Release Notes for Signal Processing Toolbox™

© COPYRIGHT 2004–2012 by The MathWorks, Inc.

The software described in this document is furnished under a license agreement. The software may be used or copied only under the terms of the license agreement. No part of this manual may be photocopied or reproduced in any form without prior written consent from The MathWorks, Inc.

FEDERAL ACQUISITION: This provision applies to all acquisitions of the Program and Documentation by, for, or through the federal government of the United States. By accepting delivery of the Program or Documentation, the government hereby agrees that this software or documentation qualifies as commercial computer software or commercial computer software documentation as such terms are used or defined in FAR 12.212, DFARS Part 227.72, and DFARS 252.227-7014. Accordingly, the terms and conditions of this Agreement and only those rights specified in this Agreement, shall pertain to and govern the use, modification, reproduction, release, performance, display, and disclosure of the Program and Documentation by the federal government (or other entity acquiring for or through the federal government) and shall supersede any conflicting contractual terms or conditions. If this License fails to meet the government's needs or is inconsistent in any respect with federal procurement law, the government agrees to return the Program and Documentation, unused, to The MathWorks, Inc.

Trademarks

MATLAB and Simulink are registered trademarks of The MathWorks, Inc. See www.mathworks.com/trademarks for a list of additional trademarks. Other product or brand names may be trademarks or registered trademarks of their respective holders.

Patents

MathWorks products are protected by one or more U.S. patents. Please see www.mathworks.com/patents for more information.

R2012b

Signal Browser in SPTool	2
GPU acceleration for <code>xcorr</code> , <code>xcorr2</code> , <code>fftfilt</code> , <code>xcov</code> , and <code>cconv</code> functions	6

R2012a

Measurements for Bilevel Pulse Waveforms	8
Signal Statistics	9

R2011b

Passband and Stopband Weights for Fixed-Order Unconstrained Partial Band Differentiator Filters	12
Numerator and Denominator Order Specifications Added to <code>filterbuilder</code> for Lowpass and Highpass Butterworth Designs	13
Conversion of Error and Warning Message Identifiers ...	14

R2011a

Enhancements to <code>filtfilt</code>	16
Symmetric Window Option for Blackman-Harris Windows	17
<code>rectpuls</code> Returns Double-Precision Vector	18
Code Generation from MATLAB and Fixed-Point MEX-File Generation	19

R2010b

Embedded MATLAB Support for Additional Signal Processing Toolbox Functions	22
---	----

R2010a

Single-Precision Support Added for dfilter Objects	24
Embedded MATLAB Support for Additional Signal Processing Toolbox Functions	25
Functions, Objects, Object Methods, and Object Properties Being Removed	26
Warning for Filter Designer in SPTool	29

R2009b

Embedded MATLAB Support Added to Signal Processing Toolbox Functions	32
Ability to Export Filter Coefficients Added to realizemdl ..	33

R2009a

New filter design approach using fdesign and filterbuilder	36
New dfilter method to specify filter coefficients at block ports	37

R2008b

New Walsh–Hadamard Transform functions	40
--	----

R2008a

New Marcum Q Function	42
Conversion Between Magnitude and dB Added	43
PMTM Function Enhanced with Ability to Keep or Drop Last Taper	44

R2007b

Confidence Interval Estimation Added	46
Spurious-Free Dynamic Range (SFDR) Measurement Added	47
Local Maxima/Peak Finder Added	48
Conversions Between Power and dB Added	49

R2007a

lsf2poly and latefilt Multi-Channel Input Support Added	52
Circular Convolution (cconv) Function Added	53
Spectrum Objects Partial Frequency Range Input Support Added	54
cceps Factorize Algorithm Information Clarified	55
dfilt.statespace Now Supports realizemdl Method	56
ellip and ellipap Functions Enhanced	57

R2006b

Frequency Vector Input Added to Spectral Analysis Functions	60
FFT Length in Spectral Analyses Changed	61
sosfilt and dfilt filter Method Support Multidimensional Array Input	62
dfilt block Method Supports Target Subsystem Destination and Link Between Command Line and Model	63
gaussfir Algorithm Updated	64

R2006a

Taylor Window Function Added	66
SPTool Filter Designer Replaced by FDATool	67
sgolay Example Improved	68
zp2sos zeroflag Parameter Added	69
Help for Objects Changed	70

R14SP3

dfilt (Discrete-Time Filters) Delay Structure Added	72
WinTool/WVTool Normalize Magnitude Added	73
FDATool/FVTool Plot Displays Improved	74
FVTool Passband Zoom Added	75

R14SP2

FDATool and FVTool Changes	78
dfilt Changes	80
Spectral Analysis Changes	81
Other Changes	83

R2012b

Version: 6.18
New Features: Yes
Bug Fixes: Yes

Signal Browser in SPTool

Compatibility Considerations: Yes

The R2012b release introduces a revamped Signal Browser GUI. Whenever you select one or more signals in the **Signals** list box and click the **View** button, The Signal Browser GUI launches from the SPTool GUI. The Signal Browser allows you to perform the following additional operations:

- Time Domain Measurements Panels — The Signal Browser includes new side panels labeled **Trace Selection**, **Cursor Measurements**, **Signal Statistics**, **Bilevel Measurements**, and **Peak Finder**.
 - The **Trace Selection** panel allows you to choose which signal to make the active signal when you select multiple input signals in the **Signals** list box in SPTool. This panel replaces the **Select Trace** toolbar button () and **Select a trace** dialog box that were used in previous releases to choose an active signal. In the Signal Browser menu, select **Tools > Measurements > Trace Selection**.
 - The **Cursor Measurements** panel displays screen cursors. This panel replaces the **Markers** menu and all the corresponding toolbar buttons that were used in previous releases to show and configure markers. In the Signal Browser toolbar, click the Cursor Measurements button (). Alternatively, in the Signal Browser menu, select **Tools > Measurements > Cursor Measurements**.
 - The **Signal Statistics** panel displays the maximum, minimum, peak-to-peak difference, mean, median, and RMS values of a selected signal. It also displays the times at which the maximum and minimum values occur. In the Signal Browser toolbar, click the Signal Statistics button (). Alternatively, in the Signal Browser menu, select **Tools > Measurements > Signal Statistics**.
 - The **Bilevel Measurements** panel displays information about a selected signal's transitions, overshoots or undershoots, and cycles. In the Signal Browser toolbar, click the Bilevel Measurements button (). Alternatively, in the Signal Browser menu, select **Tools > Measurements > Bilevel Measurements**.

- The **Peak Finder** panel displays maxima and the times at which they occur. These displays allow you to modify the settings for peak threshold, maximum number of peaks, and peak excursion. In the Signal Browser toolbar, click the Peak Finder button (). Alternatively, in the Signal Browser menu, select **Tools > Measurements > Peak Finder**.
- Multiple Display Support — R2012b enhances the Signal Browser by allowing you to choose to have multiple displays. This feature allows you to tile your screen into a number of separate displays, up to a grid of 4 rows and 4 columns. You may find multiple displays useful when you select multiple input signals in the **Signals** list box in SPTool. To set the number of displays, in the Signal Browser toolbar, click the Layout button (). Alternatively, in the Signal Browser menu, select **View > Layout**.
- Style dialog box — R2012b enhances the Signal Browser by allowing you to customize the style of displays using a Style dialog box. You can change the color of the figure containing the displays, the background and foreground colors of display axes, and properties of lines in a display. The Style dialog box replaces the **Line Properties** toolbar button and **Edit Line** dialog box that were used in previous releases for customizing line properties. To view or modify the line style of the active signal, in the Signal Browser menu, select **View > Style**. You can also right-click on the display and select **Style**. The Signal Browser — Style dialog box opens.
 - Sampled data as stairs — The Signal Browser can display a signal as a *stairstep* graph. A stairstep graph includes only horizontal lines and vertical lines. Each horizontal line represents the signal value for a discrete sample period and is connected to two vertical lines. Each vertical line represents a change in values occurring at a sample. Using this approach is equivalent to using the MATLAB® `stairs` function. Stairstep graphs are useful for drawing time history graphs of digitally sampled data. To display a sampled signal as a Stairstep graph, in the Signal Browser — Style dialog box, set the **Plot type** parameter to **Stairs**.
- Properties dialog box — R2012b enhances the Signal Browser by providing a central location where you can modify the properties of a display. To change options for a display, in the Signal Browser menu, select **View > Properties**. You can also right-click on the display and select **Properties**. The Signal Browser — Visuals:Time Domain Options dialog box opens.

- **Complex data support** — The Signal Browser accepts complex-valued input signals and can visualize them in two distinct fashions. By default, the complex data is displayed in real and imaginary form as different-colored lines on the same axes. Alternately, you can display the magnitude and phase of the signal on separate axes in the same display. To change the complex data options, in the Signal Browser — Visuals:Time Domain Options dialog box, select the **Display** tab. Then, select or clear the **Plot signal(s) as magnitude and phase** check box.
- **Ability to change the time units of the display** — The Signal Browser allows you to label the *time*-axis in three different ways. First, you can confirm the default operation, in which the Signal Browser displays time in metric units. The Signal Browser chooses the appropriate metric units, based on the minimum *time*-axis limit and the maximum *time*-axis limit of the scope window. Second, you can verify that the *time*-axis is always labeled as **Time (seconds)** and that the appropriate power of 10 appears in the bottom-right corner of the Time Scope display. Finally, you remove the units in the *time*-axis label entirely. To change the manner in which the time units are displayed, in the Signal Browser — Visuals:Time Domain Options dialog box, select the **Main** tab. Then, set the **Time Units** parameter to either **Metric** (based on Time Span), **Seconds**, or **None**, respectively.

See the “Signal Browser” reference topic for more information.

Compatibility Considerations

The R2012b Signal Browser GUI replaces the tool available in previous releases that was also named Signal Browser. In R2012b, you can still use the Signal Browser from previous releases, which is hereafter referred to as the Legacy Browser. To do so, execute the following steps.

- 1** In the SPTool menu, select **File > Preferences**.
- 2** In the list at the left side, select **Signal Browser**.
- 3** Under **Signal Browser**, select the **Use Legacy Browser (to be removed)** check box.
- 4** Click **OK**.

Now when you select one or more signals from the **Signals** list and click the **View** button, the Legacy Browser opens.

GPU acceleration for `xcorr`, `xcorr2`, `fftfilt`, `xcov`, and `cconv` functions

The R2012b release introduces GPU acceleration for `xcorr`, `xcorr2`, `fftfilt`, `xcov`, and `cconv`. GPU acceleration for these functions requires Parallel Computing Toolbox™ software and meeting the GPU computing requirements detailed here:

<http://www.mathworks.com/products/parallel-computing/requirements.html>.

If you have the Parallel Computing Toolbox, you can use `gpuArray` to create a `GPUArray` object. The supported Signal Processing Toolbox™ functions accept `GPUArray` objects as inputs.

R2012a

Version: 6.17
New Features: Yes
Bug Fixes: No

Measurements for Bilevel Pulse Waveforms

In R2012a, you can perform a number of basic measurements on bilevel pulse waveforms. These measurements include:

- State levels — You can estimate the state levels of a bilevel waveform using the histogram method with `statelevels`.
- Transition metrics — You can measure the rise time, fall time, and mid-reference level instants of waveform transitions. See the help for `midcross`, `risetime`, `falltime`, and `slewrates` for details. Additionally, R2012a introduces pulse metrics to measure bilevel waveform behavior in pretransition and posttransition regions including, `overshoot`, `undershoot`, and `settlingtime`.
- Duration metrics — See the help for `pulsewidth`, `pulseperiod`, `pulsesep`, and `dutycycle` for details.

Signal Statistics

The R2012a release introduces a number of basic signal statistics to augment the statistical measurements available in base MATLAB. See the function reference pages for `rms`, `rssq`, `peak2peak`, and `peak2rms` for details.

R2011b

Version: 6.16
New Features: Yes
Bug Fixes: Yes

Passband and Stopband Weights for Fixed-Order Unconstrained Partial Band Differentiator Filters

In R2011b, you can specify passband and stopband weights for a fixed-order unconstrained partial band differentiator filter design. You can access this capability through `filterbuilder` and `fdesign.differentiator`. With `fdesign.differentiator`, use the specification string `'N,Fp,Fst'`, and set the design method to `'equiripple'`. The following example shows you how to see the passband weight, `Wpass`, and stopband weight, `Wstop`, design options.

```
d = fdesign.differentiator('N,Fp,Fst',30,0.25,0.5);  
designopts(d,'equiripple')
```

Specify the passband or stopband weight values when you design your equiripple filter. For example:

```
Hd = design(d,'equiripple','Wstop',4);
```

Numerator and Denominator Order Specifications Added to filterbuilder for Lowpass and Highpass Butterworth Designs

In R2011b, you can specify different numerator and denominator orders in `filterbuilder` for lowpass and highpass Butterworth (maxflat) designs.

Access this option in `filterbuilder` by setting **Impulse response** under **Filter specifications** to IIR and **Order mode** to Specify. The default is equal order for both the numerator and denominator. Check **Denominator order** to specify a different denominator order.

Conversion of Error and Warning Message Identifiers

Compatibility Considerations: Yes

For R2011b, Signal Processing Toolbox error and warning message identifiers have changed.

Compatibility Considerations

If you have scripts or functions that use these changed message identifiers, you must update the code to use the new identifiers. Typically, message identifiers are used to turn off specific warning messages. You can also use them in code that uses a `try/catch` statement and performs an action based on a specific error identifier.

If your code checks for a message identifier in a warning or error, you must update it to check for the new warning or error instead. To determine the identifier for a warning, run the following command just after you see the warning:

```
[MSG,MSGID] = lastwarn;
```

This command saves the message identifier to the variable `MSGID`.

To determine the identifier for an error, run the following command just after you see the error:

```
exception = MException.last;  
MSGID = exception.identifier;
```

Note Warning messages indicate a potential issue with your code. While you can turn off a warning, a suggested alternative is to change your code so that your code does not generate warnings.

R2011a

Version: 6.15
New Features: Yes
Bug Fixes: Yes

Enhancements to `filtfilt`

In R2011a, there are two major enhancements to `filtfilt`:

- 1** `filtfilt` has been completely rewritten to improve performance. Actual performance improvement depends on your hardware, filter length, signal length, and number of channels.
- 2** `filtfilt` now accepts IIR filters in second-order section (biquad) form.

Symmetric Window Option for Blackman-Harris Windows

Compatibility Considerations: Yes

In R2011a, `blackmanharris` and `nutallwin` have a symmetric window design option. The input argument `SFLAG` controls the window option and defaults to `'symmetric'`. `'periodic'` returns a N-periodic window. The default symmetric option is preferred in FIR filter design because it results in linear phase. In spectral analysis applications, the periodic option is preferred.

Compatibility Considerations

In releases previous to R2011a, `blackmanharris` and `nutallwin` only return N-periodic windows. To reproduce behavior in R2011a consistent with behavior in previous releases, use:

```
win = blackman(N,'periodic'); % N is the window length
```

or

```
win = nutallwin(N,'periodic'); % N is the window length
```

rectpuls Returns Double-Precision Vector

Compatibility Considerations: Yes

In R2011a, `rectpuls` returns a double-precision vector instead of a logical vector.

Compatibility Considerations

In previous releases, `rectpuls` returns a logical vector. To produce behavior in R2011a consistent with previous releases, cast the output of `rectpuls` to a logical vector.

```
t = linspace(0,1,0.01);  
y = logical(rectpuls(t));
```

Code Generation from MATLAB and Fixed-Point MEX-File Generation

Compatibility Considerations: Yes

In R2011a, MathWorks® is no longer using the term *Embedded MATLAB* to refer to the language subset that supports code generation from MATLAB algorithms. This nomenclature incorrectly implies that the generated code is used in embedded systems only.

The new term is *code generation from MATLAB*. This terminology better reflects the full extent of the capability for translating MATLAB algorithms into readable, efficient, and compact MEX and C/C++ code for deployment to both desktop and embedded systems.

Signal Processing Toolbox users who have the DSP System Toolbox™ and MATLAB Coder™ software can generate deployable C/C++ code and MEX files using supported functions in the Signal Processing Toolbox.

You can find material on using Code Generation from MATLAB with the Signal Processing Toolbox software in “Code Generation from MATLAB Support in Signal Processing Toolbox”.

Users who have the DSP System Toolbox and Fixed-Point Toolbox™ can accelerate MEX-files for fixed-point applications using `fiaccel`.

Compatibility Considerations

The functionality associated with C/C++ and MEX code generation from MATLAB has changed in R2011a. These changes include:

- The compiler flag `#codegen` replaces `#eml`.
- `codegen` replaces `emlc` and `emlmex` for generating deployable C/C++ code and MEX-files from MATLAB algorithms. You must have the DSP System Toolbox and the MATLAB Coder software to use `codegen`.
- `fiaccel` replaces `emlmex` for generating fixed-point MEX code from MATLAB algorithms. To use `fiaccel`, you must have the DSP System Toolbox and Fixed-Point Toolbox software and your MATLAB code must satisfy the conditions described on the `fiaccel` reference page.

R2010b

Version: 6.14
New Features: Yes
Bug Fixes: Yes

Embedded MATLAB Support for Additional Signal Processing Toolbox Functions

In R2010b, Embedded MATLAB[®] supports `upsample` and `downsample` in the Signal Processing Toolbox.

R2010a

Version: 6.13
New Features: Yes
Bug Fixes: Yes

Single-Precision Support Added for `dfilt` Objects

In R2010a, users can construct `dfilt` objects with single-precision floating point arithmetic. Set the `Arithmetic` property to `'single'` to obtain a single-precision floating point representation of the filter coefficients.

Embedded MATLAB Support for Additional Signal Processing Toolbox Functions

In R2010a, Embedded MATLAB supports additional functions in the Signal Processing Toolbox. You can find a comprehensive list of supported functions at [. You can find examples of using supported functions with the Signal Processing Toolbox software at “Code Generation from MATLAB Support in Signal Processing Toolbox”.](#)

Functions, Objects, Object Methods, and Object Properties Being Removed

Compatibility Considerations: Yes

Name	What Happens When you use the Function, Object, Object Method, or Object Property	Use Instead	Compatibility Considerations
addsection (Method for dfilter.cascade and dfilter.parallel objects)	Errors	addstage method	Replace all instances of the addsection method with the addstage method for dfilter.cascade and dfilter.parallel objects.
FFTLength (Property of spectrum objects)	Errors	'NFFT' parameter in psd or msspectrum methods	Replace all instances of the FFTLength property in spectrum objects by the 'NFFT' parameter in the psd or msspectrum methods.
freqzplot	Warns	fvtool	Replace all instances of freqzplot with fvtool.

Name	What Happens When you use the Function, Object, Object Method, or Object Property	Use Instead	Compatibility Considerations
removesection (Method for <code>dfilt.cascade</code> and <code>dfilt.parallel</code> objects)	Errors	removestage method	Replace all instances of the <code>removesection</code> method with the <code>removestage</code> method for <code>dfilt.cascade</code> and <code>dfilt.parallel</code> objects.
Section (Property of <code>dfilt.cascade</code> and <code>dfilt.parallel</code> objects)	Errors	Stage property	Replace all instances of the <code>Section</code> property with the <code>Stage</code> property for <code>dfilt.cascade</code> and <code>dfilt.parallel</code> objects.

Name	What Happens When you use the Function, Object, Object Method, or Object Property	Use Instead	Compatibility Considerations
Sidelobe_atten (Property of sigwin.chebwin object)	Errors	SidelobeAtten property	Replace all instances of the Sidelobe_atten property with the SidelobeAtten property for sigwin.chebwin objects.
specplot	Warns	plot method with DSPDATA object	Replace all instances of specplot with the plot method for DSPDATA objects.

Warning for Filter Designer in SPTool

Compatibility Considerations: Yes

In R2010a, the use of Filter Designer in `sptool` is not recommended. Use `fdatool` instead. Under `File > Preferences-> Filter Designer` in SPTool, you may still select to use Filter Designer, but you will receive a warning that Filter Designer will be removed in a future release. If you select Filter Designer, you will be prompted to change your preferences in the `sigprefs.mat` and `startup.spt` files when you exit SPTool. Changing your preferences to use Filter Designer results in a warning each time SPTool starts. See “Setting Preferences” and “Saving and Loading Sessions” for details.

Compatibility Considerations

Because a future release will remove Filter Designer, use `fdatool` instead. Filters created in Filter Designer are not compatible with FDATool. Under `File > Preferences-> Filter Designer` in `sptool`, you can select to use FDATool. You receive a prompt to convert filters created in Filter Designer to a format compatible with FDATool. When you exit `sptool` after changing your preferences, you receive another prompt, instructing you to update your preferences to use FDATool.

R2009b

Version: 6.12
New Features: Yes
Bug Fixes: Yes

Embedded MATLAB Support Added to Signal Processing Toolbox Functions

In R2009b, Embedded MATLAB supports the generation of embeddable C code for a subset of Signal Processing Toolbox filter design and window generation functions. You must install both the Signal Processing Toolbox and Signal Processing Blockset™ software to use this feature. Depending on which Embedded MATLAB feature you wish to use, additional products are required. The generated C code meets the strict memory and data type requirements of embedded target environments. See “Code Generation from MATLAB Support in Signal Processing Toolbox” for a list of supported Signal Processing Toolbox functions and examples.

Ability to Export Filter Coefficients Added to `realizemdl`

If you use Simulink®, you can now use the new `MapCoeffstoPorts` property with `realizemdl` to map filter coefficients from `dfilt` objects to constant blocks. The coefficients also appear in the MATLAB workspace providing tunability to the realized Simulink model. See `dfilt` for a list of supported filter structures and any restrictions.

R2009a

Version: 6.11
New Features: Yes
Bug Fixes: Yes

New filter design approach using `fdesign` and `filterbuilder`

A new and more robust way to design filters has been added to the toolbox—`fdesign` objects and the `filterbuilder` GUI. The following filter responses are supported: lowpass, highpass, bandpass, bandstop, Hilbert, differentiator, pulse-shaping (including FIR Gaussian) and arbitrary magnitude. Advanced design methods and additional responses are available in Filter Design Toolbox™.

New dfilt method to specify filter coefficients at block ports

A new option has been added to the dfilt block method to specify filter coefficients via Simulink block ports.

R2008b

Version: 6.10
New Features: Yes
Bug Fixes: Yes

New Walsh–Hadamard Transform functions

A new fast Walsh–Hadamard transform `fwht` function and an inverse fast Walsh–Hadamard transform `ifwht` have been added to the toolbox. An associated demo has also been added.

R2008a

Version: 6.9
New Features: Yes
Bug Fixes: Yes

New Marcum Q Function

A new `marcumq` function, which implements the generalized Marcum Q function, has been added to the toolbox.

Conversion Between Magnitude and dB Added

The new utility functions `mag2db` and `db2mag` have been added for converting from magnitude to dB and dB to magnitude, respectively.

PMTM Function Enhanced with Ability to Keep or Drop Last Taper

You can now specify whether to keep or drop the last taper for calculating the `pmtm`, which returns the PSD using the Thomson multitaper method. By default, the last taper is dropped. If you set the `DropLastTaper` property `false`, the last taper is included.

R2007b

Version: 6.8
New Features: Yes
Bug Fixes: Yes

Confidence Interval Estimation Added

The `spectrum` object has been enhanced with a new method for calculating confidence intervals for PSDs and mean-squared spectra.

Spurious-Free Dynamic Range (SFDR) Measurement Added

The dspdata object has been enhanced with a new method to measure spurious-free dynamic range (SFDR) for mean-squared spectra.

Local Maxima/Peak Finder Added

A new function `findpeaks` has been added to identify local maxima in a data vector. You can specify the minimum peak height and distance from its neighbors to limit the results. A `findpeaks` method has also been added to the `dspdata` object.

Conversions Between Power and dB Added

The new utility functions `pow2db` and `db2pow` have been added for converting from power to dB and dB to power, respectively.

R2007a

Version: 6.7
New Features: Yes
Bug Fixes: Yes

lsf2poly and latcfilt Multi-Channel Input Support Added

`lsf2poly` and `latcfilt` now support N-D array input where each column represents a separate input channel.

Circular Convolution (cconv) Function Added

A new function (cconv) that computes circular convolution has been added to the toolbox.

Spectrum Objects Partial Frequency Range Input Support Added

spectrum objects now support computing the spectrum and pseudospectrum on a user-specified vector of frequencies. This vector identifies the frequencies at which the spectrum or pseudospectrum is calculated.

cceps Factorize Algorithm Information Clarified

A more detailed explanation of the factorize algorithm and an example have been added to the cceps reference page.

dfilt.statespace Now Supports realizemdl Method

You can now create a Simulink block from `dfilt.statespace` objects with the `dfilt realizemdl` method.

ellip and ellipap Functions Enhanced

Both `ellip` and `ellipap` have been enhanced so that they are able to handle filters with more stringent requirements.

R2006b

Version: 6.6
New Features: Yes
Bug Fixes: Yes

Frequency Vector Input Added to Spectral Analysis Functions

The spectral analysis command line functions (`pburg`, `pcov`, `peig`, `periodogram`, `pmcov`, `pmtm`, `pmusic`, `pwelch`, and `pyulear`) now accept a frequency vector as an input parameter. This vector identifies the frequencies at which the spectral analysis function returns an estimate.

For functions that use the Goertzel algorithm (`periodogram`, `pmtm`, `pwelch`, and `spectrogram`), the frequency inputs are rounded to match the nearest bin value used by the algorithm.

FFT Length in Spectral Analyses Changed

Compatibility Considerations: Yes

The `FFTLength` parameter has been removed from all spectrum objects and you now specify the number of FFT points (NFFT) via the `psd`, `msspectrum`, or `pseudospectrum` estimation method. The NFFT value can be an integer or a string (either `'Nextpow2'` or `'Auto'`). `'Nextpow2'` is the default and sets the number of FFT points to the next power of 2 greater than the input signal length (or the segment length for `spectrum.welch` objects). `'Auto'` sets the number of FFT points to be equal to the input signal or segment length.

Compatibility Considerations

You should update any existing code that specifies the `FFTLength` parameter and instead use the NFFT parameter associated with an estimation method.

You should also verify that any `spectrum.welch` objects are using the desired FFT length, since the FFT length is now based on the segment length instead of the input signal length.

sosfilt and dfilt filter Method Support Multidimensional Array Input

You can now input a multidimensional array to `sosfilt` and to the `dfilt` filter method.

dfilt block Method Supports Target Subsystem Destination and Link Between Command Line and Model

The `dfilt` block method now allows you to specify a target subsystem in your Simulink model where you want to place the block. Two new parameters implement this: `'Destination'` and `'LinkObj'`. The `'Destination'` specifies where to place the block and `'LinkObj'` creates a link between the block in your model and inputs from the command line.

gaussfir Algorithm Updated

The alpha parameter in the formula used in `gaussfir` has been updated to match the formula in Rappaport T.S., *Wireless Communications Principles and Practice*, 2nd Edition, Prentice Hall, 2001.

R2006a

Version: 6.5
New Features: Yes
Bug Fixes: Yes

Taylor Window Function Added

A new function `taylorwin` for generating Taylor windows has been added.

SPTool Filter Designer Replaced by FDATool

Compatibility Considerations: Yes

FDATool has replaced the SPTool Filter Designer as the preferred method for designing filters for use in SPTool. For details, see “FDATool” in the Signal Processing Toolbox documentation.

Compatibility Considerations

The format in which filters are saved differs between SPTool Filter Designer and FDATool. When you load an SPTool session with saved filters, you are prompted to upgrade your filters to use FDATool format.

sgolay Example Improved

The example for `sgolay` has been improved and expanded.

zp2sos zeroflag Parameter Added

A new parameter `zeroflag` has been added to `zp2sos`. This parameter is used for real zeros that are the negatives of each other. For these zeros it specifies whether to keep them together instead of ordering them according to proximity to poles.

Help for Objects Changed

To obtain help for objects, use `help object.constructor` instead of the old `help object/constructor`. Note that to obtain help for methods, you still use `help object/method`.

R14SP3

Version: 6.4
New Features: Yes
Bug Fixes: Yes

dfilt (Discrete-Time Filters) Delay Structure Added

A new delay structure (`dfilt.delay`) has been added to `dfilt` objects. This structure adds latency to any signal filtered with it.

WinTool/WVTool Normalize Magnitude Added

A Normalize magnitude option has been added to the **Analysis Parameters** of WinTool and WVTool magnitude plots.

FDATool/FVTool Plot Displays Improved

The default plots for filter responses have been improved. The y -axis autoscaling includes buffer regions around the data and shows only the significant data. To see all of the data without any buffer regions, select **Full view** from the **View** menu.

FVTool Passband Zoom Added

If you have a filter in FVTool that was created in FDATool or from a Filter Design Toolbox `fdesign` object, you can use **Passband** on the **View** menu to zoom the passband region.

R14SP2

Version: 6.3
New Features: Yes
Bug Fixes: Yes

FDATool and FVTool Changes

Compatibility Considerations: Yes

FDATool Spectral Rejection Masks Added

You can draw lines on your filter response in FDATool to indicate rejection areas.

FDATool Generated C Header File Complex Filter Support

FDATool now supports generating C header files for complex filters.

FDATool Tip of the Day Added

A new Tip of the Day dialog displays when you start FDATool. It contains tips and hints for using FDATool.

FDATool State Space Filters Support Removed

FDATool no longer supports state space filters.

Compatibility Considerations

If you load a saved FDATool session that contains a state space filter, it is converted to a direct-form II transposed filter.

FDATool/FVTool New Analysis Parameters Magnitude Response Options

Three new options have been added to the Analysis Parameters for magnitude response displays.

- **Normalize Magnitude to 1 (0 dB)** — displays the magnitude so that the maximum magnitude value occurs at 0 dB
- **Autoscale axes** — automatically scales the response data y-axis
- **dB Display Range** — If you are not using autoscale and the magnitude display is in dB, this allows you to specify the y-axis limits, .

FVTool SOS Filter Coefficients Display Enhancement

The coefficient view in FVTool now displays each section of a second-order section filter as a separate filter with its own numerator, denominator, and gain.

FVTool Default Phase Units Changed

The default units for the phase response in FVTool have been changed to radians. This is consistent with the `phasez` function.

Compatibility Considerations

You should verify that the FVTool phase plots generated by existing code display the desired units.

dfilt Changes

Compatibility Considerations: Yes

dfilt Coefficients Method Changed

The `dfilt` `coefficients` method has been changed to the `coeffs` method, which returns a structure. See the `Methods` section of `dfilt` for information.

Compatibility Considerations

You should update any code that uses the `coefficients` method to use the new `coeffs` method and its returned structure.

dfilt Filter States Changed to Use States Property

You cannot pass filter states (initial and final conditions) via the `dfilt filter` method. You must use the `states` property. See `dfilt` for more information.

Compatibility Considerations

You should update any code that passed filter states via the `dfilt filter` method to use the new `states` property.

Spectral Analysis Changes

Compatibility Considerations: Yes

spectrogram Function Replaces specgram

spectrogram has been added to replace the grandfathered specgram function. If you use this function with no outputs, a surface plot is displayed, instead of an image.

Compatibility Considerations

You should update any code that references specgram to use the new spectrogram function. spectrogram uses different default values than specgram and the order of the inputs has changed.

Spectral Analysis Functions Inputs Changed

pwelch (and the other spectrum analysis functions) no longer accept 'half' or 'whole'. You must use 'onesided' or 'twosided' to indicate the type of analysis you want.

Compatibility Considerations

You should update any code that uses 'half' or 'whole' with spectral analysis functions and instead use 'onesided' or 'twosided', respectively.

PSD Objects and Function Output Plots Changed

The following functions and methods now generate standard MATLAB plots, instead of launching an interactive plot. Refer to the MATLAB documentation for information on plots.

- dspdata plot method
- spectrum psd, pseudospectrum, and msspectrum methods
- pburg
- pcov
- periodogram

- pmcov
- pmtm
- pwe1ch
- pyulear

Other Changes

Compatibility Considerations: Yes

gaussfir Function Replaces firgauss

`gaussfir` has been added to replace the grandfathered `firgauss` function. `gaussfir` uses parameters that are common to communications systems.

Compatibility Considerations

You should update any code that references `firgauss` to use the new `gaussfir`.

firpm and cfirpm Inputs Changed

The `firpm` and `cfirpm` functions now take function handles as inputs instead of strings.

Compatibility Considerations

You should update any code that uses `firpm` or `cfirpm` so that it will work correctly with function handle inputs instead of string input.

New Demos

Signal Processing Toolbox demos have been reorganized and a new demo on the analysis of a numerically controlled oscillator (NCO) has been added.

Filter Wizard Product Dependency Removed

The Filter Wizard no longer requires Filter Design Toolbox software. You can use the Filter Wizard if you have Signal Processing Toolbox software and Simulink installed. If you have the Filter Design Toolbox software installed, more options are available. See `dspfwiz` for more information.
