Summary by Version	1
Version 5.8 (R2012a) Symbolic Math Toolbox Software	5
Version 5.7 (R2011b) Symbolic Math Toolbox Software	13
Version 5.6 (R2011a) Symbolic Math Toolbox Software	18
Version 5.5 (R2010b) Symbolic Math Toolbox Software	22
Version 5.4 (R2010a) Symbolic Math Toolbox Software	27
Version 5.3 (R2009b) Symbolic Math Toolbox Software	33
Version 5.2 (R2009a) Symbolic Math Toolbox Software	37
Version 5.1 (R2008b) Symbolic Math Toolbox Software	42
Version 5.0 (R2008a+) Symbolic Math Toolbox Software	43
Version 4.9 (R2007b+) Symbolic Math Toolbox Software	44
Version 3.2.3 (R2008a) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software	52

Version 3.2.2 (R2007b) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software	53
Version 3.2 (R2007a) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software	54
Version 3.1.5 (R2006b) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software	55
Version 3.1 (R14) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software	56
Compatibility Summary for Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software	61

Summary by Version

This table provides quick access to what's new in each version. For clarification, see "Using Release Notes" on page 3.

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Latest Version	Yes	Yes	Bug Reports
V5.8 (R2012a)	Details	Summary	Includes fixes
V5.7 (R2011b)	Yes	Yes	Bug Reports
	Details	Summary	Includes fixes
V5.6 (R2011a)	Yes	Yes	Bug Reports
	Details	Summary	Includes fixes
V5.5 (R2010b)	Yes	Yes	Bug Reports
	Details	Summary	Includes fixes
V5.4 (R2010a)	Yes	Yes	Bug Reports
	Details	Summary	Includes fixes
V5.3 (R2009b)	Yes	Yes	Bug Reports
	Details	Summary	Includes fixes
V5.2 (R2009a)	Yes	Yes	Bug Reports
	Details	Summary	Includes fixes
V5.1 (R2008b)	No	No	Bug Reports Includes fixes
		Note If you are upgrading from a version before 4.9, see the release notes for "Version 4.9 (R2007b+) Symbolic Math Toolbox Software" on page 44.	

Version (Release)	New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
V5.0 (R2008a+)	No	Note If you are upgrading from a	Bug Reports Includes fixes
		version before 4.9, see the release notes for "Version 4.9 (R2007b+) Symbolic Math Toolbox Software" on page 44.	
V4.9 (R2007b+)	Yes Details	Yes Summary	Bug Reports Includes fixes
V3.2.3 (R2008a)	No	No	Bug Reports Includes fixes
V3.2.2 (R2007b)	No	No	Bug Reports Includes fixes
V3.2 (R2007a)	Yes Details	No	Bug Reports Includes fixes
V3.1.5 (R2006b)	Yes Details	Yes Summary	Bug Reports Includes fixes
V3.1.4 (R2006a)	No	No	Bug Reports Includes fixes
V3.1.3 (R14SP3)	No	No	No bug fixes
V3.1.2 (R14SP2)	No	No	Bug Reports Includes fixes
V3.1.1 (R14SP1)	No	No	No bug fixes
V3.1 (R14)	Yes Details	No	No bug fixes

Using Release Notes

Use release notes when upgrading to a newer version to learn about:

- New features
- Changes
- Potential impact on your existing files and practices

Review the release notes for other MathWorks® products required for this product (for example, MATLAB® or Simulink®). Determine if enhancements, bugs, or compatibility considerations in other products impact you.

If you are upgrading from a software version other than the most recent one, review the current release notes and all interim versions. For example, when you upgrade from V1.0 to V1.2, review the release notes for V1.1 and V1.2.

What Is in the Release Notes

New Features and Changes

- New functionality
- Changes to existing functionality

Version Compatibility Considerations

When a new feature or change introduces a reported incompatibility between versions, the **Compatibility Considerations** subsection explains the impact.

Compatibility issues reported after the product release appear under Bug Reports at the MathWorks Web site. Bug fixes can sometimes result in incompatibilities, so review the fixed bugs in Bug Reports for any compatibility impact.

Fixed Bugs and Known Problems

MathWorks offers a user-searchable Bug Reports database so you can view Bug Reports. The development team updates this database at release time

and as more information becomes available. Bug Reports include provisions for any known workarounds or file replacements. Information is available for bugs existing in or fixed in Release 14SP2 or later. Information is not available for all bugs in earlier releases.

Access Bug Reports using your MathWorks Account.

Documentation on the MathWorks Web Site

Related documentation is available on mathworks.com for the latest release and for previous releases:

- Latest product documentation
- Archived documentation

Version 5.8 (R2012a) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.8 (R2012a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are:

- "New Special Functions" on page 6
- "New Vector Analysis Functions" on page 6
- "Computations with Symbolic Functions" on page 6
- "Assumptions on Variables" on page 7
- "New Relational Operators Create Equations, Inequalities, and Relations" on page 7
- "New Logical Operators Create Logical Expressions" on page 8
- "New Functions Test Validity of Symbolic Equations, Inequalities, and Relations" on page 8
- "New Functions Manipulate Symbolic Expressions" on page 9
- "New odeToVectorField Function Converts Higher-Order Differential Equations to Systems of First-Order Differential Equations" on page 9
- "New Calling Syntax for the taylor Function" on page 9
- "New MuPAD Functions Compute Rectangular and Triangular Pulse Functions" on page 10
- "MuPAD det, linalg::det, inverse, linsolve, and linalg::matlinsolve Functions Accept the New Normal Option" on page 10

- "MuPAD linalg::matlinsolve Function Accepts the New ShowAssumptions Option" on page 10
- "Enhanced MuPAD pdivide Function" on page 10
- "Improved MuPAD prog::remember Function" on page 11
- "Functionality Being Removed or Changed" on page 11

New Special Functions

The following special functions are available:

- airy computes the Airy functions of the first and the second kinds. It also computes the first derivatives of the Airy functions.
- beta computes the beta function.
- erfinv and erfcinv compute the inverse and inverse complementary error functions.
- factorial computes the factorial function.
- nchoosek computes binomial coefficients.
- whittakerM and whittakerW compute the Whittaker M and Whittaker W functions.

New Vector Analysis Functions

The following vector analysis functions are available:

- curl computes the curl of a vector field.
- divergence computes the divergence of a vector field.
- laplacian computes the laplacian of a scalar function.
- potential computes the scalar potential of a vector field.
- vectorPotential computes the vector potential of a three-dimensional vector field.

Computations with Symbolic Functions

The toolbox lets you create symbolic functions. For details, see "Creating Symbolic Functions".

dsolve, ezplot, the new odeToVectorField function, and other Symbolic Math $Toolbox^{TM}$ functions now support computations with symbolic functions.

The toolbox also provides the following functions to support common operations on symbolic functions:

- argnames returns a symbolic array of all input variables of a symbolic function.
- formula returns a mathematical expression that defines the symbolic function.

Assumptions on Variables

You can set assumptions on symbolic variables by using these functions:

- assume sets assumptions on symbolic variables.
- assumeAlso adds assumptions on symbolic variables without erasing the previous assumptions.
- assumptions shows assumptions set on symbolic variables.

New Relational Operators Create Equations, Inequalities, and Relations

Use these relational operators to create symbolic equations, inequalities, and relations:

- == and its functional form eq create a symbolic equation. You can solve these equations using solve or dsolve, plot them using ezplot, set assumptions using assume or assumeAlso, or use them in logical expressions.
- ~= and its functional form ne create a symbolic inequality. You can use inequalities in assumptions and logical expressions.
- >, >=, <, <=, and their functional forms ge, gt, le, and lt create symbolic relations. You can use relations in assumptions and logical expressions.

Compatibility Considerations

In previous releases, eq evaluated equations and returned logical 1 or 0. Now it returns unevaluated equations letting you create equations that you can pass to solve, assume, and other functions. To obtain the same results as in previous releases, wrap equations in logical or isAlways. For example, use logical(A == B).

New Logical Operators Create Logical Expressions

Use these logical operations let you create logical expressions with symbolic subexpressions:

- & or its functional form and defines the logical conjunction (the logical AND) for symbolic expressions.
- | or its functional form or defines the logical disjunction (the logical OR) for symbolic expressions.
- ~ or its functional form not defines the logical negation (the logical NOT) for symbolic expressions.
- xor defines the logical exclusive disjunction (the logical XOR) for symbolic expressions.

If logical expressions are elements of a symbolic array, you can use these new functions to test the logical expressions:

- all tests whether all equations and inequalities represented as elements of a symbolic array are valid.
- any tests whether at least one of equations and inequalities represented as elements of a symbolic array is valid.

New Functions Test Validity of Symbolic Equations, Inequalities, and Relations

Use these functions to test symbolic equations, inequalities, and relations, including logical statements:

• isAlways checks whether an equation, inequality, or relation holds for all values of its variables.

• logical checks the validity of an equation, inequality, or relation. This function does not simplify or mathematically transform expressions that form an equation, inequality, or relation. It also typically ignores assumptions on variables.

New Functions Manipulate Symbolic Expressions

These functions provide more flexible options for manipulating symbolic expressions:

- The rewrite function rewrites expressions in terms of target functions. It returns a mathematically equivalent form of an expression using the specified target functions. For example, it can rewrite trigonometric expressions using the exponential function.
- children returns child subexpressions, or terms, of a symbolic expression.

New odeToVectorField Function Converts Higher-Order Differential Equations to Systems of First-Order Differential Equations

odeToVectorField converts second- and higher-order differential equations to systems of first-order differential equations. It returns a symbolic vector representing the resulting system of first-order differential equations. With matlabFunction you can generate a MATLAB function from this vector, and then use it as an input for the MATLAB numerical solvers ode23 and ode45.

In $MuPAD^{@}$, the new numeric::odeToVectorField function is equivalent to numeric::ode2vectorfield.

New Calling Syntax for the taylor Function

The taylor function that computes the Taylor series expansions has a new syntax and set of options.

Compatibility Considerations

The new syntax is not valid before Version 5.8. The old syntax is still supported, but will be removed in a future release. To update existing code that relies on the old syntax, make the following changes to the taylor function calls:

- Specify the truncation order using the name-value pair argument Order.
- Specify the expansion point using the name-value pair argument ExpansionPoint.

Alternatively, specify the expansion point as a third input argument. In this case, you must also specify the independent variable or the vector of variables as the second input argument.

For details and examples, see taylor.

New MuPAD Functions Compute Rectangular and Triangular Pulse Functions

The MuPAD rectpulse and tripulse functions compute the rectangular and triangular pulse functions, respectively.

MuPAD det, linalg::det, inverse, linsolve, and linalg::matlinsolve Functions Accept the New Normal Option

The MuPAD det, linalg::det, inverse, linsolve, and linalg::matlinsolve functions accept the new Normal option that guarantees normalization of the returned results. The _invert methods of the MuPAD Dom::Matrix(R) and Dom::DenseMatrix(R) domains also accept Normal.

MuPAD linalg::matlinsolve Function Accepts the New ShowAssumptions Option

The MuPAD linalg::matlinsolve function accepts the new ShowAssumptions option. This option lets you see internal assumptions on symbolic parameters that linalg::matlinsolve makes while solving a system of equations.

Enhanced MuPAD pdivide Function

Enhanced MuPAD pdivide function now performs pseudo-division of multivariate polynomials.

Improved MuPAD prog::remember Function

Improved MuPAD prog::remember function, which lets you use the remember mechanism in procedures streamlines such processes as debugging, profiling, and argument checking.

Functionality Being Removed or Changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
Old syntax of taylor	Warns	New syntax	Update all instances of taylor function calls using the new syntax.
Default number of simplification steps in simplify has changed from 50 to 100.	Uses the new default setting	simplify(S,'Steps',50)	To terminate algebraic simplification after 50 steps, call simplify with the name-value pair argument 'Steps', 50.
char(A,d)	Warns	char(A)	Replace all instances of char(A,d) with char(A).
emlBlock	Warns	matlabFunctionBlock	Replace all instances of emlBlock with matlabFunctionBlock.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
psi(k0:k1,X)	Warns	psi(k,X) where k is a scalar specifying the kth derivative of psi at the elements of X.	Replace all instances of psi(k0:k1,X) with psi(k,X), where k is a scalar. To modify your code, loop through the values k0:k1. For example: for k = k0:k1 Y(:,k) = psi(k,X); end In the future, size(Y) will be size(X). Modify any code that depends on size(Y).
sqrt target of the MuPAD simplify function	Warns	MuPAD radsimp or simplifyRadical	Replace all instances of simplify function calls involving the sqrt target with radsimp or simplifyRadical. Alternatively, replace these calls with simplify function calls without targets.
cos, sin, exp, and ln targets of the MuPAD simplify function	Warns	MuPAD simplify without targets	Replace all instances of simplify function calls involving these targets with simplify function calls without targets. This can lead to a better simplification for some expressions.
MuPAD frame function	Errors	Nothing	No replacement

Version 5.7 (R2011b) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.7 (R2011b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are:

- "MATLAB Editor Now Supports MuPAD Program Files" on page 14
- "dsolve, expand, int, simple, simplify, and solve Accept More Options" on page 14
- "New read Function Reads MuPAD Program Files in MATLAB" on page 14
- $\bullet\,$ "New symprod Function Computes Products of Series" on page 15
- $\bullet\,$ "New hessian Function Computes Hessian Matrices" on page $15\,$
- $\bullet\,$ "New gradient Function Computes Vector Gradients" on page $15\,$
- "New erfc Function Computes the Complementary Error Function" on page 15
- "New psi Function Computes the Digamma and Polygamma Functions" on page 15
- "New wrightOmega Function Computes the Wright omega Function" on page 15
- "New simplifyFraction Function Simplifies Expressions" on page 15
- "New MuPAD simplifyRadical Function Simplifies Radicals in Arithmetical Expressions" on page 16
- "pretty Function Now Uses Abbreviations in Long Output Expressions for Better Readability" on page 16

- "MuPAD normal Function Accepts the New Expand Option" on page 16
- "Modified MuPAD groebner Library" on page 16
- "MuPAD groebner::gbasis Function Accepts the New Factor and IgnoreSpecialCases Options" on page 17
- "New MuPAD Functions for Computing Logarithms" on page 17
- "Functionality Being Removed or Changed" on page 17

MATLAB Editor Now Supports MuPAD Program Files

You can open and edit MuPAD program files (.mu files) in the MATLAB Editor. MATLAB Editor supports syntax highlighting and smart indenting for these files.

dsolve, expand, int, simple, simplify, and solve Accept More Options

dsolve now accepts the IgnoreAnalyticConstraints and MaxDegree options.

expand now accepts the ArithmeticOnly and IgnoreAnalyticConstraints options.

int now accepts the IgnoreAnalyticConstraints, IgnoreSpecialCases, and PrincipalValue options.

simple now accepts the IgnoreAnalyticConstraints option.

simplify now accepts the IgnoreAnalyticConstraints, Seconds, and Steps options.

solve now accepts the IgnoreAnalyticConstraints, IgnoreProperties, MaxDegree, PrincipalValue, and Real options.

New read Function Reads MuPAD Program Files in MATLAB

read simplifies using your own MuPAD procedures in MATLAB. See "Before Calling a Procedure" for details.

New symprod Function Computes Products of Series

symprod computes definite and indefinite products of symbolic series.

New hessian Function Computes Hessian Matrices

hessian computes the Hessian matrix of a scalar function.

New gradient Function Computes Vector Gradients

gradient computes the vector gradient of a scalar function in Cartesian coordinates. In MuPAD, the new linalg::gradient function is equivalent to linalg::grad.

New erfc Function Computes the Complementary Error Function

erfc computes the complementary error function.

New psi Function Computes the Digamma and Polygamma Functions

psi computes the digamma and polygamma functions.

New wrightOmega Function Computes the Wright omega Function

wrightOmega computes the Wright omega function.

New simplifyFraction Function Simplifies Expressions

simplifyFraction returns a simplified form of a fraction where both numerator and denominator are polynomials and their greatest common divisor is 1. In MuPAD, the new simplifyFraction function is equivalent to normal.

New MuPAD simplifyRadical Function Simplifies Radicals in Arithmetical Expressions

The new MuPAD simplifyRadical function is equivalent to the MuPAD radsimp function.

pretty Function Now Uses Abbreviations in Long Output Expressions for Better Readability

pretty uses abbreviations when presenting symbolic results in the MATLAB Command Window. This new format of presenting symbolic results enhances readability of long output expressions.

MuPAD normal Function Accepts the New Expand Option

The MuPAD normal function accepts the new Expand option that determines whether numerators and denominators of fractions are expanded.

Compatibility Considerations

In previous releases, normal returned a fraction with the expanded numerator and denominator by default. Now the default setting is that normal can return factored expressions in numerators and denominators. In explicit calls to normal, you can use the Expand option to get the same behavior as in previous releases.

If a function calls normal internally, then that function can return its results in a different form. These new results are mathematically equivalent to the results that you get in previous releases. Many MuPAD library functions can call normal.

Modified MuPAD groebner Library

All functions of the MuPAD groebner library now can accept and return polynomials with arbitrary arithmetical expressions.

MuPAD groebner::gbasis Function Accepts the New Factor and IgnoreSpecialCases Options

With the Factor option, groebner::gbasis returns a set of lists, such that:

- Each list is the Groebner basis of an ideal.
- The union of these ideals is a superset of the ideal given as input, and a subset of the radical of that ideal.

With the IgnoreSpecialCases option, groebner::gbasis handles all coefficients in all intermediate results as nonzero unless these coefficients are equal to 0 for all parameter values.

New MuPAD Functions for Computing Logarithms

The new MuPAD log2 and log10 functions compute logarithms to the bases 2 and 10, respectively. Also, in MuPAD log(x) is now an alias for ln(x).

Functionality Being Removed or Changed

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
emlBlock	Warns	matlabFunctionBlock	Replace all instances of emlBlock with matlabFunctionBlock.
Real and IgnoreProperties options in MuPAD ode::solve	Warns	IgnoreSpecialCases or IgnoreAnalyticConstraints	Try using IgnoreSpecialCases or IgnoreAnalyticConstraints instead.

Version 5.6 (R2011a) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.6 (R2011a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are:

- "Expression Wrapping of Math Output in the MuPAD Notebook Interface" on page 19
- "Symbolic Solver Handles More Non-Algebraic Equations" on page 19
- "Improved Performance in the Ordinary Differential Equation Solver" on page 19
- "Improved Performance for Polynomial Arithmetic Operations" on page 19
- "New MuPAD polylib::subresultant Function Computes Subresultants of Polynomials" on page 19
- "MuPAD partfrac Function Accepts the New List Option" on page 19
- "New MuPAD inverf and inverfc Functions Compute the Inverses of Error Functions" on page 20
- "New MuPAD numlib::checkPrimalityCertificate Function Tests Primality Certificates" on page 20
- "New Demos" on page 20
- "Functionality Being Removed or Changed" on page 20

Expression Wrapping of Math Output in the MuPAD Notebook Interface

The new default format of presenting results enhances readability by wrapping long output expressions, including long numbers, fractions and matrices.

Symbolic Solver Handles More Non-Algebraic Equations

The enhanced rationalize function in MuPAD helps the symbolic solver to handle more systems of non-algebraic equations. In particular, this improvement enables the toolbox to solve more systems of trigonometric equations.

Improved Performance in the Ordinary Differential Equation Solver

The ordinary differential equation solver demonstrates better performance.

Improved Performance for Polynomial Arithmetic Operations

The MuPAD functions gcdex, partfrac, polylib::resultant, and solvelib::pdioe now demonstrate better performance.

New MuPAD polylib::subresultant Function Computes Subresultants of Polynomials

polylib::subresultant computes subresultants of two polynomials or polynomial expressions.

MuPAD partfrac Function Accepts the New List Option

With the new List option, partfrac returns a list consisting of the numerators and denominators of the partial fraction decomposition.

New MuPAD inverf and inverfc Functions Compute the Inverses of Error Functions

The inverf function computes the inverse of the error function.

The inverfc function computes the inverse of the complementary error function.

New MuPAD numlib::checkPrimalityCertificate Function Tests Primality Certificates

numlib::checkPrimalityCertificate tests primality certificates returned by numlib::proveprime. For information about proving primality of numbers, see "Proving Primality" in the MuPAD documentation.

New Demos

There are three new demos that show how to solve equations and compute derivatives and integrals:

- Solving Algebraic and Differential Equations
- Differentiation
- Integration

To run the new demos, enter symeqndemo, symdiffdemo, or symintdemo in the MATLAB Command Window.

Functionality Being Removed or Changed

Functionality	What Happens When You	Use This Instead	Compatibility Considerations

	Use This Functionality?		
MuPAD matchlib::analyze	Errors	MuPAD prog::exprtree	To visualize expressions, use prog::exprtree.
MuPAD prog::testcall	Errors	Nothing	No replacement
MuPAD prog::testerrors	Errors	Nothing	No replacement
Old syntax of MuPAD prog::getOptions	Errors	The new syntax	Update all instances of prog::getOptions calls using the new syntax.
Old syntax of MuPAD prog::trace	Errors	The new syntax	Update all instances of prog::trace calls using the new syntax.

Version 5.5 (R2010b) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.5 (R2010b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are:

- "sym Function Creates Matrices of Symbolic Variables" on page 23
- "generate::Simscape Function Generates Simscape Equations from MuPAD Expressions" on page 23
- "MuPAD Code Generation Functions Accept the New NoWarning Option" on page 23
- "Improved MuPAD Hyperlink Dialog Box" on page 23
- "MuPAD Notebook Highlights Matched and Unmatched Delimiters" on page 23
- "Improved Performance When Solving Linear Systems in a Matrix Form" on page 24
- "MuPAD Solver for Ordinary Differential Equations Handles More Equation Types" on page 24
- "New Syntax for the MuPAD prog::getOptions Function" on page 24
- "New Syntax for the MuPAD prog::trace Function" on page 24
- "Improved Interface for Arithmetical Operations on Polynomials" on page 24
- "MuPAD igcd Function Now Accepts Complex Numbers as Arguments" on page 25
- "Enhanced Solver For Factorable Polynomial Systems" on page 25

- "MuPAD Now Evaluates Large Sums with Subtractions Faster" on page 25
- "MuPAD freeIndets Function Accepts the New All Option" on page 25
- "Functionality Being Removed or Changed" on page 26

sym Function Creates Matrices of Symbolic Variables

The sym function now provides a shortcut for creating vectors and matrices of symbolic variables.

For more information, see "Creating a Matrix of Symbolic Variables".

generate::Simscape Function Generates Simscape Equations from MuPAD Expressions

The new MuPAD function generate::Simscape converts MuPAD expressions to SimscapeTM equations.

MuPAD Code Generation Functions Accept the New NoWarning Option

MuPAD functions generate::C, generate::fortran, generate::MATLAB, and generate::Simscape accept the new NoWarning option. The option suppresses all warnings issued by these functions.

Improved MuPAD Hyperlink Dialog Box

Creating and editing links in MuPAD has become easier with the improved Hyperlink dialog box.

MuPAD Notebook Highlights Matched and Unmatched Delimiters

MuPAD Notebook now can notify you about matched and unmatched delimiters such as parentheses, brackets, and braces.

Improved Performance When Solving Linear Systems in a Matrix Form

MuPAD linalg::matlinsolve function, which solves linear systems of equations in a matrix form, demonstrates better performance.

MuPAD Solver for Ordinary Differential Equations Handles More Equation Types

Enhanced MuPAD solver handles more first-order nonlinear and third-order linear ordinary differential equations. The solver demonstrates improved performance.

New Syntax for the MuPAD prog::getOptions Function

The prog::getOptions function that collects and verifies options within a procedure has the new syntax.

Compatibility Considerations

The new syntax is not valid in MuPAD versions earlier than 5.5. The old syntax is supported in MuPAD 5.5, but will be removed in a future release.

New Syntax for the MuPAD prog::trace Function

The prog::trace function used for debugging has the new syntax. The function observes entering and exiting the MuPAD functions.

Compatibility Considerations

The new syntax is not valid in MuPAD versions earlier than 5.5. The old syntax is not supported in MuPAD 5.5.

Improved Interface for Arithmetical Operations on Polynomials

Improved interface for arithmetical operations between polynomials and arithmetical expressions. In previous releases, to perform an arithmetical operation on a polynomial and an arithmetical expression, you must explicitly convert that expression to a polynomials of the corresponding type. Now, when you operate on a polynomial and an arithmetical expression, MuPAD internally converts the arithmetical expression to a polynomial and performs the calculation.

MuPAD igcd Function Now Accepts Complex Numbers as Arguments

The MuPAD igcd function, which computes the greatest common divisor of integers, now accepts complex numbers. Both real and imaginary parts of accepted complex numbers must be integers or arithmetic expressions that represent integers.

Enhanced Solver For Factorable Polynomial Systems

The MuPAD solve function performs better on factorable polynomial systems.

MuPAD Now Evaluates Large Sums with Subtractions Faster

MuPAD performs evaluations of large sums that contain subtractions faster than in previous releases.

Compatibility Considerations

In MuPAD, the difference operator (-) no longer invokes the _subtract function. Instead, it invokes the _plus and _negate functions. For example, a - b is equivalent to _plus(a, _negate(b)).

MuPAD freeIndets Function Accepts the New All Option

The freeIndets function accepts the new All option. With this option, freeIndets does not exclude the 0th operand from the list of free identifiers.

Functionality Being Removed or Changed

Functionality	What Happens When You Use This Functionality?	Use This Instead	Compatibility Considerations
diff and int methods for inputs of the char type	Warns	sym	Use the sym method instead.
MuPAD matchlib::analyze	Warns	MuPAD prog::exprtree	To visualize expressions, use prog::exprtree.
MuPAD prog::testcall	Warns	None	No replacement
MuPAD prog::testerrors	Warns	None	No replacement
The following options in MuPAD prog::trace:	Errors	None	No replacement. These options are not supported in the
• All			current release.
• Backup			
• Force			
• Name			
• Proc			
• Plain			
• Width			
Global properties in MuPAD	Errors	Assumptions on each variable	Make assumptions on each variable instead.

Version 5.4 (R2010a) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.4 (R2010a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are:

- "When Opening Notebook, MuPAD Can Jump to Particular Locations" on page 28
- "simscape Equation Function Generates Simscape Equations from Symbolic Expressions" on page 28
- "New Calling Syntax for the sort Function" on page 28
- "Changes in the symengine Function" on page 29
- "64-Bit GUI Support for Macintosh" on page 29
- "New MuPAD Print Preview Dialog" on page 29
- "Improved Configure MuPAD Dialog Box" on page 29
- "MuPAD Support for Basic Arithmetic Operations for Lists" on page 29
- "Improved Performance When Operating on Matrices with Symbolic Elements" on page 29

When Opening Notebook, MuPAD Can Jump to Particular Locations

The mupad command that opens a MuPAD notebook now supports references to particular places inside a notebook. You can create a link target inside a notebook and refer to it when opening a notebook.

simscapeEquation Function Generates Simscape Equations from Symbolic Expressions

The new simscapeEquation command represents symbolic expressions in the form of Simscape equations. For more information, see Generating Simscape Equations in the Symbolic Math Toolbox documentation.

New Calling Syntax for the sort Function

The sort function that sorts the element of symbolic arrays and polynomials has the new syntax and set of options.

Compatibility Considerations

In previous releases, the sort function flattened symbolic matrices to vectors before sorting the elements. Now the sort function sorts the elements of each column or each row of a symbolic matrix. If you want to obtain the same results as in the previous release, flatten the symbolic matrix before sorting it: sort(A(:)).

Changes in the symengine Function

The toolbox no longer supports the ability to choose an alternative symbolic engine.

64-Bit GUI Support for Macintosh

MuPAD now supports 64-bit graphical user interfaces (such as notebooks and Editor and Debugger windows) for a 64-bit Macintosh® operating system.

New MuPAD Print Preview Dialog

Adjusting MuPAD documents for printing is easier with the new Print Preview dialog. You can view one or several pages, zoom in and out, switch between page orientations, adjust the page settings without closing the dialog, and print the page or save it to PDF format

Improved Configure MuPAD Dialog Box

Specifying the default settings for graphical user interfaces, such as notebooks and Editor and Debugger windows, has become easier with the improved configuration dialog box.

MuPAD Support for Basic Arithmetic Operations for Lists

Basic arithmetic operations now work for lists.

Improved Performance When Operating on Matrices with Symbolic Elements

MuPAD demonstrates better performance when handling some linear algebra operations on matrices containing symbolic elements.

Enhanced MuPAD divide Function

Enhanced MuPAD divide function computes the quotient and remainder for division of multivariate polynomials.

Improved Performance for Operations on Polynomials

Improved performance for conversions involving polynomials. Improved performance for operations on polynomials including evaluation, multiplication, and division.

Compatibility Considerations

If the coefficients of a polynomial contain the variables of the polynomial itself, the form of results returned by the MuPAD poly function can differ from previous releases. In previous releases, the poly function converted such coefficients to monomials. Now the poly function can return the coefficients of the original expression as coefficients in the resulting polynomial. To get the same behavior as in previous releases, useexpr to convert an original polynomial into an expression, and then call the poly function. For example, the following call exercises the old behavior: poly(expr(p), [y, x]).

MuPAD coeff Function Accepts the New All Option

The coeff function accepts the newAll option. With this option, coeff returns all coefficients of a polynomial including those equal to 0.

MuPAD expand Function Accepts the New ArithmeticOnly Option

The expand function accepts the new ArithmeticOnly option. The option allows you to expand a sum without expanding trigonometric expressions and special functions in its terms. Technically, the option omits overloading the expand function for each term of the original expression.

MuPAD expand Function Now Expands Powers of Products

The expand function now expands powers of products such as $(xy)^n$ for positive x and y. When called with the IgnoreAnalyticConstraints option , the function expands the power of products for arbitrary terms.

New Calling Syntax for MuPAD rationalize Function

The rationalize function that transforms an arbitrary expression into a rational expression has the new syntax and set of options.

Compatibility Considerations

The new syntax is not valid in MuPAD versions earlier than 5.4. The old syntax is supported in MuPAD 5.4, but will be removed in a future release.

Enhanced MuPAD simplify and Simplify Functions

Enhanced simplification functions, simplify and Simplify, demonstrate better results for expressions involving trigonometric and hyperbolic functions, square roots, and sums over roots of unity.

MuPAD subs Function Accepts the New EvalChanges Option

The subs function now accepts the new EvalChanges option. By default, subs does not evaluate an expression after making substitutions. With this option, subs evaluates all subexpressions that contain substitutions.

MuPAD Solver for Ordinary Differential Equations Handles More Equation Types

Enhanced MuPAD solver handles more second-order linear and first-order nonlinear ordinary differential equations. The solver demonstrates improved performance.

The digits and vpa Functions: Compatibility Considerations

It is no longer possible to set the number of digits to 1 when using the digits and vpa functions. The Symbolic Math Toolbox software version number 4.9 and lower allowed you to set the number of digits to 1.

Functionality Being Removed or Changed

Functionality	What Happens When You Use This Functionality?	Use This Instead	Compatibility Considerations
MuPAD Domain Dom::Ideal	Errors	groebner	Represent ideals as lists, and use functions of the groebner package instead.
MuPAD student library	Errors	plot::Integral and linalg	Use plot::Integral and the linalg package instead.
MuPAD relation option in simplify	Errors	None	No replacement
Global property	Warns	Assumptions on each variable	Make assumptions on each variable instead.

Version 5.3 (R2009b) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.3 (R2009b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are described here:

- "Support for Windows x64 and 64-Bit Macintosh" on page 33
- "sym and syms Use Reserved Words as Variable Names" on page 34
- "Toolbox Now Displays Floating-Point Results with Their Original Precision" on page 34
- "New MuPAD Preference Pref::outputDigits Controls Floating-Point Outputs" on page 35
- "Solver for Ordinary Differential Equations Handles More Equation Types" on page 35
- "MuPAD limit Function Supports Limits for Incomplete Gamma Function and Exponential Integral Function" on page 35
- "Enhanced Simplification Routines for MuPAD Special Functions" on page 35
- "Enhanced MuPAD combine Function for Logarithms" on page 35
- $\bullet\,$ "MuPAD normal Function Accepts New Options" on page $35\,$
- "Functionality Being Removed or Changed" on page 35

Support for Windows x64 and 64-Bit Macintosh

The toolbox now supports 64-bit Windows® and Macintosh operating systems. If you work in the MuPAD Notebook Interface on a 64-bit Macintosh operating

system, MuPAD runs a 64-bit engine with 32-bit graphical user interfaces, such as notebooks and Editor and Debugger windows.

sym and syms Use Reserved Words as Variable Names

sym and syms commands now treat reserved MuPAD words, except pi, as variable names.

Compatibility Considerations

In previous releases, the reserved words returned MuPAD values. If your code uses the reserved words as MuPAD commands, modify your code and use the evalin command with the reserved word as a name. For example, use evalin(symengine, 'beta').

Toolbox Now Displays Floating-Point Results with Their Original Precision

The toolbox now displays the floating-point results with the original precision with which the toolbox returned them.

Compatibility Considerations

In previous releases, the toolbox displayed floating-point results with the current precision. You must update the existing code that relies on the output precision for displaying floating-point numbers. Use digits to set the precision you need before computing such results. The toolbox displays the results with the same number of digits it used to compute the results. The toolbox also can increase the specified precision of calculations by several digits.

In previous releases, sym(A, 'f') represented numbers in the form $(2^e + N^2(e - 52))$ or $(2^e + N^2(e - 52))$, with integers for N and e, and N 0. Now sym(A, 'f') displays results in the rational form that actually represents the double-precision floating-point numbers.

New MuPAD Preference Pref::outputDigits Controls Floating-Point Outputs

New preference Pref::outputDigits controls the precision MuPAD uses to display floating-point results.

Solver for Ordinary Differential Equations Handles More Equation Types

Enhanced solvers handle more equation types of second-order homogeneous linear ordinary differential equations. The solver demonstrates improved performance.

MuPAD limit Function Supports Limits for Incomplete Gamma Function and Exponential Integral Function

Enhanced limit function now can compute limits for incomplete Gamma function and exponential integral function.

Enhanced Simplification Routines for MuPAD Special Functions

Enhanced simplification routines for MuPAD hypergeom, mejerG, and bessel special functions.

Enhanced MuPAD combine Function for Logarithms

Enhanced combine function demonstrates better performance for logarithms.

MuPAD normal Function Accepts New Options

The normal command now accepts the options NoGcd, ToCancel, Rationalize, Recursive, and Iterations. The options control costly operations, such as recognizing greatest common divisors and algebraic dependencies.

Functionality Being Removed or Changed

Functionality	What Happens When You Use This Functionality?	Use This Instead	Compatibility Considerations
MuPAD Domain Dom::Ideal	Warns	groebner	Represent ideals as lists, and use functions of the groebner package instead.
MuPAD student library	Warns	plot::Integral and linalg	Use plot::Integral and the linalg package instead.
d in char(A, d)	Warns	None	No replacement
MuPAD relation option in simplify	Warns	None	No replacement

Version 5.2 (R2009a) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.2 (R2009a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are described here:

- "dsolve Accepts the New Option IgnoreAnalyticConstraints" on page 38
- "emlBlock Function Generates Embedded MATLAB Function Blocks from Symbolic Objects" on page 38
- "matlabFunction Improves Control over Input and Output Parameters" on page 38
- "Enhancements to Object-Oriented Programming Capabilities" on page 39
- "generate::MATLAB Function Converts MuPAD Expressions to MATLAB Code" on page 39
- "MuPAD IgnoreAnalyticConstraints Option Specifies That Core Functions Apply Common Algebraic Assumptions to Simplify Results" on page 39
- "MuPAD Outputs Contain Abbreviations for Better Readability" on page 40
- "MuPAD Solver for Ordinary Differential Equations Handles More Equation Types" on page 40
- "MuPAD limit Function Now Can Compute Limits for Piecewise Functions" on page 40
- "New and Improved MuPAD Special Functions" on page 40
- "New Calling Syntax for Test Report Function prog::tcov" on page 40
- "New Demos" on page 41

dsolve Accepts the New Option IgnoreAnalyticConstraints

The dsolve command now accepts the option IgnoreAnalyticConstraints. The option controls the level of mathematical rigor that the solver uses on the analytical constraints on the solution. By default, the solver ignores all analytical constraints.

Compatibility Considerations

The results of the dsolve command can differ from those returned in the previous release. If you want to obtain the same solutions as in the previous release, set the value of the option IgnoreAnalyticConstraints to none.

emlBlock Function Generates Embedded MATLAB Function Blocks from Symbolic Objects

The new emlBlock command converts symbolic expressions to Embedded MATLAB® Function Blocks. You can use these blocks in any Simulink installation, even those without a Symbolic Math Toolbox license. For more information, see Generating Embedded MATLAB Blocks in the Symbolic Math Toolbox documentation.

matlabFunction Improves Control over Input and Output Parameters

matlabFunction now accepts multiple expressions and cell arrays of symbolic arrays as input parameters. The function now allows you to specify the names of the output parameters.

Compatibility Considerations

In previous releases, the default name of an output variable was RESULT. Now the default names of the output variables coincide with the names you use to call matlabFunction. You must update existing code that relies on the default output name RESULT. You can change your code using any of these methods:

- Define the name of an output variable as RESULT.
- Change the name of an input variable to RESULT.

 Throughout your code change the variable name from RESULT to the input name.

Enhancements to Object-Oriented Programming Capabilities

The Symbolic Math Toolbox product uses some object-oriented programming features to implement symbolic objects. Major enhancements to object-oriented programming capabilities enable easier development and maintenance of large applications and data structures. For a full description of object-oriented features, see the MATLAB Object-Oriented Programming documentation.

Compatibility Considerations

It is no longer possible to add methods to @sym by creating a @sym directory containing custom methods.

For an empty x, sym(x) returns a symbolic object of the same size as x. In previous releases, sym(x) returned a symbolic object of size 0-by-0 for an empty x.

generate::MATLAB Function Converts MuPAD Expressions to MATLAB Code

The new generate::MATLAB command converts MuPAD expressions, equations, and matrices to MATLAB formatted strings.

MuPAD IgnoreAnalyticConstraints Option Specifies That Core Functions Apply Common Algebraic Assumptions to Simplify Results

The new IgnoreAnalyticConstraints option allows the use of a set of simplified mathematical rules when solving equations, simplifying expressions, or integrating. For example, this option applies practical, but not generally correct rules for combining logarithms: $\ln(a) + \ln(b) = \ln(a \cdot b)$

MuPAD Outputs Contain Abbreviations for Better Readability

The new default format of presenting results enhances readability of long output expressions by using abbreviations.

MuPAD Solver for Ordinary Differential Equations Handles More Equation Types

The solver now can handle more than 200 additional types of second-order ordinary differential equations. The solver demonstrates improved performance.

MuPAD limit Function Now Can Compute Limits for Piecewise Functions

The enhanced limit function computes limits of piecewise functions including bidirectional and one-sided limits.

New and Improved MuPAD Special Functions

MuPAD includes the following new special functions:

- laguerreL represents Laguerre's L function.
- erfc(x,n) returns iterated integrals of the complementary error function.
- meijerG represents the Meijer G function.

The hypergeom special function demonstrates better performance.

New Calling Syntax for Test Report Function prog::tcov

The prog::tcov function that inspects the data collected during the code execution has the new syntax and set of options.

Compatibility Considerations

The new syntax is not valid in MuPAD versions earlier than 5.2. MuPAD 5.2 does not support the earlier syntax.

New Demos

To see new demos that use MuPAD Notebook Interface, type $\mathtt{mupadDemo}$ at the MATLAB command line or click MuPAD Notebooks Demo.

Version 5.1 (R2008b) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.1 (R2008b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
No	No	Bug Reports Includes fixes

There are no new features or changes in this version.

Note If you are upgrading from a version before 4.9, see the release notes for "Version 4.9 (R2007b+) Symbolic Math Toolbox Software" on page 44.

Version 5.0 (R2008a+) Symbolic Math Toolbox Software

This table summarizes what's new in Version 5.0 (R2008a+):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
No	No	Bug Reports Includes fixes

There are no new features or changes in this version.

Note If you are upgrading from a version before 4.9, see the release notes for "Version 4.9 (R2007b+) Symbolic Math Toolbox Software" on page 44.

Version 4.9 (R2007b+) Symbolic Math Toolbox Software

This table summarizes what's new in Version 4.9 (R2007b+):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are described here:

- "MuPAD Engine Replaces Maple Engine" on page 44
- "New MuPAD Language and Libraries Supplant Extended Symbolic Math Toolbox Software" on page 49
- "New MuPAD Help Viewer (GUI)" on page 49
- "New MuPAD Notebook Interface (GUI)" on page 49
- "New MuPAD Editor and Debugger (GUI)" on page 50
- "New Functionality for Communication Between MATLAB Workspace and MuPAD" on page 50
- $\bullet\,$ "New symengine Command for Choosing a Maple Engine" on page $51\,$
- "New matlabFunction Generates MATLAB Functions" on page 51

MuPAD Engine Replaces Maple Engine

The default Symbolic Math Toolbox engine is now the MuPAD engine. For more information, see the "MuPAD in Symbolic Math Toolbox" chapter in the Symbolic Math Toolbox User's Guide.

Compatibility Considerations

The new engine causes many computed results to differ from those returned by previous versions of Symbolic Math Toolbox software.

General Differences.

- Many computations return in a permuted order (such as a + b instead of b + a).
- Some computations return in a different, mathematically equivalent form (such as (cos(x))^2 instead of 1 - (sin(x))^2).
- diff(dirac(t)) returns dirac(t,1) instead of dirac(1,t).
- sym(x,'f') no longer produces strings of the form hex digits*2^n.
 Instead the strings have the form (2^e+N*2^(e-52)), where N and e are integers.
- For toolbox calculations, some symbols can only be used as symbolic variables, and not in strings: E, I, D, O, beta, zeta, theta, psi, gamma, Ci, Si, and Ei. This is because those symbols represent MuPAD reserved words, and are interpreted as the MuPAD word if you pass them as strings. The words Ci, Si, Ei represent special mathematical functions: the cosine integral, sine integral, and exponential integral respectively.
- Error and warning message IDs may have changed.
- Performance of numerical integration is slower than in previous versions.
- Subexpressions, calculated by the subexpr function, may be different than in previous versions.
- The pretty function no longer uses partial subexpressions (with syntax %n).

Calculus.

- Int no longer evaluates some integrals, including many involving Bessel functions.
- symsum(sin(k*pi)/k,0,n) no longer evaluates to pi.

Linear Algebra.

- The output of colspace may differ from previous versions, but it is mathematically equivalent.
- The eig function may return eigenvalues in a different order than previous versions. Expressions returned by eig may be larger than in previous versions.

- The jordan function may return diagonal subblocks in a different order than previous versions.
- svd may return singular values in a different order than previous versions.

Simplification.

- The coeffs function may return multivariable terms in a different order than in previous versions.
- The expand function may return some trig and exponential expressions differently than in previous versions.
- The simplify function involving radicals and powers make fewer assumptions on unknown symbols than in previous versions.
- The subexpr function may choose a different subexpression to be the common subexpression than in previous versions.
- Subexpressions no longer have partial subexpressions (previous syntax %n).
- The solve function returns solutions with higher multiplicity only when solving a single polynomial.
- acot(-x) = -acot(x) instead of pi acot(x) as in previous versions.
- acoth(-x) = -acoth(x) instead of 2*acoth(0) acoth(x) as in previous versions.
- The simple function has several differences:
 - The 'how' value combine(trig) has been replaced with combine(sincos), combine(sinhcosh), and combine(ln).
 - The 'how' values involving convert have been replaced with rewrite.
 - A new 'how' value of mlsimplify(100) indicates the MuPAD function Simplify(...,Steps=100) simplified the expression.
 - Simplifications such as (sin(x)^2)^(1/2) to sin(x) are no longer performed, since the MuPAD language is careful not to make assumptions about the sign of sin(x).

Conversion.

- Arithmetic involving the vpa function uses the current number of digits
 of precision. Variable precision arithmetic may have different rounding
 behaviors, and answers may differ in trailing digits (trailing zeros are
 now suppressed).
- The char function returns strings using MuPAD syntax instead of Maple™ syntax.
- Testing equality does not compare strings as in previous versions; the symbolic engine equality test is used.
- Saving and loading symbolic expressions is compatible with previous versions, except when the symbolic contents use syntax or functions that differ between Maple or MuPAD engines. For example, suppose you save the symbolic object sym('transform::fourier(f,x,w)'), which has MuPAD syntax. You get a MATLAB error if you try to open the object while using a Maple engine.
- LaTeX output from the latex function may look different than before.
- C and Fortran code generated with the ccode and fortran functions may be different than before. In particular, generated files have intermediate expressions as "optimized" code. For more information, see the "Generating C or Fortran Code" section of the User's Guide.
- pretty output may look different than before.

Equation Solving.

- solve returns solutions with higher multiplicity only when solving a single polynomial.
- solve may return a different number of solutions than before.
- Some calls to dsolve that used to return results involving lambertw now return no solution.
- dsolve can now use the variable C.
- Some dsolve results are more complete (more cases are returned).
- Some dsolve results are less complete (not all previous answers are found).

- finverse may be able to find inverses for different classes of functions than before.
- When finverse fails to find an explicit inverse, it produces different output than before.

Transforms.

• Fourier and inverse Fourier transforms return the MuPAD form transform::fourier when they cannot be evaluated. For example,

```
h = sin(x)/exp(x^2);
FF = fourier(h)

FF =
transform::fourier(sin(x)/exp(x^2), x, -w)
```

The reason for this behavior is the MuPAD definition of Fourier transform and inverse Fourier transform differ from their Symbolic Math Toolbox counterparts by the sign in the exponent:

	Symbolic Math Toolbox definition	MuPAD definition
Fourier transform	$F(w) = \int_{-\infty}^{\infty} f(x)e^{-iwx}dx$	$F(w) = \int_{-\infty}^{\infty} f(x)e^{iwx}dx$
Inverse Fourier transform	$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} F(w)e^{iwx}dw$	$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} F(w)e^{-iwx}dw$

- Several Fourier transforms can no longer be calculated, especially those involving Bessel functions.
- ztrans and iztrans may return more complicated expressions than before.

Special Mathematical Functions.

• The three-parameter Riemann Zeta function is no longer supported.

heaviside(0) = 0.5; in previous versions it was undefined.

maple.

• The maple, mhelp, and procread functions error, unless a Maple engine is installed and selected with symengine.

New MuPAD Language and Libraries Supplant Extended Symbolic Math Toolbox Software

The functionality of the MuPAD language, together with the included libraries, goes far beyond that of the previous Symbolic Math Toolbox software. However, it is not identical to that of the previous Extended Symbolic Math ToolboxTM software. The differences between these software packages are beyond the scope of these release notes.

You can access the MuPAD language in several ways:

- To learn the commands, syntax, and functionality of the language, use the MuPAD Help browser, or read the Tutorial.
- Use a MuPAD notebook, which contains an integrated help system for the language syntax.
- Use the new evalin function or feval function to access the MuPAD language at the MATLAB command line. More detail is available in the "Calling Built-In MuPAD Functions from the MATLAB Command Window" section of the User's Guide.

New MuPAD Help Viewer (GUI)

The MuPAD help viewer contains complete documentation of the MuPAD language, and of the MuPAD Notebook Interface. For more information, see the "Getting Help for MuPAD" section of the User's Guide.

New MuPAD Notebook Interface (GUI)

A MuPAD notebook is an interface for performing symbolic math computations with embedded math notation, graphics, animations, and text. It also enables you to share, document, and publish your calculations and graphics. For example, the MuPAD help viewer is essentially a special MuPAD notebook.

For more information, see the "Calculating in a MuPAD Notebook" section of the User's Guide.

New MuPAD Editor and Debugger (GUI)

The MuPAD Editor GUI enables you to write custom symbolic functions and libraries in the MuPAD language. The Debugger enables you to test your code. For more information, consult the MuPAD help viewer.

New Functionality for Communication Between MATLAB Workspace and MuPAD

Function	Use
doc(symengine,)	Access the MuPAD Help browser.
evalin(symengine,)	Use MuPAD functionality in the MATLAB workspace.
feval(symengine,)	Use MuPAD functionality in the MATLAB workspace.
getVar	Copy expressions residing in a MuPAD notebook into the MATLAB workspace.
mupad	Launch a MuPAD notebook .
mupadwelcome	Access MuPAD GUIs .
reset(symengine,)	Clear the MuPAD engine for the MATLAB workspace.
setVar	Copy expressions residing in the MATLAB workspace into a MuPAD notebook.
symvar	Produce a list of symbolic objects in an expression.

For more information, see the "Integration of MuPAD and MATLAB" section of the User's Guide.

New symengine Command for Choosing a Maple Engine

If you own a compatible version of a Maple software, you can choose to have Symbolic Math Toolbox software use the Maple engine instead of a MuPAD engine. You might want to do this if you have existing Maple programs. Choose the engine by entering symengine at the MATLAB command line; this brings up a GUI for making your choice.

New matlabFunction Generates MATLAB Functions

The new matlabFunction generates MATLAB functions from symbolic expressions. matlabFunction writes the generated code to a file or creates a function handle. You can use the generated function handles and files in any MATLAB installation, even those without a Symbolic Math Toolbox license. For more information, see "Generating MATLAB Functions" in the User's Guide.

Version 3.2.3 (R2008a) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software

This table summarizes what's new in Version 3.2.3 (R2008a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
No	No	Bug Reports Includes fixes

There are no new features or changes in this version.

Version 3.2.2 (R2007b) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software

This table summarizes what's new in Version 3.2.2 (R2007b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
No	No	Bug Reports Includes fixes

There are no new features or changes in this version.

Version 3.2 (R2007a) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software

This table summarizes what's new in Version 3.2 (R2007a):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	Bug Reports Includes fixes

New features and changes introduced in this version are described here:

Maple 10 Access Added for Linux 64-bit Processors and Intel Macintosh Platforms

MATLAB now supports Maple Version 10 on 32-bit Windows, 32- and 64-bit Linux® platforms, and the Intel® and PowerPC® Macintosh platforms.

Version 3.1.5 (R2006b) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software

This table summarizes what's new in version 3.1.5 (R2006b):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	Yes-Details labeled as Compatibility Considerations, below. See also Summary.	Bug Reports Includes fixes

New features and changes introduced in this version are described here:

Change in call to code generation package using the maple function

Calling a function in code generation package using Maple software now requires you to explicitly include the package name. For example,

```
maple('codegen[fortran](x^2-4)');
```

The generated code output using these methods is unaffected by this change.

Compatibility Considerations

In previous versions, functions in the code generation package of Maple software were made automatically available using the Maple with command, and did not require the package name. For example

```
maple('fortran(x^2-4)');
```

This sometimes caused a conflict when assigning to Maple variables having the same name as a function in the code generation package.

Version 3.1 (R14) Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software

This table summarizes what's new in version 3.1 (R14):

New Features and Changes	Version Compatibility Considerations	Fixed Bugs and Known Problems
Yes Details below	No	No

New features and changes introduced in this version are described here:

- "Rounding Operations" on page 56
- "Quotient and Remainder for Division of Integers and Polynomials" on page 57
- "Dirac and Step Functions" on page 57
- "Sorting Symbolic Expressions" on page 58
- "Coefficients of Multivariable Expressions" on page 58
- "Multidimensional Symbolic Arrays" on page 59
- "Conversion to Nondouble Numeric Data Types" on page 59
- "Logarithms to Base 2 and Base 10" on page 60
- "Modulus After Division" on page 60

Rounding Operations

The following new functions perform rounding operations on symbolic arrays:

- ceil Round a number x to the nearest integer greater than or equal to x.
- fix Round toward zero.
- floor Round a number x to the nearest integer less than or equal to x.
- frac Compute the fractional part of a number.
- round Round a number to the nearest integer.

For example,

Quotient and Remainder for Division of Integers and Polynomials

The new function quorem computes the quotient and remainder for division of integers and polynomials. For example,

```
syms x y
p = x^3-2*x+5
[q,r] = quorem(x^5,p)

p =
x^3-2*x+5

q =
x^2+2

r =
-5*x^2-10+4*x
```

Dirac and Step Functions

The following new functions compute the Dirac delta and Heaviside functions:

- dirac Compute the Dirac delta function.
- heaviside Compute the Heaviside step function.

For example,

Sorting Symbolic Expressions

The new function sort sorts symbolic expressions. For example,

```
syms a b c d e x
sort([a c e b d])

ans =
[ a, b, c, d, e]
sort([a c e b d]*x.^(0:4).')

ans =
x^4*d+x^3*b+e*x^2+x*c+a
```

Coefficients of Multivariable Expressions

The new function coeffs computes coefficients of a multivariate polynomial. For example,

```
syms c t x y
t = 2 + (3 + 4*log(x))^2 - 5*log(x);
coeffs(expand(t))

ans =
[ 11, 19, 16]

z = 3*x^2*y^2 + 5*x*y^3
[c,t] = coeffs(z,y)

z =
3*x^2*y^2+5*x*y^3
```

```
c =
[ 3*x^2, 5*x]
t =
[ y^2, y^3]
```

Multidimensional Symbolic Arrays

The new function reshape reshapes symbolic arrays. For example,

```
syms x
A = reshape(x.^{(1:9)},1,3,3)
A(:,:,1) = [ x, x^2, x^3]
A(:,:,2) = [ x^4, x^5, x^6]
A(:,:,3) = [ x^7, x^8, x^9]
```

Conversion to Nondouble Numeric Data Types

The following new functions enable you to convert symbolic arrays to nondouble numeric data types:

- int8 Convert a symbolic matrix to signed 8-bit integers.
- int16 Convert a symbolic matrix to signed 16-bit integers.
- int32 Convert a symbolic matrix to signed 32-bit integers.
- int64 Convert a symbolic matrix to signed 64-bit integers.
- single Convert a number to single precision.
- uint8 Convert a symbolic matrix to unsigned 8-bit integers.
- uint16 Convert a symbolic matrix to unsigned 16-bit integers.
- uint32 Convert a symbolic matrix to unsigned 32-bit integers.
- uint64 Convert a symbolic matrix to unsigned 64-bit integers.

Logarithms to Base 2 and Base 10

The following new functions enable you to compute the logarithm of symbolic arrays to base 2 and base 10:

- log10 Compute base 10 logarithm.
- log2 Compute base 2 logarithm.

Modulus After Division

The new function mod computes modulus after division. For example,

```
syms x

mod(x^3-2*x+999,10)

ans =

x^3+8*x+9
```

Compatibility Summary for Symbolic Math Toolbox and Extended Symbolic Math Toolbox Software

This table summarizes new features and changes that might cause incompatibilities when you upgrade from an earlier version, or when you use files on multiple versions. Details are provided with the description of the new feature or change.

Version (Release)	New Features and Changes with Version Compatibility Impact
Latest Version V5.8 (R2012a)	See the Compatibility Considerations subheading for each of these new features or changes:
	• "New Calling Syntax for the taylor Function" on page 9
	• "New Relational Operators Create Equations, Inequalities, and Relations" on page 7
	See "Functionality Being Removed or Changed" on page 11.
V5.7 (R2011b)	See the Compatibility Considerations subheading for each of these new features or changes:
	• "MuPAD normal Function Accepts the New Expand Option" on page 16
	See "Functionality Being Removed or Changed" on page 17.
V5.6 (R2011a)	See "Functionality Being Removed or Changed" on page 20.

Version (Release)	New Features and Changes with Version Compatibility Impact
V5.5 (R2010b)	See the Compatibility Considerations subheading for each of these new features or changes:
	• "New Syntax for the MuPAD prog::getOptions Function" on page 24
	"New Syntax for the MuPAD prog::trace Function" on page 24
	• "MuPAD Now Evaluates Large Sums with Subtractions Faster" on page 25
	See "Functionality Being Removed or Changed" on page 26.
V5.4 (R2010a)	See the Compatibility Considerations subheading for each of these new features or changes:
	• "New Calling Syntax for the sort Function" on page 28
	• "Improved Performance for Operations on Polynomials" on page 30
	"New Calling Syntax for MuPAD rationalize Function" on page 31
	• "The digits and vpa Functions: Compatibility Considerations" on page 31
	See "Functionality Being Removed or Changed" on page 32.

Version (Release)	New Features and Changes with Version Compatibility Impact
V5.3 (R2009b)	See the Compatibility Considerations subheading for each of these new features or changes:
	• "sym and syms Use Reserved Words as Variable Names" on page 34
	• "Toolbox Now Displays Floating-Point Results with Their Original Precision" on page 34
	See "Functionality Being Removed or Changed" on page 35.
V5.2 (R2009a)	See the Compatibility Considerations subheading for each of these new features or changes:
	• "dsolve Accepts the New Option IgnoreAnalyticConstraints" on page 38
	• "matlabFunction Improves Control over Input and Output Parameters" on page 38
	• "Enhancements to Object-Oriented Programming Capabilities" on page 39
	• "New Calling Syntax for Test Report Function prog::tcov" on page 40
V5.1 (R2008b)	None

Version (Release)	New Features and Changes with Version Compatibility Impact
V5.0 (R2008a+)	None
V4.9 (R2007b+)	See the Compatibility Considerations subheading for each of these new features or changes: • "MuPAD Engine Replaces Maple Engine" on page 44
V3.2.3 (R2008a)	None
V3.2.2 (R2007b)	None
V3.2 (R2007a)	None
V3.1.5 (R2006b)	See the Compatibility Considerations subheading for each of these new features or changes: • "Change in call to code generation package using the maple function" on page 55
V3.1.4 (R2006a)	None
V3.1.3 (R14SP3)	None
V3.1.1 (R14SP1)	None
V3.1 (R14)	None
