Financial Instruments Toolbox™ Release Notes

Contents

R2017a

Interest-Rate Instruments: Price interest rate options with negative rates using normal volatility model and shifted SABR model 1-2

Equity Instruments: Price American vanilla options using Barone-Adesi and Whaley model 1-2

bkcaplet and bkfloorlet removal 1-2

R2016b

Equity Instruments: Price barrier options with closed form, Crank-Nicolson method, and Monte Carlo simulation . . . 2-2

Equity Instruments: Price European options with finite differences method 2-2

Hybrid Instruments: Price convertible bonds with a default risk and recovery rate using standard and implied trinomial trees 2-2

Numerix CAIL Engine: Access the Numerix Engine directly from MATLAB using an updated API 2-2

Functions moved from Financial Instruments Toolbox to Financial Toolbox 2-3

help fininstdemos removal 2-3

bkcaplet and bkfloorlet removal **2-3**

R2016a

Cap and Floor Instruments: Volatility stripping **3-2**

Swap Instruments: Pricing cross-currency, fixed-fixed, and float-float swaps **3-2**

cbprice removal **3-2**

R2015b

Hybrid Instruments: Price convertible bonds using standard and implied trinomial trees **4-2**

Equity Instruments: Price equity derivatives using a standard trinomial tree **4-2**

Simple Interest Convention: Calculate zero curves, forward curves, discount curves, rates, and bootstrapping using simple interest **4-2**

cbprice removal **4-3**

R2015a

Price convertible bonds using CRR and EQP lattice models **5-2**

Collateral-level computation from credit exposure simulations 5-2

Wrong-way risk example 5-2

R2014b

Pricing functionality for forward options 6-2

Amortizing caps and floors pricing using lattice models . . . 6-2

Power price simulation example 6-2

Hull-White single-factor model calibration using volatility surface 6-2

SABR option greeks computation 6-2

Amortizing caps and floors pricing using closed form solutions (Black or Linear Gaussian two-factor models) . 6-3

Asian options pricing example 6-3

Numerix CrossAsset Integration Layer (CAIL) 11 example . 6-3

R2014a

Dual curve construction 7-2

Dual curve pricing of caps, floors, and swaptions using the Black model 7-2

Dual curve pricing of swaps and floating-rate notes 7-2

Monte Carlo and analytical pricing of lookback options . . . 7-2

Implied Black volatility computation for the SABR stochastic volatility model 7-3

User-specified simulation paths for Longstaff-Schwartz pricing functions 7-3

`creditexposures` function to compute credit exposures from mark-to-market OTC contract values 7-3

`exposureprofiles` function to derive credit exposure profiles from credit exposures 7-3

Enhanced pricing functions for instruments and portfolios with cash flows between tree levels 7-3

Swing option pricing example 7-3

R2013b

Support for Numerix CrossAsset Integration Layer (CAIL) API 8-2

Kirk's approximation and Bjerksund-Stensland closed-form pricing models for spread options 8-2

Finite difference and Monte Carlo simulation pricing for American spread options 8-2

Levy and Kemna-Vorst closed-form pricing and Monte Carlo simulation pricing for Asian options 8-3

Additional CDS option pricing functionality for index swaptions 8-3

Pricing functions for vanilla options using Monte Carlo simulation 8-3

Hedging strategies using spread options example 8-4

Pricing European and American spread options example . . 8-4

First-to-default (FTD) swaps example 8-4

New function for risky present value of a basis point 8-4

`optimoptions` support 8-5

Functions moved from Financial Instruments Toolbox to Financial Toolbox 8-5

R2013a

Pricing functions for options on floating-rate notes (FRNs) 9-2

Pricing functions for FRNs with embedded options 9-2

Performance enhancements in implied volatility calculations 9-2

Calibration and Monte Carlo simulation of single-factor and multifactor interest-rate models, including Hull-White, Linear Gaussian, and LIBOR Market Models 9-3

R2012b

Merge of Fixed-Income Toolbox and Financial Derivatives Toolbox to Financial Instruments Toolbox 10-2

Cap and floor floating-rate note pricing using trees 10-2

Forward-swap pricing using trees or term structure 10-2

Functions for fitting and extracting calibrated parameters from `IRFunctionCurve` objects 10-3

LIBOR market model example **10-3**

Counterparty credit risk example **10-3**

Conversion of error and warning message identifiers **10-3**

R2017a

Version: 2.5

New Features

Bug Fixes

Compatibility Considerations

Interest-Rate Instruments: Price interest rate options with negative rates using normal volatility model and shifted SABR model

The following functions support the normal volatility model (Bachelier model) for interest-rate options to handle negative rates:

- `swaptionbynormal`
- `capbynormal`
- `floorbynormal`

The following functions provide an optional `Shift` argument to support the shifted Black model and the shifted SABR model for interest-rate options to handle negative rates:

- `blackvolbysabr` (Shifted SABR)
- `optsensbysabr` (Shifted SABR)
- `swaptionbyblk` (Shifted Black)
- `capbyblk` (Shifted Black)
- `floorbyblk` (Shifted Black)
- `capvolstrip` (Shifted Black)
- `floorvolstrip` (Shifted Black)

Equity Instruments: Price American vanilla options using Barone-Adesi and Whaley model

Support for American vanilla options using the Barone-Adesi and Whaley model:

- `optstockbybaw`
- `optstocksensbybaw`
- `impvbybaw`

bkcaplet and bkfloorlet removal

`bkcaplet` and `bkfloorlet` will be removed in a future release. Use `capbyblk` and `floorbyblk` instead.

Compatibility Considerations

Function Name	What Happens When You Use This Function	Use This Function Instead	Compatibility Considerations
`bkcaplet` and `bkfloorlet`	Errors	`capbyblk` or `floorbyblk`	Replace all instances of `bkcaplet` and `bkfloorlet` with `capbyblk` or `floorbyblk`.

R2016b

Version: 2.4

New Features

Bug Fixes

Compatibility Considerations

Equity Instruments: Price barrier options with closed form, Crank-Nicolson method, and Monte Carlo simulation

The following functions support barrier options for equity or energy derivatives:

- barrierbyfd calculates barrier option prices using finite difference method.
- barriersensbyfd calculates barrier option prices and sensitivities using finite difference method.
- barrierbybls calculates prices for a European barrier option using Black-Scholes option pricing model.
- barriersensbybls calculates prices and sensitivities for a European barrier option using Black-Scholes option pricing model.
- barrierbyls calculates barrier option prices using Longstaff-Schwartz model.
- barriersensbyls calculates barrier option prices and sensitivities using Longstaff-Schwartz model.

Equity Instruments: Price European options with finite differences method

The following functions support vanilla options for equity derivatives:

- optstockbyfd calculates vanilla option prices using finite differences method.
- optstocksensbyfd calculates vanilla option prices and sensitivities using finite differences method.

Hybrid Instruments: Price convertible bonds with a default risk and recovery rate using standard and implied trinomial trees

Support for default for risk and recovery rate using cbondbycrr, cbondbyeqp, cbondbystt, and cbondbyitt. To specify a convertible bond risk and recovery rate, use the name-value pair arguments for `DefaultProbability` and `RecoveryRate`.

Numerix CAIL Engine: Access the Numerix Engine directly from MATLAB using an updated API

Support for an updated Numerix® CAIL API, using the numerixCrossAsset object and the associated methods for: applicationCall, applicationData, applicationMatrix, getdata, and close.

Functions moved from Financial Instruments Toolbox to Financial Toolbox

The following functions are moved from Financial Instruments Toolbox™ to Financial Toolbox™:

- cdsbootstrap calculates barrier option prices using finite difference method.
- cdsprice calculates barrier option prices and sensitivities using finite difference method.
- cdsspread calculates price for a European barrier options using Black-Scholes option pricing model.
- cdsrpv01 calculates price and sensitivities for a European barrier options using Black-Scholes option pricing model.
- creditexposures computes credit exposures from contract values.
- exposureprofiles compute exposure profiles from credit exposures.

help fininstdemos removal

The `help fininstdemos` command is removed in this release. Use the demo command instead.

Compatibility Considerations

Command Name	What Happens When You Use This Command	Use This Command Instead	Compatibility Considerations
`help fininstdemo`	Errors	`demo 'toolbox' 'financial instruments'`	Replace all instances of `help fininstdemos` with `demo 'toolbox' 'financial instruments'`.

bkcaplet and bkfloorlet removal

bkcaplet and bkfloorlet will be removed in a future release. Use capbyblk and floorbyblk instead.

Compatibility Considerations

Function Name	What Happens When You Use This Function	Use This Function Instead	Compatibility Considerations
bkcaplet and bkfloorlet	Warns	capbyblk or floorbyblk	Replace all instances of bkcaplet and bkfloorlet with capbyblk or floorbyblk.

R2016a

Version: 2.3

New Features

Bug Fixes

Compatibility Considerations

Cap and Floor Instruments: Volatility stripping

The following functions support cap and volatility stripping for interest-rate instruments:

- capvolstrip strips caplet volatilities from flat cap volatilities.
- floorvolstrip strips floorlet volatilities from flat floor volatilities.

Swap Instruments: Pricing cross-currency, fixed-fixed, and float-float swaps

Support for pricing cross-currency swaps using swapbyzero. Support for fixed-fixed and float-float swaps is added to instswap, swapbybdt, swapbyhjm, swapbybdt, swapbybk, swapbyzero.

cbprice removal

cbprice is removed in this release. Use cbondbycrr, cbondbyeqp, cbondbyitt, or cbondbystt instead.

Compatibility Considerations

Function Name	What Happens When You Use This Function	Use This Function Instead	Compatibility Considerations
cbprice	Errors	cbondbycrr, cbondbyeqp, cbondbyitt, or cbondbystt	Replace all instances of cbprice with cbondbycrr, cbondbyeqp, cbondbyitt, or cbondbystt.

R2015b

Version: 2.2

New Features

Bug Fixes

Compatibility Considerations

Hybrid Instruments: Price convertible bonds using standard and implied trinomial trees

The following functions support building a standard trinomial tree:

- stttree
- stttimespec

cbondbystt supports pricing a convertible bond using an `STTTree`.

`ITTree` now supports pricing convertible bonds with cbondbyitt.

Equity Instruments: Price equity derivatives using a standard trinomial tree

`STTTree` supports pricing for equity derivatives.

The following modified functions support the following equity instruments:

- Asian options — asianbystt
- Lookback options — lookbackbystt
- Barrier options — barrierbystt
- Vanilla options — optstockbystt
- Compound options — compoundbystt
- sttprice
- sttsens

Simple Interest Convention: Calculate zero curves, forward curves, discount curves, rates, and bootstrapping using simple interest

Simple interest support for the following functions.

- rate2disc — Support added for `Compounding = 0` for simple interest where there is no compounding.
- disc2rate — Support added for `Compounding = 0` for simple interest where there is no compounding.

- ratetimes — Support added for `Compounding = 0` for simple interest where there is no compounding.
- IRDataCurve — Support added for `Compounding = 0` for simple interest for “zero” and “discount” curve types only (not supported for “forward” curves) where there is no compounding.
- getForwardRates — Support added for `Compounding = 0` for simple interest where there is no compounding.
- getZeroRates — Support added for `Compounding = 0` for simple interest where there is no compounding.
- bootstrap — Support added for `Compounding = 0` for simple interest for “zero” and “discount” curve types only (not supported for “forward” curves) where there is no compounding.
- intenvset — Support added for `Compounding = 0` for simple interest where there is no compounding.

cbprice removal

cbprice will be removed in a future release. Use cbondbycrr, cbondbyeqp, cbondbyitt, or cbondbystt instead.

Compatibility Considerations

Function Name	What Happens When You Use This Function	Use This Function Instead	Compatibility Considerations
cbprice	Warns	cbondbycrr, cbondbyeqp, cbondbyitt, or cbondbystt	Replace all instances of cbprice with cbondbycrr, cbondbyeqp, cbondbyitt, or cbondbystt.

R2015a

Version: 2.1

New Features

Bug Fixes

Price convertible bonds using CRR and EQP lattice models

cbondbycrr and cbondbyeqp calculate the price of convertible bonds using the Tsiveriotis and Fernandes model. instcbond is the constructor for the `CBond` instrument type

The following modified functions support the new convertible bond (`CBond`) instrument:

- instadd
- instdisp
- crrprice
- eqpprice
- crrsens
- eqpsens

Collateral-level computation from credit exposure simulations

creditexposures is enhanced to support computing exposures for counterparties under collateral agreements.

Wrong-way risk example

The example for modeling wrong-way risk for counterparty credit risk using a Gaussian copula is available as `Example_WrongWayRisk.m` at `\finist\fininstdemos`. For more information, see Wrong Way Risk with Copulas.

R2014b

Version: 2.0

New Features

Bug Fixes

Pricing functionality for forward options

Support is provided for pricing forward options using a modified Black approximation model with optstockbyblk and optstocksensbyblk using a new name-value pair argument for `ForwardMaturity`, which is the maturity date of the forward contract.

Amortizing caps and floors pricing using lattice models

Support is provided for name-value pair argument, `Principal`, to pass the schedule to compute the price for amortizing caps (capbybdt, capbybk, capbyhjm, and capbyhw) and floors (floorbybdt, floorbybk, floorbyhjm, and floorbyhw). In addition, instcap and instfloor are enhanced to support the creation of cap and floor instruments with amortizing caps and floors.

Power price simulation example

The example for simulating power price and mean reverting jump diffusion is available as `SimulateElectricityPricesExample.m` at `\fininst\fininstdemos`. For more information, see Simulating Electricity Prices with Mean-Reversion and Jump-Diffusion.

Hull-White single-factor model calibration using volatility surface

hwcalbycap and hwcalbyfloor support a new syntax.

```
[Alpha, Sigma, OptimOut] = hwcalbycap(RateSpec, MarketStike, MarketMaturity, MarketVola

[Alpha, Sigma, OptimOut] = hwcalbyfloor(RateSpec, MarketStike, MarketMaturity, MarketVo
```

The `Strike`, `Settle`, and `Maturity` input arguments are no longer required input arguments. By omitting these input arguments, you can use the `MarketStike`, `MarketMaturity`, and `MarketVolatility` input arguments calibrate the HW model using the entire cap or floor surface.

SABR option greeks computation

Support is provided for `Delta`, `Vega`, `ModifiedDelta`, and `ModifiedVega` sensitivities for the SABR stochastic model using optsensbysabr.

Amortizing caps and floors pricing using closed form solutions (Black or Linear Gaussian two-factor models)

For the Black model, support is available for an enhanced name-value pair argument, `Principal`, to pass the schedule to compute the price for amortizing caps (capbyblk) and floors (floorbyblk). For the Linear Gaussian two-factor model, support is available for an enhanced name-value pair argument, `Notional`, to pass the schedule to compute the price for amortizing caps (capbylg2f) and floors (floorbylg2f).

Asian options pricing example

The example comparing multiple approaches to pricing Asian options is available as `AsianOptionExample.m` at `\fininst\fininstdemos`. For more information, see Pricing Asian Options.

Numerix CrossAsset Integration Layer (CAIL) 11 example

The example for Numerix CAIL 11 support is available at `\fininst\fininstdemos \NumerixFileProcessor.m`.

R2014a

Version: 1.3

New Features

Bug Fixes

Dual curve construction

Support for bootstrapping an interest rate curve using a different curve for discounting the cash flows with the following enhancements:

- bootstrap accepts a new optional input argument for `DiscountCurve`.
- bootstrap accepts a new bootstrapping instrument type called `FRA` for a forward rate agreement instrument.

For more information on using bootstrap for dual curve construction, see the example: Dual Curve Bootstrapping.

Dual curve pricing of caps, floors, and swaptions using the Black model

capbyblk, floorbyblk, and swaptionbyblk accept an optional input argument for `ProjectionCurve`.

Dual curve pricing of swaps and floating-rate notes

swapbyzero and floatbyzero have new examples to demonstrate pricing a swap and a floating-rate note with two curves.

Monte Carlo and analytical pricing of lookback options

Support for lookback options using closed-form solutions or Monte Carlo simulations.

Function	Purpose
lookbackbycvgsg	Calculate prices of European lookback fixed- and floating-strike options using the Conze-Viswanathan and Goldman-Sosin-Gatto models.
lookbacksensbycvgsg	Calculate prices and sensitivities of European fixed- and floating-strike lookback options using the Conze-Viswanathan and Goldman-Sosin-Gatto models.
lookbackbyls	Calculate prices of lookback fixed- and floating-strike options using the Longstaff-Schwartz model.
lookbacksensbyls	Calculate prices and sensitivities of lookback fixed- and floating-strike options using the Longstaff-Schwartz model.

Implied Black volatility computation for the SABR stochastic volatility model

Support for blackvolbysabr to calibrate the SABR model parameters and to compute SABR implied Black volatilities.

User-specified simulation paths for Longstaff-Schwartz pricing functions

Support for optpricebysim to calculate the price and sensitivities of European or American call or put options based on simulation results of the underlying asset. For American options, the Longstaff-Schwartz least squares method is used to calculate the early exercise premium.

`creditexposures` function to compute credit exposures from mark-to-market OTC contract values

Support for computing credit exposures as a part of a counterparty credit risk workflow. For more information, see creditexposures.

`exposureprofiles` function to derive credit exposure profiles from credit exposures

Support for computing various credit exposure profiles, including potential future exposure and expected exposure. For more information, see exposureprofiles.

Enhanced pricing functions for instruments and portfolios with cash flows between tree levels

The pricing algorithms for vanilla stock options have been enhanced to support `ExerciseDates` between tree levels. While `ExerciseDates` previously allowed only values that coincided with tree dates, the new pricing algorithm allows arbitrary `ExerciseDates` between the tree valuation date and tree maturity. For more information see the Bermuda option examples in optstockbycrr, optstockbyeqp, and optstockbyitt.

Swing option pricing example

New example for Pricing Swing Options using the Longstaff-Schwartz Method.

R2013b

Version: 1.2

New Features

Compatibility Considerations

Support for Numerix CrossAsset Integration Layer (CAIL) API

Support for accessing Numerix instruments and risk models.

Class	Purpose
numerix	Create a numerix object to set up the Numerix CrossAsset Integration Layer (CAIL) environment.

Method	Purpose
numerix.parseResults	Converts Numerix CAIL data to MATLAB® data types.

Kirk's approximation and Bjerksund-Stensland closed-form pricing models for spread options

Support pricing and sensitivity of spread options for the energy market using closed-form solutions.

Function	Purpose
spreadbykirk	Price European spread options using the Kirk pricing model.
spreadsensbykirk	Calculate European spread option prices and sensitivities using the Kirk pricing model.
spreadbybjs	Price European spread options using the Bjerksund-Stensland pricing model.
spreadsensbybjs	Calculate European spread option prices and sensitivities using the Bjerksund-Stensland pricing model.

Finite difference and Monte Carlo simulation pricing for American spread options

Support pricing and sensitivity of spread options for the energy market using Monte Carlo simulation.

Function	Purpose
spreadbyfd	Price European or American spread options using the Alternate Direction Implicit (ADI) finite difference method.

Function	Purpose
spreadsensbyfd	Calculate price and sensitivities of European or American spread options using the Alternate Direction Implicit (ADI) finite difference method.
spreadbyls	Price European or American spread options using Monte Carlo simulations.
spreadsensbyls	Calculate price and sensitivities for European or American spread options using Monte Carlo simulations.

Levy and Kemna-Vorst closed-form pricing and Monte Carlo simulation pricing for Asian options

Support pricing and sensitivity of Asian options for the energy market using Monte Carlo simulation and closed-form solutions.

Function	Purpose
asianbyls	Price European or American Asian options using the Longstaff-Schwartz model.
asiansensbyls	Calculate prices and sensitivities of European or American Asian options using the Longstaff-Schwartz model.
asianbykv	Price European geometric Asian options using the Kemna-Vorst model.
asiansensbykv	Calculate prices and sensitivities of European geometric Asian options using the Kemna-Vorst model.
asianbylevy	Price European arithmetic Asian options using the Levy model.
asiansensbylevy	Calculate prices and sensitivities of European arithmetic Asian options using the Levy model.

Additional CDS option pricing functionality for index swaptions

New example for Pricing a CDS Index Option.

Pricing functions for vanilla options using Monte Carlo simulation

Support pricing and sensitivity of vanilla options for the energy market using Monte Carlo simulation.

Function	Purpose
optstockbyls	Price European, Bermudan, or American vanilla options using the Longstaff-Schwartz model.
optstocksensbyls	Calculate European, Bermudan, or American vanilla option prices and sensitivities using the Longstaff-Schwartz model.

Hedging strategies using spread options example

New example for Hedging Strategies Using Spread Options.

Pricing European and American spread options example

New example for Pricing European and American Spread Options.

First-to-default (FTD) swaps example

New example for First-to-Default Swaps.

New function for risky present value of a basis point

cdsrpv01 computes risky present value of a basis point (RPV01) for a credit default swap (CDS) and conforms to the industry standards (ISDA CDS Standard Model).

Compatibility Considerations

Compared with the previous version of Financial Instruments Toolbox, there are minor changes in the values computed by cdsbootstrap, cdsspread, cdsprice, and cdsoptprice when the starting dates do not fall on a payment date. The affected output arguments are as follows:

- cdsbootstrap: `ProbData`, `HazData`
- cdsspread: `Spread`
- cdsprice: `Price`
- cdsoptprice: `Payer`, `Receiver`

While the magnitudes of the value changes are very small, they might affect users who depend on exact matches to previous values. These changes are caused by the

modification of the way risky present value of a basis point (RPV01) is computed and these changes were made to better reflect the industry practice of paying CDS premiums only on specific payment dates.

`optimoptions` support

optimoptions support for IRFitOptions, fitFunction method, hwcalbycap, and hwcalbyfloor.

Functions moved from Financial Instruments Toolbox to Financial Toolbox

The following functions are moved from Financial Instruments Toolbox to Financial Toolbox:

- cdai
- cdprice
- cdyield
- tbilldisc2yield
- tbillprice
- tbillrepo
- tbillval01
- tbillyield
- tbillyield2disc

R2013a

Version: 1.1

New Features

Pricing functions for options on floating-rate notes (FRNs)

Support for pricing a floating-rate note instrument with an option using tree models.

Function	Purpose
optfloatbybdt	Price an option for a floating-rate note using a Black-Derman-Toy interest-rate tree.
optfloatbyhjm	Price an option for a floating-rate note using a Heath-Jarrow-Morton interest-rate tree.
optfloatbyhw	Price an option for a floating-rate note using a Hull-White interest-rate tree.
optfloatbybk	Price an option for a floating-rate note using a Black-Karasinski interest-rate tree.
instoptfloat	Define the option instrument for a floating-rate note.

Pricing functions for FRNs with embedded options

Support for pricing a floating-rate note instrument with an embedded option using tree models.

Function	Purpose
optemfloatbybdt	Price an embedded option for a floating-rate note using a Black-Derman-Toy interest-rate tree.
optemfloatbybk	Price an embedded option for a floating-rate note using a Black-Karasinski interest-rate tree.
optemfloatbyhjm	Price an embedded option for a floating-rate note using a Heath-Jarrow-Morton interest-rate tree.
optemfloatbyhw	Price an embedded option for a floating-rate note using a Hull-White interest-rate tree.
instoptemfloat	Define the floating-rate note with an embedded option instrument.

Performance enhancements in implied volatility calculations

Improved performance for calculating implied volatility when using impvbybjs and impvbyrgw.

Calibration and Monte Carlo simulation of single-factor and multifactor interest-rate models, including Hull-White, Linear Gaussian, and LIBOR Market Models

Support for pricing interest-rate instruments for caps, floors, and swaptions using Monte Carlo simulation with Hull-White, Shifted Gaussian, and LIBOR Market Models. There are three new classes, three new methods, and four new functions.

Class	Purpose
HullWhite1F	Create a Hull-White one-factor model.
LinearGaussian2F	Create a two-factor additive Gaussian interest-rate model.
LiborMarketModel	Create a LIBOR Market Model.

Method	Purpose
HullWhite1F.simTermSt	Simulate term structures for a Hull-White one-factor model.
LinearGaussian2F.simT	Simulate term structures for a two-factor additive Gaussian interest-rate model.
LiborMarketModel.simT	Simulate term structures for a LIBOR Market Model.

Function	Purpose
capbylg2f	Price caps using a Linear Gaussian two-factor model.
floorbylg2f	Price floors using a Linear Gaussian two-factor model.
swaptionbylg2f	Price European swaptions using a Linear Gaussian two-factor model.
blackvolbyrebonato	Compute the Black volatility for a LIBOR Market Model using the Rebonato formula.

R2012b

Version: 1.0

New Features

Compatibility Considerations

Merge of Fixed-Income Toolbox and Financial Derivatives Toolbox to Financial Instruments Toolbox

Fixed-Income Toolbox™ and Financial Derivatives Toolbox™ are merged into the new product Financial Instruments Toolbox.

Cap and floor floating-rate note pricing using trees

Support for pricing capped, collared, and floored floating-rate notes using the `CapRate` and `FloorRate` arguments.

Function	Purpose
floatbybdt	Price a capped floating-rate note using a Black-Derman-Toy interest-rate tree.
floatbyhjm	Price a capped floating-rate note using a Heath-Jarrow-Morton interest-rate tree.
floatbyhw	Price a capped floating-rate note using a Hull-White interest-rate tree.
floatbybk	Price a capped floating-rate note using a Black-Karasinski interest-rate tree.
instfloat	Create a capped floating-rate note instrument.
instadd	Add capped floating-rate note instruments to a portfolio.

Forward-swap pricing using trees or term structure

Support for interest-rate forward swaps using the new `StartDate` argument to define the future date for the swap instrument.

Function	Purpose
swapbyzero	Price a bond using a set of zero curves.
swapbybdt	Price a forward swap using a Black-Derman-Toy interest-rate tree.
swapbyhjm	Price a forward swap using a Heath-Jarrow-Morton interest-rate tree.
swapbyhw	Price a forward swap using a Hull-White interest-rate tree.

Function	Purpose
swapbybk	Price a forward swap using a Black-Karasinski interest-rate tree.
instswap	Create a forward swap instrument.
instadd	Add forward swap instruments to a portfolio.

Functions for fitting and extracting calibrated parameters from `IRFunctionCurve` objects

New enhancements for IRFunctionCurve object, including the ability to get calibrated parameters, the ability to specify linear inequality parameter constraints, and support for curve type in fitSmoothingSpline to be forward, zero, and discount.

LIBOR market model example

New example for mortgage prepayment that uses a LIBOR market model to generate interest-rate evolutions. For more information, see Prepayment Modeling with a Two Factor Hull White Model and a LIBOR Market Model.

Counterparty credit risk example

New example for computing the unilateral Credit Value (Valuation) Adjustment (CVA) for a bank holding a portfolio of vanilla interest-rate swaps with several counterparties. For more information, see Counterparty Credit Risk and CVA.

Conversion of error and warning message identifiers

For R2012b, error and warning message identifiers have changed in Financial Instruments Toolbox.

Compatibility Considerations

If you have scripts or functions that use message identifiers that changed, you must update the code to use the new identifiers. Typically, message identifiers are used to turn off specific warning messages, or in code that uses a `try/catch` statement and performs an action based on a specific error identifier.

For example, because Fixed-Income Toolbox and Financial Derivatives Toolbox merged to become Financial Instruments Toolbox, the `finfixed` and `finderiv` message identifiers have changed to `fininst`. If your code checks for `finfixed` or `finderiv` message identifiers, you must update it to check for `finisnt` instead.

To determine the identifier for an error, run the following command just after you see the error:

```
exception = MException.last;
MSGID = exception.identifier;
```

To determine the identifier for a warning, run the following command just after you see the warning:

```
[MSG,MSGID] = lastwarn;
```

This command saves the message identifier to the variable `MSGID`.
