto Statements	Return Points	Quality Status	Level
V4	6	7	1	1	755	463	FAIL	PASS	PASS	112	PASS	PASS	186	PASS	PASS	0	PASS	FAIL	SQ0-1
@_polysp																			SQ0-1
@example					248	136	16.0%	PASS	PASS	45	PASS	PASS	61	PASS	PASS	0	PASS	FAIL	SQ0-1
@initialisat					108	71	4.0%	PASS	PASS	13	PASS	PASS	20	PASS	PASS	0	PASS	FAIL	SQ0-1
@main.c					58	45	4.0%	PASS	PASS	6	PASS	PASS	22	PASS	PASS	0	PASS	FAIL	SQ0-1
@single_file					140	80	19.0%	PASS	PASS	23	PASS	PASS	36	PASS	PASS	0	PASS	FAIL	SQ0-1
@tasks1.c					117	82	7.0%	PASS	PASS	13	PASS	PASS	32	PASS	PASS	0	PASS	FAIL	SQ0-1
@tasks2.c					84	49	11.0%	PASS	PASS	12	PASS	PASS	15	PASS	PASS	0	PASS	FAIL	SQ0-1

The software generates numeric values or pass/fail results for various metrics.

For more information, see “Software Quality with Polyspace Metrics” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Filtering Orange Checks Caused by Input Data (New for C++)

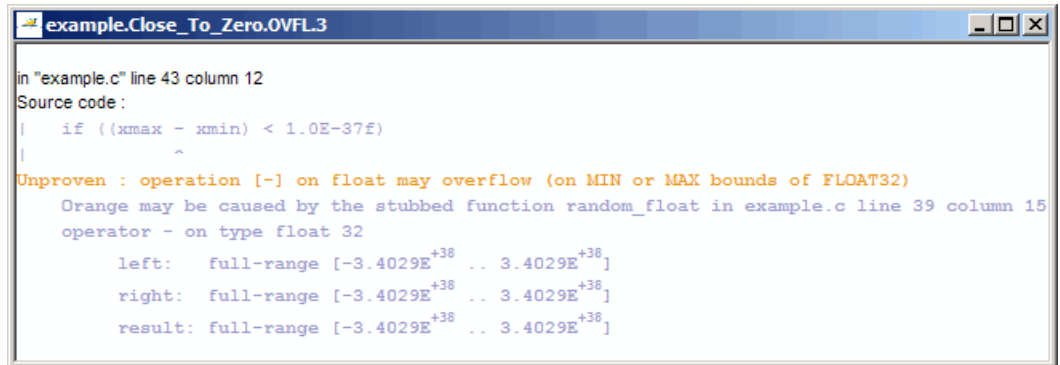

Polyspace verification now identifies orange checks caused by input data for C++ code, in addition to C code. The software provides additional information on these orange checks, and allows you to hide them in the Run-Time Checks perspective.

Note Although this type of orange check could reveal a bug, they usually do not.

Verification can identify orange checks caused by:

- Stubs
- Main-generator calls
- Volatile variables
- Extern variables
- Absolute address

When the software identifies this type of orange check, the Run-Time Checks perspective provides information on its cause.

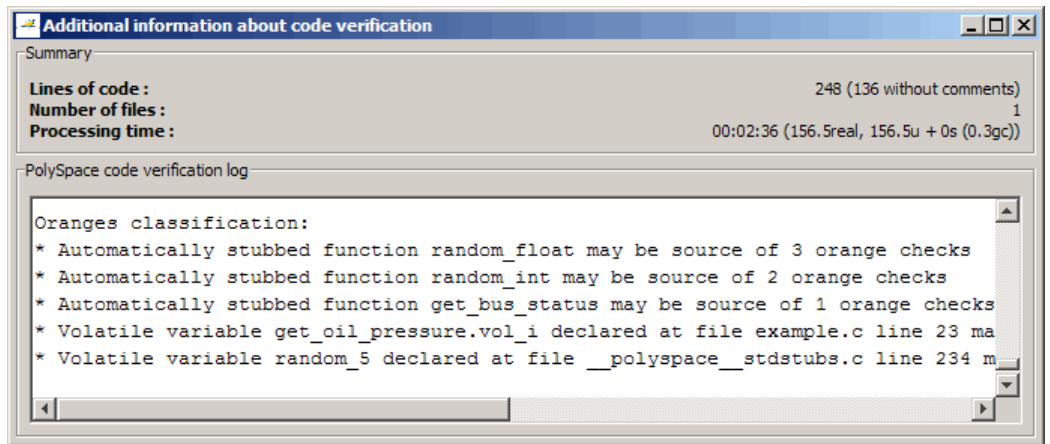

```

example.Close_To_Zero.OVFL.3

in "example.c" line 43 column 12
Source code :
|   if ((xmax - xmin) < 1.0E-37f)
|       ^
Unproven : operation [-] on float may overflow (on MIN or MAX bounds of FLOAT32)
Orange may be caused by the stubbed function random_float in example.c line 39 column 15
operator - on type float 32
    left:  full-range [-3.4029E+38 .. 3.4029E+38 ]
    right: full-range [-3.4029E+38 .. 3.4029E+38 ]
    result: full-range [-3.4029E+38 .. 3.4029E+38 ]

```

The Polyspace code verification log file also lists possible sources of imprecision for orange checks.

```

Additional information about code verification

Summary
Lines of code :                248 (136 without comments)
Number of files :              1
Processing time :              00:02:36 (156.5real, 156.5u + 0s (0.3gc))

PolySpace code verification log

Oranges classification:
* Automatically stubbed function random_float may be source of 3 orange checks
* Automatically stubbed function random_int may be source of 2 orange checks
* Automatically stubbed function get_bus_status may be source of 1 orange checks
* Volatile variable get_oil_pressure.vol_i declared at file example.c line 23 ma
* Volatile variable random_5 declared at file __polyspace_stdstubs.c line 234 m

```

In addition, you can now hide these types of orange checks in the Run-Time Checks perspective. When using Expert mode, click the **Color filter** icon, then clear the **Orange checks possibly impacted by inputs** option.

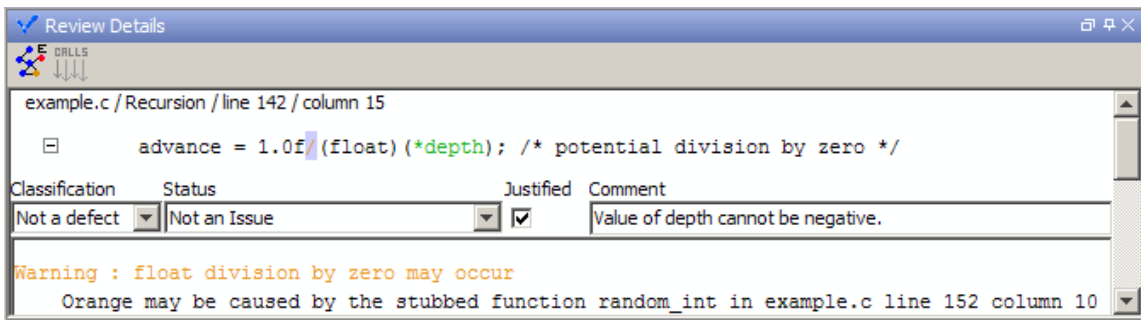

The software hides orange checks impacted by inputs.

For more information, see “Working with Orange Checks Caused by Input Data” in the *Polyspace Products for C++ User’s Guide*.

New Options to Classify Run-Time Checks and Coding Rules Violations

When reviewing results in the Run-Time Checks perspective or the Coding Rules perspective, the software now provides additional options for classifying checks

After you review the check, you can specify the following:

- **Classification** – Select an option to describe the seriousness of the issue.
- **Status** – Select an option to describe how you intend to address the issue.
- **Justified** – Select the check box to indicate that you have justified this check or rule violation.

- **Comment** – Enter additional information about the check

The software provides predefined values for Classification and Status. You can also define your own statuses.

In addition to reviewing checks through the user interface, you can place comments in your code that highlight and categorize checks identified in previous verifications. The software displays the information that you provide within your code comments, and marks the checks as **Justified**.

For more information, see “Reviewing and Commenting Checks” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Compatibility Considerations. The syntax for code comments has changed to reflect the new options for categorizing checks.

The syntax for run-time checks is now:

```
/* polyspace<RTE:RTE1 : [Classification] : [Status] > [Comment] */
```

The syntax for coding-rule violations is now:

```
/* polyspace<JSF:Rule1 : [Classification] : [Status] > [Comment] */
```

If you placed comments in your code using the previous syntax, the comments will still appear in your results, but the text may be displayed in different columns.

For more information on code comments, including full syntax, see “Highlighting Known Coding Rule Violations and Run-Time Errors” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Japanese and Korean Text in Comments

Japanese and Korean characters are now supported for comments in results review.

For more information, see “Reviewing Checks Progressively” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Pointer Information in the Run-Time Checks Perspective

Enhanced ToolTip messages on pointers to improve understanding of problems with the pointer.

For example, messages on offset in the allocated buffer now indicate if the pointer is inside its bounds, in addition to giving raw numbers.

For more information, see “Using Pointer Information in Results Manager Perspective” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Main Generation in C++

Enhanced main generation options in C++ allow you to use both main generator and class analyzer modes at the same time (the options `-class-analyzer` and `-main-generator-calls` can be used simultaneously).

In addition, the options **Select methods called by the generated main** (`-class-analyzer-calls`), and **Function calls** (`-main-generator-calls`) are enhanced to provide more flexibility in configuring what functions are called. by the generated main.

The default behavior of the main generator is now as follows:

- If you set the **Class name** (`-class-analyzer`) option to `all` or `custom`, and set `-class-analyzer-calls`, then the option `-main-generator-calls` is automatically set to `unused`, unless you explicitly set another value for `-main-generator-calls`.
- Setting the **Function calls** (`-main-generator-calls`) option to `unused`, `all`, or `custom` automatically sets `-class-analyzer` to `none`, unless you explicitly set the `-class-analyzer` option.

For more information, see “Generate a main (`-main-generator`)” in the *Polyspace Products for C++ Reference*.

Compatibility Considerations. If you use scripts that specify a value for the option `-class-analyzer-calls`, you may need to update your scripts to reflect the new option arguments. The new syntax is:

```
-class-analyzer-calls [ all | unused | inherited_all |
```

```
inherited_unused | custom ]
```

Where:

- all corresponds to the previous argument "default."
- inherited_unused corresponds to previous argument "inherited."
- inherited_all means every inherited methods will be called by the generated main.

Multiple Functions Called Before Main

The option **First functions to call** (-function-called before main) now accepts a list of multiple functions, instead of just a single function.

For more information, see “Functions called after loop (-function-called-after-loop)” in the *Polyspace Products for C/C++ Reference* or “Generate a main (-main-generator)” in the *Polyspace Products for C++ Reference*.

Support for C99 Extensions (C)

Partial support of C99 extensions.

A new option, -allow-language-extensions, enables verification to accept a subset of common C language constructs and extended keywords, as defined by the C99 standard or supported by many compilers.

When you select this option, the following constructs are supported:

- Designated initializers (labeling initialized elements)
- Compound literals (structs or arrays as values)
- Boolean type (_Bool)
- Statement expressions (statements and declarations inside expressions)
- typeof constructs
- Case ranges
- Empty structures

- Cast to union
- Local labels (`__label__`)
- Hexadecimal floating-point constants
- Extended keywords, operators, and identifiers (`_Pragma`, `__func__`, `__const__`, `__asm__`)

In addition, when you use this option, the software ignores the following extended keywords:

- `near`
- `far`
- `restrict`
- `__attribute__(X)`
- `rom`

For more information, see “Allow language extensions (-allow-language-extensions)” in the *Polyspace Products for C/C++ Reference*.

New Target Processor Support (C)

Added support for 64-bit target.

The Target processor type (-target) option now supports the target `x86_64`, allowing the verification to emulate 64-bit processors.

For more information, see “Predefined Target Processor Specifications” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Default Target Processor

The default setting of the Target processor type (-target-processor) option has changed from SPARC to i386.

Compatibility Considerations. If you launch verifications without specifying a value for this option, the default value has changed. Therefore, your verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Default Operating System Target

The default setting of the Operating system target for Polyspace stubs (-OS-target) option has changed from Solaris to Linux.

Compatibility Considerations. If you launch verifications without specifying a value for this option, the default value has changed. Therefore, your verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Include Folders Added to Verification by Default

Polyspace software now automatically adds the following standard include folders after any includes you specify:

- *PolySpace_Install/Verifier/include/include-gnu*
- *PolySpace_Install/Verifier/include/include-gnu/next*

The path to these folders will be printed in the log file at the beginning of the compilation.

Compatibility Considerations. The total number of checks in your verification may change when compared to previous releases, if you did not previously include these folders.

Operating System Support

Added support for the Windows® 7 operating system.

Solaris™ operating system is no longer supported for new installations.

For more information, see the *Polyspace Installation Guide*.

Changes to Verification Results

- “Compatibility Considerations” on page 100
- “New NIP Check on Pointer to Member Function” on page 100
- “Generated Main Calls in the Main Loop and init Function” on page 101
- “INF Checks Replaced by Value on Range (C++)” on page 102
- “Value on Range (VOR) Values in pass0 Results” on page 102
- “Changes in Behavior of Inline and Sensitivity Context Options” on page 103
- “Permissiveness on Delete of Pointer to Incomplete Class” on page 103

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Refer to the following sections for information on the specific changes.

New NIP Check on Pointer to Member Function. New NIP check introduced on variables corresponding to a pointer to member function when verifying the pointer.

Previously, pointers to member functions were translated into a structure composed of 4 fields. In this release, these 4 fields are checked and the information is merged into a NIP.

For example (in R2010a and earlier):

```
struct A {
    virtual void f() { } ;
    void g() {} ;
};

int main()
{
    A a ;
    void (A::*pmf)() ;
    volatile int alea ;
```

```

if (alea)
    assert(pmf != 0) ; // RED NIV located on '(' => expected a NIP

if (alea)
    (a.*pmf)(); // no red, only grey

if (alea)
    pmf = &A::f ;
else
    pmf = &A::g ;

assert(pmf != 0) ; // spurious info on '(', green NIV instead of NIP

(a.*pmf)(); //

}

```

In R2010b, some NIV checks may change to NIP checks (on pointer to member function) The Selectivity rate of your results may change when compared to previous versions of the software.

Generated Main Calls in the Main Loop and init Function. The call of a function given to the option `-function-called-before-main` is now removed from the main-generator loop.

In previous releases, when an "init" function was called before the main loop, it was also called in the main loop. For example:

```

void main(void)
{
    /* ***** *
    * Initialization of global variables with random *
    * ***** */

    /* ***** *
    * Call of initialization function *
    * ***** */
    {

```

```
        /* call it */
        init();
    }
    while (PST_TRUE())
    {
        /* ***** *
        * Call of functions *
        * ***** */
        if (PST_TRUE())
        {

            /* call it */
            init();
        }
        if (PST_TRUE())
        {

            /* call it */
            foo();
        }
    }
}
```

This init function is now removed from the main-generator loop.

The Selectivity rate of your results may change when compared to previous versions of the software.

INF Checks Replaced by Value on Range (C++). When transforming C checks into C++ checks, the software changes INF checks into a new value on range category (VOBJ) and displays them like other value on range (VOR) information in the Run-Time Checks perspective.

The number of checks in your results may decrease when compared to previous releases.

Value on Range (VOR) Values in pass0 Results. Verification results now give value on range values (intervals) computed during pass0.

In previous releases, value on range values in `pass0` could only be constants or the type `full-range`.

When reviewing `pass0` results, value on range tooltips will now contain more information than in previous releases.

Changes in Behavior of Inline and Sensitivity Context Options.

Verification now displays a warning if you specify a nonexistent function as an argument of the options **Inline** (`-inline`) or **Sensitivity context** (`-context-sensitivity`). The option is ignored, and verification continues.

In previous releases, specifying a nonexistent function caused the verification to stop.

Permissiveness on Delete of Pointer to Incomplete Class. Polyspace verification now gives a warning when it detects a delete on a pointer with incomplete class, unless you set the Dialect (`-dialect`) option to `iso`. If you specify the `iso` dialect, the verification will raise a compilation error.

In previous releases, a delete on a pointer with incomplete class implied a crash, and produced an error. For example:

```
#include <memory>

typedef class BaseClass;
typedef class Container
{
private:
    std::auto_ptr<BaseClass> data;

public:
    Container(std::auto_ptr<BaseClass> p) : data(p) {};
};
```

In R2010b, this code will be accepted with a warning, except in `iso` mode, where it will raise a compilation error.

Changes to Coding Rules Checker Results

- “Compatibility Considerations” on page 104
- “MISRA and JSF Violations No Longer Reported on Internal Include Folders” on page 104
- “MISRA-C++ Rule 2-10-2 Violations on Type Hidden by Using Directive” on page 104
- “MISRA-C++ Rules 2-10-4 and 2-10-6 Violations on Templates” on page 105
- “MISRA-C++ Rule 3-1-1 Duplicate Violations” on page 106
- “MISRA-C++ Rule 3-4-1 Violations on Local Variables” on page 106
- “MISRA-C++ Rule 7-4-3 Violations on Assembly Language” on page 107
- “MISRA-C++ Rule 12-1-1, 12-1-2, and 12-8-2 Violations” on page 107
- “JSF Rule AV-136 Violations on Local Variables” on page 109

Compatibility Considerations. Due to changes in the coding rules checker, the number of coding rule violations may change when compared to previous versions of the software.

Refer to the following sections for information on the specific changes.

MISRA and JSF Violations No Longer Reported on Internal Include Folders. The coding rules checker now ignores the Include folders provided with the product (`include-gnu/` and `include-linux/`).

No violations are reported for identifiers appearing in hidden files, even if these files are hidden in a hard-coded way.

The total number of violations reported by the coding rules checker may decrease when compared to previous releases, since any violations within the include files are no longer reported.

MISRA-C++ Rule 2-10-2 Violations on Type Hidden by Using Directive. The MISRA-C++ checker is more precise on violations of rule 2-10-2, “Identifiers declared in an inner scope shall not hide an identifier declared in an outer scope,” when the type is hidden by a using directive on the same type.

For example:

```
#include "misra.h"

namespace ns1 {
    class A    // No Violation since the type A is declared only here.
    {
        A & operator= ( A const & rhs );
    public:
        A ( );
        virtual void bar( ) = 0;

    };
}
using ns1::A;
namespace ns2 {
    class D : public A
    {
    public:
        virtual void foo( ) = 0;
        D ( ) : A()
        {
        }
    };
}
```

In previous releases, the MISRA-C++ checker incorrectly reported a violation on the type A.

You may see fewer violations of rule 2-10-2 in MISRA C++ reports, when compared with previous releases.

MISRA-C++ Rules 2-10-4 and 2-10-6 Violations on Templates. The coding rules checker no longer reports violations of MISRA-C++ Rules 2-10-4 “A class, union or enum name (including qualification, if any) shall be a unique identifier,” and 2-10-6 “If an identifier refers to a type, it shall not also refer to an object or a function in the same scope” when the template class is present in the code. A violation is reported only for explicit specialization (which has its own declaration).

You may see fewer violations of rules of 2-10-4 and 2-10-6 in MISRA C++ reports, when compared with previous releases.

MISRA-C++ Rule 3-1-1 Duplicate Violations. The coding rules checker no longer reports duplicate violations of MISRA-C++ Rule 3-1-1 "It shall be possible to include any header file in multiple translation units without violating the One Definition Rule."

In previous releases, the coding rules checker sometimes incorrectly reported this violation multiple times on the same function.

You may see fewer violations of rule 3-1-1 in MISRA C++ reports, when compared with previous releases.

MISRA-C++ Rule 3-4-1 Violations on Local Variables. The MISRA-C++ coding rules checker is more precise on violations of Rule 3-4-1, "An identifier declared to be an object or type shall be defined in a block that minimizes its visibility."

For example, the coding rules checker no longer reports violations of rule 3-4-1 for the following code:

```
volatile int32_t rd;
if (rd != 0) {
    int32_t i;
    {
        int32_t j;
        {
            goto L1;
        }
        rd = j;
    }
    rd = i;
}
```

In previous releases, the coding rules checker incorrectly reported a violation of rule 3-4-1 for the variable rd.

You may see fewer violations of rule 3-4-1 in MISRA C++ reports.

MISRA-C++ Rule 7-4-3 Violations on Assembly Language. The MISRA-C++ checker no longer reports errors for rule 7-4-3, “Assembly language shall be encapsulated and isolated,” for certain compliant constructions. For example:

```
void Delay_a ( void )
{
    asm ( "NOP" );    // Compliant
}
```

In previous releases, the MISRA-C++ checker incorrectly reported a violation of rule 7-4-3 for this code.

You may see fewer violations of rule 7-4-3 in MISRA C++ reports.

MISRA-C++ Rule 12-1-1, 12-1-2, and 12-8-2 Violations. The MISRA-C++ checker is more precise on violations of rule 12-1-1, “An object’s dynamic type shall not be used from the body of its constructor or destructor,” rule 12-1-2 “All constructors of a class should explicitly call a constructor for all of its immediate base classes and all virtual base classes,” and rule 12-8-2 “The copy assignment operator shall be declared protected or private in an abstract class.”

Violations of rule 12-1-1 are now reported on destructors. For example:

```
class C2
{
public:
    ~C2 ( )
    {
        typeid ( C2 ); // New 12-1-1 violation reported here
        C2::foo ( );
        foo ( );
        dynamic_cast< C2* > ( this );
    }
    virtual void foo ( );
    C2 ( )
    {
        typeid ( C2 ); // 12-1-1 violation reported
        C2::foo ( );
        foo ( );
    }
}
```

```
        dynamic_cast< C2* > ( this );
    }
};
```

In addition, violations of these rules are now reported in the following cases:

- On `typeid` on any class with virtual function in itself or in one of its base.
- On `typeid` on pointer `this` or conversion of pointer `this`.
- On `dynamic_cast` on pointer `this` or conversion of pointer `this`.

For example, in the following code violations are now reported on `typeid` if the type is struct:

```
struct S2
{
    ~S2 ( )
    {
        typeid ( S2 ); // New violation reported here
        S2::foo ( );
        foo ( );
        dynamic_cast< S2* > ( this );
    }
    virtual void foo ( );
    S2 ( )
    {
        typeid ( S2 ); // New violation reported here
        S2::foo ( );
        foo ( );
        dynamic_cast< S2* > ( this );
    }
};
```

In previous releases, the MISRA-C++ checker did not report these violations.

You may see additional violations of rule 12-1-1, 12-1-2, and 12-8-2 in MISRA C++ reports, when compared with previous releases.

JSF Rule AV-136 Violations on Local Variables. The JSF C++ coding rules checker is more precise on violations of Rule 136, “Declarations should be at the smallest feasible scope.”

For example, the coding rules checker no longer reports violations of rule 136 for the following code:

```
volatile int32_t rd;
if (rd != 0) {
    int32_t i;
    {
        int32_t j;
        {
            goto L1;
        }
        rd = j;
    }
    rd = i;
}
```

In previous releases, the coding rules checker incorrectly reported a violation of rule 136 for the variable `rd`.

You may see fewer violations of rule 136 in JSF C++ reports.

Polyspace Server for C/C++ Product

Polyspace Metrics Web Interface

A web-based tool for software development managers, quality assurance engineers, and software developers, which allows you to do the following in software projects:

- Evaluate software quality metrics
- Monitor the variation of code metrics, coding rule violations, and run-time checks through the lifecycle of a project
- View defect numbers, run-time reliability of the software, review progress, and the status of the code with respect to software quality objectives.

In addition, if you have the Polyspace Client™ for C/C++ product installed on your computer, you can drill down to coding rule violations and run-time checks in the Polyspace verification environment. This allows you to:

- Review coding rule violations
- Review run-time checks and, if required, classify these checks as defects

For more information, see *Software Quality with Polyspace Metrics* in the *Polyspace Products for C/C++ User's Guide* or *Polyspace Products for C++ User's Guide*.

Automatic Verification

Configure verifications to start automatically and periodically, for example, at a specific time every night. At the end of each verification, the software stores results in a results repository and updates the metrics for your software project. You can also configure the software to send you an email at the end of the verification. This email contains links to results, compilation errors, run-time errors, or processing errors.

For more information, see *Specifying Automatic Verification* in the *Polyspace Products for C/C++ User's Guide* or *Polyspace Products for C++ User's Guide*.

Operating System Support

Added support for the Windows 7 operating system.

Solaris operating system is no longer supported for new installations.

For more information, see the *Polyspace Installation Guide*.

Version 6.0 (R2010b) Polyspace for Ada Products

This table summarizes what's new in V6.0 (R2010b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 112
- “Polyspace® Server™ for Ada Product” on page 118

Polyspace Client for Ada Product

Polyspace Graphical User Interface

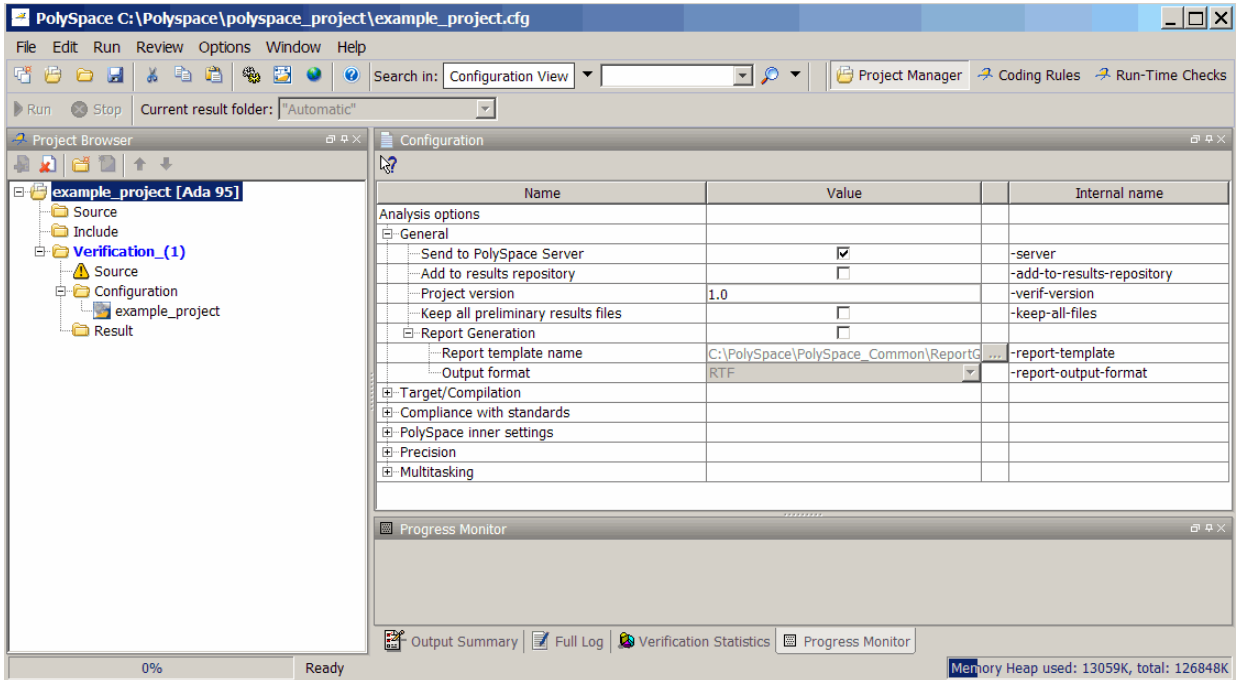

Redesigned Polyspace graphical user interface replaces the Launcher and Viewer modules with a single, unified interface called the Polyspace verification environment (PVE).

You use the Polyspace verification environment to create Polyspace projects, launch verifications, and review verification results. The new interface also enables you to provide comments in the source code or in the results.

The Polyspace verification environment consists of two perspectives:

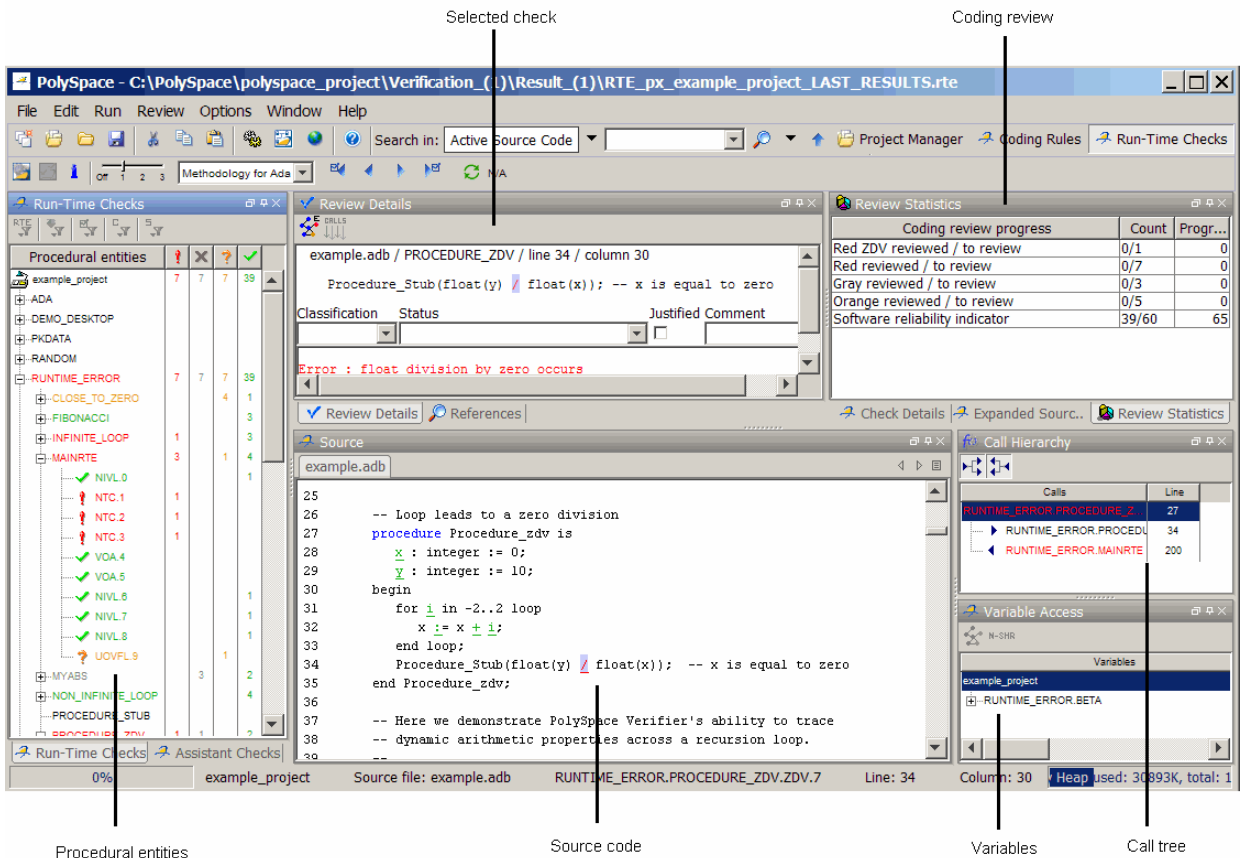

- “Project Manager Perspective” on page 113
- “Run-Time Checks Perspective” on page 114

Project Manager Perspective. The Project Manager perspective allows you to create projects, set verification parameters, and launch verifications.

For information on using the Project Manager perspective, see “Setting Up a Verification Project” in the *Polyspace Products for Ada User’s Guide*.

Run-Time Checks Perspective. The Run-Time Checks perspective allows you to review verification results, comment individual checks, and track review progress.

For information on using the Run-Time Checks perspective, see “Reviewing Verification Results” in the *Polyspace Products for Ada User’s Guide*.

Data Range Specifications

The Data Range Specifications (DRS) feature allows you to set constraints on data ranges using a text file. With this text file, you can specify data ranges for global variables, stubbed functions and procedures, and function call inputs.

For more information, see *Specifying Data Ranges for Variables, Functions, and Procedures* in the *Polyspace Products for Ada User's Guide*.

Extended Support for Tasks

You can now verify Ada code that contains the following task-related features :

- Pointers to explicit tasks
- Private task types
- Tasks with discriminants
- Entry families
- Explicit tasks declared in a package – you can now verify the package with the `-main-generator` option

Previously, these features would generate errors during a verification.

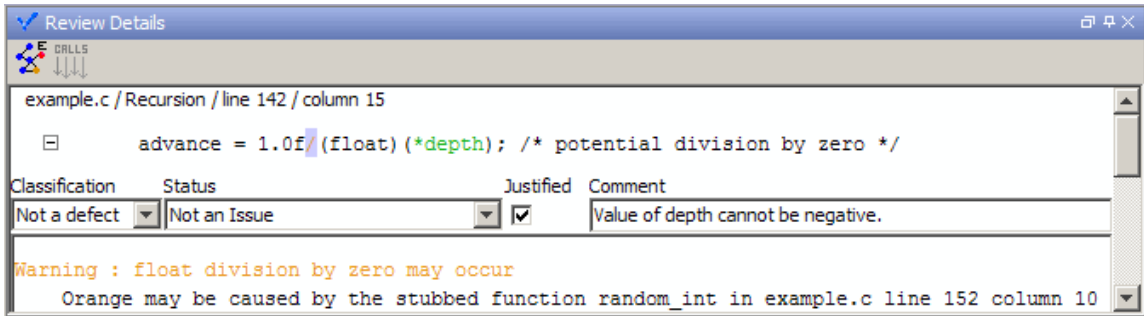

Preprocessor Macros for Compilation

You can now specify, with the `-D` option, the use of preprocessor macros in code compilation. The `-U` option, which nullifies this `-D` option, is also available.

For more information, see “Defined Preprocessor Macros” (`-D` compiler-flag) and “Undefined Preprocessor Macros” (`-U` compiler-flag) in the *Polyspace Products for Ada Reference Guide*.

New Options to Classify Run-Time Checks

When reviewing results in the Run-Time Checks perspective, the software now provides additional options for classifying checks

After you review the check, you can specify the following:

- **Classification** – Select an option to describe the seriousness of the issue.
- **Status** – Select an option to describe how you intend to address the issue.
- **Justified** – Select the check box to indicate that you have justified this check.
- **Comment** – Enter additional information about the check

The software provides pre-defined values for Classification and Status. You can also define your own statuses.

In addition to reviewing checks through the user interface, you can place comments in your code that highlight and categorize checks identified in previous verifications. The software displays the information that you provide within your code comments, and marks the checks as **Justified**.

For more information, see “Reviewing and Commenting Checks” in the *Polyspace Products for Ada User’s Guide*.

Compatibility Considerations. The syntax for code comments has changed to reflect the new options for categorizing checks.

The syntax for run-time checks is now:

```
-- polyspace<RTE:RTE1 : [Classification] : [Status] > [Comment]
```

If you placed comments in your code using the previous syntax, the comments will still appear in your results, but the text may be displayed in different columns.

For more information, see “Syntax for Run-Time Errors” in the *Polyspace Products for Ada User’s Guide*.

Permissiveness on File and Folder Names

Polyspace software now allows space characters in the names of Projects, source files, and folders, as well as in option arguments.

In addition, multiple source files with the same name are now allowed.

Note Non-ASCII characters in file names are not supported.

Default Target Processor

The default setting of the Target processor type (`-target-processor`) option has changed from SPARC to i386.

Compatibility Considerations. If you launch verifications without specifying a value for this option, the default value has changed. Therefore, your verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Operating System Support

Added support for the Windows 7 operating system.

Solaris operating system is no longer supported for new installations.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for Ada Product

Polyspace Metrics Web Interface

A web-based tool for software development managers, quality assurance engineers, and software developers, which allows you to do the following in software projects:

- Evaluate software quality metrics
- Monitor the variation of code metrics, and run-time checks through the lifecycle of a project
- View defect numbers, run-time reliability of the software, review progress, and the status of the code with respect to software quality objectives.

In addition, if you have the Polyspace Client for Ada product installed on your computer, you can drill down to run-time checks in the Polyspace verification environment. You can review these run-time checks and, if required, classify these checks as defects.

For more information, see Software Quality with Polyspace Metrics in the *Polyspace Products for Ada User's Guide*.

Automatic Verification

Configure verifications to start automatically and periodically, for example, at a specific time every night. At the end of each verification, the software stores results in a results repository and updates the metrics for your software project. You can also configure the software to send you an email at the end of the verification. This email contains links to results, compilation errors, run-time errors, or processing errors.

For more information, see *Specifying Automatic Verification in the Polyspace Products for Ada User's Guide*.

Operating System Support

Added support for the Windows 7 operating system.

Solaris operating system is no longer supported for new installations.

For more information, see the *Polyspace Installation Guide*.

Version 5.6 (R2010b) Polyspace Model Link Products

This table summarizes what's new in V5.6 (R2010b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Model Link™ SL Product” on page 120
- “Polyspace® UML Link™ RH Product” on page 121

Polyspace Model Link SL Product

Data Range Management

Improved DRS generation in the Polyspace Model Link SL product using the Embedded Coder™ codeInfo feature.

DRS generation can now:

- Locate input ports, and gather min/max data from the MATLAB workspace or blocks in the model to use as constraints.
- Locate output ports, and gather min/max data from the MATLAB workspace or blocks in the model to use as properties to be proven.

For more information, see the *Polyspace Model Link Products User's Guide*.

Verification Options Set by Default

The following options are no longer set by default when you launch a verification.

- `-ignore-float-rounding`
- `-allow-ptr-arith-on-struct`

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Changes to verification results will be more significant when compared to release R2008b or earlier, and less significant with R2009a or later.

Simulink Software Support

Added support for Simulink Version 7.6 (R2010b).

Polyspace UML Link RH Product

Rhapsody Support

Added support for Telelogic® Rhapsody® Version 7.4.

Version 7.2 (R2010a) Polyspace for C/C++ Products

This table summarizes what's new in V7.2 (R2010a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 122
- “Polyspace® Server™ for C/C++ Product” on page 146

Polyspace Client for C/C++ Product

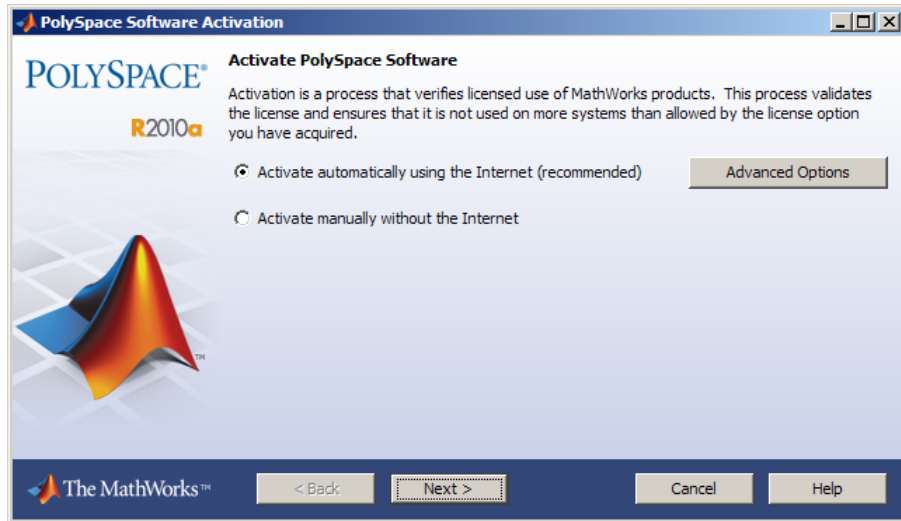

License Activation

Polyspace products now support the MathWorks software activation mechanism.

Activation is a process that verifies licensed use of MathWorks products. The process validates your product licenses and ensures that they are used correctly. You must complete the activation process before you can use Polyspace software.

Note If you are using Designated Computer (Individual) licenses, you must activate the license for each Polyspace system individually. However, if you are using Concurrent licenses for multiple Polyspace systems, you do not need to activate each Polyspace system. You activate the license once (for the FLEXnet license server), then provide license files for each Polyspace system.

The easiest way to activate the software is to log in to your MathWorks Account during installation. At the end of the installation process, the Polyspace Software Activation dialog box opens.

Follow the prompts in the Polyspace Software Activation dialog box to complete the activation process.

If you do not have a MathWorks account, you can create one during the activation process. To create an account, you must have an Activation Key, which identifies the license you want to install and activate.

If your Polyspace system is not connected to the internet, you can access the MathWorks License Center on a computer with internet access, activate your license, and download a license file for transfer to your Polyspace system. If you do not have access to a computer with an Internet connection, contact Customer Support.

For more information on how to activate your software, see “Activating Polyspace Software” in the *Polyspace Installation Guide*.

For more information on software activation, including frequently asked questions, refer to the MathWorks Web site:
www.mathworks.com/support/activation/polyspace.html

MISRA C++ Checker

Polyspace software can now analyze your C++ code to check compliance with the MISRA C++ coding standard.

The Polyspace MISRA C++ checker provides messages when MISRA C++ rules are not respected. Most messages are reported during the compile phase of a verification.

The MISRA C++ checker can check 167 of the 183 statically enforceable MISRA C++ coding rules.

Note The Polyspace MISRA C++ checker is based on MISRA C++:2008 – “Guidelines for the use of the C++ language in critical systems.” For more information on these coding standards, see <http://www.misra-cpp.com>.

For more information, see *Checking Coding Rules*, in the *PolySpace Client/Server for C++ User Guide*.

Source Code Comments

Polyspace software now allows you to place comments in your code that provide information about known coding rule violations and run-time errors. You can use these comments to

- Hide or highlight known coding rule violations.
- Highlight and categorize previously identified run-time errors.

This information can then make the review process quicker and easier by allowing you to focus on new coding rule violations and run-time errors. .

When you review verification results, the Viewer displays comments on individual checks. You can then skip these commented checks, or simply use them as additional information during your review.

The coding rules log in the Launcher displays comments regarding coding rules. You can use these comments to filter out commented violations from the results, or simply to provide additional information on specific violations.

For more information, see “Highlighting Known Coding Rule Violations and Run-Time Errors” in the *PolySpace Products for C User’s Guide*.

Importing Review Comments

New Import/Export checks and comments report allows you to you to compare the source code and verification results from a previous verification to the current verification, and highlights differences in the results.

Importing review comments from a previous verification can be extremely useful, since it allows you to avoid reviewing checks twice, and to compare verification results over time. However, if your code has changed since the previous verification, or if you have upgraded to a new version of the software, the imported comments may not be applicable to your current results. For example, the color of a check may have changed, or the justification for an orange check may no longer be relevant to the current code.

Use the Import/Export checks and comments report to highlight these differences, and focus on unreviewed results.

For more information, see “Importing and Exporting Review Comments” in the *Polyspace Products for C/C++ User’s Guide*.

Compatibility Considerations. In previous releases, when you specified the option `-keep-all-files`, it was possible to add comments to the results for a specific verification level (for example, `pass2`), and then import them into another set of results (for example `pass4`) in the same results folder.

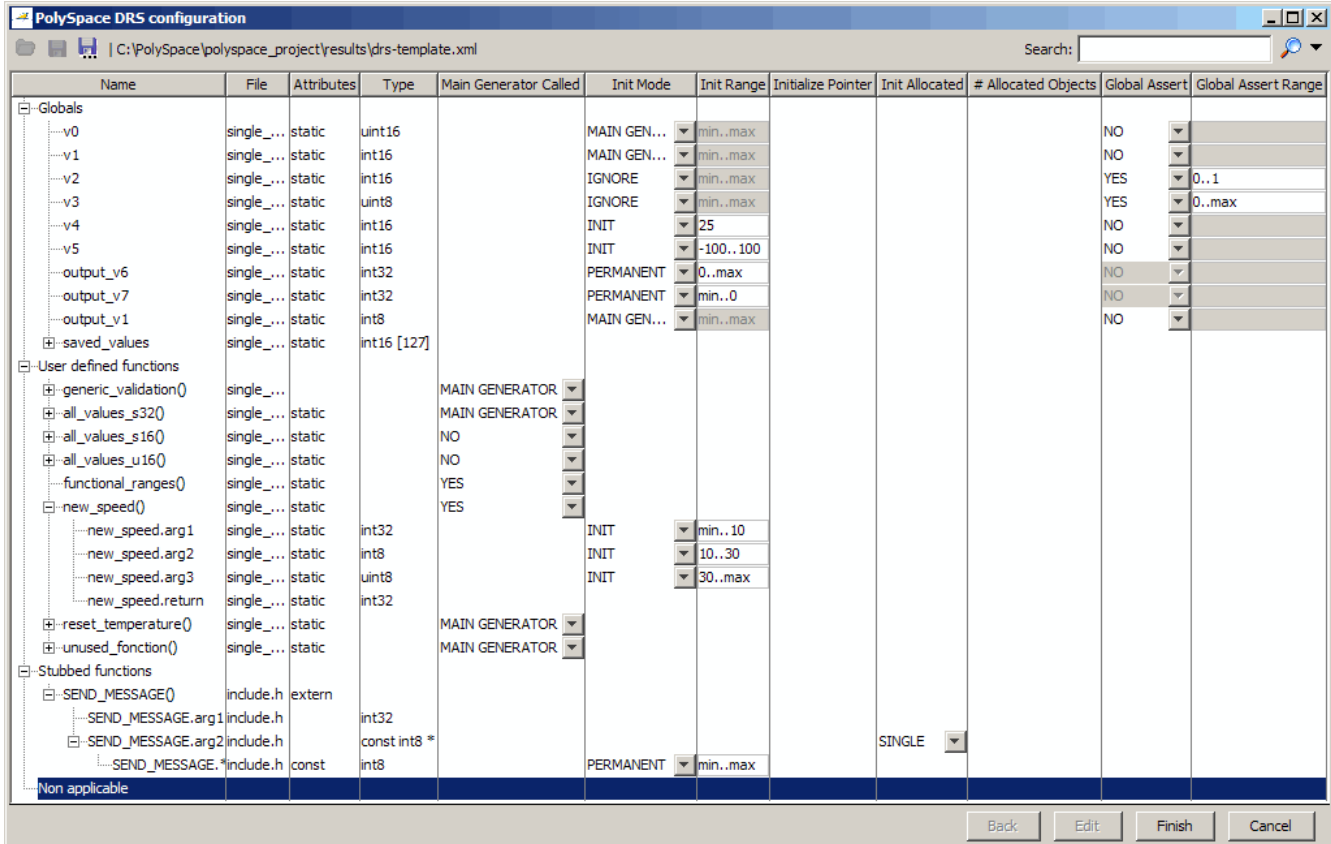

This is no longer possible in R2010a.

Data Range Specifications (DRS) Enhancements

Enhanced Data Range Specifications, including new format and workflow.

The Polyspace Data Range Specifications (DRS) feature now allows you to set constraints on data ranges using a new graphical user interface. When you enable the DRS feature, Polyspace software analyzes the files in your project, and generate a DRS template containing all the global variables, user defined functions, and stub functions for which you can specify data ranges.

To specify data ranges, you then edit this template using the Polyspace DRS configuration interface.

In addition, the DRS feature now allows you to specify constraints for additional types of data, including:

- Input parameters for user-defined functions called by the main generator
- Static variables
- Pointers (C only)

For more information, see “Specifying Data Ranges for Variables and Functions (Contextual Verification)” in the *PolySpace Products for C User’s Guide*.

Compatibility Considerations. Symbols ranged by DRS (init, permanent or globalassert mode) are no longer ignored by the main-generator. This can lead to differences in values and colors, for example full range instead of 0, or orange instead of green.

Pointer Information in the Viewer

Enhanced ToolTips in the Viewer now display pointer information, in addition to data ranges.

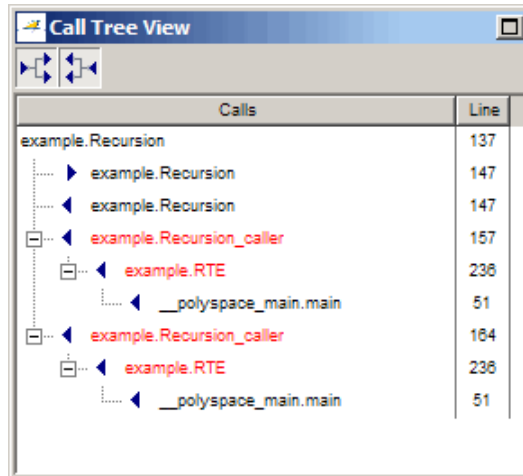

The software now provides, through tooltip messages, useful information about pointers to variables or functions. You see this information in the source code view when you place your cursor over a pointer, dereference character, function call, or function declaration. In addition, if you click a pointer check, dereference character, function call, or function declaration, the software displays pointer information in the selected check view.

For more information, see “Using Pointer Information in Results Manager Perspective” in the *PolySpace Products for C User’s Guide*.

Enhanced Call Tree View and Variables View (Data Dictionary)

Enhanced user interface of the Call Tree View and Variables View improves navigation and usability.

In the Call Tree View, you can now double click any function call to go directly to the function definition.

The image shows a 'Call Tree View' window with a tree structure of function calls. The window has a title bar 'Call Tree View' and navigation icons. The main area is a table with two columns: 'Calls' and 'Line'. The tree structure shows a sequence of calls starting from 'example.Recursion' at line 137, which calls 'example.Recursion' at line 147, which in turn calls 'example.Recursion_caller' at line 157. This caller then calls 'example.RTE' at line 236, which calls '__polyspace_main.main' at line 51. This sequence repeats once more.

Calls	Line
example.Recursion	137
▶ example.Recursion	147
◀ example.Recursion	147
◀ example.Recursion_caller	157
◀ example.RTE	236
◀ __polyspace_main.main	51
◀ example.Recursion_caller	164
◀ example.RTE	236
◀ __polyspace_main.main	51

In the Variables View, you can now right-click a variable to show legend information, and can open the concurrent access graph for a variable directly from the Variables View.

Variables	# Read	# Write	W.T.	R.T.	Protection	Usa...	File	Line	Col	Detailed Type

tasks1.SHR6	2	1					tasks1.c	32	11	int 32

For more information, see “Exploring the Results Manager Perspective” in the *PolySpace Products for C User’s Guide*.

Enhanced Search Function in Viewer

Enhanced Search feature in the Viewer improves navigation in your results.

The Viewer toolbar now contains a Search interface. This allows you to quickly enter search terms, specify search options, and set the scope for your search.

For more information, see “Exploring the Results Manager Perspective” in the *PolySpace Products for C User’s Guide*.

Filtering Orange Checks in Viewer (C only)

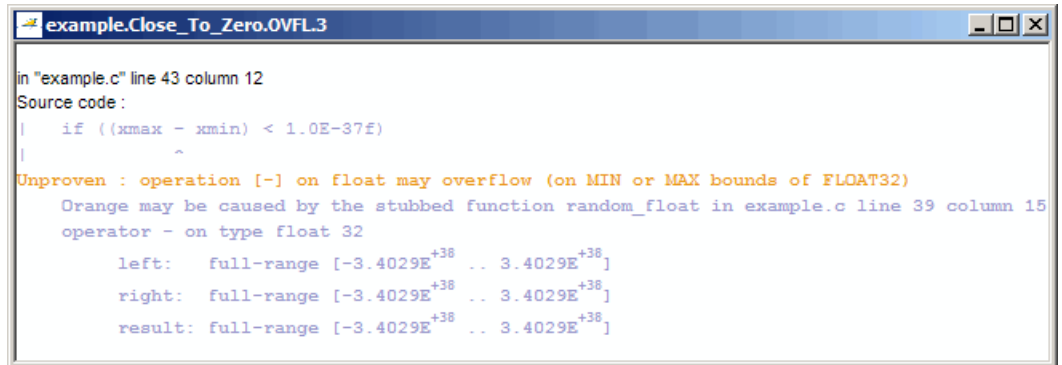

Polyspace verification now identifies orange checks caused by input data. The software provides additional information on these orange checks, and allows you to hide them in the Viewer.

Note Although this type of orange check could reveal a bug, they usually do not.

Verification can identify orange checks caused by:

- Stubs
- Main-generator calls
- Volatile variables
- Extern variables
- Absolute address

When the software identifies this type of orange check, the Viewer provides information on its cause.

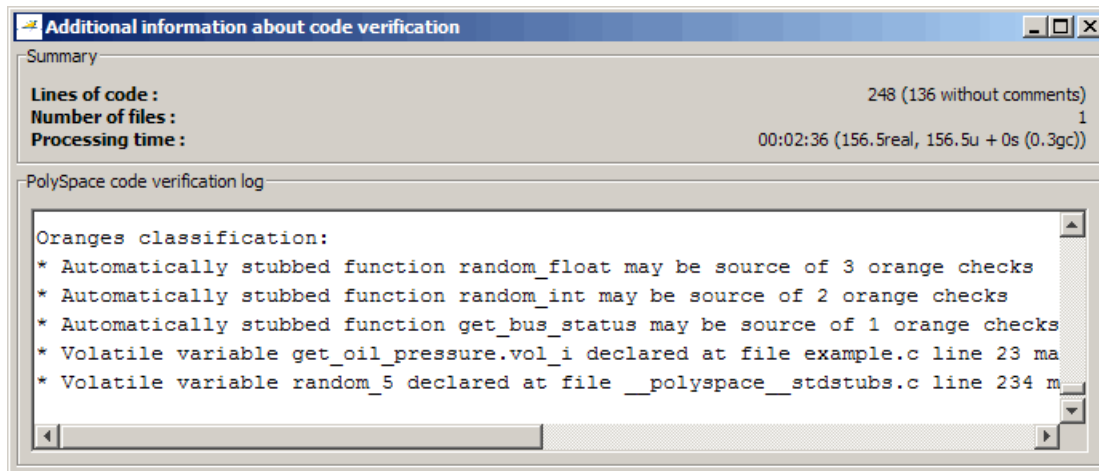

```

example.Close_To_Zero.OVFL.3

in "example.c" line 43 column 12
Source code :
|   if ((xmax - xmin) < 1.0E-37f)
|       ^
|
Unproven : operation [-] on float may overflow (on MIN or MAX bounds of FLOAT32)
Orange may be caused by the stubbed function random_float in example.c line 39 column 15
operator - on type float 32
    left:  full-range [-3.4029E+38 .. 3.4029E+38 ]
    right: full-range [-3.4029E+38 .. 3.4029E+38 ]
    result: full-range [-3.4029E+38 .. 3.4029E+38 ]

```

The Polyspace code verification log file also lists possible sources of imprecision for orange checks.

```

Additional information about code verification

Summary
Lines of code :                248 (136 without comments)
Number of files :              1
Processing time :              00:02:36 (156.5real, 156.5u + 0s (0.3gc))

PolySpace code verification log

Oranges classification:
* Automatically stubbed function random_float may be source of 3 orange checks
* Automatically stubbed function random_int may be source of 2 orange checks
* Automatically stubbed function get_bus_status may be source of 1 orange checks
* Volatile variable get_oil_pressure.vol_i declared at file example.c line 23 ma
* Volatile variable random_5 declared at file __polyspace__stdstubs.c line 234 m

```

In addition, you can now hide these types of orange checks in the Viewer. When using Expert mode, click the filter button to hide oranges impacted by input data.

For more information, see “Working with Orange Checks Caused by Input Data” in the *PolySpace Products for C User’s Guide*.

Methodological Assistant Enhancements

Enhanced Methodological Assistant in the Viewer.

The Methodological Assistant now allows you to define either a minimum percentage of orange checks to review, or a specific number of orange checks to review. This makes it easier to set specific quality criteria for your code at each level of review.

In addition, the Methodological Assistant now presents checks in a more logical order. Checks that are most likely to reveal bugs appear first, while non-useful checks no longer appear.

The new order of checks is:

- 1** All red checks (an error always occurs)
- 2** Orange checks known to produce errors in some situations (dark orange).
For example, red for one call to a procedure and green for another.
- 3** Some gray checks (UNR checks)
- 4** Other orange checks (depending on the methodology and criterion level)

Most gray checks no longer appear in the Methodological Assistant, since reviewing many gray checks that occur after a red check is not useful. Only UNR checks that are not nested within dead code blocks appear in assistant mode.

Compatibility Considerations. The number of checks presented for review in Assistant mode is different than in previous releases, since most gray checks no longer appear. In addition, the order in which you review checks is different.

Class Analyzer Enhancements for C++

Enhanced class analyzer can analyze a file with more than one class.

Unit-by-unit verifications can now verify files containing more than one class. Every class and function out of class contained in such files is now verified.

For more information, see *PolySpace Class Analyzer* in the *PolySpace Client/Server for C++ User Guide*.

Compatibility Considerations. In -unit-by-unit mode, files that previously were not verified because they contained more than one class are now verified.

Change to Time Format in Log File

The time format reported in the log file has been updated to provide more information.

Example of new line (R2010a and later):

```
User time for polyspace-c: 00:02:24 (144.6real, 144.6u + 0s  
(0.3gc))
```

Example of old line (R2009b and earlier):

```
User time for rte-kernel: 4684.4real, 4319.2u + 324.6s (0.3gc)
```

Compatibility Considerations. The new time format can impact some scripts that summarize information from the log file.

Merging of OVFL and UNFL Checks

Overflow (OVFL) and underflow (UNFL) checks have been merged into a single OVFL check. This reduces the number of orange checks you need to review, while continuing to provide the same information.

For red and orange checks, the check message provides the bounds that cause the overflow.

Compatibility Considerations. The Selectivity rate of your results may change when compared to previous versions of the software. Underflows and overflows are now identified as a single check, so the Selectivity will decrease if the checks were green (2 green checks become 1 green), but will increase if the checks were both orange (2 orange checks become 1 orange).

Improved UNR Checks

Enhanced unreachable code (UNR) checks now provide additional information to help you understand the results. UNR checks now include information on:

- Localization of condition
- Type of condition
- End of block localization

For example:

```
// UNR (unreachable code) => UNR (unreachable code) \
(end of block at line YYY)

// UNR (unreachable code) => UNR (unreachable code) \
(condition at line XXX, column AAA) ?
```

In addition, verification now reports new UNR checks on:

- unreachable statements after return, break, goto, and continue statements.
- if statements when the if condition is always true and if there is no else statement.

For more information on these new checks, see “Changes to Verification Results” on page 136.

Compatibility Considerations. The number of checks in your verification results may change due to the new UNR checks.

Changes to Verification Results

- “Compatibility Considerations” on page 136
- “Merging of OVFL and UNFL Checks” on page 137
- “New Gray (UNR) Checks on return, break, goto, and continue Statements” on page 137
- “New Gray (UNR) Check on If Statement Without Else” on page 137
- “Nested Gray (UNR) Checks No Longer Appear in Reports” on page 138
- “Dead Code on Else Branch” on page 138
- “Data Ranges for Fields of Structures (C)” on page 138
- “Functions Called Before Main in Unit-by-unit Verification (C++)” on page 139
- “Main Generator Initialization of Function Pointers” on page 139
- “OVFL Check on Array Index Removed” on page 140
- “IDP Check on Local Member Access Removed (C++)” on page 140
- “OBAI Check on Dynamic Initialization of Array Removed (C++)” on page 141
- “Duplicate Checks in For/While Loops Removed” on page 142
- “malloc(0) Limitation Removed” on page 142
- “Change in OOP on Deletion of Null Pointer (C++)” on page 142
- “Change to IDP Check When Accessing a Field of an Inherited Class (C)” on page 143

Compatibility Considerations. Verification results may change when compared to previous versions of the software. Some checks may change color, and the Selectivity rate of your results may change.

Refer to the following sections for information on the specific changes.

Merging of OVFL and UNFL Checks. Overflow (OVFL) and underflow (UNFL) checks have been merged into a single OVFL check. This reduces the number of orange checks you need to review, while continuing to provide the same information.

For red and orange checks, the check message provides the bounds that cause the overflow.

The Selectivity rate of your results may change when compared to previous versions of the software.

New Gray (UNR) Checks on return, break, goto, and continue Statements. Verification now reports gray UNR checks on unreachable statements after return, break, goto, and continue statements.

For example:

```
67 switch (counter) {
68   case 0:
69     counter = 0;
70     break;
71   case 1:
72     counter = 2;
73     break;
74     counter = 2; /* unreachable code ! */
75     break;
```

The number of checks in your verification results may increase due to these new UNR checks.

New Gray (UNR) Check on If Statement Without Else. Verification now reports a gray UNR check on an if statement when the if condition is always true and if there is no else statement.

This allows you to find if branches that are always reachable, even when there is no else.

For example:

```
if (true()) // UNR if-condition always evaluates to true
```

```
{  
  // ...  
}
```

The number of checks in your verification results may increase due to new UNR checks.

Nested Gray (UNR) Checks No Longer Appear in Reports. Nested UNR checks in unreachable blocks no longer appear in the Methodological Assistant, or in generated reports.

The number of checks in generated reports may decrease due to elimination of these checks..

Dead Code on Else Branch. Verification now reports gray UNR checks on empty branches.

For example:

```
void fct (void)  
{  
  int a = 1;  
  if (a){  
    a++;  
  }  
  else // ==> Now gray UNR  
  {  
    // dummy  
  }  
}
```

The number of checks in your verification results may increase due to the new UNR check on empty branches.

Data Ranges for Fields of Structures (C). Symbols ranged by DRS (init, permanent or globalassert mode) are now considered by the main-generator.

In previous releases, if DRS provided ranges for some fields of a structure, the other fields (not ranged by DRS) were not initialized by the main-generator, and therefore had an initial value of 0.

For example:

```
// DRS: s.x 0 10 init

struct { int x; int y; } s;
int foo(void)
{
    return s.y; // y value: 0, full-range expected
}
```

Symbols ranged by DRS are no longer ignored by the main-generator. This can lead to differences in values and colors, for example full range instead of 0, or orange instead of green.

Functions Called Before Main in Unit-by-unit Verification (C++). The behavior of the option `-function-called-before-main` has changed for unit-by-unit verifications of C++ code.

When you set the option `-function-called-before-main` in unit-by-unit mode:

- If the `init` function is an out of class function, it is called at the beginning of the generated main (before calls to constructors).
- If the `init` function is a method, it is called after all constructor calls of the corresponding class.

In previous releases, the `init` function was always called after constructor calls for each class.

Verification results may change when compared to previous versions of the software, due to changes in the call sequence.

Main Generator Initialization of Function Pointers. The main-generator now initializes function pointers with default-mode stubs instead of pure stubs.

In previous releases, the main-generator initialized function pointers with pointers to pure functions.

This change may lead to differences in the color of checks in your results.
For example:

```
int x;  
  s->fptr(&x);  
  read(x); // LNIV red with 9b -> orange with 10a
```

OVFL Check on Array Index Removed. In previous releases, verification reported an overflow (OVFL) check on pointer/array dereference. However, this overflow never occurred if there was an OBAI problem first. Therefore, the check was not useful.

In R2010a, the OVFL check no longer appears on array index, the check has been merged into the OBAI check.

For example, in the following code there is no OVFL check on the array index.

```
int main(void)  
{  
  volatile int i,x;  
  int tab[10];  
  
  x = tab[i];  
  
}
```

The Selectivity of your results may change when compared to previous versions of the software. The OVFL check on array access has been merged into the OBAI check, so there are fewer checks reported. Selectivity will increase if the overflow check was orange, but will decrease if the OVFL check was green.

IDP Check on Local Member Access Removed (C++). Verification no longer reports an IDP check on local member access.

In previous releases, verification reported an IDP check. This IDP appeared on the “.” when accessing the field of an object returned by copy construction.

For example:

```
struct C {
```

```

    C(const C&c1) { k =c1.k; }
    C() { k = 0 ;}
    int k ;
} ;

C g() {
    C ret ;
    ret.k = 2 ; // IDP on "." here
    return ret;
}

int main() {
    C c = g() ;
}

```

However, this check was caused by an internal pointer and was not useful.

The Selectivity of your results may change when compared to previous versions of the software.

OBAI Check on Dynamic Initialization of Array Removed (C++).

Verification no longer reports an OBAI check on dynamic initialization of array.

In previous releases, verification reported an OBAI check. The OBAI check appeared on dynamic initialization of array with an aggregate.

For example:

```

int main(void)
{
    float tab[] = // extra green obai check
    {
        4.3,
        0.0F
    };

    return 0;
}

```

However, this check was caused by an internal translation and was not useful.

The Selectivity of your results may change when compared to previous versions of the software.

Duplicate Checks in For/While Loops Removed. Verification no longer reports duplicate checks in condition expression of `for` and `while` loops.

Any duplicate checks on a loop condition are now merged in a single check, except when condition expression is complex.

Due to the reduction in the number of checks, the selectivity of your results may change when compared to previous versions of the software.

malloc(0) Limitation Removed. Verification no longer has a limitation when `malloc(0)` returns a null pointer.

In previous releases, verification reported a green check on the following code:

```
assert(malloc(0) == NULL) ;
```

However, this construction could fail. The software now correctly verifies this construction.

Verification results may change when compared to previous versions of the software.

Change in OOP on Deletion of Null Pointer (C++). Verification no longer reports a red OOP check when deleting a null pointer.

In previous releases, verification reported a red OOP check on the following code:

```
struct A {
    virtual void f() { }
    ~A() { }
} ;

int main() {
    A* pa ;
    if (0) pa = (A*) 0xffff;
```

```

    pa = 0;
    delete pa ; // red OOP
}

```

However, calling "delete" on a null pointer is allowed. The red OOP when deleting a null pointer is now gray.

Verification results may change when compared to previous versions of the software.

Change to IDP Check When Accessing a Field of an Inherited Class (C). Verification no longer reports a red IDP check when accessing a field of an inherited class with an mcpu target.

In previous releases, verification reported a red IDP check.

For example:

```

struct Val {
    int val;
};

struct Left : virtual Val {
    int left;
    virtual int get_left() { return left; } // polymorphic:yes
};

struct Right : virtual Val {
    int right;
    virtual int get_right() { return right; }
};

struct S : Left, Right { // multiple:yes
};

S s = S();
Left& le = s; // intermediate:global, reference:yes
Right& re = s; // intermediate:global, reference:yes

int main(void){

```

```
    assert(re.val == 0);    // Unexpected red IDP
}
```

However, this was not actually an error. The check is no longer red.

The color of the IDP check has changed when compared to previous versions of the software.

Changes to Coding Rules Checker Results

- “Compatibility Considerations” on page 144
- “MISRA-C Rule 10.1 Violations on Constant Operands” on page 144
- “MISRA-C Rule 12.5 Violation Report Improved” on page 145
- “MISRA-C Rule 7.1 Violations on File Names of Preprocessed Files” on page 145
- “MISRA-C Rule 5.4 Violations on Anonymous Structures and Unions” on page 145
- “JSF Rule AV-151 Violations on Evaluation of Constant” on page 145

Compatibility Considerations. Due to changes in the coding rules checker, the number of coding rule violations may change when compared to previous versions of the software.

Refer to the following sections for information on the specific changes.

MISRA-C Rule 10.1 Violations on Constant Operands. The MISRA-C checker no longer reports errors for rule 10.1, “The value of an expression of integer type shall not be implicitly converted to a different underlying type,” for certain constructions. For example:

```
int i;
for (i = 0; i < 12; i++)
```

An integer constant that fits into the size of a char is now seen as a signed char whatever the sign of char (this depends on the selected target or is set by option).

If you use the options `-target powerpc` or `-default-sign-of-char unsigned`, the coding rules checker will report fewer violations of MISRA-C rule 10.1 on constant operands.

MISRA-C Rule 12.5 Violation Report Improved. The coding rules checker now reports a column number for violations of MISRA-C rule 12.5.

You may see more violations of rule 12.5, since two violations that occur on same line but in different columns are now identified separately.

MISRA-C Rule 7.1 Violations on File Names of Preprocessed Files.

The coding rules checker no longer reports violations of MISRA-C rule 7.1 on the names of internal preprocessing files. These violations occurred in projects containing Japanese characters.

You may see fewer violations of rule 7.1 in MISRA reports.

MISRA-C Rule 5.4 Violations on Anonymous Structures and Unions.

The coding rules checker no longer reports violations of MISRA-C rule 5.4 on anonymous struct/union fields.

You may see fewer violations of rule 5.4 in MISRA reports.

JSF Rule AV-151 Violations on Evaluation of Constant. The coding rules checker no longer reports violations of JSF rule AV-151 on internal evaluation of a constant value, for example when there is an expression in an enum list.

You may see fewer violations of rule AV-151 in JSF reports.

Enumerated Types Support

The option `-enum-type-definition` allows verification to use different base types to represent an enumerated type, depending on the enumerator values and the selected definition.

When using this option, each enum type is represented by the smallest integral type that can hold all its enumeration values.

Possible values are:

- defined-by-standard.
- auto-signed-first.
- auto-unsigned-first

For more information, see “Enum type definition (-enum-type-definition)” in the *PolySpace Products for C Reference*.

New Target Processor Support

Added support for the c18 24-bit target processor (C only).

For more information, see “Predefined Target Processor Specifications” in the *PolySpace Products for C Reference*.

Operating System Support

Added support for the following Linux® distributions:

- OpenSuSE 11.1
- Debian 5.x
- Ubuntu 8.04, 8.10, 9.04, and 9.10

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for C/C++ Product

License Activation

Polyspace products now support the MathWorks software activation mechanism.

Activation is a process that verifies licensed use of MathWorks products. The process validates your product licenses and ensures that they are used correctly. You must complete the activation process before you can use Polyspace software.

Note If you are using Designated Computer (Individual) licenses, you must activate the license for each Polyspace system individually. However, if you are using Concurrent licenses for multiple Polyspace systems, you do not need to activate each Polyspace system. You activate the license once (for the FLEXnet license server), then provide license files for each Polyspace system.

The easiest way to activate the software is to log in to your MathWorks Account during installation. At the end of the installation process, the Polyspace Software Activation dialog box opens.

Follow the prompts in the Polyspace Software Activation dialog box to complete the activation process.

If you do not have a MathWorks account, you can create one during the activation process. To create an account, you must have an Activation Key, which identifies the license you want to install and activate.

If your Polyspace system is not connected to the internet, you can access the MathWorks License Center on a computer with internet access, activate your license, and download a license file for transfer to your Polyspace system. If

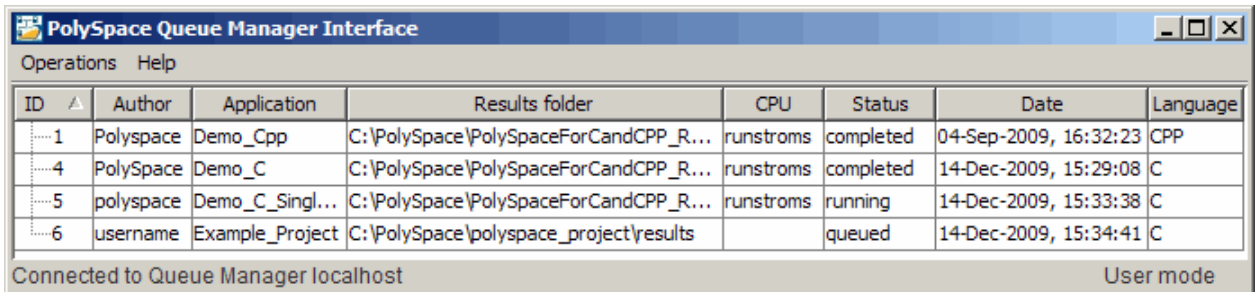

you do not have access to a computer with an Internet connection, contact Customer Support.

For more information on how to activate your software, see “Activating Polyspace Software” in the *Polyspace Installation Guide*.

For more information on software activation, including frequently asked questions, refer to the MathWorks Web site:
www.mathworks.com/support/activation/polyspace.html

Queue Manager Interface

The Polyspace Queue Manager Interface (Spooler) is now available on Linux machines, providing a graphical interface for managing verification jobs on the Polyspace server.

The screenshot shows a window titled "PolySpace Queue Manager Interface" with a menu bar containing "Operations" and "Help". Below the menu bar is a table with the following columns: ID, Author, Application, Results folder, CPU, Status, Date, and Language. The table contains four rows of data. At the bottom of the window, it says "Connected to Queue Manager localhost" on the left and "User mode" on the right.

ID	Author	Application	Results folder	CPU	Status	Date	Language
1	Polyspace	Demo_Cpp	C:\PolySpace\PolySpaceForCandCPP_R...	runstroms	completed	04-Sep-2009, 16:32:23	CPP
4	PolySpace	Demo_C	C:\PolySpace\PolySpaceForCandCPP_R...	runstroms	completed	14-Dec-2009, 15:29:08	C
5	polyspace	Demo_C_Singl...	C:\PolySpace\PolySpaceForCandCPP_R...	runstroms	running	14-Dec-2009, 15:33:38	C
6	username	Example_Project	C:\PolySpace\polyspace_project\results		queued	14-Dec-2009, 15:34:41	C

For more information, see “Managing Verification Jobs Using the Polyspace Queue Manager” in the *Polyspace Products for C/C++ User’s Guide* or *Polyspace Products for C++ User’s Guide*.

Operating System Support

Added support for the following Linux distributions:

- OpenSuSE 11.1
- Debian 5.x
- Ubuntu 8.04, 8.10, 9.04, and 9.10

For more information, see the *Polyspace Installation Guide*.

Version 5.5 (R2010a) Polyspace for Ada and Model Link Products

This table summarizes what's new in V5.5 (R2010a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 149
- “Polyspace® Server™ for Ada Product” on page 152
- “Polyspace® Model Link™ SL Product” on page 154

Polyspace Client for Ada Product

License Activation

Polyspace products now support the MathWorks software activation mechanism.

Activation is a process that verifies licensed use of MathWorks products. The process validates your product licenses and ensures that they are used correctly. You must complete the activation process before you can use Polyspace software.

Note If you are using Designated Computer (Individual) licenses, you must activate the license for each Polyspace system individually. However, if you are using Concurrent licenses for multiple Polyspace systems, you do not need to activate each Polyspace system. You activate the license once (for the FLEXnet license server), then provide license files for each Polyspace system.

The easiest way to activate the software is to log in to your MathWorks Account during installation. At the end of the installation process, the Polyspace Software Activation dialog box opens.

Follow the prompts in the Polyspace Software Activation dialog box to complete the activation process.

If you do not have a MathWorks account, you can create one during the activation process. To create an account, you must have an Activation Key, which identifies the license you want to install and activate.

If your Polyspace system is not connected to the internet, you can access the MathWorks License Center on a computer with internet access, activate your license, and download a license file for transfer to your Polyspace system. If

you do not have access to a computer with an Internet connection, contact Customer Support.

For more information on how to activate your software, see “Activating Polyspace Software” in the *Polyspace Installation Guide*.

For more information on software activation, including frequently asked questions, refer to the MathWorks Web site:
www.mathworks.com/support/activation/polyspace.html

Source Code Comment Support

Polyspace software now allows you to place comments in your code that provide information about known run-time errors. You can use these comments to highlight and categorize previously identified run-time errors. This information can then make the review process quicker and easier.

When you review verification results, the Viewer displays comments on individual checks. You can then skip these commented checks during the review process, or simply use them as additional information during your review.

For more information, see “Highlighting Known Run-Time Errors” in the *Polyspace Products for Ada User’s Guide*.

Eclipse Integration

Polyspace integration with the Eclipse IDE, Version 3.4 and 3.5.

The Polyspace Client for Ada can be integrated with the Eclipse™ Integrated Development Environment through the Polyspace plug-in for Eclipse IDE.

This plug-in provides Polyspace source code verification and bug detection functionality for source code developed within Eclipse IDE. Features include the following:

- A contextual menu that allows you to launch a verification of one or more files.
- Views in the Eclipse editor that allow you to set verification parameters and monitor verification progress.

For more information, see “Using Polyspace Software in the Eclipse™ IDE” in the *Polyspace Products for Ada User’s Guide*.

Operating System Support

Added support for the following Linux distributions:

- OpenSuSE 11.1
- Debian 5.x
- Ubuntu 8.04, 8.10, 9.04, and 9.10

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for Ada Product

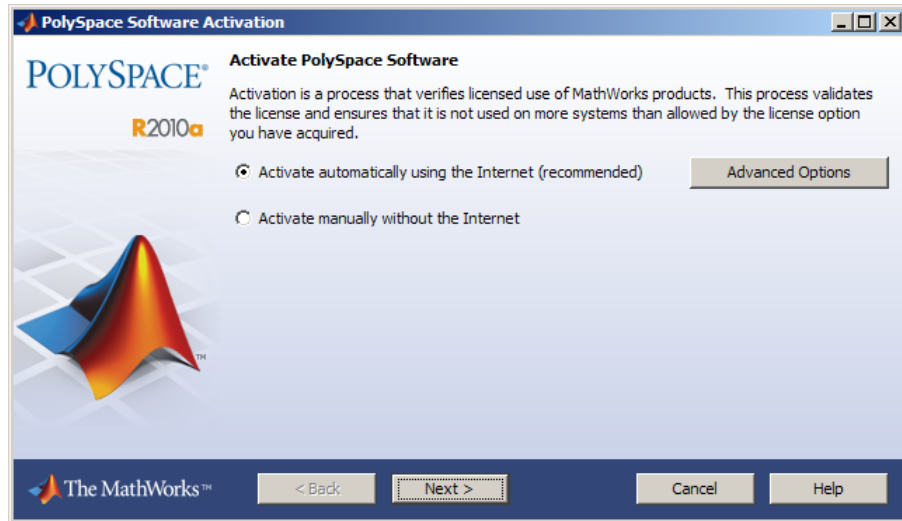

License Activation

Polyspace products now support the MathWorks software activation mechanism.

Activation is a process that verifies licensed use of MathWorks products. The process validates your product licenses and ensures that they are used correctly. You must complete the activation process before you can use Polyspace software.

Note If you are using Designated Computer (Individual) licenses, you must activate the license for each Polyspace system individually. However, if you are using Concurrent licenses for multiple Polyspace systems, you do not need to activate each Polyspace system. You activate the license once (for the FLEXnet license server), then provide license files for each Polyspace system.

The easiest way to activate the software is to log in to your MathWorks Account during installation. At the end of the installation process, the Polyspace Software Activation dialog box opens.

Follow the prompts in the Polyspace Software Activation dialog box to complete the activation process.

If you do not have a MathWorks account, you can create one during the activation process. To create an account, you must have an Activation Key, which identifies the license you want to install and activate.

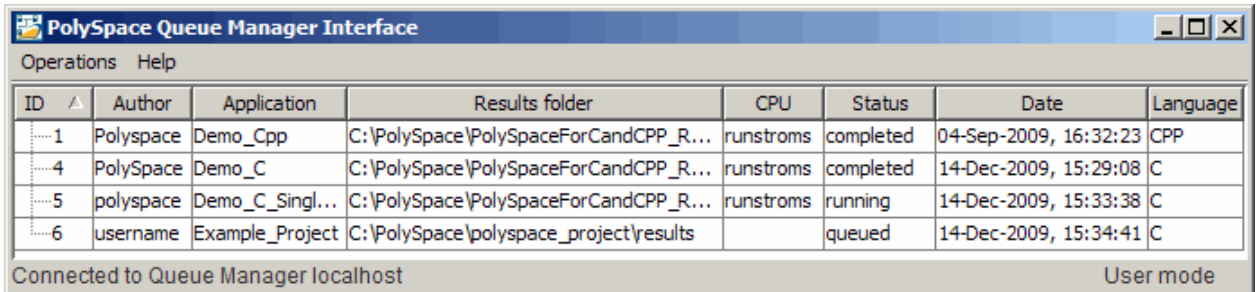

If your Polyspace system is not connected to the internet, you can access the MathWorks License Center on a computer with internet access, activate your license, and download a license file for transfer to your Polyspace system. If you do not have access to a computer with an Internet connection, contact Customer Support.

For more information on how to activate your software, see “Activating Polyspace Software” in the *Polyspace Installation Guide*.

For more information on software activation, including frequently asked questions, refer to the MathWorks Web site:
www.mathworks.com/support/activation/polyspace.html

Queue Manager Interface

The Polyspace Queue Manager Interface (Spooler) is now available on Linux machines, providing a graphical interface for managing verification jobs on the Polyspace server.

The screenshot shows a window titled "PolySpace Queue Manager Interface" with a menu bar containing "Operations" and "Help". Below the menu bar is a table with the following columns: ID, Author, Application, Results folder, CPU, Status, Date, and Language. The table contains four rows of data. At the bottom of the window, it says "Connected to Queue Manager localhost" on the left and "User mode" on the right.

ID	Author	Application	Results folder	CPU	Status	Date	Language
1	Polyspace	Demo_Cpp	C:\PolySpace\PolySpaceForCandCPP_R...	runstroms	completed	04-Sep-2009, 16:32:23	CPP
4	PolySpace	Demo_C	C:\PolySpace\PolySpaceForCandCPP_R...	runstroms	completed	14-Dec-2009, 15:29:08	C
5	polyspace	Demo_C_Singl...	C:\PolySpace\PolySpaceForCandCPP_R...	runstroms	running	14-Dec-2009, 15:33:38	C
6	username	Example_Project	C:\PolySpace\polyspace_project\results		queued	14-Dec-2009, 15:34:41	C

For more information, see “Managing Verification Jobs Using Polyspace Queue Manager” in the *Polyspace Products for Ada User’s Guide*.

Operating System Support

Added support for the following Linux distributions:

- OpenSuSE 11.1
- Debian 5.x
- Ubuntu 8.04, 8.10, 9.04, and 9.10

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link SL Product

License Activation

Polyspace products now support the MathWorks software activation mechanism.

Activation is a process that verifies licensed use of MathWorks products. The process validates your product licenses and ensures that they are used

correctly. You must complete the activation process before you can use Polyspace software.

Note If you are using Designated Computer (Individual) licenses, you must activate the license for each Polyspace system individually. However, if you are using Concurrent licenses for multiple Polyspace systems, you do not need to activate each Polyspace system. You activate the license once (for the FLEXnet license server), then provide license files for each Polyspace system.

The easiest way to activate the software is to log in to your MathWorks Account during installation. At the end of the installation process, the Polyspace Software Activation dialog box opens.

Follow the prompts in the Polyspace Software Activation dialog box to complete the activation process.

If you do not have a MathWorks account, you can create one during the activation process. To create an account, you must have an Activation Key, which identifies the license you want to install and activate.

If your Polyspace system is not connected to the internet, you can access the MathWorks License Center on a computer with internet access, activate your license, and download a license file for transfer to your Polyspace system. If you do not have access to a computer with an Internet connection, contact Customer Support.

For more information on how to activate your software, see “Activating Polyspace Software” in the *Polyspace Installation Guide*.

For more information on software activation, including frequently asked questions, refer to the MathWorks Web site:
www.mathworks.com/support/activation/polyspace.html

Data Range Specifications for Custom Simulink Data Objects

Polyspace Model Link SL software now accepts every Simulink or mpt object containing min and max values.

In previous releases, the software did not create DRS entries for custom Simulink Data Objects, only for `Simulink.Parameter`, `mpt.Parameter`, `Simulink.Signal`, and `mpt.Signal`.

Compatibility Considerations. Verification results may change when compared to previous versions of the software, due to data ranges being applied to additional objects.

Simulink Software Support

Added support for Simulink Version 7.5 (R2010a).

Version 7.1 (R2009b) Polyspace for C/C++ Products

This table summarizes what's new in V7.1 (R2009b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 157
- “Polyspace® Server™ for C/C++ Product” on page 161

Polyspace Client for C/C++ Product

Report Generator

New Report Generator that presents Polyspace results in PDF, HTML, and other output formats.

The Polyspace Report Generator allows you to generate reports about your verification results, using the following predefined report templates:

- **Coding Rules Report** – Provides information about compliance with MISRA-C Coding Rules, as well as Polyspace configuration settings for the verification.
- **Developer Report** – Provides information useful to developers, including summary results, detailed lists of red, orange, and gray checks, and Polyspace configuration settings for the verification.
- **Developer with Green Checks Report** – Provides the same content as the Developer Report, but also includes a detailed list of green checks.

- **Quality Report** – Provides information useful to quality engineers, including summary results, statistics about the code, graphs showing distributions of checks per file, and Polyspace configuration settings for the verification.

The Polyspace Report Generator allows you to generate verification reports in the following formats:

- HTML
- PDF
- RTF
- Microsoft Word
- XML

Note Microsoft Word format is not available on UNIX platforms. RTF format is used instead.

For more information, see “Generating Reports of Verification Results” in the *Polyspace Products for C/C++ User’s Guide*.

Viewer Enhancements

Enhanced Viewer displays results with tooltips containing the values of variables, operands, function parameters, and return values.

You can see range information associated with variables and operators within the source code view.

Note The displayed range information represents a superset of dynamic values, which the software computes using static methods.

If a line of code is all the same color, selecting the line opens an Expanded Source Code window. Place your cursor over the required operator or variable in this window to view range information.

If a line of code contains different colored checks, selecting a check displays the error or warning message along with range information in the selected check view.

For more information, see “Using Range Information in the Results Manager Perspective” in the *Polyspace Products for C/C++ User’s Guide*.

Global Data Graphs

New Graphs (similar to concurrent access graphs) available for all global data.

You can display the access sequence for any variable that is read or written in the code. The access graph displays the read and write access for the variable.

For more information, see “Displaying the Access Graph for Variables” in the *Polyspace Products for C/C++ User’s Guide*.

Unit-by-unit Verification

New option to create a separate verification job for each source file in the project.

When you run a unit-by-unit verification, each source file is compiled, sent to the Polyspace Server, and verified individually.

The queue manager displays a job for the full verification group, as well as jobs for each unit (using a tree structure).

When verification is complete, you can download and view results for the entire project, or for individual units. When downloading a verification group, all the unit results are downloaded and a summary of the download status for each unit is displayed.

Note Unit by unit verification is available only for server verifications.

For more information, see “Running Verification Unit-by-Unit” in the *PolySpace Products for C Reference*.

Changes to Coding Rules Checker Results

- “Compatibility Considerations” on page 160
- “MISRA-C Rule 5.1 Analysis Improved” on page 160
- “MISRA-C Rule 5.2 Analysis Improved” on page 160
- “MISRA-C Rule 5.7 Analysis Improved” on page 160
- “MISRA-C Rule 8.10 Analysis Improved” on page 160
- “MISRA-C Rule 10.1 Analysis Relaxed” on page 161
- “MISRA-C Rule 10.5 Analysis Improved” on page 161
- “MISRA-C Rule 12.7 Analysis Improved” on page 161
- “MISRA-C Rule 15.0 Analysis Improved” on page 161
- “MISRA-C Rule 16.4 Analysis Improved” on page 161

Compatibility Considerations. Due to changes in the coding rules checker, the number of coding rule violations may change when compared to previous versions of the software.

Refer to the following sections for information on the specific changes.

MISRA-C Rule 5.1 Analysis Improved. The coding rules checker now applies MISRA-C rule 5.1 to all identifiers external and internal.

MISRA-C Rule 5.2 Analysis Improved. The coding rules checker now detects violations of MISRA-C Rule 5.2 when the declaration in the outer scope occurs after the declaration in the inner scope.

MISRA-C Rule 5.7 Analysis Improved. The coding rules checker now detects violations of MISRA-C Rule 5.7 in local reused identifiers.

MISRA-C Rule 8.10 Analysis Improved. Only the last declaration takes precedence for `static` or `extern`. The coding rules checker no longer reports violations of MISRA-C Rule 8.10 if the last declaration is `static`.

MISRA-C Rule 10.1 Analysis Relaxed. The coding rules checker has relaxed enforcement of MISRA-C Rule 10.1 for `x` in `[x]` for any type of expression `x`.

MISRA-C Rule 10.5 Analysis Improved. The coding rules checker now detects violations of MISRA-C Rule 10.5 in expressions with constants.

For example:

```
c = (uint8_t)(ui8 << ( 1U << 2U ) );
```

MISRA-C Rule 12.7 Analysis Improved. The coding rules checker now detects violations of MISRA-C Rule 12.7 in expressions with constants.

For example:

```
~(i=1);
```

MISRA-C Rule 15.0 Analysis Improved. The coding rules checker now detects violations of MISRA-C Rule 15.0 in all statements between switch and first case clause (label, harmless statement).

In addition the coding rules checker now detects jumps and label statements.

MISRA-C Rule 16.4 Analysis Improved. The coding rules checker now keeps the names of the parameters of the first declaration, and reports violations of MISRA-C Rule 16.4 for each occurrence.

Operating System Support

Added support for Windows Server® 2008.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for C/C++ Product

Operating System Support

Added support for Windows Server 2008.

For more information, see the *Polyspace Installation Guide*.

Version 5.4 (R2009b) Polyspace for Ada and Model Link Products

This table summarizes what's new in V5.4 (R2009b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 163
- “Polyspace® Server™ for Ada Product” on page 170
- “Polyspace® Model Link™ SL Product” on page 170

Polyspace Client for Ada Product

Report Generator

New Report Generator that presents Polyspace results in PDF, HTML, and other output formats.

The Polyspace Report Generator allows you to generate reports about your verification results, using the following predefined report templates:

- **Coding Rules Report** – Provides information about compliance with MISRA-C Coding Rules, as well as Polyspace configuration settings for the verification.
- **Developer Report** – Provides information useful to developers, including summary results, detailed lists of red, orange, and gray checks, and Polyspace configuration settings for the verification.
- **Developer with Green Checks Report** – Provides the same content as the Developer Report, but also includes a detailed list of green checks.
- **Quality Report** – Provides information useful to quality engineers, including summary results, statistics about the code, graphs showing distributions of checks per file, and Polyspace configuration settings for the verification.

The Polyspace Report Generator allows you to generate verification reports in the following formats:

- HTML
- PDF
- RTF
- Microsoft Word
- XML

Note Microsoft Word format is not available on UNIX platforms. RTF format is used instead.

For more information, see “Generating Reports of Verification Results” in the *Polyspace Products for Ada User’s Guide* .

Main Generator Enhancements

Enhanced main generator that considers the scope of a procedure and variable, improving error detection at the package level.

This change may affect your results compared with previous releases, and how you interpret the new results. Specific changes include:

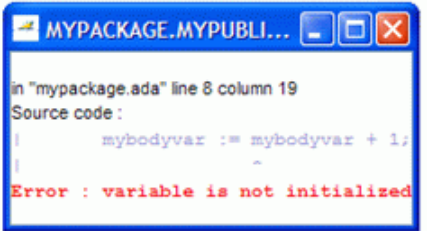

- Uninitialized package body variables are considered uninitialized
- Uncalled package-scope procedures/functions are considered unreachable
- Functions/procedures declared at the spec level are called only once
- Uninitialized spec level variables are considered possibly uninitialized

For more information on the main generator, see “Main Generator Overview” in the *Polyspace Products for Ada User’s Guide* .

Uninitialized Package Body Variables are Considered Uninitialized.

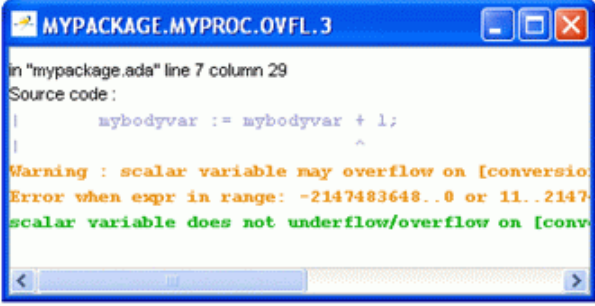

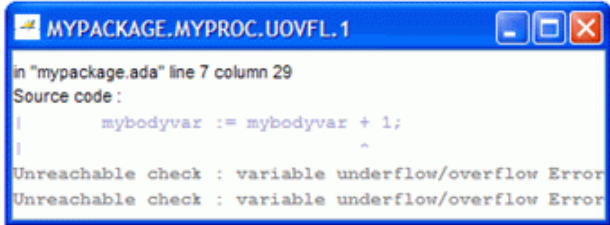

Uninitialized variables that are declared only in the package body are now considered uninitialized, and generate red NIV checks.

Previously, these variables were considered initialized (green NIV) with full-range values. This behaviour made interpretation of results easier and allowed verification to continue. However, the software now considers these variables uninitialized (red NIV) and stops verification at this point. This new behaviour is more accurate with respect to the actual initialization state of the variables. You must correct the code before verification can continue. Alternatively, you can use the option `-continue-with-all-niv`.

Change 1: Uninitialized package body variables are considered uninitialized	
Settings: -main-generator	
9a	9b
<pre> 1 package mypackage is 2 type myint is new integer range 1..10; 3 procedure myPublicProc; 4 end mypackage; 5 package body mypackage is 6 mybodyvar : myint; 7 procedure myPublicProc is begin 8 mybodyvar := mybodyvar + 1; 9 end myPublicProc; 10 end mypackage; </pre> 	<pre> 1 package mypackage is 2 type myint is new integer range 1..10; 3 procedure myPublicProc; 4 end mypackage; 5 package body mypackage is 6 mybodyvar : myint; 7 procedure myPublicProc is begin 8 mybodyvar := mybodyvar + 1; 9 end myPublicProc; 10 end mypackage; </pre> 

Uncalled Package-scope Procedures/Functions are Considered Unreachable. Procedures and functions that are declared in the package but not called by code within the package body provided for the verification will now be considered unreachable (gray).

Previously, all procedures and functions in a package were considered for verification and subsequently colored. The argument for this behavior was that these functions and procedures could be called by code inside the package that had not been provided for the verification. Now, the software considers this code unreachable (gray) unless there is a path of execution that leads to it.

Change 2: Uncalled package-scope procedures/functions are considered unreachable	
Settings: -main-generator	
9a	9b
<pre> 1 package mypackage is 2 type myint is new integer range 1..10; 3 end mypackage; 4 package body mypackage is 5 mybodyvar : myint; 6 procedure myProc is begin 7 mybodyvar := mybodyvar + 1; 8 end myProc; 9 end mypackage; </pre>	<pre> 1 package mypackage is 2 type myint is new integer range 1..10; 3 end mypackage; 4 package body mypackage is 5 mybodyvar : myint; 6 procedure myProc is begin 7 mybodyvar := mybodyvar + 1; 8 end myProc; 9 end mypackage; </pre>
	

Functions/Procedures Declared at the Spec Level are Called Only

Once. Functions or procedures declared at the specification level are called only once.

Note This behavior changed in Release 2010a. In R2010a or later, the main generator can call a function several times.

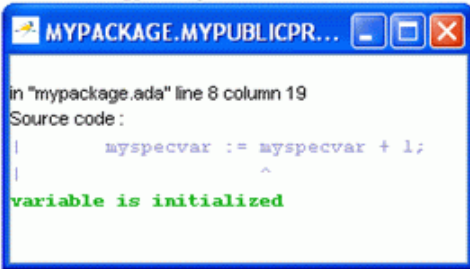

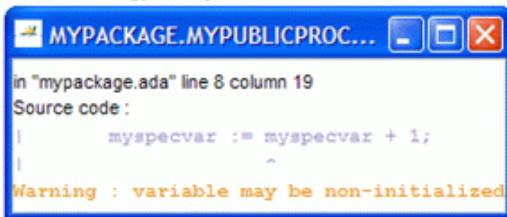

Uninitialized Spec Level Variables are Considered Possibly

Uninitialized. Uninitialized variables declared in a package specification will now be considered possibly uninitialized (orange NIV). Previously, these variables were considered initialized (green NIV) with full-range values.

The software now considers uninitialized variables that are declared only in the package *body* as uninitialized (red NIV). However, for uninitialized variables declared in a package *specification*, it is possible that packages

that use these variables may initialize these variables. The software now recognizes this possibility and generates orange NIV checks for uninitialized variables declared in a package specification.

This behavior is not changed if you use options `-init-stubbing-vars-random` or `-init-stubbing-vars-zero-or-random` to initialize uninitialized variables. Specification-level variables will still be considered possibly uninitialized (orange NIV), because the packages that use these variables can alter the variables, even to the extent of uninitialized the variables.

Change 4: Uninitialized spec level variables are considered possibly uninitialized	
Settings: -main-generator	
9a	9b
<pre> 1 package mypackage is 2 type myint is new integer range 1..10; 3 procedure myPublicProc; 4 <u>myspecvar</u> : myint; 5 end mypackage; 6 package body mypackage is 7 procedure myPublicProc is begin 8 <u>myspecvar</u> := <u>myspecvar</u> + 1; 9 end myPublicProc; 10 end mypackage; </pre> 	<pre> 1 package mypackage is 2 type myint is new integer range 1..10; 3 procedure myPublicProc; 4 <u>myspecvar</u> : myint; 5 end mypackage; 6 package body mypackage is 7 procedure myPublicProc is begin 8 <u>myspecvar</u> := <u>myspecvar</u> + 1; 9 end myPublicProc; 10 end mypackage; </pre> 

Compatibility Considerations. Changes to the main generator may result in differences in your verification results, when compared with earlier versions of the software. If you verified your code with previous versions of the software (for example, R2009a), be aware of these changes, how they affect your colored results and the way you interpret the results.

Global Data Graphs

New Graphs (similar to concurrent access graphs) available for all global data.

You can display the access sequence for any variable that is read or written in the code. The access graph displays the read and write access for the variable.

For more information, see “Displaying the Access Graph for Variables” in the *Polyspace Products for Ada User’s Guide* .

Unit-by-unit Verification

New option to create a separate verification job for each source file in the project.

When you run a unit-by-unit verification, each source file is compiled, sent to the Polyspace Server, and verified individually.

The queue manager displays a job for the full verification group, as well as jobs for each unit (using a tree structure).

When verification is complete, you can download and view results for the entire project, or for individual units. When downloading a verification group, all the unit results are downloaded and a summary of the download status for each unit is displayed.

Note Unit by unit verification is available only for server verifications.

For more information, see “Running Verification Unit-by-Unit” in the *Polyspace Products for Ada Reference*.

Operating System Support

Added support for Windows Server 2008.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for Ada Product

Operating System Support

Added support for Windows Server 2008.

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link SL Product

Simulink Software Support

Added support for Simulink Version 7.4 (R2009b).

Version 7.0 (R2009a) Polyspace for C/C++ Products

This table summarizes what's new in V7.0 (R2009a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 171
- “Polyspace® Server™ for C/C++ Product” on page 176

Polyspace Client for C/C++ Product

JSF++ Support

Enhanced JSF C++ checker supports all checkable Joint Strike Fighter Air Vehicle C++ coding standards (JSF++:2005).

Polyspace software can now check all possible C++ programming rules defined by Lockheed Martin® for the JSF program. These coding standards are designed to improve the robustness of C++ code, and improve maintainability.

For more information, see *JSF C++ Checker*, in the *PolySpace Client/Server for C++ User Guide*.

Back to Source Link

New “back-to-source” link in the Polyspace launcher associates compile errors, MISRA-C violations, and JSF++ violations reported in the logs directly to the source file.

For more information, see “Viewing Coding Rules Checker Results” in the *PolySpace Products for C User’s Guide* or *Examining the JSF Log*, in the *PolySpace Client/Server for C++ User Guide*.

Eclipse Integration

New Polyspace integration with the Eclipse IDE, Version 3.3.

The Polyspace Client for C/C++ product can be integrated with the Eclipse Integrated Development Environment through the Polyspace C/C++ plug-in for Eclipse IDE.

This plug-in provides Polyspace source code verification and bug detection functionality for source code developed within Eclipse IDE. Features include the following:

- A contextual menu that allows you to launch a verification of one or more files.
- Views in the Eclipse editor that allow you to set verification parameters and monitor verification progress.

For more information, see “Using Polyspace Software in the Eclipse IDE” in the *PolySpace Products for C User’s Guide*.

Performance Improvements for Multi-Core Systems

Enhanced performance on multi-core architecture platforms, improving the speed of Polyspace code verification.

The time required to perform an average code verification has been reduced. On multi-core systems, you can now select the number of processes that can run simultaneously, further improving performance.

For more information, see “Number of processes for multiple CPU core systems (-max-processes)” in the *PolySpace Products for C Reference*.

Architecture Improvements

Several changes have been made to the Polyspace architecture to improve overall performance, as well as the precision of verification results.

During each verification phase (pass), the software now only analyzes those procedures that need to be analyzed. This means that starting with PASS1, if the verification cannot be more precise than that already completed in a previous pass, the procedure is not analyzed again. This improves the overall performance of the verification. It also means that some passes will finish more quickly than others, and some passes could be completely empty. This is normal behavior.

In addition, these architecture improvements result in the following changes:

- The `quick` precision option is now obsolete, and has been removed. `quick` mode has been replaced with verification PASS0. PASS0 takes somewhat longer to run, but the results are more complete. The limitations of `quick` mode, (no NTL or NTC checks, no float checks, no variable dictionary) no longer apply. Unlike `quick` mode, PASS0 also provides full navigation in the Viewer.
- The `voa` option is now obsolete, and has been removed. Value On Assignment checks are now provided by default. In general, this means that Polyspace results now contain many more VOA checks. For C applications, all possible VOA are given.
- The UOVFL (Float Underflows and Overflows) check no longer exists. Float underflows and overflows are now reported as two separate checks. This is similar to the way integers are handled.

Note Since the single UOVFL check has been replaced by two checks, the total number of checks reported by Polyspace on a given file may be different in this release than with previous versions of the software.

- Messages have been improved for float arithmetic checks, making them similar to the messages for integers. For example, NIV checks on float variables now contain the type size (32 or 64).
- For IPT (Inspection Point) checks, there is now one check for each variable. Previously there was a single IPT check (on the keyword) for multiple variables.
- The log file has several additions, including the names of each PASS, the verification phases, and additional messages.

Compatibility Considerations. The verification results provided by Polyspace software may be different in R2009a than with previous releases of the software. Verification results are more precise, and the total number of checks reported on a given source file may be different. In general, the software now reports more checks, due to increased VOA checks, changes to the IPT check, and the single float UOVFL check being replaced by two checks (UNFL and OVFL).

In addition, due to the float UOVFL check being split into two checks, the selectivity (number of proven checks red+green+gray / number of total checks) of a verification may change significantly for applications using many float variables. For example, an application that had 10 orange UOVFL checks with a previous release, could now have up to 20 orange UNFL and OVFL checks on the same float variables. Although this appears to be a decrease in precision, the verification itself is not less precise.

Mathematical Functions Included in Stubs

Mathematical functions are now included in the standard stubs. This means:

- An IRV (Initialized Return Value) check appears on the math function call.
- The POW check no longer appears in the Viewer.
- Math functions appear in the call graph.
- The modeling of mathematical functions is visible through the stub body, instead of being handled internally.
- By default, math functions are launched with the option `-context-sensitivity`, allowing them to distinguish their calling sites.

In addition, you can provide your own math functions instead of using the standard stub provided by Polyspace software. This allows the software to verify the body of the math function, instead of using a stub for the math function.

For example, in C90, the mathematical function `fabs()` has the prototype:

```
double fabs(double) ;
```

However, on a 16-bit target, the function may have the prototype:

```
float fabs(float);
```

In this case, you would want to verify your own `fabs()` function.

To provide your own math function:

- 1 Create source code for the function. For example:

```
float  fabs (float var)
{
    if (var >= 0.0f)
        return var;
    return -var;
}
```

- 2 Provide the function to your verification using the `D` compiler flag. For example:

```
polyspace-c -D __polyspace_no_fabs
```

Note There is a compiler flag for each standard ANSI C90 mathematical function. A complete list of flags is located in the file: `%POLYSPACE_C%\Verifier\cinclue__polyspace__stdstubs.c`.

Compatibility Considerations. Since the POW check no longer appears in the Viewer, verification results may be different in R2009a than with previous releases of the software.

Character Encoding Options

New character encoding option allows you to view source files created on an operating system that uses different character encoding than your current system.

You specify the character encoding used by the operating system on which the source file was created using the **Character encoding** tab in the Preferences dialog box of the Polyspace Viewer.

For more information, see “Setting Character Encoding Preferences” in the *PolySpace Products for C User’s Guide*.

Automatic Orange Tester

The Automatic Orange Tester (for C), dynamically stresses unproven code (orange checks) to help you identify run-time errors.

For more information, see “Automatically Testing Orange Code” in the *Polyspace Products for C/C++ User’s Guide*.

Compatibility Considerations. If you open verification results created with an older version of the product in the Automatic Orange Tester, you may get a compilation error. The version of the product used to create the instrumented source code must be the same as the one used for analysis in the Automatic Orange Tester.

To avoid this problem, re-launch the code verification with the current version of the product.

Operating System Support

Added support for Windows Server 2003, Windows Vista™, and Red Hat Enterprise Linux Workstation v.5.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for C/C++ Product

Performance Improvements for Multi-Core Systems

Enhanced performance on multi-core architecture platforms, improving the speed of Polyspace code verification.

The time required to perform an average code verification has been reduced. On multi-core systems, you can now select the number of processes that can run simultaneously, further improving performance.

For more information, see “Number of processes for multiple CPU core systems (-max-processes)” in the *Polyspace Products for C/C++ Reference*

Polyspace Products for C++ Reference.

Architecture Improvements

Several changes have been made to the Polyspace architecture to improve overall performance, as well as the precision of verification results.

During each verification phase (pass), the software now only analyzes those procedures that need to be analyzed. This means that starting with PASS1, if the verification cannot be more precise than that already completed in a previous pass, the procedure is not analyzed again. This improves the overall performance of the verification. It also means that some passes will finish more quickly than others, and some passes could be completely empty. This is normal behavior.

In addition, these architecture improvements result in the following changes:

- The `quick` precision option is now obsolete, and has been removed. `quick` mode has been replaced with verification PASS0. PASS0 takes somewhat longer to run, but the results are more complete. The limitations of `quick` mode, (no NTL or NTC checks, no float checks, no variable dictionary) no longer apply. Unlike `quick` mode, PASS0 also provides full navigation in the Viewer.
- The `voa` option is now obsolete, and has been removed. Value On Assignment checks are now provided by default. In C, all possible VOA are given.
- The UOVFL (Float Underflows and Overflows) check no longer exists. Float underflows and overflows are now reported as two separate checks. This is similar to the way integers are handled.

Note Since the single UOVFL check has been replaced by two checks, the total number of checks reported by Polyspace on a given file may be different in this release than with previous versions of the software.

- Messages have been improved for float arithmetic checks, making them similar to the messages for integers. For example, NIV checks on float variables now contain the type size (32 or 64).
- For IPT (Inspection Point) checks, there is now one check for each variable. Previously there was a single IPT check (on the keyword) for multiple variables.
- The log file has several additions, including the names of each PASS, the verification phases, and additional messages.

Compatibility Considerations. The verification results provided by Polyspace software may be different in R2009a than with previous releases of the software. Verification results are more precise, and the total number of checks reported on a given source file may be different. In general, the software now reports more checks, due to increased VOA checks, changes to the IPT check, and the single float UOVFL check being replaced by two checks (UNFL and OVFL).

In addition, due to the float UOVFL check being split into two checks, the selectivity (number of proven checks red+green+gray / number of total checks) of a verification may change significantly for applications using many float variables. For example, an application that had 10 orange UOVFL checks with a previous release, could now have up to 20 orange UNFL and OVFL checks on the same float variables. Although this appears to be a decrease in precision, the verification itself is not less precise.

Operating System Support

Added support for Windows Server 2003, Windows Vista, and Red Hat Enterprise Linux Workstation v.5.

For more information, see the *Polyspace Installation Guide*.

Version 5.3 (R2009a) Polyspace for Ada and Model Link Products

This table summarizes what's new in V5.3 (R2009a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports Polyspace Model Link TL Bug Reports Polyspace UML Link RH Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 179
- “Polyspace® Server™ for Ada Product” on page 180
- “Polyspace® Model Link™ SL Product” on page 180
- “Polyspace® UML Link™ RH Product” on page 181

Polyspace Client for Ada Product

Character Encoding Options

New character encoding option allows you to view source files created on an operating system that uses different character encoding than your current system.

You specify the character encoding used by the operating system on which the source file was created using the **Character encoding** tab in the Preferences dialog box of the Polyspace Viewer.

For more information, see “Setting Character Encoding Preferences” in the *Polyspace Products for Ada User’s Guide*.

Operating System Support

Added support for Windows Server 2003, Windows Vista, and Red Hat Enterprise Linux Workstation v.5.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for Ada Product

Operating System Support

Added support for Windows Server 2003, Windows Vista, and Red Hat Enterprise Linux Workstation v.5.

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link SL Product

Polyspace Menu Option in Simulink

New option in the Simulink Tools menu to launch Polyspace software directly from Simulink.

For more information, see “Running Verification with Polyspace Model Link SL Software” in the *Polyspace Model Link Products User’s Guide*.

Manual Selection of Data Range Specifications (DRS) File

You can now manually select a Data Range Specification (DRS) file within Simulink, instead of accepting the default DRS file.

For more information, see “Data Range Specification” in the *Polyspace Model Link Products User’s Guide*.

Simulink Software Support

Added support for Simulink Version 7.3 (R2009a).

Polyspace UML Link RH Product

Rhapsody Support

Added support for Telelogic Rhapsody Version 7.2 and 7.3.

Version 6.0 (R2008b) Polyspace for C/C++ Products

This table summarizes what's new in V6.0 (R2008b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for C/C++ Product” on page 182
- “Polyspace® Server™ for C/C++ Product” on page 183

Polyspace Client for C/C++ Product

Automatic Orange Tester

Automatic Orange Tester (for C), dynamically stresses unproven code (orange checks) to identify run-time errors, and provides information to help you identify the cause of these errors.

The Automatic Orange Tester complements the results review in the Viewer module of Polyspace Client for C/C++ by automatically creating test cases for all input variables in orange code, and then dynamically testing the code to find actual runtime errors. The Automatic Orange Tester also provides detailed information on why each test-case failed. You can use this information to quickly identify the cause of the error, and determine if there is an actual bug in the code.

For more information, see “Automatically Testing Orange Code” in the *PolySpace Client/Server for C User’s Guide*.

JSF++ Support

Support for a subset of the Joint Strike Fighter Air Vehicle C++ coding standards (JSF++:2005).

Polyspace software can now check 120 of the C++ programming rules defined by Lockheed Martin for the JSF program. These coding standards are designed to improve the robustness of C++ code, and improve maintainability.

For more information, see *JSF C++ Checker*, in the *PolySpace Client/Server for C++ User Guide*.

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for C/C++ Product

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Version 5.2 (R2008b) Polyspace for Ada and Model Link Products

This table summarizes what's new in V5.2 (R2008b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	Includes fixes: Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 184
- “Polyspace® Server™ for Ada Product” on page 184
- “Polyspace® Model Link™ SL Product” on page 185
- “Polyspace® Model Link™ TL Product” on page 185
- “Polyspace® UML Link™ RH Product” on page 186

Polyspace Client for Ada Product

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for Ada Product

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link SL Product

Model Reference Support

Added support for Simulink Model Reference.

Polyspace Model Link SL software now automatically detects model references in Simulink models, allowing you to quickly track any verification issues back to the original model.

For more information, see the *Polyspace Model Link Products User's Guide*.

Stateflow Chart Support

Added support for Stateflow® Charts within Simulink models.

Polyspace Model Link SL software now supports Stateflow Charts within Simulink models, allowing you to quickly track any verification issues back to the original Stateflow chart. In addition, any Stateflow comments are now highlighted in the Polyspace source code view.

For more information, see the *Polyspace Model Link Products User's Guide*.

Simulink Software Support

Added support for Simulink Version 7.2 (R2008b).

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link TL Product

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Polyspace UML Link RH Product

Ada Language Support

Added support for Ada language in Rhapsody software.

For more information, see the *Polyspace UML Link RH User's Guide*.

Operating System Support

Added support for 64-bit Linux.

For more information, see the *Polyspace Installation Guide*.

Version 5.1 (R2008a) Polyspace Software

This table summarizes what's new in V5.1 (R2008a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes—Details labeled as Compatibility Considerations , below. See also Summary.	Includes fixes: Polyspace Client for C/C++ Bug Reports Polyspace Server for C/C++ Bug Reports Polyspace Client for Ada Bug Reports Polyspace Server for Ada Bug Reports Polyspace Model Link SL Bug Reports

New features and changes introduced in this version are organized by product:

- “Polyspace® Client™ for Ada Product” on page 187
- “Polyspace® Server™ for Ada Product” on page 189
- “Polyspace® Client™ for C/C++ Product” on page 191
- “Polyspace® Server™ for C/C++ Product” on page 194
- “Polyspace® Model Link™ SL Product” on page 195
- “Polyspace® Model Link™ TL Product” on page 196
- “Polyspace® UML Link™ RH Product” on page 196

Polyspace Client for Ada Product

Removed Cygwin Software Dependency for Windows Platforms

Previous versions of Polyspace products used Cygwin™ emulation to run UNIX® commands on Windows systems.

In version 5.1, the Cygwin software dependency has been removed. Removing Cygwin simplifies the Polyspace product installation process while improving the performance and robustness of the Polyspace Verification process.

Compatibility Considerations. Due to the Cygwin changes, Polyspace Client for Ada Version 5.1 is not compatible with previous versions of Polyspace products on Windows platforms. To avoid compatibility problems on Windows platforms, you must upgrade all your Polyspace client and server products at the same time.

If your Polyspace server is running on a Windows platform, the binary files used for batch commands in previous releases will not work without Cygwin software installed. In version 5.1, the software provides new .exe files for these batch commands. However, these files are now located in a different location.

Commands	Previous Location	New Location
Standard	<i>PolyspaceInstallDir</i> \verifier\bin\	<i>PolyspaceInstallDir</i> \verifier\wbin\
Remote Launcher	<i>Polyspace_Common</i> \RemoteLauncher\bin\	<i>Polyspace_Common</i> \RemoteLauncher\wbin\
Viewer	<i>Polyspace_Common</i> \Viewer\bin\	<i>Polyspace_Common</i> \Viewer\wbin\

If you wrote scripts using batch commands in previous releases, you must modify the scripts to use the new commands.

In addition, if you used Cygwin shell scripts for postprocessing or target compilation, those scripts will no longer run on version 5.1. To support scripting, the Polyspace software now includes Perl. You can access Perl in:

PolyspaceInstallDir\verifier\tools\perl\win32\bin\perl.exe

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

Viewer Improvements

Enhanced exploring capability in the viewer to provide more focused information.

Unnecessary information has been eliminated from the Procedural Entities (RTE) View and Call Tree View to improve usability.

Enhanced Compilation Checks

Enhanced compilation checks to stop verification only when a pointer to a task is initiated or used, rather than when it is declared.

One-Click Enhancements

Enhanced Polyspace-In-One-Click options, to allow switching between multiple projects using a browse history.

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for Ada Product

Removed Cygwin Software Dependency for Windows Platforms

Previous versions of Polyspace products used Cygwin emulation to run UNIX commands on Windows systems.

In version 5.1, the Cygwin software dependency has been removed. Removing Cygwin simplifies the Polyspace product installation process while improving the performance and robustness of the Polyspace Verification process.

Compatibility Considerations. Due to the Cygwin changes, Polyspace Server™ for Ada Version 5.1 is not compatible with previous versions of Polyspace products on Windows platforms. To avoid compatibility problems on Windows platforms, you must upgrade all your Polyspace client and server products at the same time.

If your Polyspace server is running on a Windows platform, the binary files used for batch commands in previous releases will not work without Cygwin software installed. In version 5.1, the software provides new .exe files for these batch commands. However, these files are now located in a different location.

Commands	Previous Location	New Location
Standard	<i>PolyspaceInstallDir</i> \verifier\bin\	<i>PolyspaceInstallDir</i> \verifier\wbin\
Remote Launcher	<i>Polyspace_Common</i> \RemoteLauncher\bin\	<i>Polyspace_Common</i> \RemoteLauncher\wbin\
Viewer	<i>Polyspace_Common</i> \Viewer\bin\	<i>Polyspace_Common</i> \Viewer\wbin\

If you wrote scripts using batch commands in previous releases, you must modify the scripts to use the new commands.

In addition, if you used Cygwin shell scripts for postprocessing or target compilation, those scripts will no longer run on version 5.1. To support scripting, the Polyspace software now includes Perl. You can access Perl in:

```
PolyspaceInstallDir\verifier\tools\perl\win32\bin\perl.exe
```

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Polyspace Client for C/C++ Product

Removed Cygwin Software Dependency for Windows Platforms

Previous versions of Polyspace products used Cygwin emulation to run UNIX commands on Windows systems.

In version 5.1, the Cygwin software dependency has been removed. Removing Cygwin simplifies the Polyspace product installation process while improving the performance and robustness of the Polyspace Verification process.

Compatibility Considerations. Due to the Cygwin changes, Polyspace Client for C/C++ Version 5.1 is not compatible with previous versions of Polyspace products on Windows platforms. To avoid compatibility problems on Windows platforms, you must upgrade all your Polyspace client and server products at the same time.

If your Polyspace server is running on a Windows platform, the binary files used for batch commands in previous releases will not work without Cygwin software installed. In version 5.1, the software provides new .exe files for these batch commands. However, these files are now located in a different location.

Commands	Previous Location	New Location
Standard	<i>PolyspaceInstallDir</i> \verifier\bin\	<i>PolyspaceInstallDir</i> \verifier\wbin\
Remote Launcher	<i>Polyspace_Common</i> \RemoteLauncher\bin\	<i>Polyspace_Common</i> \RemoteLauncher\wbin\
Viewer	<i>Polyspace_Common</i> \Viewer\bin\	<i>Polyspace_Common</i> \Viewer\wbin\

If you wrote scripts using batch commands in previous releases, you must modify the scripts to use the new commands.

In addition, if you used Cygwin shell scripts for postprocessing or target compilation, those scripts will no longer run on version 5.1. To support scripting, the Polyspace software now includes Perl. You can access Perl in:

```
PolyspaceInstallDir\verifier\tools\perl\win32\bin\perl.exe
```

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

Viewer Improvements

Enhanced exploring capability in the viewer to provide more precise locations for C++ checks.

The source code view of the Polyspace viewer now displays the location of C++ checks more accurately.

One-Click Enhancements

Enhanced Polyspace-In-One-Click options, to allow switching between multiple projects using a browse history.

For more information, see “Day to Day Use” in the *PolySpace Client/Server for C User Guide*.

Generic Target Option for C++

New Generic Target option for C++, to allow custom target processors. The Generic Target option for C++ is similar to the previous Generic Target for C.

For more information, see *Defining Generic Targets* in the *PolySpace Client/Server for C++ User Guide*.

Class Analyzer Enhancements for C++

Enhanced class analyzer now calls all private constructors and destructors.

Previously, the sources analyzed were generally non-inherited public or protected methods of the class. In version 5.1, the functions that are analyzed include all non-inherited constructors and destructors, and all non-inherited public or protected methods of the class.

For more information, see *PolySpace Class Analyzer* in the *PolySpace Client/Server for C++ User Guide*.

GNU Compiler Support for C++

New support for the GNU® compiler (GCC 3.4) for C++.

The new GNU dialect option supports variable length arrays, anonymous structures, and other constructions allowed by GCC.

For more information, see *Dialect Issues* in the *PolySpace Client/Server for C++ User Guide*.

Polyspace C++ Add-in for Visual Studio

Simplified user interface for Polyspace C++ add-in for Microsoft Visual Studio.

The Polyspace Browser tab has been eliminated from the Visual Studio window. To perform an analysis of a file in Visual Studio, you now simply right-click on the file and select **Start Polyspace**.

For more information, see *Using PolySpace Software in Visual Studio* in the *PolySpace Client/Server for C++ User Guide*.

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Polyspace Server for C/C++ Product

Removed Cygwin Software Dependency for Windows Platforms

Previous versions of Polyspace products used Cygwin emulation to run UNIX commands on Windows systems.

In version 5.1, the Cygwin software dependency has been removed. Removing Cygwin simplifies the Polyspace product installation process while improving the performance and robustness of the Polyspace Verification process.

Compatibility Considerations. Due to the Cygwin changes, Polyspace Server for C/C++ Version 5.1 is not compatible with previous versions of Polyspace products on Windows platforms. To avoid compatibility problems on Windows platforms, you must upgrade all your Polyspace client and server products at the same time.

If your Polyspace server is running on a Windows platform, the binary files used for batch commands in previous releases will not work without Cygwin software installed. In version 5.1, the software provides new .exe files for these batch commands. However, these files are now located in a different location.

Commands	Previous Location	New Location
Standard	<i>PolyspaceInstallDir\verifier\bin\</i>	<i>PolyspaceInstallDir\verifier\wbin\</i>
Remote Launcher	<i>Polyspace_Common\RemoteLauncher\bin\</i>	<i>Polyspace_Common\RemoteLauncher\wbin\</i>
Viewer	<i>Polyspace_Common\Viewer\bin\</i>	<i>Polyspace_Common\Viewer\wbin\</i>

If you wrote scripts using batch commands in previous releases, you must modify the scripts to use the new commands.

In addition, if you used Cygwin shell scripts for postprocessing or target compilation, those scripts will no longer run on version 5.1. To support scripting, the Polyspace software now includes Perl. You can access Perl in:

`PolyspaceInstallDir\verifier\tools\perl\win32\bin\perl.exe`

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

GNU Compiler Support for C++

New support for the GNU compiler (GCC 3.4) for C++.

The new GNU dialect option supports variable length arrays, anonymous structures, and other constructions allowed by GCC.

For more information, see *Dialect Issues* in the *PolySpace Client/Server for C++ User Guide*.

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link SL Product

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

Simulink Software Support

Added support for Simulink Version 7.1 (R2008a).

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Polyspace Model Link TL Product

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Polyspace UML Link RH Product

Enhanced Installer

Version 5.1 includes an enhanced and simplified installer for all Polyspace products. The installation process is now faster and easier to complete than in previous releases.

For more information, see the *Polyspace Installation Guide*.

Rhapsody Support

Added support for Telelogic Rhapsody Version 7.1.

C Language Support

Added support for C language in Rhapsody software.

For more information, see the *Polyspace UML Link RH User's Guide*.

Operating System Support

Added support for the following operating systems:

- Solaris 2.10
- Windows XP x64 (32-bit mode)

For more information, see the *Polyspace Installation Guide*.

Compatibility Summary for Polyspace Software

This table summarizes new features and changes that might cause incompatibilities when you upgrade from an earlier version, or when you use files on multiple versions. Details are provided in the description of the new feature or change.

Version (Release)	New Features and Changes with Version Compatibility Impact
Latest Version for C/C++ Products V8.3 (R2012a)	See the Compatibility Considerations subheading for these new features or changes: <ul style="list-style-type: none"> • “Suppression of NTC, NTL and UNR Checks Caused by Red Checks” on page 12 • “Absolute Addresses” on page 17
Latest Version for Ada Products V6.3 (R2012a)	See the Compatibility Considerations subheading for this new feature or change: <ul style="list-style-type: none"> • “Suppression of NTC, NTL and UNR Checks Caused by Red Checks” on page 23
Latest Version for Model Link Products V5.9 (R2012a)	None

Version (Release)	New Features and Changes with Version Compatibility Impact
V8.2 (R2011b) for C/C++ Products	<p>See the Compatibility Considerations subheading for these new features or changes:</p> <ul style="list-style-type: none"> • “STD_LIB Check” on page 30 • “Enhanced MISRA-C Coding Rules Checker” on page 31 • “No Gray Checks in Unreachable Code” on page 33 • “Changes to Verification Results” on page 36 • “Changes to Coding Rules Checker Results” on page 37 • “Running Multiple Verifications Simultaneously” on page 41
V6.2 (R2011b) for Ada Products	<p>See the Compatibility Considerations subheading for these new features or changes:</p> <ul style="list-style-type: none"> • “No Gray Checks in Unreachable Code” on page 44 • “Running Multiple Verifications Simultaneously” on page 46
V5.8 (R2011b) for Model Link Products	None

Version (Release)	New Features and Changes with Version Compatibility Impact
V8.1 (R2011a) for C/C++ Products	<p>See the Compatibility Considerations subheading for these new features or changes:</p> <ul style="list-style-type: none">• “Overflow Check Customization” on page 55• “Main Generator Improvements” on page 56• “Precision Improvements” on page 84• “Permissive Mode Set By Default” on page 58• “Product Name Change in Files and Folders” on page 60• “Changes to Verification Results” on page 61• “Changes to Coding Rules Checker Results” on page 63
V6.1 (R2011a) for Ada Products	<p>See the Compatibility Considerations subheading for these new features or changes:</p> <ul style="list-style-type: none">• “Generated Main with Explicit Tasks and Accept Statements” on page 72• “Enhancements in Run-Time Checks Perspective” on page 72• “UOVFL and UNFL Checks Removed” on page 72• “NIV Checks for Universal Constants” on page 73• “Scaling Issue for Large Applications with Nested Structures/Arrays” on page 74• “Product Name Change in Files and Folders” on page 74• “Changes to Verification Results” on page 75

Version (Release)	New Features and Changes with Version Compatibility Impact
	<ul style="list-style-type: none"> • “Generated Main with Explicit Tasks and Accept Statements” on page 80
V5.7 (R2011a) for Model Link Products	<p>See the Compatibility Considerations subheading for this new feature or change:</p> <ul style="list-style-type: none"> • “Overflow Check Customization” on page 82 • “Main Generator Improvements” on page 83 • “Precision Improvements” on page 84
V8.0 (R2010b) for C/C++ Products	<p>See the Compatibility Considerations subheading for these new features or changes:</p> <ul style="list-style-type: none"> • “New Options to Classify Run-Time Checks and Coding Rules Violations” on page 94 • “Main Generation in C++” on page 96 • “Default Target Processor” on page 98 • “Default Operating System Target” on page 99 • “Include Folders Added to Verification by Default” on page 99 • “Changes to Verification Results” on page 100
V6.0 (R2010b) for Ada Products	<p>See the Compatibility Considerations subheading for these new features or changes:</p> <ul style="list-style-type: none"> • “New Options to Classify Run-Time Checks” on page 115 • “Default Target Processor” on page 117
