## polarpattern class

Interactive plot of radiation patterns in polar format

### Description

polarpattern class plots antenna or array radiation patterns in interactive polar format. You can also plot other types of polar data. Use these plots when interactive data visualization or measurement is required. Right-click the **Polar Measurement** window to change the properties, zoom in, or add more data to the plot.

## Construction

`polarpattern` plots antenna or array radiation patterns and other types of data in polar format. `polarpattern` plots field value data of radiation patterns for visualization and measurement. Right-click the polar plot to interact.

`polarpattern(data)` creates a polar plot with magnitude values in the vector `d`. In this polar plot, angles are uniformly spaced on the unit circle, starting at 0 degrees.

`polarpattern(angle, magnitude)` creates a polar plot from a set of angle vectors and corresponding magnitudes. You can also create polar plots from multiple sets for angle vectors and corresponding sets of magnitude using the syntax: `polarpattern(angle1, magnitude1, angle2, magnitude2...)`.

`p = polarpattern(____)` returns an object handle that you can use to customize the plot or add measurements. You can specify any of the arguments from the previous syntaxes.

`p = polarpattern('gco')` returns an object handle from polar pattern in the current figure.

`polarpattern(____, Name, Value)` creates a polar plot, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding property value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values. To list all the property `Name, Value` pairs, use `details(p)`. To list all the property `Name, Value` pairs, use `details(p)`. You can use the properties to extract any data from the radiation pattern from the polar plot. For example, `p = polarpattern(data, 'Peaks', 3)` identifies and displays the three highest peaks in the pattern data.

For a list of properties, see `PolarPattern`.

`polarpattern(ax, ____)` creates a polar plot using axes handle, `ax` instead of the current axes handle.

## Input Arguments

### **data — Antenna or array data**

real length- $M$  vector | real  $M$ -by- $N$  matrix | real  $N$ - $D$  array | complex vector or matrix

Antenna or array data, specified as one of the following:

- A real length- $M$  vector, where  $M$  contains the magnitude values with angles assumed to be  $\frac{(0 : M - 1)}{M} \times 360^\circ$  degrees.
- A real  $M$ -by- $N$  matrix, where  $M$  contains the magnitude values and  $N$  contains the independent data sets. Each column in the matrix has angles taken from the vector  $\frac{(0 : M - 1)}{M} \times 360^\circ$  degrees.
- A real  $N$ - $D$  array, where  $N$  is the number of dimensions. Arrays with dimensions 2 and greater are independent data sets.
- A complex vector or matrix, where `data` contains Cartesian coordinates ( $x, y$ ) of each point.  $x$  contains the real (`data`) and  $y$  contains the imaginary (`data`).

When `data` is in a logarithmic form, such as dB, magnitude values can be negative. In this case, `polarpattern` plots the smallest magnitude values at the origin of the polar plot and largest magnitude values at the maximum radius.

### **angle — Set of angles**

vector in degrees

Set of angles, specified as a vector in degrees.

### **magnitude — Set of magnitude values**

vector | matrix

Set of magnitude values, specified as a vector or a matrix. For a matrix of magnitude values, each column is an independent set of magnitude values and corresponds to the same set of angles.

## Methods

add	Add data to existing polar plot
addCursor	Add cursor to polar plot angle
animate	Replace existing data with new data for animation
createLabels	Create legend labels
findLobes	Main, back and side lobe data
replace	Replace existing data with new data in polar plot
showPeaksTable	Show or hide peak marker table
showSpan	Show or hide angle span between two markers

## Examples

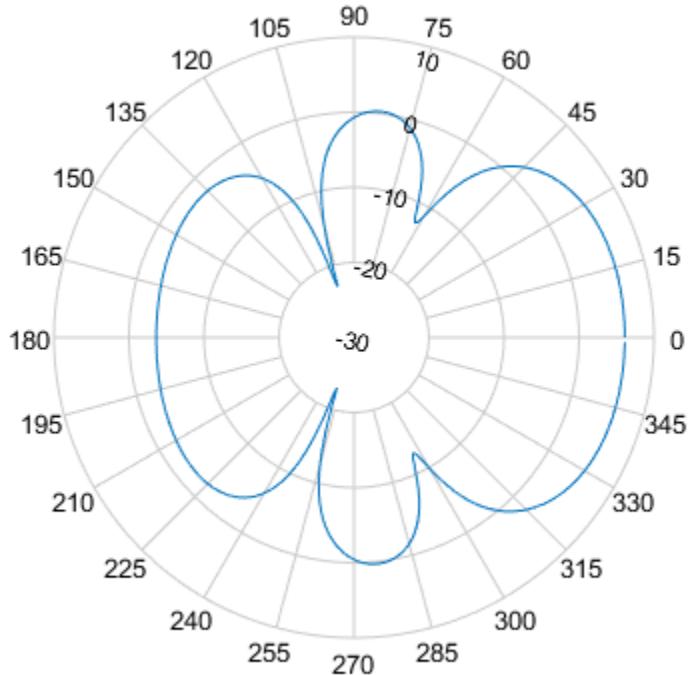

### Polar Pattern for Vivaldi Antenna

Create a default Vivaldi antenna and calculate the directivity at 1.5 GHz.

```
v = vivaldi;
V = pattern(v,1.5e9,0,0:1:360);
```

Plot the polar pattern of the calculated directivity.

```
P = polarpattern(V);
```

## Polar Pattern of Cavity Antenna

Create a default cavity antenna. Calculate the directivity of the antenna and write the data to `cavity.pln` using the `msiwrite` function.

```
c = cavity;
msiwrite(c,2.8e9,'cavity','Name','Cavity Antenna Specifications');
```

Read the cavity specification file into `Horizontal`, `Vertical`, and `Optional` structures using the `msiread` function.

```
[Horizontal,Vertical,Optional] = msiread('cavity.pln')
```

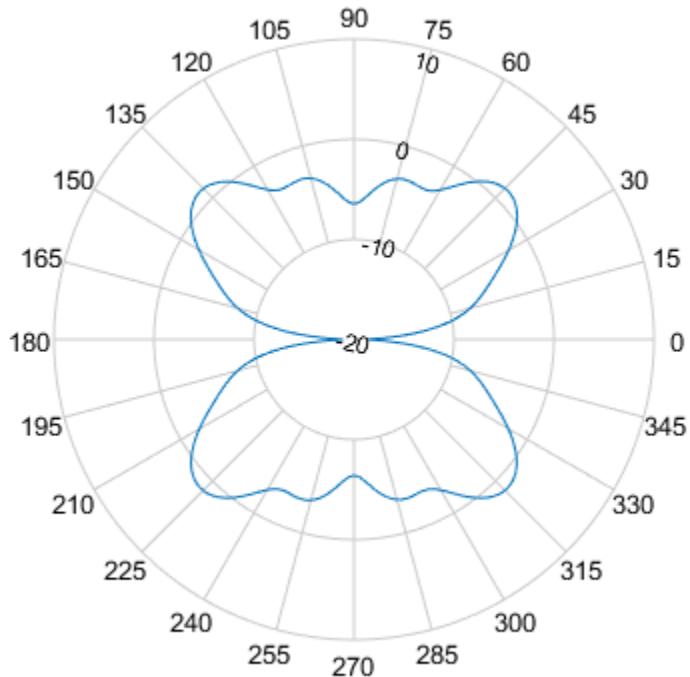

```
Horizontal =  
  
    struct with fields:  
  
        PhysicalQuantity: 'Gain'  
            Magnitude: [360x1 double]  
                Units: 'dBi'  
                Azimuth: [360x1 double]  
                Elevation: 0  
                Frequency: 2.8000e+09  
                Slice: 'Elevation'
```

```
Vertical =  
  
    struct with fields:  
  
        PhysicalQuantity: 'Gain'  
            Magnitude: [360x1 double]  
                Units: 'dBi'  
                Azimuth: 0  
                Elevation: [360x1 double]  
                Frequency: 2.8000e+09  
                Slice: 'Azimuth'
```

```
Optional =  
  
    struct with fields:  
  
        name: 'Cavity Antenna Specifications'  
        frequency: 2.8000e+09  
        gain: [1x1 struct]
```

Plot the polar pattern of the cavity at azimuth angles.

```
P = polarpattern(Horizontal.Azimuth,Horizontal.Magnitude);
```

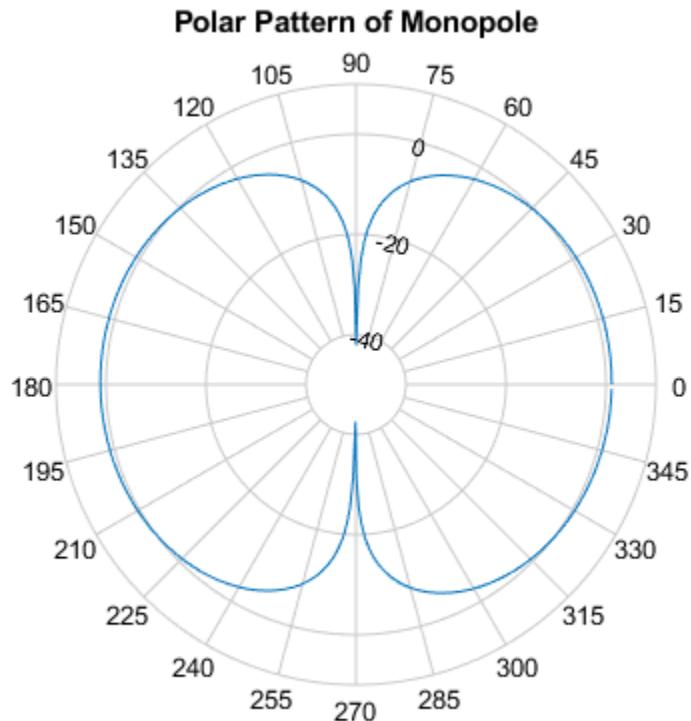

### Add Title to Polar Plot

Create a default monopole antenna and calculate the directivity at 75 MHz.

```
m = monopole;  
M = pattern(m, 75e6, 0, 0:1:360);
```

Plot the polar pattern of the antenna.

```
P = polarpattern(M, 'TitleTop', 'Polar Pattern of Monopole');
```

### Polar Pattern Properties

Create a default dipole antenna and calculate the directivity at 75 MHz.

```
d = dipole;
D = pattern(d, 75e6, 0, 0:1:360);
```

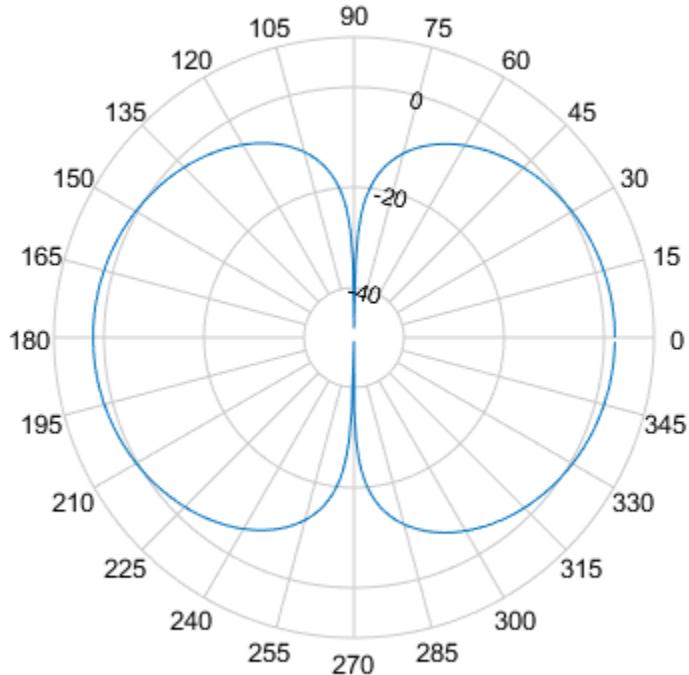

Plot the polar pattern of the antenna and display the properties of the plot.

```
P = polarpattern(D);
details(P)
```

### Remove -Inf and NaN Values in Antenna PolarPattern

Use `Clean Data in Antenna Metrics` to remove `-inf` and `NaN` values in a monopole antenna polar pattern. It is recommended to use `Clean Data` for partial data with `-inf` and `NaN` values.

```
m = monopole;  
m.GroundPlaneLength = inf;
```

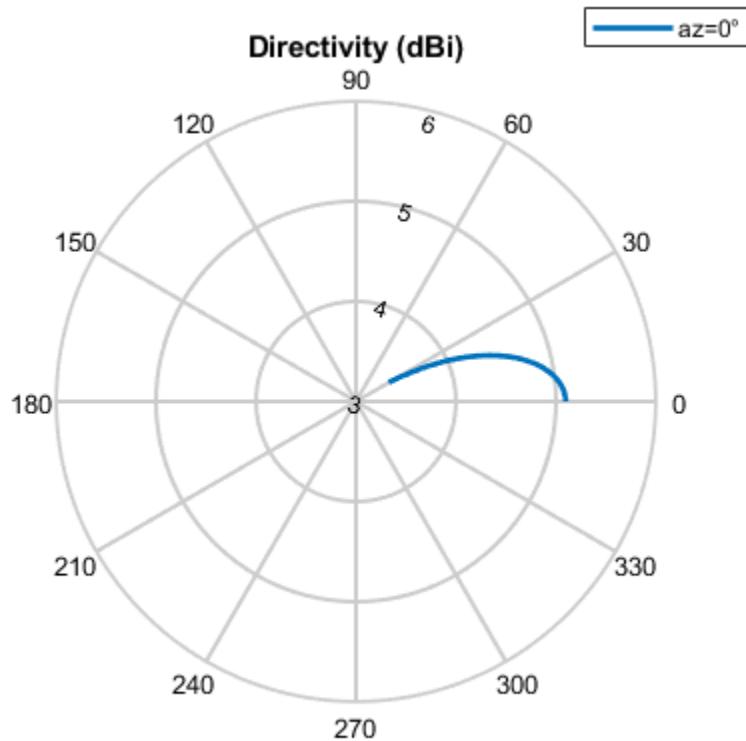

Plot the beamwidth of the antenna at 70 MHz.

```
figure;  
beamwidth(m, 70e6, 0, -50:30)
```

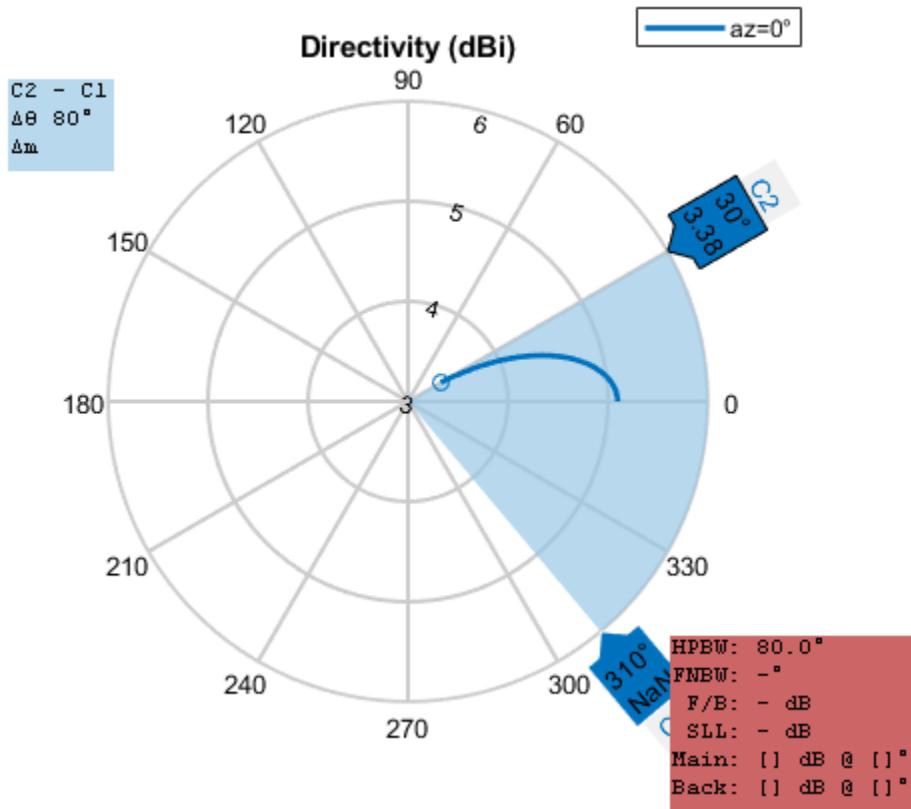

Plot the radiation pattern of the antenna at 70 MHz.

```
figure;  
pattern(m, 70e6, 0, -50:30);
```

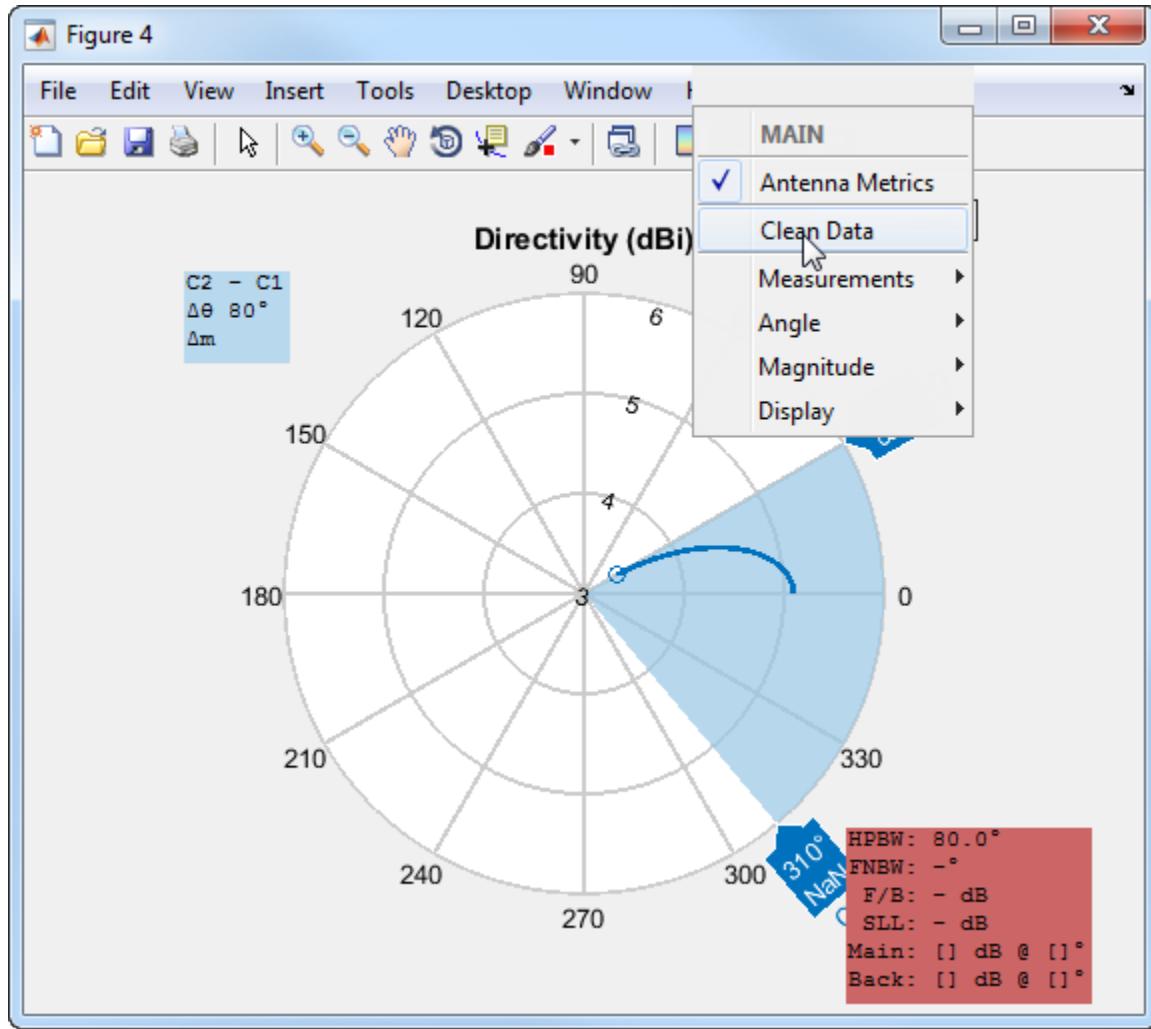

Use `polarpattern` to view antenna metrics of the radiation pattern.

```
P = polarpattern('gco');  
P.AntennaMetrics = 1;
```

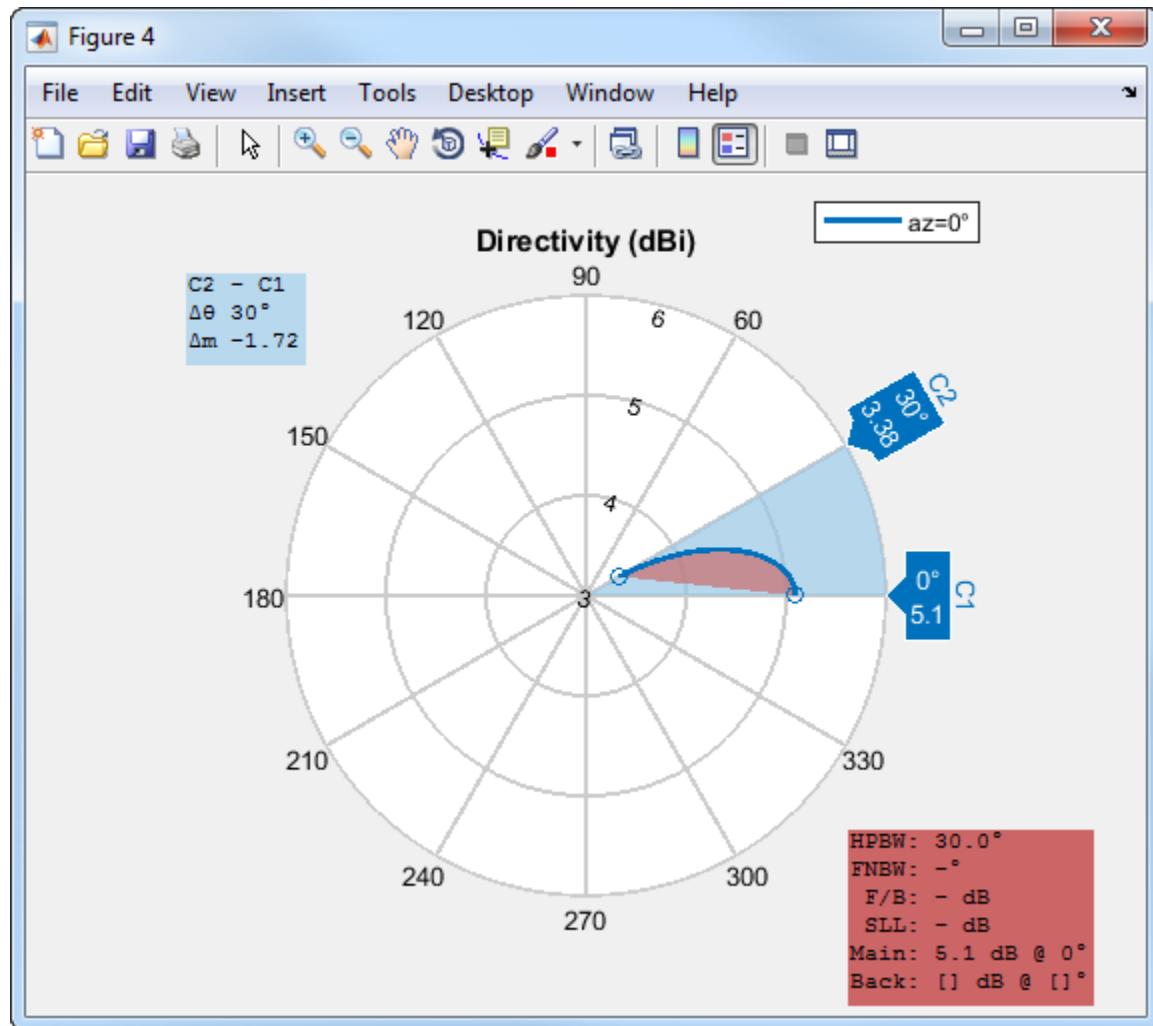

Compare the beamwidth plot and the polarpattern plot. You will see that Antenna Metrics does not represent the beamwidth correctly.

Use Clean Data to clean the -inf and NaN values.

After using `Clean Data`, you see that the `polarpattern` beamwidth calculation matches the beamwidth plot calculation.

# Antenna Objects — Alphabetical List

---

## biquad

Create biquad antenna

### Description

The `biquad` antenna is center fed and symmetric about its origin. The default length is chosen for an operating frequency of 2.8 GHz.

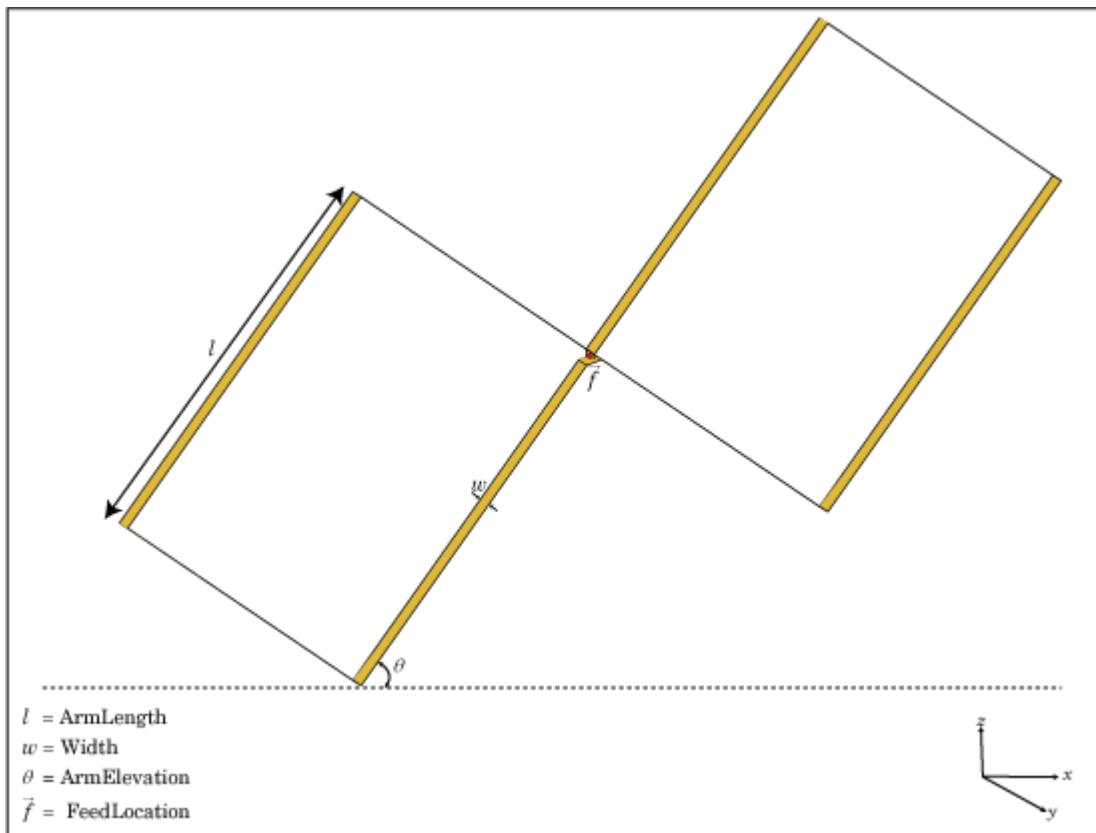

The width of the strip is related to the diameter of an equivalent cylinder:

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical dipole.
- $r$  is the radius of equivalent cylindrical dipole.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default strip dipole is center-fed. The feed point coincides with the origin. The origin is located on the Y-Z plane.

## Creation

### Syntax

```
bq = biquad  
bq = biquad(Name,Value)
```

### Description

`bq = biquad` creates a biquad antenna.

`bq = biquad(Name,Value)` creates a biquad antenna with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **ArmLength — Length of two arms**

0.0305 (default) | scalar

Length of two arms, specified as a scalar in meters. The default length is chosen for an operating frequency of 2.8 GHz.

Example: `'ArmLength',0.0206`

Data Types: `double`

### **Width — Biquad arm width**

1.0000e-03 (default) | scalar

Biquad arm width, specified as a scalar in meters.

Example: `'Width',0.006`

Data Types: `double`

### **ArmElevation — Angle formed by biquad arms to X-Y plane**

45 (default) | scalar

Angle formed by biquad arms to the X-Y plane, specified a scalar in meters.

Example: `'ArmElevation', 50`

Data Types: `double`

### **Load — Lumped elements**

[1x1 `LumpedElement`] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## **Object Functions**

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna

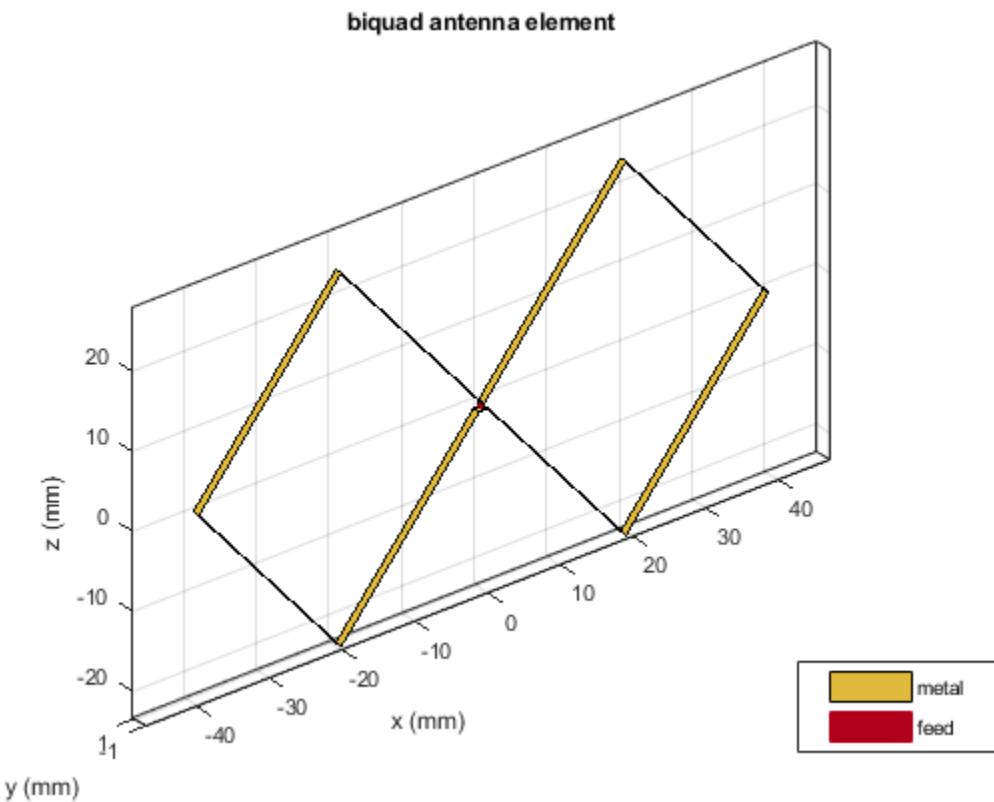

charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Create and View Biquad Antenna

Create a biquad antenna with arm angles at 50 degrees and view it.

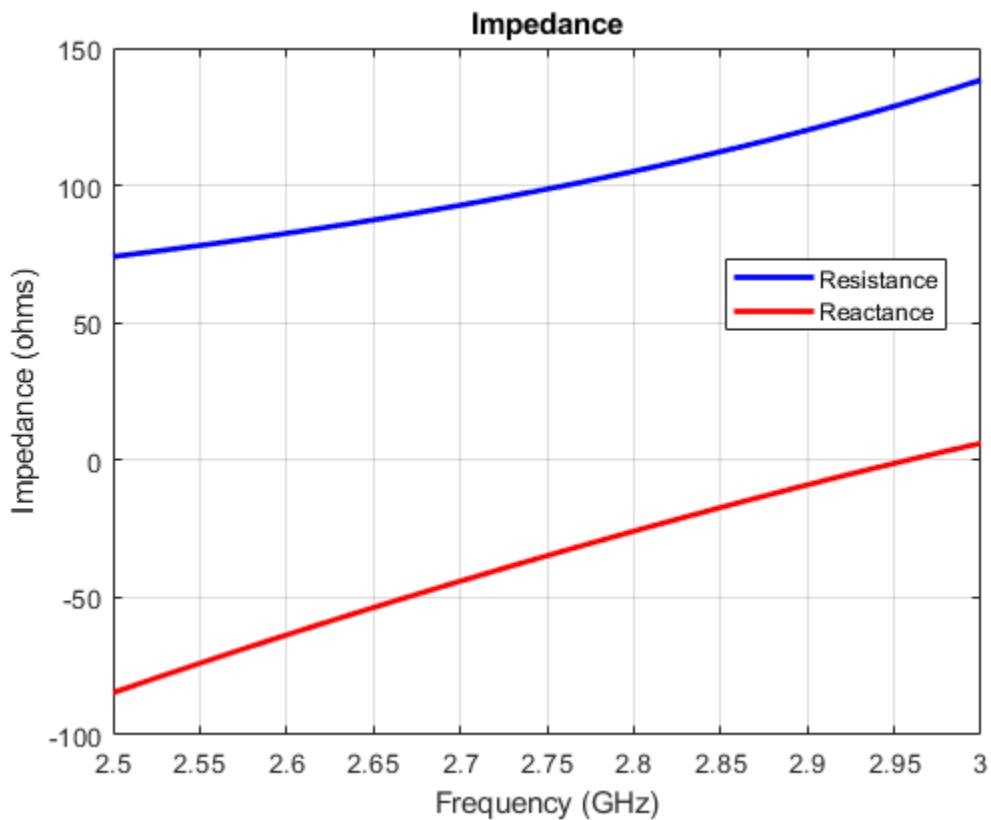

```
bq = biquad('ArmElevation',50);  
show(bq)
```

### Impedance of Biquad Antenna

Calculate the impedance of a biquad antenna over a frequency span 2.5GHz-3GHz.

```
bq = biquad('ArmElevation',50);  
impedance(bq,linspace(2.5e9,3e9,51));
```

# bowtieRounded

Create rounded bowtie dipole antenna

## Description

The `bowtieRounded` object is a planar bowtie antenna, with rounded edges, on the Y-Z plane. The default rounded bowtie is center fed. The feed point coincides with the origin. The origin is located on the Y-Z plane.

## Creation

### Syntax

```
br = bowtieRounded  
br = bowtieRounded(Name,Value)
```

### Description

`br = bowtieRounded` creates a half-wavelength planar bowtie antenna with rounded edges.

`br = bowtieRounded(Name,Value)` creates a planar bowtie antenna with rounded edges, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Length — Rounded bowtie length**

0.2000 (default) | scalar

Rounded bowtie length, specified a scalar in meters. By default, the length is chosen for the operating frequency of 490 MHz.

Example: `'Length', 3`

Data Types: double

### **FlareAngle — Rounded bowtie flare angle**

90 (default) | scalar

Rounded bowtie flare angle, specified a scalar in degrees.

---

**Note** Flare angle should be less than 175 degrees and greater than 5 degrees.

---

Example: 'FlareAngle', 80

Data Types: double

#### **Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`. `lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

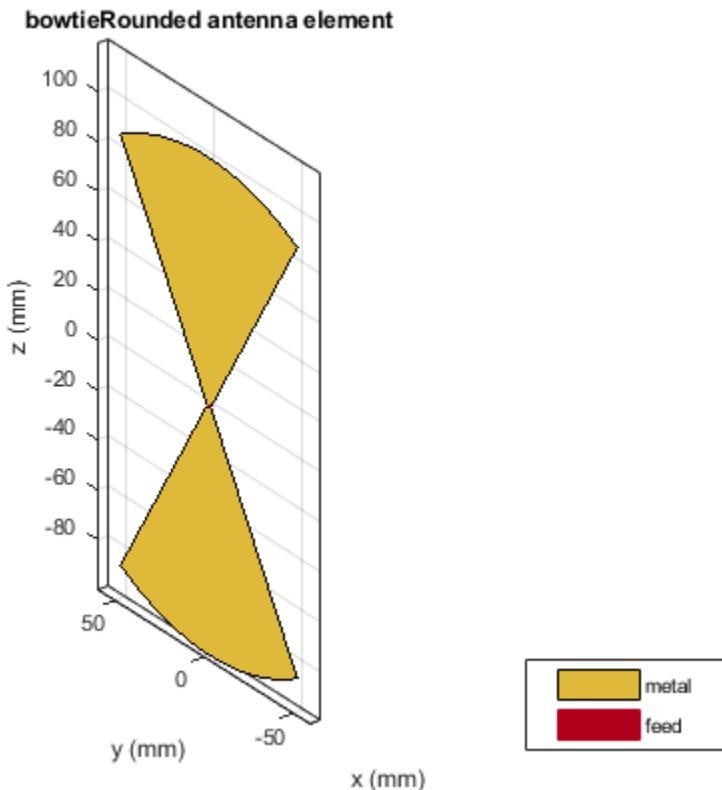

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Create and View Center-Fed Rounded Bowtie Antenna

Create and view a center-fed rounded bowtie that has a flare angle of 60 degrees.

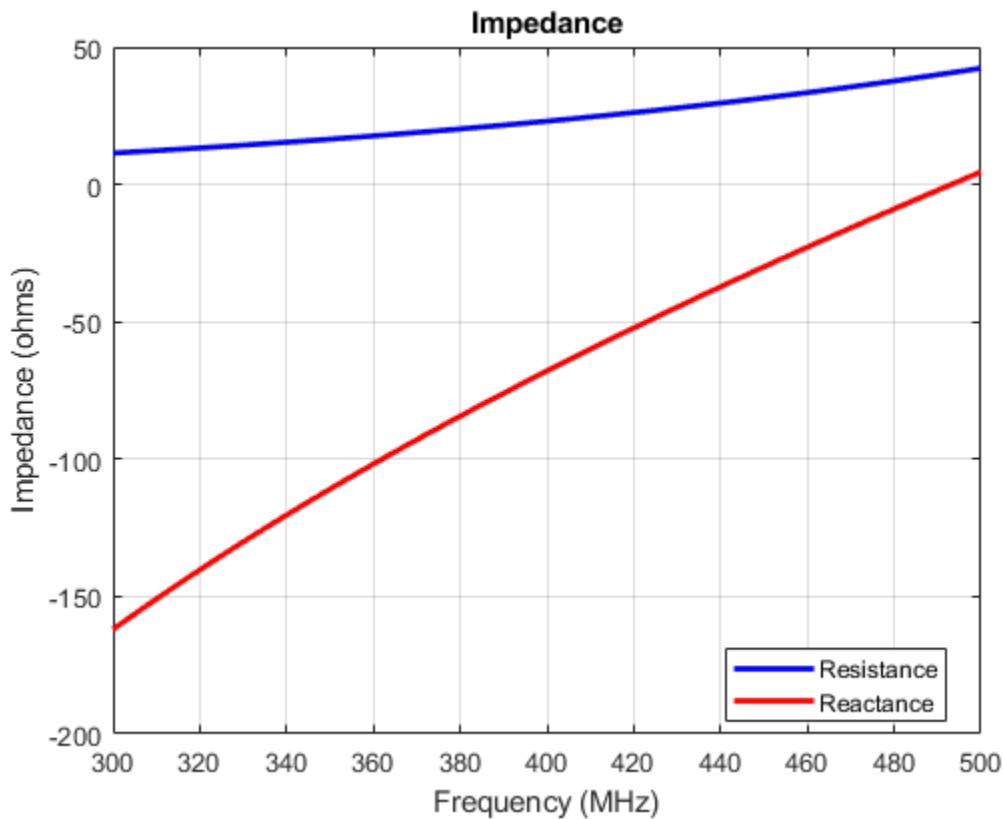

```
b = bowtieRounded('FlareAngle', 60);  
show(b);
```

### **Impedance of Rounded Bowtie Antenna**

Calculate and plot the impedance of a rounded bowtie over a frequency range of 300MHz-500MHz.

```
b = bowtieRounded('FlareAngle', 60);  
impedance(b, linspace(300e6, 500e6, 51))
```

## bowtieTriangular

Create planar bowtie dipole antenna

### Description

The `bowtieTriangular` object is a planar bowtie antenna on the Y-Z plane. The default planar bowtie dipole is center-fed. The feed point coincides with the origin. The origin is located on the Y-Z plane.

# Creation

## Syntax

```
bt = bowtieTriangular  
bt = bowtieTriangular(Name,Value)
```

## Description

`bt = bowtieTriangular` creates a half-wavelength planar bowtie antenna.

`bt = bowtieTriangular(Name,Value)` creates a planar bowtie antenna with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Length — Planar bowtie length**

0.2000 (default) | scalar

Planar bowtie length, specified as a scalar in meters. By default, the length is chosen for the operating frequency of 410 MHz.

Example: `'Length', 3`

Data Types: `double`

### **FlareAngle — Planar bowtie flare angle**

90 (default) | scalar

Planar bowtie flare angle near the feed, specified as a scalar in meters.

---

**Note** Flare angle should be less than 175 degrees and greater than 5 degrees.

---

Example: `'FlareAngle', 80`

Data Types: double

### **Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`. `lumpedElement` is the object handle for the load created using `lumpedElement`.

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

# cavity

Create cavity-backed antenna

## Description

The `cavity` object is a cavity-backed antenna located on the X-Y-Z plane. The default cavity antenna has a dipole as an exciter. The feed point is on the exciter.

## Creation

### Syntax

```
c = cavity  
c = cavity(Name,Value)
```

### Description

`c = cavity` creates a cavity backed antenna located on the X-Y-Z plane. By default, the dimensions are chosen for an operating frequency of 1 GHz.

`c = cavity(Name,Value)` creates a cavity-backed antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Exciter — Antenna type used as exciter**

`dipole` (default) | `object`

Antenna type used as an exciter, specified as an object. Except reflector and cavity antenna elements, you can use all the single elements in the Antenna Toolbox as an exciter.

Example: `'Exciter', dipole`

### **Substrate — Type of dielectric material**

`'Air'` (default) | `object`

Type of dielectric material used as a substrate, specified as an object. For more information see, `dielectric`. For more information on dielectric substrate meshing, see “Meshing”.

---

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: `d = dielectric('FR4');` 'Substrate',`d`

Example: `d = dielectric('FR4');` cavity.Substrate = `d`

**Length — Length of rectangular cavity along x-axis**

0.2000 (default) | scalar

Length of the rectangular cavity along the x-axis, specified as a scalar in meters.

Example: 'Length', 30e-2

Data Types: double

**Width — Width of rectangular cavity along y-axis**

0.2000 (default) | scalar

Width of the rectangular cavity along the y-axis, specified as a scalar in meters.

Example: 'Width', 25e-2

Data Types: double

**Height — Height of rectangular cavity along z-axis**

0.0750 (default) | scalar

Height of the rectangular cavity along the z-axis, specified as a scalar in meters.

Example: 'Height', 7.5e-2

Data Types: double

**Spacing — Distance between exciter and base of cavity**

0.0750 (default) | scalar

Distance between the exciter and the base of the cavity, specified as a scalar in meters.

Example: 'Spacing', 7.5e-2

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', lumpedelement. lumpedelement is the object handle for the load created using lumpedElement.

**EnableProbeFeed — Create probe feed from backing structure to exciter**  
0 (default) | 1

Create probe feed from backing structure to exciter, specified as a 0 or 1. By default, probe feed is not enabled.

Example: 'EnableProbeFeed', 1

Data Types: double

**Tilt — Tilt angle of antenna**  
0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

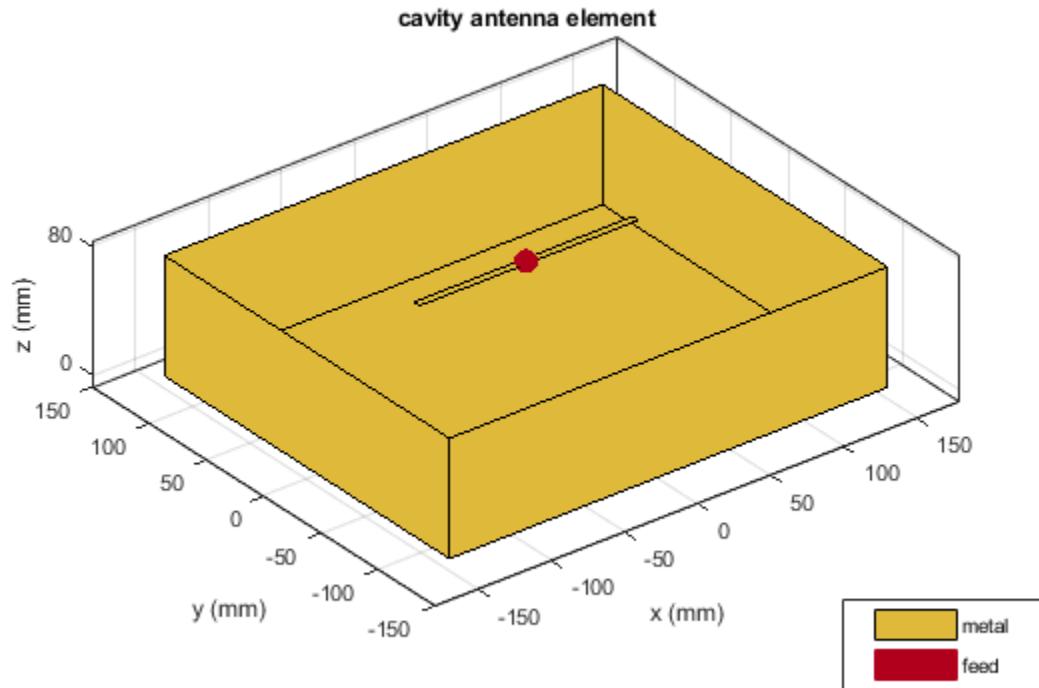

show	Display antenna or array structure; Display shape as filled patch

vswr	Voltage standing wave ratio of antenna

## Examples

### Create and View Cavity-Backed Antenna.

Create and view a cavity-backed dipole antenna with 30cm length, 25cm width, 7.5cm height and spaced 7.5cm from the bowtie for operation at 1GHz.

```
c = cavity('Length',30e-2, 'Width',25e-2,'Height',7.5e-2,'Spacing',7.5e-2);
show(c)
```

### Radiation Pattern of Cavity-Backed Antenna

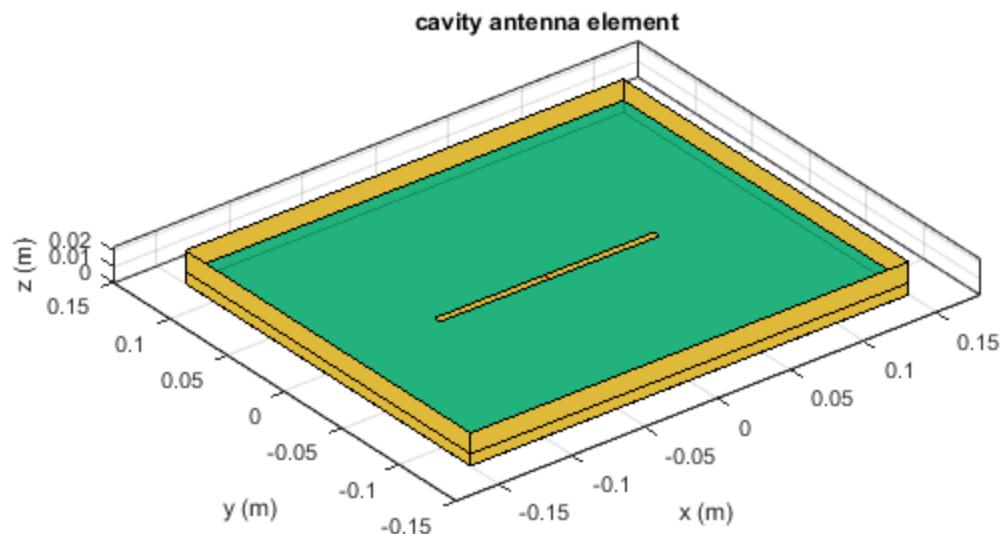

Create a cavity-backed antenna using a dielectric substrate 'FR4'.

```
d = dielectric('FR4');
c = cavity('Length',30e-2,'Width',25e-2,'Height',20.5e-3,'Spacing',7.5e-3, ...
    'Substrate',d)
show(c)
```

```
c =
```

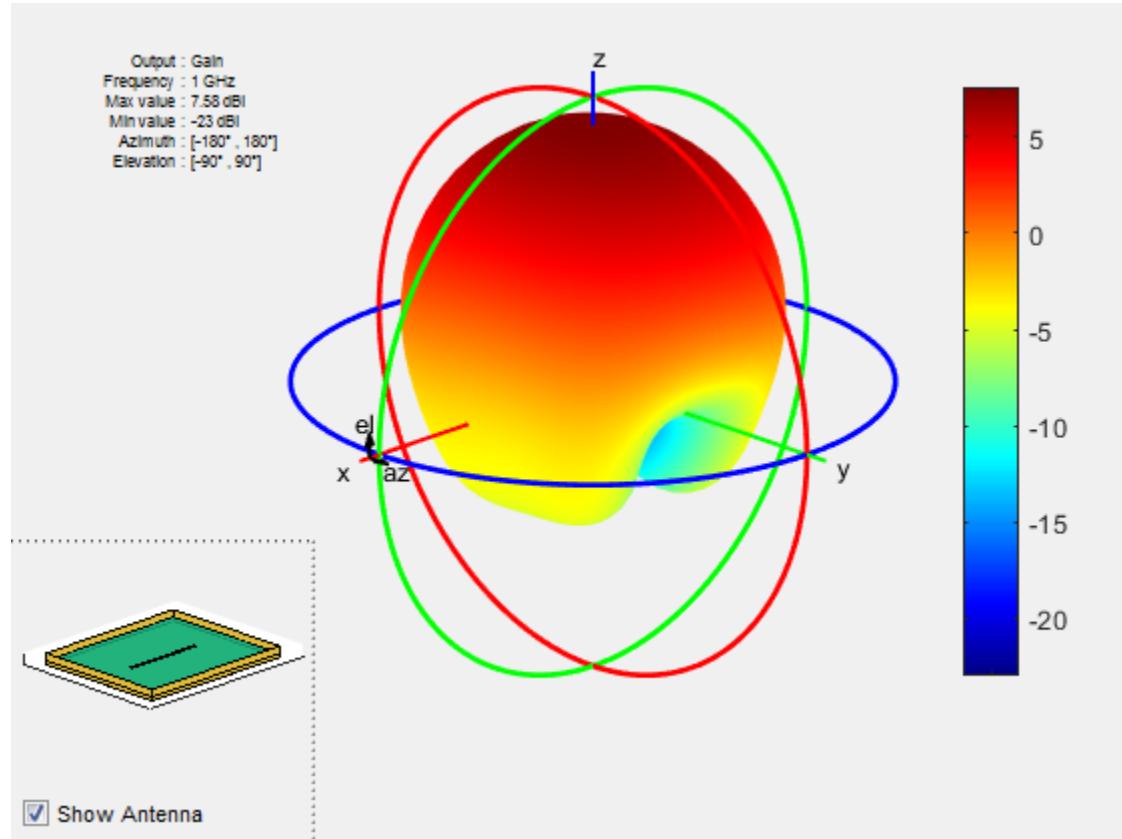

cavity with properties:

```
Exciter: [1x1 dipole]
Substrate: [1x1 dielectric]
Length: 0.3000
Width: 0.2500
Height: 0.0205
Spacing: 0.0075
Tilt: 0
TiltAxis: [1 0 0]
```

Plot the radiation pattern of the antenna at a frequency of 1 GHz.

```
figure  
pattern(c,1e9)
```

## dipole

Create strip dipole antenna

### Description

The `dipole` object is a strip dipole antenna on the Y-Z plane.

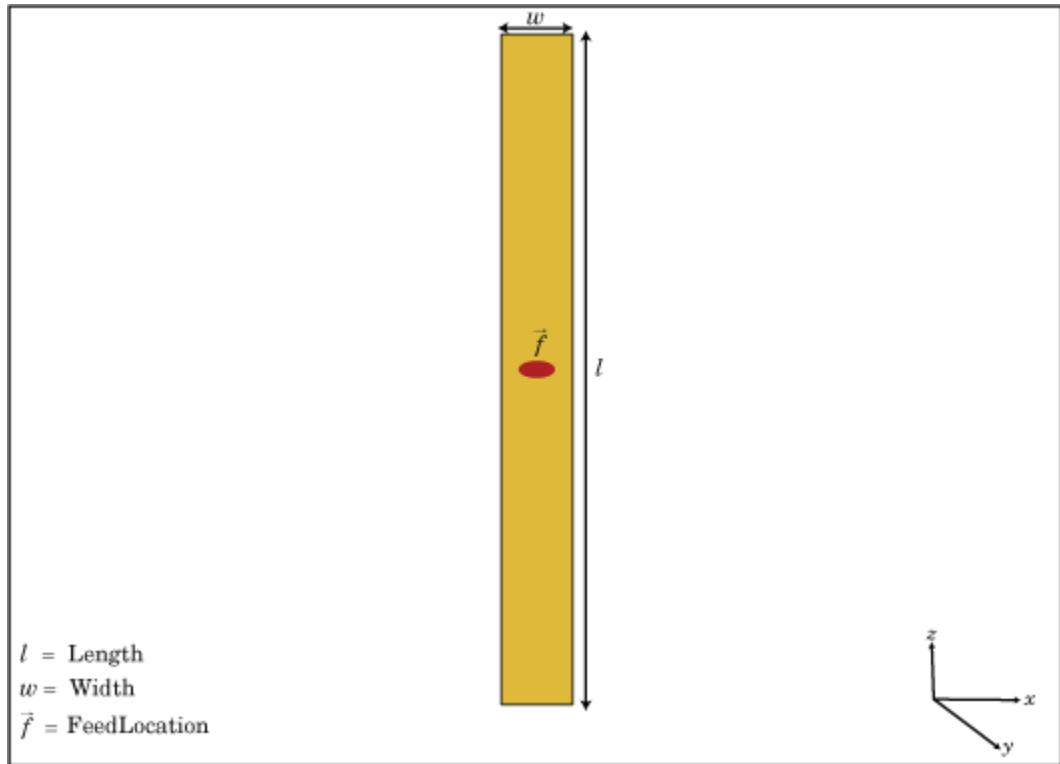

The width of the dipole is related to the diameter of an equivalent cylindrical dipole by the equation

$$w = 2d = 4r$$

where:

- $d$  is the diameter of equivalent cylindrical dipole.
- $r$  is the radius of equivalent cylindrical dipole.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default strip dipole is center-fed. The feed point coincides with the origin. The origin is located on the Y-Z plane.

## Creation

## Syntax

```
d = dipole  
d = dipole(Name,Value)
```

## Description

`d = dipole` creates a half-wavelength strip dipole antenna on the Y-Z plane.

`d = dipole(Name,Value)` creates a dipole antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and

Value is the corresponding value. You can specify several name-value pair arguments in any order as Name1, Value1, ..., NameN, ValueN. Properties you do not specify retain their default values.

## Properties

### **Length — Dipole length**

2 (default) | scalar

Dipole length, specified as a scalar in meters. By default, the length is chosen for an operating frequency of 75 MHz.

Example: 'Length', 3

Data Types: double

### **Width — Dipole width**

0.1000 (default) | scalar

Dipole width, specified as a scalar in meters.

---

**Note** Dipole width should be less than 'Length'/5 and greater than 'Length'/1001. [2]

---

Example: 'Width', 0.05

Data Types: double

### **FeedOffset — Signed distance from center of dipole**

0 (default) | scalar

Signed distance from center of dipole, specified as a scalar in meters. The feed location is on Y-Z plane.

Example: 'FeedOffset', 3

Data Types: double

### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## **Object Functions**

<code>show</code>	Display antenna or array structure; Display shape as filled patch
<code>info</code>	Display information about antenna or array

axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array

## Examples

### Create and View Dipole Antenna

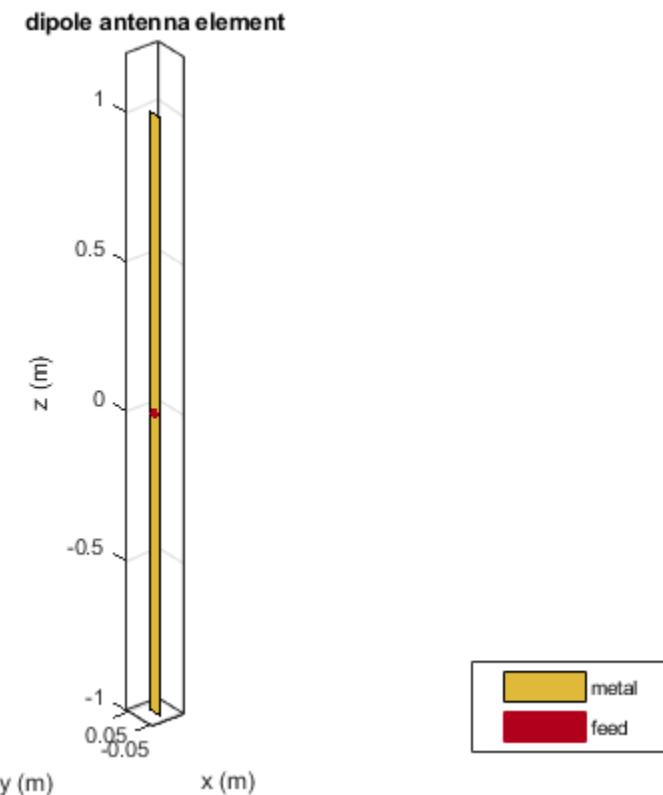

Create and view a dipole with 2m length and 0.5m width.

```
d = dipole('Width',0.05)

d =
dipole with properties:

    Length: 2
    Width: 0.0500
    FeedOffset: 0
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]

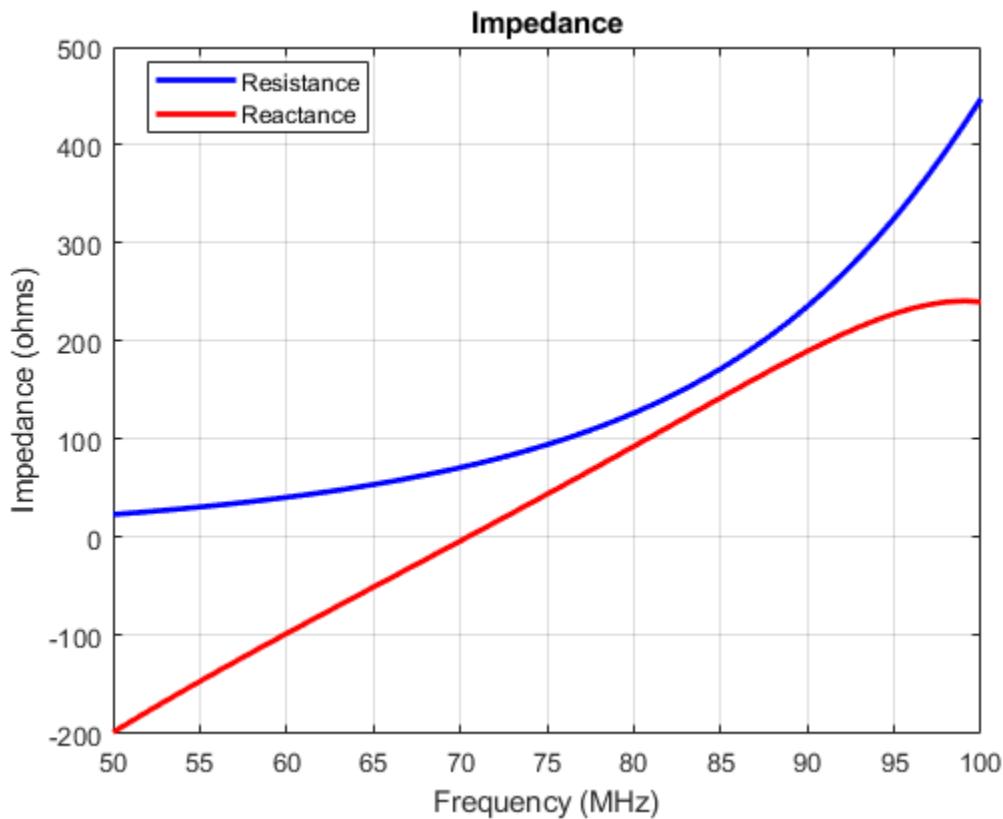

show(d)
```

### Impedance of Dipole Antenna

Calculate the impedance of a dipole over a frequency range of 50MHz - 100MHz.

```
d = dipole('Width',0.05);  
impedance(d,linspace(50e6,100e6,51))
```

### Infinite Reflector Backed Dielectric Substrate Antenna

Design a dipole antenna backed by a dielectric substrate and an infinite reflector.

Create a dipole antenna of length, 0.15 m, and width, 0.015 m.

```
d = dipole('Length',0.15,'Width',0.015, 'Tilt',90,'TiltAxis',[0 1 0]);
```

Create a reflector using the dipole antenna as an exciter and the dielectric, teflon as the substrate.

```
t = dielectric('Teflon')
rf = reflector('Exciter',d,'Spacing',7.5e-3,'Substrate',t);
```

```
t =
```

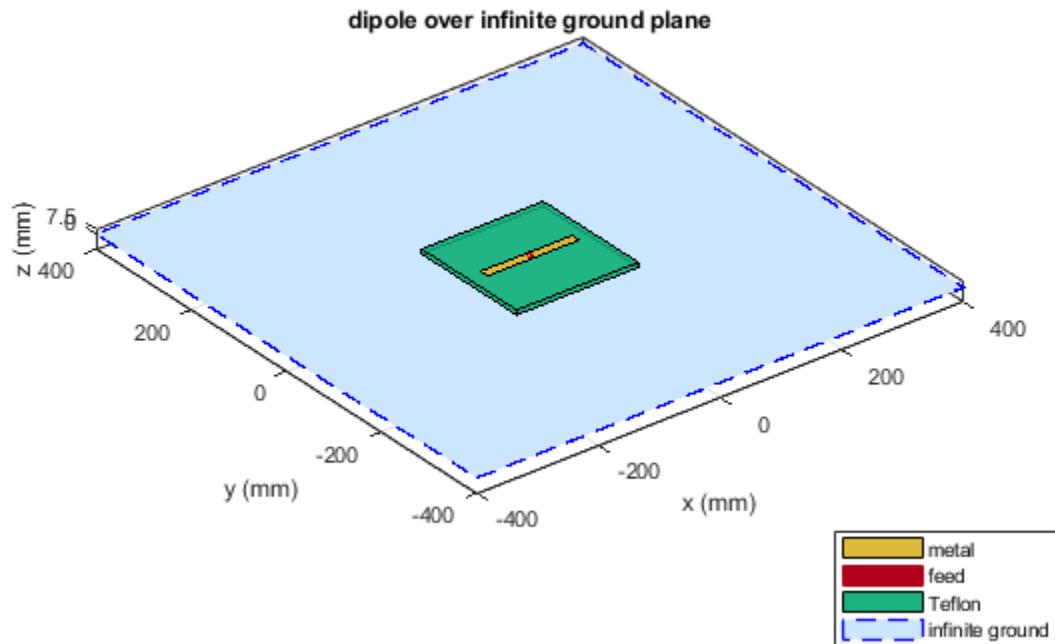

```
dielectric with properties:
```

```
Name: 'Teflon'
EpsilonR: 2.1000
LossTangent: 2.0000e-04
Thickness: 0.0060
```

For more materials see <a href="matlab:openDielectricCatalog">catalog</a>

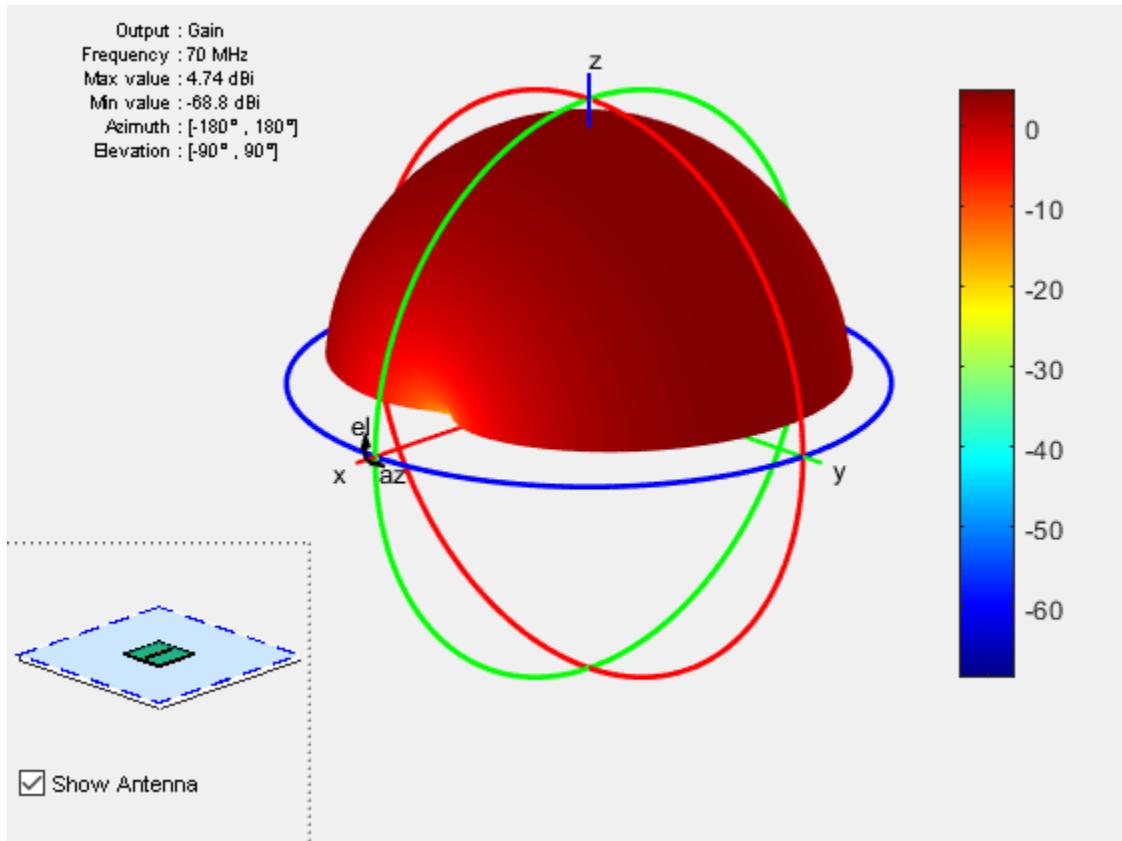

Set the groundplane length of the reflector to inf. View the structure.

```
rf.GroundPlaneLength = inf;
show(rf)
```

Calculate the radiation pattern of the antenna at 70 MHz.

```
pattern(rf, 70e6)
```

# dipoleFolded

Create folded dipole antenna

## Description

The `dipolefolded` object is a folded dipole antenna on the X-Y plane.

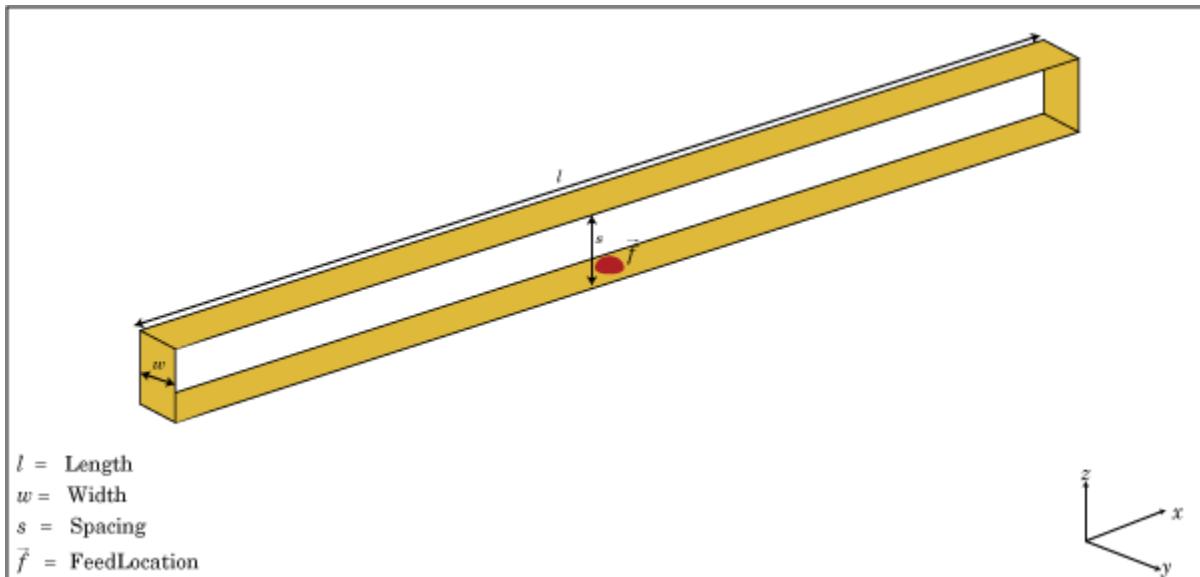

The width of the dipole is related to the diameter of an equivalent cylindrical dipole by the equation

$$w = 2d = 4r$$

, where

- $d$  is the diameter of the equivalent cylindrical pole
- $r$  is the radius of the equivalent cylindrical pole.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default folded dipole is center-fed. The feed point of the dipole coincides with the origin. The origin is located on the X-Y plane. When compared to the planar dipole, the folded dipole structure increases the input impedance of the antenna.

## Creation

## Syntax

```
dF = dipoleFolded  
dF = dipoleFolded(Name,Value)
```

## Description

`dF = dipoleFolded` creates a half-wavelength folded dipole antenna.

`dF = dipoleFolded(Name,Value)` creates a half-wavelength folded dipole antenna with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Length — Folded dipole length**

2 (default) | scalar

Folded dipole length, specified as a scalar in meters. By default, the length is chosen for an operating frequency of 70.5 MHz.

Example: 'Length', 3

Data Types: double

### **Width — Folded dipole width**

0.0040 (default) | scalar

Folded dipole width, specified as a scalar in meters.

---

**Note** Folded dipole width should be less than 'Length'/20 and greater than 'Length'./1001. [2]

---

Example: 'Width', 0.05

Data Types: double

### **Spacing — Shorting stub lengths at dipole ends**

0.0245 (default) | scalar

Shorting stub lengths at dipole ends, specified as a scalar in meters. The value must be less than Length/50.

Example: 'Spacing', 3

Data Types: double

### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

# dipoleVee

Create V-dipole antenna

## Description

The `dipoleVee` object is a planar V-dipole antenna in the X-Y plane.

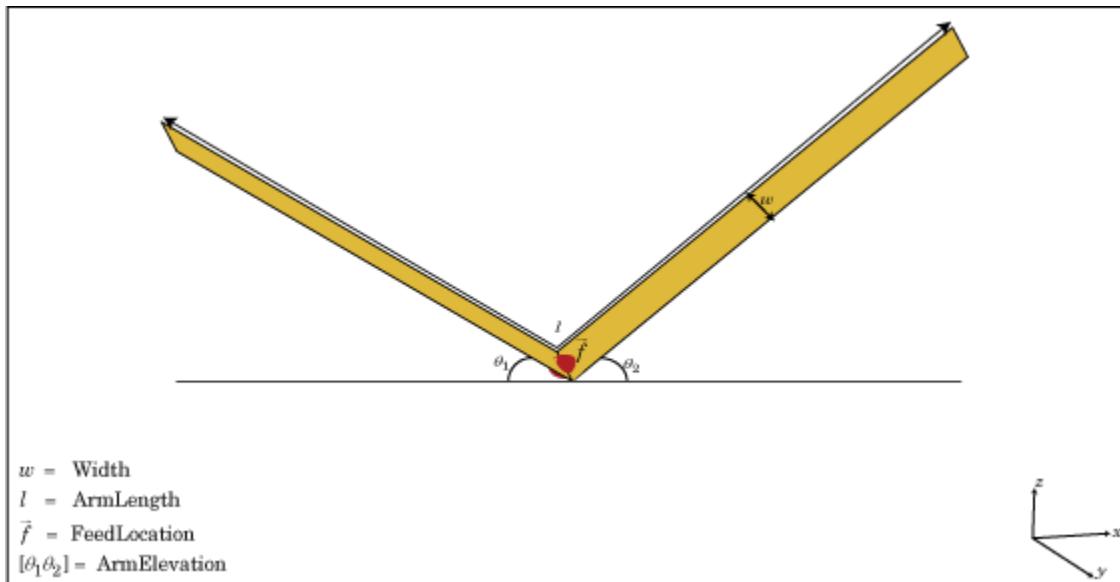

The width of the dipole is related to the circular cross-section by the equation

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical pole
- $r$  is the radius of equivalent cylindrical pole

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The V-dipole antenna is bent around the feed point. The default V-dipole is center-fed and is in the X-Y plane. The feed point of the V-dipole antenna coincides with the origin.

## Creation

### Syntax

```
dv = dipoleVee  
dv = dipoleVee(Name,Value)
```

### Description

`dv = dipoleVee` creates a half-wavelength V-dipole antenna.

`dv = dipoleVee(Name,Value)` creates a half-wavelength V-dipole antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **ArmLength — Length of two arms**

[1 1] (default) | two-element vector

Length of two arms, specified as a two-element vector in meters. By default, the arm lengths are chosen for an operating frequency of 75 MHz.

Example: '`ArmLength`', [1, 3]

Data Types: `double`

### **Width — V-dipole arm width**

0.1000 (default) | scalar

V-dipole arm width, specified as a scalar in meters.

---

**Note** Dipole width should be less than `Total Arm Length/5` and greater than `Total Arm Length/1001`. [2]

---

Example: 'Width', 0.05

Data Types: double

#### **ArmElevation — Angle made by two arms about X-Y plane**

[45 45] (default) | two-element vector

Angle made by two arms about X-Y plane, specified as a two-element vector in degrees.

Example: 'ArmElevation', [55 35]

Data Types: double

#### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.

- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

## dipoleMeander

Create meander dipole antenna

### Description

The `dipoleMeander` class creates a meander dipole antenna with four dipoles. The antenna is center fed and it is symmetric about its origin. The first resonance of meander dipole antenna is at 200 MHz.

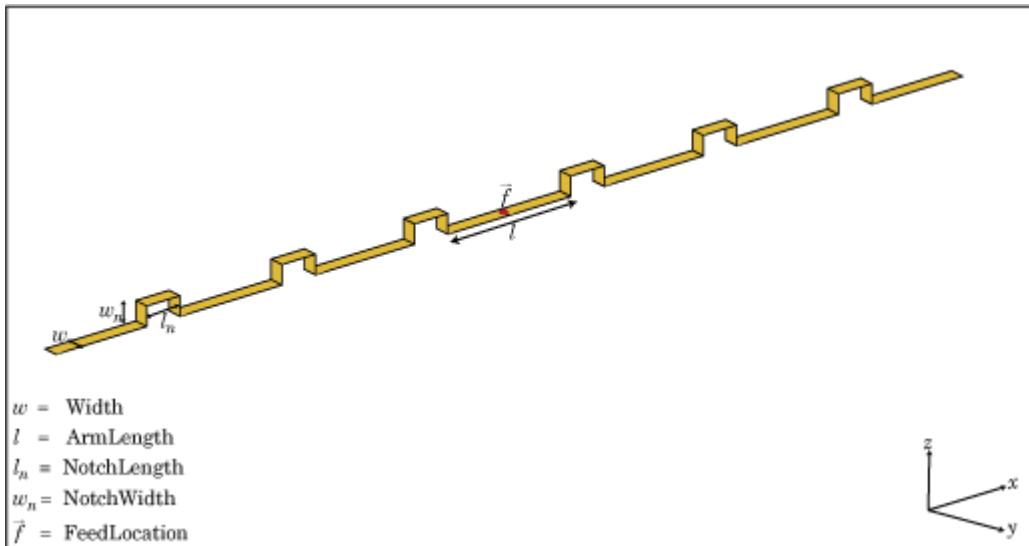

The width of the dipole is related to the diameter of an equivalent cylindrical dipole by the equation

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical dipole.
- $r$  is the radius of equivalent cylindrical dipole.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default strip dipole is center-fed. The feed point coincides with the origin. The origin is located on the X-Y plane.

## Creation

### Syntax

```
dm = dipoleMeander
dm = dipoleMeander(Name,Value)
```

### Description

`dm = dipoleMeander` creates a meander dipole antenna with four dipoles.

`dm = dipoleMeander(Name,Value)` creates a meander dipole antenna with four dipoles, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Width — Dipole width**

0.0040 (default) | scalar

Dipole width, specified as a scalar in meters.

Example: 'Width', 0.05

Data Types: double

### **ArmLength — Length of individual dipole arms**

[0.0880 0.0710 0.0730 0.0650] (default) | vector

Length of individual dipole arms, specified as a vector in meters. The total number of dipole arms generated is :

$$2 * N - 1$$

where  $N$  is the number of specified arm lengths.

Example: 'ArmLength', [0.6000 0.5000 1 0.4000]

Data Types: double

### **NotchLength — Notch length along length of antenna**

0.0238 (default) | scalar

Notch length along the length of the antenna, specified as a scalar in meters.

For example, in a dipole meander antenna with seven stacked arms there are six notches.

Example: 'NotchLength', 1

Data Types: double

### **NotchWidth — Notch width perpendicular to length of antenna**

0.0238 (default) | scalar

Notch width perpendicular to the length of the antenna, specified as a scalar in meters.

Example: 'NotchWidth', 1

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

### Create and View Meander Dipole Antenna

Create and view the default meander dipole antenna.

```
dm = dipoleMeander  
dm =  
    dipoleMeander with properties:  
  
        Width: 0.0040  
        ArmLength: [0.0880 0.0710 0.0730 0.0650]  
        NotchLength: 0.0238  
        NotchWidth: 0.0170  
        Tilt: 0  
        TiltAxis: [1 0 0]  
        Load: [1x1 lumpedElement]
```

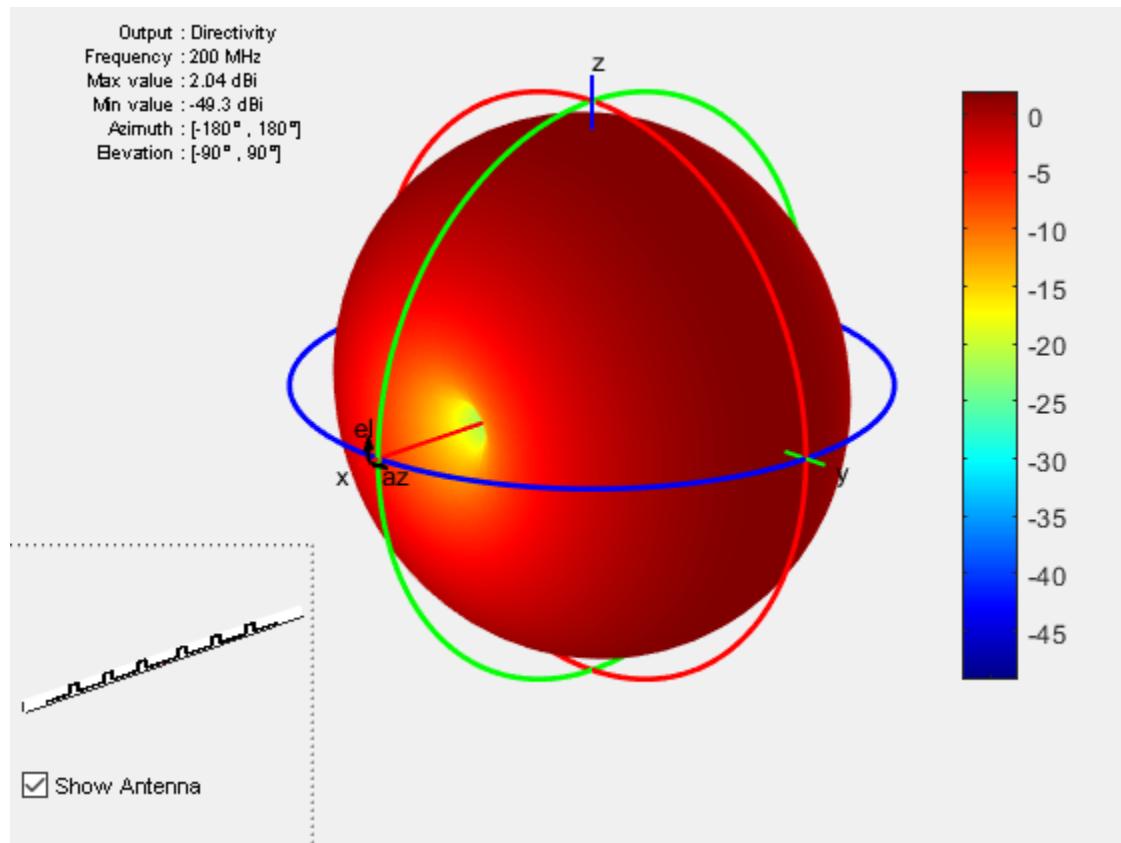

```
show(dm)
```

### Plot Radiation Pattern Of Meander Dipole Antenna

Plot the radiation pattern of meander dipole antenna at a 200MHz frequency.

```
dm = dipoleMeander;
pattern(dm,200e6)
```

## dipoleBlade

Create blade dipole antenna

### Description

The `dipoleBlade` object is a wideband blade dipole antenna oriented along the X-Y plane.

The width of the dipole is related to the circular cross-section by the equation,

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical pole
- $r$  is the radius of equivalent cylindrical pole

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width.

## Creation

### Syntax

```
db = dipoleBlade  
db = dipoleBlade(Name,Value)
```

### Description

`db = dipoleBlade` creates a wideband blade dipole antenna on the X-Y plane.

`db = dipoleBlade(Name,Value)` creates a wideband blade dipole antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### Length — Blade dipole length

0.1170 (default) | scalar

Blade dipole length, specified as a scalar in meters.

Example: `'Length', 0.5`

Data Types: `double`

**Width — Blade dipole width**

0.1400 (default) | scalar

Blade dipole width, specified as a scalar in meters.

Example: 'Width', 0.2

Data Types: double

**TaperLength — Taper length**

0.1120 (default) | scalar

Taper length, specified as a scalar in meters.

Example: 'TaperLength', 0.500

Data Types: double

**FeedWidth — Blade dipole feed width**

0.0030 (default) | scalar

Blade dipole feed width, specified as a scalar in meters.

Example: 'FeedWidth', 0.006

Data Types: double

**FeedGap — Blade dipole feed length or distance between the two wings of the dipole**

0.0030 (default) | scalar

Blade dipole feed length or distance between the two wings of the dipole, specified as a scalar in meters.

Example: 'FeedGap', 0.006

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency

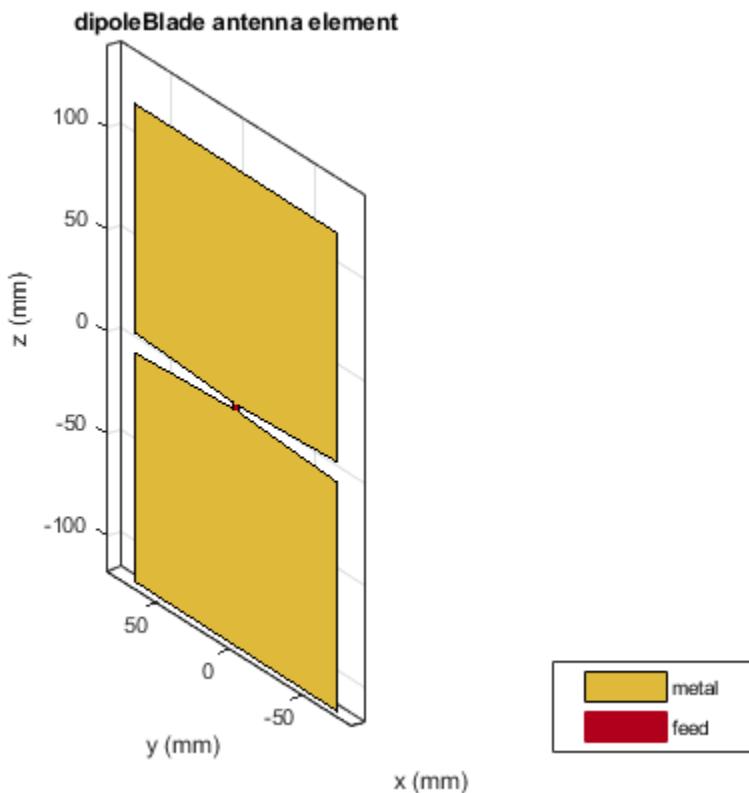

EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Default Blade Dipole and Radiation Pattern

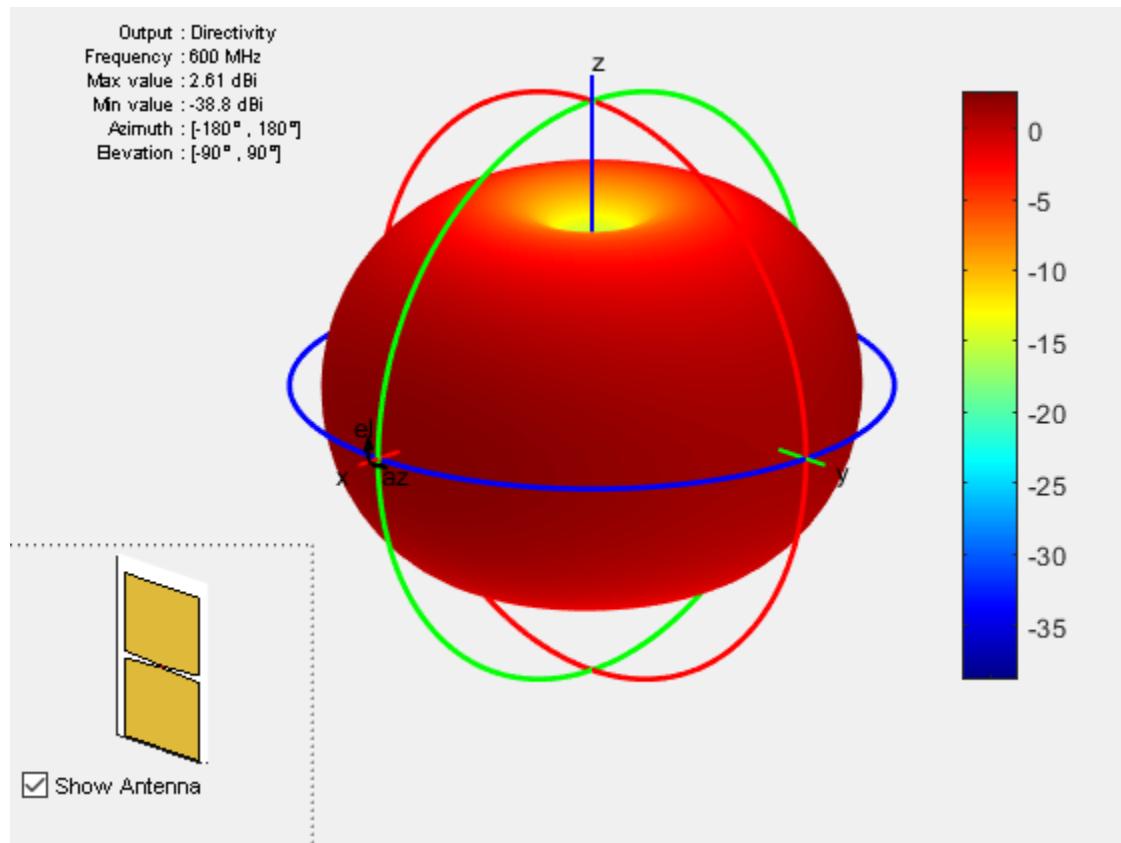

Create and view a default blade dipole.

```
db = dipoleBlade  
  
db =  
dipoleBlade with properties:  
  
    Length: 0.1170  
    TaperLength: 0.1120  
        Width: 0.1400  
    FeedWidth: 0.0030  
      FeedGap: 0.0030  
        Tilt: 0  
    TiltAxis: [1 0 0]  
        Load: [1x1 lumpedElement]  
  
show(db);
```

Plot the radiation pattern of the blade dipole at 600 MHz.

pattern(db, 600e6)

## dipoleCycloid

Create cycloid dipole antenna

### Description

The `dipoleCycloid` object is a half-wavelength cycloid dipole antenna. For the default cycloid dipole, the feed point is on the loop section. The default length is for an operating frequency of 48 MHz.

The width of the dipole is related to the circular cross-section by the equation

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical pole
- $r$  is the radius of equivalent cylindrical pole

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width.

## Creation

### Syntax

```
dc = dipoleCycloid
dc = dipoleCycloid(Name,Value)
```

### Description

`dc = dipoleCycloid` creates a half-wavelength cycloid dipole antenna oriented along Z-axis.

`dc = dipoleCycloid(Name,Value)` creates a half-wavelength cycloid dipole antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### Length — Dipole length along z-axis

1.2200 (default) | scalar

Dipole length along z-axis, specified as a scalar in meters. By default, the length is for an operating frequency of 48 MHz.

Example: 'Length', 0.9

Data Types: double

**Width — Dipole width**

0.0508 (default) | scalar

Dipole width, specified as a scalar in meters.

Example: 'Width', 0.09

Data Types: double

**LoopRadius — Circular loop radius in X-Y plane**

0.3100 (default) | scalar

Circular loop radius in X-Y plane, specified as a scalar in meters.

Example: 'LoopRadius', 0.500

Data Types: double

**Gap — Gap of loop in X-Y plane**

0.0400 (default) | scalar

Gap of loop in X-Y plane, specified as a scalar in meters.

Example: 'Gap', 0.006

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as the comma-separated pair consisting of 'Load' and a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

## Examples

### Default Cycloid Dipole

Create a default cycloid dipole antenna using the `dipoleCycloid` object and view it.

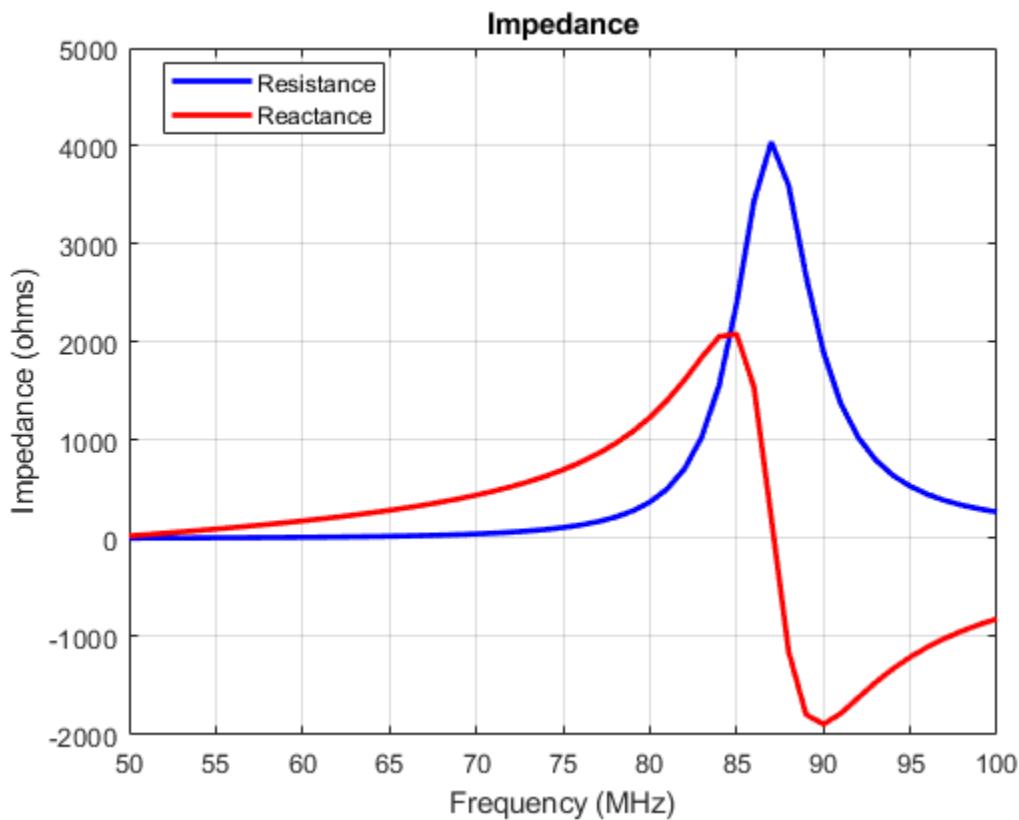

```
dc = dipoleCycloid  
  
dc =  
    dipoleCycloid with properties:  
  
        Length: 1.2200  
        Width: 0.0508  
        LoopRadius: 0.3100  
        Gap: 0.0400  
        Tilt: 0  
        TiltAxis: [1 0 0]  
        Load: [1x1 lumpedElement]  
  
show(dc)
```

### Impedance of Cycloid Dipole

Calculate the impedance of a cycloid dipole of width, 0.05 m, over a frequency span of 50 MHz - 100 MHz.

```
d = dipoleCycloid('Width',0.05);
impedance(d,linspace(50e6,100e6,51))
```

### Radiation Pattern of Cycloid Dipole

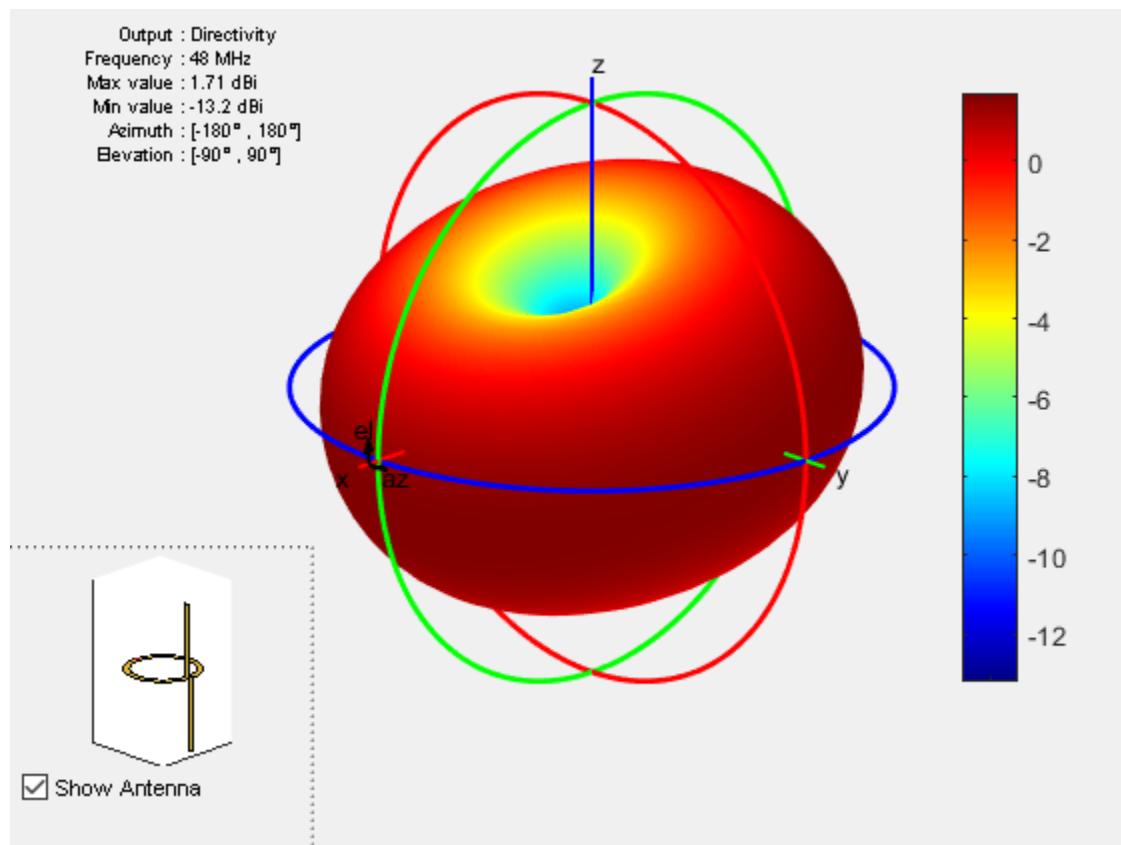

Plot the radiation pattern of a cycloid dipole of width, 0.05 m, at a frequency of 48 MHz.

```
d = dipoleCycloid('Width', 0.05)
pattern(d, 48e6)
```

```
d =
```

```
dipoleCycloid with properties:
```

```
Length: 1.2200
Width: 0.0500
LoopRadius: 0.3100
Gap: 0.0400
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

# dipoleHelix

Create helical dipole antenna

## Description

The `dipoleHelix` object is a helical dipole antenna. The antenna is typically center fed. You can move the feed along the antenna length using the feed offset property. Helical dipoles are used in satellite communications and wireless power transfers.

The width of the strip is related to the diameter of an equivalent cylinder by this equation

$$w = 2d = 4r$$

where:

- $w$  is the width of the strip.
- $d$  is the diameter of an equivalent cylinder.
- $r$  is the radius of an equivalent cylinder.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default helical dipole antenna is center-fed. The circular ground plane is on the X-Y plane. Commonly, helical dipole antennas are used in axial mode. In this mode, the helical dipole circumference is comparable to the operating wavelength, and has maximum directivity along its axis. In normal mode, the helical dipole radius is small compared to the operating wavelength. In this mode, the helical dipole radiates broadside, that is, in the plane perpendicular to its axis. The basic equation for the helical dipole antenna is:

$$x = r \cos(\theta)$$

$$y = r \sin(\theta)$$

$$z = S\theta$$

where:

- $r$  is the radius of the helical dipole.

- $\theta$  is the winding angle.
- $S$  is the spacing between turns.

For a given pitch angle in degrees, use the `helixpitch2spacing` utility function to calculate the spacing between the turns in meters.

## Creation

### Syntax

```
dh = dipoleHelix  
dh = dipoleHelix(Name,Value)
```

### Description

`dh = dipoleHelix` creates a helical dipole antenna. The default antenna operates around 2 GHz.

`dh = dipoleHelix(Name,Value)` creates a helical dipole antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Radius — Turn radius**

0.0220 (default) | scalar

Turn radius, specified as a scalar in meters.

Example: `'Radius', 2`

Data Types: double

### **Width — Strip width**

1.0000e-03 (default) | scalar

Strip width, specified as a scalar in meters.

---

**Note** Strip width should be less than `'Radius'/5` and greater than `'Radius'/250`. [4]

---

Example: `'Width', 5`

Data Types: double

**Turns — Number of turns of helical dipole**

3 (default) | scalar

Number of turns of the helical dipole, specified a scalar.

Example: 'Turns', 2

Data Types: double

**Spacing — Spacing between turns**

0.0350 (default) | scalar

Spacing between turns, specified as a scalar in meters.

Example: 'Spacing', 1.5

Data Types: double

**WindingDirection — Direction of helical dipole turns (windings)**

'CCW' (default) | 'CW'

Direction of helical dipole turns (wingdings), specified as 'CW' or 'CCW'.

Example: 'WindingDirection','CW'

Data Types: string

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**FeedOffset — Signed distance of feedpoint from origin**

0 (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector in meters. Use this property to adjust the location of the feedpoint relative to the ground plane and patch.

Example: 'FeedOffset', [0.01 0.01]

Data Types: double

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## **Object Functions**

show	Display antenna or array structure; Display shape as filled patch

## Examples

### Helical Dipole Antenna

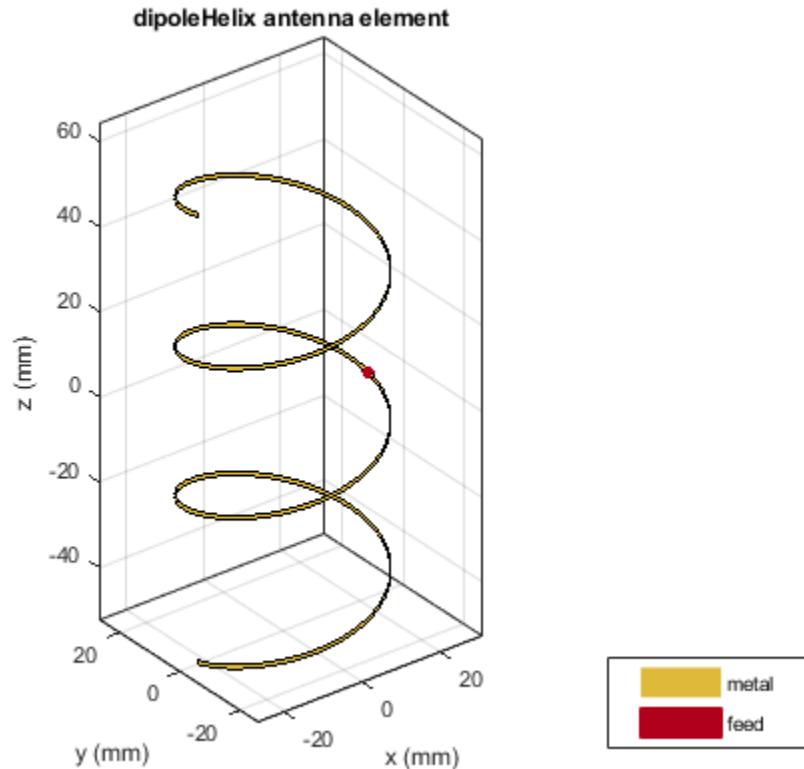

Create a default helical dipole antenna and view it.

```
dh = dipoleHelix

dh =
    dipoleHelix with properties:

    Radius: 0.0220
    Width: 1.0000e-03
    Turns: 3
    Spacing: 0.0350
    WindingDirection: 'CCW'
    FeedOffset: 0
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]

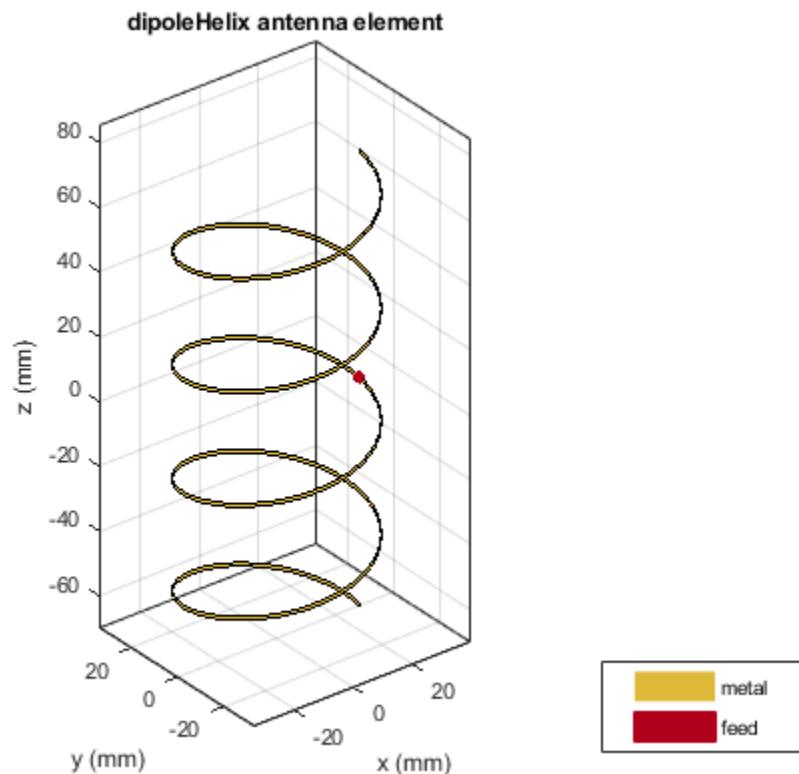

show(dh)
```

### Radiation Pattern of Helical Dipole

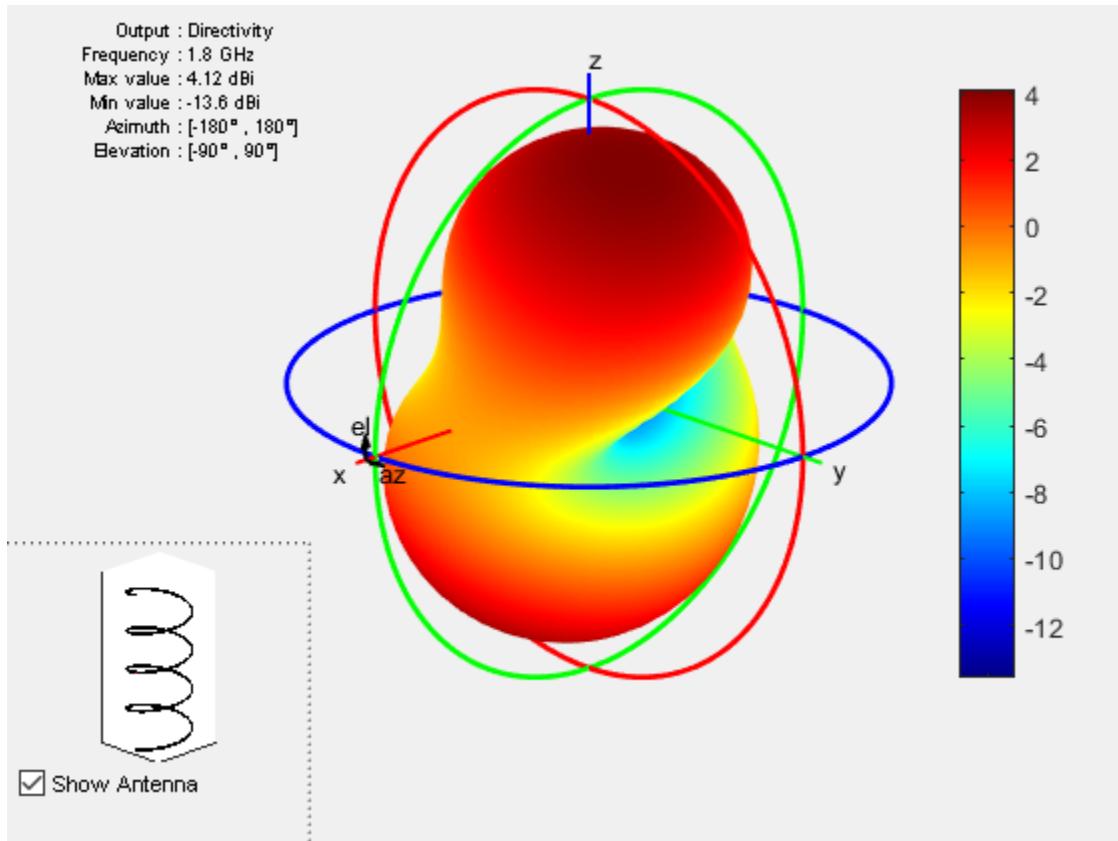

Create a four-turn helical dipole antenna with a turn radius of 28 mm and a strip width of 1.2 mm.

```
dh = dipoleHelix('Radius',28e-3,'Width',1.2e-3,'Turns',4);  
show(dh)
```

Plot the radiation pattern of the helical dipole at 1.8 GHz.

```
pattern(dh, 1.8e9);
```

# helix

Create helix antenna on ground plane

## Description

The `helix` object is a helix antenna on a circular ground plane. The helix antenna is a common choice in satellite communication.

The width of the strip is related to the diameter of an equivalent cylinder by the equation  $w = 2d = 4r$

where:

- $w$  is the width of the strip.
- $d$  is the diameter of an equivalent cylinder.
- $r$  is the radius of an equivalent cylinder.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default helix antenna is end-fed. The circular ground plane is on the X-Y plane. Commonly, helix antennas are used in axial mode. In this mode, the helix circumference is comparable to the operating wavelength and the helix has maximum directivity along its axis. In normal mode, helix radius is small compared to the operating wavelength. In this mode, the helix radiates broadside, that is, in the plane perpendicular to its axis. The basic equation for the helix is

$$x = r \cos(\theta)$$

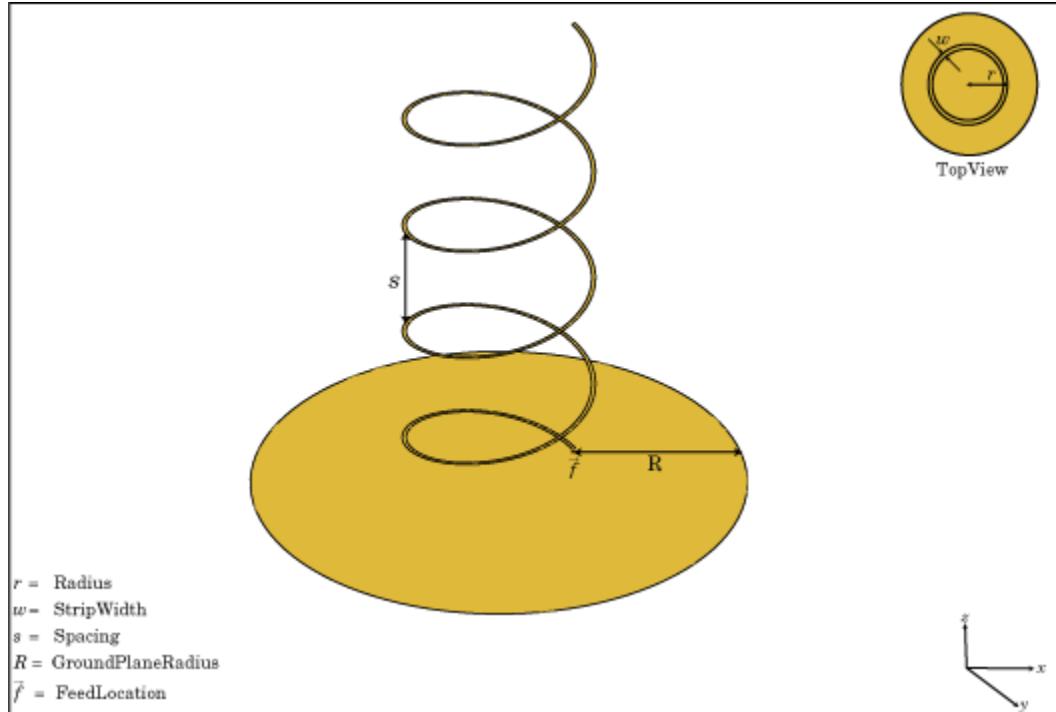

$$y = r \sin(\theta)$$

$$z = S\theta$$

where

- $r$  is the radius of the helix.
- $\theta$  is the winding angle.
- $S$  is the spacing between turns.

For a given pitch angle in degrees, use the `helixpitch2spacing` utility function to calculate the spacing between the turns in meters.

## Creation

## Syntax

```
hx = helix  
hx = helix(Name,Value)
```

## Description

`hx = helix` creates a helix antenna operating in axial mode. The default antenna operates around 2 GHz.

---

`hx = helix(Name,Value)` creates a helix antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Radius — Turn radius**

0.0220 (default) | scalar

Turn radius, specified as a scalar in meters.

Example: `'Radius', 2`

Data Types: `double`

### **Width — Strip width**

1.0000e-03 (default) | scalar

Strip width, specified as a scalar in meters.

---

**Note** Strip width should be less than `'Radius'/5` and greater than `'Radius'/250`. [4]

---

Example: `'Width', 5`

Data Types: `double`

### **Turns — Number of turns of helix**

3 (default) | scalar

Number of turns of the helix, specified as a scalar.

Example: `'Turns', 2`

Data Types: `double`

### **Spacing — Spacing between turns**

0.0350 (default) | scalar

Spacing between turns, specified as a scalar in meters.

Example: 'Spacing', 1.5

Data Types: double

**WindingDirection — Direction of helix turns (windings)**

CW | CCW

Direction of helix turns (wingdings), specified as CW or CCW.

Example: 'WindingDirection', CW

Data Types: char

**GroundPlaneRadius — Ground plane radius**

0.0750 (default) | scalar in meters

Ground plane radius, specified as a scalar in meters. By default, the ground plane is on the X-Y plane and is symmetrical about the origin.

Example: 'GroundPlaneRadius', 2.05

Data Types: double

**FeedStubHeight — Feeding stub height from ground**

1.0000e-03 (default) | scalar

Feeding stub height from ground, specified as a scalar in meters. B

Example: 'FeedStubHeight', 2.000e-03

---

**Note** The default value is chosen to allow backward compatibility.

---

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. You can add a load anywhere on the surface of the antenna. By default, it is at the origin. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

Example: `hx.Load = lumpedElement('Impedance', 75)`

Data Types: double

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector in degrees.

Example: `'Tilt', 90`

Example: `hx.Tilt = [90 90 0]`

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points space.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: `'TiltAxis',[0 1 0]`

Example: `'TiltAxis',[0 0 0;0 1 0]`

Example: `hx.TiltAxis = Z`

Data Types: double

## **Object Functions**

## Examples

### Create and View Helix Antenna

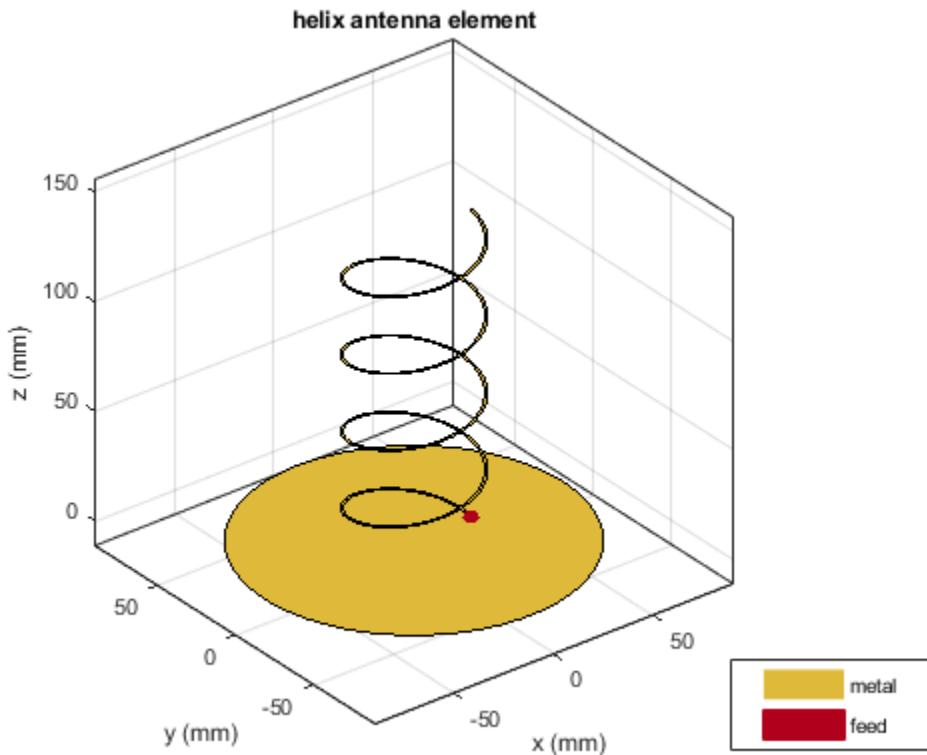

Create and view a helix antenna that has 28 mm turn radius, 1.2 mm strip width, and 4 turns.

```
hx = helix('Radius',28e-3,'Width',1.2e-3,'Turns',4)

hx =
    helix with properties:

        Radius: 0.0280
        Width: 0.0012
        Turns: 4
        Spacing: 0.0350
        WindingDirection: 'CCW'
        FeedStubHeight: 1.0000e-03
        GroundPlaneRadius: 0.0750
        Tilt: 0
        TiltAxis: [1 0 0]
        Load: [1x1 lumpedElement]

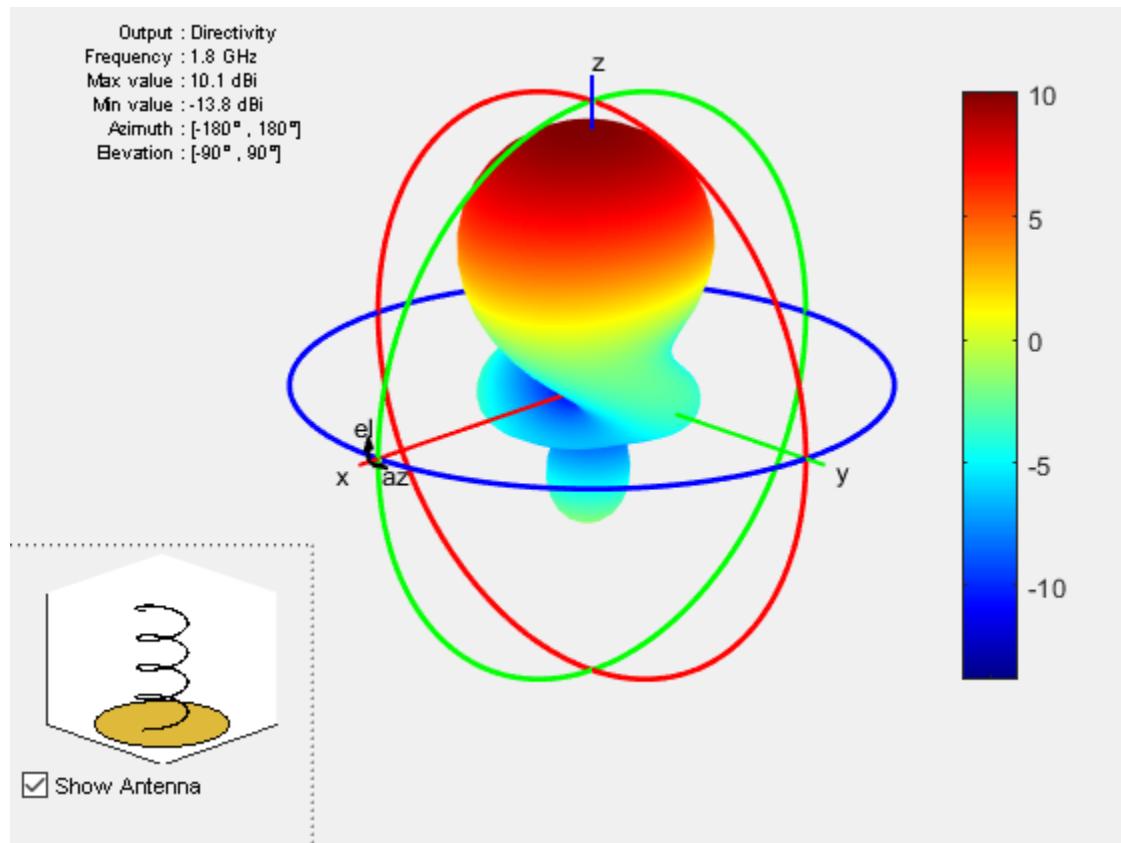

show(hx)
```

### Radiation Pattern of Helix Antenna

Plot the radiation pattern of a helix antenna at a frequency of 1 GHz.

```
hx = helix('Radius',28e-3,'Width',1.2e-3,'Turns',4);  
pattern(hx,1.8e9);
```

### Calculate Spacing of Helix Antenna with Varying Radius

Calculate spacing of a helix that has a pitch of 12 degrees and a radius that varies from 20 mm to 22 mm in steps of 0.5 mm.

```
s = helixpitch2spacing(12,20e-3:0.5e-3:22e-3)  
s =  
0.0267    0.0274    0.0280    0.0287    0.0294
```

## Introduced in R2015a

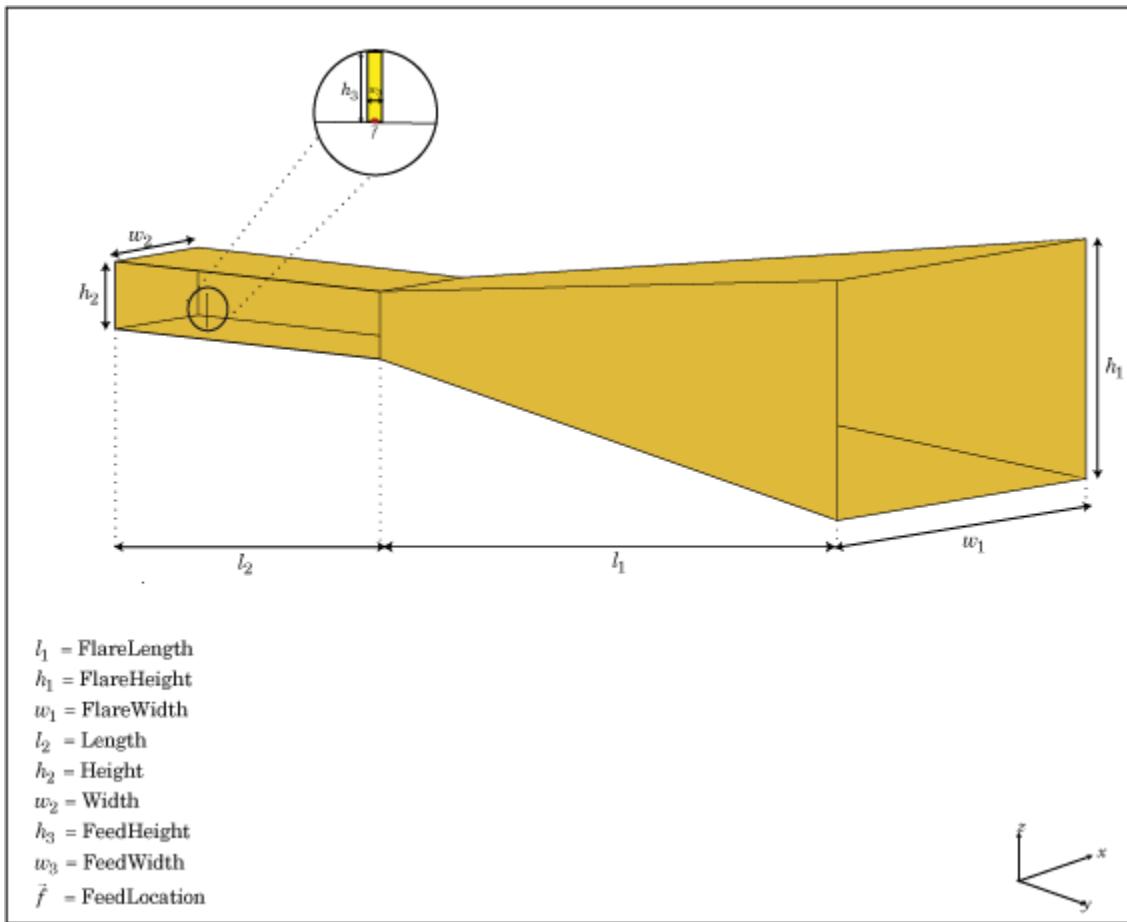

## horn

Create horn antenna

### Description

The `horn` object is a pyramidal horn antenna with a standard-gain, 15 dBi. The default horn antenna operates in the X-Ku band, which ranges from 10 GHz to 15 GHz. By default, the horn antenna feed is a WR-75 rectangular waveguide with an operating frequency at 7.87 GHz.

For a given flare angles of the horn and dimensions of the waveguide, use the `hornangle2size` utility function to calculate the equivalent flare width and flare height of the horn.

## Creation

### Syntax

```
hr = horn  
hr = horn(Name,Value)
```

## Description

`hr = horn` creates a standard-gain pyramidal horn antenna.

`hr = horn(Name,Value)` creates a horn antenna with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. Properties not specified retain their default values.

## Properties

### **FlareLength — Flare length of horn**

0.1020 (default) | scalar

Flare length of horn, specified as a scalar in meters.

Example: '`FlareLength`', 0.35

Data Types: double

### **FlareWidth — Flare width of horn**

0.0571 (default) | scalar

Flare width of horn, specified as a scalar in meters.

Example: '`FlareWidth`', 0.2

Data Types: double

### **FlareHeight — Flare height of horn**

0.0338 (default) | scalar

Flare height of horn, specified as a scalar in meters.

Example: '`FlareHeight`', 0.15

Data Types: double

### **Length — Rectangular waveguide length**

0.0500 (default) | scalar

Rectangular waveguide length, specified as a scalar in meters.

Example: 'Length', 0.09

Data Types: double

**Width — Rectangular waveguide width**

0.0190 (default) | scalar

Rectangular waveguide width, specified as a scalar in meters.

Example: 'Width', 0.05

Data Types: double

**Height — Rectangular waveguide height**

0.0095 (default) | scalar

Rectangular waveguide height, specified as a scalar in meters.

Example: 'Height', 0.0200

Data Types: double

**FeedHeight — Height of feed**

0.0048 (default) | scalar

Height of feed, specified as a scalar in meters.

Example: 'FeedHeight', 0.0050

Data Types: double

**FeedWidth — Width of feed**

1.0000e-04 (default) | scalar

Width of feed, specified as a scalar in meters.

Example: 'FeedWidth', 5e-05

Data Types: double

**FeedOffset — Signed offset of feedpoint from center of ground plane**

[-0.0155 0] (default) | two-element vector

Signed offset from center of ground plane, specified as a two-element vector in meters.

Example: 'FeedOffset', [-0.0070 0.01]

Data Types: double

### **Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

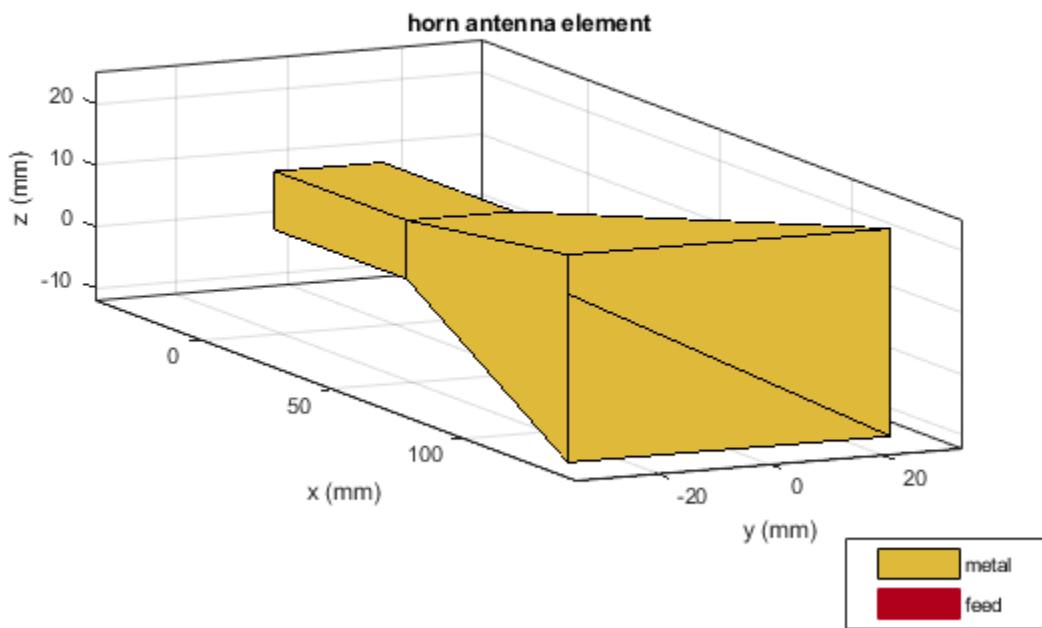

### Default Horn Antenna

Create and view a default horn antenna.

```
h = horn  
h =  
    horn with properties:  
  
        FlareLength: 0.1020  
        FlareWidth: 0.0571  
        FlareHeight: 0.0338  
        Length: 0.0500  
        Width: 0.0190  
        Height: 0.0095  
        FeedWidth: 1.0000e-04
```

```
FeedHeight: 0.0048
FeedOffset: [-0.0155 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

```
show(h)
```

## **invertedF**

Create inverted-F antenna over rectangular ground plane

### **Description**

The `invertedF` object is an inverted-F antenna mounted over a rectangular ground plane.

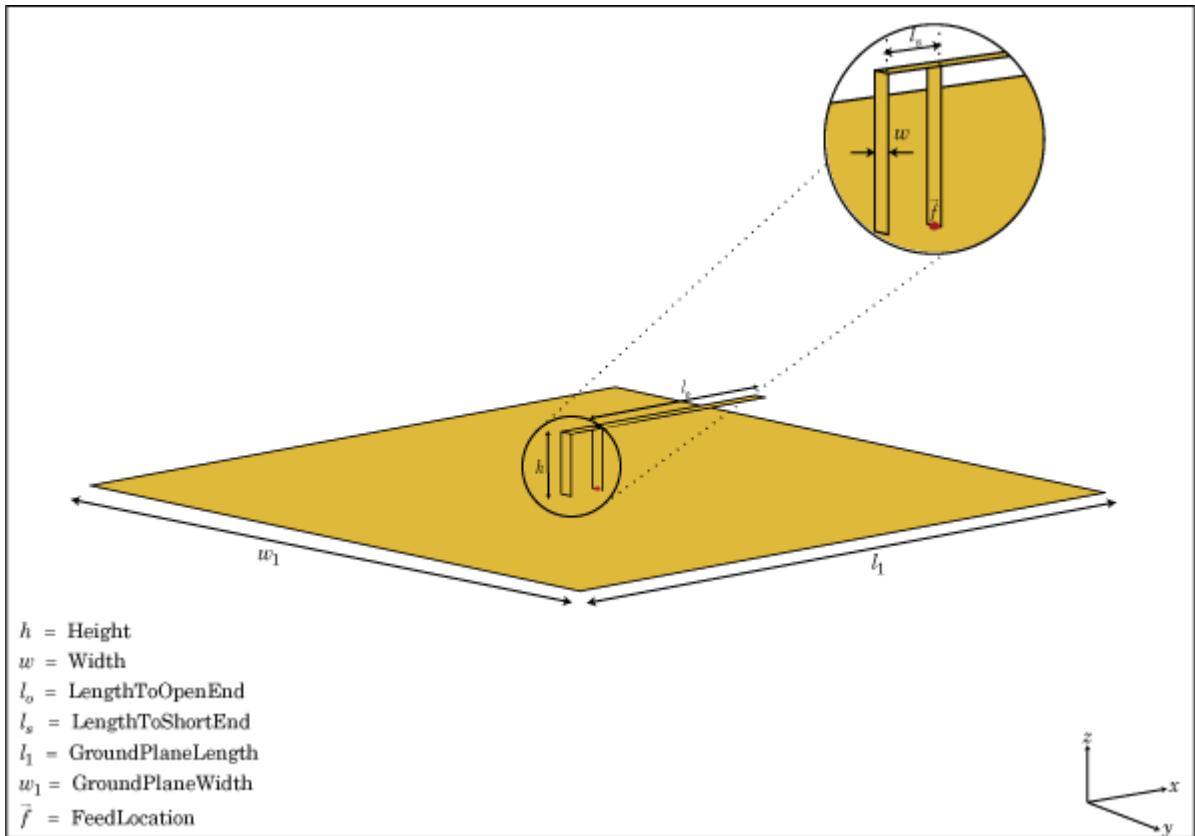

The width of the metal strip is related to the diameter of an equivalent cylinder by the equation

$$w = 2d = 4r$$

where:

- $d$  is the diameter of equivalent cylinder
- $r$  is the radius of equivalent cylinder

For a given cylinder radius, use the utility function `cylinder2strip` to calculate the equivalent width. The default inverted-F antenna is center-fed. The feed point coincides with the origin. The origin is located on the X-Y plane.

## Creation

### Syntax

```
f = invertedF  
f = invertedF(Name,Value)
```

## Description

`f = invertedF` creates an inverted-F antenna mounted over a rectangular ground plane. By default, the dimensions are chosen for an operating frequency of 1.7 GHz.

`f = invertedF(Name,Value)` creates an inverted-F antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Height — Vertical element height along z-axis**

0.0140 (default) | scalar

Vertical element height along z-axis, specified as a scalar in meters.

Example: `'Height', 3`

Data Types: `double`

### **Width — Strip width**

0.0020 (default) | scalar

Strip width, specified as a scalar in meters.

---

**Note** Strip width should be less than `'Height'`/4 and greater than `'Height'`/1001. [2]

---

Example: `'Width', 0.05`

Data Types: `double`

### **LengthToOpenEnd — Stub length from feed to open end**

0.0310 (default) | scalar

Stub length from feed to open end, specified as a scalar in meters.

Example: `'LengthToOpenEnd', 0.05`

**LengthToShortEnd — Stub length from feed to shorting end**

0.0060 (default) | scalar

Stub length from feed to shorting end, specified as a scalar in meters.

Example: 'LengthToShortEnd', 0.0050

**GroundPlaneLength — Ground plane length along x-axis**

0.1000 (default) | scalar

Ground plane length along x-axis, specified as a scalar in meters. Setting 'GroundPlaneLength' to Inf, will use the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 4

Data Types: double

**GroundPlaneWidth — Ground plane width along y-axis**

0.1000 (default) | scalar

Ground plane width along y-axis, specified as a scalar in meters. Setting 'GroundPlaneWidth' to Inf, will use the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 2.5

Data Types: double

**FeedOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector.

Example: 'FeedOffset', [2 1]

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## **Object Functions**

show	Display antenna or array structure; Display shape as filled patch

patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Create and View Inverted-F Antenna

Create and view an inverted-F antenna with 14mm height over a ground plane of dimensions 200mmx200mm.

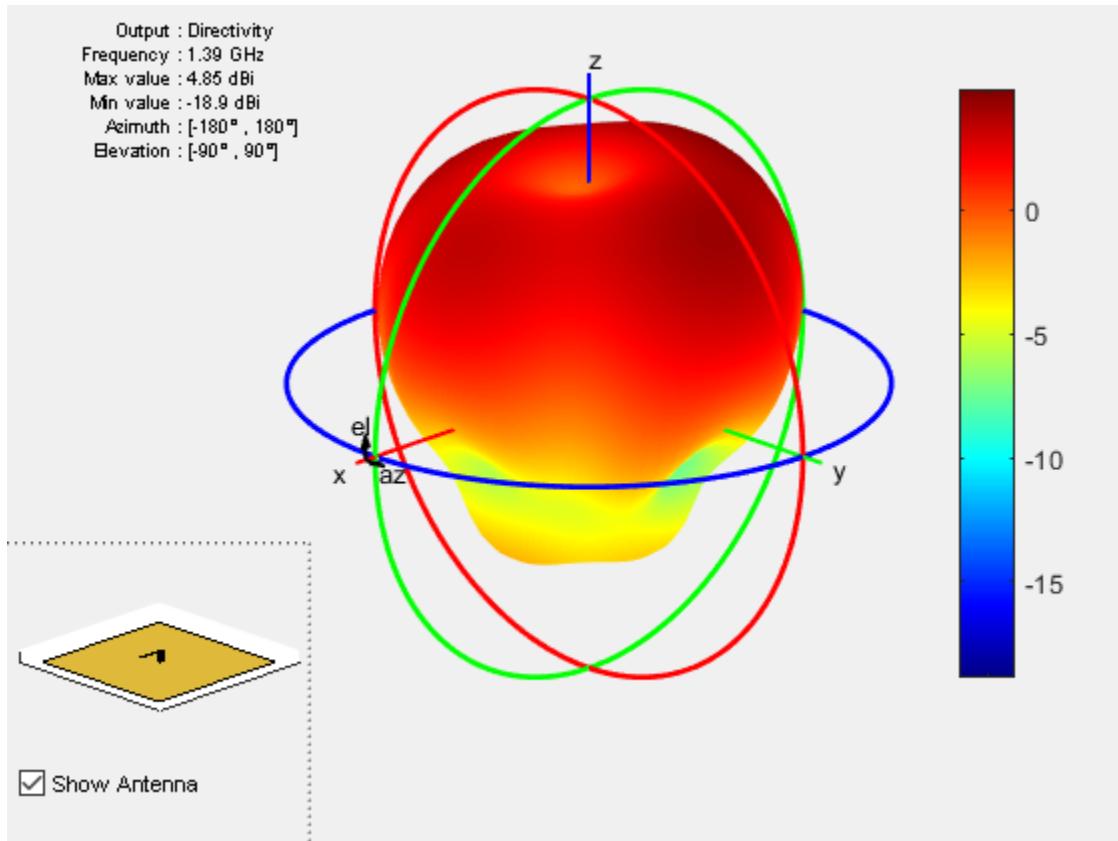

```
f = invertedF('Height',14e-3, 'GroundPlaneLength',200e-3, ...
    'GroundPlaneWidth',200e-3);
show(f)
```

### Plot Radiation Pattern of Inverted-F

This example shows you how to plot the radiation pattern of an inverted-F antenna for a frequency of 1.3GHz.

```
f = invertedF('Height',14e-3, 'GroundPlaneLength', 200e-3,  
              'GroundPlaneWidth', 200e-3);  
pattern(f,1.39e9)
```

# invertedL

Create inverted-L antenna over rectangular ground plane

## Description

The `invertedL` object is an inverted-L antenna mounted over a rectangular ground plane.

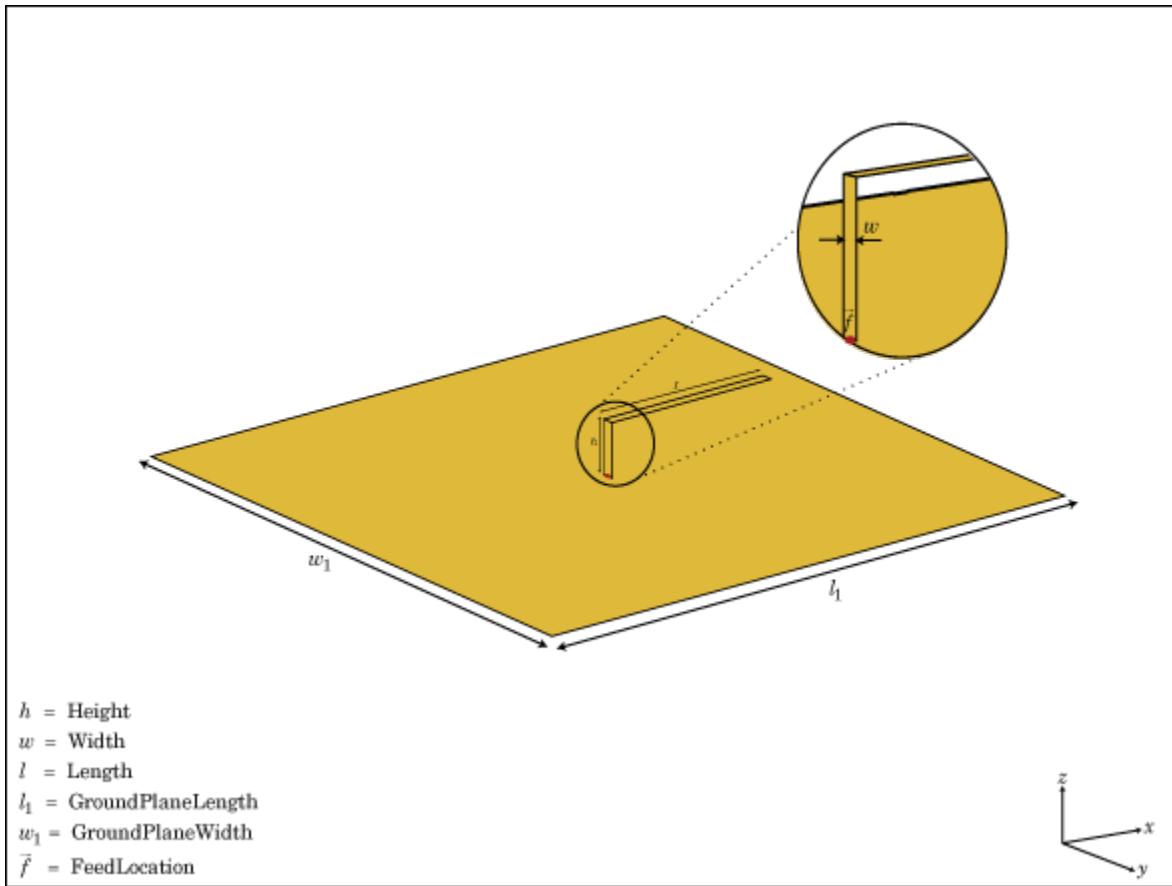

The width of the metal strip is related to the diameter of an equivalent cylinder by the equation

$$w = 2d = 4r$$

where:

- $d$  = diameter of equivalent cylinder
- $r$  = radius of equivalent cylinder

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default inverted-L antenna is center-fed. The feed point coincides with the origin. The origin is located on the X-Y plane.

## Creation

### Syntax

```
h = invertedL  
h = invertedL(Name,Value)
```

## Description

`h = invertedL` creates an inverted-L antenna mounted over a rectangular ground plane. By default, the dimensions are chosen for an operating frequency of 1.7 GHz.

`h = invertedL(Name,Value)` creates an inverted-L antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Height — Height of inverted element along z-axis**

0.0140 (default) | scalar

Height of inverted element along z-axis, specified a scalar in meters.

Example: `'Height', 3`

Data Types: `double`

### **Width — Strip width**

0.0020 (default) | scalar

Strip width, specified as a scalar in meters.

---

**Note** Strip width should be less than `'Height' / 4` and greater than `'Height' / 1001`. [2]

---

Example: `'Width', 0.05`

Data Types: `double`

### **Length — Stub length along x-axis**

0.0310 (default) | scalar

Stub length along x-axis, specified as a scalar in meters.

Example: `'Length', 0.01`

**GroundPlaneLength — Ground plane length along x-axis**

0.1000 (default) | scalar

Ground plane length along x-axis, specified a scalar in meters. Setting 'GroundPlaneLength' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 4

Data Types: double

**GroundPlaneWidth — Ground plane width along y-axis**

0.1000 (default) | scalar

Ground plane width along y-axis, specified as a scalar in meters. Setting 'GroundPlaneWidth' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 2.5

Data Types: double

**FeedOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector.

Example: 'FeedOffset', [2 1]

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

## invertedFcoplanar

Create inverted-F antenna in same plane as rectangular ground plane

### Description

The `invertedFcoplanar` object is a coplanar inverted-F antenna with a rectangular ground plane. By default, the dimensions are chosen for an operating frequency of 1.7 GHz. Coplanar inverted-F antennas are used in RFID tags and Internet of Things (IoT) applications. This antenna is an altered version of the inverted-F antenna, providing a low-profile antenna with more design parameters and a wider bandwidth.

## Creation

### Syntax

```
fco = invertedFcoplanar  
fco = invertedF(Name,Value)
```

### Description

`fco = invertedFcoplanar` creates a coplanar inverted-F antenna with the rectangular ground plane. By default, the antenna dimensions are for an operating frequency of 1.7 GHz.

`fco = invertedF(Name,Value)` creates a coplanar inverted-F antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### RadiatorArmWidth — Width of radiating arm

0.0040 (default) | scalar

Width of radiating arm, specified as the comma-separated pair consisting of '`RadiatorArmWidth`' and a scalar in meters.

Example: '`RadiatorArmWidth`', 0.05

Data Types: double

### FeederArmWidth — Width of feeding arm

1.0000e-03 (default) | scalar

Width of feeding arm, specified as a scalar in meters.

Example: '`FeederArmWidth`', 0.05

Data Types: double

**ShortingArmWidth — Width of shorting arm**

0.0040 (default) | scalar

Width of shorting arm, specified as a scalar in meters.

Example: 'ShortingArmWidth', 1

Data Types: double

**Height — Height of antenna**

0.0100 (default) | scalar

Height of antenna from ground plane, specified as a scalar in meters.

Example: 'Height', 0.0800

Data Types: double

**LengthToOpenEnd — Length of stub from feed to open end**

0.0350 (default) | scalar

Length of the stub from feed to the open-end, specified as a scalar in meters.

Example: 'LengthToOpenEnd', 0.050

Data Types: double

**LengthToShortEnd — Length of stub from feed to shorting end**

0.0100 (default) | scalar

Length of the stub from feed to the shorting end, specified as a scalar in meters.

Example: 'LengthToShortEnd', 0.035

Data Types: double

**GroundPlaneLength — Length of ground plane**

0.0800 (default) | scalar

Length of the ground plane, specified as a scalar in meters.

Example: 'GroundPlaneLength', 0.035

Data Types: double

**GroundPlaneWidth — Width of ground plane**

0.0700 (default) | scalar

Width of the ground plane, specified as a scalar in meters.

Example: 'GroundPlaneWidth', 0.035

Data Types: double

**FeedOffset — Signed distance from center of ground plane**

0 (default) | scalar

Signed distance from center of groundplane, specified as a scalar in meters.

Example: 'FeedOffset', 0.06

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Analysis Functions

# Examples

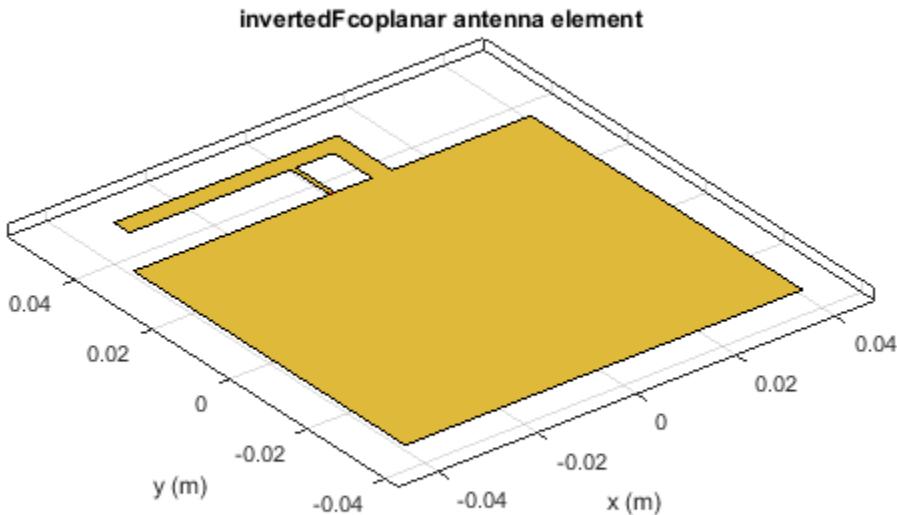

## Coplanar Inverted-F Antenna

Create a default coplanar inverted-F antenna and view it.

```
fco = invertedFcoplanar
show(fco)

fco =
invertedFcoplanar with properties:

    RadiatorArmWidth: 0.0040
        FeederArmWidth: 1.0000e-03
    ShortingArmWidth: 0.0040
        LengthToOpenEnd: 0.0350
    LengthToShortEnd: 0.0100
            Height: 0.0100
    GroundPlaneLength: 0.0800
    GroundPlaneWidth: 0.0700
        FeedOffset: 0
            Tilt: 0
    TiltAxis: [1 0 0]
        Load: [1×1 lumpedElement]
```

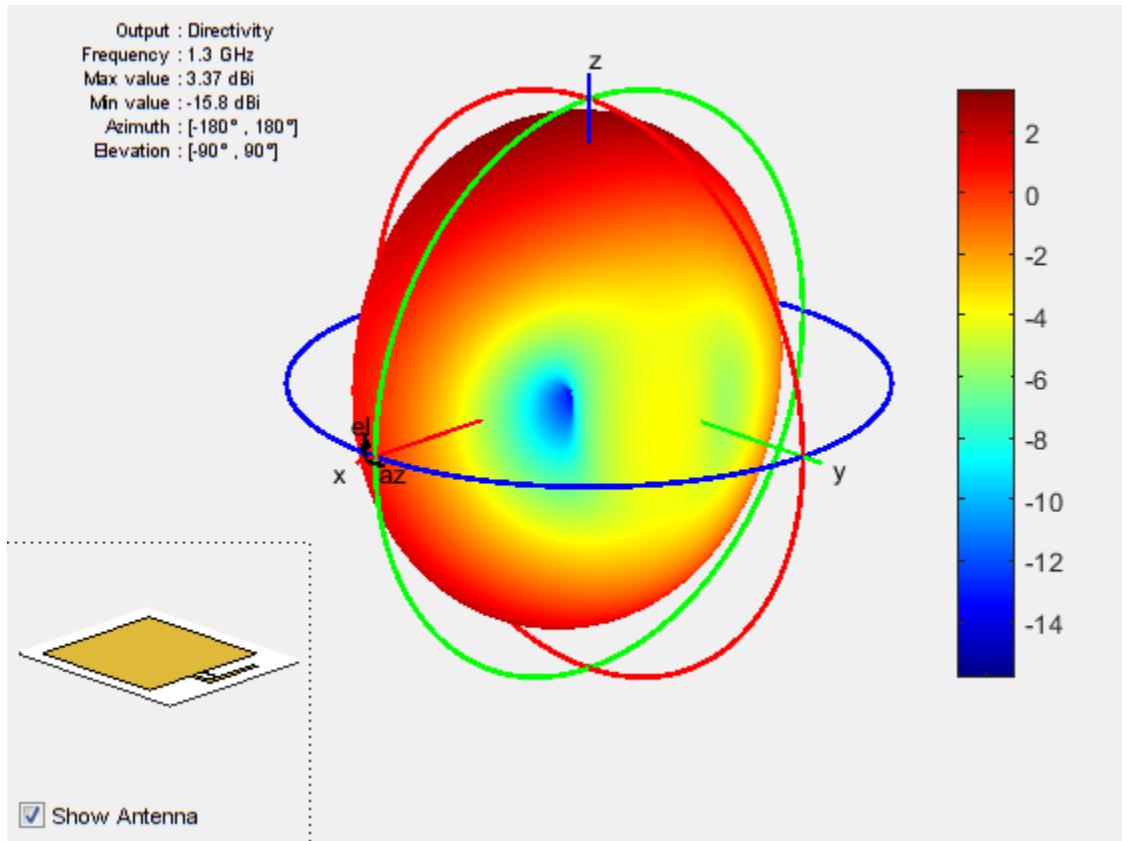

### Radiation Pattern of Coplanar Inverted-F Antenna

Create a coplanar inverted-F antenna of height 0.014 m, ground plane length 0.1 m, and ground plane width 0.1 m.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Plot the radiation pattern of the above antenna at 1.30 GHz.

```
pattern(fco,1.30e9)
```

# invertedLcoplanar

Create inverted-L antenna in same plane as rectangular ground plane

## Description

The `invertedLcoplanar` object is a coplanar inverted-L antenna with the rectangular ground plane. By default, the dimensions are chosen for an operating frequency of 1.6 GHz. This antenna is used in applications that require low-profile narrow-bandwidth antennas, such as the transmitter for a garage door opener and Internet of Things (IoT) applications.

## Creation

### Syntax

```
lco = invertedLcoplanar  
lco = invertedLcoplanar(Name,Value)
```

### Description

`lco = invertedLcoplanar` creates a coplanar inverted-L antenna with the rectangular ground plane. By default, the antenna dimensions are for an operating frequency of 1.6 GHz.

`lco = invertedLcoplanar(Name,Value)` creates a coplanar inverted-L antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **RadiatorArmWidth — Width of radiating arm**

0.0020 (default) | scalar

Width of radiating arm, specified as a scalar in meters.

Example: `'RadiatorArmWidth', 0.05`

Data Types: double

### **FeederArmWidth — Width of feeding arm**

0.0020 (default) | scalar

Width of feeding arm, specified as scalar in meters.

Example: `'FeederArmWidth', 0.05`

Data Types: double

**Height — Height of antenna**

0.0100 (default) | scalar

Height of antenna from ground plane, specified as a scalar in meters.

Example: 'Height', 0.0800

Data Types: double

**Length — Length of stub from feed to open end**

0.0350 (default) | scalar

Length of the stub from the feed to the open-end, specified as a scalar in meters.

Example: 'Length', 0.0800

Data Types: double

**GroundPlaneLength — Length of ground plane**

0.0800 (default) | scalar in meters

Length of the ground plane, specified as a scalar in meters.

Example: 'GroundPlaneLength', 0.035

Data Types: double

**GroundPlaneWidth — Width of ground plane**

0.0700 (default) | scalar

Width of the ground plane, specified as a scalar in meters.

Example: 'GroundPlaneWidth', 0.035

Data Types: double

**FeedOffset — Signed distance from center of ground plane**

0 (default) | scalar

Signed distance from center of groundplane, specified a scalar in meters.

Example: 'FeedOffset', 0.06

Data Types: double

### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
show	Display antenna or array structure; Display shape as filled patch
vswr	Voltage standing wave ratio of antenna

## Examples

### Coplanar Inverted-L Antenna

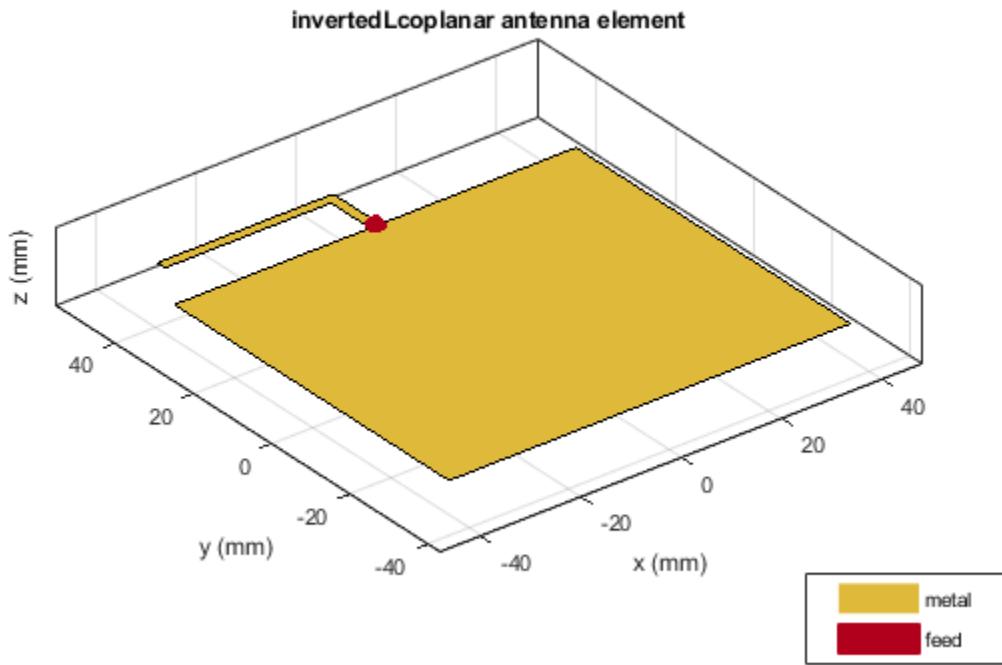

Create a default coplanar inverted-L antenna and view it.

```
lco = invertedLcoplanar

lco =
    invertedLcoplanar with properties:

    RadiatorArmWidth: 0.0020
        FeederArmWidth: 0.0020
            Length: 0.0350
                Height: 0.0100
    GroundPlaneLength: 0.0800
    GroundPlaneWidth: 0.0700
```

```
FeedOffset: 0  
Tilt: 0  
TiltAxis: [1 0 0]  
Load: [1x1 lumpedElement]  
  
show(lco)
```

### Impedance of Coplanar Inverted-L Antenna

Create a coplanar inverted-L antenna of length 0.050 m, height 0.014m, ground plane length 0.1 m, and ground plane width 0.1 m.

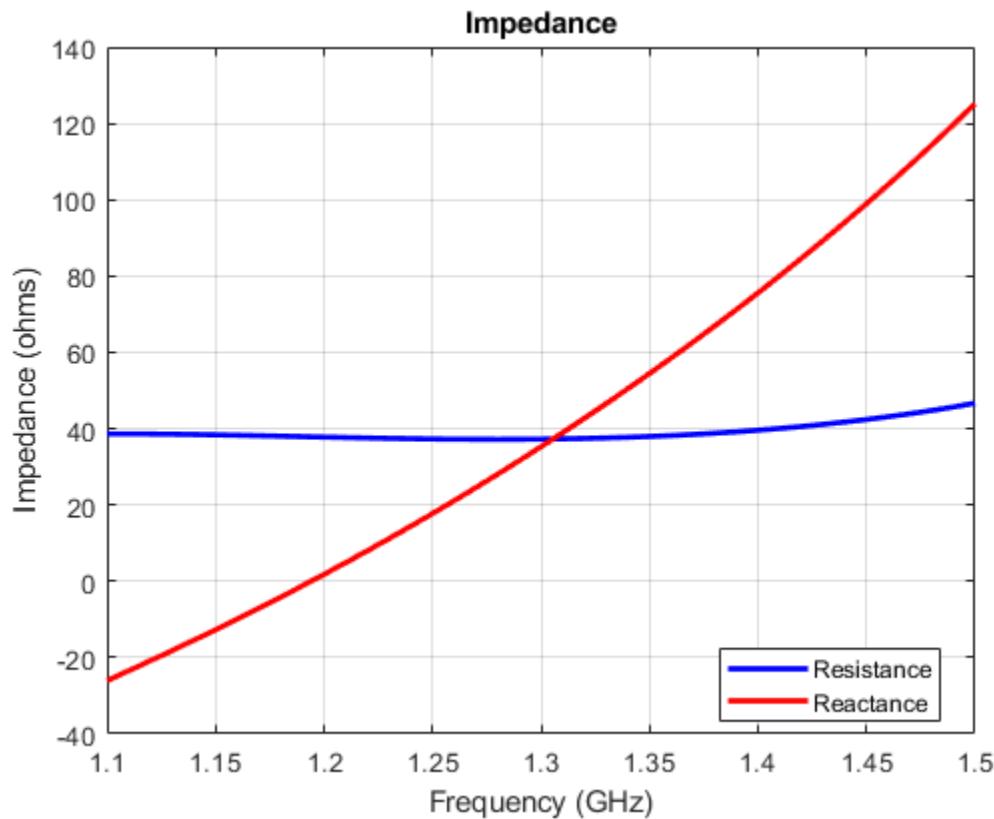

```
lco = invertedLcoplanar('Length',50e-3, 'Height',14e-3, ...
    'GroundPlaneLength',100e-3,'GroundPlaneWidth',100e-3)

lco =
    invertedLcoplanar with properties:

    RadiatorArmWidth: 0.0020
    FeederArmWidth: 0.0020
    Length: 0.0500
    Height: 0.0140
    GroundPlaneLength: 0.1000
    GroundPlaneWidth: 0.1000
    FeedOffset: 0
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]
```

Plot the impedance over 1.1 GHz to 1.5 GHz in steps of 10 MHz.

```
impedance(lco,1.1e9:10e6:1.5e9);
```

## loopCircular

Create circular loop antenna

### Description

The `loopCircular` object is a planar circular loop antenna on the X-Y plane.

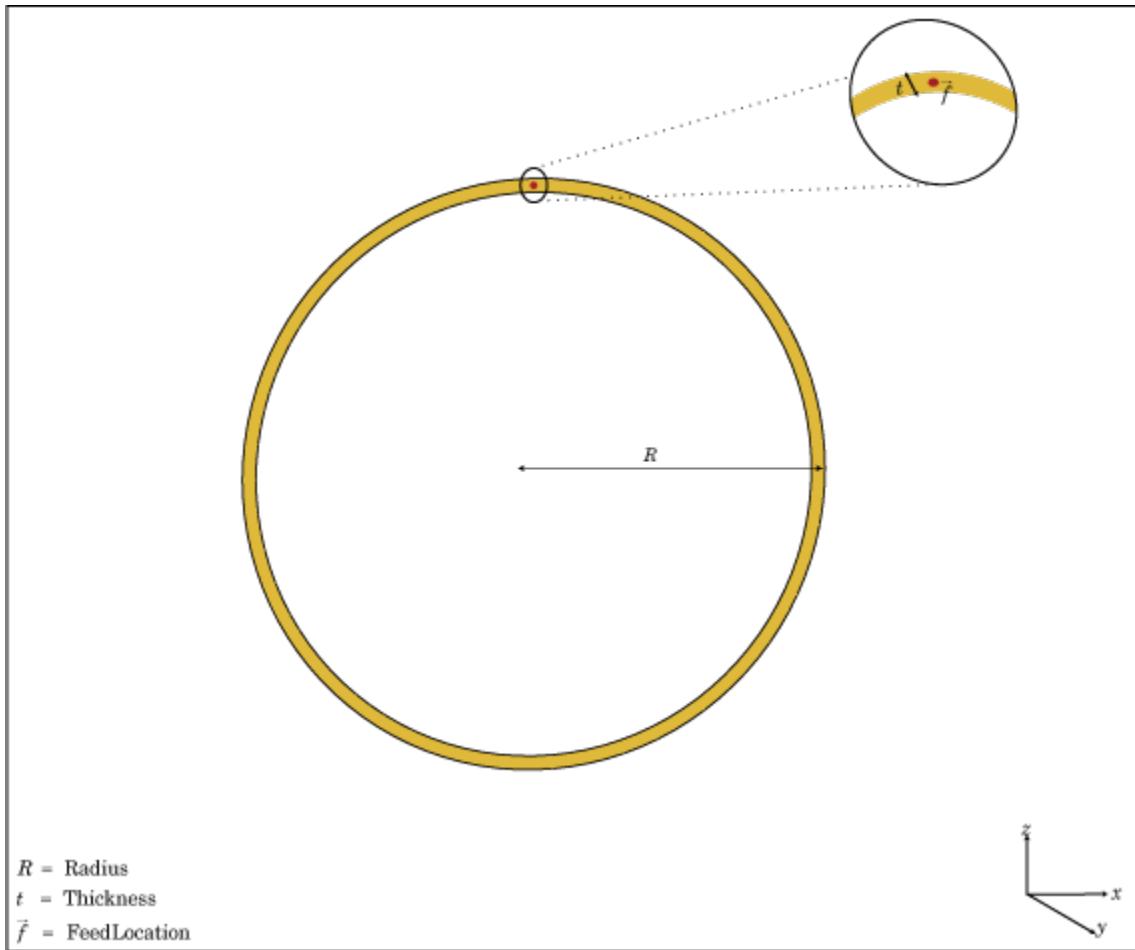

The thickness of the loop is related to the diameter of an equivalent cylinder loop by the equation

$$t = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical loop
- $r$  is the radius of equivalent cylindrical loop

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default circular loop antenna is fed at the positive X-axis. The point of the X-axis is at the midpoint of the inner and outer radii.

## Creation

### Syntax

```
h = loopCircular  
h = loopCircular(Name,Value)
```

### Description

`h = loopCircular` creates a one wavelength circular loop antenna in the X-Y plane. By default, the circumference is chosen for the operating frequency 75 MHz.

`h = loopCircular(Name,Value)` creates a one wavelength circular loop antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

### Properties

#### **Radius — Outer radius of loop**

0.6366 (default) | scalar

Outer radius of loop, specified as a scalar in meters.

Example: `'Radius', 3`

Data Types: double

#### **Thickness — Thickness of loop**

0.0200 (default) | scalar

Thickness of loop, specified as a scalar in meters.

Example: `'Thickness', 2`

Data Types: double

#### **Load — Lumped elements**

`[1x1 lumpedElement]` (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: `'Load', lumpedelement`. `lumpedelement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## **Object Functions**

## loopRectangular

Create rectangular loop antenna

### Description

The `loopRectangular` object is a rectangular loop antenna on the X-Y plane.

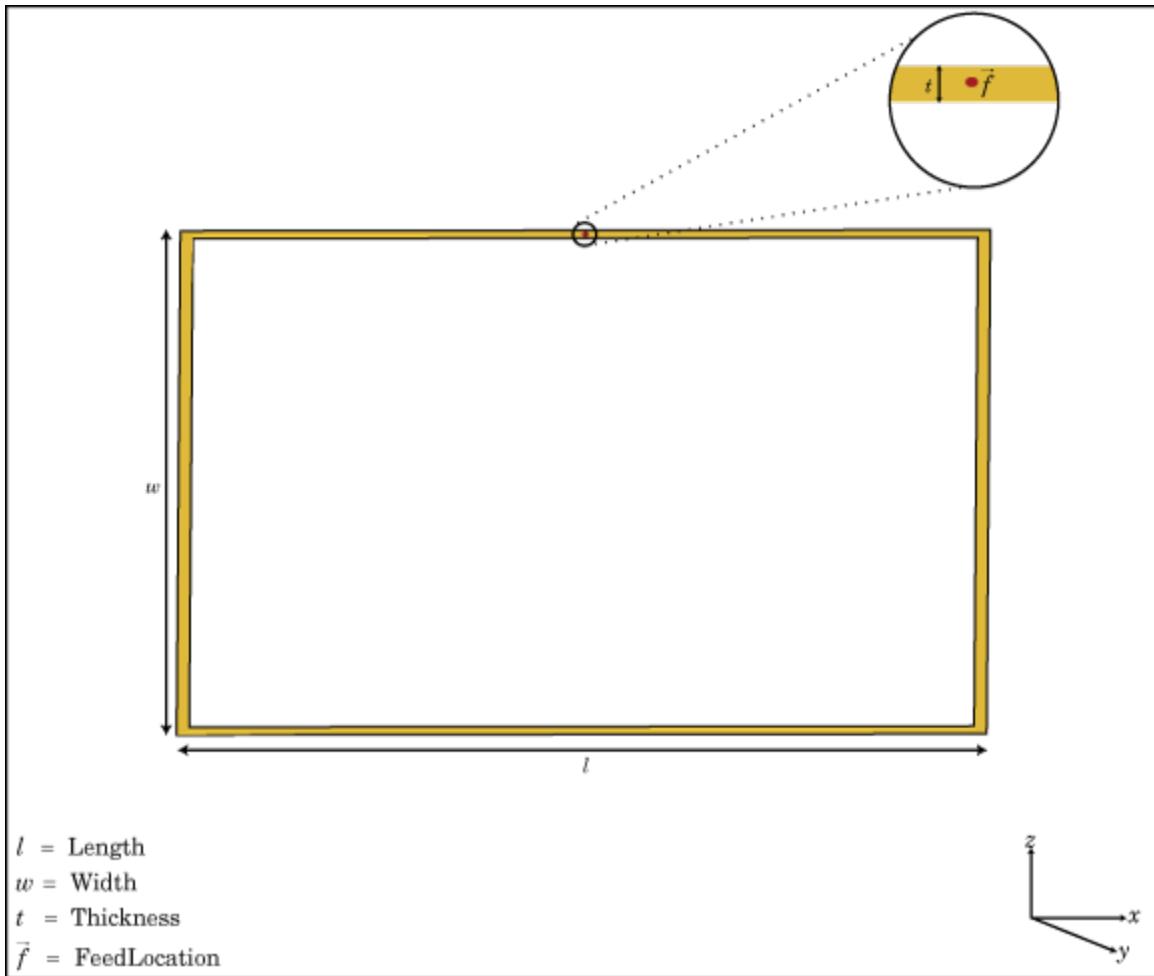

The thickness of the loop is related to the diameter of an equivalent cylinder loop by the equation

$$t = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical loop
- $r$  is the radius of equivalent cylindrical loop

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default circular loop antenna is fed at the positive Y-axis. The point of the Y-axis is the midpoint of the inner and outer perimeter of the loop.

## Creation

### Syntax

```
h = loopRectangular  
h = loopRectangular(Name,Value)
```

### Description

`h = loopRectangular` creates a rectangular loop antenna in the X-Y plane. By default, the dimensions are chosen for the operating frequency 53 MHz.

`h = loopRectangular(Name,Value)` creates a rectangular loop antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1,Value1, ..., NameN,ValueN`. Properties not specified retains their default values.

### Properties

#### **Length — Loop length along x-axis**

2 (default) | scalar

Loop length along x-axis, specified as a scalar in meters.

Example: `'Length', 3`

Data Types: double

#### **Width — Loop width along y-axis**

1 (default) | scalar

Loop width along y-axis, specified as a scalar in meters.

Example: `'Width', 2`

Data Types: double

#### **Thickness — Loop thickness**

0.0100 (default) | scalar

Loop thickness, specified as a scalar in meters.

Example: `'Thickness', 2`

Data Types: double

#### **Load — Lumped elements**

[1x1 `lumpedElement`] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## monopole

Create monopole antenna over rectangular ground plane

### Description

The `monopole` object is a monopole antenna mounted over a rectangular ground plane.

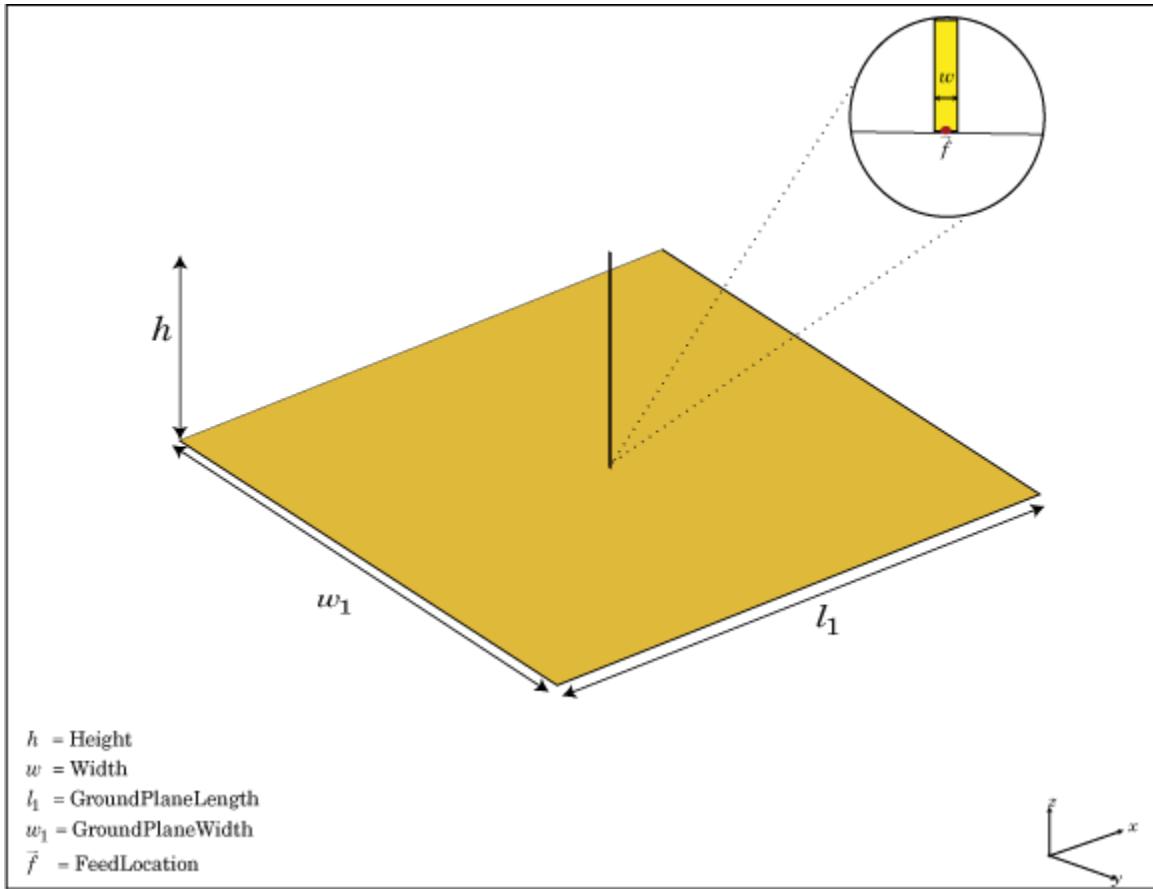

The width of the monopole is related to the diameter of an equivalent cylindrical monopole by the equation

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical monopole
- $r$  is the radius of equivalent cylindrical monopole.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default monopole is center-fed. The feed point coincides with the origin. The origin is located on the X-Y plane.

## Creation

### Syntax

```
h = monopole  
h = monopole(Name,Value)
```

## Description

`h = monopole` creates a quarter-wavelength monopole antenna.

`h = monopole(Name,Value)` creates a quarter-wavelength monopole antenna with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Height — Height of vertical element along z-axis**

1 (default) | scalar

Height of vertical element along z-axis, specified as a scalar in meters. By default, the height is chosen for an operating frequency of 75 MHz.

Example: `'Height', 3`

Data Types: `double`

### **Width — Monopole width**

0.1000 (default) | scalar

Monopole width, specified as a scalar in meters.

**Note** Monopole width should be less than `'Height'/4` and greater than `'Height'/1001`.  
[\[2\]](#)

---

Example: `'Width', 0.05`

Data Types: `double`

### **GroundPlaneLength — Ground plane length along x-axis**

2 (default) | scalar

Ground plane length along x-axis, specified as a scalar in meters. Setting `'GroundPlaneLength'` to `Inf`, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 4

Data Types: double

**GroundPlaneWidth — Ground plane width along y-axis**

2 (default) | scalar

Ground plane width along y-axis, specified as a scalar in meters. Setting 'GroundPlaneWidth' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 2.5

Data Types: double

**FeedOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector.

Example: 'FeedOffset', [2 1]

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see lumpedElement.

Example: 'Load', lumpedelement. lumpedelement is the object handle for the load created using lumpedElement.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Object Functions

# monopoleTopHat

Create capacitively loaded monopole antenna over rectangular ground plane

## Description

The `monopoleTopHat` object is a top-hat monopole antenna mounted over a rectangular ground plane. The monopole always connects with the center of top hat. The top hat builds up additional capacitance to ground within the structure. This capacitance reduces the resonant frequency of the antenna without increasing the size of the element.

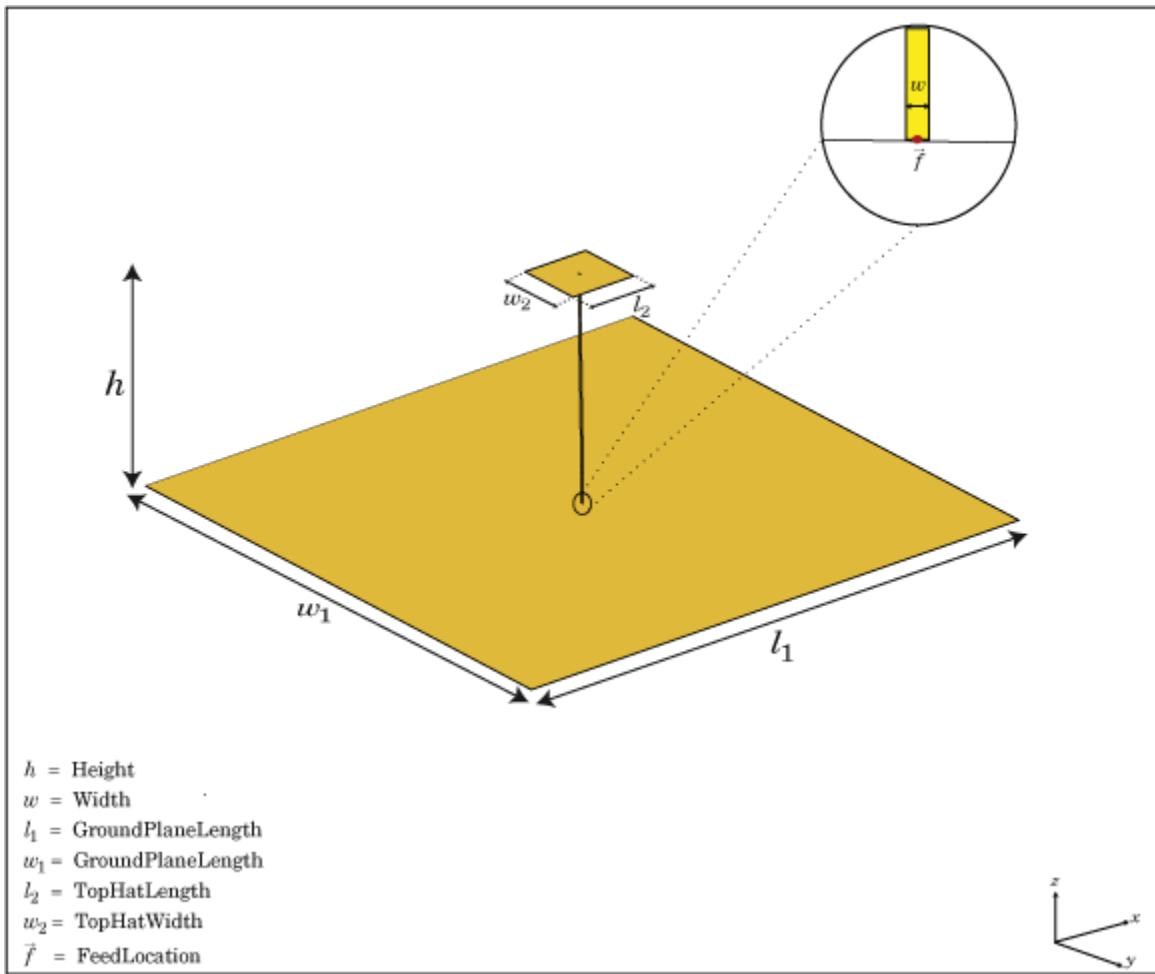

The width of the monopole is related to the diameter of an equivalent cylindrical monopole by the expression

$$w = 2d = 4r$$

, where:

- $d$  is the diameter of equivalent cylindrical monopole
- $r$  is the radius of equivalent cylindrical monopole.

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. The default top-hat monopole is center-fed. The feed point coincides with the origin. The origin is located on the X-Y plane.

## Creation

### Syntax

```
h = monopoleTopHat  
h = monopoleTopHat(Name,Value)
```

## Description

`h = monopoleTopHat` creates a capacitively loaded monopole antenna over a rectangular ground plane.

`h = monopoleTopHat(Name,Value)` creates a capacitively loaded monopole antenna with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retains their default values.

## Properties

### **Height — Monopole height**

1 (default) | scalar

Monopole height, specified as a scalar in meters. By default, the height is chosen for an operating frequency of 75 MHz.

Example: `'Height', 3`

Data Types: double

### **Width — Monopole width**

0.1000 (default) | scalar

Monopole width, specified as a scalar in meters.

---

**Note** Monopole width should be less than `'Height'/4` and greater than `'Height'/1001`.  
[2]

---

Example: `'Width', 0.05`

Data Types: double

### **GroundPlaneLength — Ground plane length along x-axis**

2 (default) | scalar

Ground plane length along x-axis, specified as a scalar in meters. Setting 'GroundPlaneLength' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 4

Data Types: double

**GroundPlaneWidth — Ground plane width along y-axis**

2 (default) | scalar

Ground plane width along y-axis, specified as a scalar in meters. Setting 'GroundPlaneWidth' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 2.5

Data Types: double

**TopHatLength — Top hat length along x-axis**

0.2500 (default) | scalar

Top hat length along x-axis, specified as a scalar in meters.

Example: 'TopHatLength', 4

Data Types: double

**TopHatWidth — Top hat width along y-axis**

0.2500 (default) | scalar

Top hat width along y-axis, specified as a scalar in meters.

Example: 'TopHatWidth', 4

Data Types: double

**FeedOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector.

Example: 'FeedOffset', [2 1]

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Examples

### Create and View Top Hat Monopole.

Create and view a top hat monopole with 1 m length, 0.01 m width, groundplane dimensions 2mx2m and top hat dimensions 0.25mx0.25m.

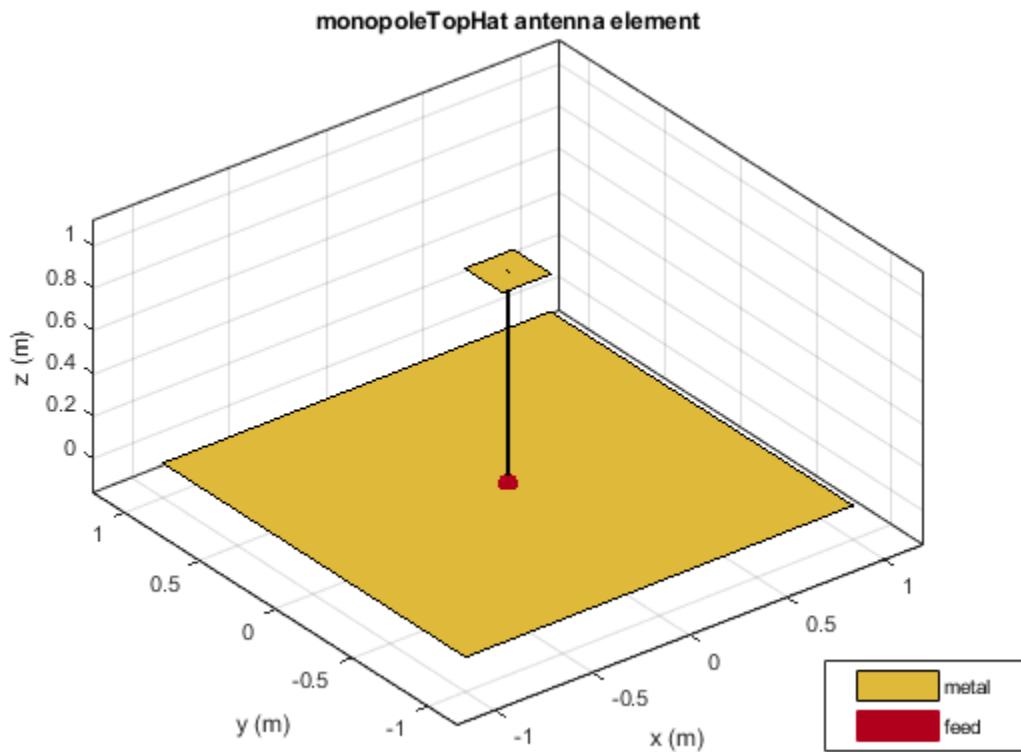

```
th = monopoleTopHat

th =
    monopoleTopHat with properties:

        Height: 1
        Width: 0.0100
        GroundPlaneLength: 2
        GroundPlaneWidth: 2
        TopHatLength: 0.2500
        TopHatWidth: 0.2500
```

```
FeedOffset: [0 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]

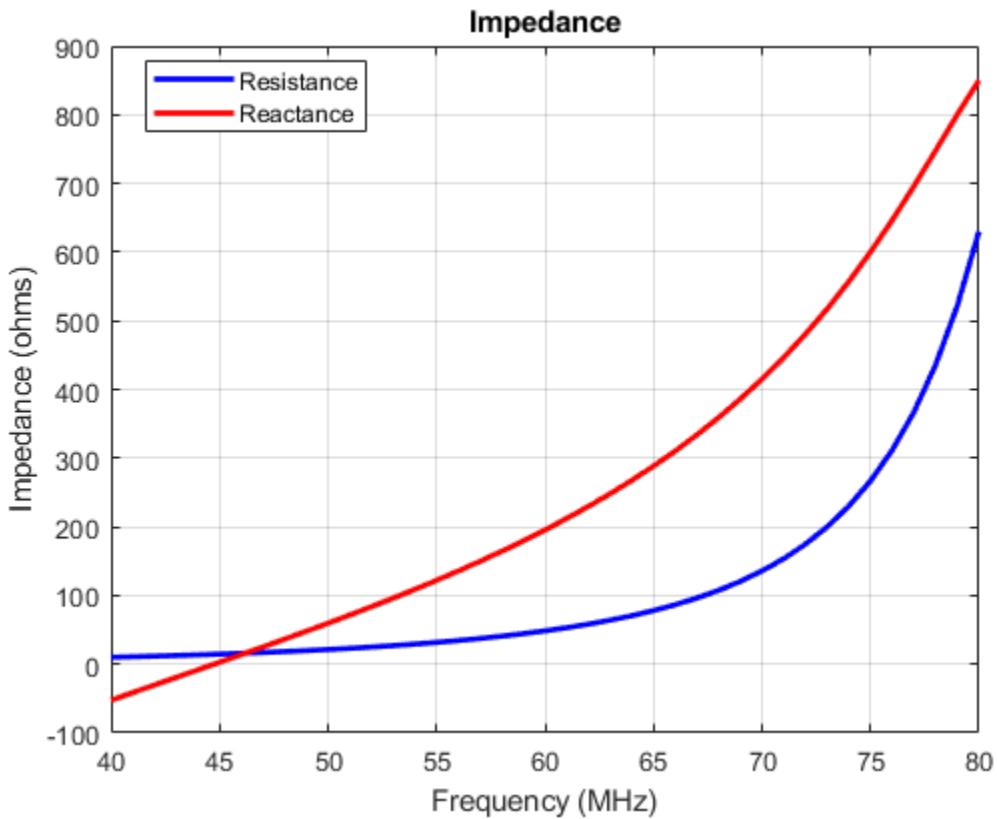

show(th)
```

### Calculate Impedance of Top Hat Monopole Antenna

Calculate and plot the impedance of a top hat monopole over a frequency range of 40MHz-80MHz.

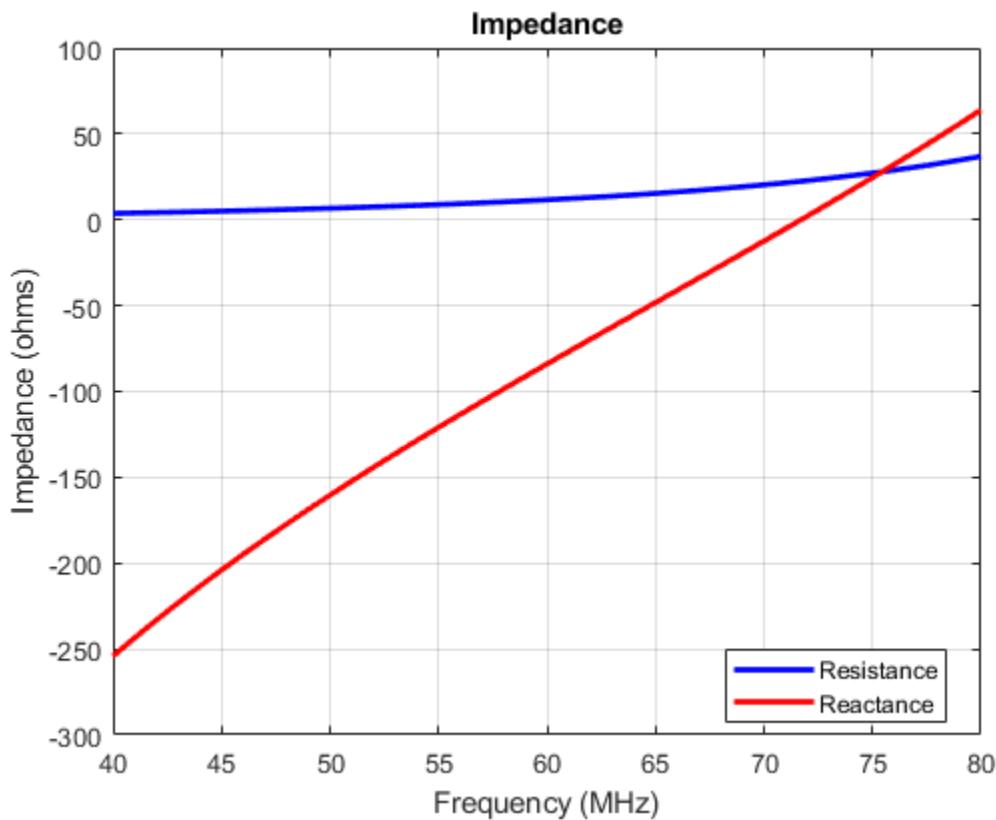

```
th = monopoleTopHat;
impedance(th,linspace(40e6,80e6,41));
```

### Compare Impedance of Top Hat Monopole Antenna and Monopole Antenna

Impedance comparison between a monopole of similar dimensions and the top hat monopole in example 2.

```
m = monopole;
figure
impedance(m,linspace(40e6,80e6,41));
```

# patchMicrostrip

Create microstrip patch antenna

## Description

The `patchMicrostrip` object is a microstrip patch antenna. The default patch is centered at the origin. The feed point is along the length of the antenna.

## Creation

## Syntax

```
pm = patchMicrostrip
```

```
pm = patchMicrostrip(Name,Value)
```

### Description

`pm = patchMicrostrip` creates a microstrip patch antenna.

`pm = patchMicrostrip(Name,Value)` creates a microstrip patch antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Length — Patch length along x-axis**

0.0750 (default) | scalar

Patch length, specified as a scalar in meters. By default, the length is measured along the x-axis.

Example: `'Length', 50e-3`

Data Types: double

### **Width — Patch width along the y-axis**

0.0375 (default) | scalar

Patch width, specified as a scalar in meters. By default, the width is measured along the y-axis.

Example: `'Width', 60e-3`

Data Types: double

### **Height — Height of substrate**

0.0060 (default) | scalar

Height of substrate, specified as a scalar in meters.

Example: `'Height', 37e-3`

Data Types: double

**Substrate — Type of dielectric material**

'Air' (default) | object

Type of dielectric material used as a substrate, specified as a object. For more information see, `dielectric`. For more information on dielectric substrate meshing, see “Meshing”.

---

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: `d = dielectric('FR4'); 'Substrate', d`

Example: `d = dielectric('FR4'); pm.Substrate = d`

**GroundPlaneLength — Ground plane length along x-axis**

0.1500 (default) | scalar

Ground plane length, specified as a scalar in meters. By default, ground plane length is measured along x-axis. Setting '`GroundPlaneLength`' to `Inf`, uses the infinite ground plane technique for antenna analysis.

Example: '`GroundPlaneLength`', `120e-3`

Data Types: double

**GroundPlaneWidth — Ground plane width along y-axis**

0.0750 (default) | scalar

Ground plane width, specified as a scalar in meters. By default, ground plane width is measured along y-axis. Setting '`GroundPlaneWidth`' to `Inf`, uses the infinite ground plane technique for antenna analysis.

Example: '`GroundPlaneWidth`', `120e-3`

Data Types: double

**PatchCenterOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector in meters. Use this property to adjust the location of the patch relative to the ground plane.

Example: 'PatchCenterOffset', [0.01 0.01]

Data Types: double

**FeedOffset** — Signed distance from center along length and width of ground plane  
[-0.0187 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector. Use this property to adjust the location of the feedpoint relative to ground plane and patch.

Example: 'FeedOffset', [0.01 0.01]

Data Types: double

**Load** — Lumped elements

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt** — Tilt angle of antenna

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis** — Tilt axis of antenna

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.

- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

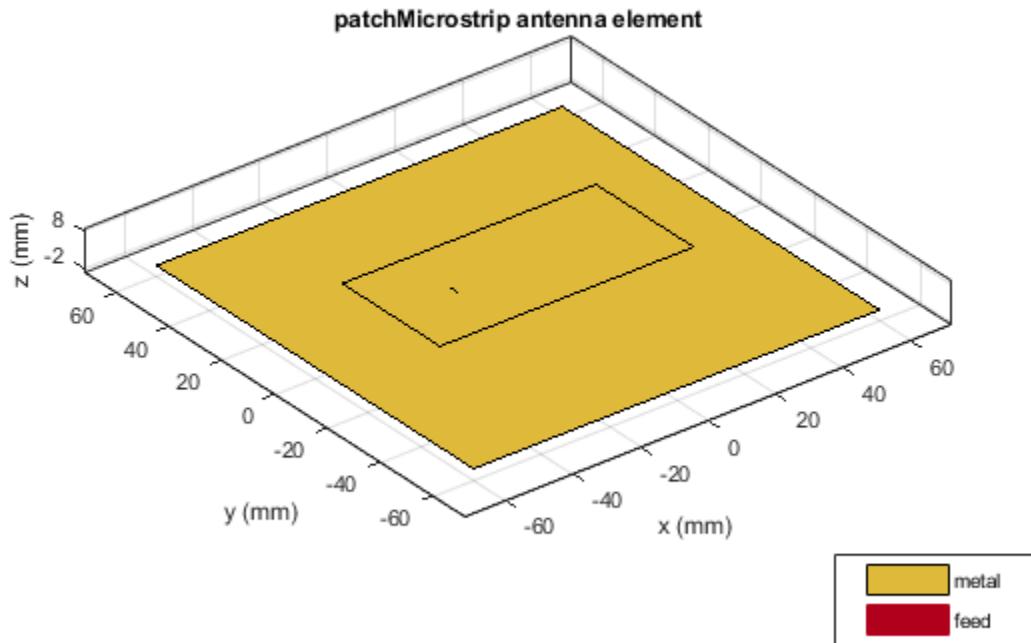

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Create and View Microstrip Patch Antenna

Create and view a microstrip patch that has 75 mm length and 37.5 mm width over a 120 mm x 120 mm ground plane.

```
pm = patchMicrostrip('Length',75e-3, 'Width',37e-3,  
                      'GroundPlaneLength',120e-3, 'GroundPlaneWidth',120e-3) ...  
  
pm =  
patchMicrostrip with properties:  
  
    Length: 0.0750  
    Width: 0.0370  
    Height: 0.0060  
    Substrate: [1x1 dielectric]  
    GroundPlaneLength: 0.1200  
    GroundPlaneWidth: 0.1200  
    PatchCenterOffset: [0 0]  
    FeedOffset: [-0.0187 0]  
    Tilt: 0  
    TiltAxis: [1 0 0]  
    Load: [1x1 lumpedElement]  
  
  
show (pm)
```

### Radiation Pattern of Microstrip Patch Antenna

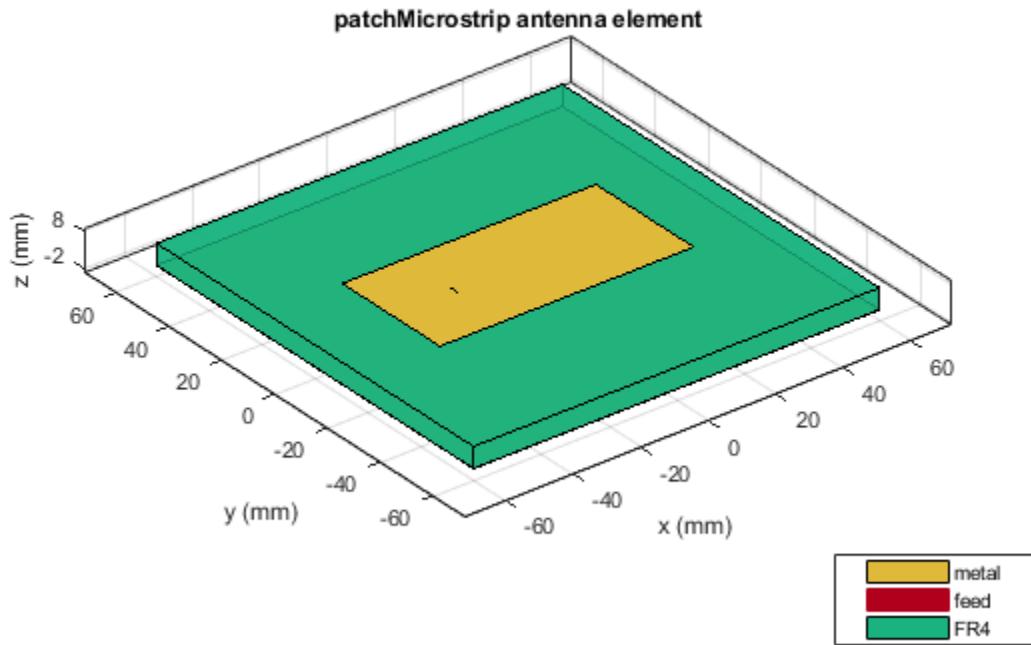

Create a microstrip patch antenna using 'FR4' as the dielectric substrate.

```
d = dielectric('FR4');
pm = patchMicrostrip('Length',75e-3, 'Width',37e-3,
    'GroundPlaneLength',120e-3, 'GroundPlaneWidth',120e-3, ...
    'Substrate',d)
show(pm)
```

```
pm =
```

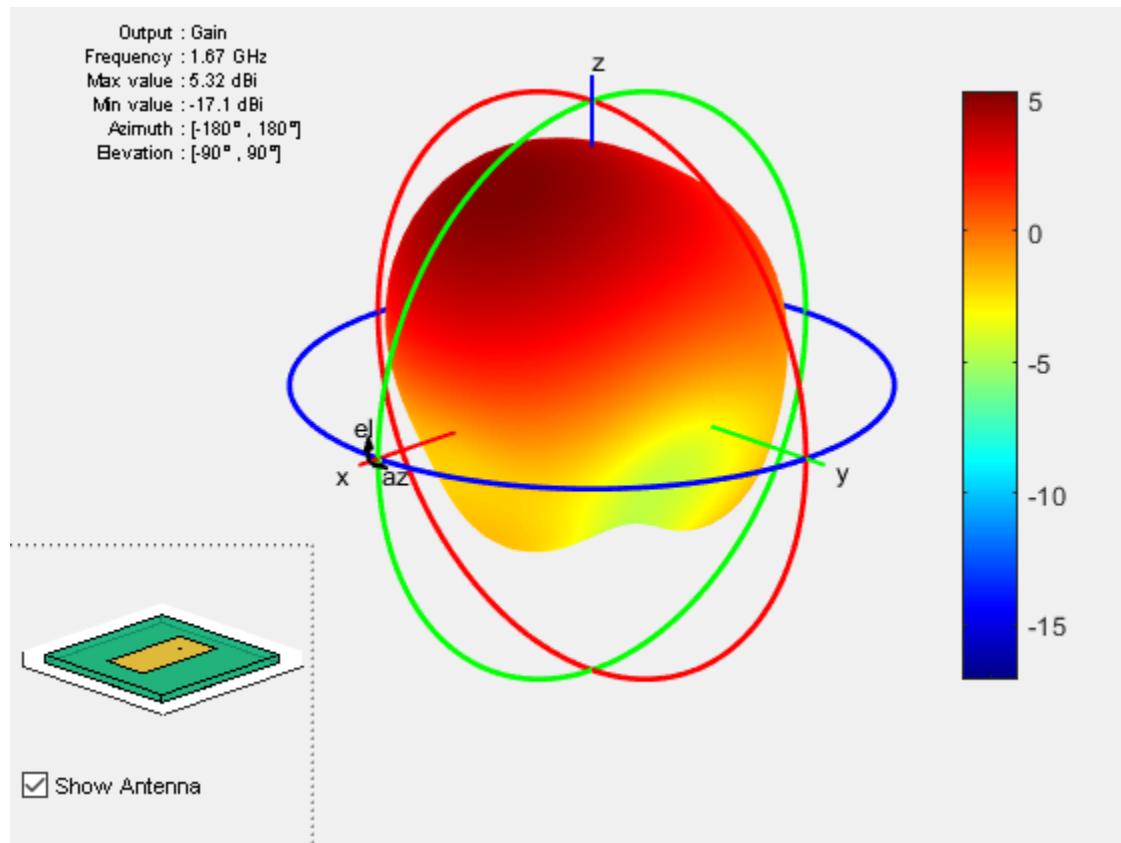

patchMicrostrip with properties:

```
Length: 0.0750
Width: 0.0370
Height: 0.0060
Substrate: [1x1 dielectric]
GroundPlaneLength: 0.1200
GroundPlaneWidth: 0.1200
PatchCenterOffset: [0 0]
FeedOffset: [-0.0187 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

Plot the radiation pattern of the antenna at a frequency of 1.67 GHz.

```
figure  
pattern(pm,1.67e9)
```

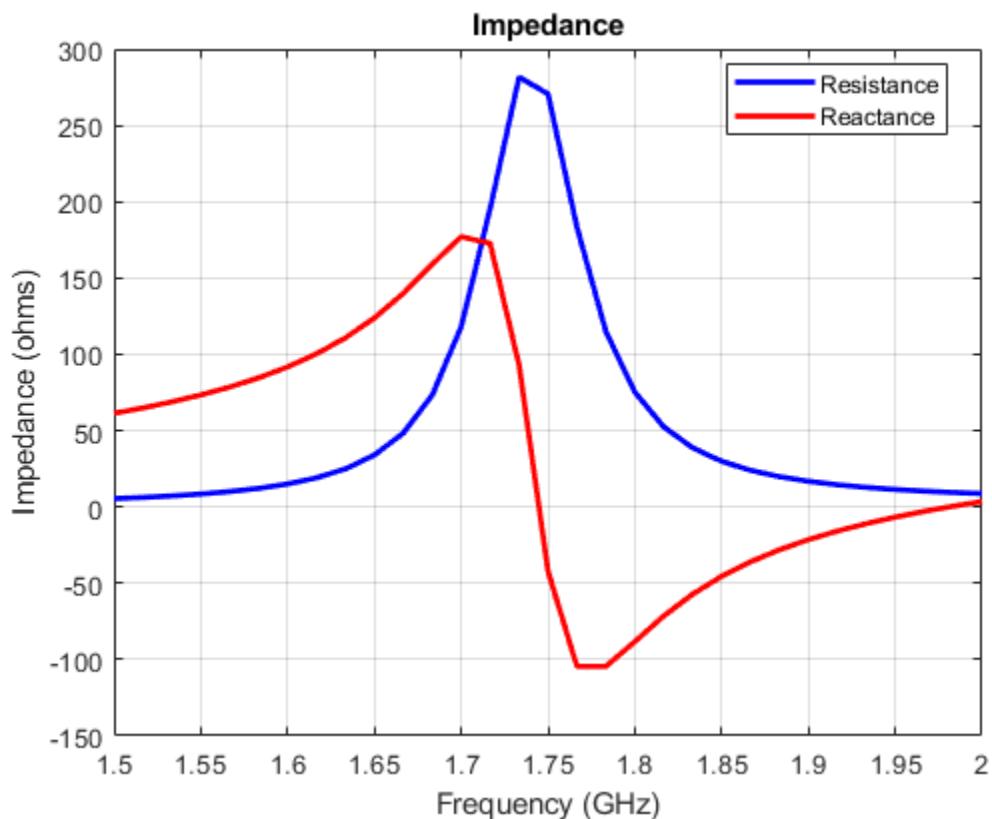

### Impedance of Microstrip Patch Antenna

Calculate and plot the impedance of a microstrip patch antenna over a frequency range of 1.5-2 GHz.

```
pm = patchMicrostrip
pm =
patchMicrostrip with properties:
Length: 0.0750
Width: 0.0375
```

```
Height: 0.0060
Substrate: [1x1 dielectric]
GroundPlaneLength: 0.1500
GroundPlaneWidth: 0.0750
PatchCenterOffset: [0 0]
FeedOffset: [-0.0187 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

```
impedance(pm,linspace(1.5e9,2e9,31));
```

“Rotate Antenna and Arrays”

**Introduced in R2015a**

# planeWaveExcitation

Create plane wave excitation environment for antenna or array

## Description

The `planeWaveExcitation` object creates an environment where a plane wave excites an antenna or array. Plane wave excitation is a scattering solution that solves the receiving antenna problem. By default, the antenna element is a dipole. The dipole is excited using a plane wave that travels along the positive x-axis having a z-polarization.

## Creation

### Syntax

```
h = planeWaveExcitation  
h = planeWaveExcitation(Name,Value)
```

## Description

`h = planeWaveExcitation` creates an environment where a plane wave excites the antenna or array. By default, the plane wave excites a dipole antenna.

`h = planeWaveExcitation(Name,Value)` returns a `planeWaveExcitation` environment, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### Element — Antenna or array element

`dipole` (default) | object handle

Antenna or array element, specified as an object handle.

Example: 'Element', linearArray

### **Direction — Incidence of plane wave**

[1 0 0] (default) | three-element real vector

Incidence of plane wave, specified as a three-element real vector.

Example: 'Direction', [0 0 1]

Data Types: double

### **Polarization — Polarization of incident electric field**

[0 0 1] (default) | three-element complex vector

Polarization of incident electric field in  $x$ ,  $y$ , and  $z$  components, specified as a three-element complex vector.

Example: 'Polarization', [0 1 0]

Data Types: double

## Object Functions

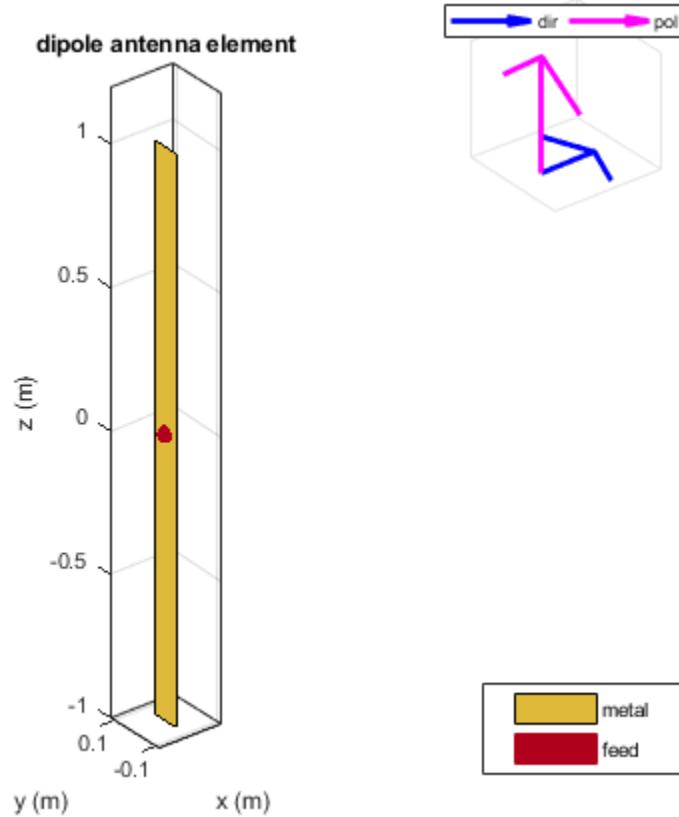

axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
show	Display antenna or array structure; Display shape as filled patch

## Examples

## Default Plane Wave Excitation

Excite a dipole antenna using a plane wave and view it.

```
h = planeWaveExcitation;  
show(h)
```

The blue arrow shows the direction of propagation of the plane wave. By default, the direction is along the  $x$ -axis. The pink arrow shows polarization of the plane wave. By default, the polarization is perpendicular to the direction of propagation i.e along the  $z$ -axis.

### Feed Current of Antenna Excited By Plane Wave.

Excite a dipole antenna using plane wave. Calculate the feed current at 70 MHz.

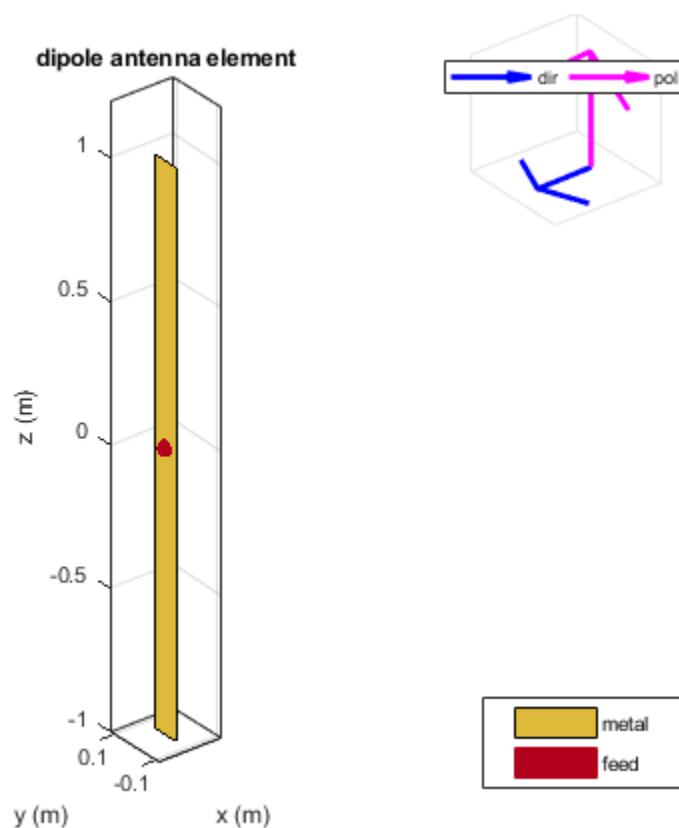

```
h = planeWaveExcitation  
cur = feedcurrent(h, 70e6)
```

```
h =  
  
planeWaveExcitation with properties:  
  
Element: [1×1 dipole]  
Direction: [1 0 0]  
Polarization: [0 0 1]  
  
cur =  
0.0181 - 0.0033i
```

### Current Distribution On Antenna

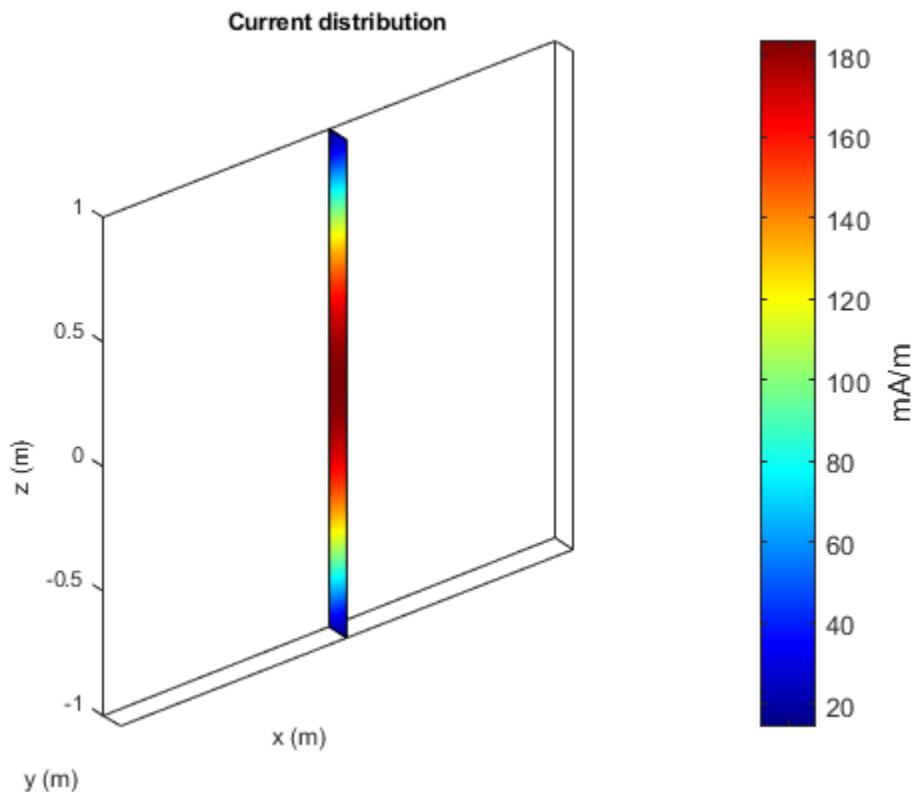

Excite a dipole antenna using a plane wave. The polarization of the wave is along the z-axis and the direction of propagation is along the negative x-axis. View the antenna.

```
p = planeWaveExcitation('Element', dipole, 'Direction', [-1 0 0], 'Polarization', [0 0  
show(p);
```

Plot the current distribution on the dipole antenna at 70 MHz.

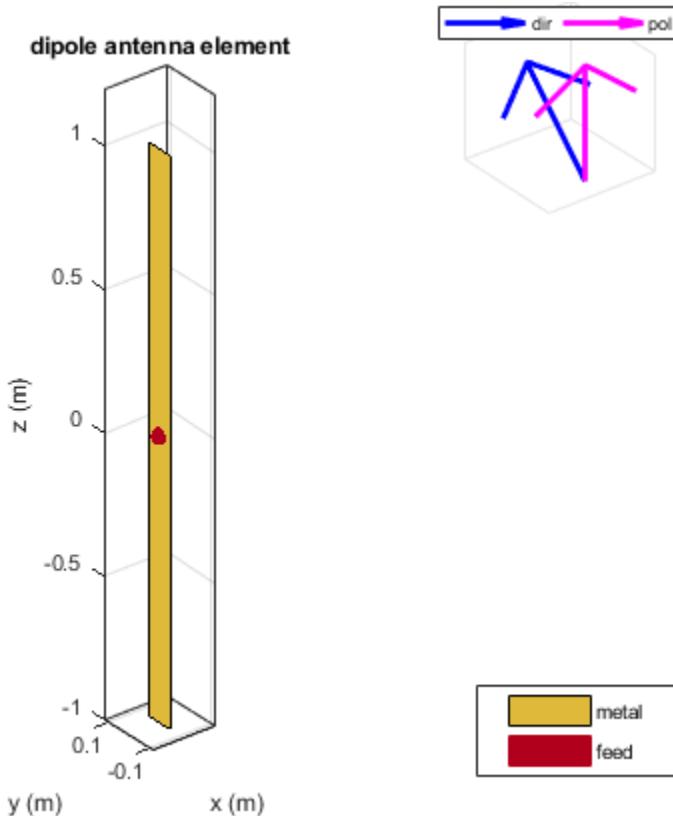

```
current(p, 70e6);
```

### Antenna Excited By Plane Wave In Arbitrary Direction

Consider a dipole excited by a plane wave.

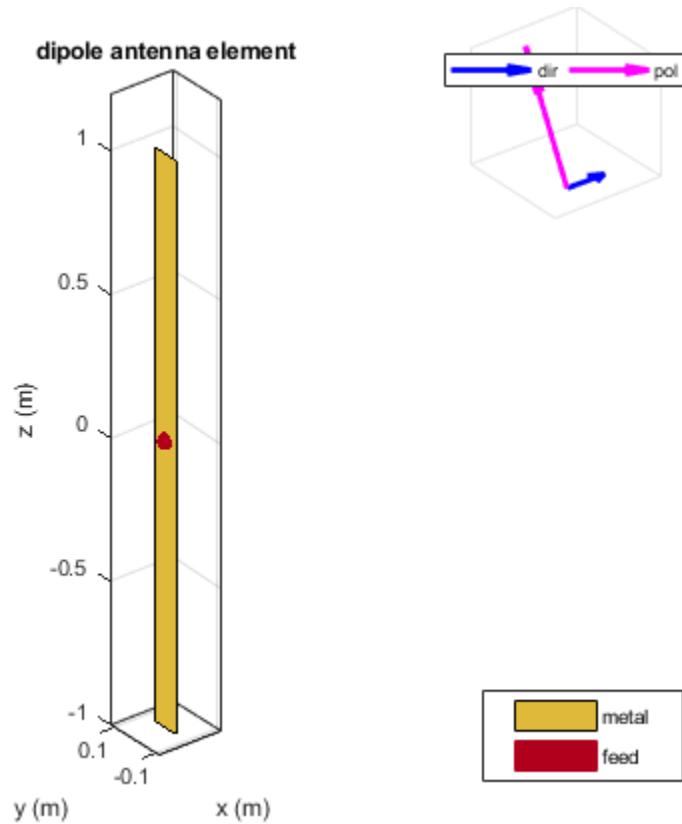

```
p = planeWaveExcitation;  
p.Direction = [0 1 1];  
show(p)
```

If you use the above option, any analysis of this antenna will error out as the polarization and direction vector are not orthogonal to each other.

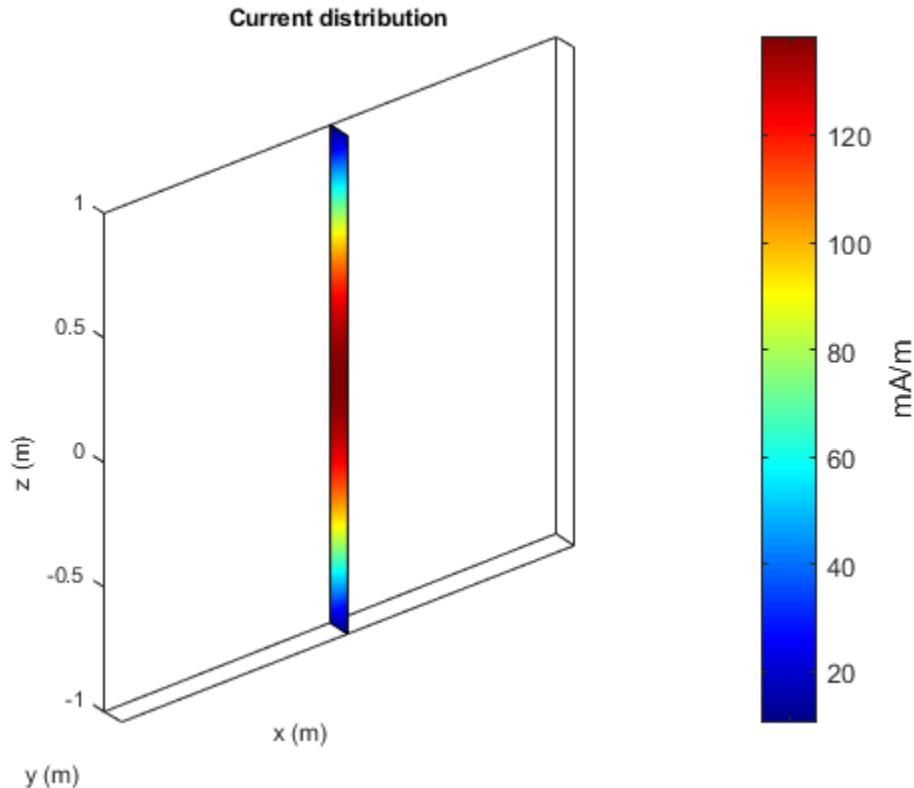

Use the cross product function to find the appropriate polarization direction of such a wave.

```
p = planeWaveExcitation;
p.Polarization = cross(p.Direction, [0 1 1]);
show(p);
```

Calculate the current distribution of the antenna.

```
current(p,75e6);
```

## pifa

Create planar inverted-F antenna

### Description

The `pifa` object is a planar inverted-F antenna. The default PIFA antenna is centered at the origin. The feed point is along the length of the antenna.

## Creation

### Syntax

```
pf = pifa  
pf = pifa(Name,Value)
```

### Description

`pf = pifa` class to create a planar inverted-F antenna.

`pf = pifa(Name,Value)` class to create a planar inverted-F antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Length — PIFA antenna length**

0.0300 (default) | scalar

PIFA antenna length, specified as a scalar in meters. By default, the length is measured along the **x-axis**.

Example: `'Length', 75e-3`

Data Types: `double`

### **Width — PIFA antenna width**

0.0200 (default) | scalar

PIFA antenna width, specified as a scalar in meters. By default, the width is measured along the **y-axis**.

Example: `'Width', 35e-3`

Data Types: `double`

**Height — Height of substrate**

0.0100 (default) | scalar

Height of the substrate, specified as a scalar in meters.

Example: 'Height', 37e-3

Data Types: double

**Substrate — Type of dielectric material**

'Air' (default) | object

Type of dielectric material used as a substrate, specified as a object. For more information see, `dielectric`. For more information on dielectric substrate meshing, see “Meshing”.

---

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: `d = dielectric('FR4');` 'Substrate', d

Example: `d = dielectric('FR4');` pf.Substrate = d

**GroundPlaneLength — Ground plane length**

0.0360 (default) | scalar

Ground plane length, specified as a scalar in meters. By default, ground plane length is measured along the x-axis. Setting 'GroundPlaneLength' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 3

Data Types: double

**GroundPlaneWidth — Ground plane width**

0.0360 (default) | scalar

Ground plane width, specified as a scalar in meters. By default, ground plane width is measured along the y-axis. Setting 'GroundPlaneWidth' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 2.5

Data Types: double

**PatchCenterOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element vector

Signed distance from the center along length and width of the ground plane, specified as a two-element vector in meters. Use this property to adjust the location of the patch relative to the ground plane.

Example: 'PatchCenterOffset', [0.01 0.01]

Data Types: double

**ShortPinWidth — Shorting pin width of patch**

0.0200 (default) | scalar

Shorting pin width of patch, specified as a scalar in meters. By default, the shorting pin width is measured along the y-axis.

Example: 'ShortPinWidth', 3

Data Types: double

**FeedOffset — Signed distance of feedpoint from origin**

[-0.0020 0] (default) | two-element vector

Signed distance from center along length and width of ground plane, specified as a two-element vector. Use this property to adjust the location of the feedpoint relative to ground plane and patch.

Example: 'FeedOffset', [0.01 0.01]

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## **Object Functions**

show	Display antenna or array structure; Display shape as filled patch

axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array

mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

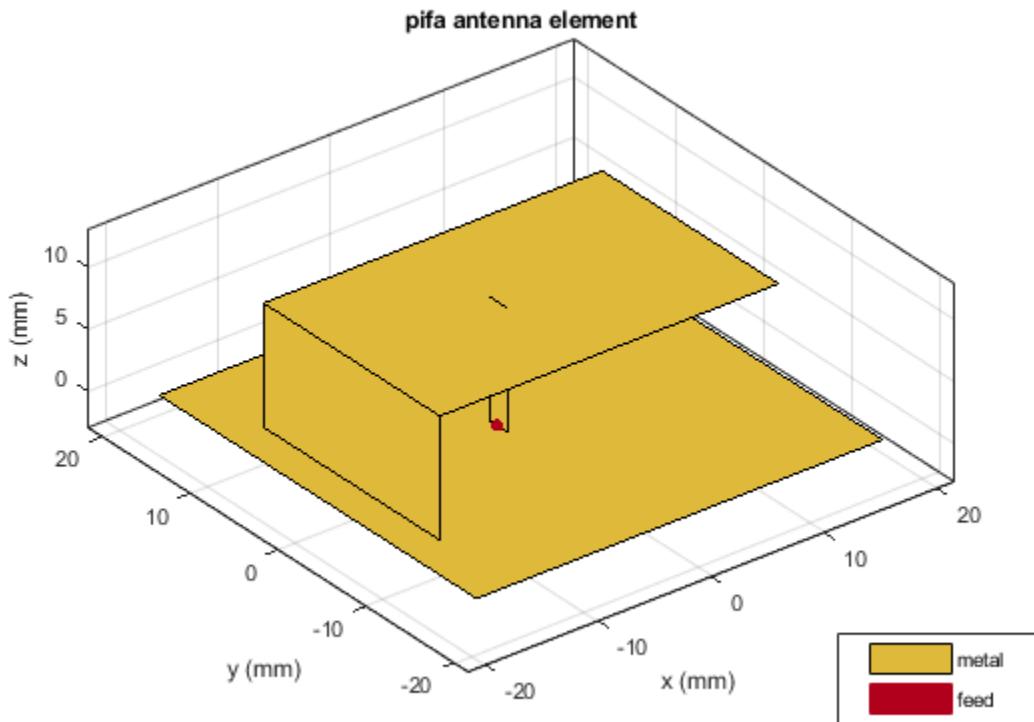

### Create and View Planar Inverted-F Antenna(PIFA) Antenna

Create and view a PIFA antenna with 30mm length, 20mm width over a 35mm x 35mm ground plane, and feedpoint at (-2mm,0,0).

```
pf = pifa
pf =
    pifa with properties:

    Length: 0.0300
    Width: 0.0200
    Height: 0.0100
    Substrate: [1x1 dielectric]
    GroundPlaneLength: 0.0360
    GroundPlaneWidth: 0.0360
    PatchCenterOffset: [0 0]
    ShortPinWidth: 0.0200
    FeedOffset: [-0.0020 0]
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]

show(pf)
```

### Radiation Pattern of PIFA Antenna

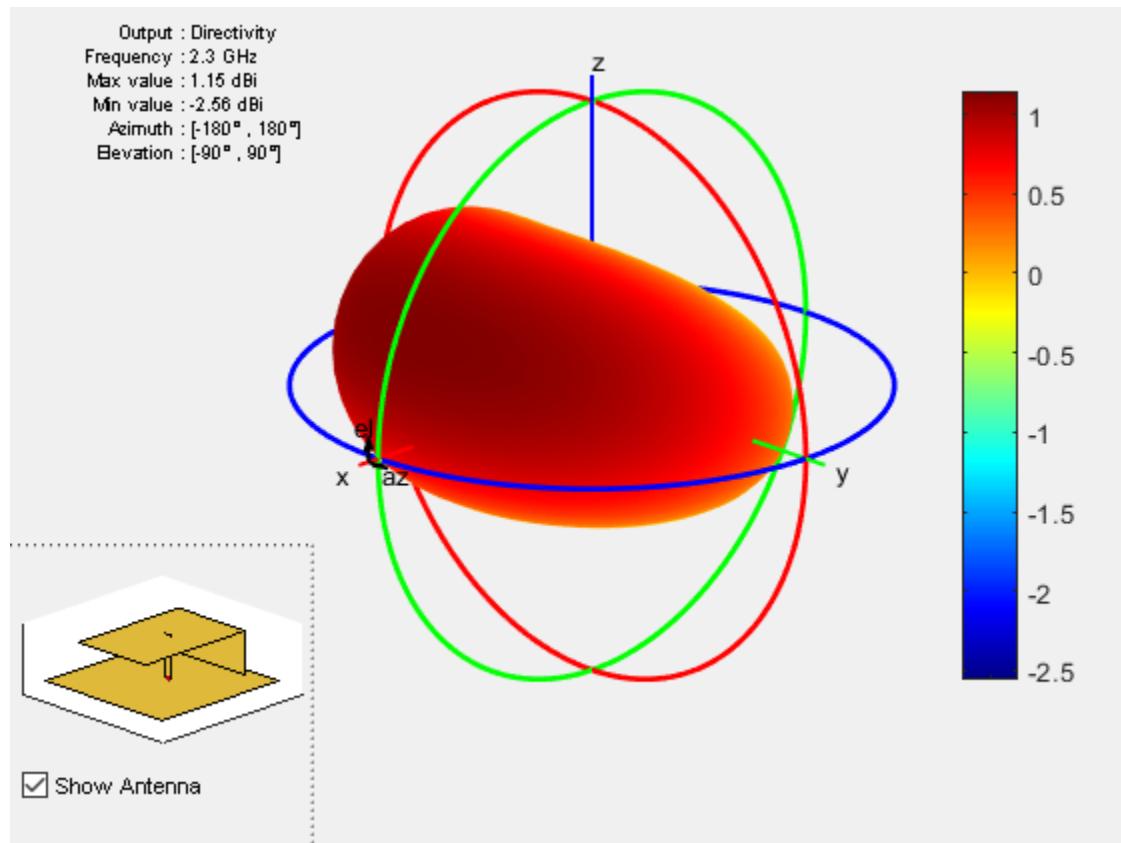

Plot the radiation pattern of a PIFA antenna at a frequency of 2.3 GHz.

```
pf = pifa('Length',30e-3, 'Width',20e-3, 'GroundPlaneLength',35e-3,...  
    'GroundPlaneWidth',35e-3)  
pattern(pf,2.3e9);
```

```
pf =
```

```
pifa with properties:
```

```
Length: 0.0300
Width: 0.0200
Height: 0.0100
Substrate: [1x1 dielectric]
GroundPlaneLength: 0.0350
GroundPlaneWidth: 0.0350
PatchCenterOffset: [0 0]
ShortPinWidth: 0.0200
FeedOffset: [-0.0020 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

### Impedance of PIFA Antenna

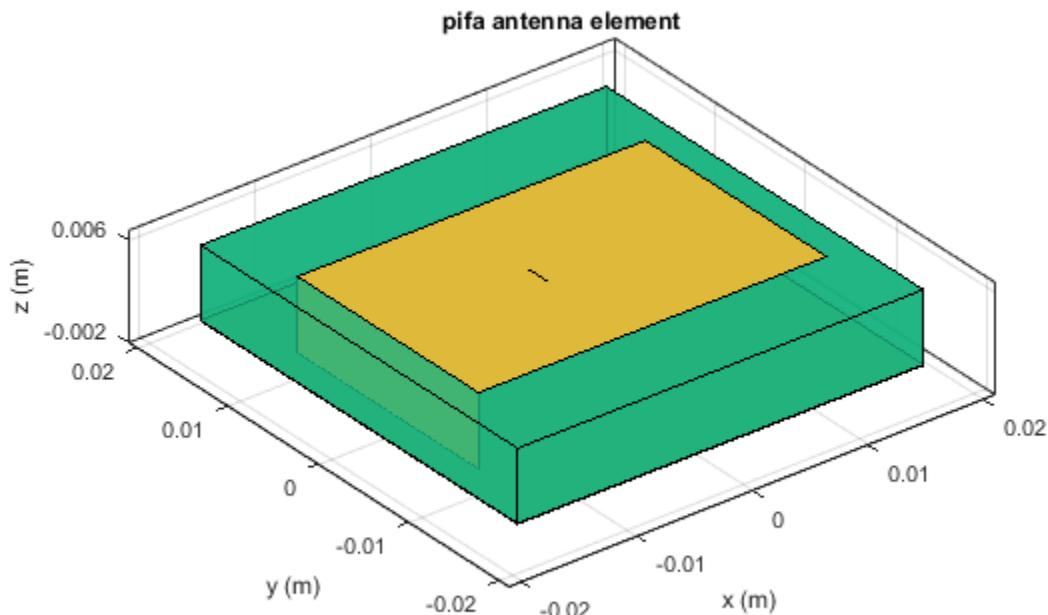

Create a PIFA antenna using a dielectric substrate 'RO4725JXR'.

```
d = dielectric('RO4725JXR');  
pf = pifa('Length',30e-3, 'Width',20e-3,'Height',0.0060, 'GroundPlaneLength',35e-3, ...  
'GroundPlaneWidth', 35e-3,'Substrate',d)  
show(pf)
```

```
pf =
```

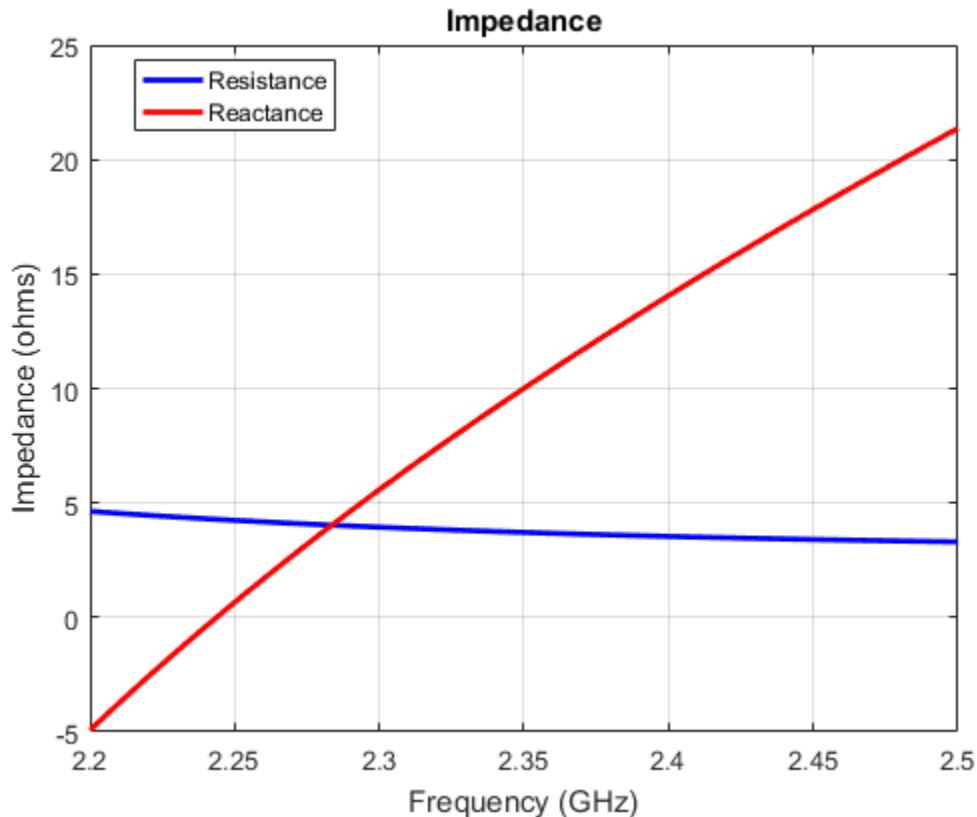

pifa with properties:

```
Length: 0.0300
Width: 0.0200
Height: 0.0060
Substrate: [1x1 dielectric]
GroundPlaneLength: 0.0350
GroundPlaneWidth: 0.0350
PatchCenterOffset: [0 0]
ShortPinWidth: 0.0200
FeedOffset: [-0.0020 0]
Tilt: 0
TiltAxis: [1 0 0]
```

Calculate the impedance of the antenna over a frequency range of 2-2.6 GHz.

```
impedance(pf,linspace(2.2e9,2.5e9,31));
```

## Topics

“Rotate Antenna and Arrays”

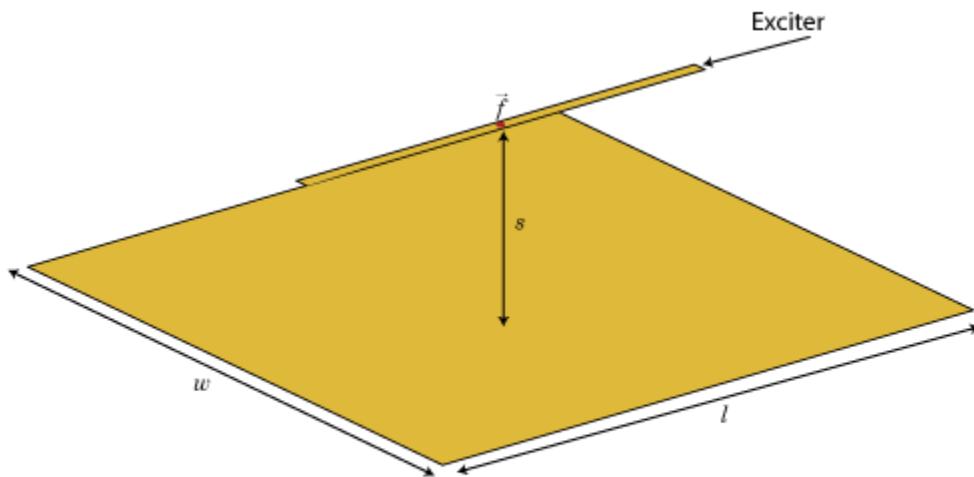

Introduced in R2015a

## reflector

Create reflector-backed antenna

### Description

The `reflector` object is a reflector-backed antenna on the X-Y-Z plane. The default reflector antenna uses a dipole as an exciter. The feed point is on the exciter.

$l$  = GroundPlaneLength

$w$  = GroundPlaneWidth

$s$  = Spacing

$\vec{f}$  = FeedLocation

## Creation

### Syntax

```
rf = reflector  
rf = reflector(Name,Value)
```

### Description

`rf = reflector` creates a reflector backed antenna located in the X-Y-Z plane. By default, dimensions are chosen for an operating frequency of 1 GHz.

`rf = reflector(Name,Value)` creates a reflector backed antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Exciter — Antenna type used as exciter**

`dipole` (default) | object

Antenna type used as an exciter, specified as an object. Except reflector and cavity antenna elements, you can use all the single elements in the Antenna Toolbox as an exciter.

Example: `'Exciter', dipole`

### **Substrate — Type of dielectric material**

`'Air'` (default) | object

Type of dielectric material used as a substrate, specified as a object. For more information see, `dielectric`. For more information on dielectric substrate meshing, see “Meshing”.

---

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: `d = dielectric('FR4');` 'Substrate',`d`

Example: `d = dielectric('FR4');` `rf.Substrate = d`

**GroundPlaneLength — Reflector length along x-axis**

0.2000 (default) | scalar

Reflector length along the x-axis, specified a scalar in meters. By default, ground plane length is measured along the x-axis. Setting 'GroundPlaneLength' toInf, uses the infinite ground plane technique for antenna analysis. You can also set the 'GroundPlaneLength' to zero.

Example: '`GroundPlaneLength`', 3

Data Types: double

**GroundPlaneWidth — Reflector width along y-axis**

0.2000 (default) | scalar

Reflector width along the y-axis, specified as a scalar in meters. By default, ground plane width is measured along the y-axis. Setting 'GroundPlaneWidth' toInf, uses the infinite ground plane technique for antenna analysis. You can also set the 'GroundPlaneWidth' to zero.

Example: '`GroundPlaneWidth`', 2.5

Data Types: double

**Spacing — Distance between reflector and exciter**

0.0750 (default) | scalar

Distance between the reflector and the exciter, specified as a scalar in meters. By default, the exciter is placed along the x-axis.

Example: '`Spacing`', 7.5e-2

Data Types: double

**Load — Lumped elements**

[1x1 `lumpedElement`] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', lumpedelement.lumpedelement is the object handle for the load created using lumpedElement.

**EnableProbeFeed — Create probe feed from backing structure to exciter**  
0 (default) | 1

Create probe feed from backing structure to exciter, specified as 0 or 1. By default, probe feed is not enabled.

Example: 'EnableProbeFeed', 1

Data Types: double

**Tilt — Tilt angle of antenna**  
0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

## Examples

### Create and View Reflector-Backed Dipole Antennna

Create a reflector backed dipole that has 30cm length, 25cm width and spaced 7.5cm from the dipole for operation at 1 GHz.

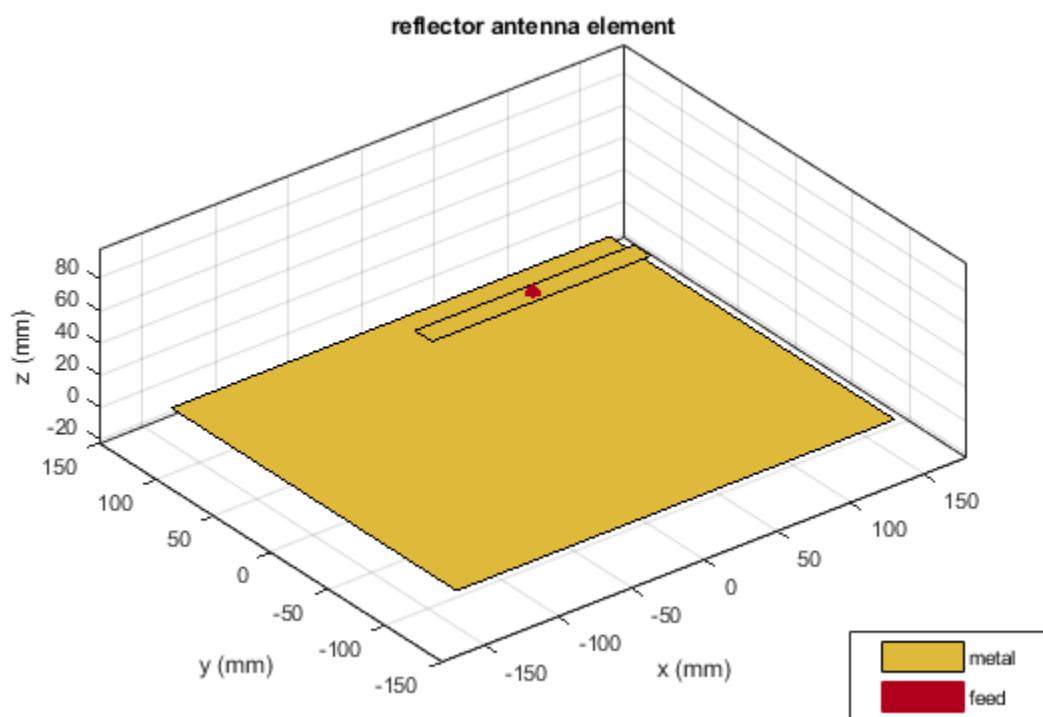

```
d = dipole('Length',0.15,'Width',0.015, 'Tilt',90,'TiltAxis',[0 1 0]);
rf = reflector('GroundPlaneLength',30e-2, 'GroundPlaneWidth',25e-2, ...
    'Spacing',7.5e-2);
rf.Exciter = d

rf =
    reflector with properties:

        Exciter: [1x1 dipole]
        Substrate: [1x1 dielectric]
    GroundPlaneLength: 0.3000
```

```
GroundPlaneWidth: 0.2500
    Spacing: 0.0750
EnableProbeFeed: 0
    Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]

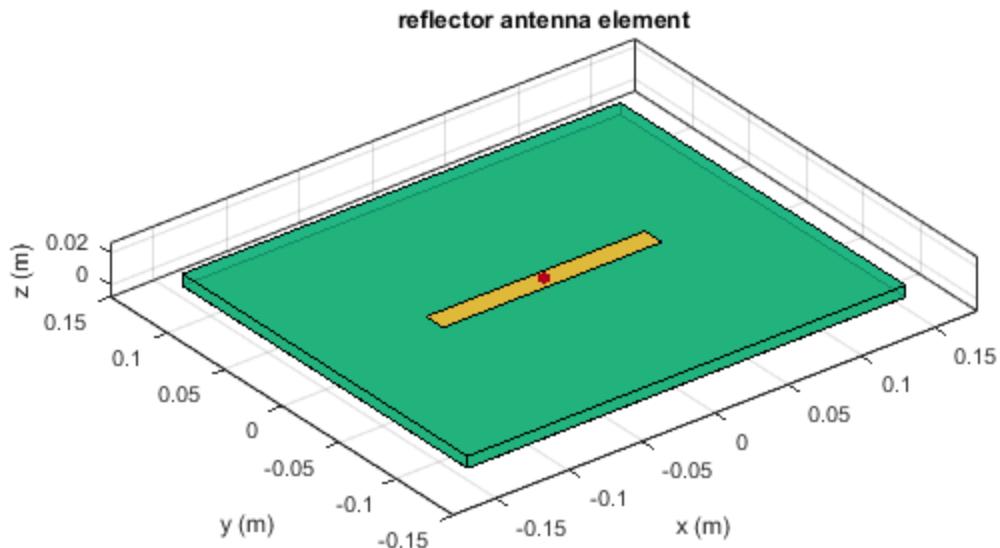

show(rf)
```

### Radiation Pattern of Reflector Backed Antenna

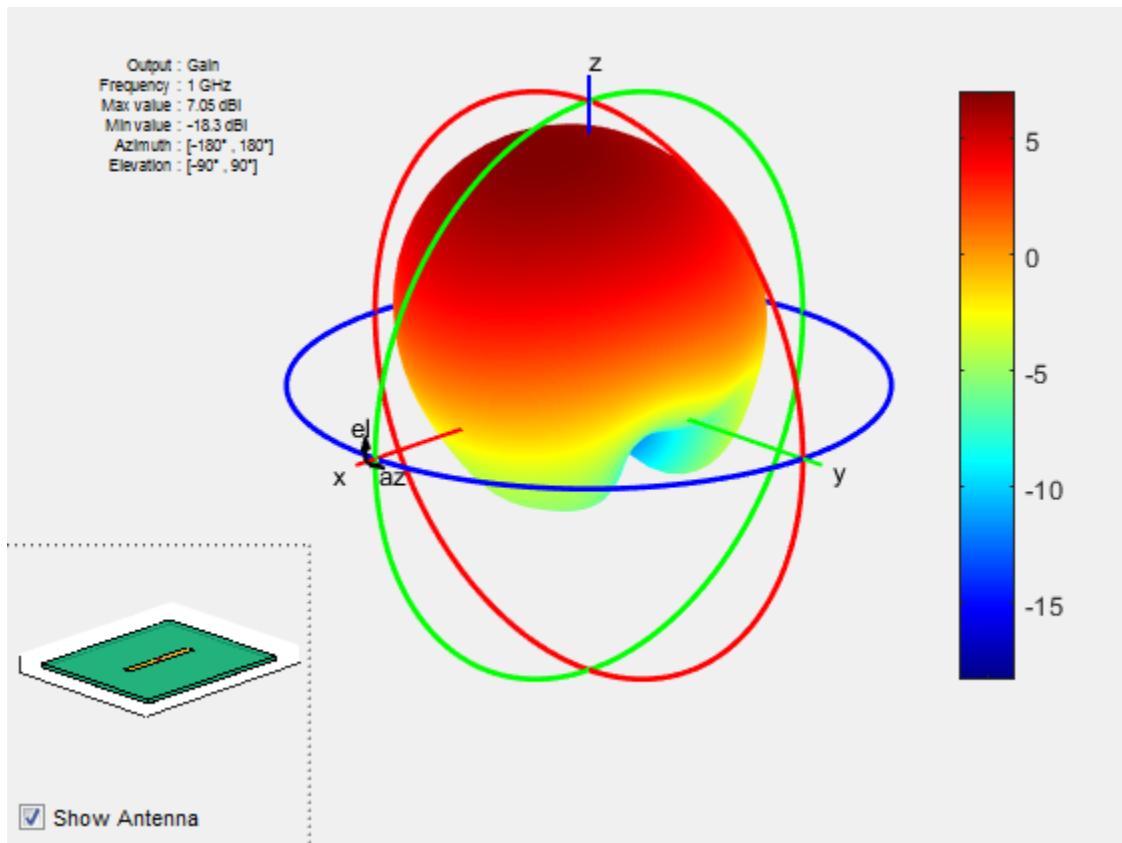

Create a reflector backed dipole antenna using a dielectric substrate 'FR4'.

```
d = dielectric('FR4');
di = dipole('Length',0.15,'Width',0.015, 'Tilt',90,'TiltAxis','Y');
rf = reflector('GroundPlaneLength',30e-2, 'GroundPlaneWidth',25e-2, ...
    'Spacing',7.5e-3,'Substrate',d);
rf.Exciter = di;
show(rf)
```

Plot the radiation pattern of the antenna at a frequency of 1 GHz.

```
figure
pattern(rf,1e9)
```

### Create Reflector-Backed Antenna Over Infinite Ground Plane

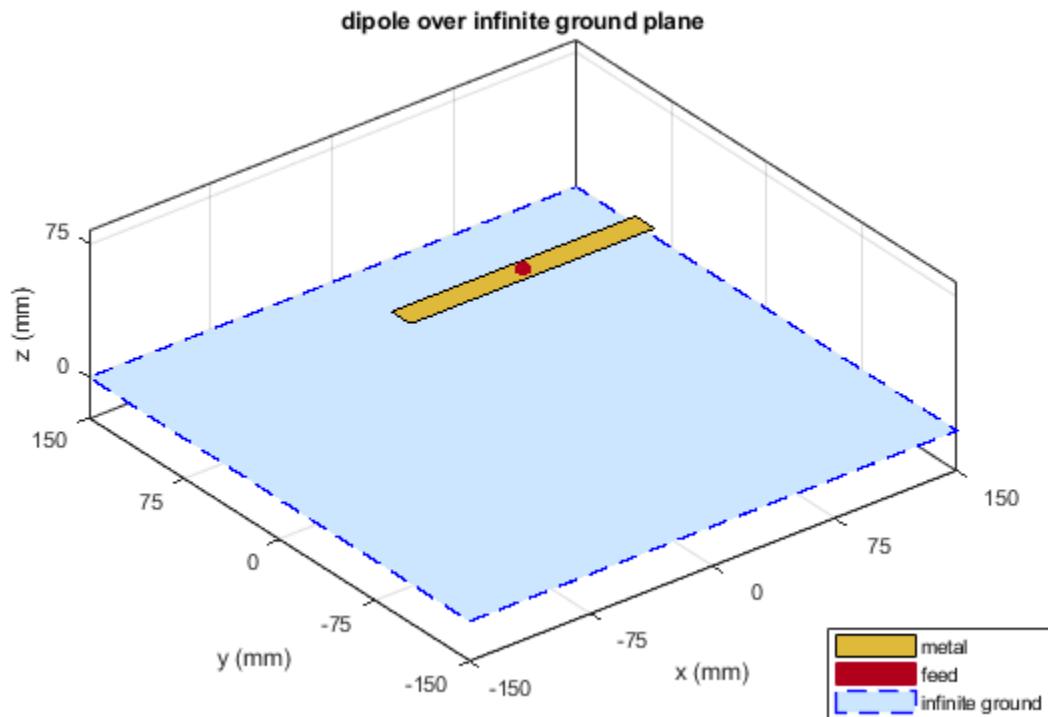

Create a reflector backed dipole that has 30cm length, 25cm width and spaced 7.5cm from the dipole for operation at 1 GHz.

```
d = dipole('Length',0.15,'Width',0.015, 'Tilt',90,'TiltAxis',[0 1 0]);
rf = reflector('GroundPlaneLength',inf, 'GroundPlaneWidth',25e-2, ...
    'Spacing',7.5e-2);
rf.Exciter = d;

rf = 
    reflector with properties:
```

```
Exciter: [1x1 dipole]
Substrate: [1x1 dielectric]
GroundPlaneLength: Inf
GroundPlaneWidth: 0.2500
Spacing: 0.0750
EnableProbeFeed: 0
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

```
show(rf)
```

### Antenna On Dielectric Substrate - Compare Gain Values

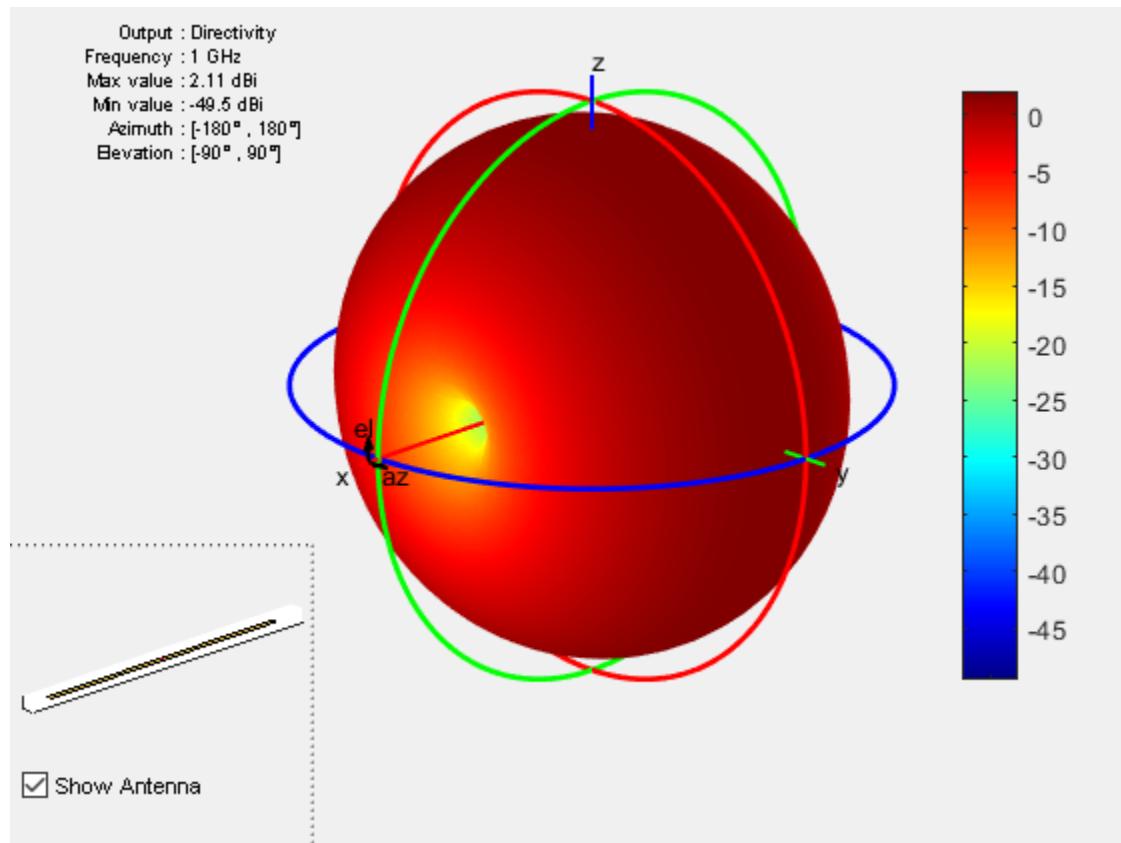

Compare the gain values of a dipole antenna in free space and dipole antenna on a substrate.

Design a dipole antenna at 1 GHz.

```
d = design(dipole,1e9);
l_by_w = d.Length/d.Width;
d.Tilt = 90;
d.TiltAxis = [0 1 0];
```

Plot the radiation pattern of the dipole in free space at 1GHz.

```
figure
pattern(d,1e9);
```

Use FR4 as the dielectric substrate.

```
t = dielectric('FR4')
eps_r = t.EpsilonR;
lambda_0 = physconst('lightspeed')/1e9;
lambda_d = lambda_0/sqrt(eps_r);
```

```
t =
```

```
dielectric with properties:
```

```
Name: 'FR4'
EpsilonR: 4.8000
```

```
LossTangent: 0.0260
Thickness: 0.0060
```

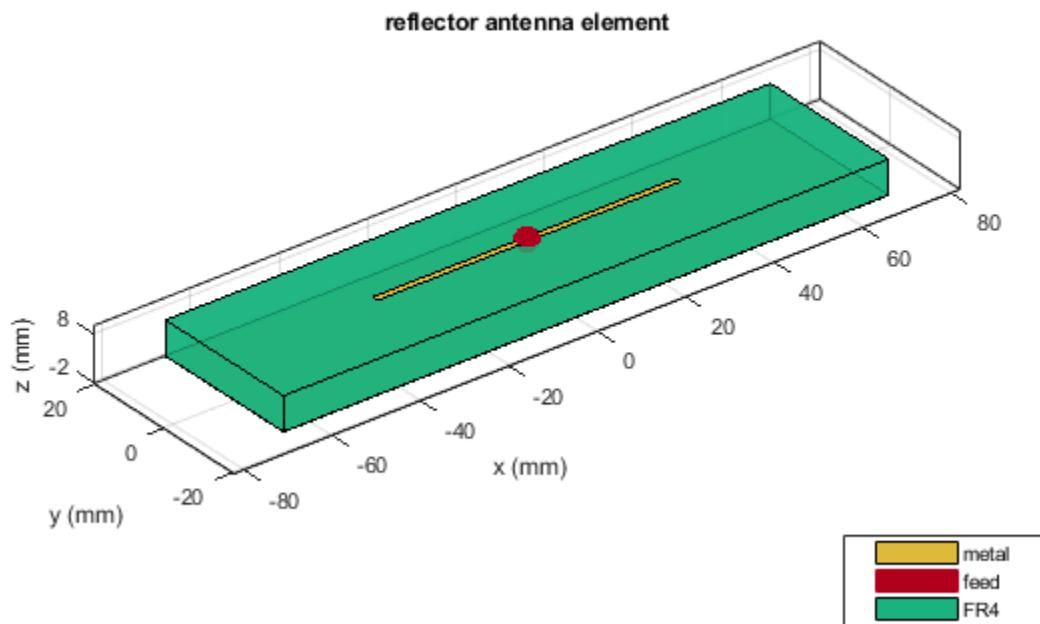

For more materials see <a href="matlab:openDielectricCatalog">catalog</a>

Adjust the length of the dipole based on the wavelength.

```
d.Length = lambda_d/2;
d.Width = d.Length/l_by_w;
```

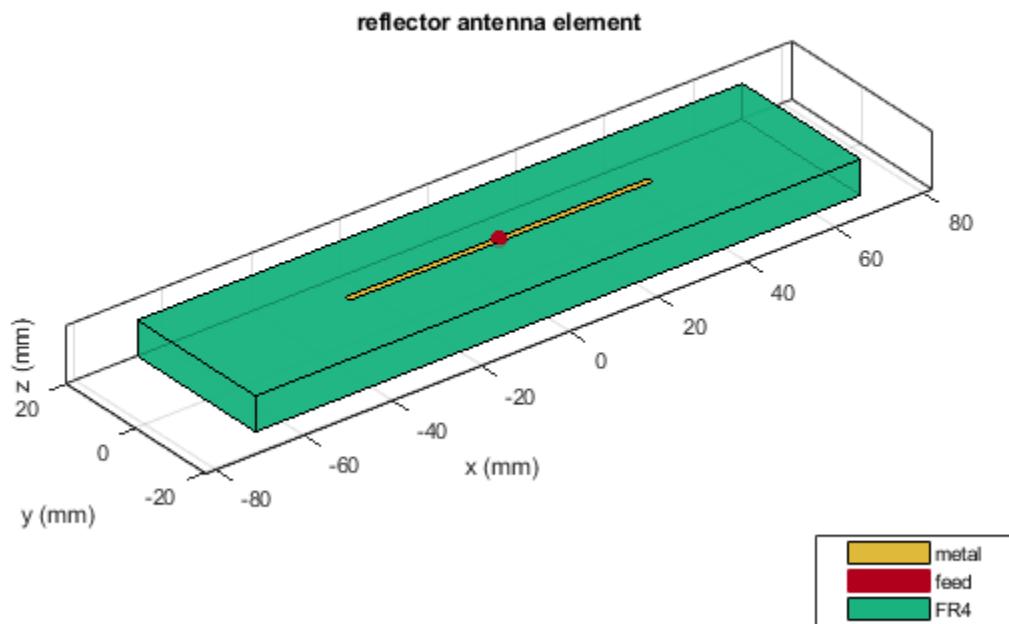

Design a reflector at 1 GHz with the dipole as the excitor and FR4 as the substrate.

```
rf = design(reflector,1e9);
rf = reflector('Exciter',d,'Spacing',7.5e-3,'Substrate',t);
rf.GroundPlaneLength = lambda_d;
rf.GroundPlaneWidth = lambda_d/4;
figure
show(rf)
```

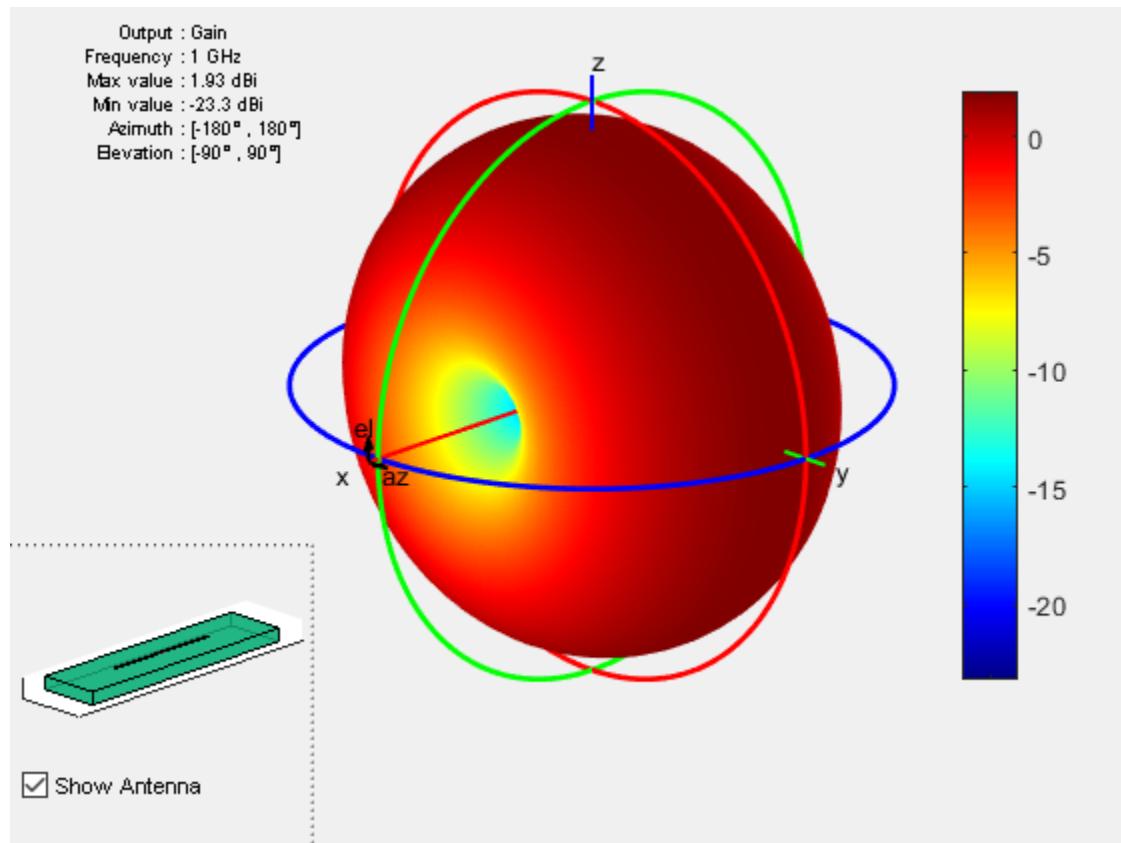

Remove the groundplane for plotting the gain of the dipole on the substrate.

```
rf.GroundPlaneLength = 0;  
show(rf)
```

Plot the radiation pattern of the dipole on the substrate at 1 GHz.

```
figure  
pattern(rf,1e9);
```

Compare the gain values.

- Gain of the dipole in free space = 2.11 dBi
- Gain of the dipole on substrate = 1.93 dBi

## slot

Create rectangular slot antenna on ground plane

### Description

The `slot` object is a rectangular slot antenna on a ground plane. The default slot has its first resonance at 130 MHz.

## Creation

### Syntax

```
s = slot  
s = slot(Name,Value)
```

### Description

`s = slot` creates a rectangular slot antenna on a ground plane.

`s = slot(Name,Value)` creates a rectangular slot antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain default values.

## Properties

### **Length — Slot length**

1 (default) | scalar

Slot length, specified as a scalar in meters.

Example: `'Length', 2`

Data Types: `double`

### **Width — Slot width**

0.1000 (default) | scalar

Slot width, specified a scalar in meters.

Example: `'Width', 0.02`

Data Types: `double`

### **SlotCenter — Slot antenna center**

[0 0 0] (default) | three-element vector in Cartesian coordinates

Slot antenna center, specified as a three-element vector in Cartesian coordinates.

Example: 'SlotCenter',[8 0 0]

Data Types: double

**GroundPlaneLength — Ground plane length**

1.5000 (default) | scalar

Ground plane length, specified as a scalar in meters. By default, the length is measured along the x-axis.

Example: 'GroundPlaneLength', 3

Data Types: double

**GroundPlaneWidth — Ground plane width**

1.5000 (default) | scalar

Ground plane width, specified as a scalar in meters. By default, the width is measured along the y-axis.

Example: 'GroundPlaneWidth', 4

Data Types: double

**FeedOffset — Distance from center along x-axis**

0 (default) | scalar

Distance from center along x-axis, specified as a scalar in meters. Offset from slot center is measured along the length.

Example: 'FeedOffset', 3

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency

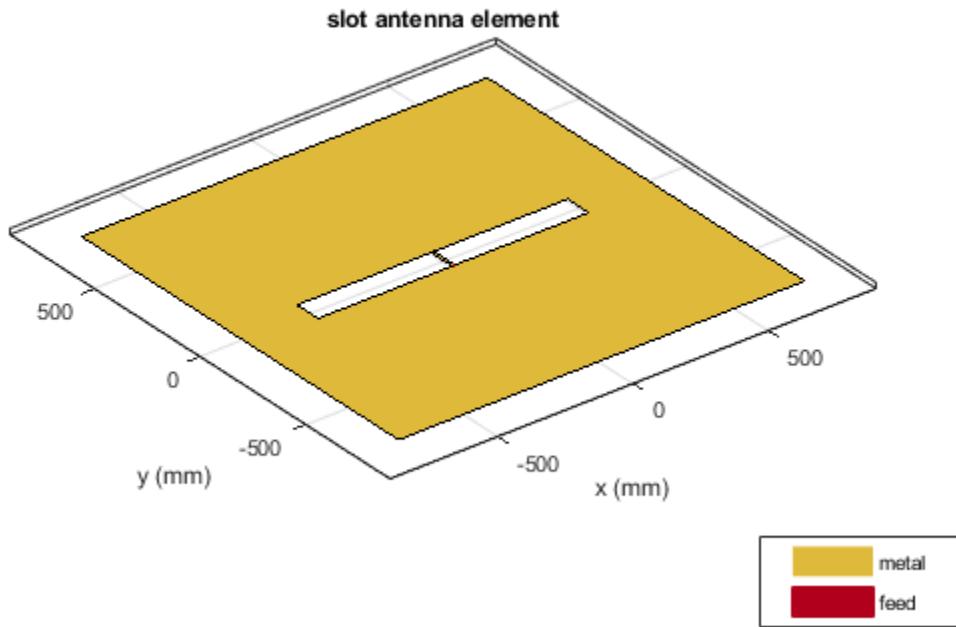

EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure

## spiralArchimedean

Create Archimedean spiral antenna

### Description

The `spiralArchimedean` object is a planar Archimedean spiral antenna on the X-Y plane. The Archimedean spiral is always center fed and has two arms. The field characteristics of this antenna are frequency independent. A realizable spiral has finite limits on the feeding region and the outermost point of any arm of the spiral. The spiral antenna exhibits a broadband behavior. The outer radius imposes the low frequency limit and the inner radius imposes the high frequency limit. The arm radius grows linearly as a function of the winding angle.

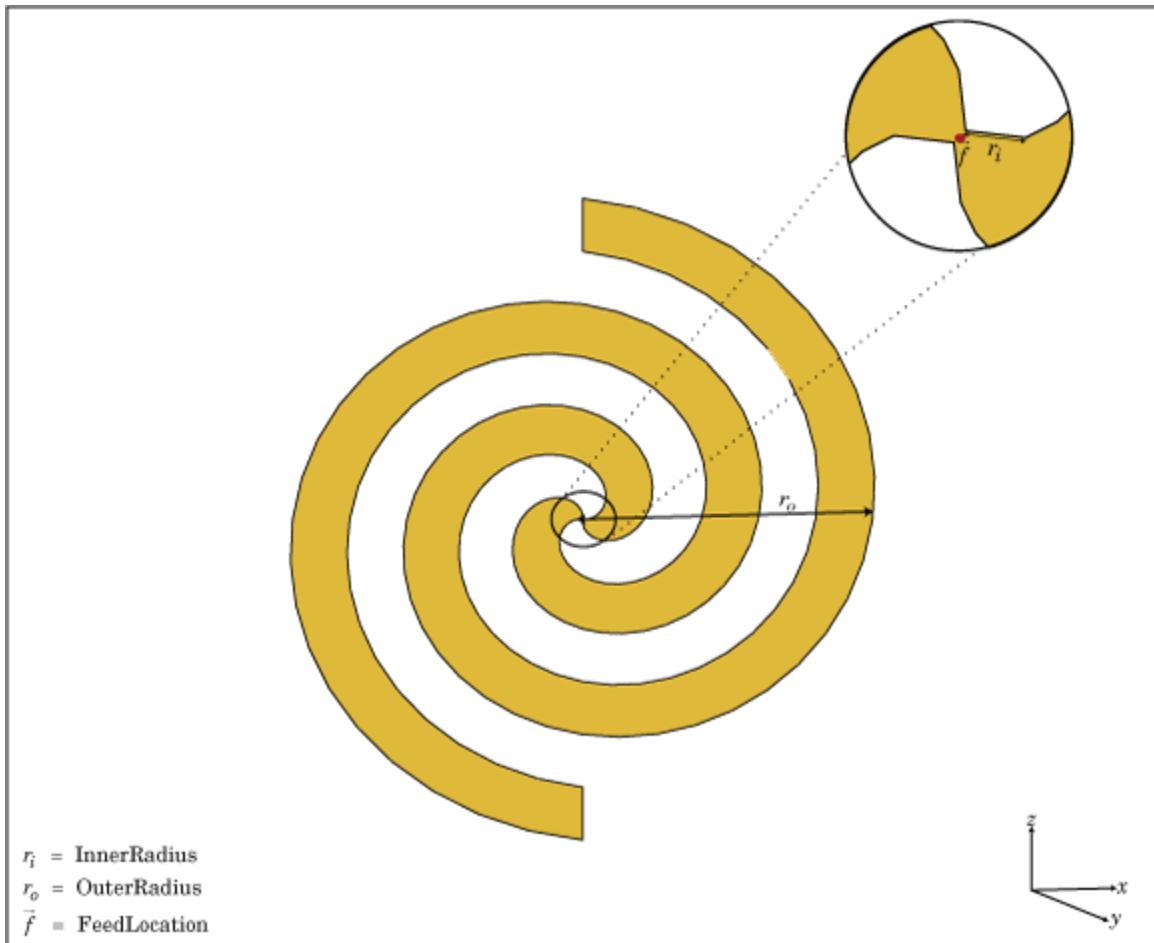

The equation of the Archimedean spiral is:

$$r = r_0 + a\phi$$

where:

- $r_0$  is the inner radius
- $a$  is the growth rate
- $\phi$  is the winding angle of the spiral

Archimedean spiral antenna is a self complimentary structure, where the spacing between the arms and the width of the arms are equal. The default antenna is center fed. The feed point coincides with the origin. the origin is located in the X-Y plane.

## Creation

## Syntax

```
sa = spiralArchimedean  
sa = spiralArchimedean(Name,Value)
```

## Description

`sa = spiralArchimedean` creates a planar Archimedean spiral on the X-Y plane. By default, the antenna operates over a broadband frequency range of 3–5 GHz.

`sa = spiralArchimedean(Name,Value)` creates a planar Archimedean spiral, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1,Value1, ..., NameN,ValueN`. Properties not specified retain their default values.

## Properties

### **Turns — Number of turns of spiral**

1.5000 (default) | scalar

Number of turns of spiral, specified as a scalar.

Example: '`Turns`', 2

Data Types: `double`

### **InnerRadius — Inner radius of spiral**

5.0000e-04 (default) | scalar

Spiral inner radius, specified as a scalar in meters.

Example: '`InnerRadius`', 1e-3

Data Types: `double`

### **OuterRadius — Outer radius of spiral**

0.0398 (default) | scalar

Outer radius of spiral, specified as a scalar in meters.

Example: '`OuterRadius`', 1e-3

Data Types: `double`

### **WindingDirection — Direction of spiral turns (windings)**

'CW' | 'CCW'

Direction of spiral turns (wingdings), specified as CW or CCW.

Example: 'WindingDirection','CW'

Data Types: char

#### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: `double`

## spiralEquiangular

Create equiangular spiral antenna

### Description

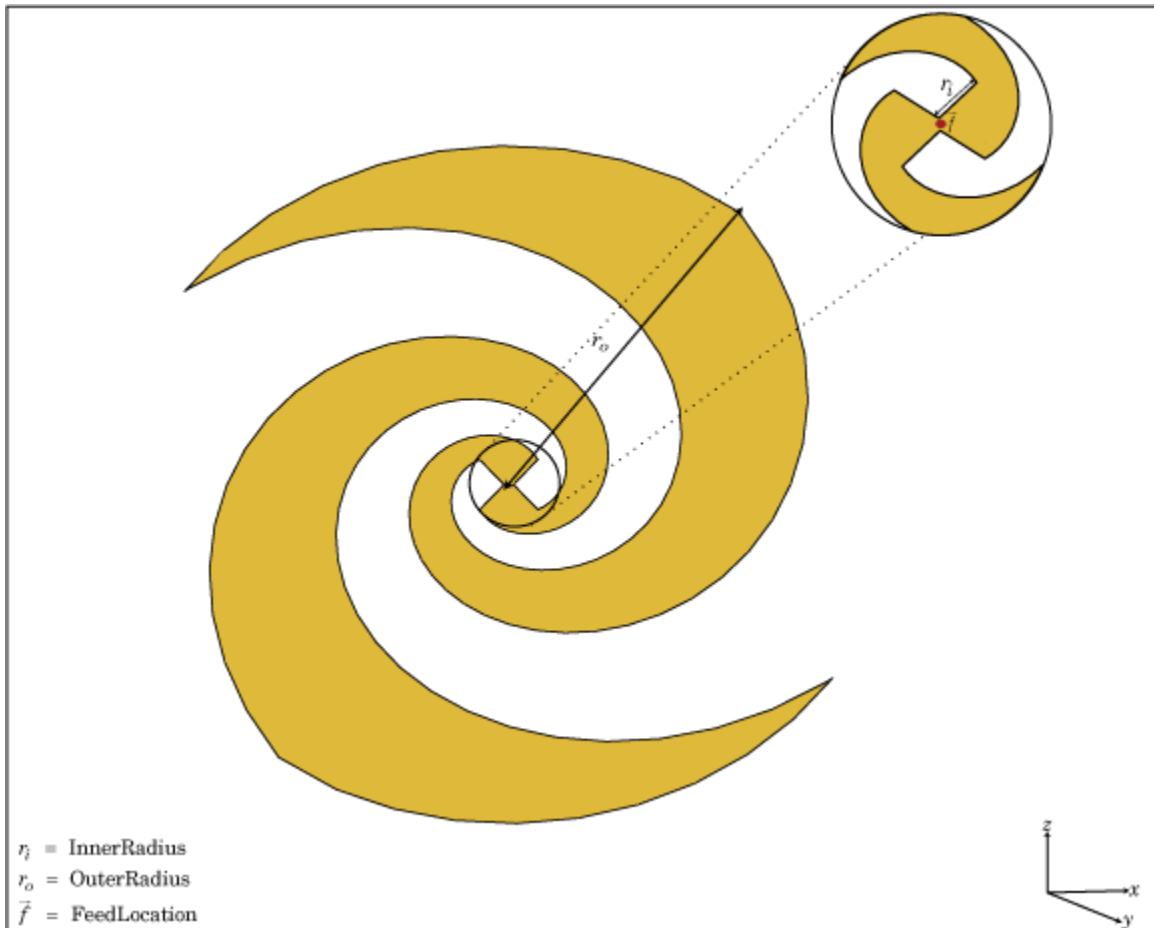

The `spiralEquiangular` object is a planar equiangular spiral antenna on the X-Y plane. The equiangular spiral is always center fed and has two arms. The field characteristics of the antenna are frequency independent. A realizable spiral has finite limits on the feeding region and the outermost point of any arm of the spiral. This antenna exhibits a broadband behavior. The outer radius imposes the low frequency limit and the inner radius imposes the high frequency limit. The arm radius grows linearly as a function of the winding angle. As a result, outer arms of the spiral are shaped to minimize reflections.

The equation of the equiangular spiral is:

$$r = r_0 e^{a\phi}$$

, where:

- $r_0$  is the starting radius
- $a$  is the growth rate
- $\phi$  is the winding angle of the spiral

## Creation

### Syntax

```
se = spiralEquiangular  
se = spiralEquiangular(Name,Value)
```

## Description

`se = spiralEquiangular` creates a planar equiangular spiral in the X-Y plane. By default, the antenna operates over a broadband frequency 4–10 GHz.

`se = spiralEquiangular(Name,Value)` creates an equiangular spiral antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **GrowthRate — Equiangular spiral growth rate**

0.3500 (default) | scalar

Equiangular spiral growth rate, specified as a scalar.

Example: `'GrowthRate', 1.2`

Data Types: `double`

### **InnerRadius — Inner radius of spiral**

0.0020 (default) | scalar

Inner radius of spiral, specified as a scalar in meters.

Example: `'InnerRadius', 1e-3`

Data Types: `double`

### **OuterRadius — Outer radius of spiral**

0.0189 (default) | scalar

Outer radius of spiral, specified as a scalar in meters.

Example: `'OuterRadius', 1e-3`

Data Types: `double`

### **WindingDirection — Direction of spiral turns (wingdings)**

`'CW'` | `'CCW'`

Direction of spiral turns (wingdings), specified as CW or CCW.

Example: 'WindingDirection','CW'

Data Types: char

#### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Object Functions

## vivaldi

Create Vivaldi notch antenna on ground plane

### Description

The `vivaldi` object is a Vivaldi notch antenna on a ground plane.

## Creation

### Syntax

```
vi = vivaldi  
vi = vivaldi(Name,Value)
```

### Description

`vi = vivaldi` creates a Vivaldi notch antenna on a ground plane. By default, the antenna operates at a frequency range of 1–2 GHz and is located in the X-Y plane.

`vi = vivaldi(Name,Value)` creates Vivaldi notch antenna, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties you do not specify retains default values.

## Properties

### **TaperLength — Taper length**

0.2430 (default) | scalar

Taper length of `vivaldi`, specified a scalar in meters.

Example: '`TaperLength`', `2e-3`

### **ApertureWidth — Aperture width**

0.1050 (default) | scalar

Aperture width, specified as a scalar in meters.

Example: '`ApertureWidth`', `3e-3`

### **OpeningRate — Taper opening rate**

25 (default) | scalar

Taper opening rate, specified a scalar. This property determines the rate at which the notch transitions from the feedpoint to the aperture. When `OpeningRate` is 0, the notch has a liner profile and for other values it has an exponential profile.

Example: `'OpeningRate', 0.3`

Data Types: `double`

**SlotLineWidth — Slot line width**

`5.0000e-04` (default) | scalar

Slot line width, specified as a scalar in meters.

Example: `'SlotLineWidth', 3`

Data Types: `double`

**CavityDiameter — Cavity termination diameter**

`0.0240` (default) | scalar

Cavity termination diameter, specified a scalar in meters.

Example: `'CavityDiameter', 2`

Data Types: `double`

**CavityToTaperSpacing — Cavity to taper distance of transition**

`0.0230` (default) | scalar

Cavity to taper distance of transition, specified as a scalar in meters. By default, this property is measured along x-axis.

Example: `'CavityToTaperSpacing', 3`

Data Types: `double`

**GroundPlaneLength — Ground plane length**

`0.3000` (default) | scalar

Ground plane length, specified as a scalar in meters. By default, ground plane length is measured along the x-axis.

Example: `'GroundPlaneLength', 2`

Data Types: `double`

**GroundPlaneWidth — Ground plane width**

0.1250 (default) | scalar

Ground plane width, specified a scalar in meters. By default, ground plane width is measured along the y-axis.

Example: 'GroundPlaneWidth', 4

Data Types: double

**FeedOffset — Distance from feed along x-axis**

0 (default) | scalar

Distance from feed along x-axis, specified a scalar in meters.

Example: 'FeedOffset', 3

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. You can add a load anywhere on the surface of the antenna. By default, the load is at the origin. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`. `lumpedElement` is the object handle for the load created using `lumpedElement`.

Example: `vi.Load = lumpedElement('Impedance', 75)`

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector in degrees.

Example: 'Tilt', 90

Example: `vi.Tilt = [90 90 0]`

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points space.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: vi.TiltAxis = z

Data Types: double

## Object Functions

# waveguide

Create rectangular waveguide

## Description

The `waveguide` object is an open-ended rectangular waveguide. The default rectangular waveguide is the WR-90 and functions in the X-band. The X-band has a cutoff frequency of 6.5 GHz and ranges from 8.2 GHz to 12.5 GHz.

## Creation

### Syntax

```
wg = waveguide  
wg = waveguide(Name,Value)
```

## Description

`wg = waveguide` creates an open-ended rectangular waveguide.

`wg = waveguide(Name,Value)` creates a rectangular waveguide with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. Properties not specified retain their default values.

## Properties

### **FeedHeight — Height of feed**

`0.0060` (default) | scalar

Height of feed, specified as a scalar in meters. By default, the feed height is chosen for an operating frequency of 12.5 GHz.

Example: `'FeedHeight', 0.0050`

Data Types: double

### **FeedWidth — Width of feed**

`6.0000e-05` (default) | scalar

Width of feed, specified as a scalar in meters.

Example: `'FeedWidth', 5e-05`

Data Types: double

### **Length — Rectangular waveguide length**

`0.0240` (default) | scalar in meters

Rectangular waveguide length, specified as a scalar in meters. By default, the waveguide length is  $1\lambda$ , where:

$$\lambda = c / f$$

- $c$  = speed of light, 299792458 m/s
- $f$  = operating frequency of the waveguide

Example: 'Length', 0.09

Data Types: double

**Width — Rectangular waveguide width**

0.0229 (default) | scalar in meters

Rectangular waveguide width, specified as a scalar in meters.

Example: 'Width', 0.05

Data Types: double

**Height — Rectangular waveguide height**

0.0102 (default) | scalar

Rectangular waveguide height, specified as a scalar in meters.

Example: 'Height', 0.0200

Data Types: double

**FeedOffset — Signed distance of feedpoint from center of ground plane**

[-0.0060 0] (default) | two-element vector

Signed distance of feedpoint from center of ground plane, specified as a two-element vector in meters. By default, the feed is at an offset of  $\lambda/4$  from the shortened end on the X-Y plane.

Example: 'FeedOffset', [-0.0070 0.01]

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## **Object Functions**

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array

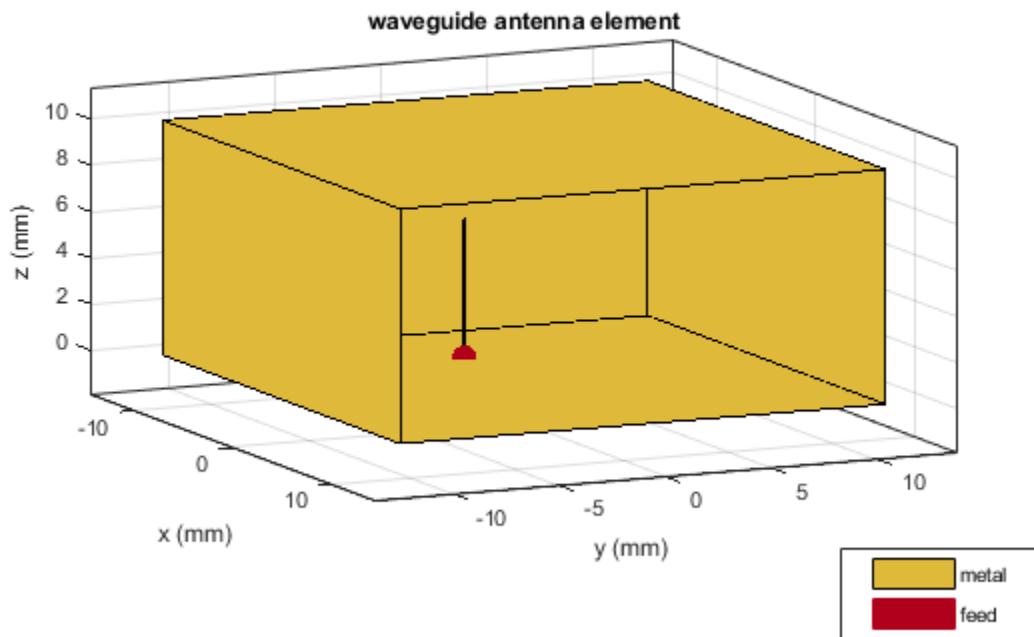

mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Default Rectangular Waveguide

Create a rectangular waveguide using default dimensions. Display the waveguide.

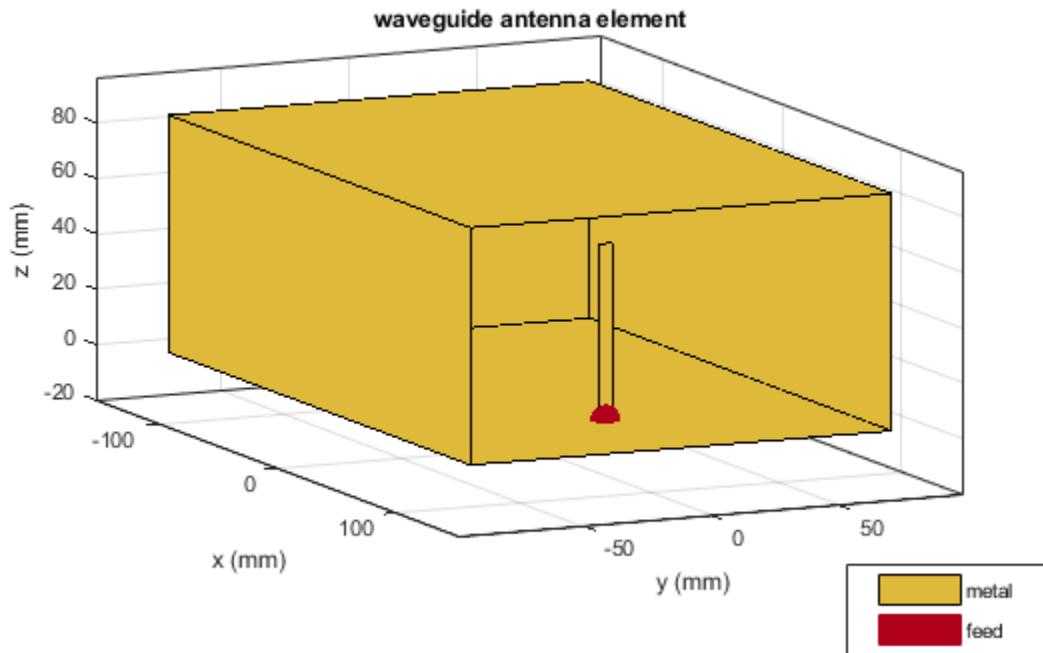

```
wg = waveguide  
wg =  
    waveguide with properties:  
  
        Length: 0.0240  
        Width: 0.0229  
        Height: 0.0102  
        FeedWidth: 6.0000e-05  
        FeedHeight: 0.0060  
        FeedOffset: [-0.0060 0]  
        Tilt: 0  
        TiltAxis: [1 0 0]  
        Load: [1x1 lumpedElement]  
  
show(wg)
```

### Radiation Pattern of WR-650 Rectangular Waveguide

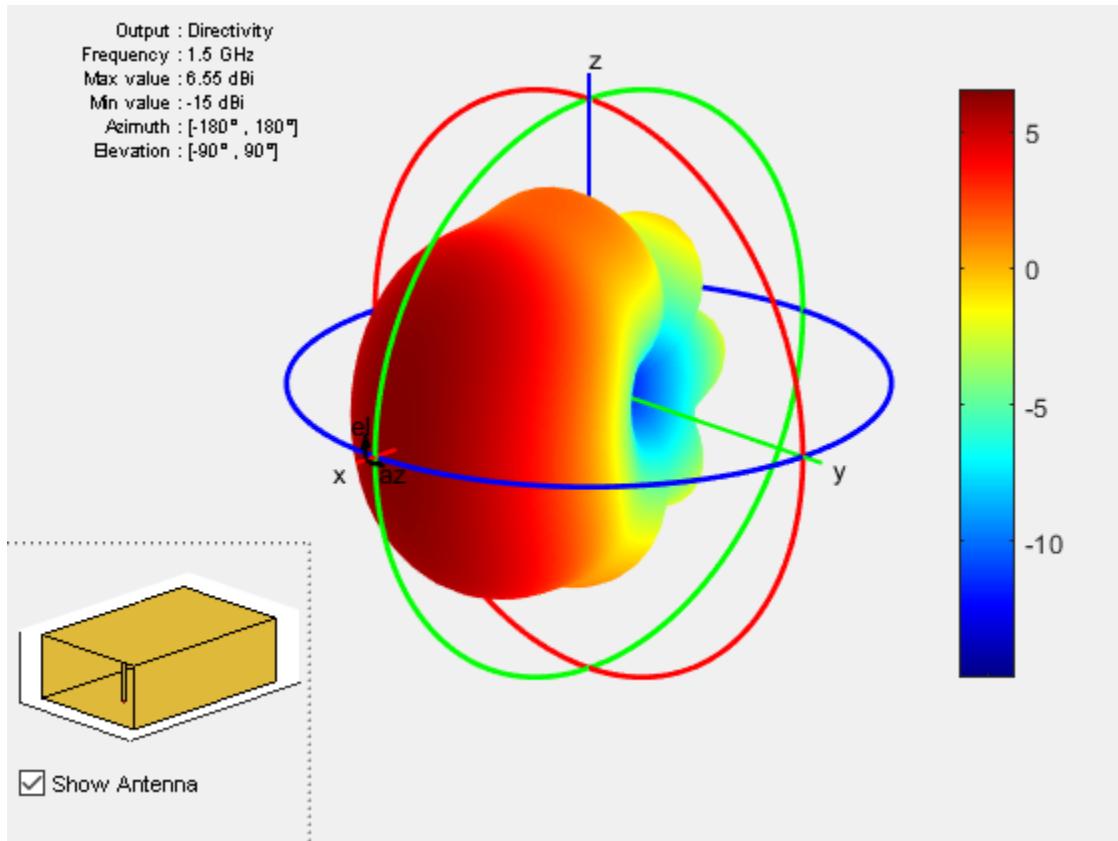

Create a WR-650 rectangular waveguide and display it.

```
wg = waveguide('Length',0.254,'Width',0.1651,'Height',0.0855,...  
    'FeedHeight',0.0635,'FeedWidth',0.00508,'FeedOffset',[0.0635 0]);  
show(wg)
```

Plot the radiation pattern of this waveguide at 1.5 GHz.

```
figure  
pattern(wg,1.5e9)
```

# yagiUda

Create Yagi-Uda array antenna

## Description

The `yagiUda` class creates a classic Yagi-Uda array comprised of an exciter, reflector, and  $N$ -directors along the z-axis. The reflector and directors create a traveling wave structure that results in a directional radiation pattern.

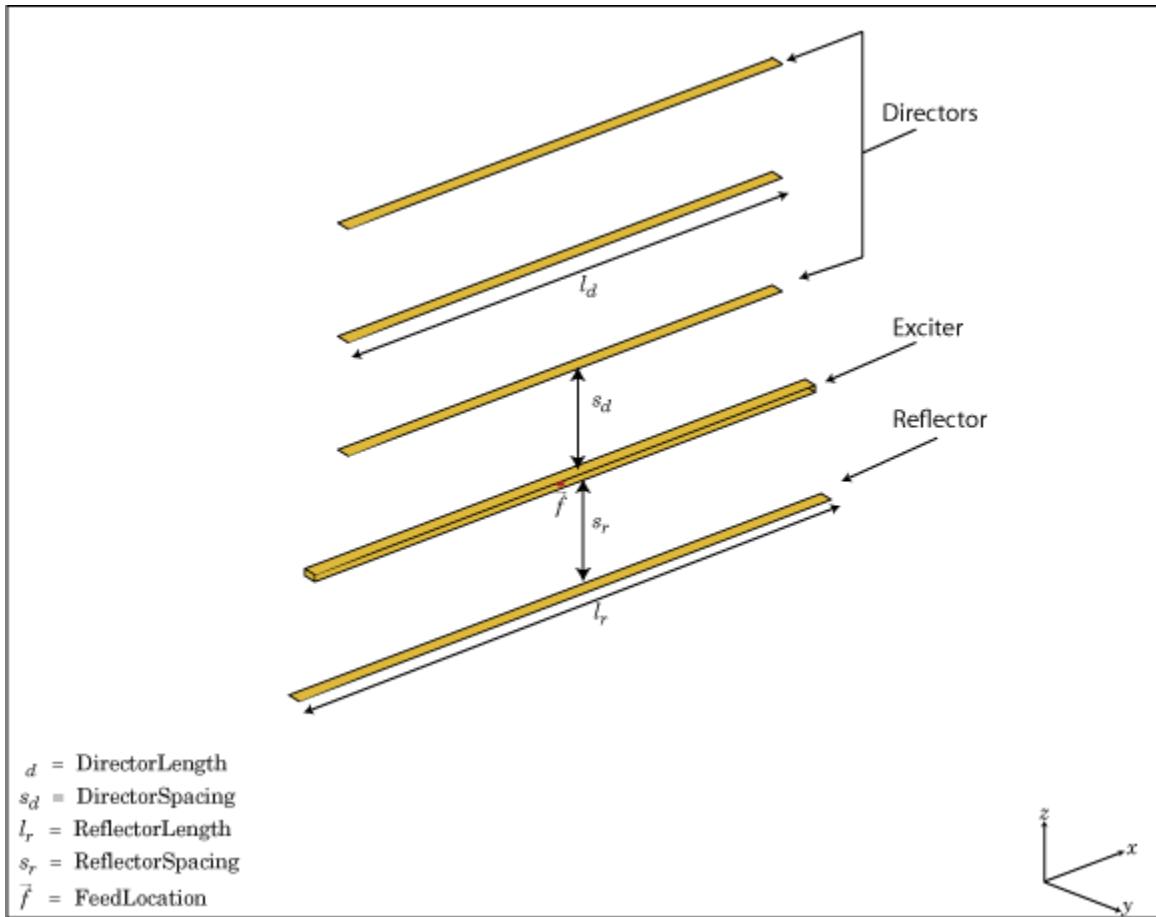

The exciter, reflector, and directors have equal widths and are related to the diameter of an equivalent cylindrical structure by the equation

$$w = 2d = 4r$$

where:

- $d$  is the diameter of equivalent cylinder
- $r$  is the radius of equivalent cylinder

For a given cylinder radius, use the `cylinder2strip` utility function to calculate the equivalent width. A typical Yagi-Uda antenna array uses folded dipole as an exciter, due to its high impedance. The Yagi-Uda is center-fed and the feed point coincides with the origin. In place of a folded dipole, you can also use a planar dipole as an exciter.

## Creation

## Syntax

```
h = yagiUda  
h = yagiUda(Name,Value)
```

## Description

`h = yagiUda` creates a half-wavelength Yagi-Uda array antenna along the Z-axis. The default Yagi-Uda uses folded dipole as three directors, one reflector and a folded dipole as an exciter. By default, the dimensions are chosen for an operating frequency of 300 MHz.

`h = yagiUda(Name,Value)` creates a half-wavelength Yagi-Uda array antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain default values.

## Properties

### **Exciter — Antenna type used as exciter**

`dipoleFolded` (default) | object

Antenna Type used as exciter, specified as the comma-separated pair consisting of '`Exciter`' and an object.

Example: `'Exciter', dipole`

### **NumDirectors — Total number of director elements**

`3` (default) | scalar

Total number of director elements, specified as a scalar.

---

**Note** Number of director elements should be less than or equal to 20.

---

Example: `'NumDirectors', 13`

Data Types: `double`

### **DirectorLength — Director length**

`0.4080` (default) | scalar | vector

Director length, specified as a scalar or vector in meters.

Example: `'DirectorLength', [0.4 0.5]`

Data Types: double

**DirectorSpacing — Spacing between directors**

0.3400 (default) | scalar | vector

Spacing between directors, specified as a scalar or vector in meters.

Example: 'DirectorSpacing', [0.4 0.5]

Data Types: double

**ReflectorLength — Reflector length**

0.5000 (default) | scalar

Reflector length, specified as a scalar in meters.

Example: 'ReflectorLength', 0.3

Data Types: double

**ReflectorSpacing — Spacing between exciter and reflector**

0.2500 (default) | scalar

Spacing between exciter and reflector, specified as a scalar in meters.

Example: 'ReflectorSpacing', 0.4

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array

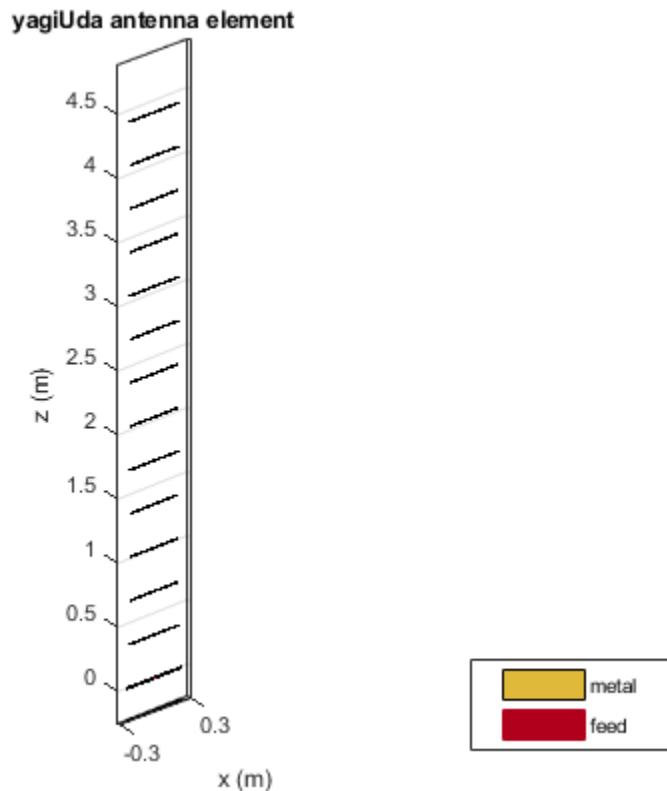

patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Create and View Yagi-Uda Array Antenna

Create and view a Yagi-Uda array antenna with 13 directors.

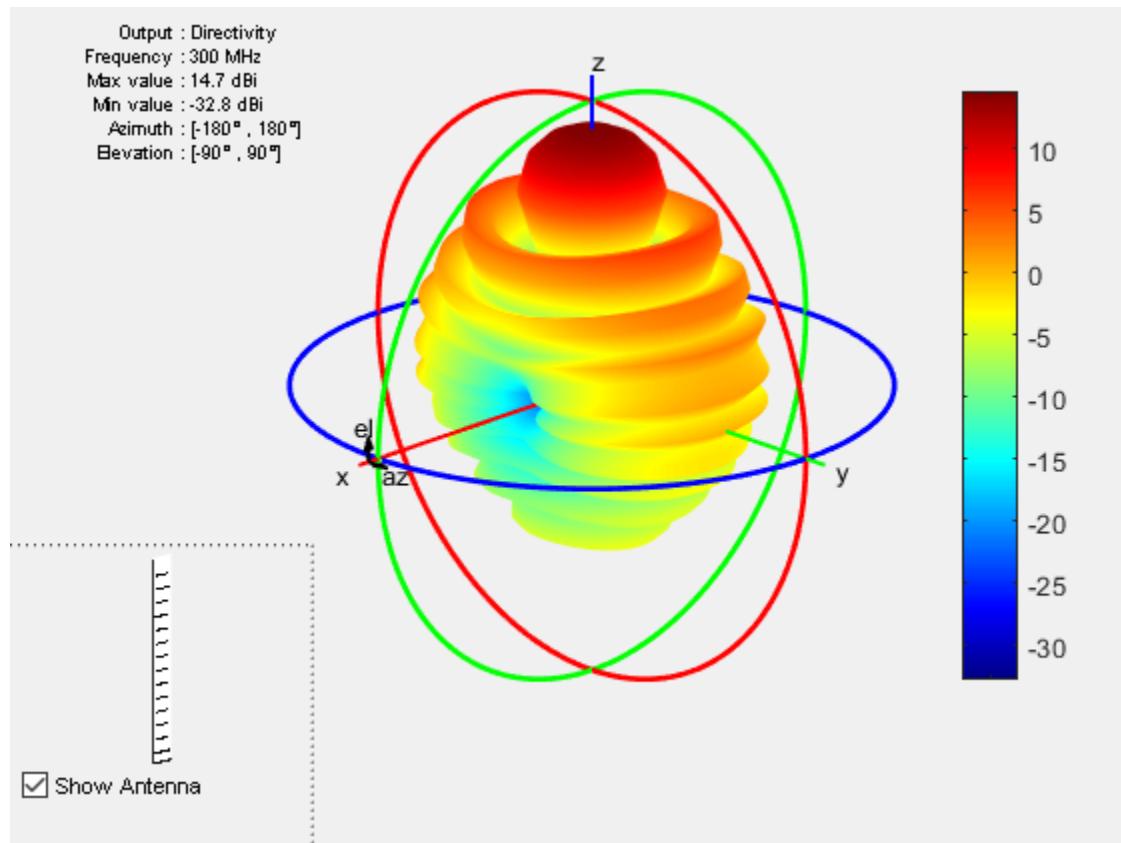

```
y = yagiUda('NumDirectors',13);  
show(y)
```

### Radiation Pattern of Yagi-Uda Array Antenna

Plot radiation pattern of a Yagi-Uda array antenna at a frequency of 30 0MHz.

```
y = yagiUda('NumDirectors',13);  
pattern(y,300e6)
```

### Calculate Cylinder to Strip Approximation

Calculate the width of the strip approximation to a cylinder of radius 20 mm.

```
w = cylinder2strip(20e-3)
```

```
w = 0.0800
```

## Topics

“Rotate Antenna and Arrays”

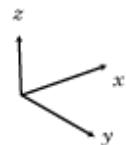

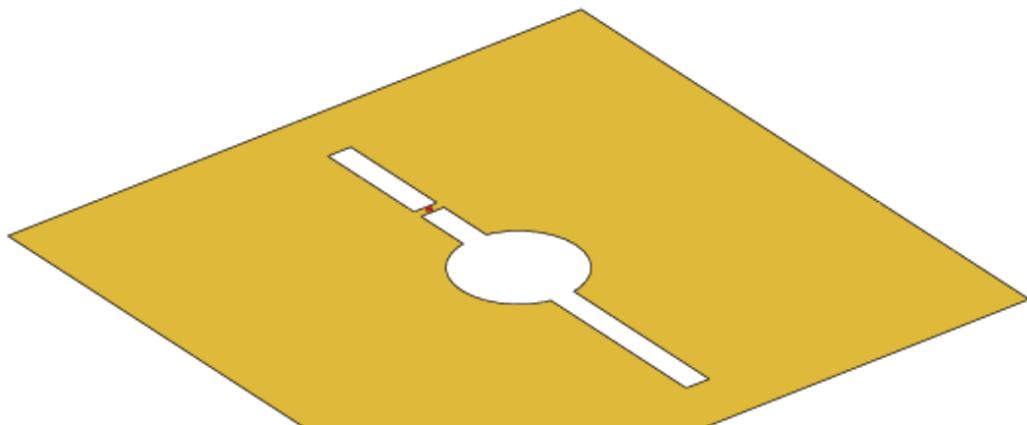

Introduced in R2015a

## customAntennaGeometry

Create antenna represented by 2-D custom geometry

### Description

The `customAntennaGeometry` object is an antenna represented by a 2-D custom geometry on the X-Y plane. Using `customAntennaGeometry`, you can import a planar mesh, define the feed for this mesh to create an antenna, analyze the antenna, and use it in finite or infinite arrays. The image shown is a custom slot antenna.

## Creation

### Syntax

```
ca = customAntennaGeometry  
ca = customAntennaGeometry(Name,Value)
```

### Description

`ca = customAntennaGeometry` creates a 2-D antenna represented by a custom geometry, based on the specified boundary.

`ca = customAntennaGeometry(Name,Value)` creates a 2-D planar antenna geometry, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Boundary — Boundary information in Cartesian coordinates**

cell array

Boundary information in Cartesian coordinates, specified as a cell array in meters.

Data Types: `double`

### **Operation — Boolean operation performed on boundary list**

'P1' (default) | character vector

Boolean operation performed on the boundary list, specified as a character vector.

Example: 'Operation', 'P1-P2'

Data Types: `double`

### **FeedLocation — Antenna feed location in Cartesian coordinates**

[0 0 0] (default) | three-element vector

Antenna feed location in Cartesian coordinates, specified as a three-element vector. The three-element vector is the X, Y, and Z coordinates respectively.

Example: 'FeedLocation', [0 0.2 0]

Data Types: double

### **FeedWidth — Width of feed section**

0.0100 (default) | scalar

Width of feed section, specified as a scalar in meters.

Example: 'FeedWidth', 0.05

Data Types: double

### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`.`lumpedElement` is the object handle for the load created using `lumpedElement`.

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.

- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Object Functions

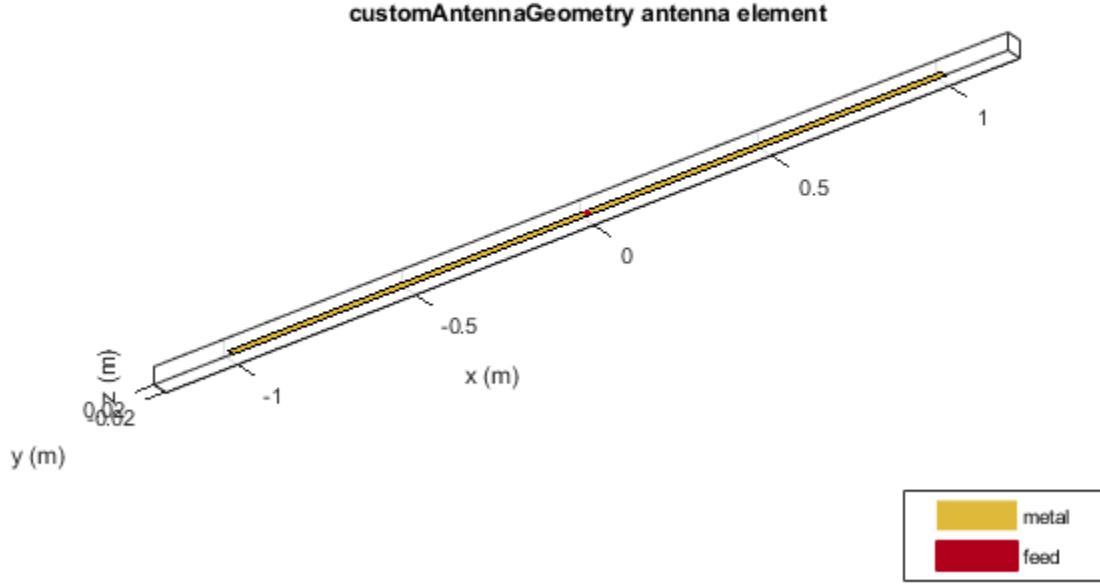

show	Display antenna or array structure; Display shape as filled patch

## Examples

### Custom Dipole Antenna

Create a custom dipole antenna and view it.

```
ca = customAntennaGeometry  
  
ca =  
    customAntennaGeometry with properties:  
  
        Boundary: {[4x3 double]}  
        Operation: 'P1'  
        FeedLocation: [0 0 0]  
        FeedWidth: 0.0200  
        Tilt: 0  
        TiltAxis: [1 0 0]  
        Load: [1x1 lumpedElement]  
  
show(ca)
```

### Custom Slot Antenna

Create a custom slot antenna using three rectangles and a circle.

Make three rectangles of 0.5 m x 0.5 m, 0.02 m x 0.4 m and 0.03 m x 0.008 m.

```
pr = em.internal.makerectangle(0.5,0.5);  
pr1 = em.internal.makerectangle(0.02,0.4);  
pr2 = em.internal.makerectangle(0.03,0.008);
```

Make a circle of radius 0.05 m.

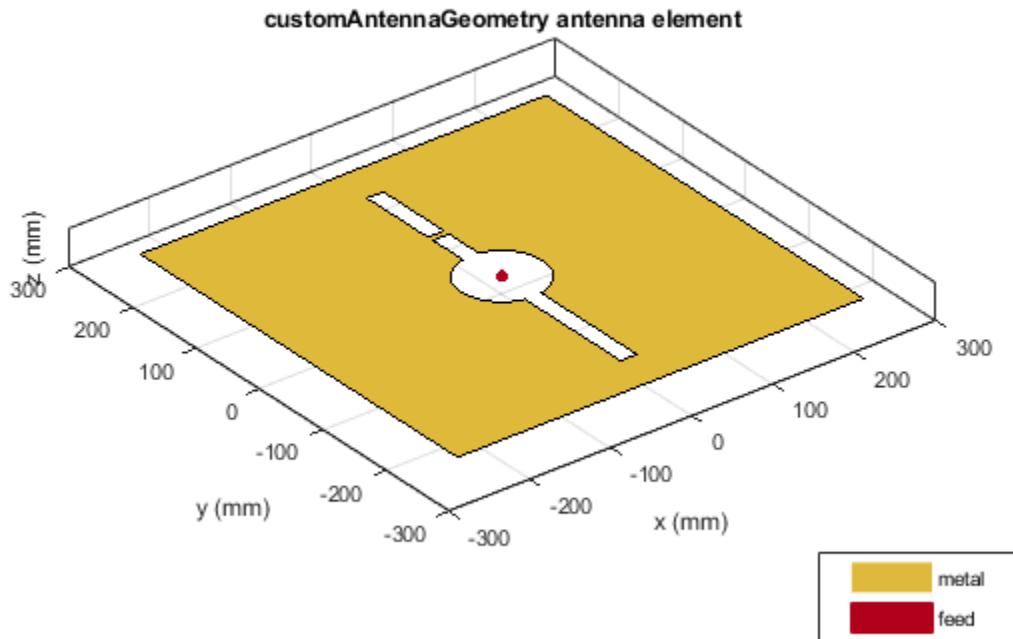

```
ph = em.internal.makecircle(0.05);
```

Translate the third rectangle to the X-Y plane using the coordinates [0 0.1 0].

```
pf = em.internal.translateshape(pr2,[0 0.1 0]);
```

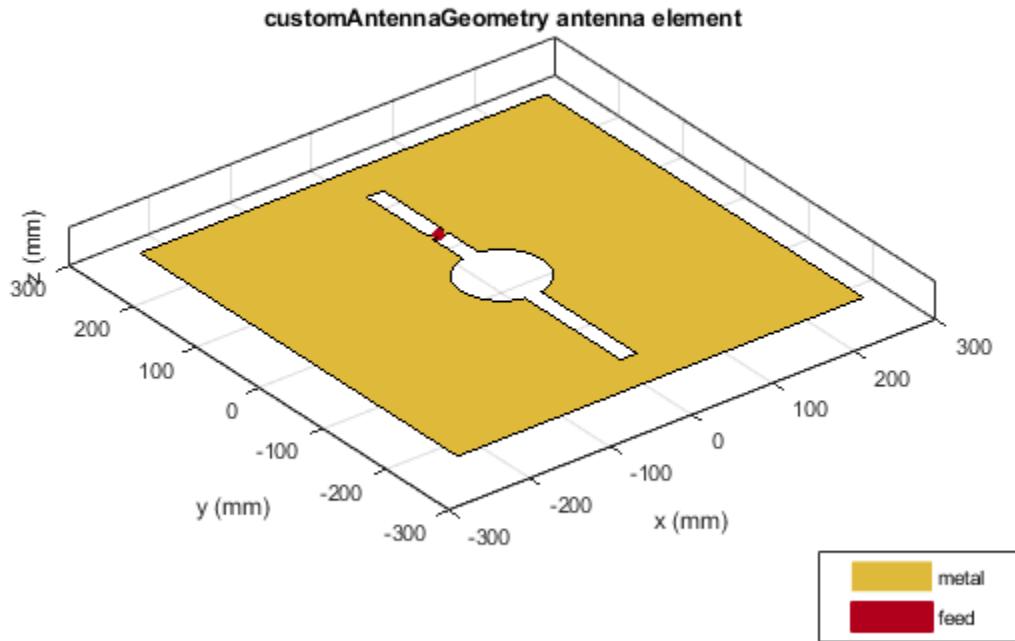

Create a custom slot antenna element using the specified boundary shapes. Transpose pr, ph, pr1, and pf to make sure the boundary inputs are column vector arrays.

```
c = customAntennaGeometry('Boundary',{pr',ph',pr1',pf'},...  
    'Operation','P1-P2-P3+P4');  
figure;  
show(c);
```

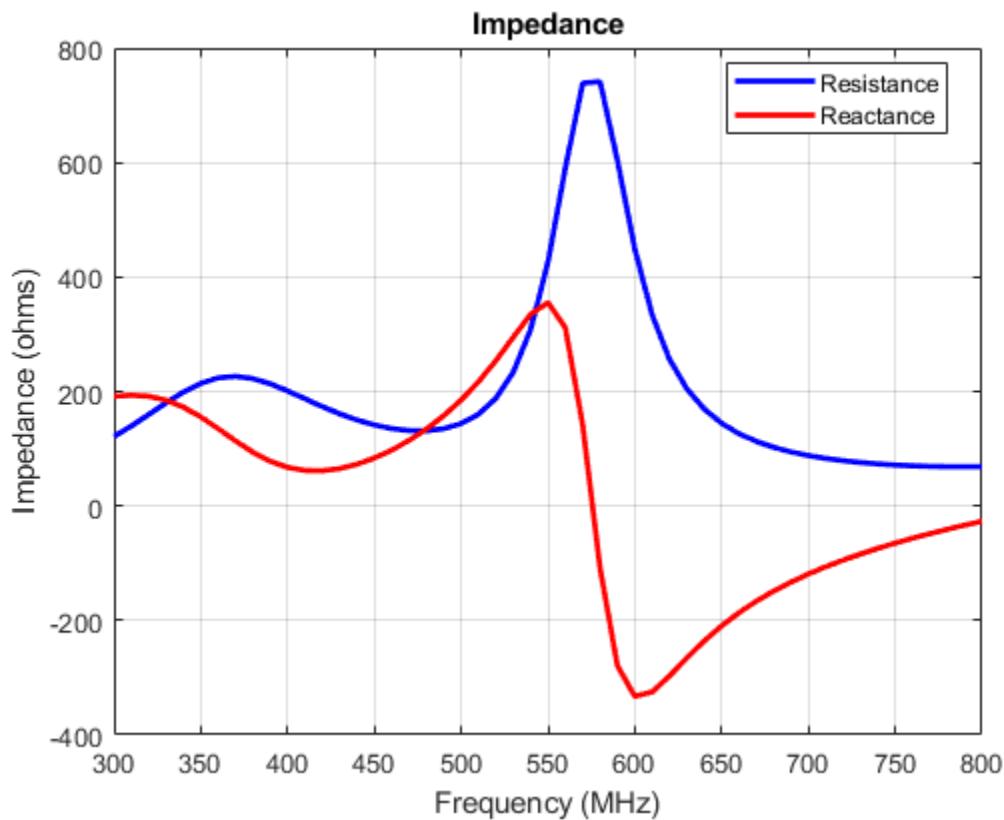

Move the feed location to new coordinates.

```
c.FeedLocation = [0,0.1,0];  
figure;  
show(c);
```

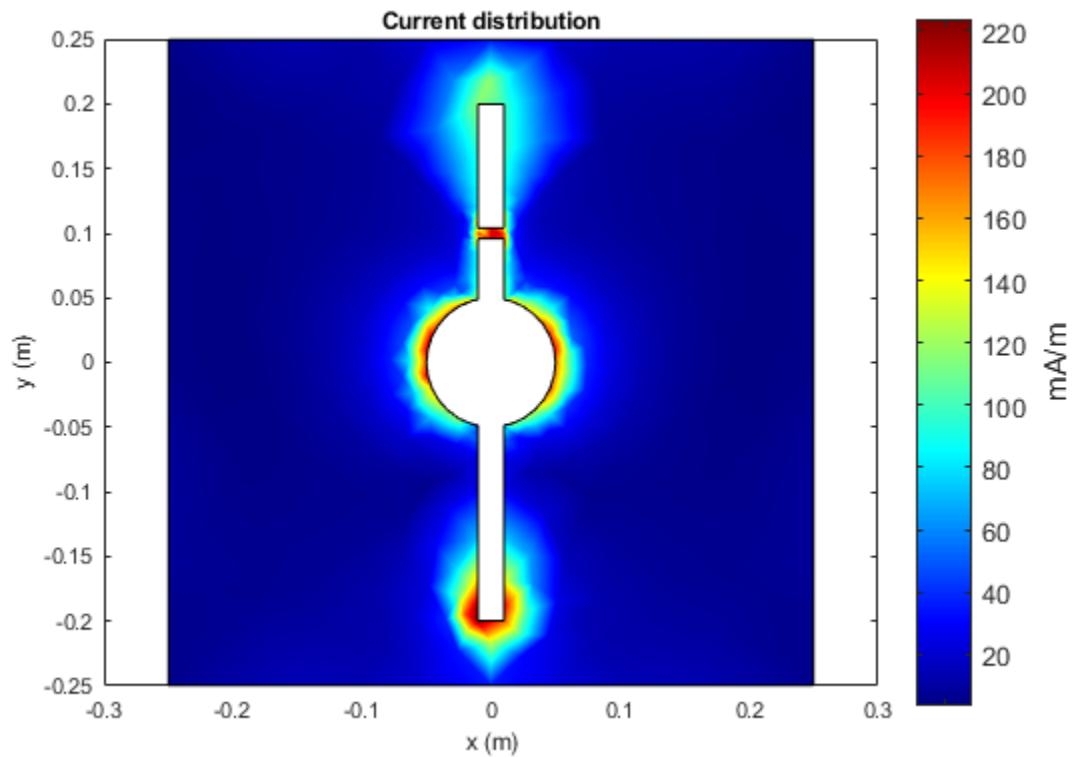

Analyze the impedance of the antenna from 300 MHz to 800 MHz.

```
figure;  
impedance(c, linspace(300e6,800e6,51));
```

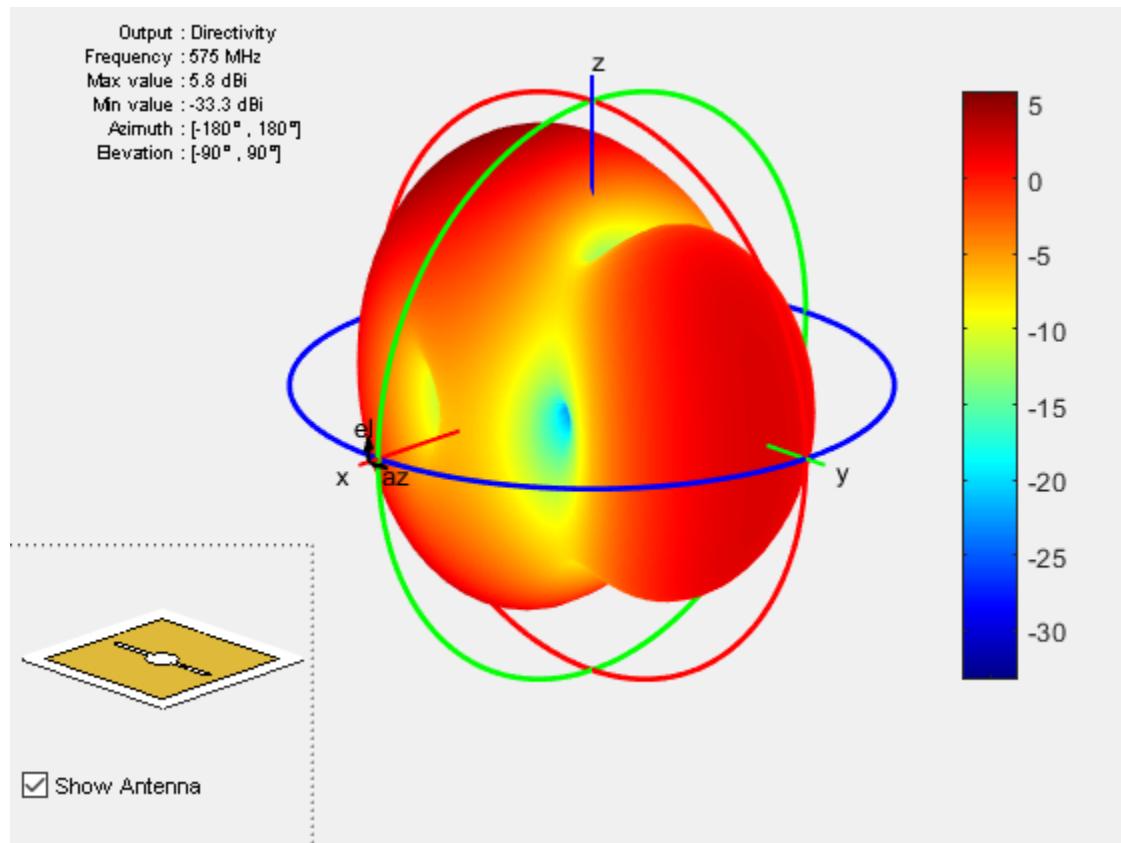

Analyze the current distribution of the antenna at 575 MHz.

```
figure;  
current(c, 575e6)
```

Plot the radiation pattern of the antenna at 575 MHz.

```
figure;  
pattern(c, 575e6)
```

## customAntennaMesh

Create 2-D custom mesh antenna on X-Y plane

### Description

The `customAntennaMesh` object creates an antenna represented by a 2-D custom mesh on the X-Y plane. You can provide an arbitrary antenna mesh to the Antenna Toolbox and analyze this mesh as a custom antenna for port and field characteristics.

### Creation

#### Description

`customantenna = customAntennaMesh(points, triangles)` creates a 2-D antenna represented by a custom mesh, based on the specified points and triangles.

#### Input Arguments

##### **points — Points in custom mesh**

2-by- $N$  or 3-by- $N$  integer matrix of Cartesian coordinates in meters

Points in a custom mesh, specified as a 2-by- $N$  or 3-by- $N$  integer matrix of Cartesian coordinates in meters.  $N$  is the number of points. In case you specify a 3x $N$  integer

matrix, the Z-coordinate must be zero or a constant value. This value sets the 'Points' property in the custom antenna mesh.

Example: [0 1 0 1; 0 1 1 0]

Data Types: double

#### **triangles — Triangles in mesh**

4-by- $M$  integer matrix

Triangles in the mesh, specified as a 4-by- $M$  integer matrix.  $M$  is the number of triangles. The first three rows are indices to the points matrix and represent the vertices of each triangle. The fourth row is a domain number useful for identifying separate parts of an antenna. This value sets the 'Triangles' property in the custom antenna mesh.

Data Types: double

## Properties

#### **Points' — Points in custom mesh**

2-by- $N$  or 3-by- $N$  integer matrix of Cartesian coordinates

Points in a custom mesh, specified as a 2-by- $N$  or 3-by- $N$  integer matrix of Cartesian coordinates in meters.  $N$  is the number of points.

Example: [0.1 0.2 0]

Data Types: double

#### **Triangles — Triangles in mesh**

4-by- $M$  integer matrix

Triangles in the mesh, specified as a 4-by- $M$  integer matrix.  $M$  is the number of triangles.

Data Types: double

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## **Object Functions**

show	Display antenna or array structure; Display shape as filled patch

## pcbStack

Single-feed or multi-feed PCB antenna

### Description

The `pcbStack` object is a single-feed or multi-feed printed circuit board (PCB) antenna. Using the PCB stack, you can create antennas using single-layer or multilayer metal or metal-dielectric substrates. You can also use the PCB stack to create antennas with an arbitrary number of feeds and vias. You can also use Antenna Toolbox catalog antennas to create a PCB antenna.

### Creation

### Syntax

```
pcbant = pcbStack  
pcbant = pcbStack(Name,Value)  
pcbant = pcbStack(ant)
```

### Description

`pcbant = pcbStack` creates an air-filled single-feed PCB with two metal layers.

`pcbant = pcbStack(Name,Value)` creates a PCB antenna, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

`pcbant = pcbStack(ant)` converts any 2D or 2.5D antenna from the antenna catalog into a PCB antenna for further modeling and analysis.

# Properties

**Name — Name of PCB antenna**

'MyPCB' (default) | character vector

Name of PCB antenna, specified a character vector.

Example: 'Name', 'PCBPatch'

Data Types: char

**Revision — Revision details of PCB antenna design**

'1.0' (default) | character vector

Revision details of PCB antenna design, specified as a character vector.

Example: 'Revision', '2.0'

Data Types: char

**BoardShape — Shape of PC board**

antenna.Rectangle (default) | object

Shape of PC board, specified as an object. Rectangle is the only supported board shape.

Example: 'BoardShape', antenna.Rectangle

**BoardThickness — Thickness of PC board**

0.0100 (default) | positive scalar

Thickness of PC board, specified as a positive scalar.

Example: 'BoardThickness', 0.02000

Data Types: double

**Layers — Metal and dielectric layers**

{ [1×1 antenna.Rectangle] [1×1 antenna.Rectangle] } (default) | cell array of metal layer shapes and dielectric

Metal and dielectric layers, specified a cell array of metal layer shapes and dielectric. You can specify one metal shape or one dielectric per layer starting with the top layer and proceeding down.

Data Types: double

**FeedLocations — Feed locations for antenna in Cartesian coordinates**

[ $-0.0187 \ 0 \ 1 \ 2$ ] (default) |  $N$ -by-3 or  $N$ -by-4 array

Feed locations for PCB antenna in Cartesian coordinates, specified as  $N$ -by-3 or  $N$ -by-4 array. The arrays translate to the following:

- $N$ -by-3 – [ $x, y, Layer$ ]
- $N$ -by-4 – [ $x, y, SigLayer, GndLayer$ ]

Example: 'FeedLocations', [-0.0187 0 1 2]

Data Types: double

**FeedDiameter — Center pin diameter of feed connector**

1.0000e-03 (default) | positive scalar in meters

Center pin diameter of feed connector, specified as a positive scalar in meters.

Example: 'FeedDiameter', 2.000e-04

Data Types: double

**ViaLocations — Electrical short locations for antenna in Cartesian coordinates**

[ $0 \ 0 \ 0$ ] (default) | real vector of size  $M$ -by-4 array

Electrical short locations for antenna in Cartesian coordinates, specified as a real vector of size  $M$ -by-4 array. The arrays translate to the following:

- $M$ -by-4 – [ $x, y, SigLayer, GndLayer$ ]

Example: 'ViaLocations', [0 -0.025 1 2]

Data Types: double

**ViaDiameter — Electrical shorting pin diameter between metal layers**

positive scalar in meters

Electrical shorting pin diameter between metal layers, specified a positive scalar in meters.

Example: 'ViaDiameter', 1.0e-3

Data Types: double

**FeedVoltage — Magnitude voltage applied at the feeds**

1 (default) | positive scalar in volts

Magnitude voltage applied at the feeds, specified as a positive scalar in volts.

Example: 'FeedVoltage', 2

Data Types: double

**FeedViaModel — Model for approximating feed and via**

'strip' (default) | 'square' | 'hexagon' | 'octagon'

Model for approximating feed and via, specified as one of the following:

- 'strip' – A rectangular strip approximation to the feed or via cylinder. This approximation is the simplest and results in a small mesh.
- 'square' – A 4-sided polyhedron approximation to the feed or via cylinder.
- 'hexagon' – A 6-sided polyhedron approximation to the feed or via cylinder.
- 'octagon' – A 8-sided polyhedron approximation to the feed or via cylinder.

Example: 'FeedViaModel', 'octagon'

Data Types: double

**FeedPhase — Excitation phase at each feed**

0 (default) | real vector in degrees

Excitation phase at each feed, specified as a real vector in degrees.

Example: 'FeedPhase', 2

Data Types: double

**Load — Lumped elements**

[1x1 LumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.Example: 'Load', `lumpedElement`. `lumpedElement` is the object handle for the load created using `lumpedElement`.Example: `pcbant.Load = lumpedElement('Impedance', 75)`

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency

EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
show	Display antenna or array structure; Display shape as filled patch
vswr	Voltage standing wave ratio of antenna

## Examples

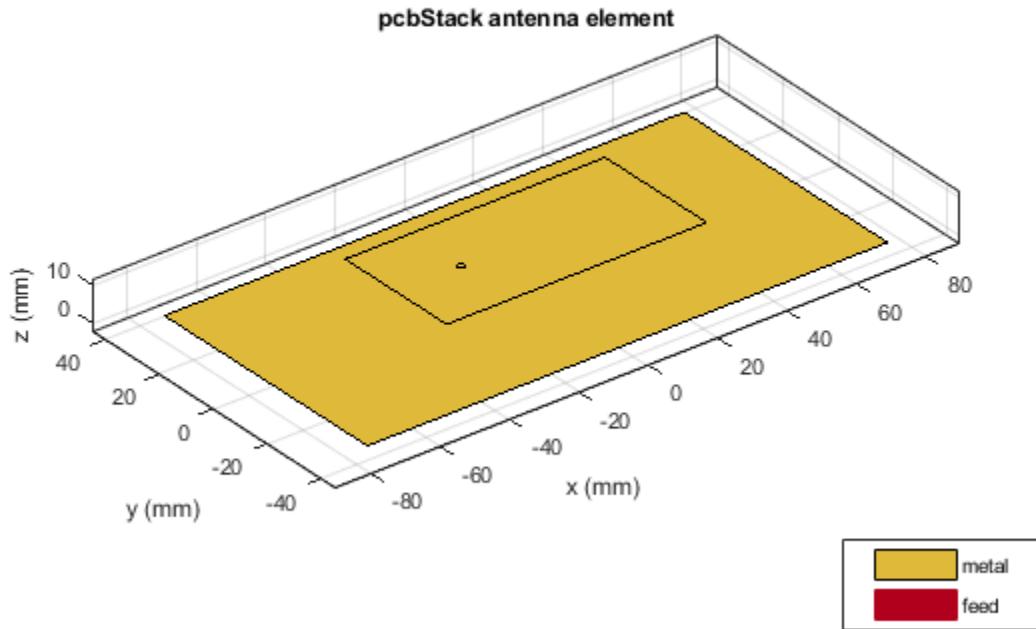

### Default PCB Antenna

Create and view a default PCB antenna.

```
p = pcbStack
p =
  pcbStack with properties:

    Name: 'MyPCB'
    Revision: 'v1.0'
    BoardShape: [1x1 antenna.Rectangle]
    BoardThickness: 0.0100
    Layers: {[1x1 antenna.Rectangle] [1x1 antenna.Rectangle]}
    FeedLocations: [-0.0187 0 1 2]
    FeedDiameter: 1.0000e-03
    ViaLocations: []
    ViaDiameter: []
    FeedViaModel: 'strip'
    FeedVoltage: 1
    FeedPhase: 0
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]
```

```
show(p);
```

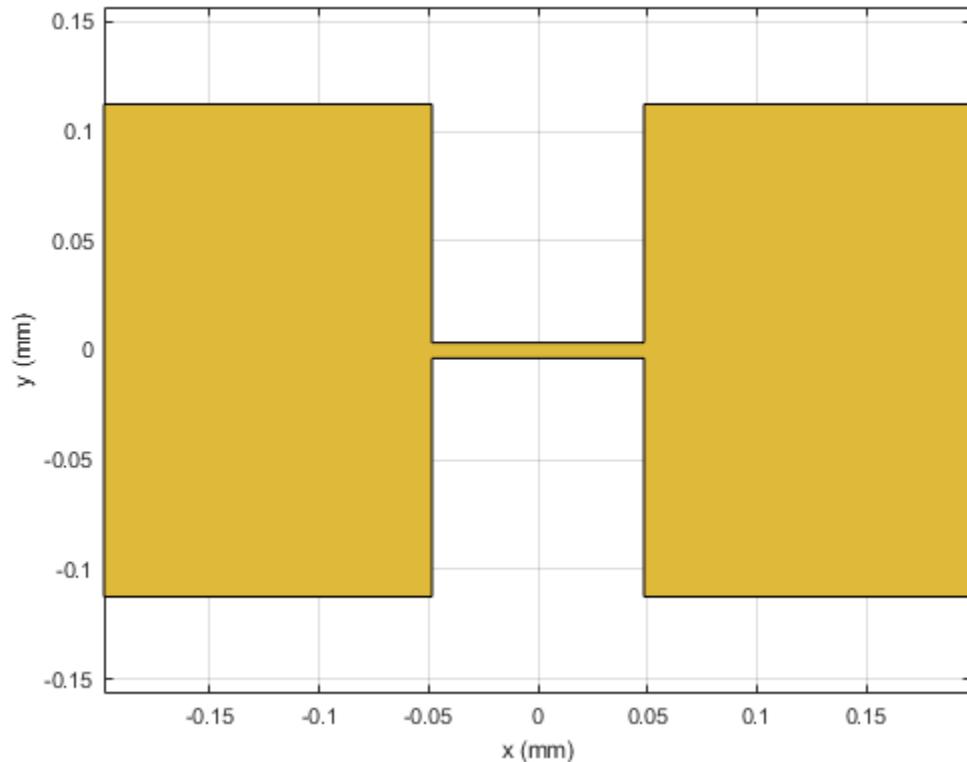

### End Loaded Planar Dipole

Setup parameters.

```
vp = physconst('lightspeed');  
f = 850e6;  
lambda = vp./f;
```

Build a planar dipole with capacitive loading at the ends.

```
L = 0.15;
W = 1.5*L;
stripL = L;
gapx = .015;
gapy = .01;
r1 = antenna.Rectangle('Center',[0,0], 'Length',L, 'Width',W, 'Center',[lambda*0.35,0]);
r2 = antenna.Rectangle('Center',[0,0], 'Length',L, 'Width',W, 'Center',[-lambda*0.35,0]);
r3 = antenna.Rectangle('Length',0.5*lambda, 'Width',0.02*lambda, 'NumPoints',2);
s = r1 + r2 + r3;
figure
show(s)
```

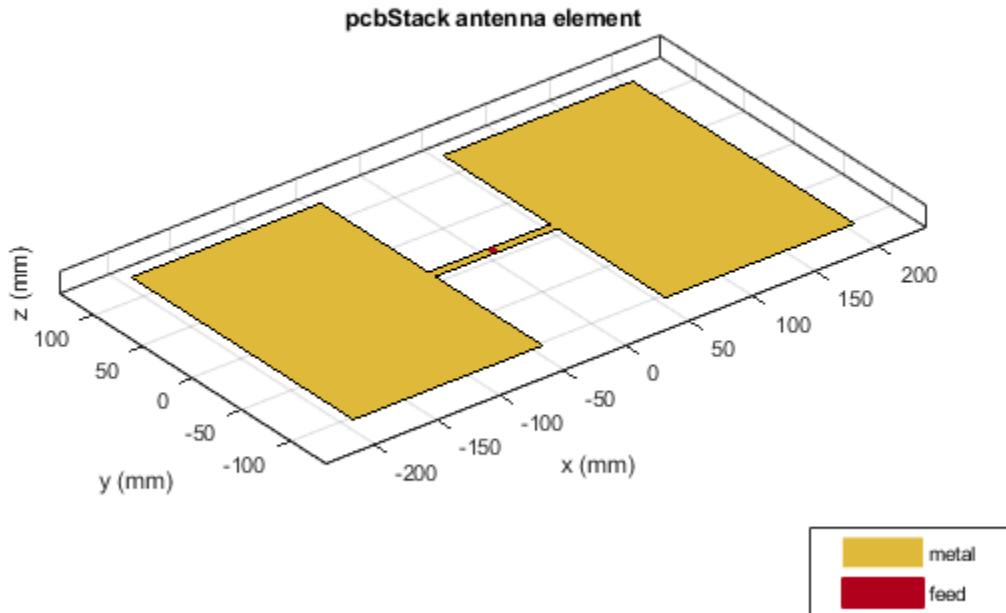

Assign the radiator shape to `pcbStack` and make the changes to the board shape and feed diameter properties.

## 2 Antenna Objects — Alphabetical List

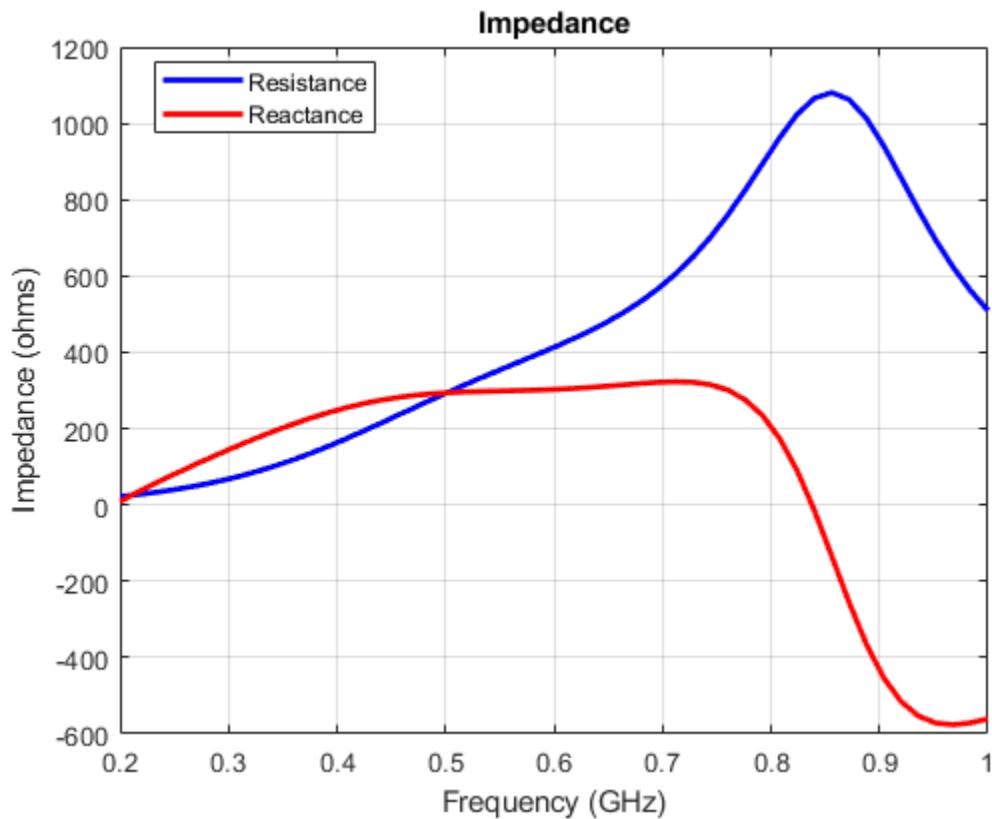

---

```
boardShape = antenna.Rectangle('Length',0.6,'Width',0.3);
p = pcbStack;
p.BoardShape = boardShape;
p.Layers = {s};
p.FeedDiameter = .02*lambda/2;
p.FeedLocations = [0 0 1];
figure
show(p)
```

Analyze the impedance of the antenna. Effect of the end-loading should result in the series resonance to be pushed lower in the band.

```
figure
impedance(p,linspace(200e6,1e9,51))
```

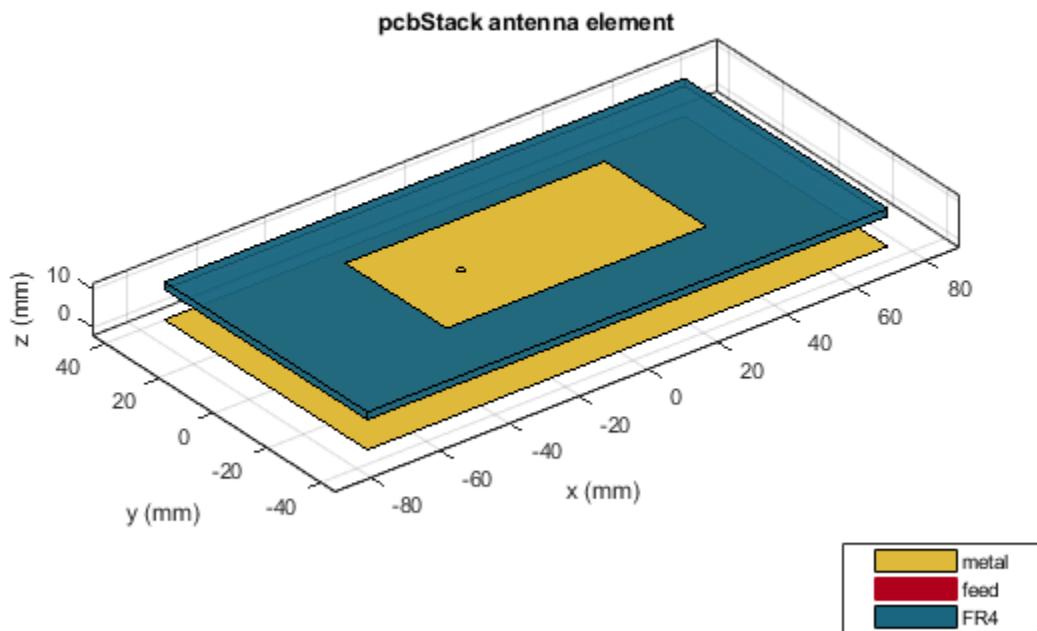

### PCB Stack of Dielectric Antenna

Create a pcb stack antenna with 2 mm dielectric thickness at the radiator and air below it. Display the structure.

```
p = pcbStack;
d1 = dielectric('FR4');
d1.Thickness = 2e-3;
d2 = dielectric('Air');
d2.Thickness = 8e-3;
p.Layers = {p.Layers{1},d1,d2,p.Layers{2}};
```

```
p.FeedLocations(3:4) = [1 4];  
show(p)
```

### Directivity Pattern of PCB Stack Antenna

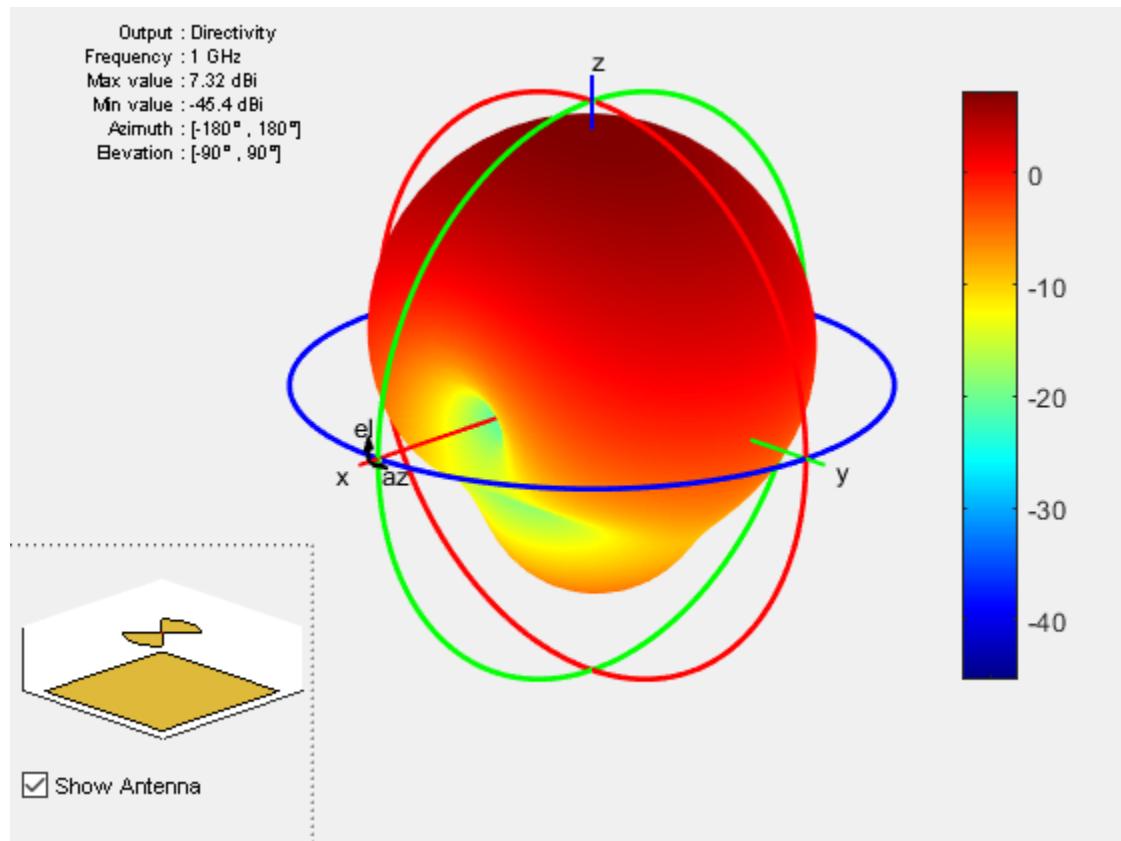

Create a pcb stack antenna from reflector backed bowtie.

```
b = design(bowtieRounded,1e9);  
b.Tilt = 90  
b.TiltAxis = [0 1 0];  
r = reflector('Exciter',b);  
p = pcbStack(r);
```

```
b =  
bowtieRounded with properties:  
  
    Length: 0.0959  
    FlareAngle: 90  
    Tilt: 90  
    TiltAxis: [1 0 0]  
    Load: [1x1 lumpedElement]
```

Plot the directivity pattern of the antenna at 1 GHz.

```
pattern(p,1e9);
```

### PCB Antenna From Antenna Library Elements

Create a coplanar inverted F antenna.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Use this antenna to create a `pcbStack` object.

```
p = pcbStack(fco);
```

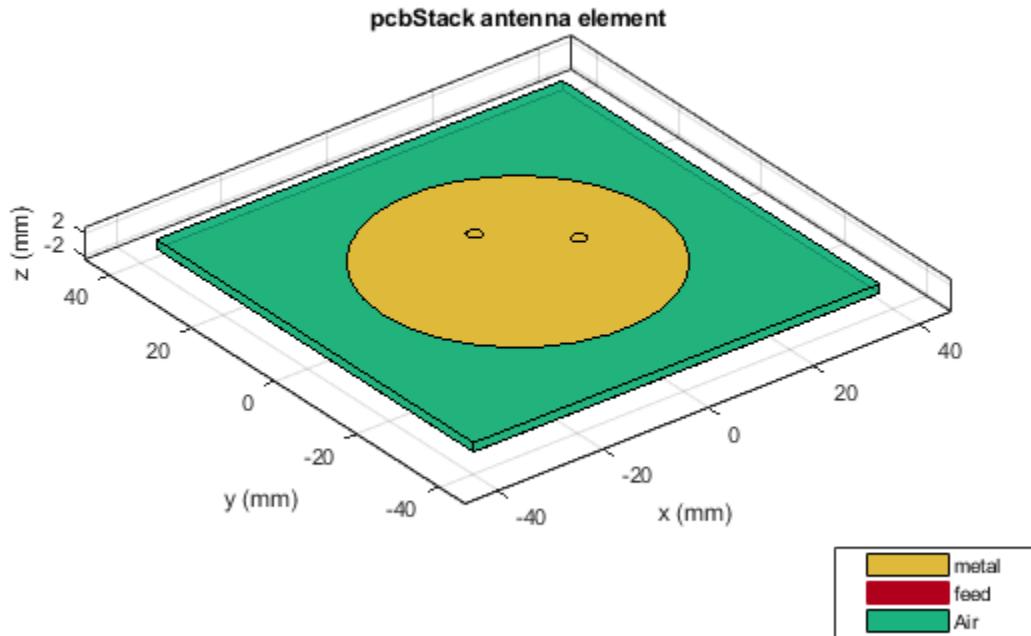

### Stack Conversion

Create a circular microstrip patch.

```
p = patchMicrostripCircular;
d = dielectric;
d.EpsilonR = 4.4;
p.Radius = .0256;
p.Height = 1.6e-3;
p.Substrate = d;
p.GroundPlaneLength = 3*.0256;
p.GroundPlaneWidth = 3*.0256;
p.FeedOffset = [.0116 0];
```

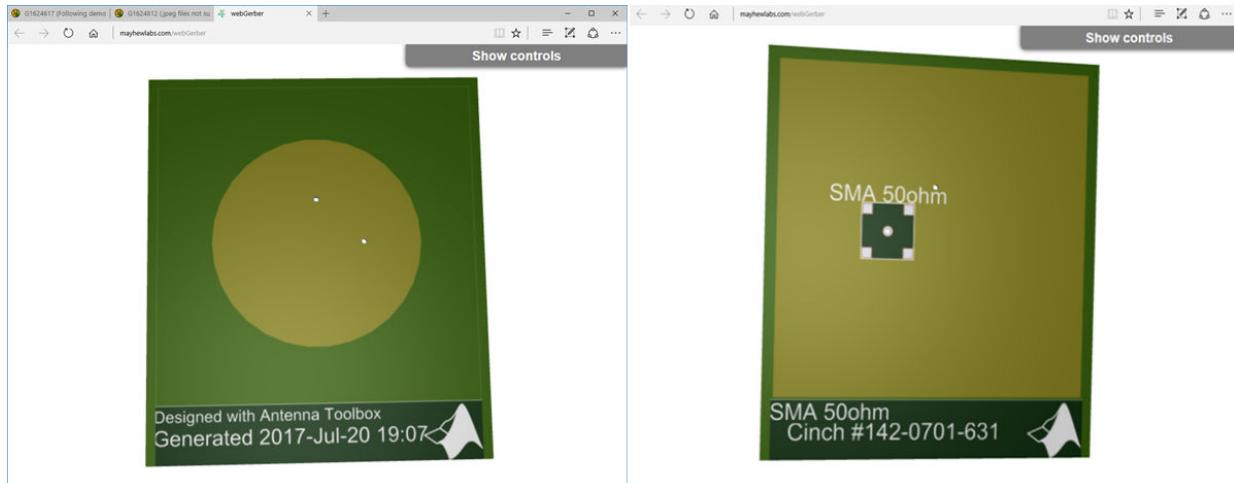

Create a PCB circular microstrip patch using pcbStack.

```
pb = pcbStack(p);
pb.FeedDiameter = 1.27e-3;
pb.ViaLocations = [0 pb.FeedLocations(1)/1.1 1 3];
pb.ViaDiameter = pb.FeedDiameter;
figure
show(pb)
```

```
C = SMA_Jack_Cinch;
O = PCBServices.MayhewWriter;
O.DefaultViaDiam = pb.ViaDiameter;
O.Filename = 'Microstrip circular patch-9a';
Am = PCBWriter(pb,O,C);
gerberWrite(Am)
```

## txsite

Create radio frequency transmitter site

### Description

Use `txsite` object to create a radio frequency transmitter site.

### Creation

### Syntax

```
tx = txsite  
tx = txsite(Name,Value)
```

### Description

`tx = txsite` creates a radio frequency transmitter site.

`tx = txsite(Name,Value)` sets properties using one or more name-value pairs. For example, `tx = txsite('Name', 'TX Site')` creates a transmitter site with name TX Site. Enclose each property name in quotes.

## Properties

### Name — Site name

character vector | string | row or column vector

Site name, specified as a character vector or string, or row or column vector of  $N$  elements.

Example: `'Name', 'Site 2'`

Example: `TX.Name = 'Fenway Park'`

Example: If you want to assign multiple values then - names = ["Fenway Park", "Faneuil Hall", "Bunker Hill Monument"]; TX = txsite('Name',names)

Data Types: char | string

#### **Latitude — Site latitude coordinates**

42.3001 (default) | numeric scalar | row or column vector

Site latitude coordinates, specified as a numeric scalar in the range of -90 to 90, or as a row or column vector of  $N$  elements. Coordinates are defined using Earth ellipsoid model WGS-84. Latitude is the north/south angle.

Example: 'Latitude',45.098

Example: TX.Latitude = 45.098

Example: If you want to assign multiple values then - latitude = [42.3467,42.3598,42.3763]; TX = txsite('Latitude',latitude)

#### **Longitude — Site longitude coordinates**

-71.3504 (default) | numeric scalar | row or column vector

Site longitude coordinates, specified as a numeric scalar or as a row or column vector of  $N$  elements. Coordinates are defined using Earth ellipsoid model WGS-84. Longitude is the east/west angle.

Example: 'Longitude',-68.890

Example: TX.Longitude = -71.0972

Example: If you want to assign multiple values then - longitude = [-71.0972,-71.0545,-71.0611]; TX = txsite('Longitude',longitude)

#### **Antenna — Antenna element or array**

dipole (default) | object | row vector

Antenna element or array specified as an object. By default, the antenna is a dipole designed for 1.9 GHz.

Example: 'Antenna',monopole

Example: TX.Antenna = monopole

**AntennaAngle — Antenna x-axis angle**

0 (default) | numeric scalar | 2-by-1 vector | 2-by- $N$  matrix

Antenna x-axis angle, specified as a numeric scalar or a 2-by-1 vector or a 2-by- $N$  matrix in degrees.

The azimuth angle measured counterclockwise from the east to the antenna's x-axis.

The elevation angle measures from the horizontal plane to antenna's x-axis from -90 to 90 degrees.

Example: 'AntennaAngle',25

Example: TX.AntennaAngle = [25,-80]

**AntennaHeight — Antenna height**

10 (default) | nonnegative numeric scalar

Antenna height from the ground elevation at the site to the center of the antenna element, specified as a nonnegative numeric scalar in meters.

Example: 'AntennaHeight',25

Example: TX.AntennaHeight = 15

**SystemLoss — System loss**

0 (default) | nonnegative numeric scalar | row vector

System loss, specified as a non-negative numeric scalar in dB.

System loss includes transmission line loss and any other miscellaneous system losses.

Example: 'SystemLoss',10

Example: txsite.SystemLoss = 10

Data Types:

**TransmitterFrequency — Transmitter operating frequency**

1.9000e+09 (default) | numeric scalar | row vector

Transmitter operating frequency, specified as a numeric scalar in Hz. The range is from 1e3 to 200e9.

Example: 'TransmitterFrequency',30e9

Example: `txsite.TransmitterFrequency = 30e9`

Data Types: double

#### **TransmitterPower — Signal power at transmitter output**

10 (default) | positive numeric scalar

Signal power at transmitter output, specified as a positive numeric scalar in watts. The transmitter out is connected to the antenna.

Example: `'TransmitterPower',30`

Example: `txsite.TransmitterPower = 30`

Data Types: double

## Object Functions

show	Show site location on map
hide	Hide site location on map
distance	Distance between sites
angle	Angle between sites
coverage	Display coverage map

## Examples

### Transmitter Site

Create and view a transmitter site at a latitude of 42.3001 and a longitude of -71.3504.

```
tx = txsite('Name','MathWorks Apple Hill','Latitude',42.3001,...  
'Longitude',-71.3504)  
show(tx);
```

```
tx =
```

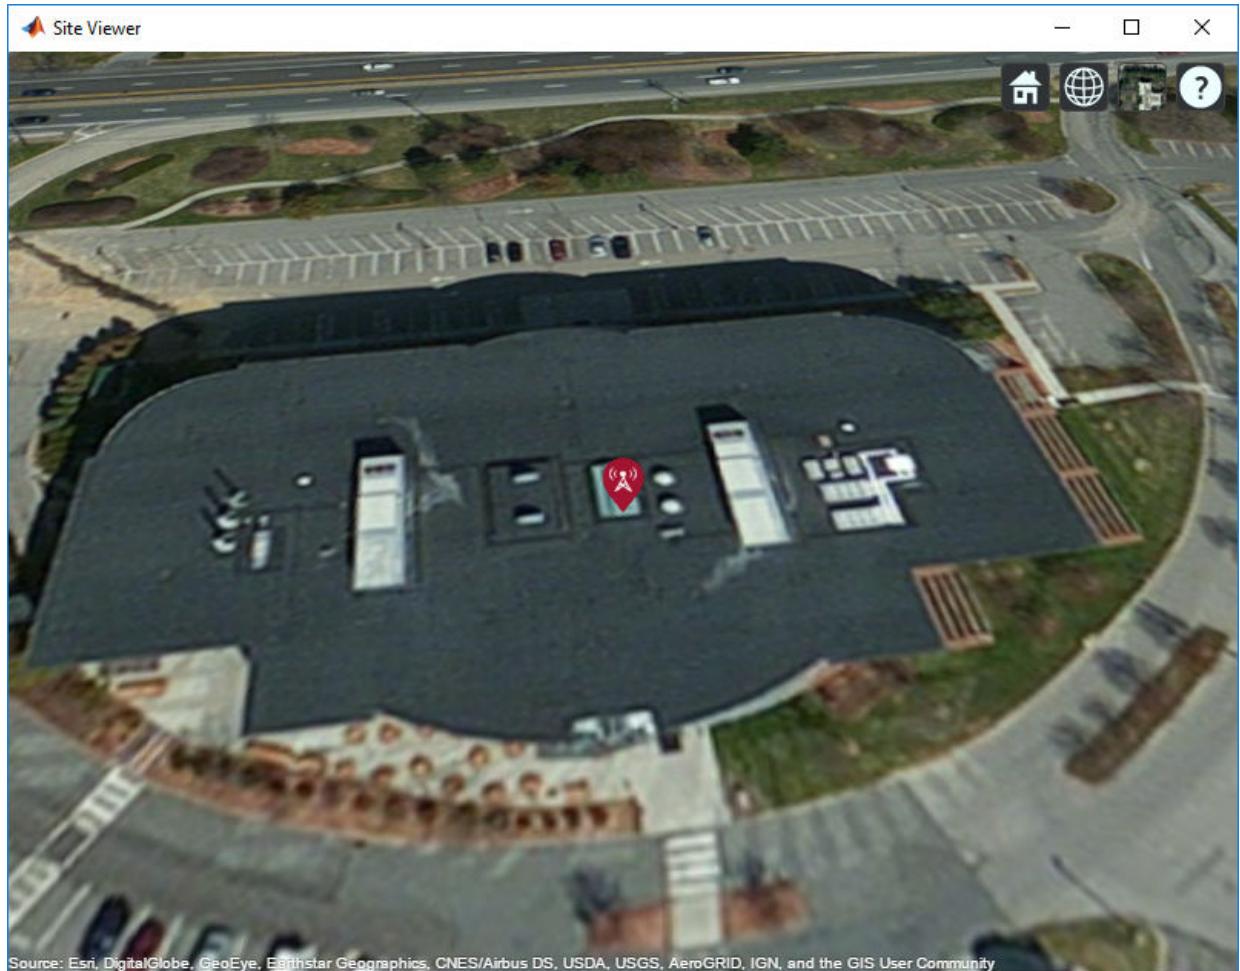

```
txsite with properties:
```

```
Name: 'MathWorks Apple Hill'  
Latitude: 42.3001
```

## **2** Antenna Objects — Alphabetical List

---

```
Longitude: -71.3504
Antenna: [1×1 dipole]
AntennaAngle: 0
AntennaHeight: 10
SystemLoss: 0
TransmitterFrequency: 1.9000e+09
TransmitterPower: 10
```

## Transmitter Array

Specify the names, latitudes, and longitudes of three transmitter locations.

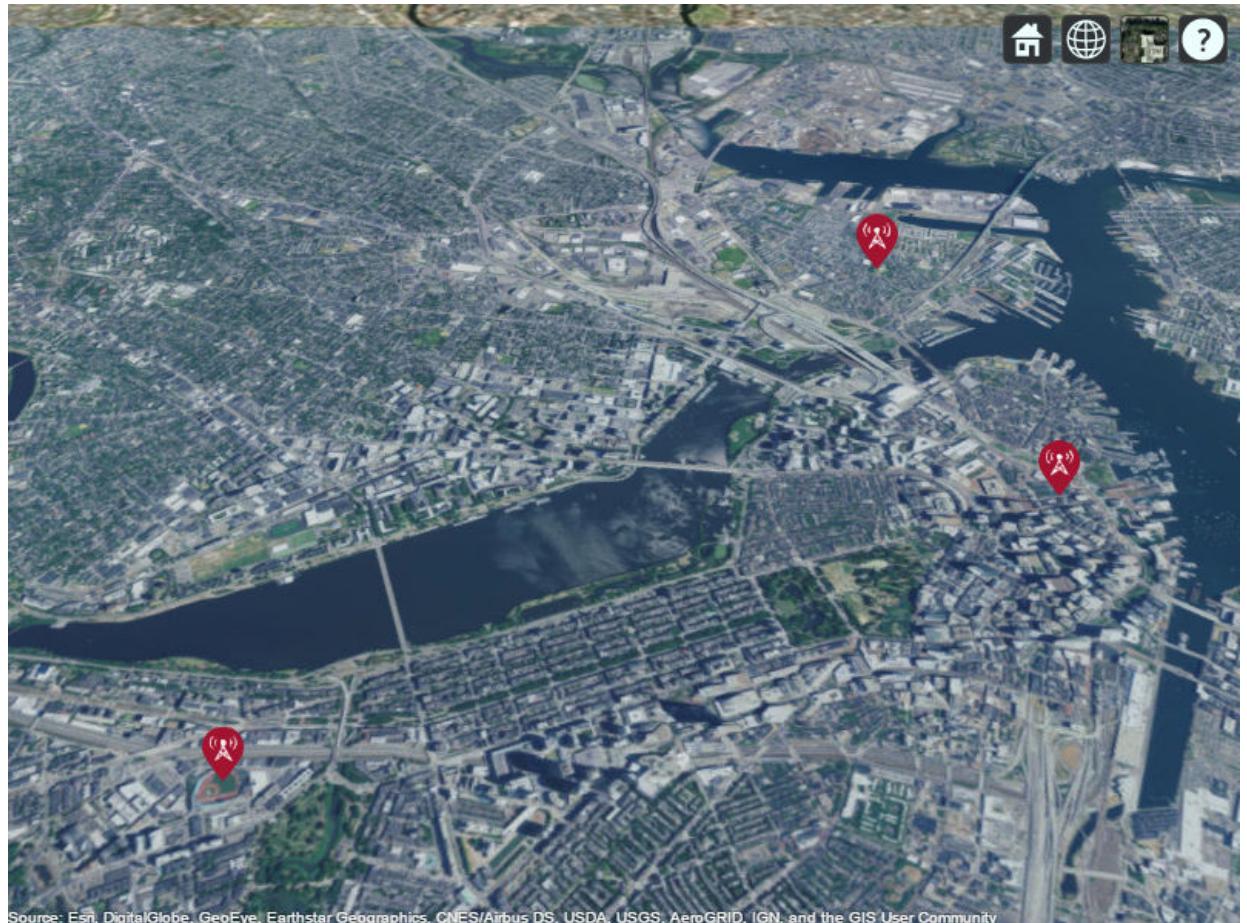

```
names = ["Fenway Park", "Faneuil Hall", "Bunker Hill Monument"];
lats = [42.3467, 42.3598, 42.3763];
lons = [-71.0972, -71.0545, -71.0611];
```

Define the frequency of the transmitters.

```
fq = 2.5e9;
```

Create and view the transmitter array.

```
txs = txsite('Name', names, ...
'Latitude', lats, ...
'Longitude', lons, ...
'TransmitterFrequency', fq);
show(txs)
```

## cavityCircular

Create circular cavity-backed antenna

### Description

Use the `circularCavity` object to create a circular cavity-backed antenna. By default, the exciter used is a dipole. The dimensions are chosen for an operating frequency of 1 GHz.

## Creation

### Syntax

```
circularcavity = cavityCircular  
circularcavity = cavityCircular(Name,Value)
```

### Description

`circularcavity = cavityCircular` creates a circular cavity-backed antenna.

`circularcavity = cavityCircular(Name,Value)` sets properties using one or more name-value pairs. For example, `circularcavity = cavityCircular('Radius',0.2)` creates a circular cavity of radius 0.2 m. Enclose each property name in quotes.

## Properties

### **Exciter — Antenna type used as exciter**

dipole (default) | object

Antenna type used as an exciter, specified as an object. Except for reflector and cavity antenna elements, you can use any of the single elements in the Antenna Toolbox as an exciter.

Example: 'Exciter',monopole

Example: `circularcavity.Exciter = monopole`

### **Radius — Cavity radius**

0.1000 (default) | scalar

Radius of cavity, specified as a scalar in meters.

Example: 'Radius', 0.2

Example: `circularcavity.Radius = 0.2`

Data Types: double

**Height — Cavity height along z-axis**

0.0750 (default) | scalar

Cavity height along z-axis, specified as a scalar in meters.

Example: 'Height', 0.001

Example: circularcavity.Height = 0.001

Data Types: double

**Spacing — Distance between exciter and base of cavity**

0.0750 (default) | scalar

Distance between the exciter and the base of the cavity, specified a scalar in meters.

Example: 'Spacing', 7.5e-2

Example: circularcavity.Spacing = 7.5e-2

Data Types: double

**Substrate — Type of dielectric material**

'Air' (default) | object

Type of dielectric material used as a substrate, specified as a object. For more information see, dielectric. For more information on dielectric substrate meshing, see “Meshing”.

---

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: d = dielectric('FR4'); 'Substrate', d

Example: d = dielectric('FR4'); circularcavity.Substrate = d

**EnableProbeFeed — Create probe feed from backing structure to exciter**

0 (default) | 1

Create probe feed from backing structure to exciter, specified as 0 or 1 or a positive scalar. By default, probe feed is not enabled.

Example: 'EnableProbeFeed', 1

Example: circularcavity.EnableProbeFeed = 1

Data Types: double | logical

#### **Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

Example: `circularcavity.Load = lumpedElement('Impedance', 75)`

#### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

#### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, "Rotate Antenna and Arrays"

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch

## Examples

### Circular Cavity-Backed Antenna

Create and view a default circular cavity-backed antenna.

```
a = cavityCircular  
show(a)  
  
a =  
  
cavityCircular with properties:  
  
    Exciter: [1×1 dipole]  
    Substrate: [1×1 dielectric]  
    Radius: 0.1000  
    Height: 0.0750  
    Spacing: 0.0750
```

```
EnableProbeFeed: 0
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

### Circular Cavity-Backed Equiangular Spiral

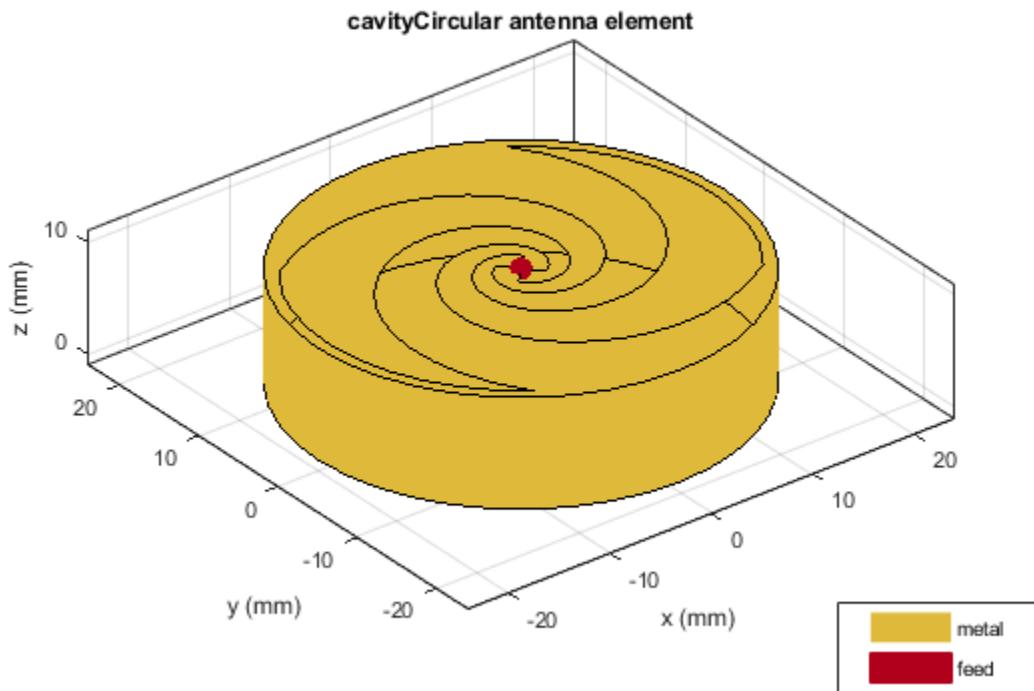

Create and view an equiangular spiral backed by a circular cavity. The cavity dimensions are:

Radius = 0.02 m

Height = 0.01 m

Spacing = 0.01 m

```
ant = cavityCircular('Exciter',spiralEquiangular,'Radius',0.02, ...
    'Height',0.01,'Spacing', 0.01);
show(ant)
```

## **cloverleaf**

Create three-petal cloverleaf antenna

### **Description**

Use the `cloverleaf` object to create a three-petal cloverleaf antenna. The default cloverleaf has 3 petals and operates at around 5.8 GHz. It has a wideband circular polarization and an omnidirectional antenna.

## Creation

## Syntax

```
cl = cloverleaf
```

```
cl = cloverleaf(Name,Value)
```

### Description

`cl = cloverleaf` creates a three-petal cloverleaf antenna.

`cl = cloverleaf(Name,Value)` sets properties using one or more name-value pairs. For example, `cl = cloverleaf('NumPetals',4)` creates a five petal cloverleaf antenna. Enclose each property name in quotes.

## Properties

### **NumPetals — Number of petals**

3 (default) | scalar

Number of petals, specified as a scalar.

Example: `'NumPetals', 4`

Example: `cl.NumPetals = 4`

Data Types: double

### **PetalLength — Total length of leaf**

0.0515 (default) | scalar

Total length of leaf, specified as a scalar in meters.

Example: `'PetalLength', 0.0025`

Example: `cl.PetalLength = 0.0025`

Data Types: double

### **PetalWidth — Leaf strip width**

`8.0000e-04` (default) | scalar

Leaf strip width, specified as a scalar in meters.

Example: `'PetalWidth', 0.001`

Example: `cl.PetalWidth = 0.001`

Data Types: double

**FlareAngle — Leaf flare angle**

105 (default) | scalar

Leaf flare angle, specified as a scalar in degrees.

Example: 'FlareAngle',100

Example: cl.FlareAngle = 100

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. You can add a load anywhere on the surface of the antenna. By default, it is at the origin. For more information, see `lumpedElement`.

Example: 'Load', lumpedelement. lumpedelement is the object handle for the load created using `lumpedElement`.

Example: cl.Load = lumpedElement('Impedance', 75)

Data Types: double

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector in degrees.

Example: 'Tilt', 90

Example: cl.Tilt = [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.

- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: cl.TiltAxis = z

Data Types: double

## Object Functions

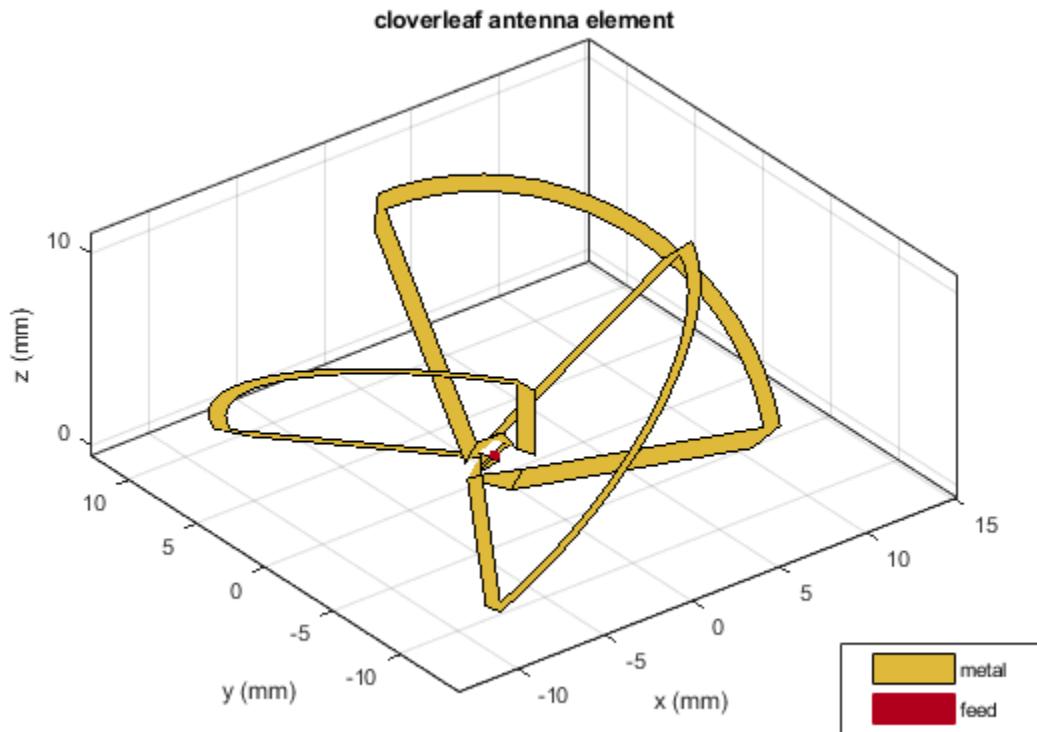

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface

vswr	Voltage standing wave ratio of antenna

## Examples

## Clover Leaf Antenna

Create and view a default cloverleaf antenna.

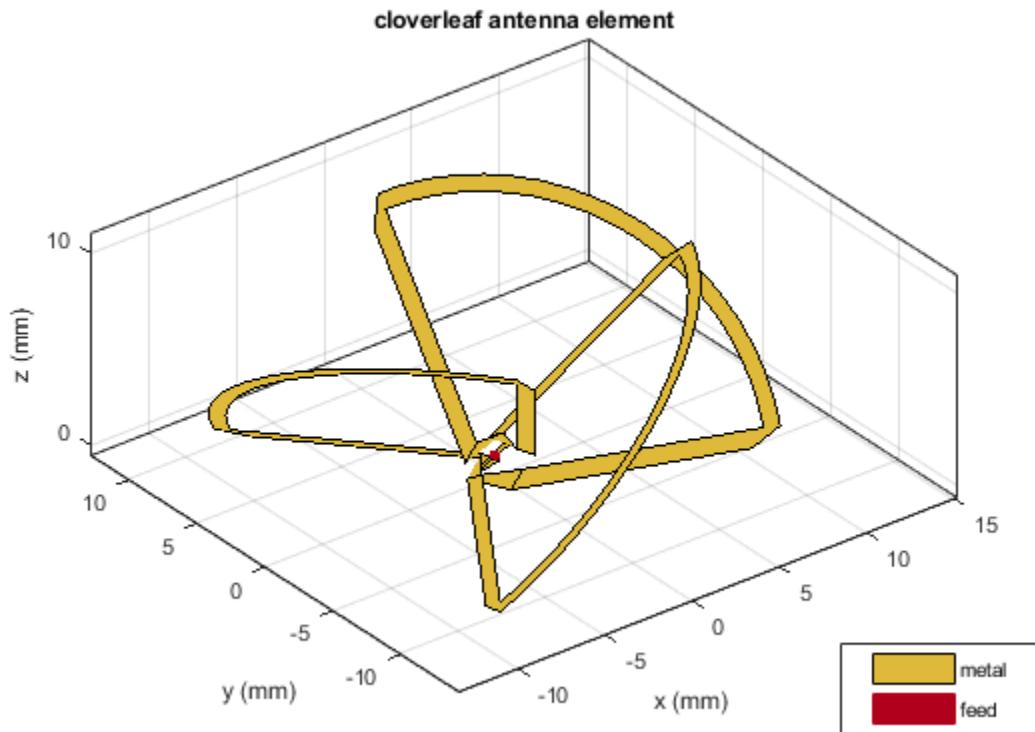

```
cl = cloverleaf  
cl =  
cloverleaf with properties:  
  
    NumPetals: 3  
    PetalLength: 0.0515  
    PetalWidth: 8.0000e-04  
    FlareAngle: 105  
    Tilt: 0  
    TiltAxis: [1 0 0]  
    Load: [1x1 lumpedElement]  
  
show(cl)
```

### Axial Ratio of Cloveleaf Antenna

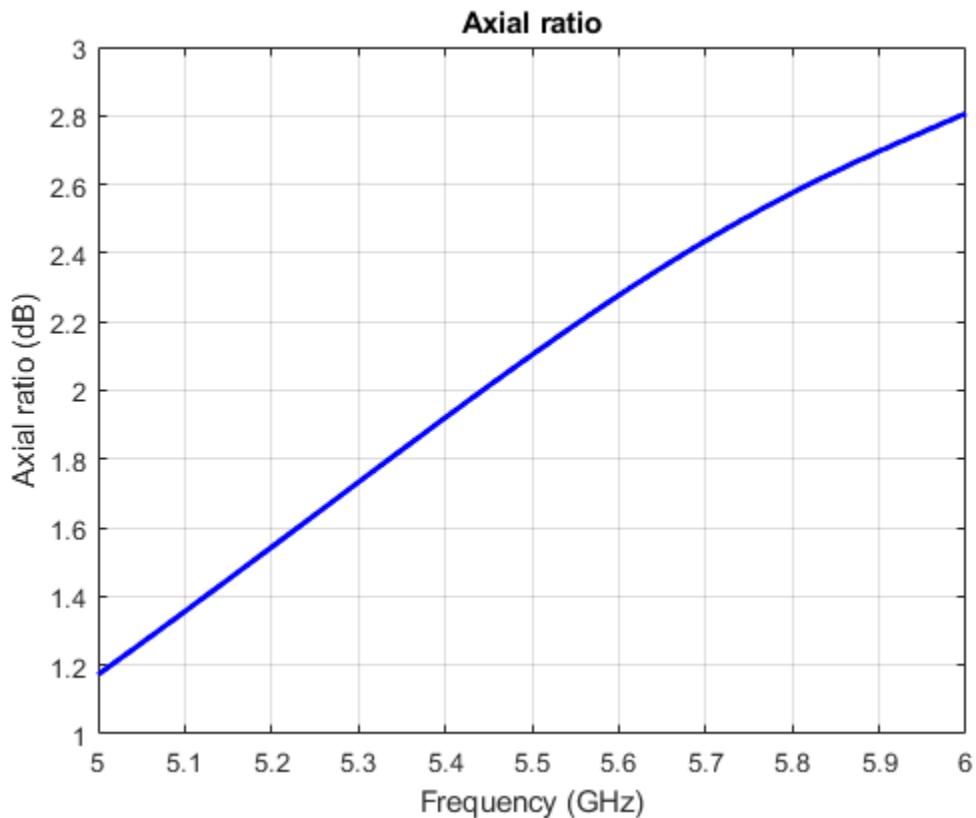

Create a cloverleaf antenna.

```
cl = cloverleaf;
show(cl);
```

Plot the axial ratio of the antenna from 5 GHz to 6 GHz.

```
freq = linspace(5e9, 6e9, 101);  
axialRatio(cl, freq, 0, 0);
```

You can see from the axial ratio plot that the antenna supports circular polarization over the entire frequency range.

Introduced in R2017b

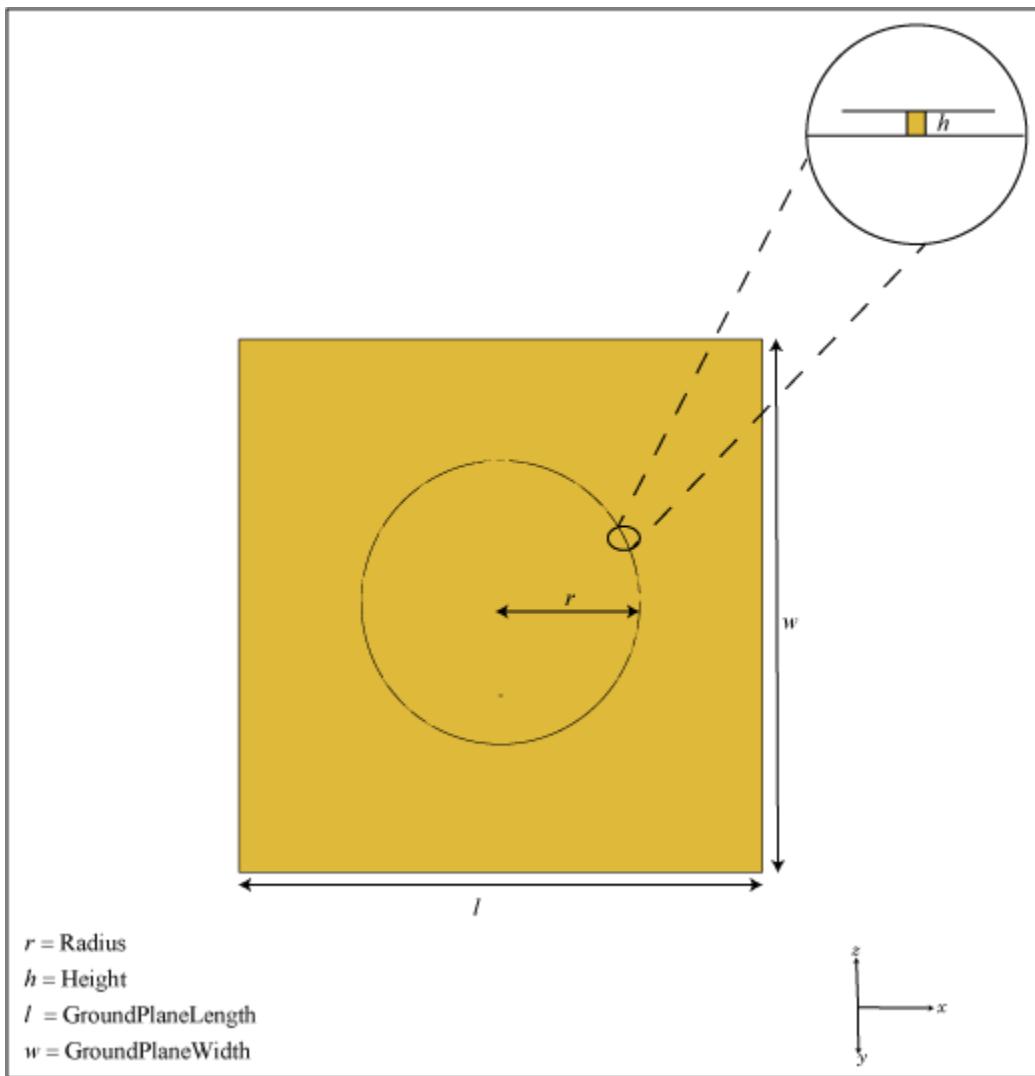

# patchMicrostripCircular

Create probe-fed circular microstrip patch antenna

## Description

Use the `patchMicrostripCircular` object to create a probe-fed circular microstrip patch antenna. By default, the patch is centered at the origin with feed point along the radius and the groundplane on the X-Y plane at  $z = 0$ .

Circular microstrip antennas are used as low-profile antennas in airborne and spacecraft applications. These antennas also find use in portable wireless applications because they are lightweight, low cost, and easily manufacturable.

## Creation

## Syntax

```
circularpatch = patchMicrostripCircular  
circularpatch = patchMicrostripCircular(Name,Value)
```

## Description

`circularpatch = patchMicrostripCircular` creates a probe-fed circular microstrip patch antenna.

`circularpatch = patchMicrostripCircular(Name,Value)` sets properties using one or more name-value pairs. For example, `circularpatch = patchMicrostripCircular('Radius',0.2)` creates a circular patch of radius 0.2 m. Enclose each property name in quotes.

## Properties

### **Radius — Patch radius**

0.0798 (default) | scalar

Patch radius, specified as a scalar in meters. The default radius is for an operating frequency of 1 GHz.

Example: `'Radius',0.2`

Example: `circularpatch.Radius = 0.2`

Data Types: `double`

### **Height — Height of patch**

0.0060 (default) | scalar

Height of patch above the ground plane along the Z-axis, specified as a scalar in meters.

Example: `'Height',0.001`

Example: `circularpatch.Height = 0.001`

Data Types: double

**GroundPlaneLength — Ground plane length**

0.3000 (default) | scalar

Ground plane length along the X-axis, specified as a scalar in meters. Setting 'GroundPlaneLength' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 120e-3

Example: circularpatch.GroundPlaneLength = 120e-3

Data Types: double

**GroundPlaneWidth — Ground plane width**

0.3000 (default) | scalar

Ground plane width along the Y-axis, specified as a scalar in meters. Setting 'GroundPlaneWidth' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 120e-3

Example: circularpatch.GroundPlaneWidth = 120e-3

Data Types: double

**Substrate — Type of dielectric material**

'Air' (default) | dielectric material object handle | dielectric material from dielectric catalog

Type of dielectric material used as a substrate, specified as a dielectric material object handle. For more information see, dielectric. For more information on dielectric substrate meshing, see "Meshing".

---

**Note** The substrate dimensions must be lesser than the groundplane dimensions.

---

Example: d = dielectric('FR4'); 'Substrate', d

Example: d = dielectric('FR4'); circularpatch.Substrate = d

**PatchCenterOffset — Signed distance from center along length and width of ground plane**

[0 0] (default) | two-element real vector

Signed distance from center along length and width of ground plane, specified as a two-element real vector with each element units in meters. Use this property to adjust the location of the patch relative to the ground plane.

Example: 'PatchCenterOffset', [0.01 0.01]

Example: circularpatch.PatchCenterOffset = [0.01 0.01]

Data Types: double

**FeedOffset — Signed distance from center along length and width of ground plane**

[-0.0525 0] (default) | two-element real vector

Signed distance from center along length and width of ground plane, specified as a two-element real vector with each element units in meters. Use this property to adjust the location of the feedpoint relative to the ground plane and patch.

Example: 'FeedOffset', [0.01 0.01]

Example: circularpatch.FeedOffset = [0.01 0.01]

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement`. `lumpedElement` is the object handle for the load created using `lumpedElement`.

Example: `circularpatch.Load = lumpedElement('Impedance', 75)`

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element units in degrees.

Example: 'Tilt', 90

Example: `circularPatch.Tilt = [90 90 0]`

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'x' | 'y' | 'z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: circularpatch.TiltAxis = [0 0 0;0 1 0]

Example: 'TiltAxis','z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array

returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Circular Microstrip Patch

Create and view a default circular microstrip patch.

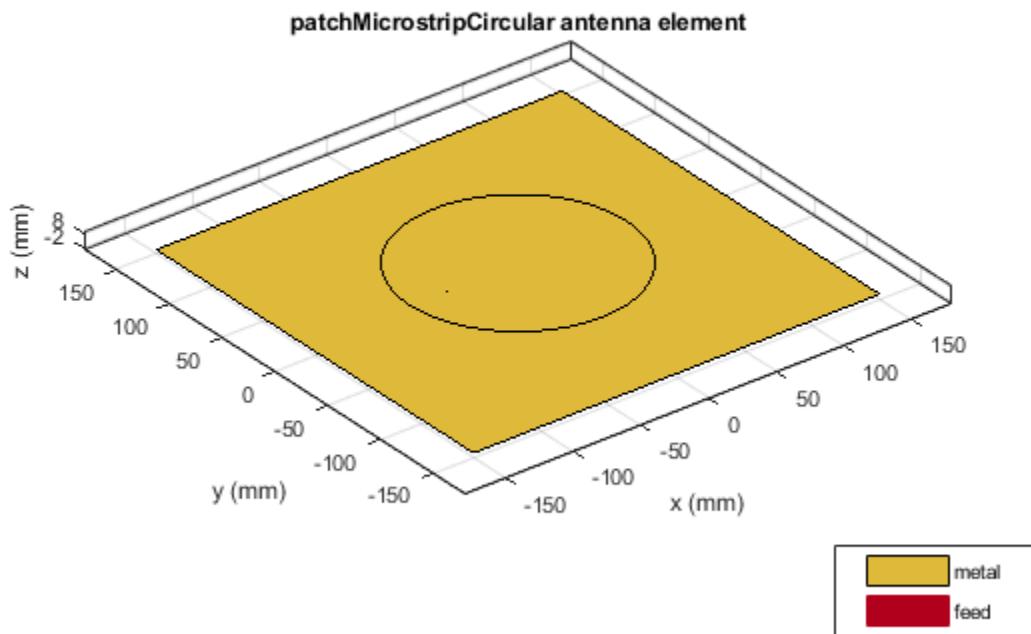

```
cp = patchMicrostripCircular  
cp =  
patchMicrostripCircular with properties:  
  
    Radius: 0.0798  
    Height: 0.0060  
    Substrate: [1x1 dielectric]  
    GroundPlaneLength: 0.3000  
    GroundPlaneWidth: 0.3000  
    PatchCenterOffset: [0 0]  
    FeedOffset: [-0.0525 0]  
    Tilt: 0  
    TiltAxis: [1 0 0]  
    Load: [1x1 lumpedElement]  
  
show(cp)
```

### Radiation Pattern and Impedance of Circular Microstrip Patch

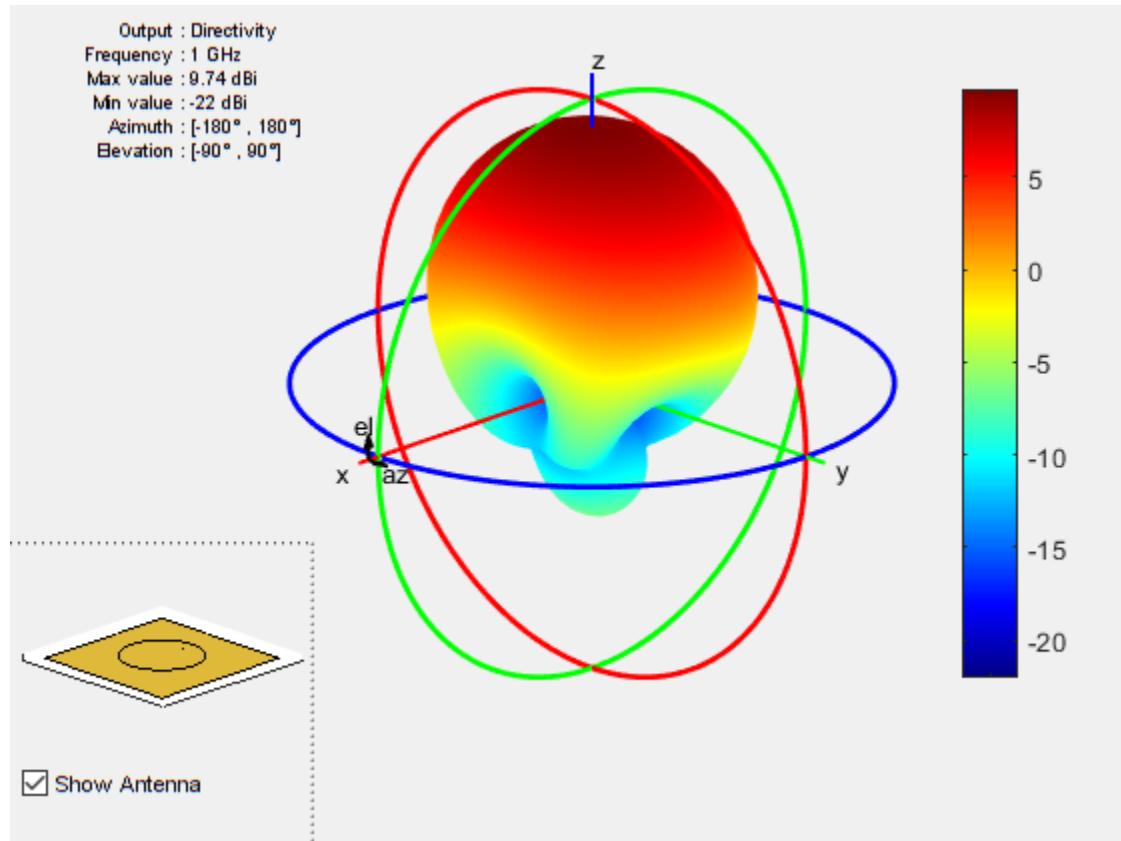

Create a circular patch antenna with radius 79.8 mm over a 300 mm by 300 mm ground plane, and offset the feed by (-52.5mm,0). Display the antenna.

```
cp = patchMicrostripCircular('Radius',0.0798,'Height',6e-3,...  
    'GroundPlaneLength',0.3,'GroundPlaneWidth',0.3,...  
    'FeedOffset',[-0.0525 0]);  
  
show(cp)
```

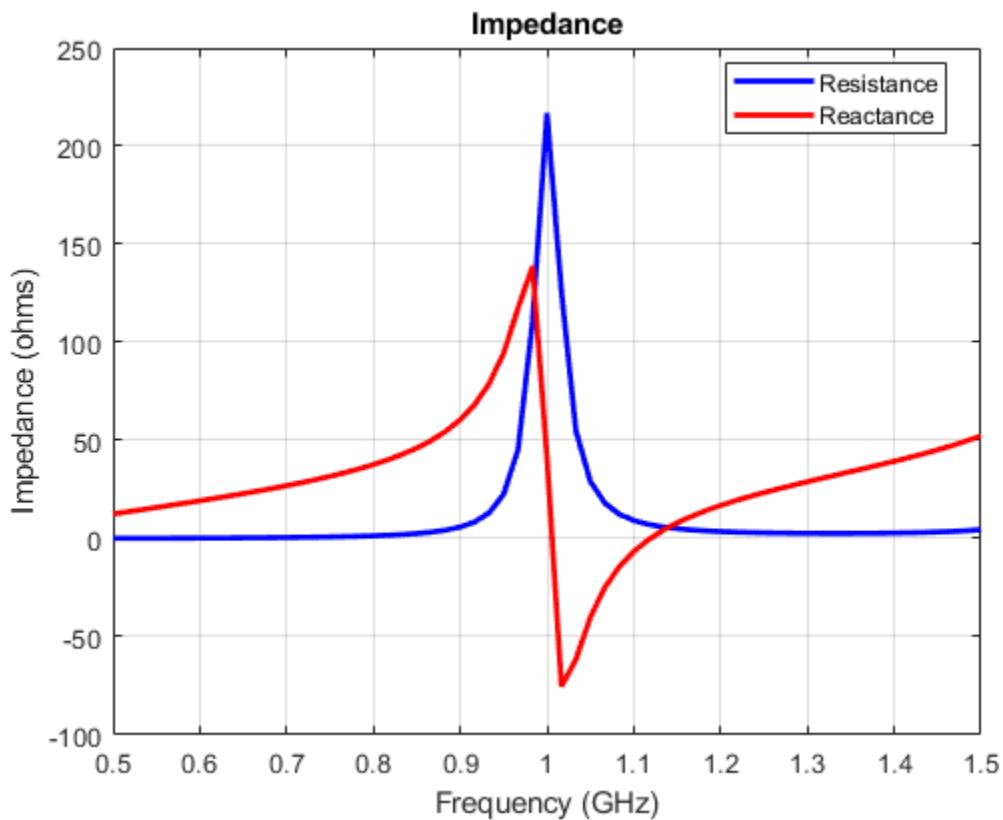

Plot the pattern of the patch antenna at 1 GHz.

```
pattern(cp,1e9);
```

Calculate the impedance of the antenna over a frequency span of 0.5GHz to 1.5GHz.

```
f = linspace(0.5e9,1.5e9,61);  
impedance(cp,f);
```

[patchMicrostrip](#) | [patchMicrostripInsetfed](#)

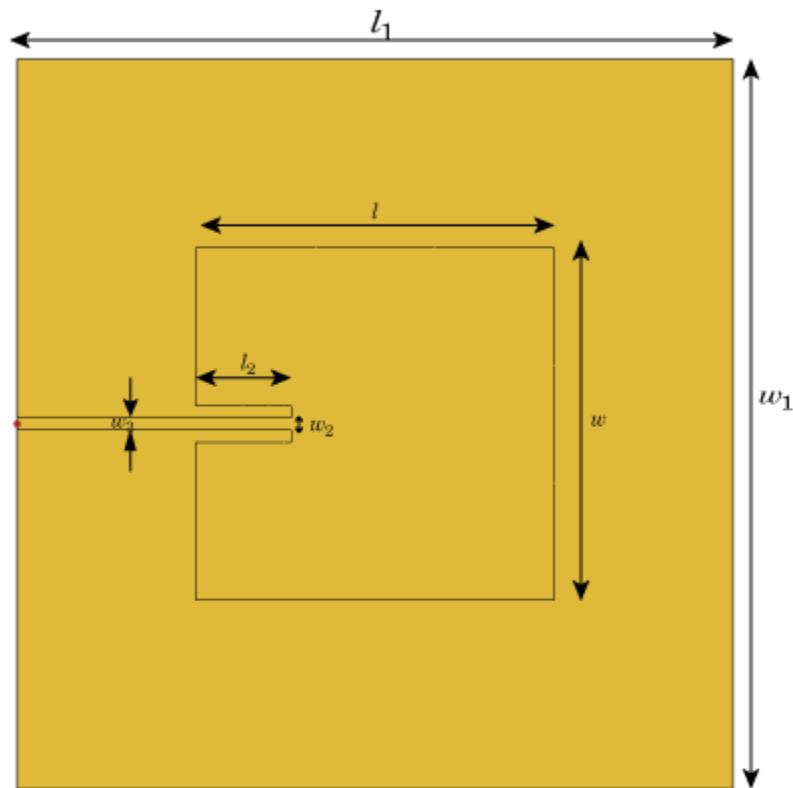

**Introduced in R2017b**

## **patchMicrostripInsetfed**

Create inset-fed microstrip patch antenna

### **Description**

Use the `patchMicrostripInsetfed` object to create an inset-fed microstrip patch antenna. The default patch is centered at the origin.

$l$  = Length

$w$  = Width

$l_1$  = GroundPlaneLength

$w_1$  = GroundPlaneWidth

$l_2$  = NotchLength

$w_2$  = NotchWidth

$w_3$  = StripLineWidth

## Creation

### Syntax

```
insetpatch = patchMicrostripInsetfed  
insetpatch = patchMicrostripInsetfed(Name,Value)
```

### Description

`insetpatch = patchMicrostripInsetfed` creates an inset-fed microstrip patch antenna centered at the origin.

`insetpatch = patchMicrostripInsetfed(Name,Value)` sets properties using one or more name-value pair. For example, `insetpatch = patchMicrostripInsetfed('Length', 0.2)` creates an inset-fed patch of length 0.2 m. Enclose each property name in quotes.

## Properties

### **Length — Patch length along X-axis**

0.0300 (default) | scalar

Patch length along X-axis, specified as a scalar in meters. The default length is for an operating frequency of 4.5 GHz.

Example: `'Length', 0.2`

Example: `insetpatch.Length = 0.2`

Data Types: `double`

### **Width — Patch width along Y-axis**

0.0290 (default) | scalar

Patch width along Y-axis, specified as a scalar in meters.

Example: `'Width', 0.1`

Example: `insetpatch.Width = 0.1`

Data Types: double

**Height — Patch height along Z-axis**

0.0013 (default) | scalar

Patch height along Z-axis, specified as a scalar in meters.

Example: 'Height', 0.001

Example: insetpatch.Height = 0.001

Data Types: double

**GroundPlaneLength — Ground plane length along X-axis**

0.0600 (default) | scalar

Ground plane length along X-axis, specified as a scalar in meters. Setting 'GroundPlaneLength' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneLength', 120e-3

Example: insetpatch.GroundPlaneLength = 120e-3

Data Types: double

**GroundPlaneWidth — Ground plane width along Y-axis**

0.0600 (default) | scalar

Ground plane width along Y-axis, specified as a scalar in meters. Setting 'GroundPlaneWidth' to Inf, uses the infinite ground plane technique for antenna analysis.

Example: 'GroundPlaneWidth', 120e-3

Example: insetpatch.GroundPlaneWidth = 120e-3

Data Types: double

**Substrate — Type of dielectric material**

'Air' (default) | dielectric material object handle

Type of dielectric material used as a substrate, specified as a dielectric material object handle. For more information see, dielectric. For more information on dielectric substrate meshing, see "Meshing".

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: `d = dielectric('FR4');` 'Substrate', `d`

Example: `d = dielectric('FR4');` `insetpatch.Substrate = d`

**PatchCenterOffset — Signed distance of patch from origin**

[0 0] (default) | two-element real vector

Signed distance of patch from origin, specified as a two-element real vector with each element units in meters. Use this property to adjust the location of the patch relative to the ground plane.

Example: `'PatchCenterOffset', [0.01 0.01]`

Example: `insetpatch.PatchCenterOffset = [0.01 0.01]`

Data Types: double

**FeedOffset — Signed distance of feed from origin**

[-0.0300 0] (default) | two-element real vector

Signed distance of feed from origin, specified as a two-element real vector with each element units in meters. Use this property to adjust the location of the feedpoint relative to the ground plane and patch.

Example: `'FeedOffset', [0.01 0.01]`

Example: `insetpatch.FeedOffset = [0.01 0.01]`

Data Types: double

**StripLineWidth — Strip line width along Y-axis**

1.0000e-03 (default) | scalar

Strip line width along Y-axis, specified as a scalar in meters.

Example: `'StripLineWidth', 0.1`

Example: `insetpatch.StripLineWidth = 0.1`

Data Types: double

**NotchLength — Notch length along X-axis**

0.0080 (default) | scalar

Notch length along X-axis, specified as a scalar in meters.

Example: 'NotchLength', 0.2

Example: insetpatch.NotchLength = 0.2

Data Types: double

**NotchWidth — Notch width along Y-axis**

0.0030 (default) | scalar

Notch width along Y-axis, specified as a scalar in meters.

Example: 'NotchWidth', 0.1

Example: insetpatch.NotchWidth = 0.1

Data Types: double

**Load — Lumped elements**

[1x1 lumpedElement] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. For more information, see `lumpedElement`.

Example: 'Load', `lumpedElement.lumpedElement` is the object handle for the load created using `lumpedElement`.

Example: `insetpatch.Load = lumpedElement('Impedance', 75)`

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: `insetpatch.Tilt = [90 90 0]`

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”.

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: insetpatch.TiltAxis = Z

Data Types: double

## Object Functions

## Topics

“Analysis of an Inset-Feed Patch Antenna on a Dielectric Substrate”

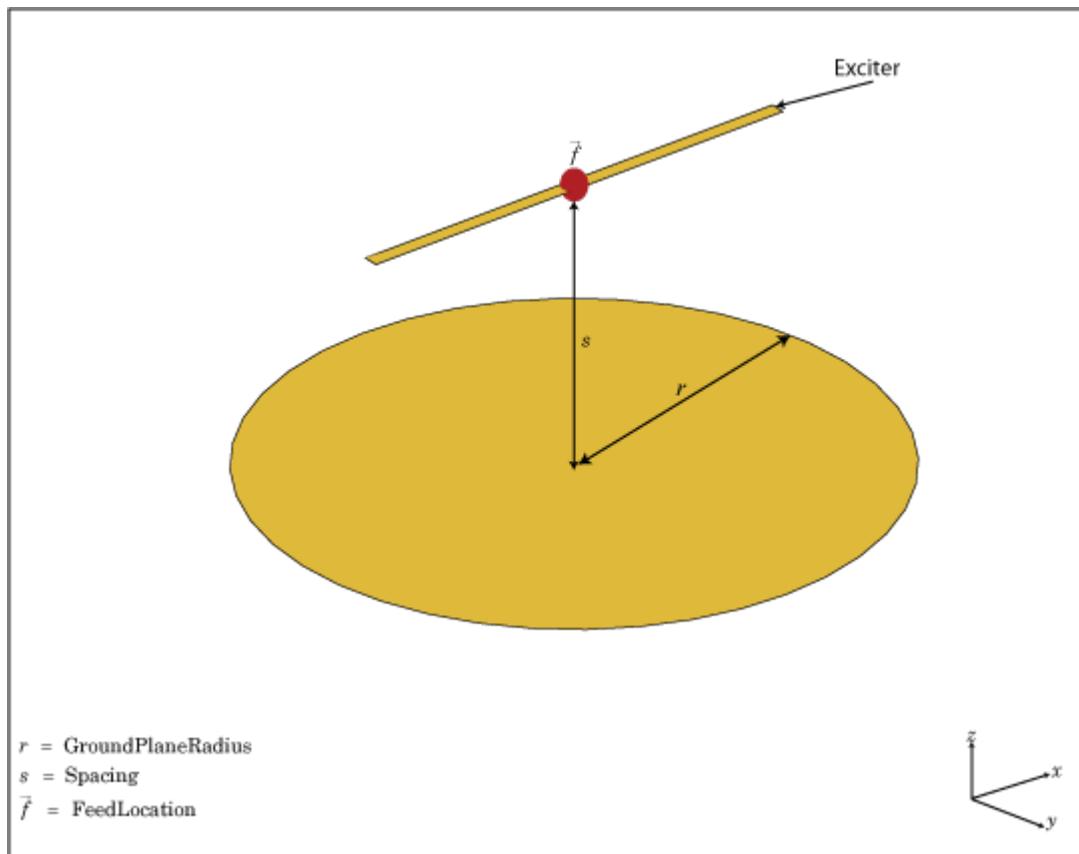

Introduced in R2017b

# reflectorCircular

Create circular reflector-backed antenna

## Description

Use the `reflectorCircular` object to create a circular reflector-backed antenna. By default the exciter is a dipole. The dimensions are chosen for an operating frequency of 1 GHz.

## Creation

### Syntax

```
rc = reflectorCircular  
rc = reflectorCircular(Name,Value)
```

### Description

`rc = reflectorCircular` creates a circular reflector backed antenna.

`rc = reflectorCircular(Name,Value)` sets properties using one or more name-value pair. For example, `rc = reflectorCircular('Radius',0.2)` creates a circular reflector of radius 0.2 m. Enclose each property name in quotes.

## Properties

### **Exciter** — Antenna type used as exciter

dipole (default) | object

Antenna type used as an exciter, specified as an object. Except for reflector and cavity antenna elements, you can use all the single elements in the Antenna Toolbox as an exciter.

Example: 'Exciter',spiralEquiangular

Example: `rc.Exciter = spiralEquiangular`

### **GroundPlaneRadius** — Reflector radius

0.1000 (default) | scalar

Radius of reflector, specified as a scalar in meters.

Example: 'Radius',0.2

Example: `rc.Radius = 0.2`

Data Types: double

**Spacing — Distance between exciter and reflector bottom**

0.0750 (default) | scalar

Distance between the exciter and the reflector, specified as a scalar in meters.

Example: 'Spacing', 7.5e-2

Example: rc.Spacing = 7.5e-2

Data Types: double

**Substrate — Type of dielectric material**

'Air' (default) | object

Type of dielectric material used as a substrate, specified as an object. For more information see, `dielectric`. For more information on dielectric substrate meshing, see “Meshing”.

---

**Note** The substrate dimensions must be equal to the groundplane dimensions.

---

Example: d = `dielectric('FR4');` 'Substrate', d

Example: d = `dielectric('FR4');` rc.Substrate = d

**EnableProbeFeed — Create probe feed from backing structure to exciter**

0 (default) | 1 | scalar

Create probe feed from backing structure to exciter, specified as 0 or 1 or a scalar. By default, probe feed is not enabled.

Example: 'EnableProbeFeed', 1

Example: rc.EnableProbeFeed = 1

Data Types: double | logical

**Load — Lumped elements**[1x1 `lumpedElement`] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. You can add a load anywhere on the surface of the antenna. By default, the load is at the origin. For more information, see `lumpedElement`.

Example: 'Load', lumpedelement. lumpedelement is the object handle for the load created using lumpedElement.

Example: `rc.Load = lumpedElement('Impedance', 75)`

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector in degrees.

Example: 'Tilt', 90

Example: `rc.Tilt = [90 90 0]`

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: `rc.TiltAxis = z`

Data Types: double

### Circular Reflector Backed Antenna

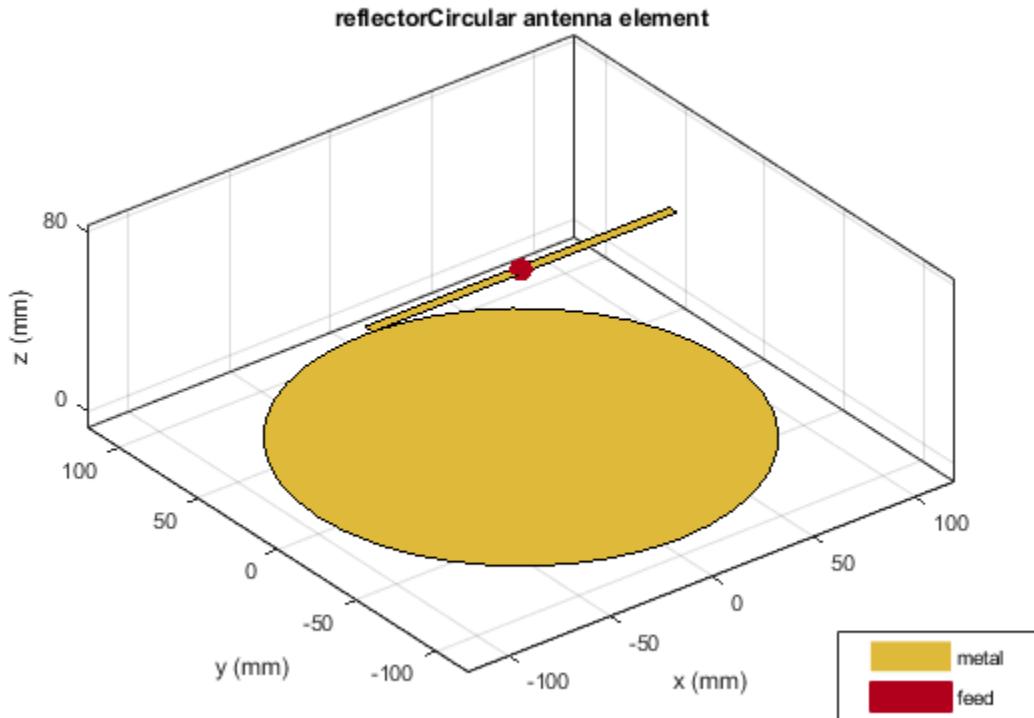

Create and view a default circular reflector backed antenna.

```
rc = reflectorCircular

rc =
    reflectorCircular with properties:

        Exciter: [1×1 dipole]
        Substrate: [1×1 dielectric]
    GroundPlaneRadius: 0.1000
        Spacing: 0.0750
    EnableProbeFeed: 0
        Tilt: 0
    TiltAxis: [1 0 0]
        Load: [1×1 lumpedElement]

show(rc);
```

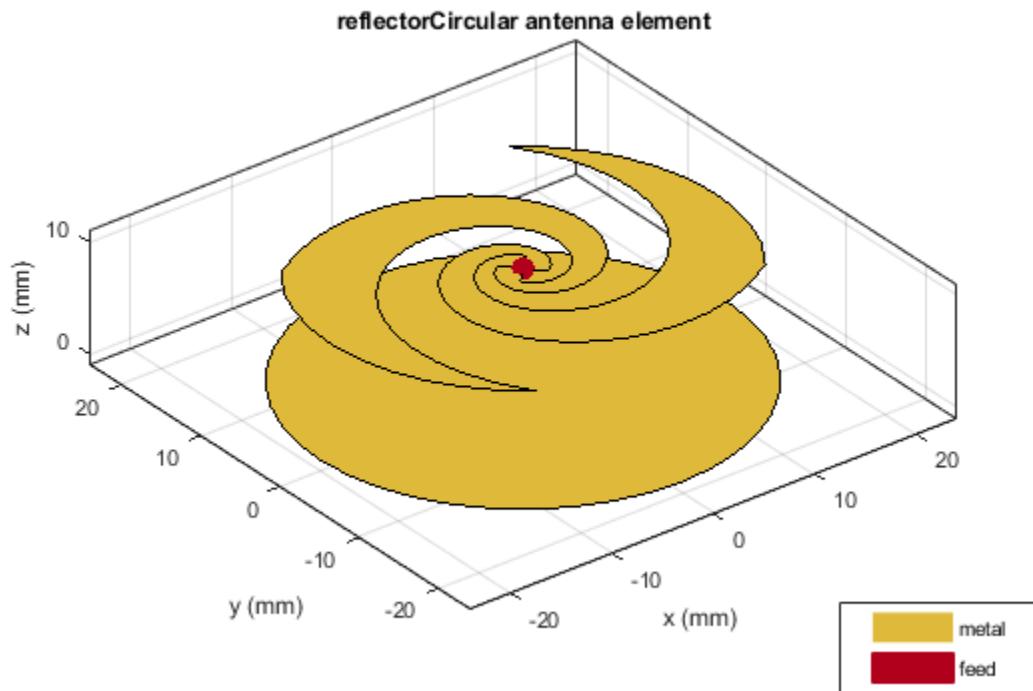

### Radiation Pattern of Circular Reflector Backed Antenna

#### Create Antenna Backed by Circular Reflector

Create an equiangular spiral backed by a circular reflector.

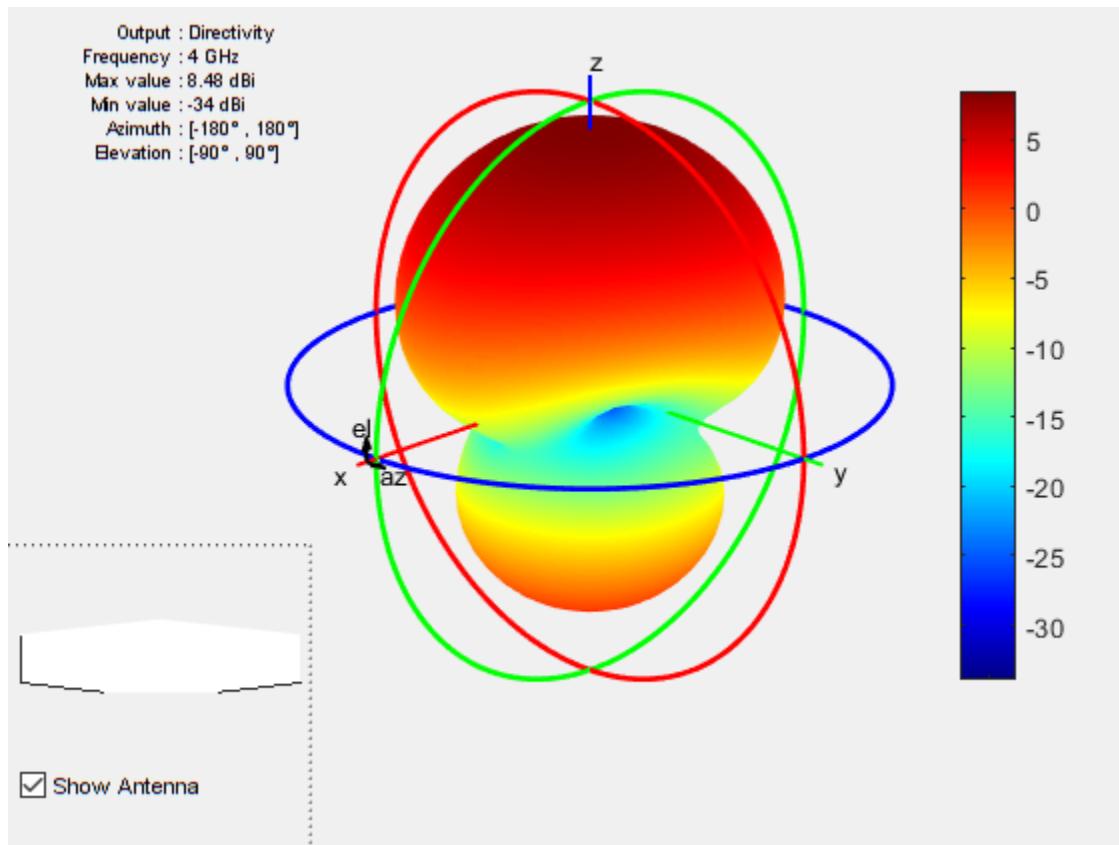

```
ant = reflectorCircular('Exciter',spiralEquiangular, 'GroundPlaneRadius', ...
    0.02, 'Spacing', 0.01);
show(ant)
```

### Plot Radiation Pattern

Plot the radiation pattern of the antenna at 4 GHz.

```
pattern(ant, 4e9)
```

## birdcage

Creates birdcage (MRI coil)

### Description

The `birdcage` object creates to create a birdcage MRI coil. This antenna is most commonly used in clinical MRI. The antenna structure consists of two circular coils connected by conductive elements called rungs. The number of rungs depends on the size of the coil and is generally an even number.

The coil is operated at 64 MHz or 128 MHz. The bircage can be loaded/excited to model a highpass or lowpass coil.

## Creation

## Syntax

```
bc = birdcage  
bc = birdcage(Name,Value)
```

## Description

`bc = birdcage` creates a birdcage antenna to model an MRI coil.

`bc = birdcage(Name,Value)` sets properties using one or more name-value pairs. For example, `bc = birdcage('NumRungs',8)` creates a birdcage with eight rungs. Enclose each property name in quotes.

## Properties

### **NumRungs — Number of rungs**

16 (default) | scalar integer

Number of rungs, specified as a scalar.

Example: `'NumRungs', 20`

Example: `bc.NumRungs = 20`

Data Types: `int8`

### **CoilRadius — Coil radius**

0.4000 (default) | scalar

Coil radius, specified as a scalar in meters.

Example: `'CoilRadius', 0.2`

Example: `bc.CoilRadius = 0.2`

Data Types:

**CoilHeight — Coil height**

0.0400 (default) | scalar

Coil height, specified as a scalar in meters.

Example: 'CoilHeight', 0.089

Example: bc.CoilHeight = 0.089

Data Types: double

**RungHeight — Height of rungs**

0.4600 (default) | scalar

Height of rungs, specified as a scalar in meters. Distance is measured from the middle of the upper coil to the middle of the lower coil.

Example: 'RungHeight', 0.56

Example: bc.RungHeight = 0.56

Data Types: double

**ShieldRadius — Shield radius**

0 (default) | scalar

Shield radius, specified as a scalar in meters. A value of zero indicates that the shield is absent.

Example: 'ShieldRadius', 0.2

Example: bc.ShieldRadius = 0.2

Data Types: double

**ShieldHeight — Shield height**

0 (default) | scalar

Shield height, specified as a scalar in meters. A value of zero indicates that the shield is absent.

Example: 'ShieldHeight', 0.089

Example: bc.ShieldHeight = 0.089

Data Types: double

**Phantom — Dielectric mesh to load birdcage**

structure

Dielectric mesh to load birdcage, specified as a structure having the following fields:

**Points — Points in custom dielectric mesh**

$N$ -by-3 matrix

Points in custom dielectric mesh, specified as an  $N$ -by-3 matrix in meters.  $N$  is the number of points.

You can use the phantom property to insert a dielectric mesh in the shape of a human head into the bird cage antenna. This dielectric cylinder has a permeability of 80. You can upload this mesh in the form of a mat file.

Data Types: double

**Tetrahedra — Tetrahedra in custom dielectric mesh**

$M$ -by-3 integer matrix

Tetrahedra in custom dielectric mesh, specified as an  $M$ -by-3 integer matrix.  $M$  is the number of tetrahedra.

Data Types: double

**EpsilonR — Relative permittivity of dielectric material**

scalar

Relative permittivity of dielectric material, specified as a scalar.

Data Types: double

**LossTangent — Loss in dielectric material**

scalar

Loss in dielectric material, specified as a scalar.

Data Types: double

Data Types: struct

**FeedLocations — Location of feeds in Cartesian coordinates**

0 (default) |  $N$ -by-3 matrix

Location of feeds in Cartesian coordinates, specified as an  $N$ -by-3 matrix. You can also use the `getLowPassLocs` and `getHighPassLocs` functions to determine the feed locations in low-pass or high-pass mode.

Example: `'FeedLocations' = [0.3981 0.0392 -0.2300; 0.3528 0.1886 -0.2300]`

Example: `b.FeedLocations = getLowPassLocs(b)`

Data Types: double

### **FeedVoltage — Magnitude of voltage**

1 (default) | scalar | 1-by- $N$  vector

Magnitude of voltage applied to each feed, specified as a scalar or 1-by- $N$  vector with each element unit in volts.

Example: `'FeedVoltage', 2`

Example: `bc.FeedVoltage = 2`

Data Types: double

### **FeedPhase — Phase shift to the voltage**

0 (default) | scalar | 1-by- $M$  vector

Phase shift to the excitation voltage at each feed, specified as a scalar or 1-by- $M$  vector with each element unit in degrees.

Example: `'FeedPhase', 45`

Example: `bc.FeedPhase = 45`

Data Types: double

### **Load — Lumped elements**

[1x1 `lumpedElement`] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. You can add a load anywhere on the surface of the antenna. By default, it is at the origin. For more information, see `lumpedElement`.

Example: `'Load', lumpedElement`. `lumpedElement` is the object handle for the load created using `lumpedElement`.

Example: `bc.Load = lumpedElement('Impedance', 75)`

**Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector in degrees.

Example: 'Tilt', 90

Example: bc.Tilt = [90 90 0]

Data Types: double

**TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0; 0 1 0]

Example: bc.TiltAxis = Z

Data Types: double

## Object Functions

getLowPassLocs	Feeding location to operate birdcage as lowpass coil
getHighPassLocs	Feeding location to operate birdcage as highpass coil
show	Display antenna or array structure; Display shape as filled patch
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface

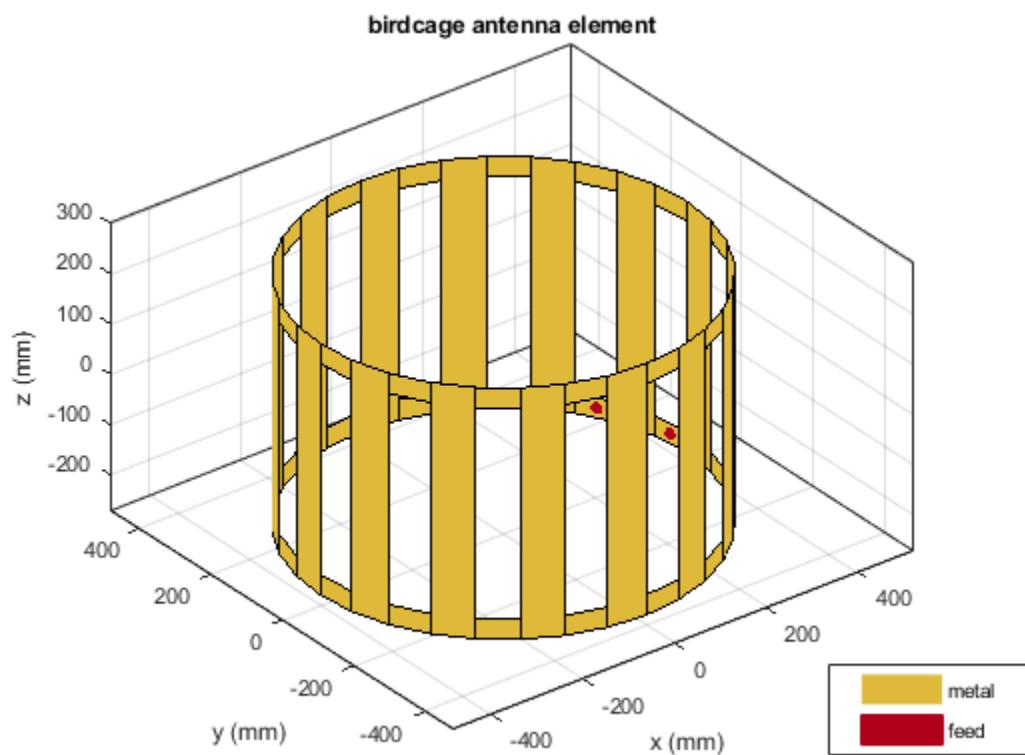

design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array

## Examples

### Birdcage Antenna

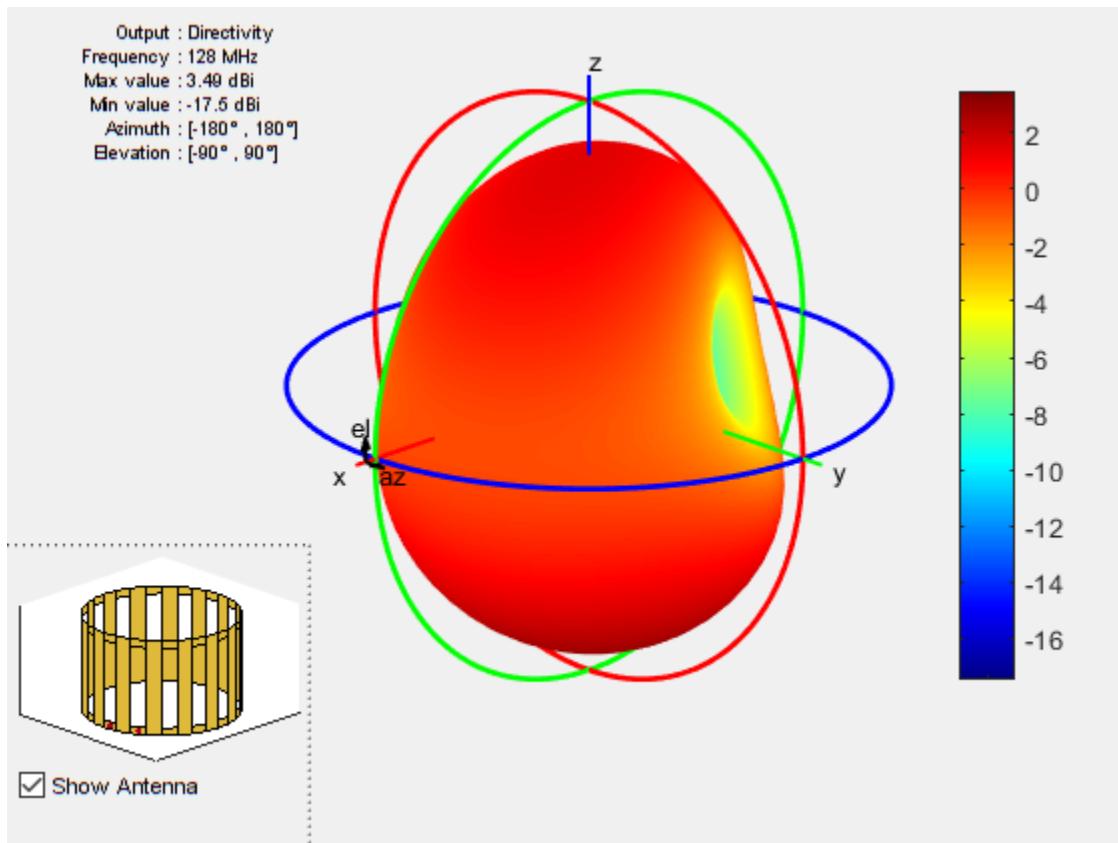

Create and view a default birdcage antenna.

```
bc = birdcage  
  
bc =  
    birdcage with properties:  
  
        NumRungs: 16  
        CoilRadius: 0.4000  
        CoilHeight: 0.0400  
        RungHeight: 0.4600  
        ShieldRadius: 0  
        ShieldHeight: 0  
        Phantom: []  
        FeedLocations: [2×3 double]  
        FeedVoltage: 1  
        FeedPhase: 0  
        Tilt: 0  
        TiltAxis: [1 0 0]  
        Load: [1×1 lumpedElement]  
  
show(bc);
```

Plot the radiation pattern at 128 MHz.

pattern(bc,128e6)

### Human Head Model Inside BirdCage

Antenna Toolbox provides two .mat files to load a phantom human head model into a birdcage antenna. The human head model is a dielectric mesh.

Load human head model file. Extract the values of "Points" and "Tetrahedra". Add a relativite permittivity (EpsilonR) of 10 and a dielectric loss (LossTangent) of 0.002. Scale the dielectric mesh to fit in the birdcage antenna. Here a value of 0.003 is multiplied to the mesh points.

```
load humanheadcoarse.mat
humanhead = struct('Points',0.003*P,'Tetrahedra',T,'EpsilonR',10, ...
    'LossTangent',0.002)

humanhead =
    struct with fields:

        Points: [584×3 double]
        Tetrahedra: [2818×4 double]
        EpsilonR: 10
        LossTangent: 0.0020
```

Add and view the human head mesh inside the birdcage.

```
b = birdcage('Phantom',humanhead)
show(b)
```

```
b =
    birdcage with properties:

        NumRungs: 16
        CoilRadius: 0.4000
        CoilHeight: 0.0400
        RungHeight: 0.4600
        ShieldRadius: 0
        ShieldHeight: 0
        Phantom: [1×1 struct]
        FeedLocations: [2×3 double]
        FeedVoltage: 1
        FeedPhase: 0
        Tilt: 0
        TiltAxis: [1 0 0]
        Load: [1×1 lumpedElement]
```

### Birdcage In High-Pass Operation

Create a birdcage antenna.

```
b = birdcage;  
show(b);
```

Use the birdcage as a high-pass coil.

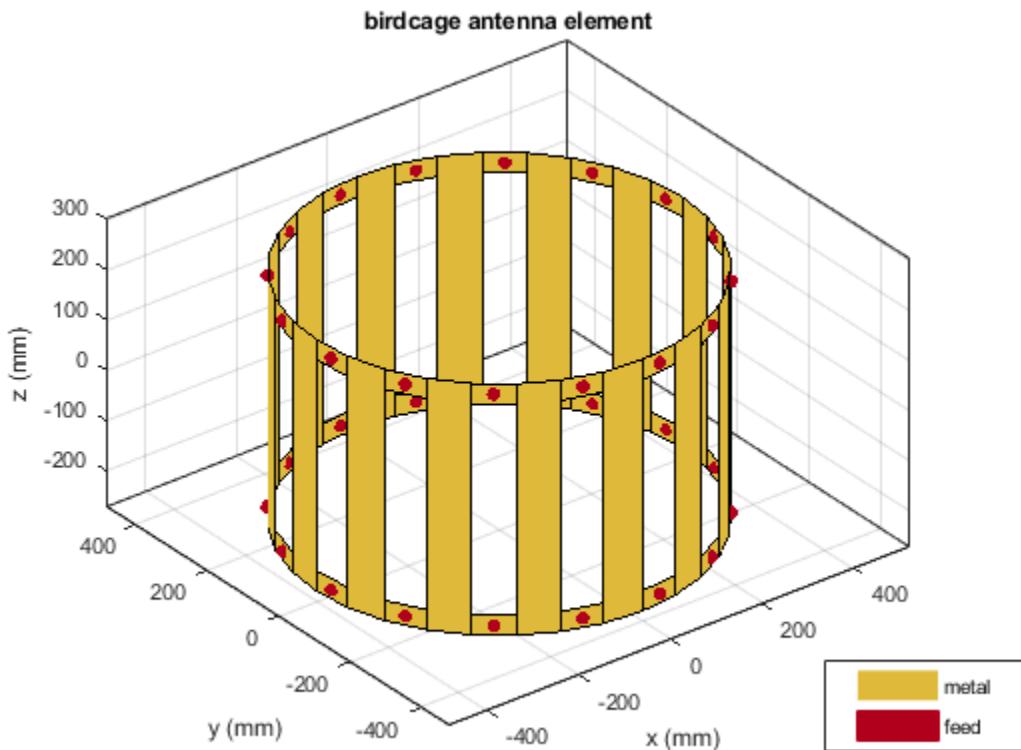

```
b.FeedLocations = getHighPassLocs(b)
show(b);
```

```
b =
```

birdcage with properties:

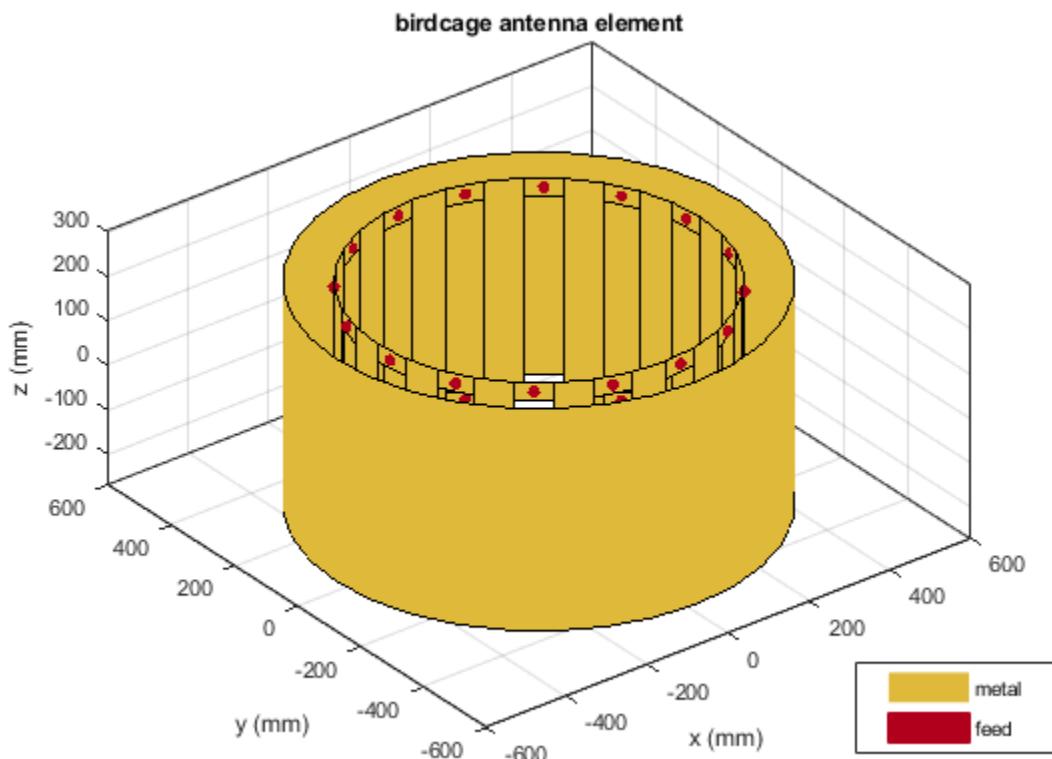

```
NumRungs: 16
CoilRadius: 0.4000
CoilHeight: 0.0400
RungHeight: 0.4600
```

```
ShieldRadius: 0
ShieldHeight: 0
    Phantom: []
FeedLocations: [32×3 double]
    FeedVoltage: 1
    FeedPhase: 0
    Tilt: 0
TiltAxis: [1 0 0]
Load: [1×1 lumpedElement]
```

Shield the antenna to ensure that radiation does not leak out.

```
b.ShieldRadius = 0.5;  
b.ShieldHeight = 0.5;  
show(b) ;
```

## **sectorInvertedAmos**

Create inverted Amos sector antenna

### **Description**

Use the `sectorInvertedAmos` object to create an inverted Amos sector antenna consisting of four dipole-like arms. The antenna is fed at the origin of the dipole. The dipole arms are symmetric about the origin. The operating frequency of the antenna is at 2.45 GHz wireless.

## Creation

### Syntax

```
amossector = sectorInvertedAmos  
amossector = sectorInvertedAmos(Name,Value)
```

### Description

`amossector = sectorInvertedAmos` creates an inverted Amos sector antenna with four dipole-like arms.

`amossector = sectorInvertedAmos(Name,Value)` sets properties using one or more name-value pair. For example, `amossector = sectorInvertedAmos('ArmWidth', 0.2)` creates an inverted Amos sector with a dipole width of 0.2 m. Enclose each property name in quotes.

## Properties

### **ArmLength — Individual dipole arm length**

[0.0880 0.0710 0.0730 0.0650] (default) | vector

Length of individual dipole arms, specified as a vector with each element unit in meters.

Example: `'ArmLength', [0.0980 0.0810 0.0830 0.0750]`

Example: `amossector.ArmLength = [0.0980 0.0810 0.0830 0.0750]`

Data Types: double

### **ArmWidth — Dipole arm width**

0.0040 (default) | scalar

Width of dipole arms, specified as a scalar in meters.

Example: `'ArmWidth', 0.0025`

Example: `amossector.ArmWidth = 0.0025`

Data Types: double

**NotchLength — Notch length**

0.0238 (default) | scalar

Notch length, specified as a scalar in meters. For an inverted Amos sector antenna with seven stacked arms, six notches are generated. Notch length is measured along the length of the antennas.

Example: 'NotchLength', 0.001

Example: amossector.NotchLength = 0.001

Data Types: double

**NotchWidth — Notch width**

0.0170 (default) | scalar

Notch width, specified as a scalar in meters. For an inverted Amos sector antenna with seven stacked arms, six notches are generated. Notch width is measured perpendicular to the length of the antenna.

Example: 'NotchWidth', 0.00190

Example: amossector.NotchWidth = 0.00190

Data Types: double

**GroundPlaneLength — Ground plane length**

0.6600 (default) | scalar

Ground plane length, specified as a scalar in meters. By default, ground plane length is measured along x-axis.

Example: 'GroundPlaneLength', 0.7500

Example: amossector.GroundPlaneLength = 0.7500

Data Types: double

**GroundPlaneWidth — Ground plane width**

0.0750 (default) | scalar

Ground plane width, specified as a scalar in meters. By default, ground plane width is measured along y-axis.

Example: 'GroundPlaneWidth', 0.0500

Example: `amossector.GroundPlaneWidth = 0.0500`

Data Types: double

### **Spacing — Distance between ground plane and antenna element**

0.0355 (default) | scalar

Distance between ground plane and antenna element, specified as a scalar in meters.

Example: `'Spacing', 0.0355`

Example: `amossector.Spacing = 0.0355`

Data Types: double

### **Load — Lumped elements**

[1x1 `lumpedElement`] (default) | lumped element object handle

Lumped elements added to the antenna feed, specified as a lumped element object handle. You can add a load anywhere on the surface of the antenna. By default, it is at the origin. For more information, see `lumpedElement`.

Example: `'Load', lumpedelement.lumpedelement` is the object handle for the load created using `lumpedElement`.

Example: `amossector.Load = lumpedElement('Impedance', 75)`

### **Tilt — Tilt angle of antenna**

0 (default) | scalar | vector

Tilt angle of antenna, specified as a scalar or vector in degrees.

Example: `'Tilt', 90`

Example: `amossector.Tilt = [90 90 0]`

Data Types: double

### **TiltAxis — Tilt axis of antenna**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vector of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the antenna, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axis.

- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: amossector.TiltAxis = Z

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
vswr	Voltage standing wave ratio of antenna

## Examples

### Inverted Amos Sector

Create and view an inverted Amos sector antenna.

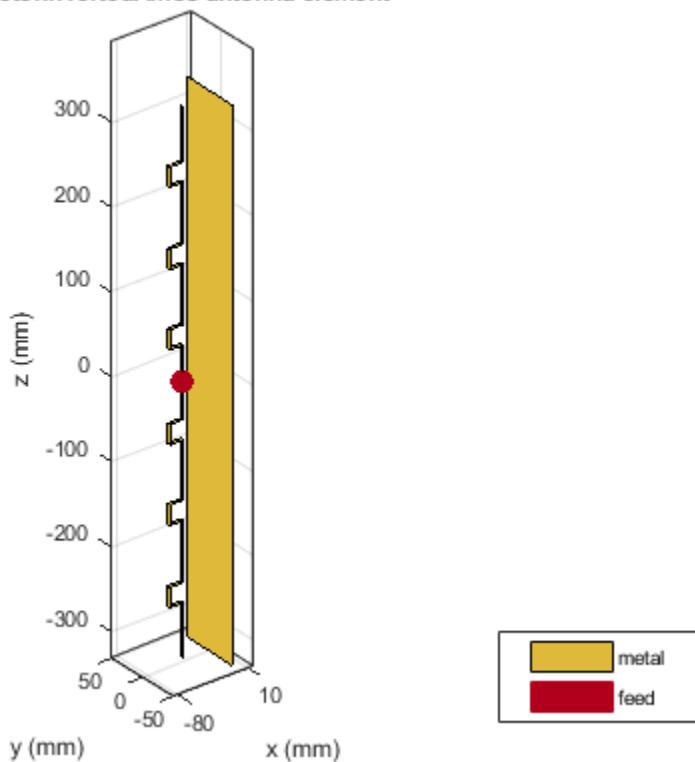

```
sectoria = sectorInvertedAmos

sectoria =
sectorInvertedAmos with properties:

    ArmLength: [0.0880 0.0710 0.0730 0.0650]
    ArmWidth: 0.0040
    NotchLength: 0.0238
    NotchWidth: 0.0170
    GroundPlaneLength: 0.6600
    GroundPlaneWidth: 0.0750
    Spacing: 0.0355
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1×1 lumpedElement]

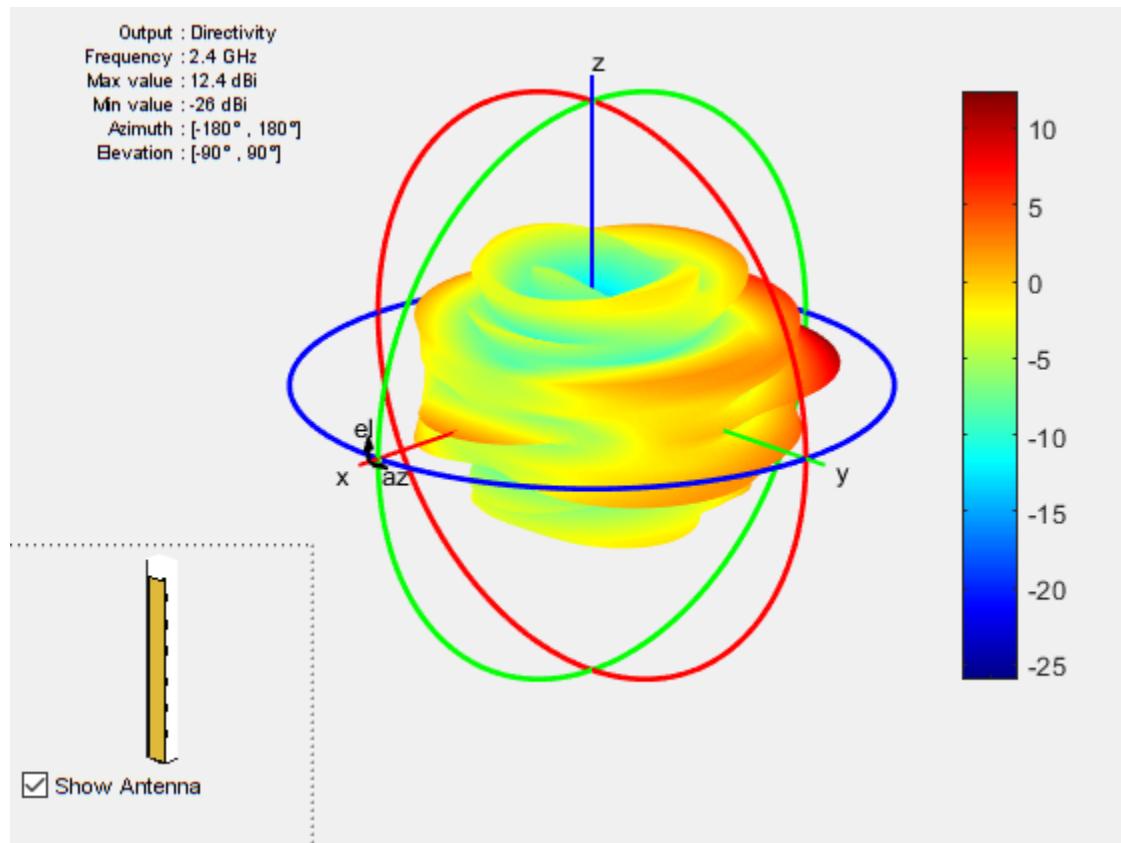

show(sectoria)
```

sectorInvertedAmos antenna element

Plot Radiation Pattern at 2.4 GHz

```
pattern(sectoria,2.4e9)
```

# rxsite

Create radio frequency receiver site

## Description

Use the `rxsite` object to create a radio frequency receiver site.

## Creation

## Syntax

```
rx = rxsite  
rx = rxsite(Name,Value)
```

## Description

`rx = rxsite` creates a radio frequency receiver site.

`rx = rxsite(Name,Value)` sets properties using one or more name-value pairs. For example, `rx = rxsite('Name', 'RX Site')` creates a receiver site with name RX Site. Enclose each property name in quotes.

## Properties

### Name — Site name

character vector | string | row or column vector

Site name, specified as a character vector or as a row or column vector or as a string.

Example: `'Name', 'Site 3'`

Example: `RX.Name = 'Site 3'`

Example: If you want to assign multiple values then - names = ["Fenway Park", "Faneuil Hall", "Bunker Hill Monument"]; RX = rxsite('Name',names)

Data Types: char | string

### **Latitude — Site latitude coordinates**

42.3021 (default) | numeric scalar | row or column vector

Site latitude coordinates, specified as a numeric scalar or a row or column vector in the range of range -90 to 90. Coordinates are defined using Earth ellipsoid model WGS-84. Latitude is the north/south angle.

Example: 'Latitude',45.098

Example: RX = 45.098

Example: If you want to assign multiple values then - latitude = [42.3467, 42.3598, 42.3763]; RX = rxsite('Latitude',latitude)

### **Longitude — Site longitude coordinates**

-71.3764 (default) | numeric scalar | row or column vector

Site longitude coordinates, specified as a numeric scalar or a row or column vector. Coordinates are defined using Earth ellipsoid model WGS-84. Longitude is the east/west angle.

Example: 'Longitude',-68.890

Example: RX.Longitude = -68.890

Example: If you want to assign multiple values then - longitude = [-71.0972, -71.0545, -71.0611]; RX = rxsite('Longitude',longitude)

### **Antenna — Antenna element or array**

dipole (default) | object | row vector

Antenna element or array object, specified as an object or a row vector of objects. By default, the antenna is a dipole designed for 1.9 GHz.

Example: 'Antenna',monopole

Example: RX.Antenna = monopole

Data Types: double

**AntennaAngle — Antenna x-axis angle**

0 (default) | numeric scalar | 2-by-1 vector | 2-by- $N$  matrix

Antenna x-axis angle, specified as a numeric scalar, a 2-by-1 vector, or a 2-by- $N$  matrix in degrees.

The numeric scalar is the azimuth angle measured counterclockwise from the east to the antenna's x-axis.

In the 2-by-1 vector, the first element is the azimuth angle and the second element elevation angle. The elevation angle measures from the horizontal plane to antenna's x-axis from -90 to 90 degrees.

Example: 'AntennaAngle',25

Example: RX.AntennaAngle = [25,-80]

Data Types: double

**AntennaHeight — Antenna height**

1 (default) | nonnegative numeric scalar | row vector

Antenna height from the ground elevation at the site to the center of the antenna element, specified as a nonnegative numeric scalar in meters.

Example: 'AntennaHeight',25

Example: RX.AntennaHeight = 15

Data Types:

**SystemLoss — System loss**

0 (default) | nonnegative numeric scalar | row vector

System loss, specified as a non-negative numeric scalar or a row vector in dB.

System loss includes transmission line loss and any other miscellaneous system losses.

Example: 'SystemLoss',10

Example: RX.SystemLoss = 10

Data Types:

**ReceiverSensitivity — Minimum received power to detect signal**

-100 (default) | numeric scalar | row vector

Minimum received power needed to detect the signal, specified as a numeric scalar or a row vector in dBm.

Example: 'ReceiverSensitivity', -80

Example: RX.ReceiverSensitivity = -80

Data Types: double

## Object Functions

show	Show site location on map
hide	Hide site location on map
distance	Distance between sites
angle	Angle between sites
sigstrength	Signal strength due to transmitter
link	Display communication link on map

## Examples

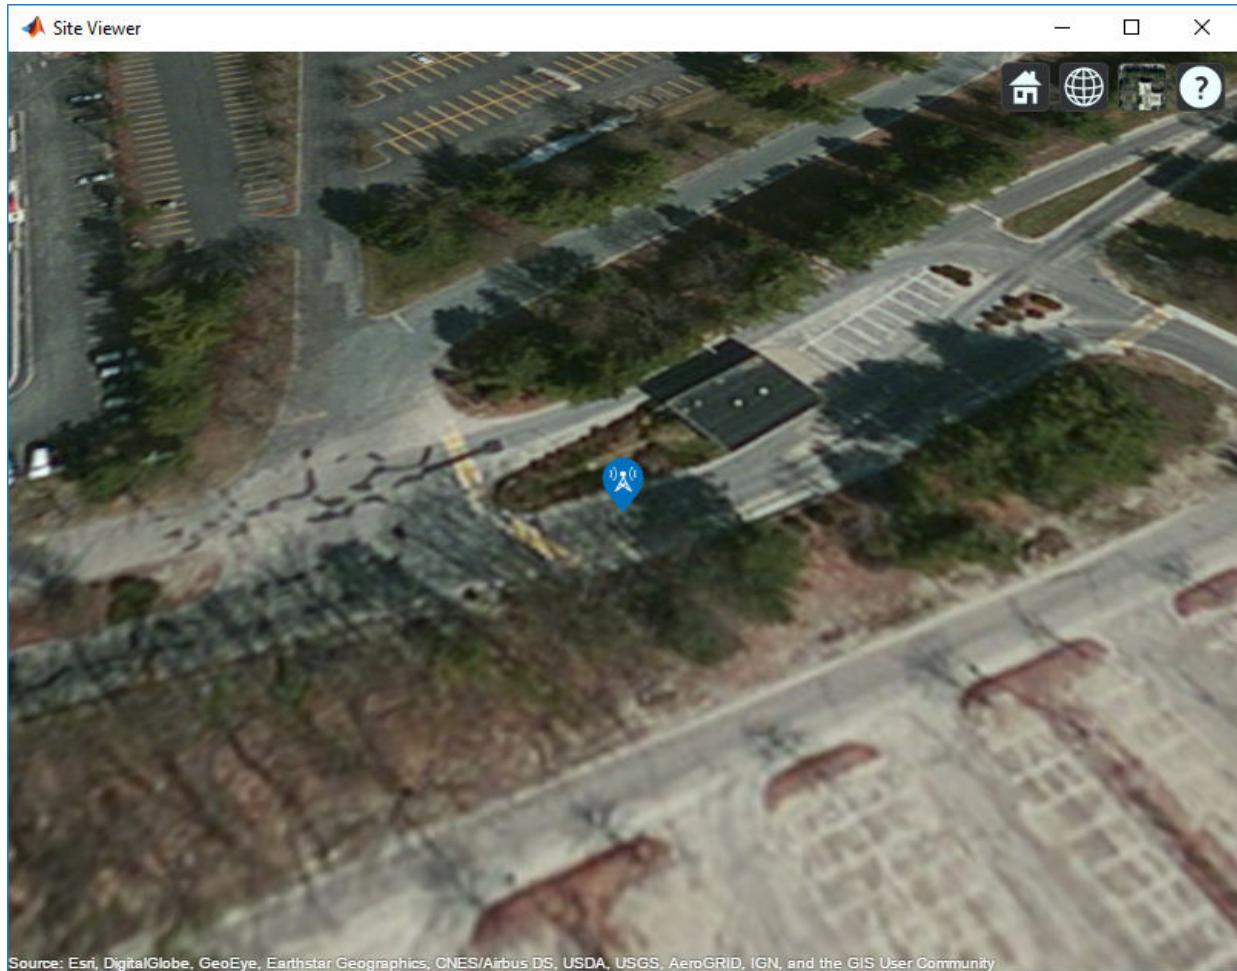

### Default Receiver Site

Create and show the default receiver site.

```
rx = rxsite  
show(rx)
```

```
rx =
```

```
    rxsite with properties:  
  
        Name: 'Site 1'  
        Latitude: 42.3021  
        Longitude: -71.3764  
        Antenna: [1×1 dipole]  
        AntennaAngle: 0  
        AntennaHeight: 1  
        SystemLoss: 0  
        ReceiverSensitivity: -100
```

### Receiver Array Site

Create and show a 1-by-3 receiver site array.

Define names and locations of the sites around Boston.

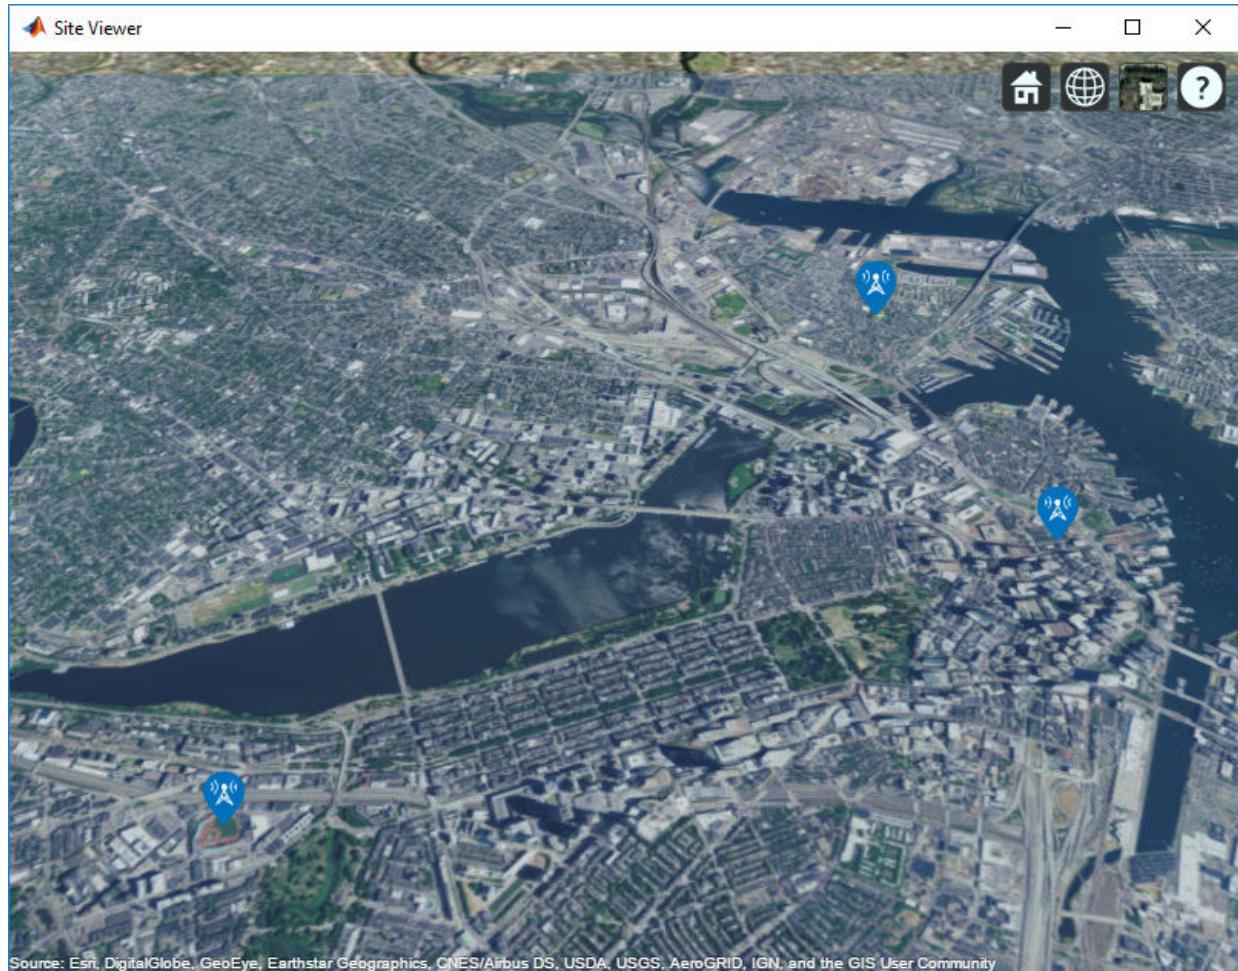

```
names = ["Fenway Park", "Faneuil Hall", "Bunker Hill Monument"];
lats = [42.3467, 42.3598, 42.3763];
lons = [-71.0972, -71.0545, -71.0611];
```

Define the sensitivity of the receivers.

```
sens = -90;
```

Create and show receiver site array.

```
rxs = rxsite('Name', names, ...
    'Latitude', lats, ...
    'Longitude', lons, ...
    'ReceiverSensitivity', sens);
show(rxs)
```

## antenna.Circle

Create circle centered at origin on X-Y plane

### Description

Use the `antenna.Circle` object to create a circle centered at the origin and on the X-Y plane. You can use `antenna.Polygon` to create single-layer or multi-layered antennas using `pcbStack`.

### Creation

### Syntax

```
circle = antenna.Circle  
circle = antenna.Circle(Name,Value)
```

### Description

`circle = antenna.Circle` creates a circle centered at the origin and on the X-Y plane.

`circle = antenna.Circle(Name,Value)` sets properties using one or more name-value pair. For example, `circle = antenna.Circle('Radius',0.2)` creates a circle of radius 0.2 m. Enclose each property name in quotes.

### Properties

#### Name — Name of circle

'mycircle' (default) | character vector

Name of circle, specified a character vector.

Example: 'Name', 'Circle1'

Example: circle.Name= 'Circle1'

Data Types: char

**Center — Cartesian coordinates of center of circle**

[ 0 0 ] (default) | 2-element vector

Cartesian coordinates of center of circle, specified a 2-element vector with each element measured in meters.

Example: 'Center', [0.006 0.006]

Example: circle.Center= [0.006 0.006]

Data Types: double

**Radius — Circle radius**

1 (default) | scalar

Circle radius, specified a scalar in meters.

Example: 'Radius', 2

Example: circle.Radius= 2

Data Types: double

**NumPoints — Number of discretization points on circumference**

20 (default) | scalar

Number of discretization points on circumference, specified a scalar.

Example: 'NumPoints', 16

Example: circle.NumPoints= 2

Data Types: double

## Object Functions

add Boolean unite operation on two shapes

subtract Boolean subtraction operation on two shapes

area Calculate area of shape in sq.m

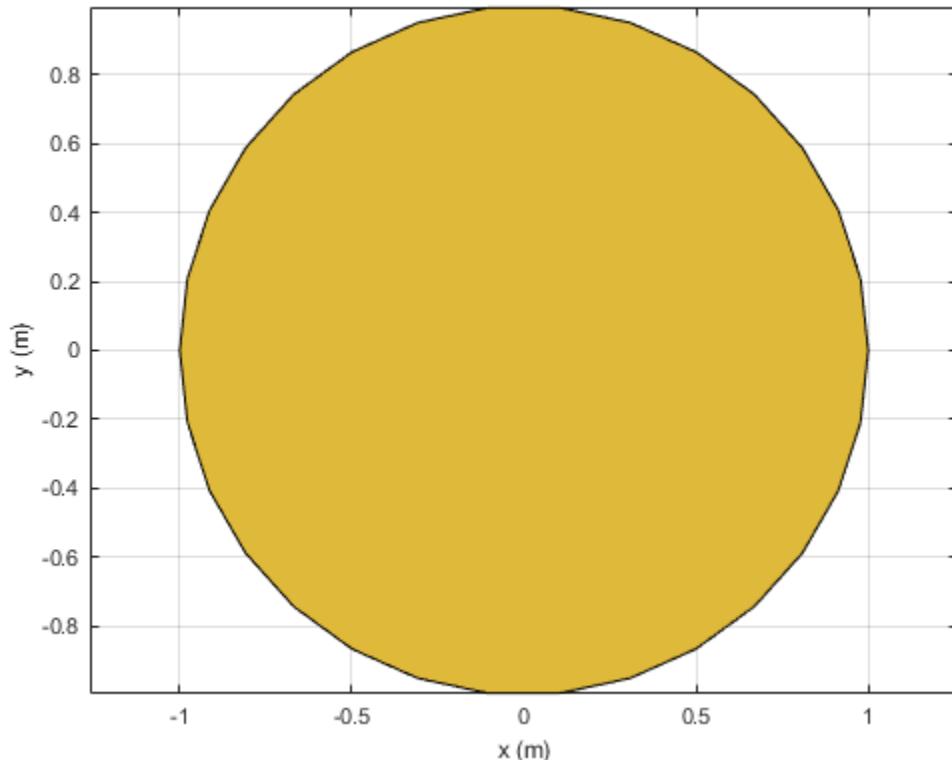

intersect	Boolean intersection operation on two shapes
rotate	Rotate shape about axis and angle
rotateX	Rotate shape about X-axis and angle
rotateY	Rotate shape about Y-axis and angle
rotateZ	Rotate shape about Z-axis and angle
translate	Move shape to new location
show	Display antenna or array structure; Display shape as filled patch
mesh	Mesh properties of metal or dielectric antenna or array structure

## Examples

### Create Circle with Default Properties

Create and view circle using `antenna.Circle` and view it.

```
c1 = antenna.Circle  
c1 =  
    Circle with properties:  
  
        Name: 'mycircle'  
        Center: [0 0]  
        Radius: 1  
        NumPoints: 30  
  
show(c1)
```

### Create Circle with Specified Properties

Create a circle with a radius of 4 m.

```
c2 = antenna.Circle('Radius', 4)
```

```
c2 =
Circle with properties:
```

```
Name: 'mycircle'
Center: [0 0]
Radius: 4
```

```
NumPoints: 30
```

### Add Two Shapes

Create circle with a radius of 1 m. The center of the circle is at [1 0].

```
circle1 = antenna.Circle('Center',[1 0], 'Radius',1);
```

Create a rectangle with a length of 2 m and a width of 4 m centered at the origin.

```
rect1 = antenna.Rectangle('Length',2, 'Width',2);
```

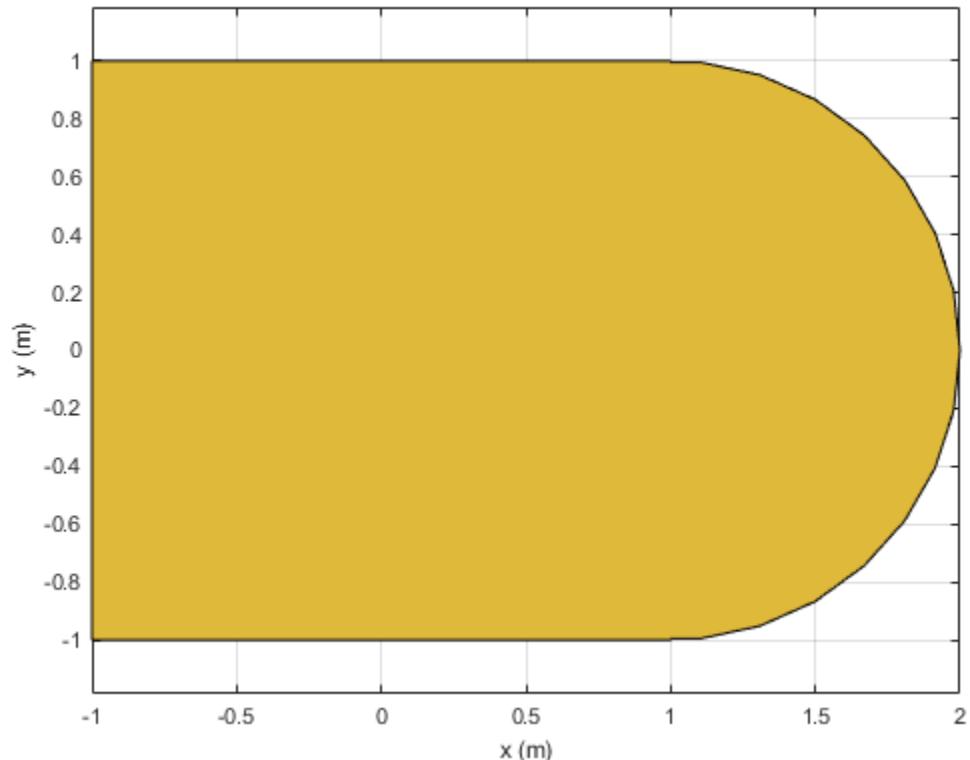

Add the two shapes together using the + function.

```
polygon1 = circle1+rect1
```

```
polygon1 =
  Polygon with properties:
```

```
  Name: 'mypolygon'
  Vertices: [60x3 double]
```

```
show(polygon1)
```

## See Also

[antenna.Polygon](#) | [antenna.Rectangle](#)

**Introduced in R2017a**

## antenna.Polygon

Create polygon on X-Y plane

### Description

Use the `antenna.Polygon` object to create a polygonal centered at the origin and on the X-Y plane. You can use `antenna.Polygon` to create single-layer or multi-layered antennas using `pcbStack`.

### Creation

### Syntax

```
polygon = antenna.Polygon  
polygon = antenna.Polygon(Name,Value)
```

### Description

`polygon = antenna.Polygon` creates a polygonal centered at the origin and on the X-Y plane.

`polygon = antenna.Polygon(Name,Value)` sets properties using one or more name-value pair. For example, `polygon = antenna.Polygon('Name', 'mypolygon')` creates a polygon of name 'mypolygon'. Enclose each property name in quotes.

### Properties

#### Name — Name of polygon

'mypolygon' (default) | character vector

Name of polygon, specified a character vector.

Example: 'Name', 'Polygon1'

Example: polygon.Name = 'Polygon1'

Data Types: char

#### **Vertices — Cartesian coordinates of polygon vertices**

[ ] (default) |  $N$ -by-3 vector

Cartesian coordinates of polygon vertices, specified as a  $N$ -by-3 vector with each element measured in meters.

Example: 'Vertices', [-1 0 0; -0.5 0.2 0; 0 0 0]

Example: polygon.Vertices = [-1 0 0; -0.5 0.2 0; 0 0 0]

Data Types: double

## Object Functions

add	Boolean unite operation on two shapes
area	Calculate area of shape in sq.m
subtract	Boolean subtraction operation on two shapes
intersect	Boolean intersection operation on two shapes
rotate	Rotate shape about axis and angle
rotateX	Rotate shape about X-axis and angle
rotateY	Rotate shape about Y-axis and angle
rotateZ	Rotate shape about Z-axis and angle
translate	Move shape to new location
show	Display antenna or array structure; Display shape as filled patch
mesh	Mesh properties of metal or dielectric antenna or array structure

## Examples

### Create and Transform Polygon

Create a polygon using `antenna.Polygon` with vertices at [-1 0 0; -0.5 0.2 0; 0 0 0] and view it.

```
p = antenna.Polygon('Vertices', [-1 0 0; -0.5 0.2 0; 0 0 0])
```

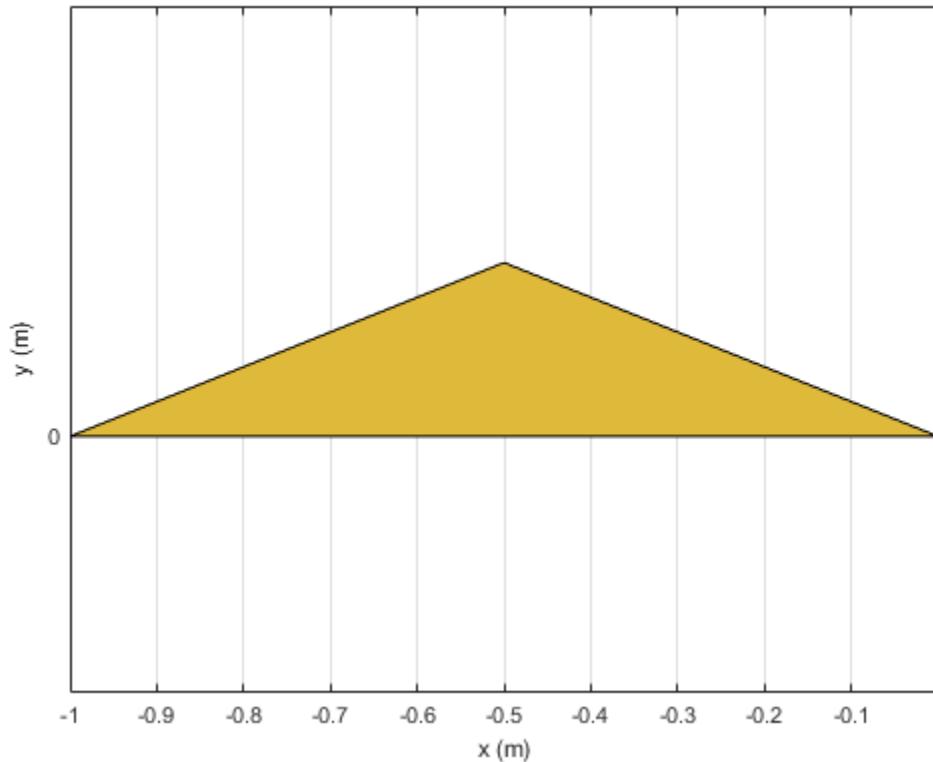

## 2 Antenna Objects — Alphabetical List

---

```
p =  
  Polygon with properties:
```

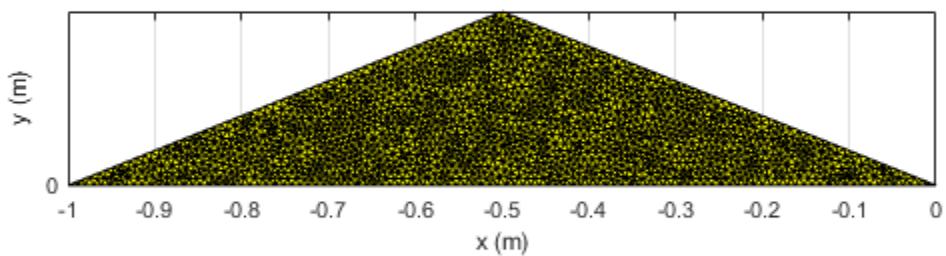

```
    Name: 'mypolygon'  
Vertices: [3x3 double]
```

```
show(p);axis equal
```

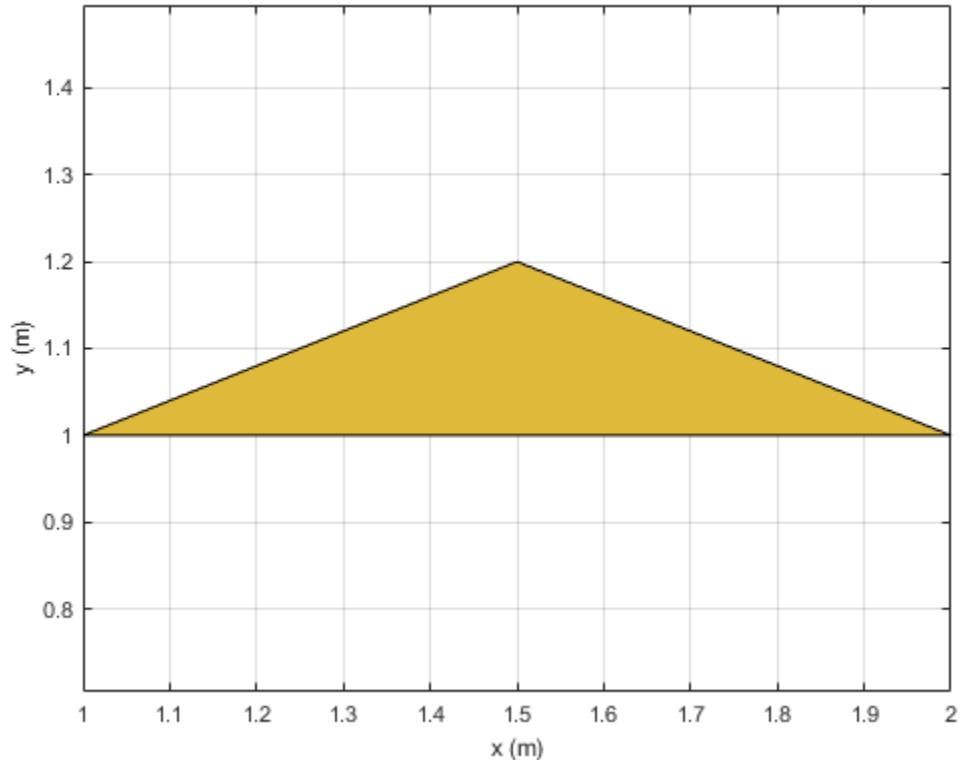

Mesh the polygon and view it.

```
mesh(p, 0.2);
```

Move the polygon to a new location on the X-Y plane.

```
translate(p, [2,1,0]); axis equal
```

## See Also

`antenna.Circle` | `antenna.Rectangle`

Introduced in R2017a

# antenna.Rectangle

Create rectangle centered at origin on X-Y plane

## Description

Use the `antenna.Rectangle` object to create a rectangle centered at the origin and on the X-Y plane. You can use `antenna.Polygon` to create single-layer or multi-layered antennas using `pcbStack`.

## Creation

### Syntax

```
rect = antenna.Rectangle  
rect = antenna.Rectangle(Name,Value)
```

### Description

`rect = antenna.Rectangle` creates a rectangle centered at the origin and on the X-Y plane.

`rect = antenna.Rectangle(Name,Value)` sets properties using one or more name-value pair. For example, `rectangle = antenna.Rectangle('Length',0.2)` creates a rectangle of length 0.2 m. Enclose each property name in quotes.

## Properties

### Name — Name of rectangle

'myrectangle' (default) | character vector

Name of rectangle, specified a character vector.

Example: 'Name', 'Rect1'

Example: rectangle.Name = 'Rect1'

Data Types: char

**Center — Cartesian coordinates of center of rectangle**

[ 0 0 ] (default) | 2-element vector

Cartesian coordinates of center of rectangle, specified a 2-element vector with each element measured in meters.

Example: 'Center', [0.006 0.006]

Example: rectangle.Center = [0.006 0.006]

Data Types: double

**Length — Rectangle length**

1 (default) | scalar

Rectangle length, specified a scalar in meters.

Example: 'Length', 2

Example: rectangle.Length = 2

Data Types: double

**Width — Rectangle width**

2 (default) | scalar

Rectangle width, specified a scalar in meters.

Example: 'Width', 4

Example: rectangle.Width = 4

Data Types: double

**NumPoints — Number of discretization points per side**

2 (default) | scalar

Number of discretization points per side, specified a scalar.

Example: 'NumPoints', 16

Example: `rectangle.NumPoints = 16`

Data Types: double

## Object Functions

add	Boolean unite operation on two shapes
area	Calculate area of shape in sq.m
subtract	Boolean subtraction operation on two shapes
intersect	Boolean intersection operation on two shapes
rotate	Rotate shape about axis and angle
rotateX	Rotate shape about X-axis and angle
rotateY	Rotate shape about Y-axis and angle
rotateZ	Rotate shape about Z-axis and angle
translate	Move shape to new location
show	Display antenna or array structure; Display shape as filled patch
mesh	Mesh properties of metal or dielectric antenna or array structure

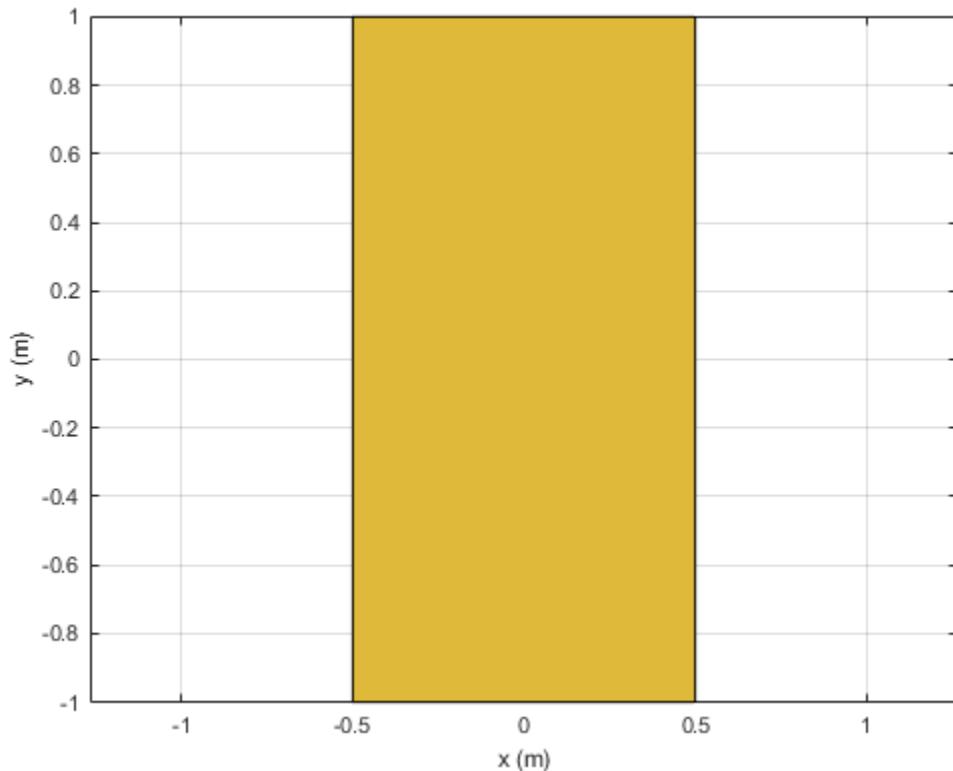

## Examples

### Create Rectangle with Default Properties

Create a rectangle shape using `antenna.Rectangle` and view it.

```
r1 = antenna.Rectangle  
show(r1)
```

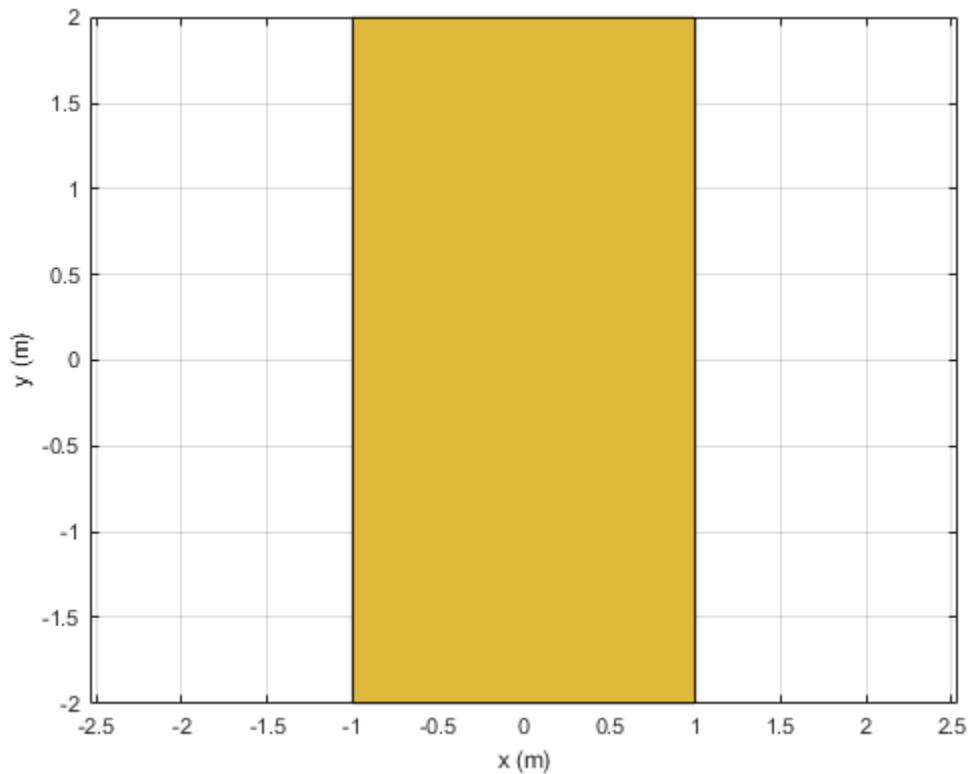

```
r1 =  
  
Rectangle with properties:  
  
    Name: 'myrectangle'  
    Center: [0 0]  
    Length: 1  
    Width: 2  
    NumPoints: 2
```

### Create and Rotate Rectangle Using Specified Properties

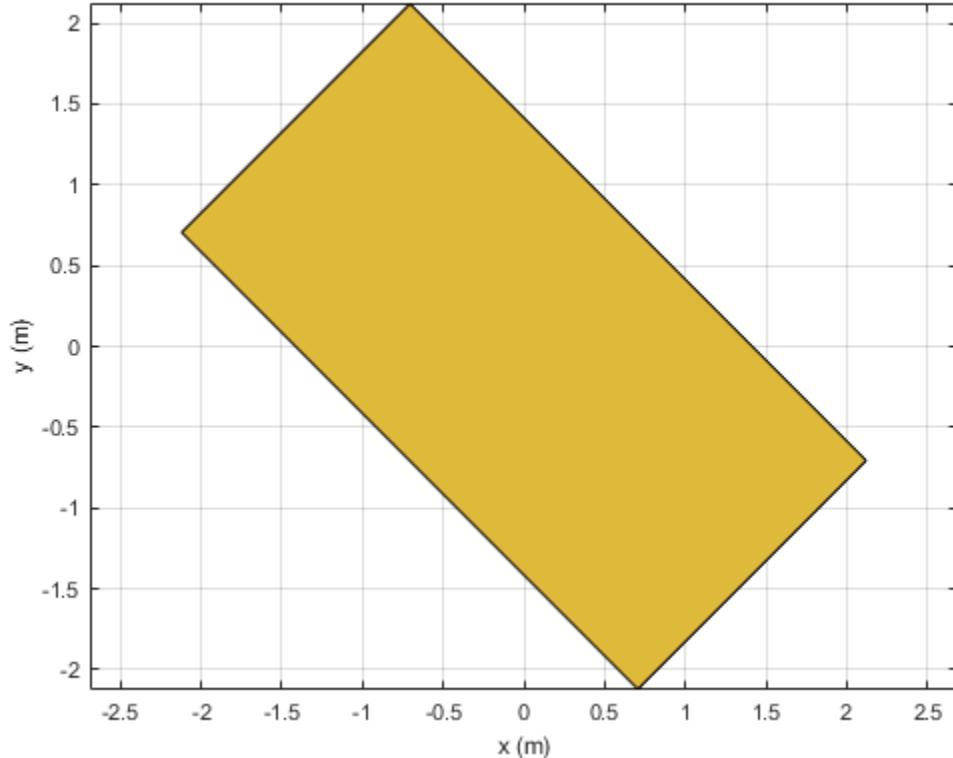

Create and view a rectangle with a length of 2 m and a width of 4 m.

```
r2 = antenna.Rectangle('Length',2,'Width',4);  
show(r2)  
axis equal
```

Rotate the rectangle.

```
rotateZ(r2, 45);  
show(r2)
```

### Create Notched Rectangle

Create a rectangle with a length of 0.15 m, and a width of 0.15 m.

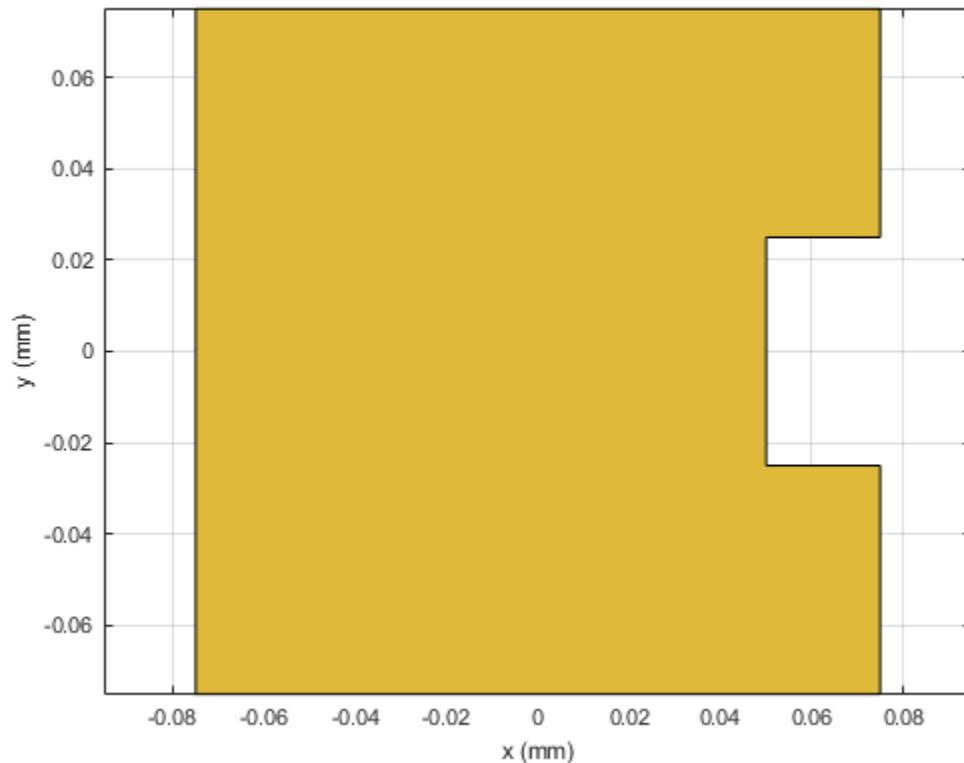

```
r = antenna.Rectangle('Length',0.15,'Width',0.15);
```

Create a second rectangle with a length of 0.05 m, and a width of 0.05 m. Set the center of the second rectangle at half the length of the first rectangle r.

```
n = antenna.Rectangle('Center',[0.075,0], 'Length',0.05, 'Width',0.05);
```

Create and view a notched rectangle by subtracting n from r.

```
rn = r-n;  
show(rn)
```

Calculate the area of the notched rectangle.

```
area(rn)
```

```
ans =
```

0.0213

[antenna.Circle](#) | [antenna.Polygon](#)

**Introduced in R2017a**

# PCBWriter

Create PCB board definitions from 2-D antenna designs

## Description

Use the `PCBWriter` object to create a printed circuit board (PCB) design files based on multilayer 2-D antenna design. PCB antennas are described by a set of manufacturing files known as Gerber files. A Gerber file uses an ASCII vector format for 2-D binary images.

## Creation

### Syntax

```
b = PCBWriter(pcbstackobject)
b = PCBWriter(pcbstackobject,rfconnector)
```

## Description

`b = PCBWriter(pcbstackobject)` creates a `PCBWriter` object that generates Gerber-format PCB design files based on a 2-D antenna design geometry using PCB stack.

`b = PCBWriter(pcbstackobject,rfconnector)` creates a customized PCB file using specified `rfconnector` type.

`b = PCBWriter(pcbstackobject,writer)` creates a customized PCB file using a specified PCB service, `writer`.

`b = PCBWriter(pcbstackobject,rfconnector,writer)` creates customised PCB file using specified PCB service and PCB connector type.

## Input Arguments

**pcbstackobject** — Single feed PCB antenna  
pcbStack object

Single feed PCB antenna, specified as a pcbStack object. For more information, see [pcbStack](#).

Example: p1 = [pcbStack](#) creates a PCB stack object, p1 a = [PCBWriter\(p1\)](#), uses p1 to create a PCBWriter object a.

**writer** — PCB service to view PCB design  
object

PCB service to view PCB design, specified as PCBServices object.

Example: s = [PCBServices.MayhewWriter](#); a = [PCBWriter\(p1,s\)](#) uses Mayhew Labs PCB service to view the PCB design. For more information on manufacturing services, see [PCBServices](#)

**rfconnector** — RF connector type  
object

RF connector type for PCB antenna feedpoint, specified as PCBCConnectors object. For information about connectors , see [PCBCConnectors](#).

Example: c = [PCBCConnectors.SMA\\_Cinch](#); a = [PCBWriter\(p1,c\)](#) uses SMA\_Cinch RF connector at feedpoint.

## Output Arguments

**b** — PCB Board definition of 2.5D antenna design  
object

PCB Board definition of 2.5D antenna design, returned as an object.

## Properties

**UseDefaultConnector** — Use default connector  
1 (default) | 0

Use default connector, specified as 0 or 1.

Example: `a.UseDefaultConnector = 1`, where `a` is a `PCBWriter` object.

Data Types: logical

**ComponentBoundaryLineWidth** — Line widths drawn around components on silk screens  
8 (default) | positive scalar

Line widths drawn around components on silk screens, specified as a positive scalar in mils.

Example: `a.ComponentBoundaryLineWidth = 10`, where `a` is a `PCBWriter` object.

Data Types: double

**ComponentNameFontSize** — Font size to label components on silk screen  
positive scalar

Font size to label components on silk screen, specified as a positive scalar in points.

Example: `a.ComponentNameFontSize = 12`, where `a` is a `PCBWriter` object.

Data Types: double

**DesignInfoFontSize** — Font size for design information added outside board profile  
positive scalar

Design information text font size added outside board profile, specified as a positive scalar.

Example: `a.DesignInfoFontSize = 12`, where `a` is a `PCBWriter` object.

Data Types: double

**Font** — Font used for component name and design info  
'Arial' (default) | character vector

Font used for component name and design info, specified as a character vector.

Example: `a.Font = 'TimesNewRoman'`, where `a` is a `PCBWriter` object.

Data Types: char

**PCBMargin** — Copper free margin around board  
0.5e-3 (default) | positive scalar

Copper free margin around board, specified as a positive scalar in meters.

Example: `a.PCBMargin = 0.7e-3`, where `a` is a `PCBWriter` object.

Data Types: `double`

### **SolderMask — Add solder mask to top and bottom of PCB**

`'both'` (default) | `'top'` | `'bottom'`

Add solder mask to top and bottom of PCB, specified as `'both'`, `'top'`, `'bottom'`.

Example: `a.SolderMask = 'top'`, where `a` is a `PCBWriter` object.

Data Types: `char`

### **SolderPaste — Generate solder paste files**

`1` (default) | `0`

Generate solder paste files as a part of PCB stack, specified as `1` or `0`.

Example: `a.SolderPaste = 0`, where `a` is a `PCBWriter` object.

Data Types: `logical`

## Object Functions

`gerberWrite` Generate Gerber files

## Examples

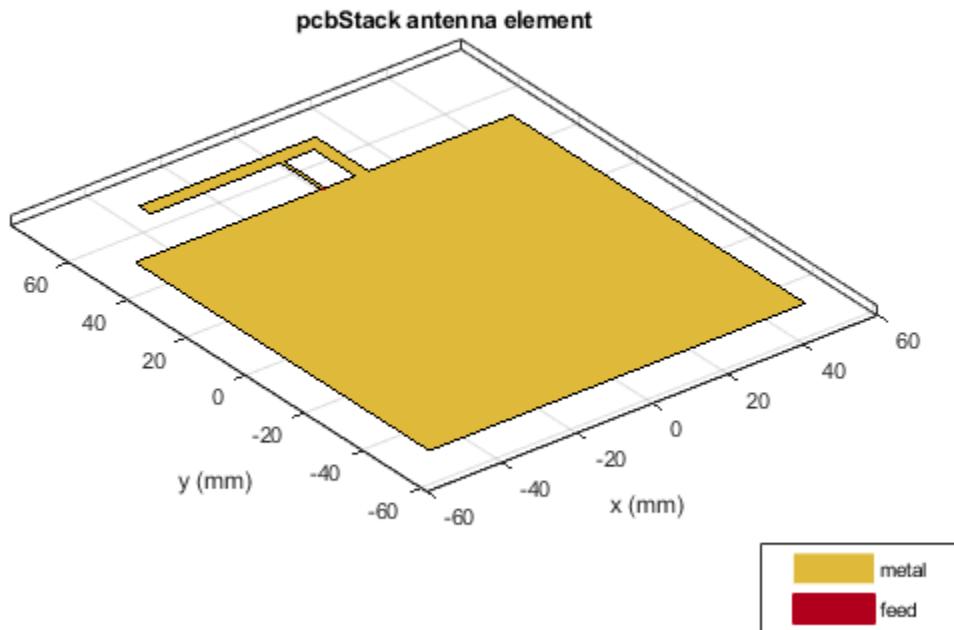

### **Generate Gerber Format Files From PCB Stack Object**

Create a coplanar inverted F antenna

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Create a `pcbStack` object.

```
p = pcbStack(fco);
show (p);
```

Generate a Gerber format design file using PCB Writer.

```
PW = PCBWriter(p)
```

```
PW =
```

```
PCBWriter with properties:
```

```
    Design: [1x1 struct]
    Writer: [1x1 Gerber.Writer]
    Connector: []
  UseDefaultConnector: 1
ComponentBoundaryLineWidth: 8
```

```
ComponentNameFontSize: []
DesignInfoFontSize: []
    Font: 'Arial'
PCBMargin: 5.0000e-04
Soldermask: 'both'
Solderpaste: 1
```

See [info</a>](matlab:info(PW)) for details

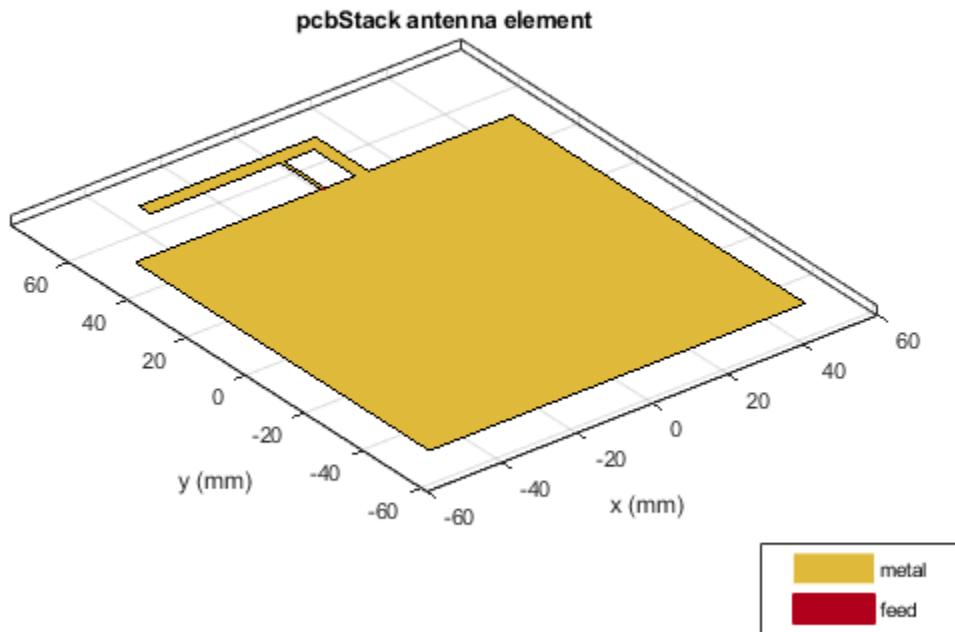

### Antenna PCB Design Using SMA Cinch Connector

Create a coplanar inverted F antenna.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Create a `pcbStack` object.

```
p = pcbStack(fco);
show(p)
```

Create an SMA\_Cinch connector using the `PCBConnectors` object.

```
c = PCBConnectors.SMA_Cinch  
  
c =  
  
SMA_Cinch with properties:  
  
    Type: 'SMA'  
    Mfg: 'Cinch'  
    Part: '142-0711-202'  
    Annotation: 'SMA'  
    Impedance: 50
```

    IncludeRootFolderInZip: 0
    PostWriteFcn: @(obj)sendTo(obj)
    SameExtensionForGerberFiles: 0
    UseExcellon: 1
```

Create an antenna design file using PCBWriter .

```
PW = PCBWriter(p,s,c)
```

```
PW =
```

PCBWriter with properties:

```
    Design: [1×1 struct]
    Writer: [1×1 PCBServices.MayhewWriter]
    Connector: [1×1 PCBConnectors.SMA_Cinch]
    UseDefaultConnector: 0
    ComponentBoundaryLineWidth: 8
    ComponentNameFontSize: []
    DesignInfoFontSize: []
        Font: 'Arial'
    PCBMargin: 5.0000e-04
    Soldermask: 'both'
```

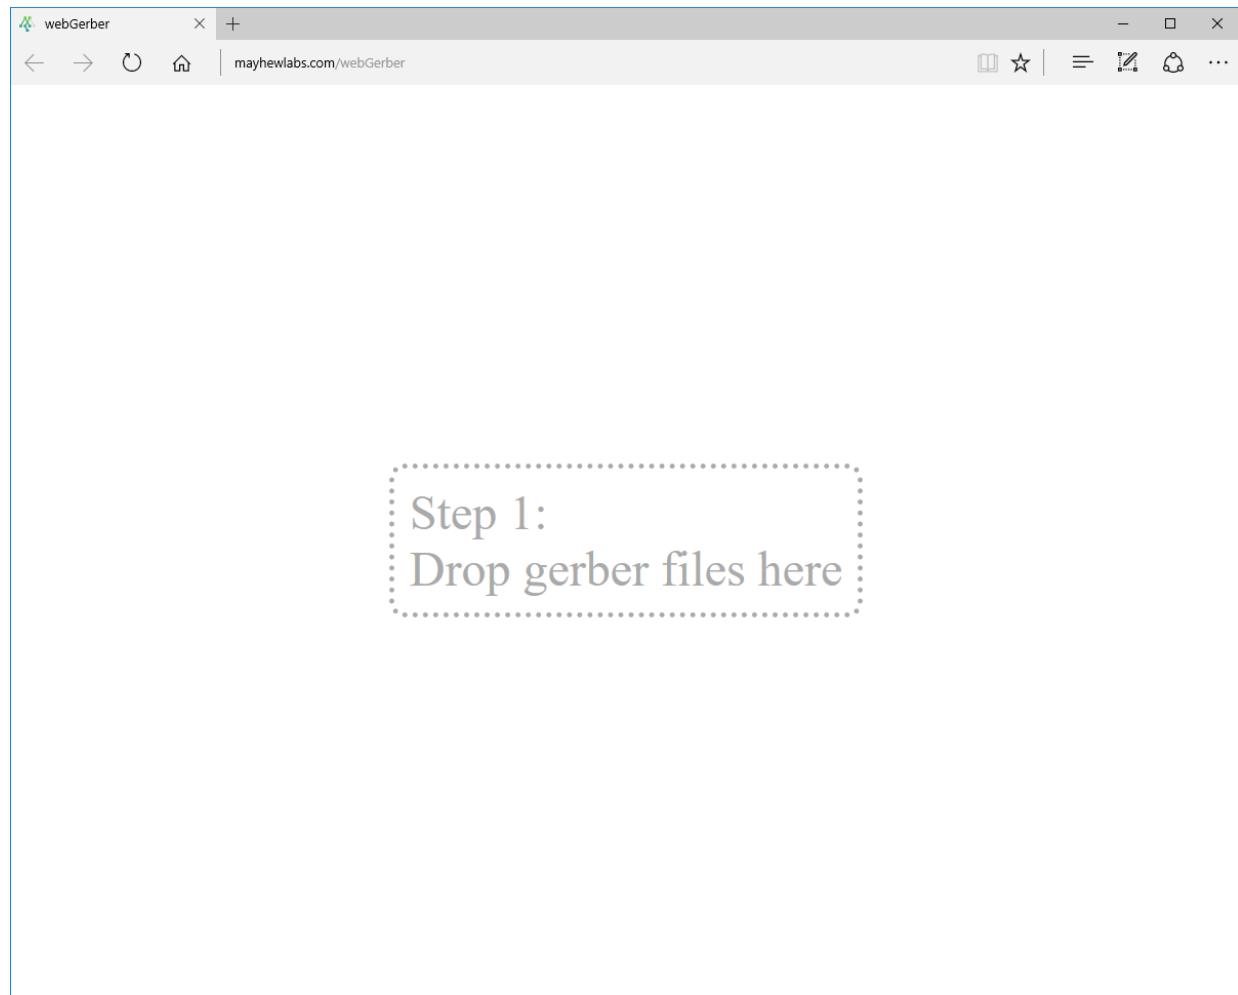

```
Solderpaste: 1
```

```
See <a href="matlab:info(PW)">info</a> for details
```

Use the `gerberWrite` method to create gerber files from the antenna design files. The files generated are then send to the Mayhew writer manufacturing service.

```
gerberWrite(PW)
```

By default, the folder containing the gerber files is called "untitled" and is located in your MATLAB folder. Running this example automatically opens up the Mayhew Labs PCB manufacturing service in your internet browser.

Drag and drop all your files from the "untitled" folder.

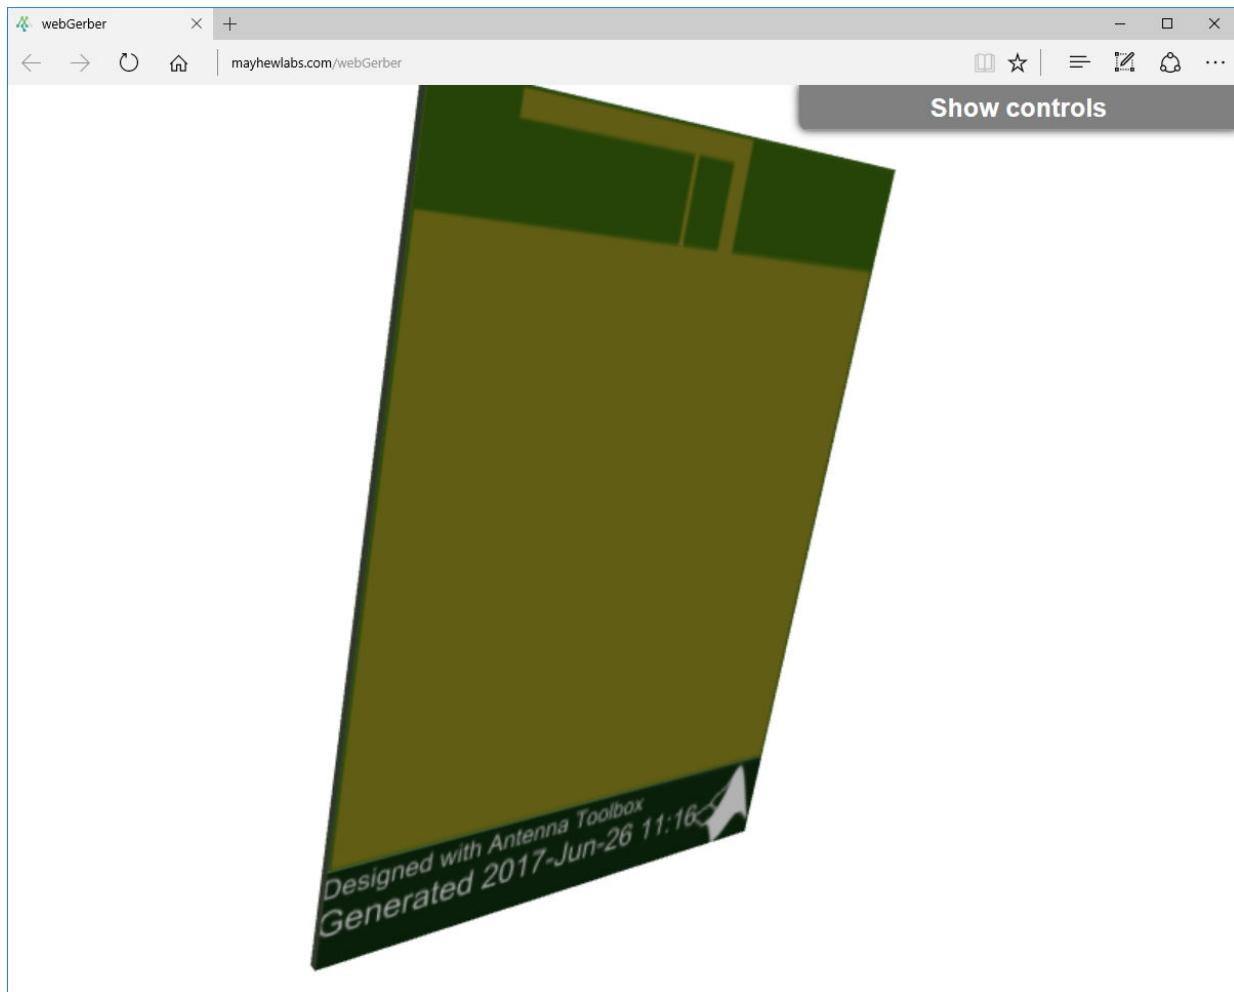

The screenshot shows a web browser window titled "webGerber" with the URL "mayhewlabs.com/webGerber". The main content area displays a list of Gerber files on the left and their corresponding layers on the right. A "Done" button is at the bottom. A dotted-line box highlights the title and the list.

File	Layer
untitled.gtl	Top copper
untitled.gto	Top silk-screen
untitled.gts	Top solder mask
untitled.ipc	No layer
untitled.txt	Drill
untitled.dri	No layer
untitled.gbl	Bottom copper
untitled.gbo	Bottom silk-screen
untitled.gbp	Bottom solder paste
untitled.gbs	Bottom solder mask
untitled.gpi	No layer

**Step 2:**  
Select the layers corresponding to the gerber files

**Done**

Click **Done** to view your Antenna PCB.

**Introduced in R2017b**

# PCBServices

Customize PCB file generation for PCB manufacturing service

## Description

Use the `PCBServices` object to customize printed circuit board (PCB) file generation for a PCB manufacturing service.

## Creation

## Syntax

```
w = PCBServices.servicetype
```

## Description

`w = PCBServices.servicetype` creates a Gerber file based on the type of service specified in `servicetype`.

## Input Arguments

**`servicetype` — Type of service from PCB services package**  
character vector

Type of service from PCB services package, specified as one of the following:

- `AdvancedCircuitsWriter` – Configure Gerber file generation for Advanced Circuits manufacturing.
- `CircuitPeopleWriter` – Configure Gerber file generation for CircuitPeople online viewer.
- `DirtyPCBsWriter` – Configure Gerber file generation for Dirty PCBs manufacturing.

- EuroCircuitsWriter – Configure Gerber file generation for EuroCircuits online viewer.
- GerberLookWriter – Configure Gerber file generation for GerbLook online viewer.
- GerberViewerWriter – Configure Gerber file generation for GerberViewer online viewer.
- MayhewWriter – Configure Gerber file generation for Mayhew Labs online 3-D viewer.
- OSHParkWriter – Configure Gerber file generation for OSH Park PCB manufacturing.
- PCBWayWriter – Configure Gerber file generation for PCBWay PCB manufacturing.
- ParagonWriter – Configure Gerber file generation for Paragon Robotics online viewer.
- SeeedWriter – Configure Gerber file generation for Seeed Fusion PCB manufacturing.
- SunstoneWriter – Configure Gerber file generation for Sunstone PCB manufacturing.
- ZofzWriter – Configure Gerber file generation for Zofz 3-D viewer.

Example: `w = PCBServices.SunstoneWriter` creates Gerber files configured to use Sunstone PCB manufacturing service.

## Output Arguments

**w — PCB manufacturing service**  
object

PCB manufacturing service, returned as an object.

## Properties

**BoardProfileFile — File type for board profile**  
`'legend' | 'profile'`

File type for board profile, specified as `'legend'` or `'profile'`.

Example: `w = PCBServices.SunstoneWriter; w.BoardProfileFile = 'profile'.`

Data Types: char

**BoardProfileLineWidth — Width of line**

1 | positive scalar

Width of line, specified as a positive scalar in mils.

PCB manufacturers vary on board profile. The most common line width is zero of a fraction widths in the chosen unit, for example, 0.1 mil.

Example: `w = PCBServices.SunstoneWriter; w.BoardProfileLineWidth = 0.1`

Data Types: double

**CoordPrecision — Precision of X and Y coordinates written to file**

[2 6] | 1-by-2 vector

Precision of X and Y coordinates written to file, specified as a 1-by2 vector [ $I F$ ], where,

- $I$  – Number of digits in the integer part,  $0 \leq I \leq 6$ .
- $F$  – Number of digits in the fractional part,  $4 \leq F \leq 6$ .

Example: `w = PCBServices.SunstoneWriter; w.CoordPrecision = [1 3]`

Data Types: double

**CoordUnits — Units of X and Y coordinates**

'in' | 'mm'

Units of X and Y coordinates, specified as inches or millimeters.

Example: `w = PCBServices.SunstoneWriter; w.CoordUnits = 'mm'`

Data Types: char

**CreateArchiveFile — Creates single archive file with all Gerber files**

1 (default) | 0

Creates single archive file with all Gerber files, specified as 1 or 0.

Example: `w = PCBServices.SunstoneWriter; w.CreateArchiveFile = 0`

Data Types: logical

**DefaultViaDiameter — Via drill diameter**

3.0000e-04 | positive scalar

Via drill diameter, specified as a positive scalar in meters. PCB manufacturers also call it minimum drilling hole diameter.

Example: `w = PCBServices.SunstoneWriter; w.DefaultViaDiameter = 0.1`

Data Types: double

**DrawArcsUsingLines — Force arcs to be drawn using lines**

0 | 1

Force arcs to be drawn using lines, specified as 1 or 0.

Example: `w = PCBServices.SunstoneWriter; w.DrawArcsUsingLines = 0`

Data Types: logical

**ExtensionLevel — Feature content for Gerber file format**

1 (default) | 2

Feature content for Gerber file format, specified as:

- 1 - Extension 1 is the most compatible setting for downstream PCB manufacturing tools.
- 2 - Extension 2 adds file attributes "%TF.<attr>\*%" to the header and footer of Gerber files.

Example: `w = PCBServices.SunstoneWriter; w.ExtensionLevel = 2`

Data Types: double

**Filename — Name of all files containing Gerber design**

'untitled' (default) | character vector

Name of all files containing Gerber design, specified as a character vector.

Example: `w = PCBServices.SunstoneWriter; w.Filename = 'antenna_design'`.

Data Types: char

**Files — Define stack of PCB files**

character vector

Define stack of PCB files, specified as a character vector. This definition includes:

- Multiples files describing one PCB.
- A "file" as a memory object containing buffers that describe or hold the file content before the file is written.
- Cell vector of `Gerber.FileFunction` objects, one per file.

Data Types: `cell | char`

**IncludeRootFolderInZip — Include top-level folder in zip archive**

`1 | 0`

Include top-level folder in zip archive, specified as 1 or 0.

Example: `w = PCBServices.SunstoneWriter; w.IncludeRootFolderInZip = 0`

Data Types: `logical`

**PostWriteFcn — Function to invoke after a successful write operation**

`function handle (default)`

Function to invoke after a successful write operation, specified as a function handle. In this case, it is the `sendTo` function. This property makes sure that the location of the Gerber files and the website of the manufacturing service is open after a successful write function.

Example: `w = PCBServices.SunstoneWriter; w.PostWriteFcn = @ (obj) sendTo (obj)`

Data Types: `function_handle`

**SameExtensionForGerberFiles — Use .gbr to be file extension for all Gerber files**

`0 | 1`

Use `.gbr` to be file extension for all Gerber files, specified as 0 or 1.

Example: `w = PCBServices.SunstoneWriter; w.SameExtensionForGerberFiles = 1`

Data Types: `logical`

**UseExcelon — Generate Excellon drill files**

`1 | 0`

Generate Excellon drill files, specified as 0 or 1.

Example: `w = PCBServices.SunstoneWriter; w.UseExcellon = 1,` generates Gerber format drill files with 'x2' extension.

Data Types: logical

## Examples

### PCB Using Mayhew Labs 3-D Viewer

Create a coplanar inverted F antenna.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Use this antenna in creating a pcb stack object.

```
p = pcbStack(fco);
```

Use a Mayhew Writer with a profile board for viewing the PCB in 3D.

```
s = PCBServices.MayhewWriter;
s.BoardProfileFile = 'profile'
```

```
s =
```

MayhewWriter with properties:

```
BoardProfileFile: 'profile'
BoardProfileLineWidth: 1
CoordPrecision: [2 6]
CoordUnits: 'in'
CreateArchiveFile: 0
DefaultViaDiam: 3.0000e-04
DrawArcsUsingLines: 1
ExtensionLevel: 1
Filename: 'untitled'
Files: {}
IncludeRootFolderInZip: 0
PostWriteFcn: @(obj)sendTo(obj)
SameExtensionForGerberFiles: 0
UseExcellon: 1
```

Create an antenna design file using `PCBWriter` .

```
PW = PCBWriter(p,s);
```

Use the `gerberWrite` method to create Gerber files from the antenna design files.

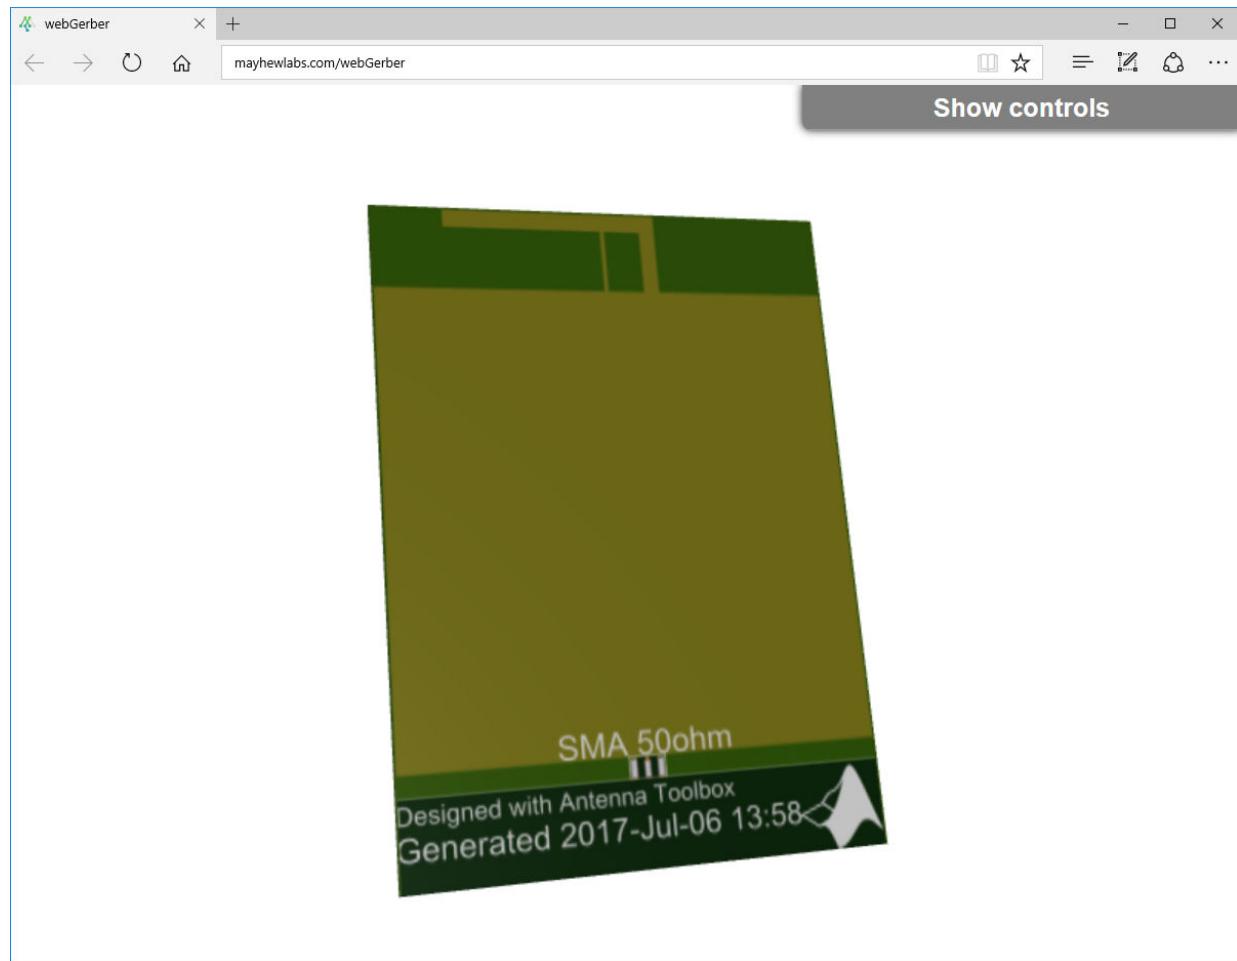

```
gerberWrite(PW)
```

YThe location of the folder and the Mayhew labs website opens automatically.

To view the board drag and drop the files. Click **Done** .

Introduced in R2017b

# PCBConnectors

RF connector at antenna feedpoint

## Description

Use `PCBConnectors` object to specify RF connectors used for antenna printed circuit board (PCB) feed points. The result is generally a set of modifications to the PCB design files. The changes to the PCB include new copper landing pads and traces, and changes to solder mask, silk screen, and solder paste files.

## Creation

## Syntax

```
c = PCBConnectors.connectortype
```

## Description

`c = PCBConnectors.connectortype` creates Gerber files based on the type of connector to use at antenna feedpoint specified in `connectortype`.

## Input Arguments

**connectortype** — Type of connector from PCB connector package  
character vector

Type of connector from PCB connector package, specified as one of the following:

- Coax Connectors - Coax RG11, RG174, RG58, and RG59 connectors directly soldered to PCB pads.
- IPX Connectors - LightHorse IPX SMT jack or plug surface mount RF connector.
- MMCX Connectors - MMCX Cinch or Samtec surface mount RF connectors.

- SMA Connectors - Generic 5-pad SMA surface mount RF connectors, with 4 corner rectangular pads, 1 round center pin. Cinch and Multicomp SMA RF connectors.
- SMAEdge Connectors- Generic SMA edge-launch surface mount RF connector. Cinch and Samtec SMA edge-launch RF connectors.
- SMB Connectors - Johnson/Emerson and Pasterneck SMB surface mount RF connectors.
- SMC Connectors - Pasterneck SMC and SMC edge-launch surface mount RF connectors.
- Coaxial Cable Connectors - Semi-rigid 0.020 inch, 0.034 inch, 0.047 inch, and 0.118 inch coaxial cable soldered to PCB pads.

Example: `c = PCBCConnectors.Semi_020` creates Gerber files configured to use semi-rigid 0.020 inch coaxial cables.

## Output Arguments

### **c — PCB connector**

object

PCB connector, returned as an object.

## Properties

### **Common Properties for All Connectors**

#### **Type — Type of connector**

character vector

Type of connector, specified as a character vector.

Example: `'Coax_RG11'`

Data Types: `char`

#### **Mfg — Name of component manufacturer**

character vector

Name of component manufacturer, specified as a character vector.

Example: `'Belden'`

Data Types: char

**Part — Manufacturer part number**

character vector | string

Manufacturer part number, specified as a character vector or string.

Example: 'RG11'

Data Types: char

**Annotation — Text added to PCB to identify component**

character vector

Text added to PCB to identify component, specified as a character vector.

Example: 'RG59U'

Data Types: char

**Impedance — Connector impedance**

50 | positive scalar

Connector impedance, specified as a positive scalar in ohms.

Example: c = PCBConnectors.MMCX\_Cinchc.Impedance = 70

Data Types: double

**Datasheet — URL for component specifications**

character vector

URL for component specifications, specified as a character vector. Data sheets are typically PDF files.

Data Types: char

**Purchase — URL for purchasing connector**

character vector

URL for purchasing connector, specified as a character vector.

Data Types: char

### Common Properties for All Coax Connectors

#### **PinDiameter — Circular pad diameter**

positive scalar

Circular pad diameter connecting the signal wire of the coax to the feedpoint, specified as a positive scalar in meters. The pin diameter is greater than the diameter of the signal wire.

Example: `c = PCBConnectors.Coax_RG59c.PinDiameter = 1.0000e-03`

Data Types: double

#### **DielectricDiameter — Dielectric diameter**

positive scalar

Dielectric diameter (white material around signal wire), specified as a positive scalar in meters. Dielectric diameter specifies the size of the non-conductive isolation ring on the PCB between the signal wire and the ground plane.

Example: `c = PCBConnectors.Coax_RG59c.DielectricDiameter = 0.0073`

Data Types: double

#### **ShieldDiameter — Ground ring diameter**

positive scalar

Ground ring diameter used to solder coax shield, specified as a positive scalar in meters.

Example: `c = PCBConnectors.Coax_RG59c.ShieldDiameter = 0.0085`

Data Types: double

#### **AddThermals — Thermal relief**

1 | 0

Thermal relief around coaxial shield connection, specified as 0 or 1. Thermal relief reduces the heat needed to solder the coax shield to the ground.

Example: `c = PCBConnectors.Coax_RG59c.AddThermals = 0`

Data Types: logical

#### **ThermalsDiameter — Arc-shaped gaps outer diameter**

positive scalar

Arc-shaped gaps outer diameter in the ground plane, specified as a positive scalar in meters.

Example: `c = PCBConnectors.Coax_RG59c.ThermalsDiameter = 0.0100`

Data Types: double

**ThermalsBridgeWidth — Width of four conductive bridges**

positive scalar

Width of four conductive bridges created across thermal gap, specified as a positive scalar in meters. The bridges are established during electrical grounding.

Example: `c = PCBConnectors.Coax_RG59c.ThermalBridgeWidth = 0.0015`

Data Types: double

**Common Properties for All 5-Pad Symmetric Surface Mount Connectors**

**TotalSize — Total length of each side of rectangular connector footprint**

2-element vector

Total length of each side of rectangular connector footprint, specified as a 2-element vector with each element unit in meters.

Example: `c = PCBConnectors.SMA_Multicompc.TotalSize = [0.0063 0.0063]`

Data Types: double

**GroundPadSize — Length of each side of ground pad**

2-element vector

Length of each side of ground pad, specified as a 2-element vector with each element unit in meters. The pads are located in each of the four corners of the connector footprint.

Example: `c = PCBConnectors.SMA_Multicompc.GroundPadSize = [0.0016 0.0016]`

Data Types: double

**SignalPadDiameter — Circular pad diameter**

positive scalar

Circular pad diameter connecting the signal pin of the coax connector, specified as a positive scalar in meters. The pad is at the center of the connector footprint.

Example: `c = PCBConnectors.SMA_MulticompC.SignalPadDiameter = 0.0012`

Data Types: double

**PinHoleDiameter — Via pin diameter**

positive scalar

Via pin diameter, specified as a positive scalar in meters.

Example: `c = PCBConnectors.SMA_MulticompC.ViaPinDiameter = 0.0012`

Data Types: double

**IsolationRing — Diameter of isolation ring that remove semicircle of copper from inner corner of ground pads**

scalar

Diameter of isolation ring that remove semicircle of copper from inner corner of ground pads, specified as a scalar in meters.

Example: `c = PCBConnectors.SMA_MulticompC.IsolationRing = 0.0012`

Data Types:

**VerticalGroundStrips — Vertical ground strips between upper and lower ground pads**

scalar

Vertical ground strips between upper and lower ground pads, specified as a scalar.

Example: `c = PCBConnectors.SMA_MulticompC.VerticalGroundStrips = 1`

Data Types: double

**Common Properties for All Edge-Launch Surface Mount Connectors**

**GroundPadSize — Ground pad size**

2-element vector

Ground pad size, specified as a 2-element vector with each element unit in meters.

Example: `c = PCBConnectors.SMAEdgec.GroundPadSize = [0.0014 0.0042]`

Data Types: double

**GroundSeparation — Space between ground pads**

positive scalar

Space between ground pads on the ground side of the board, specified as a positive scalar in meters.

Example: `c = PCBConnectors.SMAEdgec.GroundSeparation = 0.0043`

Data Types: double

**GroundPadIsolation — Width of copper removed around top layer ground pads**  
positive scalar

Width of copper removed around top layer ground pads, specified as a positive scalar in meters. This property isolates the ground pads from any signal traces or structures.

Example: `c = PCBConnectors.SMAEdgec.GroundPadIsolation = 2.5000e-04`

Data Types: double

**SignalPadSize — Signal pad size**  
2-element vector

Signal pad size, specified as a 2-element vector with each element unit in meters.

Example: `c = PCBConnectors.SMAEdgec.SignalPadSize = [0.0013 0.0036]`

Data Types: double

**SignalGap — Gap between PCB edge and start of signal pad copper**  
positive scalar

Gap between PCB edge and start of signal pad copper, specified as a positive scalar in meters.

Example: `c = PCBConnectors.SMAEdgec.SignalGap = 1.0000e-04`

Data Types: double

**SignalLineWidth — Width of signal trace**  
positive scalar

Width of signal trace extending from the signal pad to the feedpoint location, specified as a positive scalar in meters.

Example: `c = PCBConnectors.SMAEdgec.SignalLineWidth = 8.0000e-04`

Data Types: double

**EdgeLocation — PCB side that receives edge connector**

'north' | 'south' | 'east' | 'west'

PCB side that receives edge connector, specified as 'north', 'south', 'east', 'west'.

Example: `c = PCBConnectors.SMAEdgec.EdgeLocation = 'south'`

Data Types: char

**EdgeBoardProfile — Extend PCB to add connector beyond design area**

0 | 1

Extend PCB to add connector beyond design area, specified as 0 or 1

Example: `c = PCBConnectors.SMAEdgec.EdgeBoardProfile = 1`

Data Types: logical

**FillGroundSide — Fill connector region on ground side of board with copper**

0 | 1

Fill connector region on ground side of the board with copper, specified as 0 or 1

Example: `c = PCBConnectors.SMAEdgec.FillGroundSide = 1`

Data Types: logical

**Common Properties for All Staggered Surface Mount Connectors****GroundPadSize — Ground pad size**

2-element vector

Ground pad size, specified as a 2-element vector with each element unit in meters.

Example: `c = PCBConnectors.IPX_Plug_Lighthorsec.GroundPadSize = [0.0010 0.0022]`

Data Types: double

**GroundPadXSeparation — Distance between pair of ground pads along X-axis**

positive scalar

Distance between pair of ground pads along X-axis, specified as a positive scalar in meters.

Example: `c = PCBConnectors.IPX_Plug_Lighthorsec.GroundPadXSeparation = 0.0019`

Data Types: double

**GroundPadYOffset — Y-offset from signal pad to signal pad center line**  
positive scalar

Y-offset from signal pad to signal pad center line, specified as a positive scalar in meters.

Example: `c = PCBConnectors.IPX_Plug_Lighthorsec.GroundPadYOffset = 0.0015`

Data Types: double

**SignalPadSize — Signal pad size**  
2-element vector

Signal pad size, specified as a 2-element vector with each element unit in meters.

Example: `c = PCBConnectors.IPX_Plug_Lighthorsec.SignalPadSize = [1.0000e-03 1.0000e-03]`

Data Types: double

**SignalMinYSeparation — Minimum separation from ground at bottom or top for signal pad**  
positive scalar

Minimum separation from ground at bottom or top for signal pad, specified as a positive scalar in meters.

Example: `c = PCBConnectors.IPX_Plug_Lighthorsec.SignalMinYSeparation = 1.0000e-03`

Data Types: double

## Examples

### PCB Using Coax\_RG11 Connector

Create a coplanar inverted F antenna.

## 2 Antenna Objects — Alphabetical List

---

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Use this antenna to create a `pcbStack` object.

```
p = pcbStack(fco);
```

Use a `Coax_RG11` RF connector with a pin diameter of 2 mm.

```
c = PCBConnectors.Coax_RG11;
c.PinDiameter = 2.000e-03
s = PCBServices.MayhewWriter;
```

```
c =
```

`Coax_RG11` with properties:

```
Type: 'Coax'
Mfg: 'Belden'
Part: 'RG11'
Annotation: 'RG11'
Impedance: 75
Datasheet: 'http://www.belden.com/techdatas/english/8233.pdf'
Purchase: ''
PinDiameter: 0.0020
DielectricDiameter: 0.0072
ShieldDiameter: 0.0085
ThermalsDiameter: 0.0100
ThermalsBridgeWidth: 0.0015
AddThermals: 1

<a href="matlab:web('http://www.belden.com/techdatas/english/8233.pdf','-browser');"
```

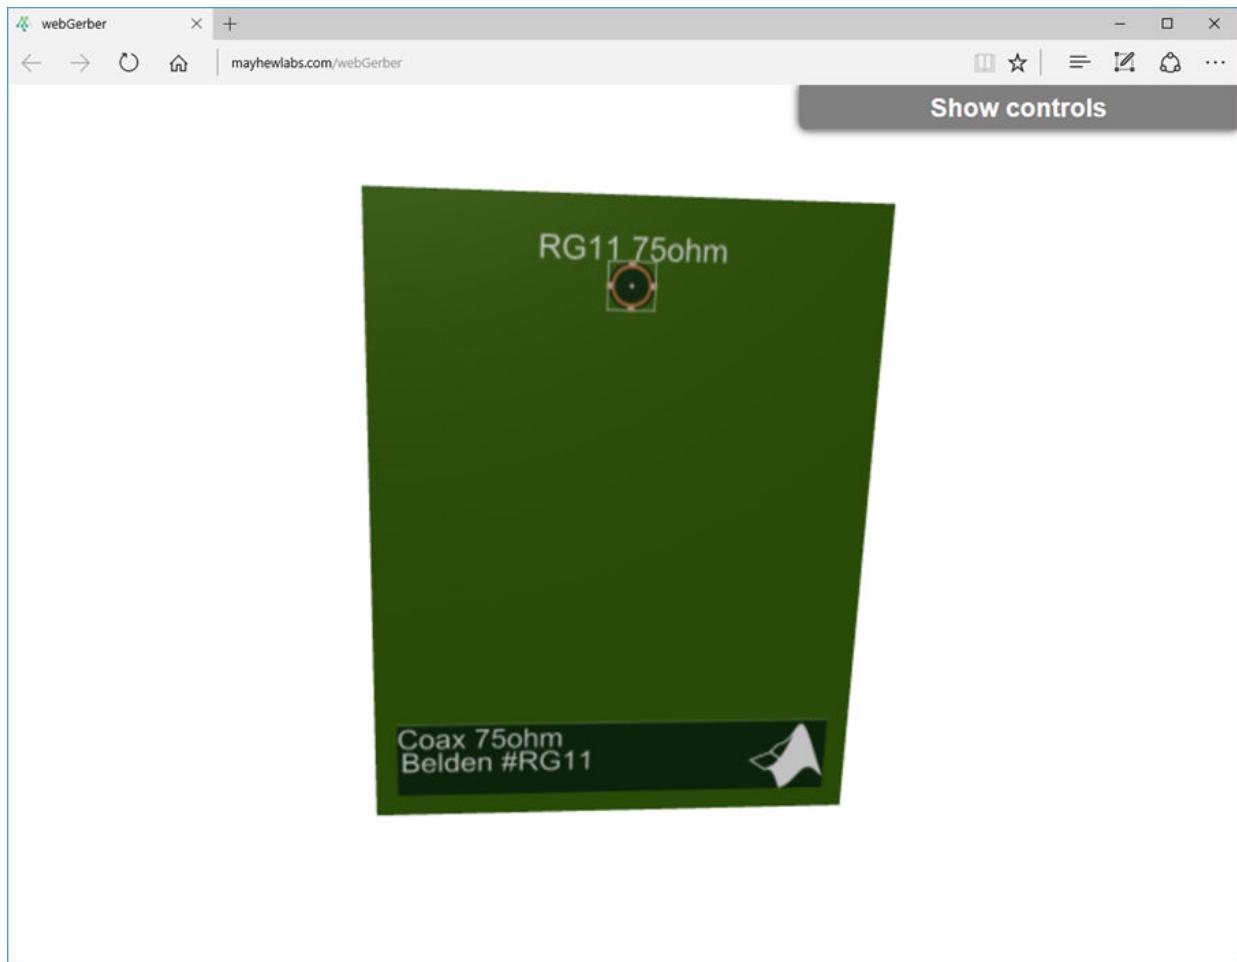

Create an antenna design file using `PCBWriter`.

```
PW = PCBWriter(p,s,c);
```

Use the `gerberWrite` method to create Gerber files from the antenna design files.

```
gerberWrite(PW)
```

To view the board, drag and drop the files. Click **Done**.

### Authoring Custom RF Connector

```
classdef SMA_Jack_Cinch < PCBConnectors.BaseSMT5PadSymmetric
    % Cinch SMA surface mount RF connector.

    properties (Constant) % Abstract
        Type      = 'SMA'
        Mfg       = 'Cinch'
        Part      = '142-0701-631'
        Annotation = 'SMA'
```

# Antenna Apps — Alphabetical List

---

## Antenna Designer

Design, visualize, and analyze antennas

### Description

The **Antenna Designer** app lets you design, visualize, and analyze antennas in the Antenna Toolbox library interactively.

Using this app, you can:

- Select antennas based on general properties or antenna performance.
- Visualize antennas based on frequency and frequency range.
- Analyze antennas based on radiation pattern, polarization, and bandwidth.
- Export selected and designed antennas as a variable to the MATLAB® workspace, as either live script or a function.

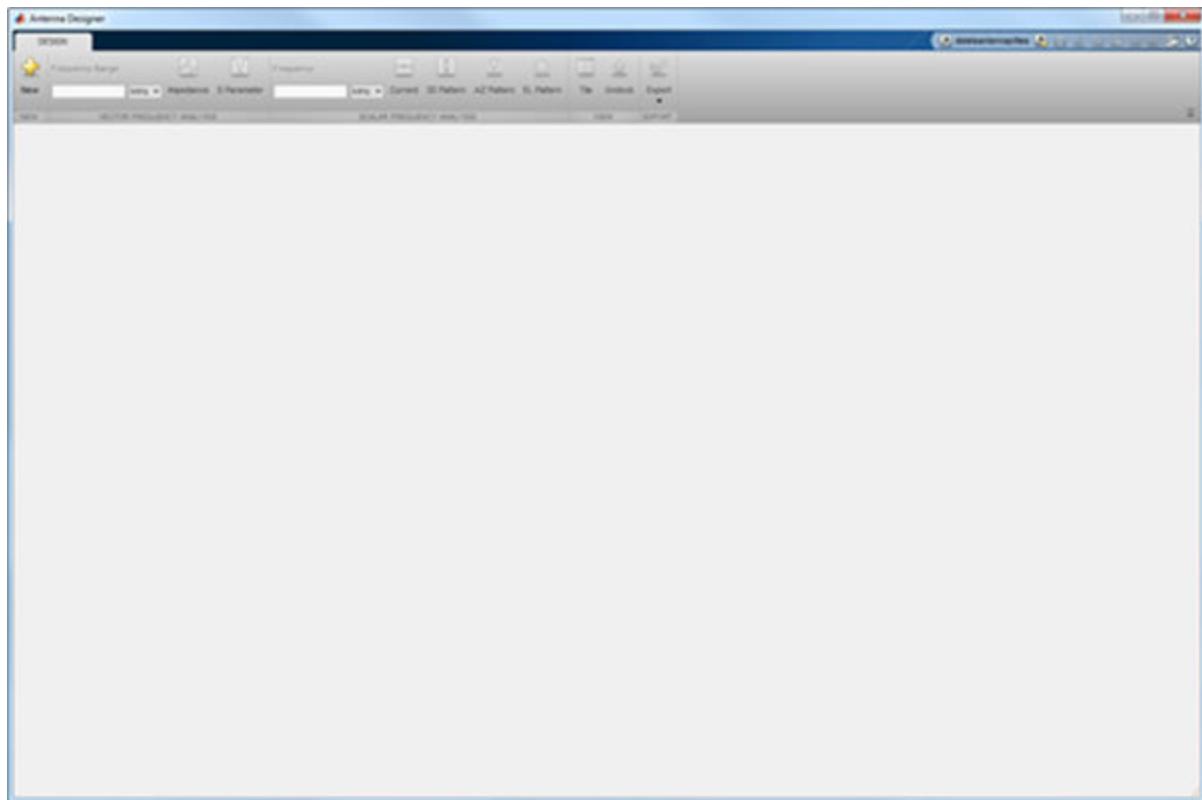

### Open the Antenna Designer App

- MATLAB Toolstrip: In the **Apps** tab, under **Signal Processing and Communications**, click the app icon.
- MATLAB command prompt: Enter `antennaDesigner`.

### Examples

#### Antenna Designer Canvas

The **Antenna Designer** opens a blank canvas.

## 1 Select and Visualize Antenna

- Click

New

in the canvas toolbar to choose the antenna you want to analyze.

- The default antenna is a dipole antenna.

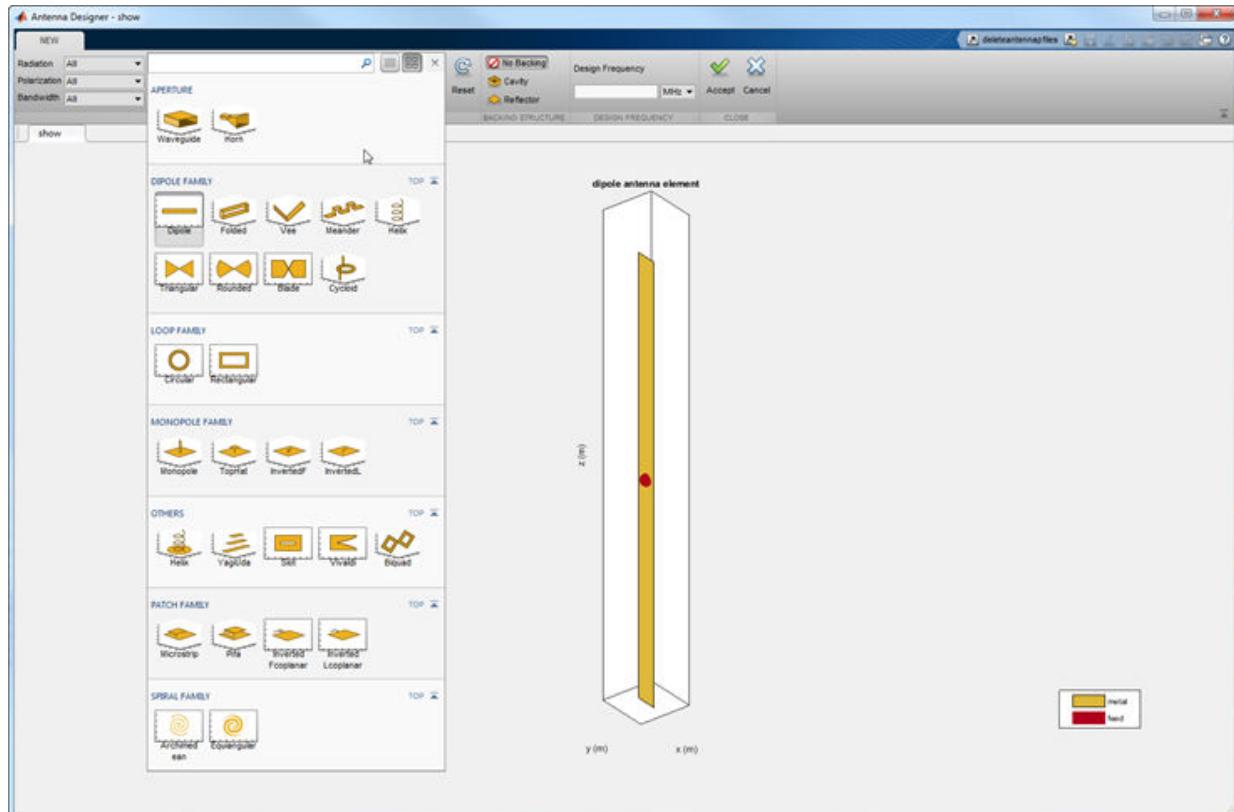

You can filter the antennas based on Radiation pattern, Polarization, and Bandwidth.

- Using the toolbar you can also add **Cavity** backing, or **Reflector** backing to the antennas.
- You can also specify the **Design Frequency** of the antenna. Setting this value scales the antenna to resonate at the specified frequency. You can also tune the antenna using **Antenna Properties** tab during analysis.
- Use **Reset**, to go back to default settings.
- Use **Accept**, to analyze the antenna characteristics.
- Use **Cancel**, to start over.

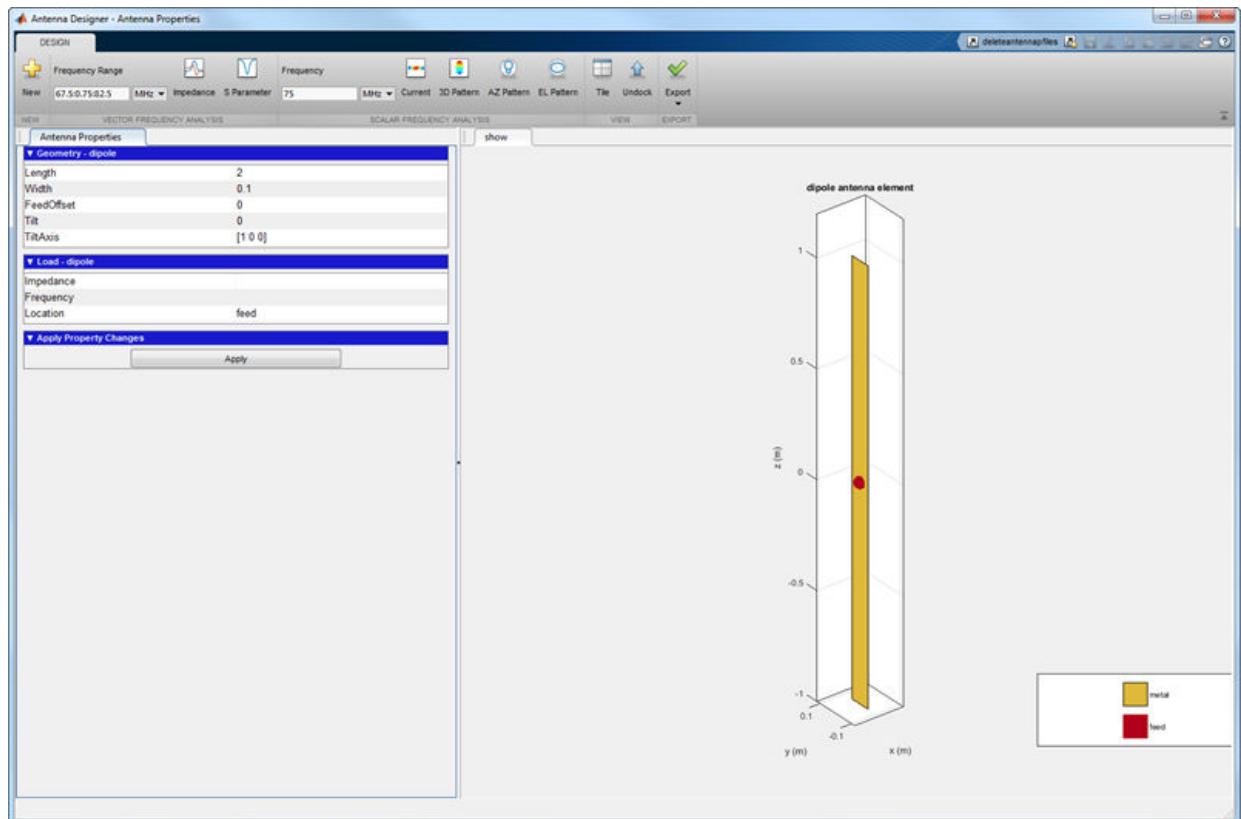

## 2 Antenna Gallery

- You can choose your antennas from the **Antenna Gallery**.

- The **Antenna Gallery** drop-down menu consists of: APERTURE, DIPOLE FAMILY, LOOP FAMILY, MONOPOLE FAMILY, OTHERS, PATCH FAMILY, and SPIRAL FAMILY.
- When you filter antennas based on Radiation pattern, Polarization, or Bandwidth, the antenna gallery greys out the antennas that do not belong to the chosen filter.

### 3 Analyze Antenna

You can plot the **Impedance** and **S Parameter** of the antenna based on the specified **Frequency Range** in Hz.

- You can visualize the **Current** distribution on the antenna based on the specified **Frequency** in Hz.

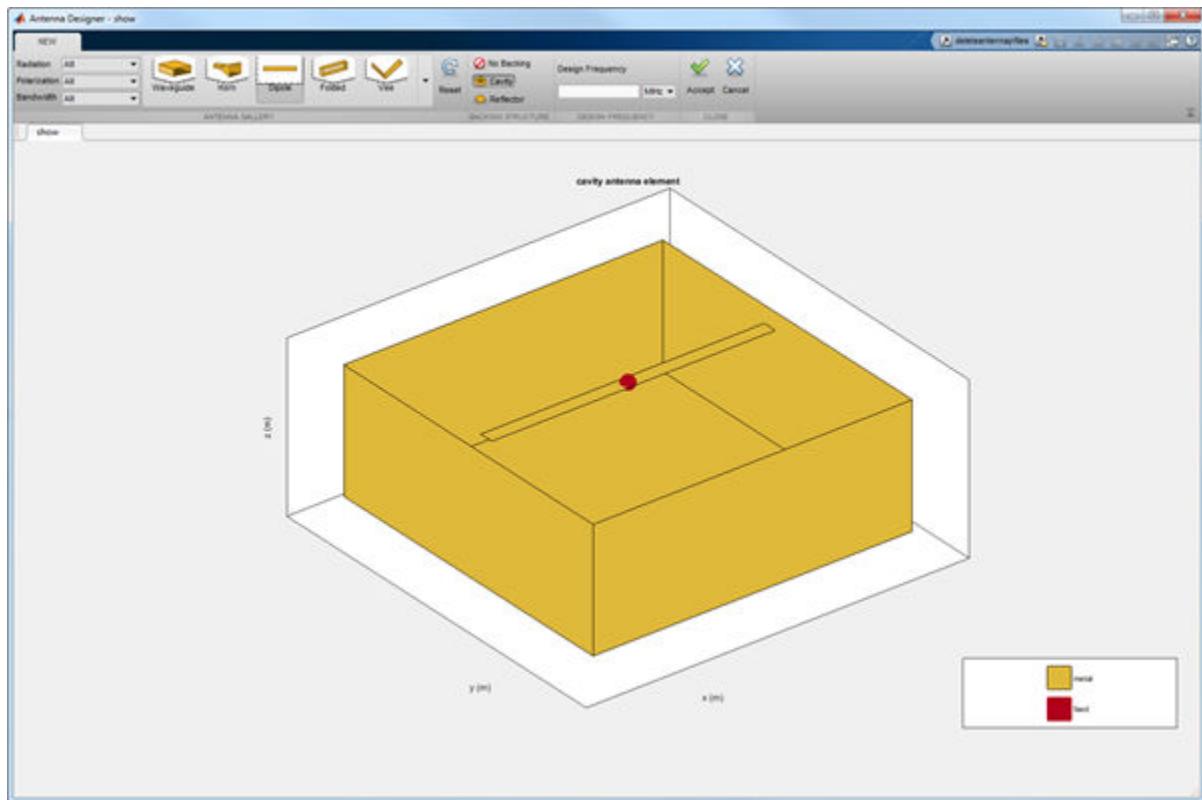

- You can visualize the **3D Pattern**, **AZ Pattern**, **EL Pattern** of the antenna based on the specified frequency. Here AZ stands for azimuth and EL stands for elevation.
- Use **Export** to view your antenna in MATLAB workspace or MATLAB script.
- Manually change the antenna properties using the **Antenna Properties** tab. In this tab, you can change the geometrical properties of the antenna, add a dielectric substrate to the antenna, and change the value and location of the load.

#### Plot Radiation Pattern of Cavity-Backed Dipole

Use the **Antenna Designer** app to plot the radiation pattern of a cavity-backed dipole antenna.

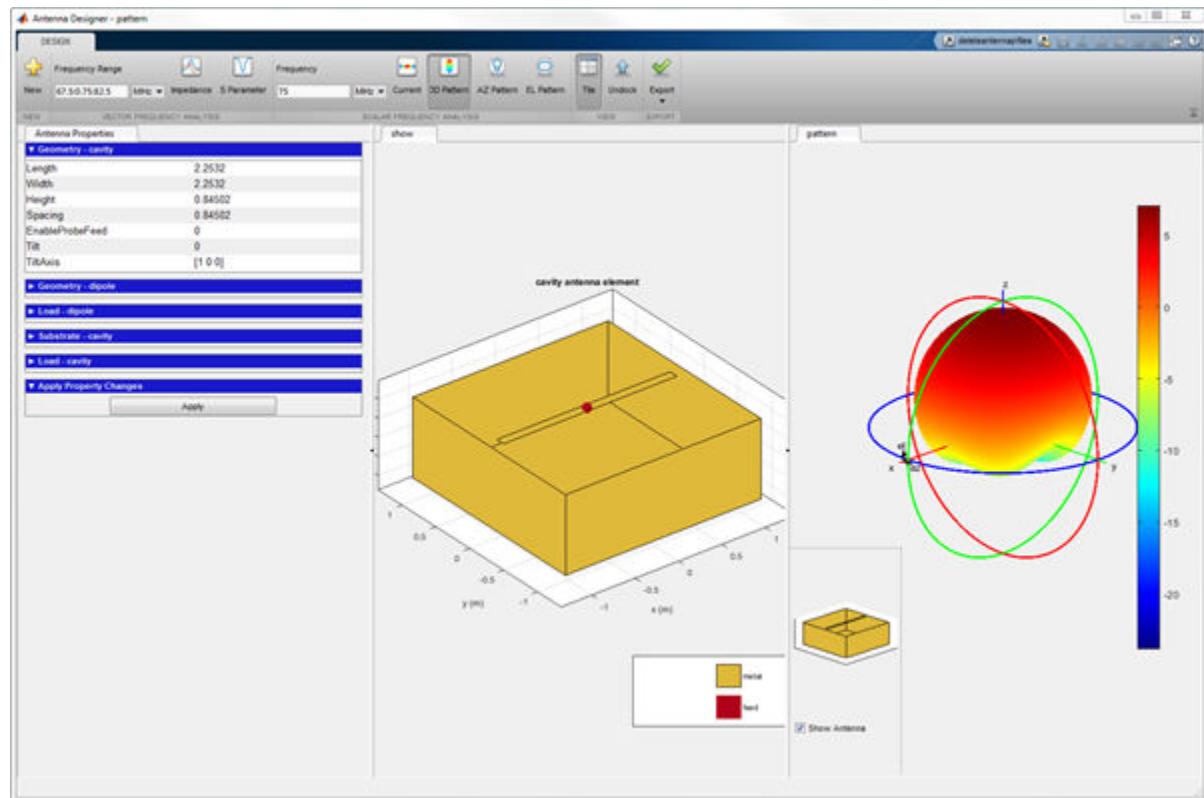

Open the app and click **New** to show the default dipole antenna.

In the **Backing Structure section**, click **Cavity** to create a cavity-backed dipole antenna.

Click **Accept**.

In **SCALAR FREQUENCY ANALYSIS**, click **3D Pattern** to calculate the radiation pattern of the cavity-backed dipole. The default frequency used is 75 MHz. Click **Tile** to view both the antenna and the radiation pattern.

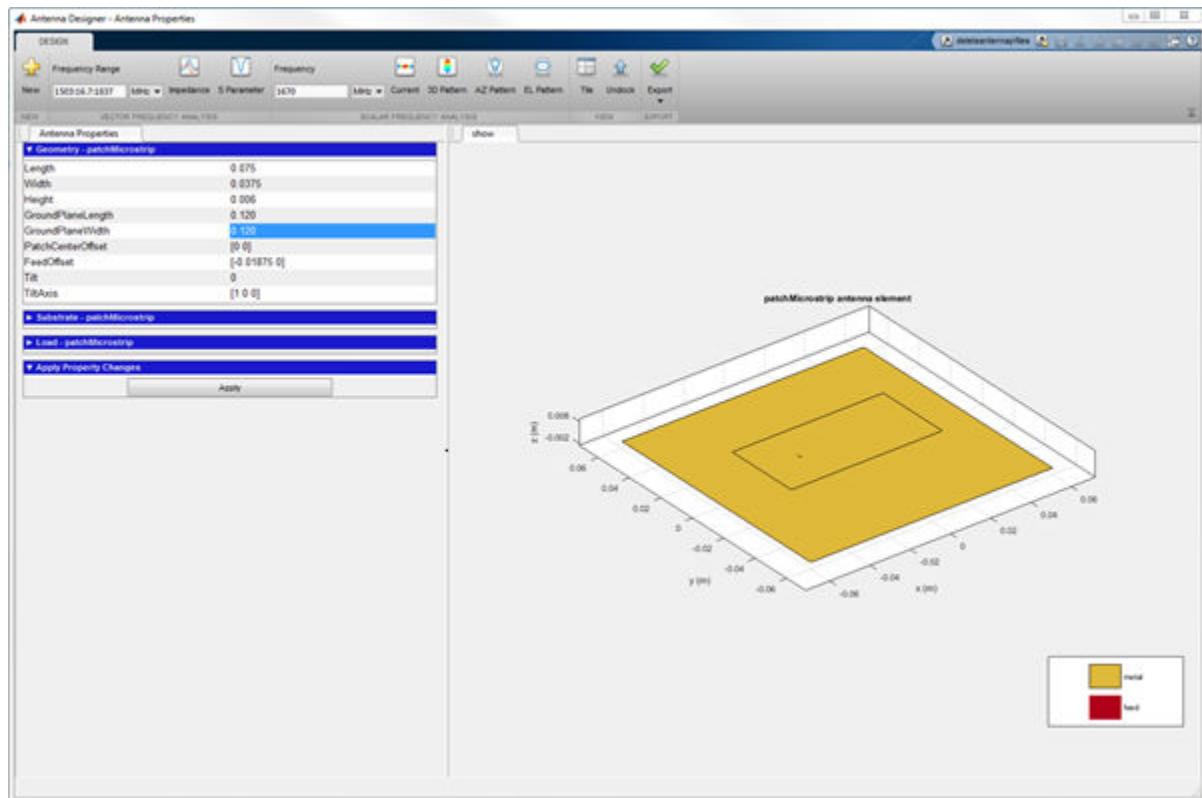

#### Analyze Patch Microstrip Antenna Having Dielectric Substrate

Use the **Antenna Designer** app to plot the radiation pattern of a patch microstrip antenna with a dielectric substrate.

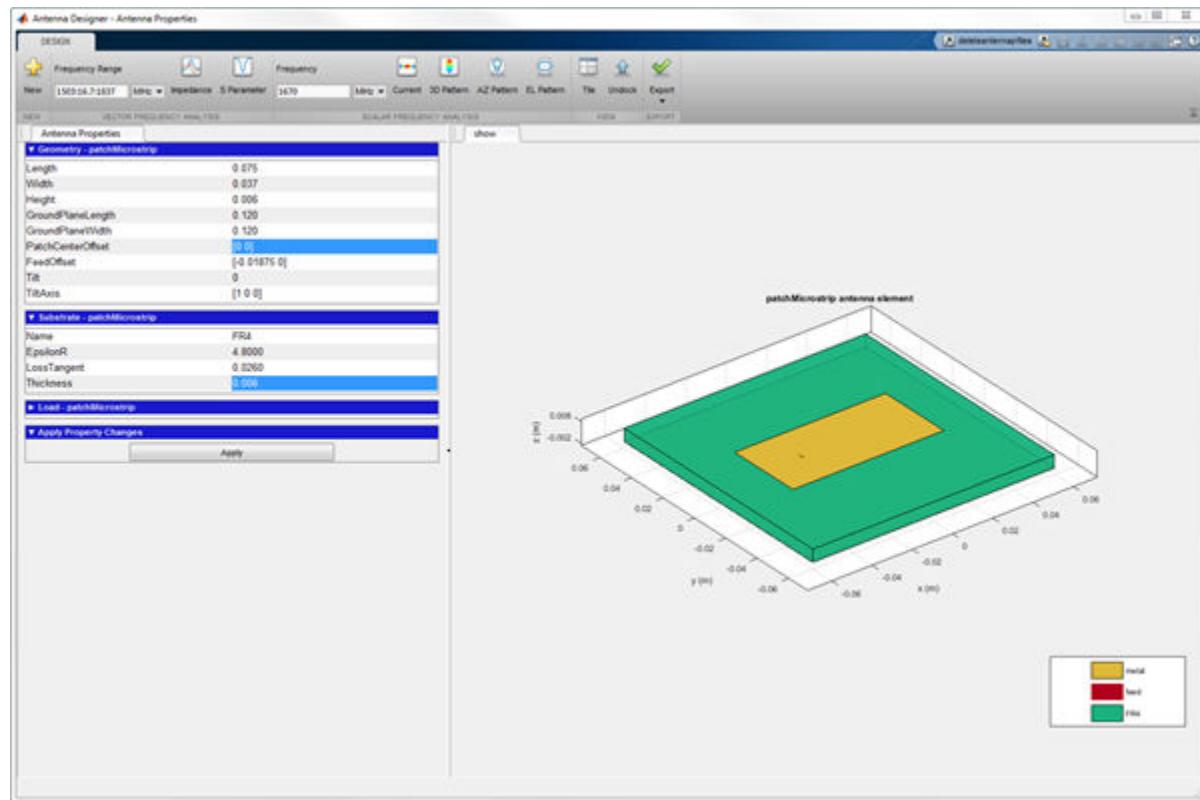

Open the app and click **New**. In the **ANTENNA GALLERY** section, under **PATCH FAMILY**, click **Microstrip** Click **Accept**.

On the **Antenna Properties** tab, change the groundplane length and groundplane width to 0.120 m. Click **Apply** to see the changes.

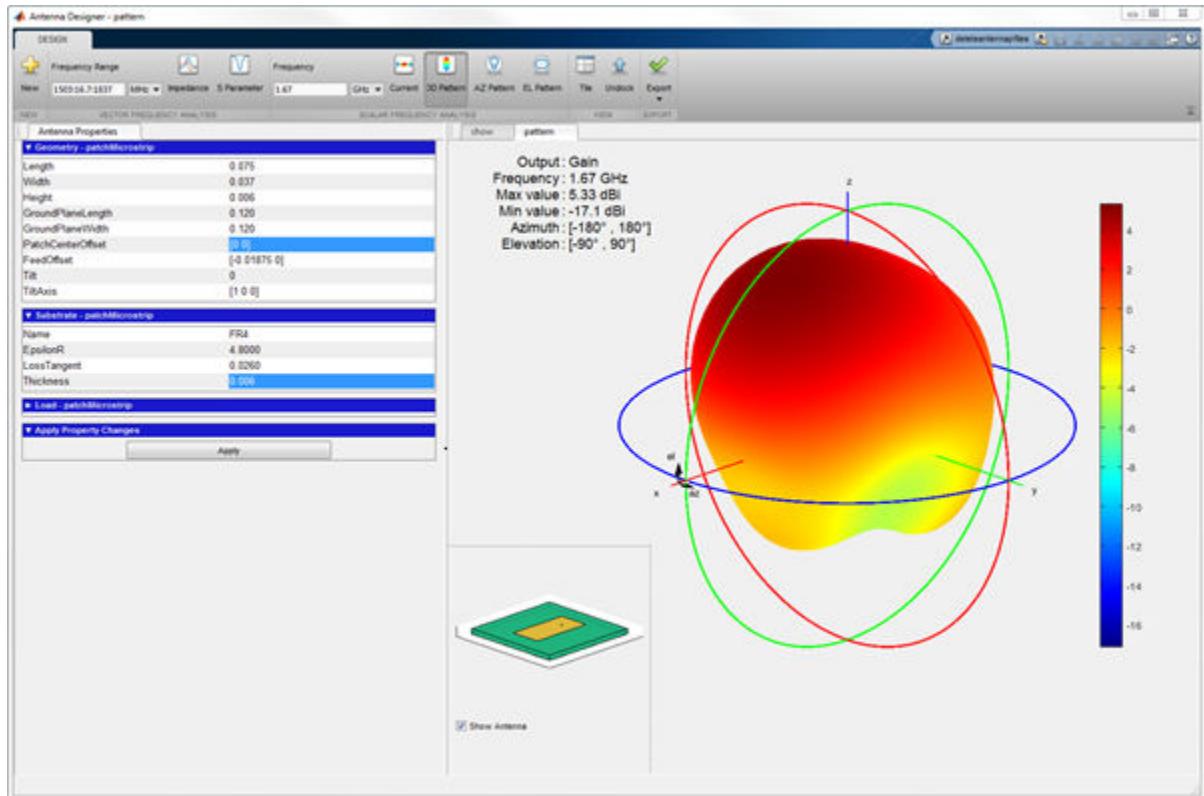

Add an FR4 dielectric as a substrate to the patch microstrip antenna. To add the dielectric, open the **Substrate** section and set **Name** to FR4, **EpsilonR** to 4.8000, and **Loss Tangent** to 0.0260. Click **Apply** to see the antenna.

### 3 Antenna Apps — Alphabetical List

Click **3D Pattern** to plot the radiation pattern of the antenna at the default frequency of 1.67 GHz.

- “Antenna Design and Analysis Using Antenna Designer App”

## Programmatic Use

`antennaDesigner` opens the **Antenna Designer** app, enabling you to design and analyze antennas present in the Antenna Toolbox library.

# Array Objects—Alphabetical List

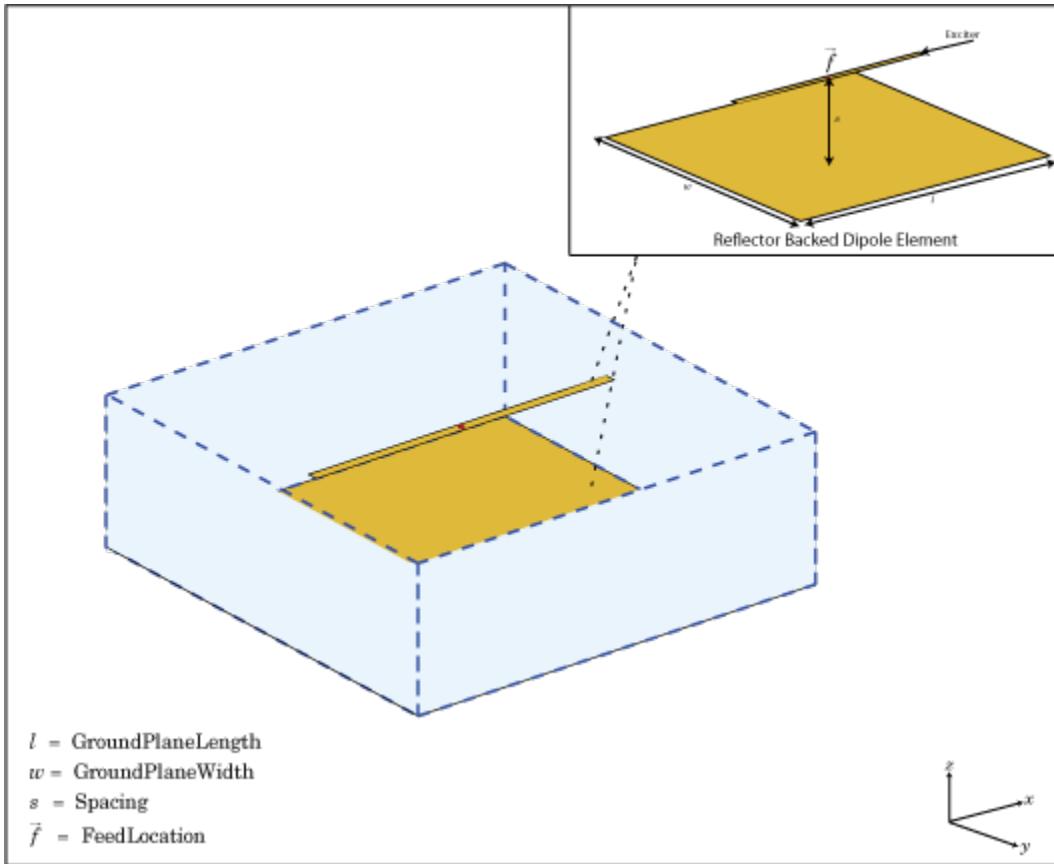

---

## **infiniteArray**

Create 2-D custom mesh antenna on X-Y plane

### **Description**

The `infiniteArray` object is an infinite antenna array in the X-Y plane. Infinite array models a single antenna element called the *unit cell*. Ground plane of the antennas specifies the boundaries of the unit cell. Antennas without a ground plane require a reflector. By default, the infinite array has reflected-backed dipoles as antenna elements. The default dimensions are chosen for an operating frequency of 1 GHz.

## Creation

### Description

`infa = infiniteArray` creates an infinite antenna array in the X-Y plane.

`infa = infiniteArray(Name,Value)` creates an infinite antenna array with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-

value pair arguments in any order as Name1, Value1, ..., NameN, ValueN. Properties not specified retain default values.

## Properties

### **Element — Type of individual antenna elements in unit cell**

reflector-backed dipole (default) | object

Type of individual antenna elements in unit cell, specified as an object. Antennas without a groundplane is backed using a reflector. The ground plane size specifies the unit cell boundaries.

Example: 'Element',reflector

### **ScanAzimuth — Scan direction in azimuth plane**

0 (default) | scalar

Scan direction in azimuth plane, specified as a scalar in degrees.

Example: 'ScanAzimuth',25

Data Types: double

### **ScanElevation — Scan direction in elevation plane**

0 (default) | scalar

Scan direction in elevation plane, specified as a scalar in degrees.

Example: 'ScanElevation',80

Data Types: double

## Object Functions

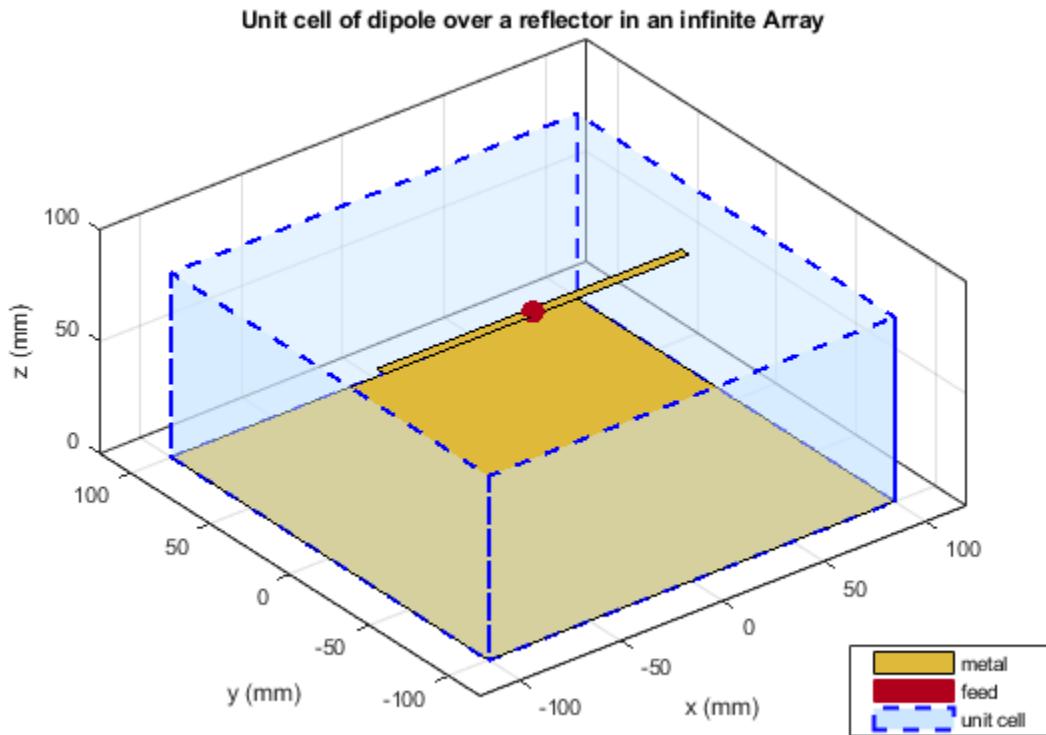

numSummationTerms Change number of summation terms for calculating periodic Green's function

## Examples

## Infinite Array of Reflector-Backed Dipoles

Create an infinite array with reflector-backed dipoles as unit cells. Scan the array at boresight. Visualize the unit cell.

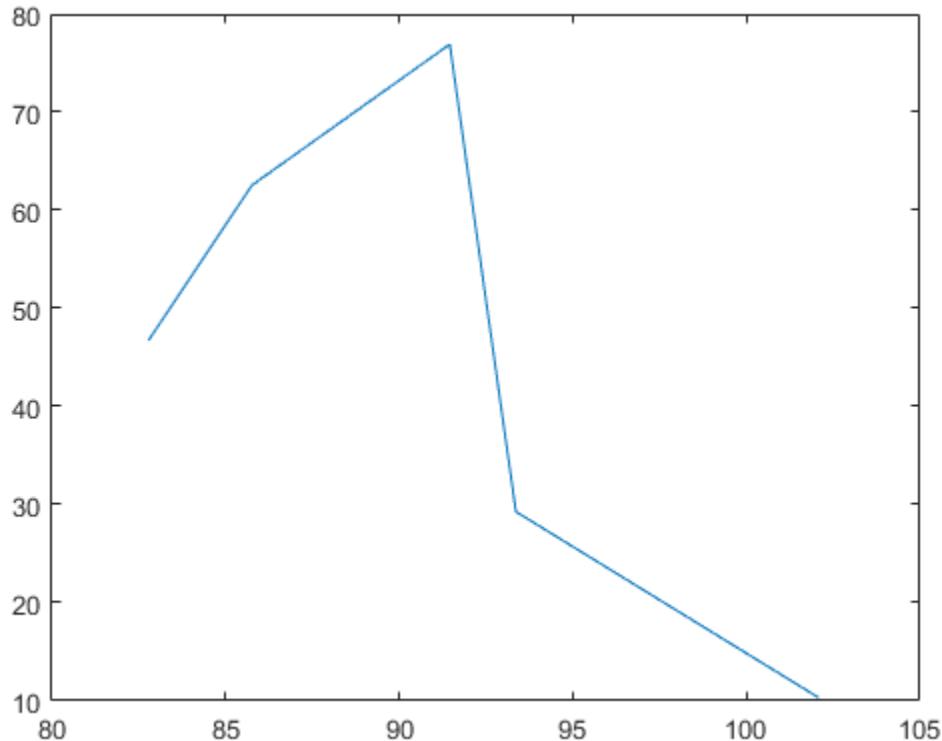

```
infa = infiniteArray('Element',reflector,'ScanAzimuth',0, ...
    'ScanElevation',90);
show(infa)
```

### Scan Impedance of Infinite Array

Calculate the scan impedance of an infinite array at 1GHz. To calculate the impedance, scan the infinite array from boresight to horizon in the elevation plane.

```
infa = infiniteArray;
theta0deg = linspace(0,90,5);
zscan = nan(1,numel(theta0deg));
for j = 1:numel(theta0deg)
    infa.ScanElevation = theta0deg(j);
    zscan(1,j) = impedance(infa,1e9);
end
plot(zscan)
```

## Topics

“Rotate Antenna and Arrays”

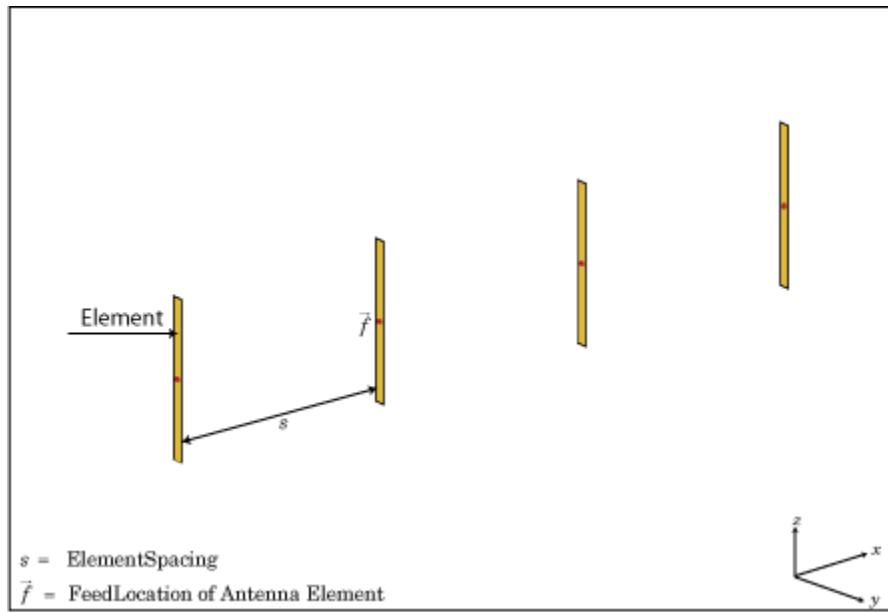

**Introduced in R2015b**

## linearArray

Create linear antenna array

### Description

The `linearArray` class creates a linear antenna array in the X-Y plane. By default, the linear array is a two-element dipole array. The dipoles are center fed. Each dipole resonates at 70 MHz when isolated.

### Creation

### Syntax

```
la = linearArray
```

```
la = linearArray(Name,Value)
```

## Description

`la = linearArray` creates a linear antenna array in the X-Y plane.

`la = linearArray(Name,Value)` class to create a linear antenna array, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`. Properties not specified retain their default values.

## Properties

### **Element — Individual antenna elements used in array**

dipole (default) | antenna object

Individual antenna elements used in array, specified as an antenna object.

Example: 'Element',monopole

### **NumElements — Number of antenna elements in array**

2 (default) | scalar

Number of antenna elements in array, specified as a scalar.

Example: 'NumElements',4

### **'ElementSpacing' — Spacing between antenna elements**

2 (default) | scalar | vector

Spacing between antenna elements, specified as a scalar or vector in meters. By default, the dipole elements are spaced 2 m apart.

Example: 'ElementSpacing',3

Data Types: double

### **AmplitudeTaper — Excitation amplitude of antenna elements**

1 (default) | scalar | vector

Excitation amplitude of antenna elements , specified as a scalar or vector. Set the property value to 0 to model dead elements. This value corresponds to the excitation voltages for the elements in the array.

Example: 'AmplitudeTaper', 3

Data Types: double

### **Phaseshift — Phase shift for antenna elements**

0 (default) | scalar | vector

Phase shift for antenna elements, specified as a scalar or vector in degrees. This value corresponds to the excitation voltages for the elements in the array.

Example: 'PhaseShift', [3 3 0 0]

Data Types: double

### **Tilt — Tilt angle of array**

0 (default) | scalar | vector

Tilt angle of array, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of array**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the array, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Object Functions

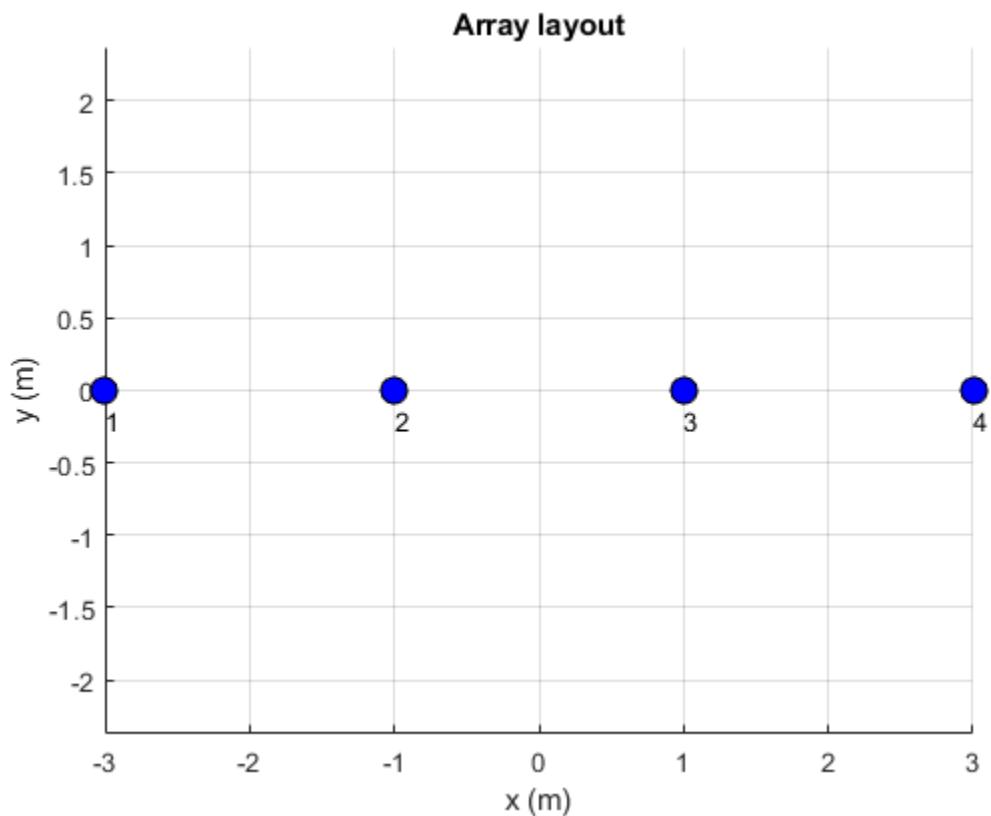

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
correlation	Correlation coefficient between two antennas in array
current	Current distribution on metal or dielectric antenna or array surface
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object

## Examples

### Create and Plot Layout of Linear Array

Create a linear array of four dipoles and plot the layout of the array.

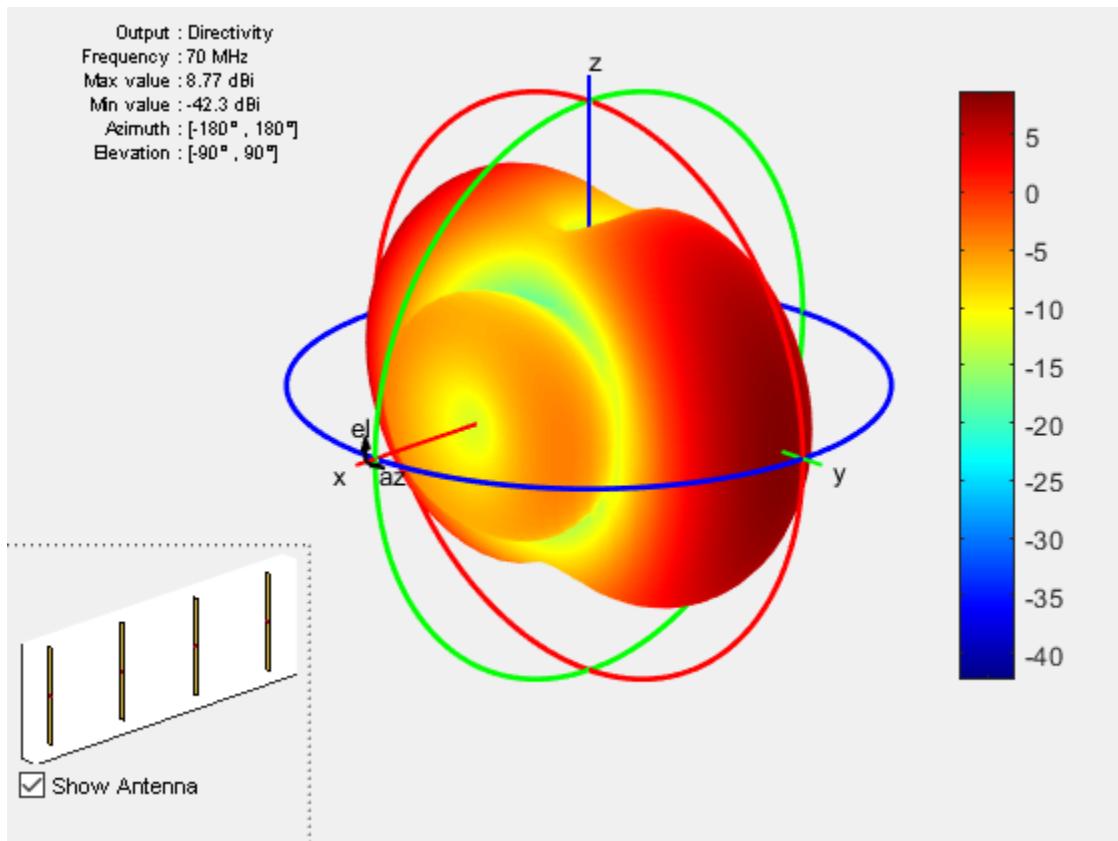

```
la = linearArray;
la.NumElements = 4;
layout(la);
```

### Radiation Pattern of Linear Array

Plot the radiation pattern of a four element linear array of dipoles at a frequency 70MHz.

```
la = linearArray('NumElements', 4);  
pattern(la, 70e6);
```

### Linear Array Using Groundplane Antennas

Create a linear array of two monopoles.

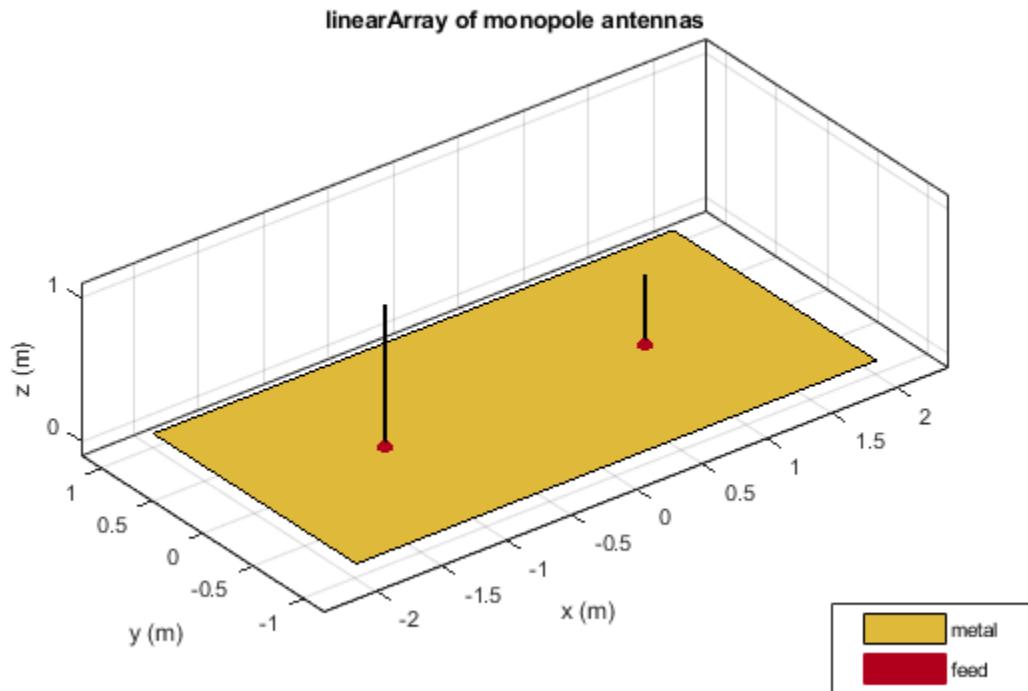

```
m1 = monopole;  
m2 = monopole('Height',0.5);  
mla = linearArray  
  
mla =  
    linearArray with properties:  
  
        Element: [1x1 dipole]
```

## 4 Array Objects—Alphabetical List

---

```
NumElements: 2
ElementSpacing: 2
AmplitudeTaper: 1
PhaseShift: 0
Tilt: 0
TiltAxis: [1 0 0]
```

```
mla.Element = [m1,m2];
show(mla);

## Topics

“Rotate Antenna and Arrays”

Introduced in R2015a

## conformalArray

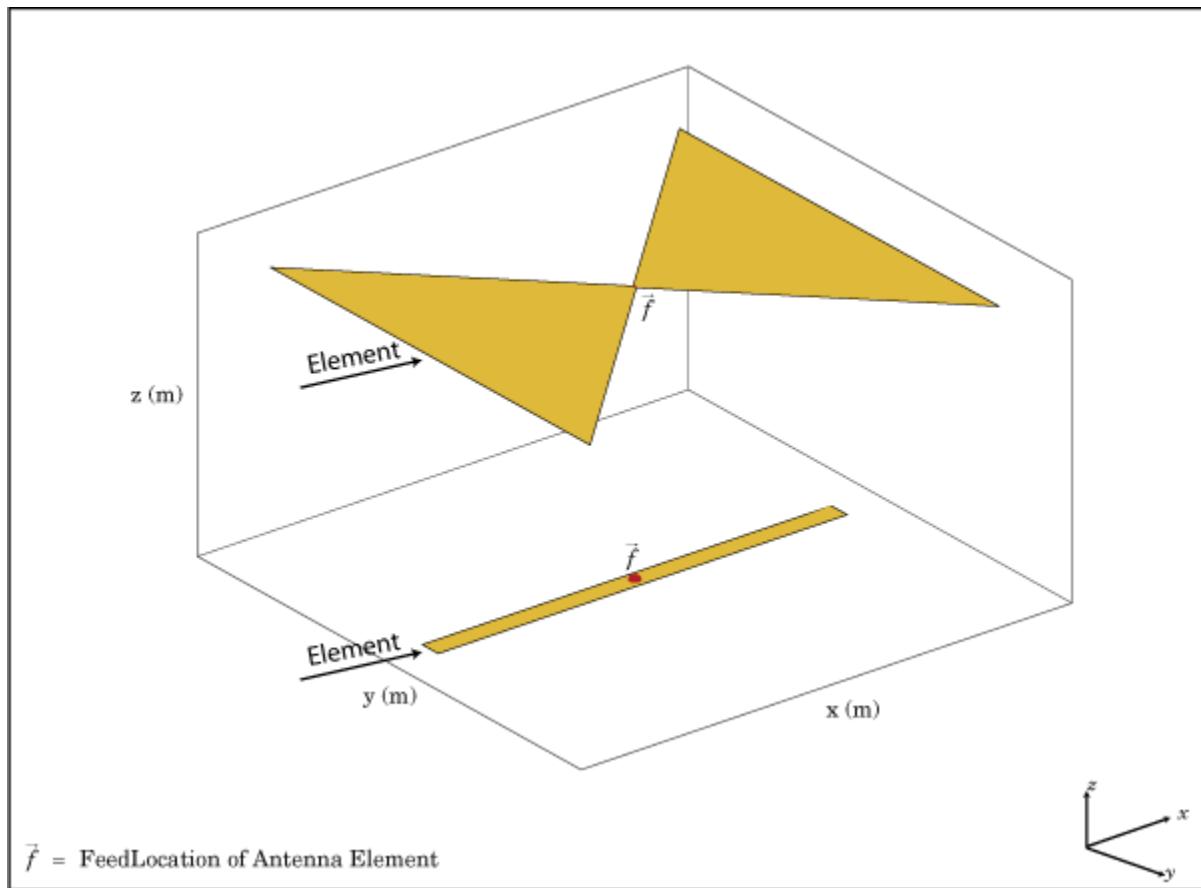

Create conformal antenna array

### Description

The `conformalArray` class creates an antenna array using any element from the antenna library. You can also specify an array of any arbitrary geometry, such as a circular array, a nonplanar array, or an array with nonuniform geometry.

Conformal arrays are used in:

- Direction-finding systems that uses circular arrays or stacked circular arrays
- Aircraft systems due to surface irregularities or mechanical stress

## Creation

### Syntax

```
ca = conformalArray  
ca = conformalArray(Name,Value)
```

### Description

`ca = conformalArray` creates a conformal antenna array using the default antenna element, shape, and antenna positions.

`ca = conformalArray(Name,Value)` creates a conformal antenna array with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1,Value1, ..., NameN,ValueN`. Properties not specified retain default values.

### Properties

#### **ElementPosition — Position of feed or origin**

`[0 0 0; 0 0 0.1500]` (default) |  $M$ -by-3 real matrix

Position of the feed or origin for each antenna element, specified as  $M$ -by-3 real matrix.  $M$  is the number of element positions. By default,  $M$  is 2. To specify additional antenna elements, add additional element positions in the conformal array.

Example: `'ElementPosition',[0.1 0.1 0.1; -0.1 -0.1 -0.1;0.2 0.0.2]`

Data Types: double

#### **Element — Individual antenna elements in array**

scalar | array of objects | cell array of objects

Individual antenna elements in the array, specified as one of the following values:

- A scalar
- An array of objects
- Cell array of objects

By default, conformal array have two antenna elements, the dipole and the bowtie. To specify additional antenna elements, add additional element positions in the conformal array. You can add both balanced and unbalanced antennas to the same conformal array.

Example: `m = monopole; h = conformalArray('Element', [m,m])`. Creates a conformal array consisting of two monopoles antenna elements.

Example: `d = dipole; mt = monopoleTopHat; h = conformalArray('Element', {d,mt})`. Creates a conformal array consisting of a dipole antenna and a monopole tophat antenna.

Data Types: cell

**Reference — Position reference for antenna element**

'feed' (default) | 'origin'

Position reference for the antenna element, specified as either 'origin' or 'feed'. For more information see "Position Reference" on page 4-35

Example: 'Reference','origin'

Data Types: char

**AmplitudeTaper — Excitation amplitude of antenna elements**

1 (default) | scalar | nonnegative vector

Excitation amplitude of the antenna elements, specified as a scalar or a nonnegative vector. To model dead elements, set the property value to 0.

Example: 'AmplitudeTaper', 3

Example: 'AmplitudeTaper', [3 0]. Creates a two-element conformal array, where 3 and 0 are the excitations amplitudes of two elements.

Data Types: double

**PhaseShift — Phase shift for antenna elements**

0 (default) | scalar | real vector

Phase shift for antenna elements, specified as a scalar or a real vector in degrees.

Example: 'PhaseShift', [-45 -45 45 45]

Data Types: double

**Tilt — Tilt angle of array**

0 (default) | scalar | vector

Tilt angle of array, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of array**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the array, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Examples

### Default Conformal Array

Create a default conformal array.

```
c = conformalArray  
c =  
    conformalArray with properties:  
  
        Element: {[1x1 dipole] [1x1 bowtieTriangular]}  
    ElementPosition: [2x3 double]  
        Reference: 'feed'  
    AmplitudeTaper: 1  
        PhaseShift: 0  
        Tilt: 0  
    TiltAxis: [1 0 0]  
  
show(c)
```

### Circular Array of Dipoles

Define the radius and the number of elements for the array.

```
r = 2;  
N = 12;
```

Create an array of 12 dipoles.

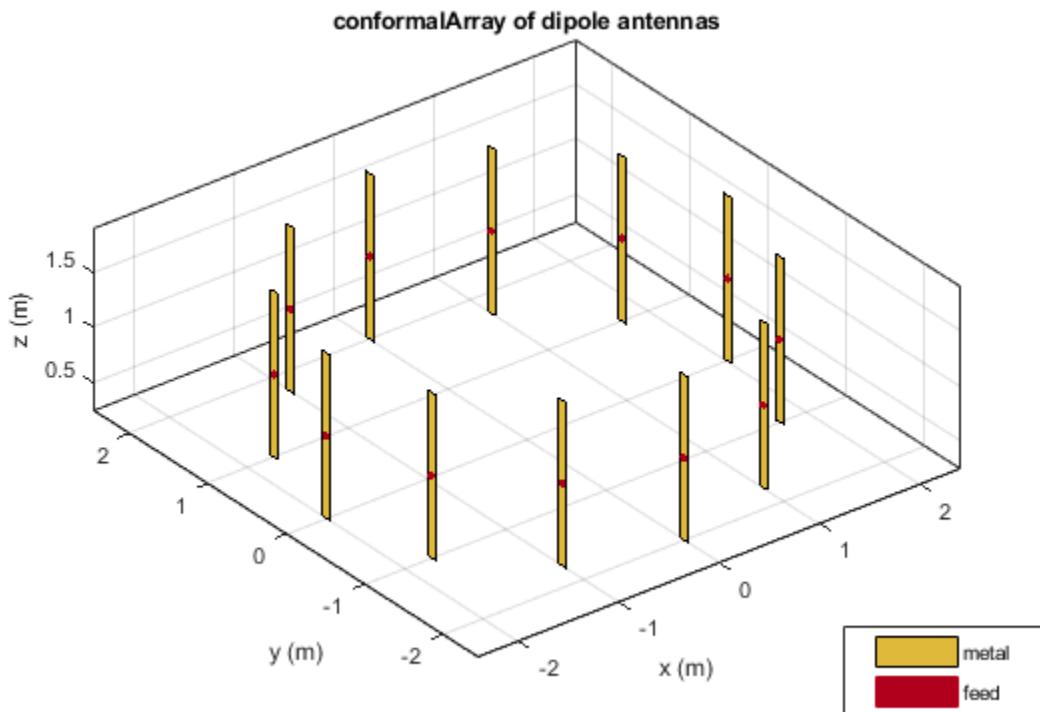

```
elem = repmat(dipole('Length',1.5),1,N);
```

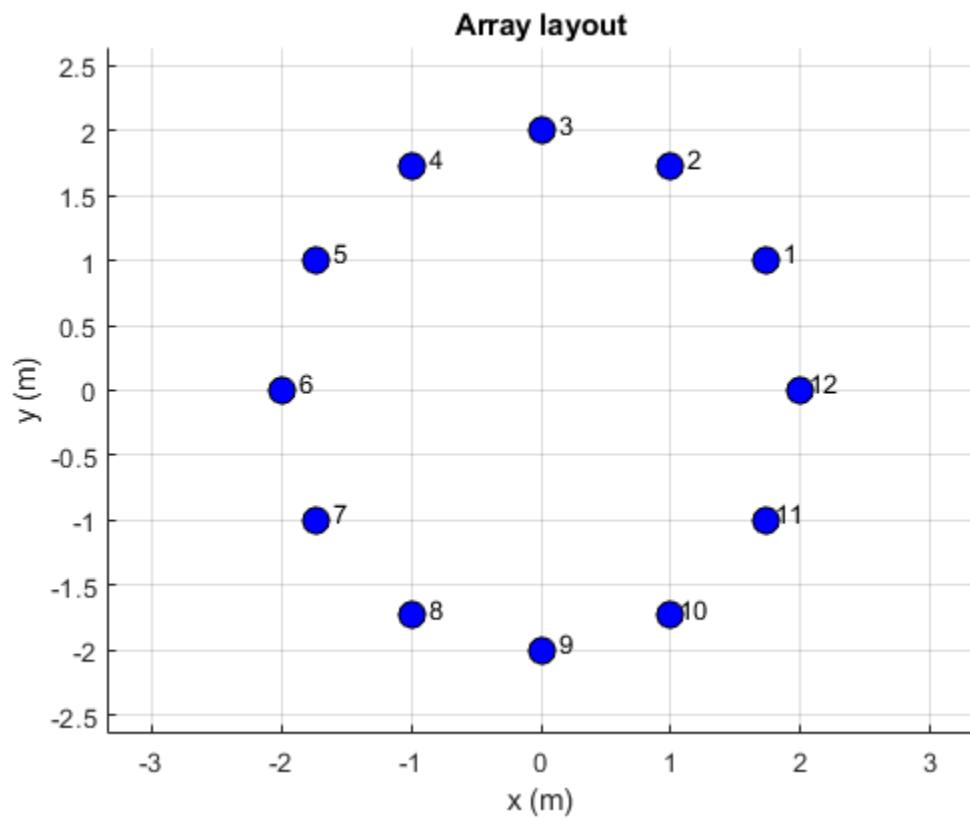

Define the x,y,z values for the element positions in the array.

```
del_th = 360/N;
th = del_th:del_th:360;
x = r.*cosd(th);
y = r.*sind(th);
z = ones(1,N);
pos = [x;y;z];
```

Create a circular array using the defined dipoles and then visualize it. Display the layout of the array.

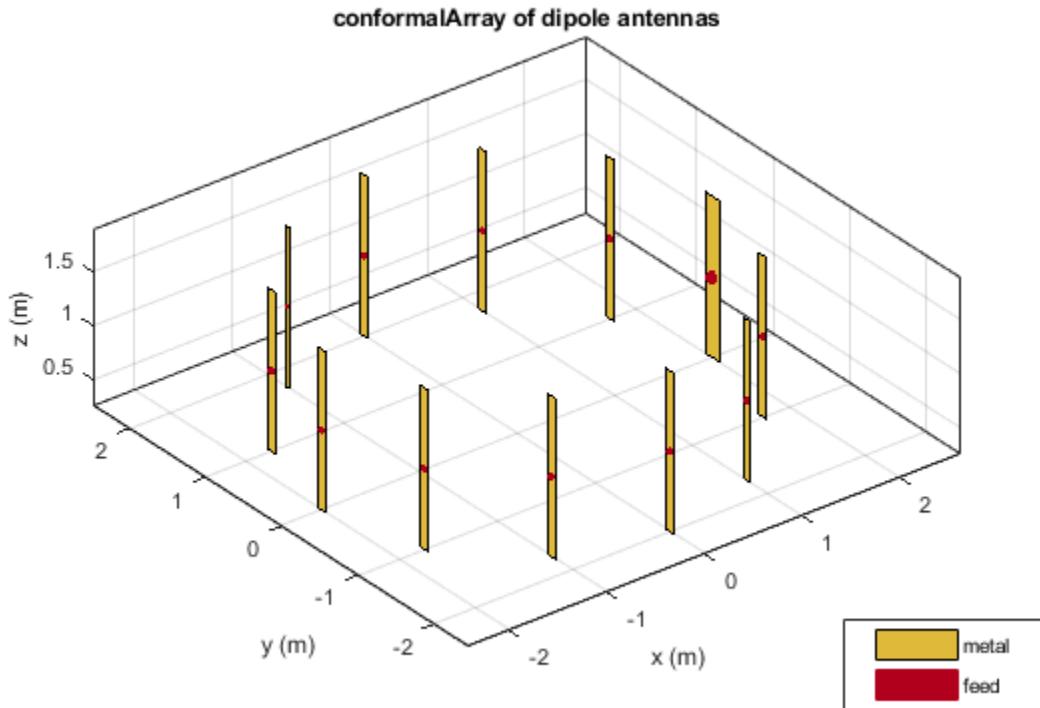

```
c = conformalArray('Element',elem,'ElementPosition',pos');
show(c)
figure
layout(c)
```

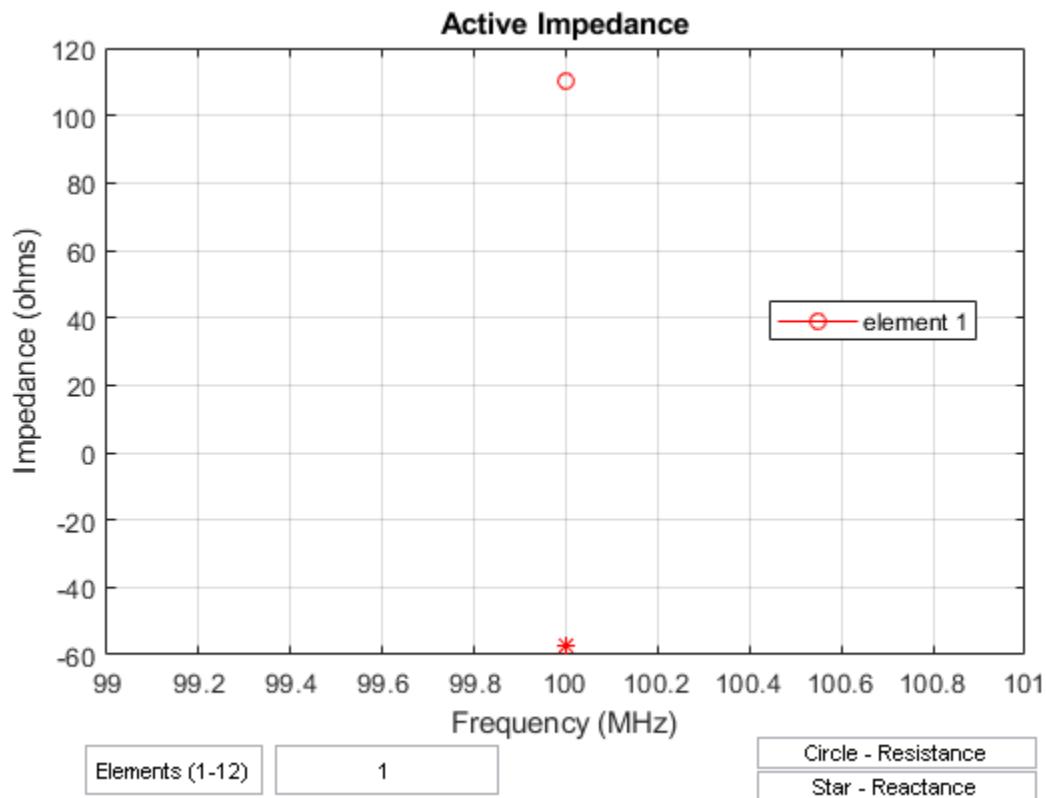

Change the width of the fourth and the twelfth element of the circular array. Visualize the new arrangement.

```
c.Element(4).Width = 0.05;  
c.Element(12).Width = 0.2;  
figure  
show(c)
```

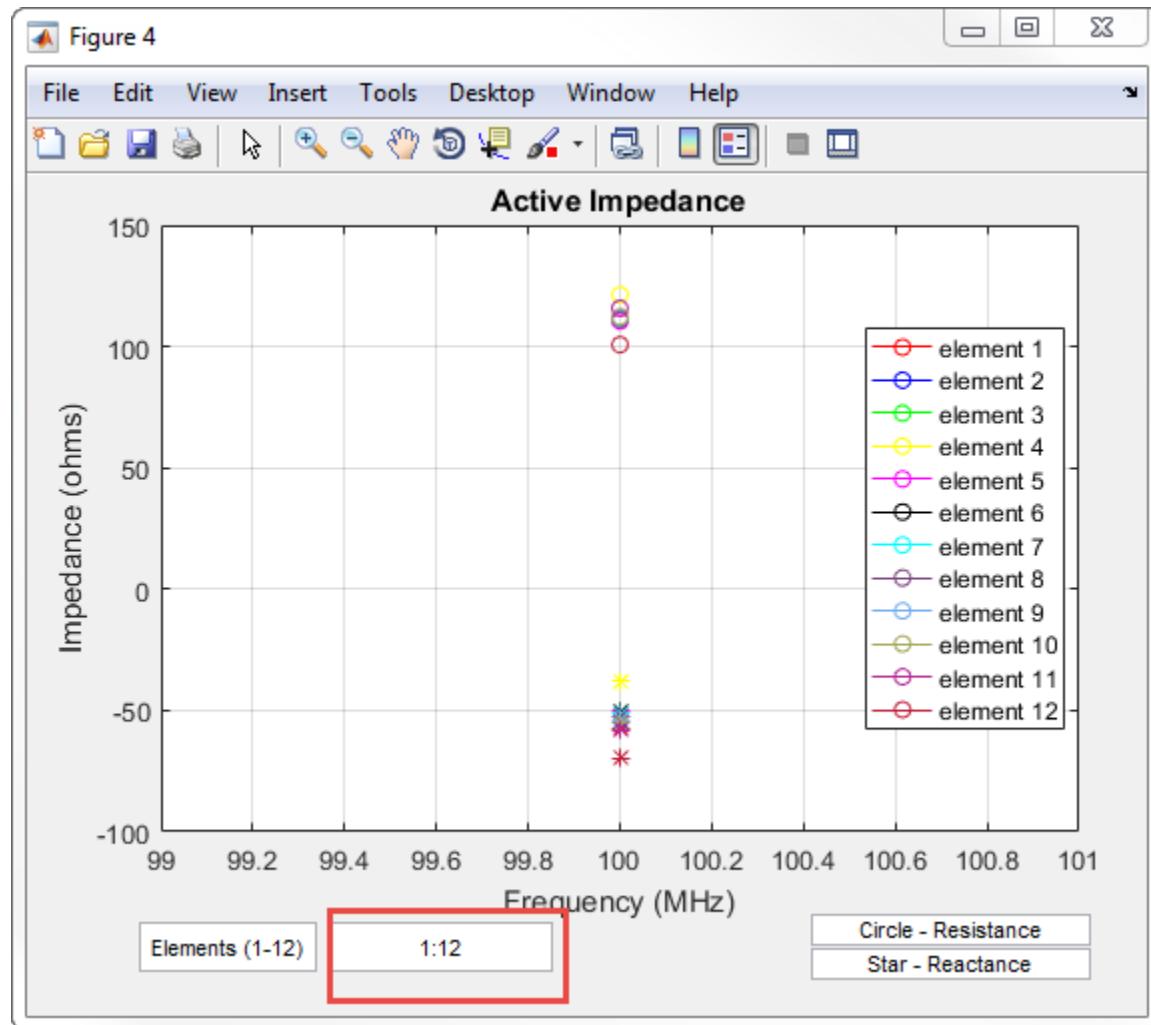

Calculate and plot the impedance of the circular array at 100 MHz. The plot shows the impedance of the first element in the array.

```
figure  
impedance(c,100e6)
```

To view the impedance of all the elements in the array change the value from **1** to **1:12** as shown in the figure.

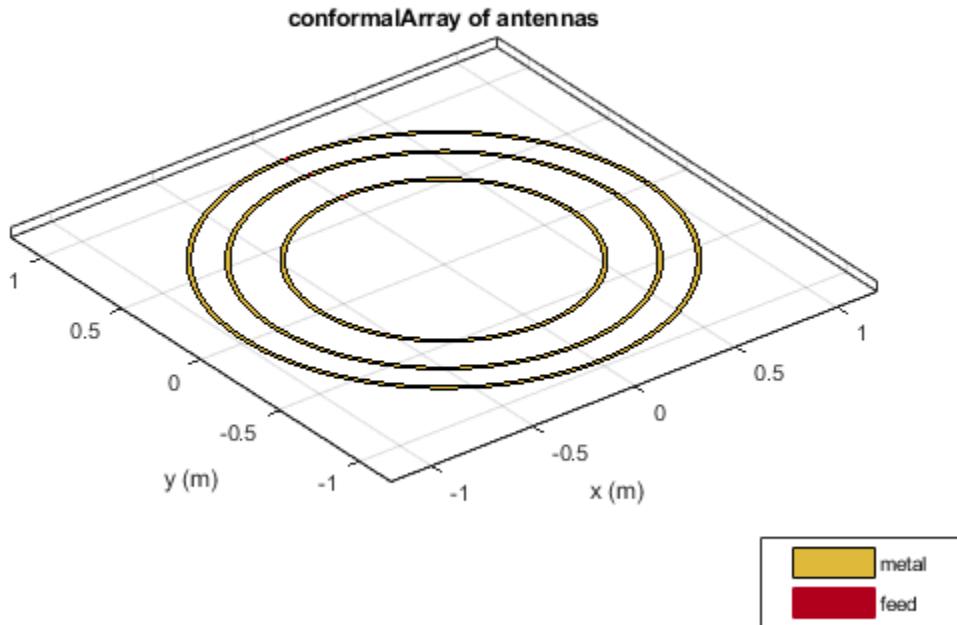

### Radiation Pattern of Concentric Array of Circular Loop Antennas

Define three circular loop antennas of radii 0.6366 m (default), 0.85 m, and 1 m, respectively.

```
l1 = loopCircular;  
l2 = loopCircular('Radius',0.85);  
l3 = loopCircular('Radius',1);
```

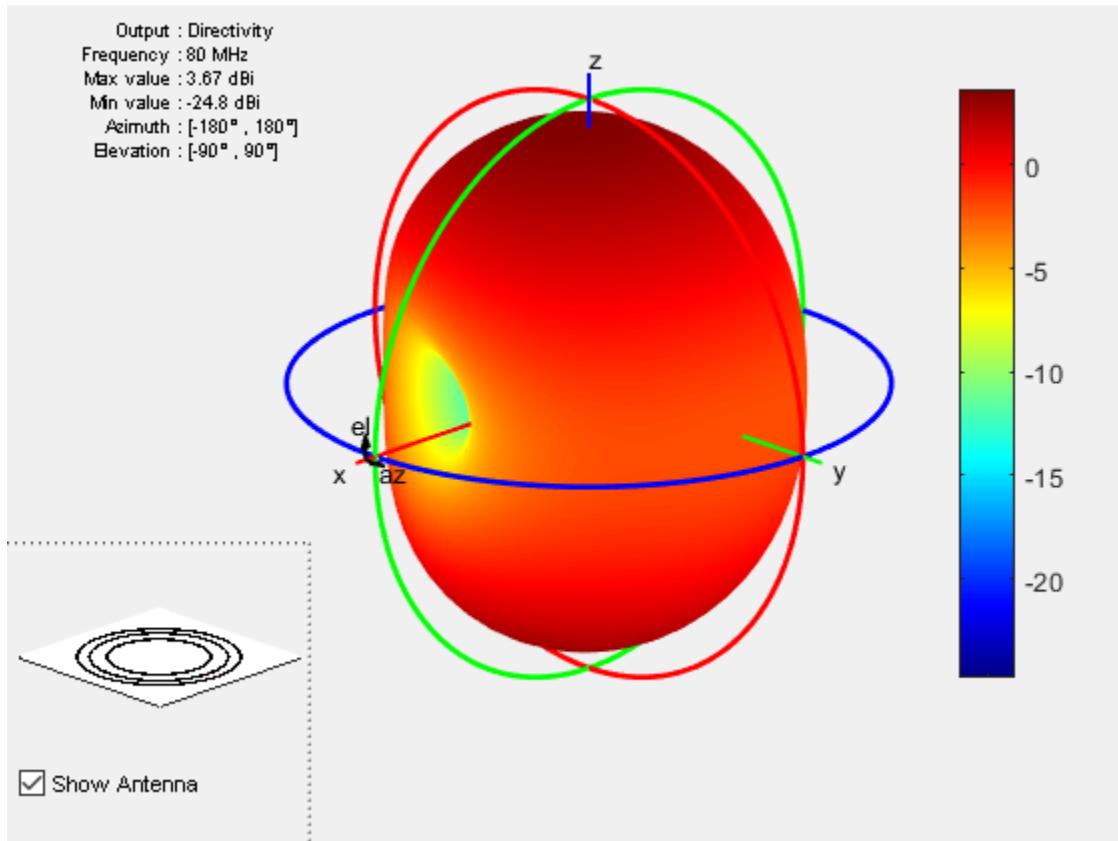

Create a concentric array that uses the origin of circular loop antennas as its position reference.

```
c = conformalArray('Element',{l1,l2,l3}, 'ElementPosition',[0 0 0;0 0 0;...  
0 0 0], 'Reference','origin');  
show(c)
```

Visualize the radiation pattern of the array at 80 MHz.

```
pattern(c,80e6)
```

### Conformal Array Using Infinite Ground Plane Antenna

Create a dipole antenna to use in the reflector and the conformal array.

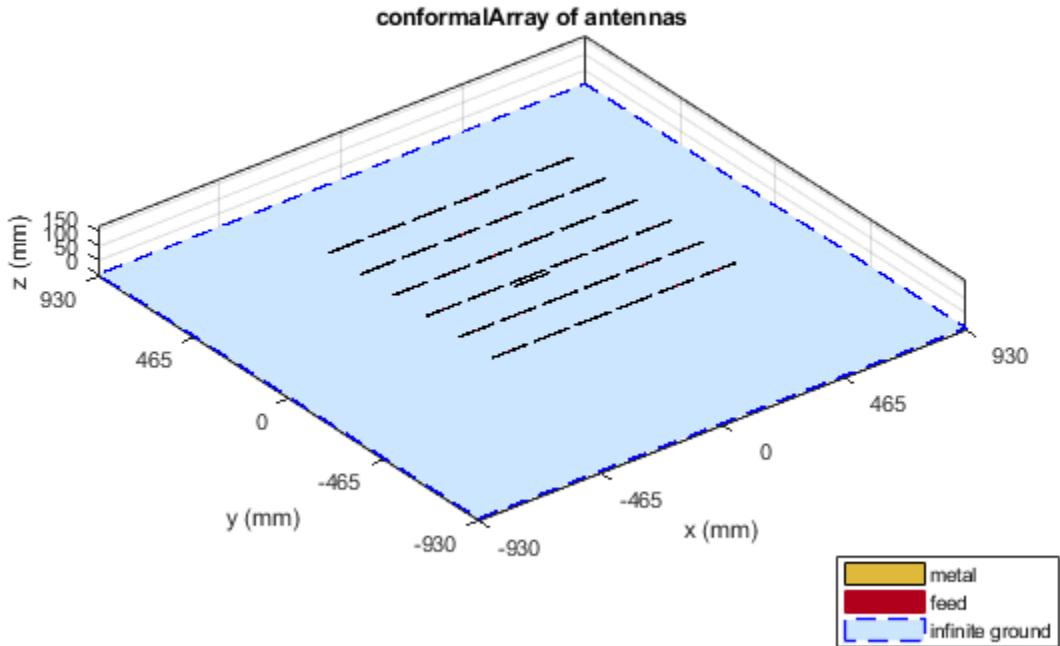

```
d = dipole('Length',0.13,'Width',5e-3,'Tilt',90,'TiltAxis','Y');
```

Create an infinite groundplane reflector antenna using the dipole as exciter.

```
rf = reflector('Exciter',d,'Spacing',0.15/2,'GroundPlaneLength',inf);
```

Create a conformal array using 36 dipole antennas and one infinite groundplane reflector antenna. View the array.

```
x = linspace(-0.4,0.4,6);
y = linspace(-0.4,0.4,6);
[X,Y] = meshgrid(x,y);
pos = [X(:) Y(:) 0.15*ones(numel(X),1)];
for i = 1:36
    element{i} = d;
end
element{37} = rf;
lwa = conformalArray('Element',element,'ElementPosition',[pos;0 0 0.15/2]);
show(lwa)
```

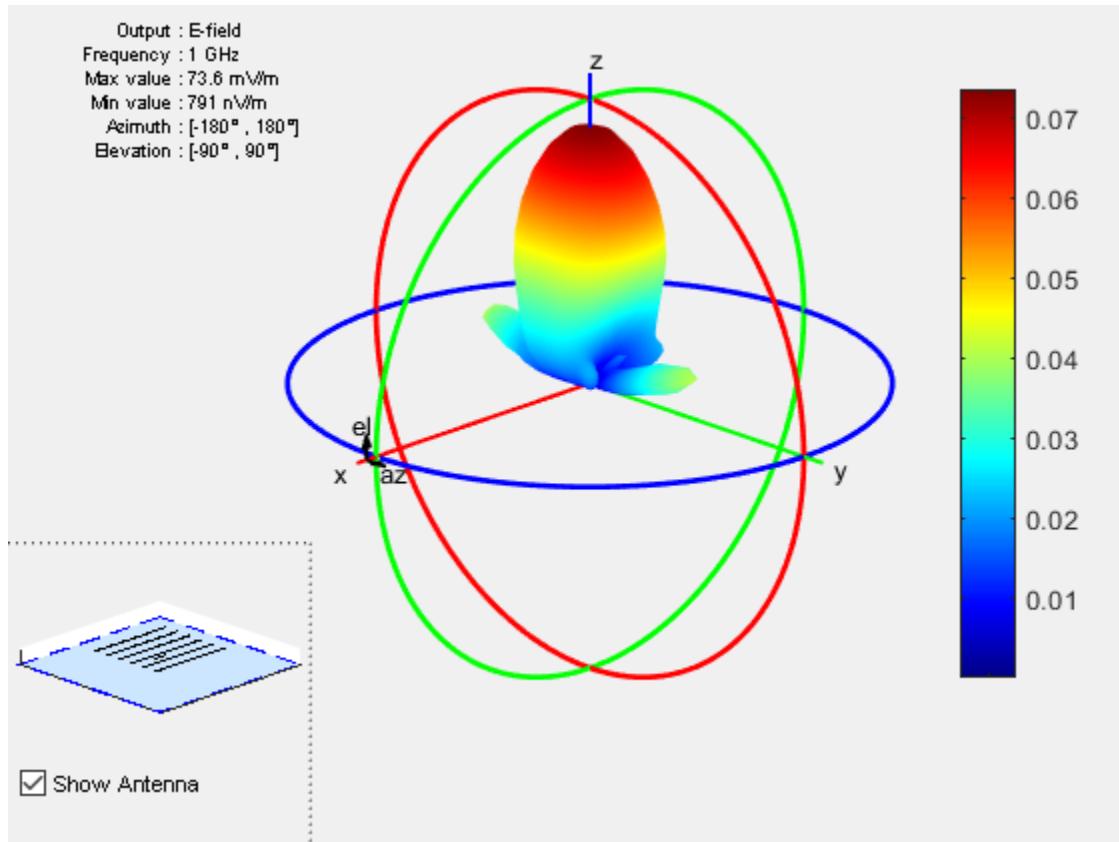

Drive only the reflector antenna with an amplitude of 1.

```
V = zeros(1,37);  
V(end) = 1;  
lwa.AmplitudeTaper = V;
```

Compute the radiation pattern of the conformal array.

```
figure  
pattern(lwa,1e9,'Type','efield')
```

### Conformal Array Using Dielectric Antennas

Create two patch microstrip antennas using dielectric substrate FR4. Tilt the second patch microstrip antenna by 180 degrees.

## 4 Array Objects—Alphabetical List

---

```
d = dielectric('FR4');
p1 = patchMicrostrip('Substrate',d);
p2 = patchMicrostrip('Substrate',d,'Tilt',180);
```

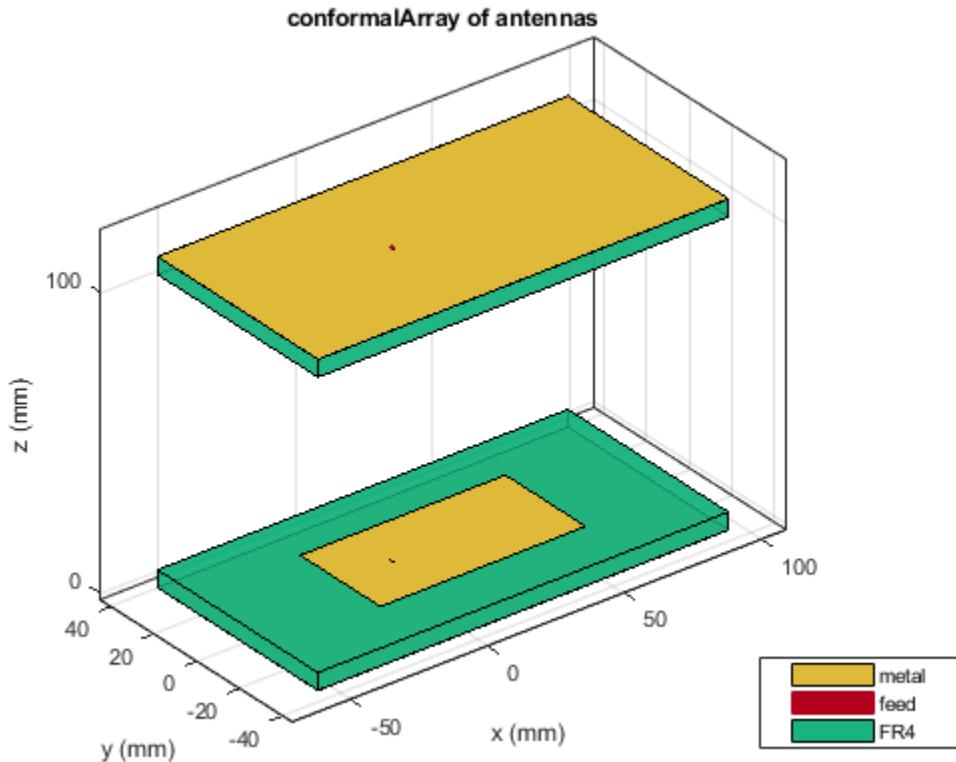

Create and view a conformal array using the two patch microstrip antennas placed 11 cm apart.

```
c = conformalArray('ElementPosition',[0 0 0;0 0 0.1100],'Element',{p1,p2})

c =
    conformalArray with properties:

        Element: {[1x1 patchMicrostrip] [1x1 patchMicrostrip]}
    ElementPosition: [2x3 double]
        Reference: 'feed'
    AmplitudeTaper: 1
        PhaseShift: 0
        Tilt: 0
    TiltAxis: [1 0 0]

show(c)
```

### Conformal Array Using Balanced and Unbalanced Antennas

Create a conformal array using dipole and monopole antennas.

```
c = conformalArray('Element', {dipole, monopole})  
c =  
    conformalArray with properties:  
  
        Element: {[1x1 dipole]  [1x1 monopole]}  
        ElementPosition: [2x3 double]  
        Reference: 'feed'
```

## 4 Array Objects—Alphabetical List

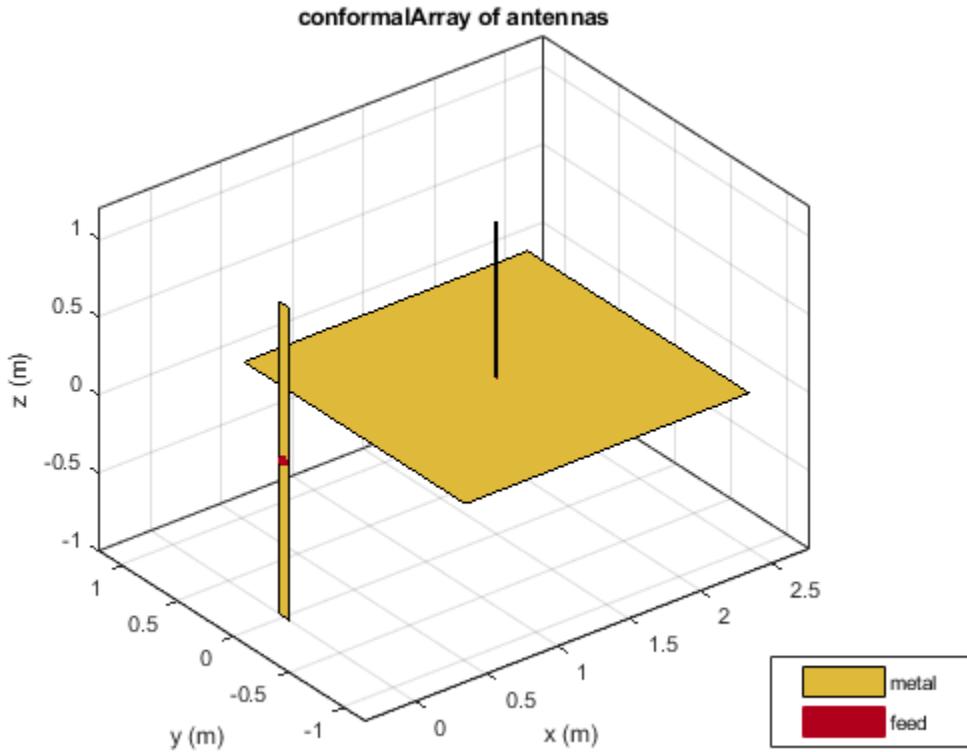

---

```
AmplitudeTaper: 1  
PhaseShift: 0  
Tilt: 0  
TiltAxis: [1 0 0]
```

```
c.ElementPosition = [0 0 0; 1.5 0 0];
```

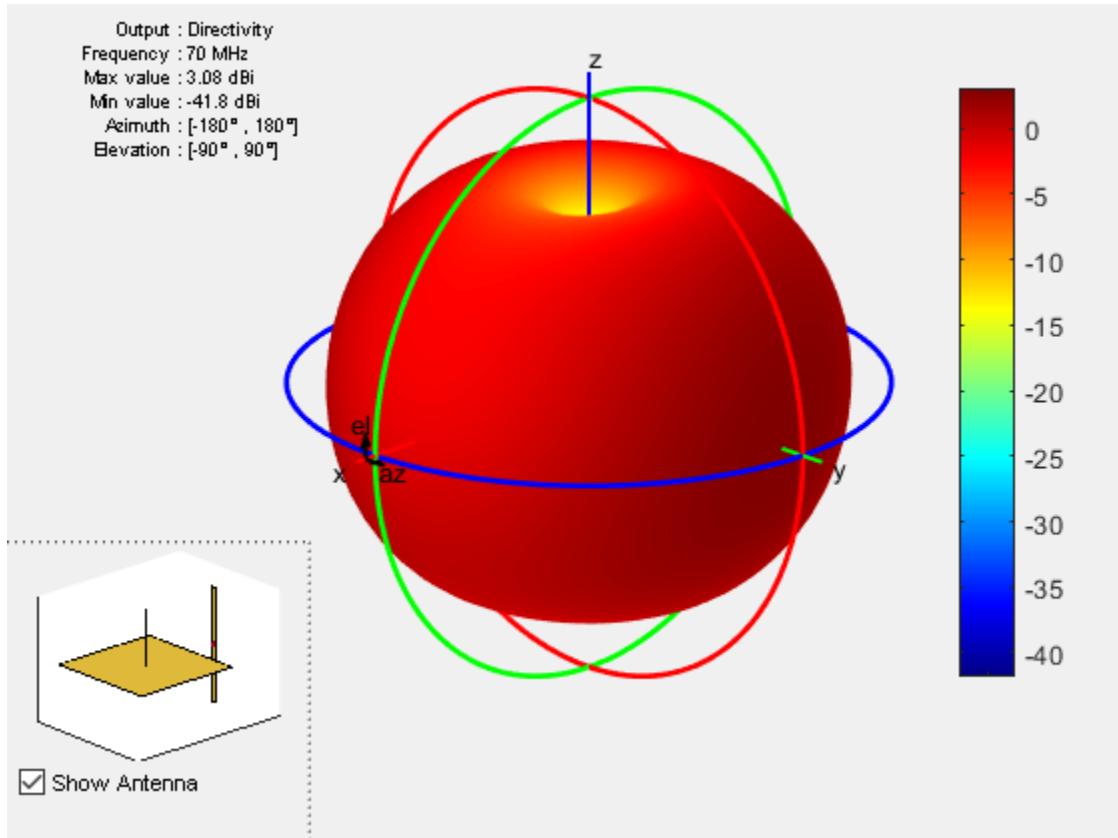

Visualize the array.

```
figure;  
show(c);
```

Plot the radiation pattern of the array at 70 MHz.

```
pattern(c, 70e6)
```

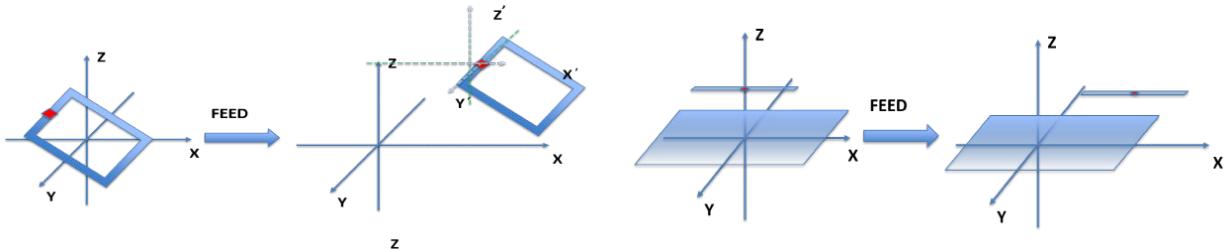

## Definitions

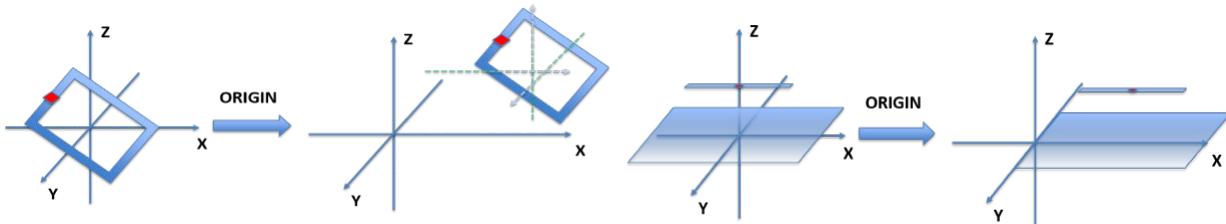

### Position Reference

'Reference' property of `conformalArray` class defines the position reference of an antenna element in 3-D space. You can position the antenna by specifying the `Reference` property as `feed` or `origin`.

Choosing `feed` as the position reference moves the antenna element with so that the new feed location is at the specified coordinates. The loop rectangle antenna and reflector-backed antenna show the new position with respect to feed:

Choosing `origin` as the position reference moves the antenna element so that new antenna origin is at the specified coordinates. The loop rectangle antenna and reflector-backed antenna show the new position with respect to origin:

# rectangularArray

Create rectangular antenna array

## Description

The `rectangularArray` class creates a rectangular antenna array in the X-Y plane. By default, the rectangular array is a four-element dipole array in a  $2 \times 2$  rectangular lattice. The dipoles are center-fed. Each dipole resonates at 70 MHz when isolated.

## Creation

### Syntax

```
ra = rectangularArray  
ra = rectangularArray(Name,Value)
```

### Description

`ra = rectangularArray` creates a rectangular antenna array in the X-Y plane.

`ra = rectangularArray(Name,Value)` creates a rectangular antenna array, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain default values.

## Properties

### **Element — Individual antenna elements used in array**

dipole (default) | antenna object

Individual antenna elements used in array, specified as an antenna object.

Example: '`Element`', monopole

### **Size — Number of antenna elements in row and column of array**

[2 2] (default) | two-element vector

Number of antenna elements in row and column of array, specified as a two-element vector.

Example: '`Size`', [4 4]

### **RowSpacing — Row spacing between two antenna elements**

2 (default) | scalar | vector

Row spacing between two antenna elements, specified as a scalar or vector in meters. By default, the antenna elements are spaced 2m apart.

Example: 'RowSpacing',[5 6]

Data Types: double

**ColumnSpacing — Column spacing between two antenna elements**

2 (default) | scalar | vector

Column spacing between two antenna elements, specified as a scalar or vector in meters. By default, the antenna elements are spaced 2m apart.

Example: 'ColumnSpacing',[3 4]

Data Types: double

**Lattice — Antenna elements spatial arrangement**

'Rectangular' (default) | "Triangular"

Antenna elements spatial arrangement, specified as a text input.

Example: 'Lattice',"Triangular"

Data Types: char

**AmplitudeTaper — Excitation amplitude of antenna elements**

1 (default) | scalar | vector

Excitation amplitude of antenna elements , specified as a scalar or vector. Set the property value to 0 to model dead elements.

Example: 'AmplitudeTaper',3

Data Types: double

**Phaseshift — Phase shift for antenna elements**

0 (default) | scalar | vector

Phase shift for antenna elements, specified as a scalar or vector in degrees.

Example: 'PhaseShift',[3 3 0 0]

Data Types: double

**Tilt — Tilt angle of array**

0 (default) | scalar | vector

Tilt angle of array, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of array**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the array, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis', [0 1 0]

Example: 'TiltAxis', [0 0 0;0 1 0]

Example: 'TiltAxis', 'Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch

## Examples

### Create and Plot Layout of Rectangular Array

Create and plot the layout of a rectangular array of four dipoles.

```
ra = rectangularArray;
ra.Size = [2 2];
layout(ra);
```

### Calculate Scan Impedance of Rectangular Array

Calculate the scan impedance of a 2x2 rectangular array of dipoles at 70 MHz.

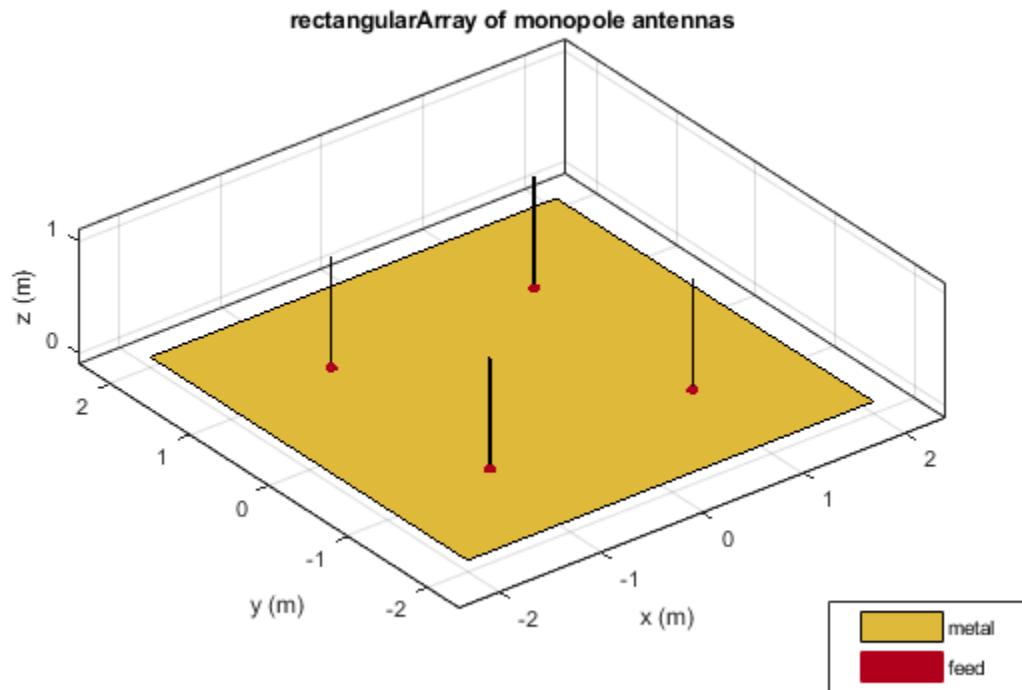

```
h = rectangularArray('Size',[2 2]);  
Z = impedance(h,70e6)
```

```
Z =  
25.9784 -54.2823i 25.9784 -54.2823i 25.9784 -54.2823i 25.9784 -54.2823i
```

## Rectangular Array Using Groundplane Antennas

Create a rectangular array of monopoles.

```
m1 = monopole;
mra = rectangularArray('Element',m1);
show(mra);
```

# circularArray

Create circular antenna array

## Description

The `circularArray` object is a circular antenna array. Circular arrays finds application in direction of arrival (DoA) systems. You can sue circular arrays to perform 2-D scanning, while lowering element counts. These arrays also have the ability for 360 degree scanning. The individual elements in the circular array are part of the same array environment. This property reduces the impact of edge effects and other coupling variation.

## Creation

### Syntax

```
ca = circularArray  
ca = circularArray(Name,Value)
```

### Description

`ca = circularArray` creates a circular antenna array in the X-Y plane.

`ca = circularArray(Name,Value)` class to create a circular antenna array, with additional properties specified by one, or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

## Properties

### **Element — Individual antenna type**

dipole (default) | vector of objects

Individual antenna type, specified as a vector of objects. This property supports scalar expansion.

Example: `'Element', [monopole, monopole]`

### **NumElements — Number of elements in array**

6 (default) | positive scalar integer

Number of elements in the array, specified as a positive scalar integer. The elements in the array are arranged along the X-axis.

Example: `'NumElements', 4`

Data Types: double

### **Radius — Radius of array**

1 (default) | positive scalar integer

Radius of array, specified as a positive scalar integer in meters.

Example: 'Radius', 0.4

Data Types: double

**AngleOffset — Starting angle offset for first element in array**

0 (default) | real scalar

Starting angle offset for first element in array, specified as a real scalar in degrees.

Example: 'AngleOffset', 8

Data Types: double

**AmplitudeTaper — Excitation amplitude for antenna elements in array**

1 (default) | real positive vector of size 'Element'

Excitation amplitude for antenna elements in the array, specified as a real positive vector of size 'Element'.

Example: 'AmplitudeTaper', [0 1]

Data Types: double

**PhaseShift — Phase shift for each element in array**

0 (default) | real vector of size 'Element' in degrees

Phase shift for each element in the array, specified as a real vector of size 'Element' in degrees.

Example: 'PhaseShift', [0 2]

Data Types: double

**Tilt — Tilt angle of array**

0 (default) | scalar | vector

Tilt angle of array, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of array**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the array, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## **Analysis Functions**

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
layout	Display array layout
show	Display antenna or array structure; Display shape as filled patch
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
correlation	Correlation coefficient between two antennas in array
current	Current distribution on metal or dielectric antenna or array surface
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array

sparameters S-parameter object

## Examples

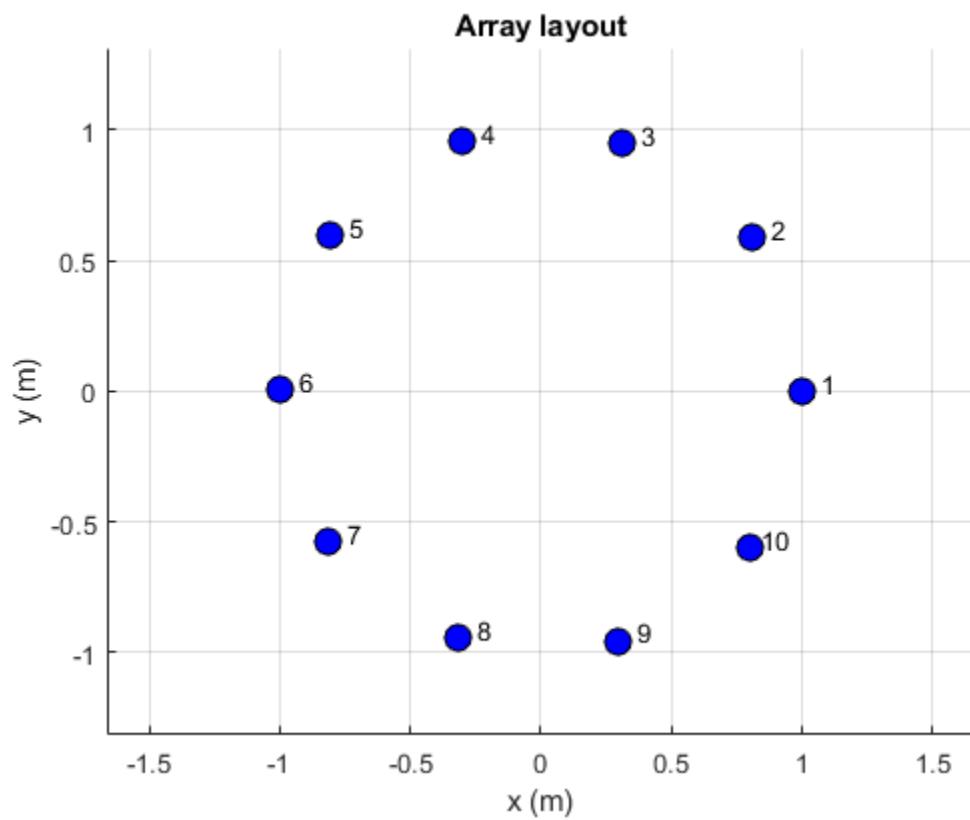

### Plot Elevation Pattern of Circular Antenna Array

Create a circular antenna array using 10 antenna elements. View the layout of the antenna elements in the array.

```
ca = circularArray('NumElements',10)
figure;
layout(ca)
```

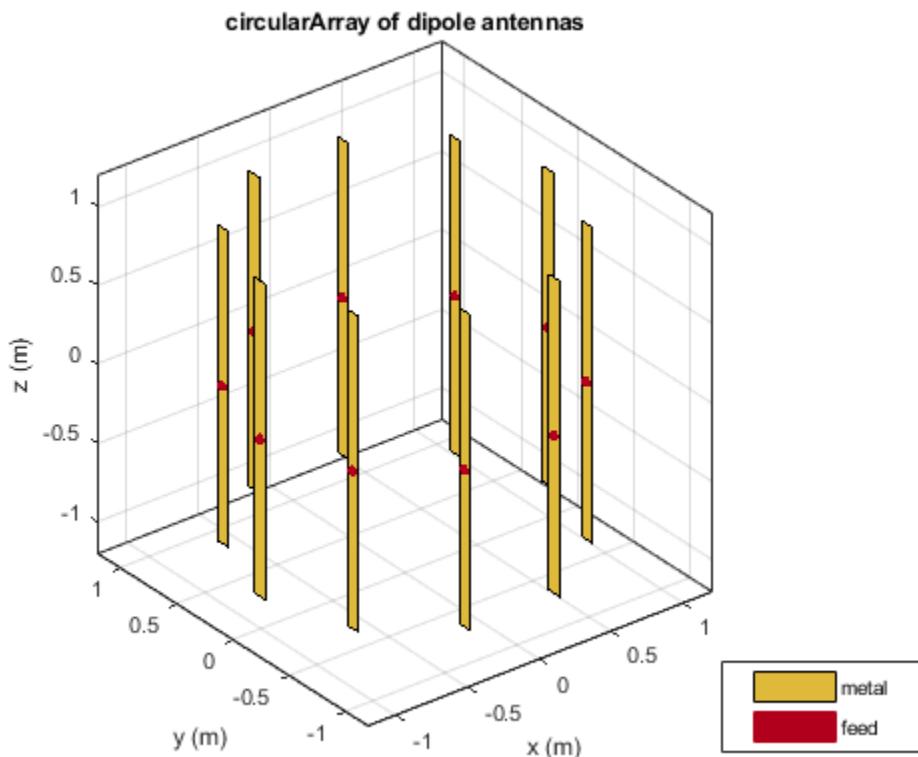

```
ca =
circularArray with properties:

    Element: [1x1 dipole]
    NumElements: 10
        Radius: 1
    AngleOffset: 0
    AmplitudeTaper: 1
    PhaseShift: 0
        Tilt: 0
    TiltAxis: [1 0 0]
```

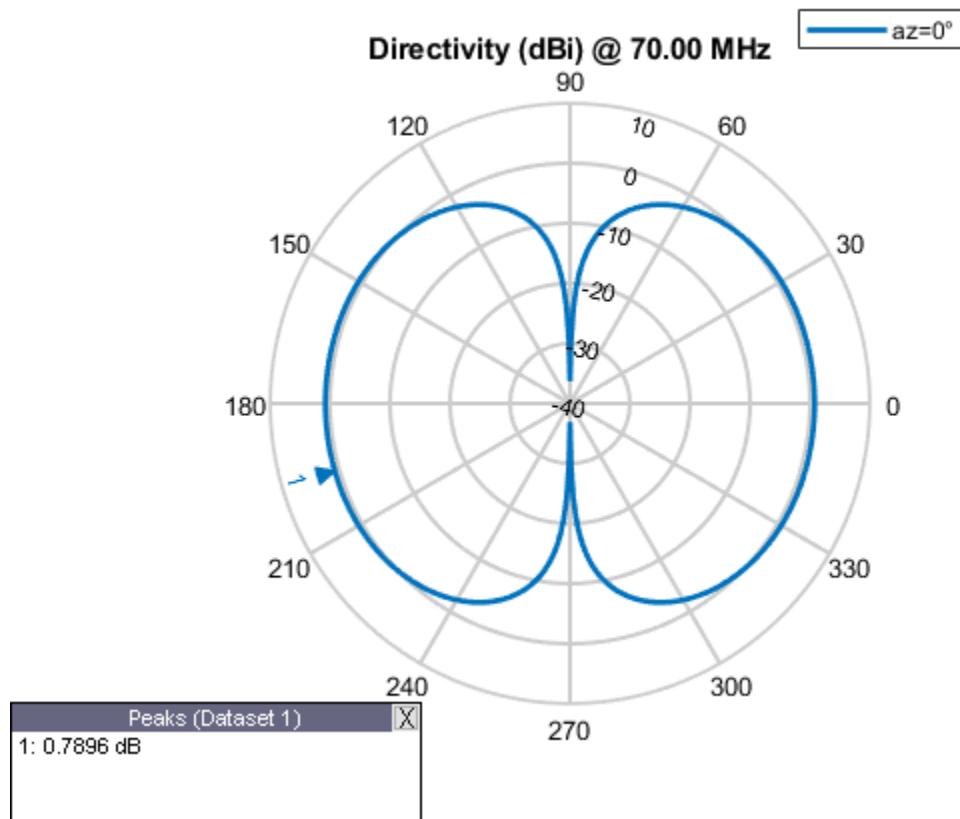

Display the array.

```
figure;  
show(ca)
```

Plot the elevation pattern of the circular array at a frequency of 70 MHz.

```
figure;  
patternElevation(ca, 70e6)
```

“Rotate Antenna and Arrays”

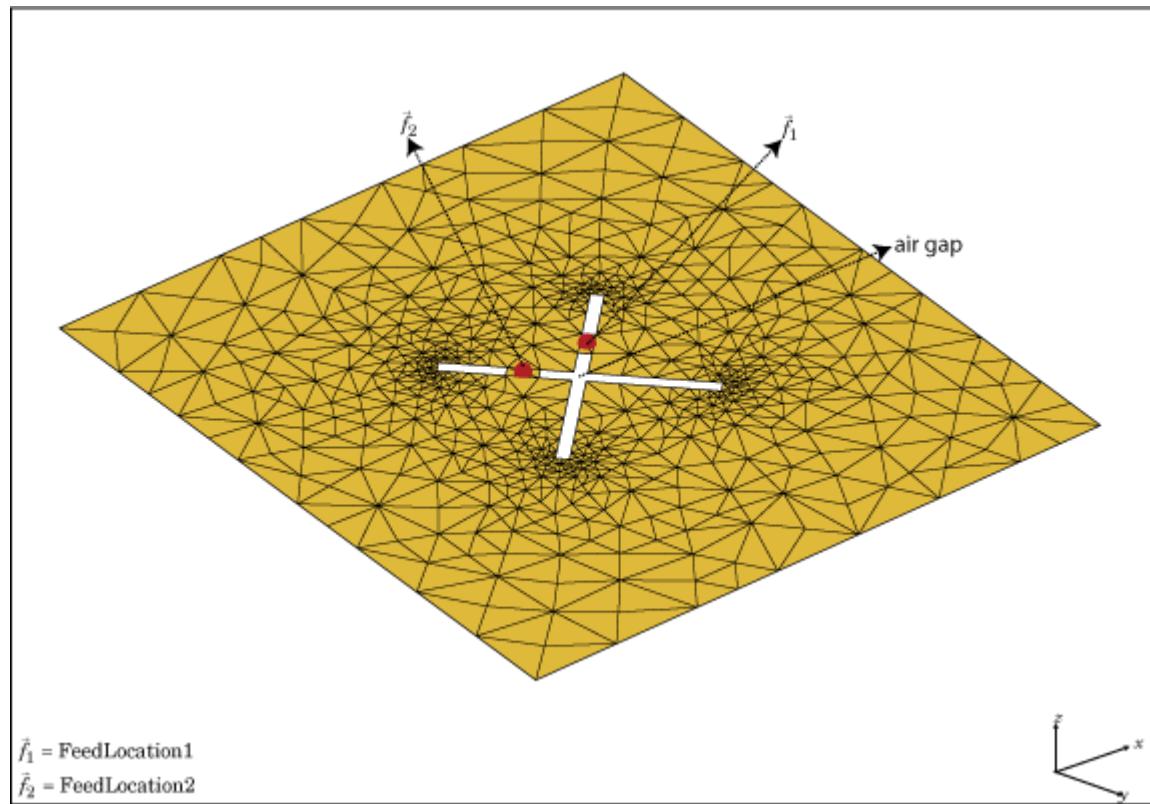

Introduced in R2016b

# customArrayMesh

Create 2-D custom mesh antenna on X-Y plane

## Description

The `customArrayMesh` object creates an array represented by a 2-D custom mesh on the X-Y plane. You can provide an arbitrary array mesh to the Antenna Toolbox and analyze this mesh as a custom array for port and field characteristics.

## Creation

### Description

`customarray = customArrayMesh(points, triangles, numfeeds)` creates a 2-D array represented by a custom mesh, based on the specified points and triangles.

### Input Arguments

#### **points — Points in custom mesh**

2-by- $N$  or 3-by- $N$  matrix of Cartesian coordinates in meters

Points in custom mesh, specified as a 2-by- $N$  or 3-by- $N$  matrix of Cartesian coordinates in meters.  $N$  is the number of points. In case you specify a 3-by- $N$  integer matrix, the Z-coordinate must be zero or a constant value. This value sets the 'Points' property in the custom array mesh.

Example: `load planarmesh.mat; c = customArrayMesh(p, t, 4)`. Creates a custom array mesh from the points, p, extracted from the `planarmesh.mat` file.

Data Types: double

#### **triangles — Triangles in mesh**

4-by- $M$  matrix

Triangles in the mesh, specified as a 4-by- $M$  matrix.  $M$  is the number of triangles. The first three rows are indices to the points matrix and represent the vertices of each triangle. The fourth row is a domain number useful for identifying separate parts of an array. This value sets the 'Triangles' property in the custom array mesh.

Example: `load planarmesh.mat; c = customArrayMesh(p, t, 4)`. Creates a custom array mesh from the triangles, t, extracted from the `planarmesh.mat` file.

Data Types: double

#### **numfeeds — Number of feeding points in array**

2 (default) | scalar

Number of feeding points in array, specified as a scalar. By default, the number of feed points are 2.

Example: `load planarmesh.mat; c = customArrayMesh(p, t, 4)`. Creates a custom array mesh requiring 4 feed points.

Data Types: double

## Properties

### **Points — Points in custom mesh**

2-by- $N$  or 3-by- $N$  matrix of Cartesian coordinates

Points in a custom mesh, specified as a 2-by- $N$  or 3-by- $N$  matrix of Cartesian coordinates in meters.  $N$  is the number of points.

Data Types: double

### **Triangles — Triangles in mesh**

4-by- $M$  matrix

Triangles in the mesh, specified as a 4-by- $M$  matrix.  $M$  is the number of triangles.

Data Types: double

### **'NumFeeds' — Number of feeding points**

scalar

Number of feeding points in the array, specified as a scalar.

Data Types: double

### **FeedLocation — Feed location of array**

Cartesian coordinates

Feed locations of array, specified as Cartesian coordinates in meters. Feed location is a read-only property. To create a feed for the 2-D custom mesh, use the `createFeed` method.

Data Types: double

### **AmplitudeTaper — Excitation amplitude of antenna elements**

1 (default) | scalar | non-negative vector

Excitation amplitude of antenna elements, specified as a scalar or a non-negative vector.  
Set the property value to 0 to model dead elements.

Example: 'AmplitudeTaper',3

Data Types: double

### **PhaseShift — Phase shift for antenna elements**

0 (default) | scalar | real vector

Phase shift for antenna elements, specified as a scalar or a real vector in degrees.

Example: 'PhaseShift',[3 3 0 0]. Creates a custom array mesh of four antennas with phase shifts specified.

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
createFeed	Create feed locations for custom array
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
correlation	Correlation coefficient between two antennas in array
current	Current distribution on metal or dielectric antenna or array surface
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object

## Examples

## Custom Array Mesh Impedance.

Load a custom mesh and create an array.

```
load planarmesh.mat;
c = customArrayMesh(p,t,2);
```

Create feeds for the custom array mesh.

```
createFeed(c,[0.07,0.01],[0.05,0.05], [-0.07,0.01],[-0.05,0.05])
```

Calculate the impedance of the array.

```
Z = impedance(c,1e9)
Z =
48.9912 -19.0104i 44.6252 -20.2045i
```

## customArrayGeometry

Create array represented by 2-D custom geometry

### Description

The `customArrayGeometry` object is an array represented by a 2-D custom geometry on the X-Y plane. You can use the `customArrayGeometry` to import a 2D custom geometry, define feeds to create an array element, and analyze the custom array.

### Creation

### Syntax

```
cg = customArrayGeometry  
ca = customArrayGeometry(Name,Value)
```

### Description

`cg = customArrayGeometry` creates a custom array represented by 2-D geometry on the X-Y plane, based on the specified boundary.

`ca = customArrayGeometry(Name,Value)` creates a 2-D array geometry, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. Properties not specified retain their default values.

### Properties

**Boundary — Boundary information in Cartesian coordinates**  
cell array

Boundary information in Cartesian coordinates, specified as a cell array in meters.

Data Types: double

**Operation — Boolean operation performed on boundary list**

'P1' (default) | character vector

Boolean operation performed on the boundary list, specified as a character vector. operation set is; [+,-,\*].

Example: 'Operation', 'P1-P2'

Data Types: double

**FeedLocation — Array element feed location in Cartesian coordinates**

[0 0 0] (default) | three-element vector

Array element feed location in Cartesian coordinates, specified as a three-element vector. The three elements represent the X, Y, and Z coordinates respectively.

Example: 'FeedLocation', [0 0.2 0]

Data Types: double

**FeedWidth — Width of feed for array elements**

0.0100 (default) | scalar

Width of feed for array elements, specified as a scalar in meters.

Example: 'FeedWidth', 0.05

Data Types: double

**AmplitudeTaper — Excitation amplitude for array elements**

1 (default) | non-negative scalar | vector of non-negative scalars

Excitation amplitude for array elements, specified as a non-negative scalar or vector of non-negative scalars. Set property value to 0 to model dead elements.

Example: 'AmplitudeTaper', 3

Data Types: double

**PhaseShift — Phase shift for array elements**

0 (default) | real scalar | real vector

Phase shift for array elements, specified as a real scalar in degrees or a real vector in degrees.

Example: 'PhaseShift',[3 3 0 0] specified the phase shift for custom array containing four elements.

Data Types: double

### **Tilt — Tilt angle of array**

0 (default) | scalar | vector

Tilt angle of array, specified as a scalar or vector with each element unit in degrees.

Example: 'Tilt', 90

Example: 'Tilt', [90 90 0]

Data Types: double

### **TiltAxis — Tilt axis of array**

[1 0 0] (default) | three-element vector of Cartesian coordinates | two three-element vectors of Cartesian coordinates | 'X' | 'Y' | 'Z'

Tilt axis of the array, specified as:

- A three-element vector of Cartesian coordinates in meters. In this case, each vector starts at the origin and lies along the specified points on the X, Y, and Z axes.
- Two points in space as three-element vectors of Cartesian coordinates. In this case, the antenna rotates along the line joining the two points.
- A string input for simple rotations around the principal planes, X, Y, or Z.

For more information see, “Rotate Antenna and Arrays”

Example: 'TiltAxis',[0 1 0]

Example: 'TiltAxis',[0 0 0;0 1 0]

Example: 'TiltAxis','Z'

Data Types: double

## Object Functions

show	Display antenna or array structure; Display shape as filled patch
info	Display information about antenna or array
axialRatio	Axial ratio of antenna
beamwidth	Beamwidth of antenna
charge	Charge distribution on metal or dielectric antenna or array surface
current	Current distribution on metal or dielectric antenna or array surface
design	Design prototype antenna for resonance at specified frequency
EHfields	Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays
impedance	Input impedance of antenna; scan impedance of array
mesh	Mesh properties of metal or dielectric antenna or array structure
meshconfig	Change mesh mode of antenna structure
pattern	Radiation pattern of antenna or array; Embedded pattern of antenna element in array
patternAzimuth	Azimuth pattern of antenna or array
patternElevation	Elevation pattern of antenna or array
returnLoss	Return loss of antenna; scan return loss of array
sparameters	S-parameter object
show	Display antenna or array structure; Display shape as filled patch
vswr	Voltage standing wave ratio of antenna

## Examples

### Create Custom Slot Antenna Array

Create a custom array using `customArrayGeometry`. Visualize it and plot the impedance. Also, visualize the current distribution on the array.

Create a ground plane with a length of 0.6 m and a width of 0.5 m.

```
Lp = 0.6;
Wp = 0.5;
[~,p1] = em.internal.makeplate(Lp,Wp,2,'linear');
```

Create slots on the ground plane with a length 0.05 m and a width of 0.4 m.

```
Ls = 0.05;
Ws = 0.4;
```

```
offset = 0.12;
[~,p2] = em.internal.makeplate(Ls,Ws,2,'linear');
p3 = em.internal.translateshape(p2, [offset, 0, 0]);
p2 = em.internal.translateshape(p2, [-offset, 0, 0]);
```

Create a feed in between the slots on the ground plane.

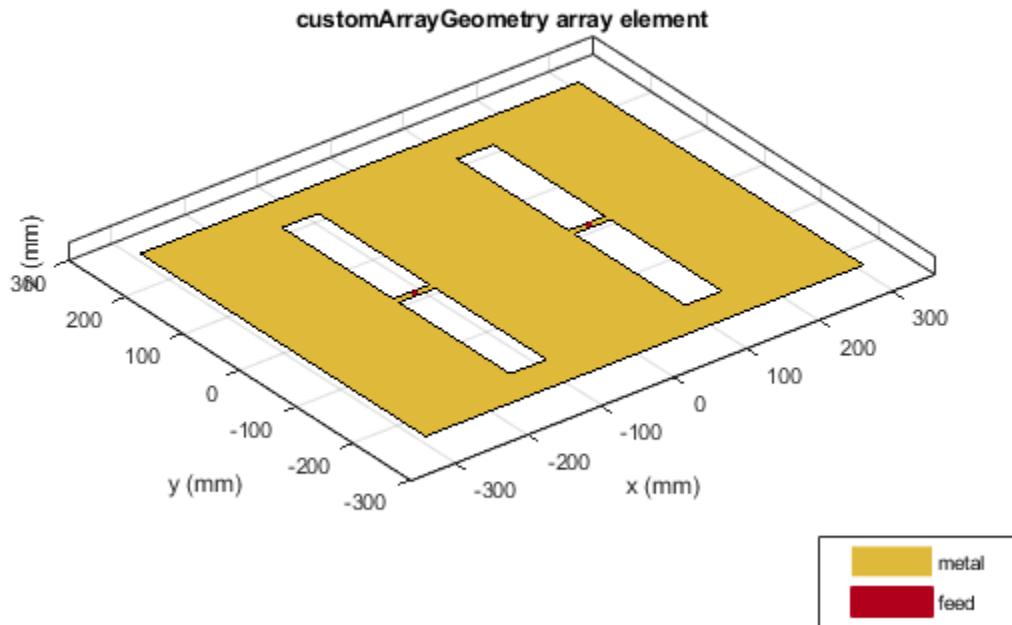

```
Wf = 0.01;
[~,p4] = em.internal.makeplate(Ls,Wf,2,'linear');
p5 = em.internal.translateshape(p4, [offset, 0, 0]);
p4 = em.internal.translateshape(p4, [-offset, 0, 0]);
```

Create an array using the slotted ground plane.

```
carray = customArrayGeometry;
carray.Boundary = {p1', p2', p3', p4', p5'};
carray.Operation= 'P1-P2-P3+P4+P5';
carray.NumFeeds = 2;
carray.FeedWidth= [0.01 0.01];
carray.FeedLocation = [-offset,0,0 ; offset,0,0];
```

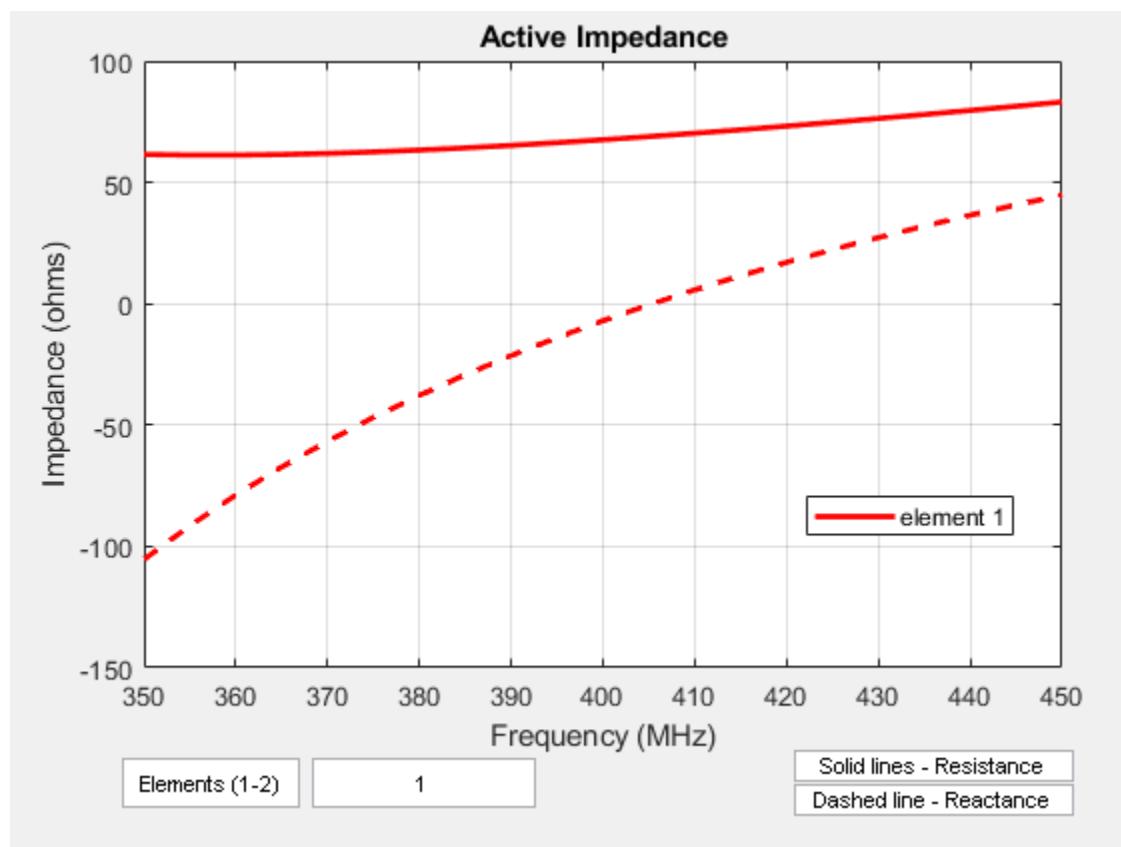

Visulaize the array.

```
figure; show(carray);
```

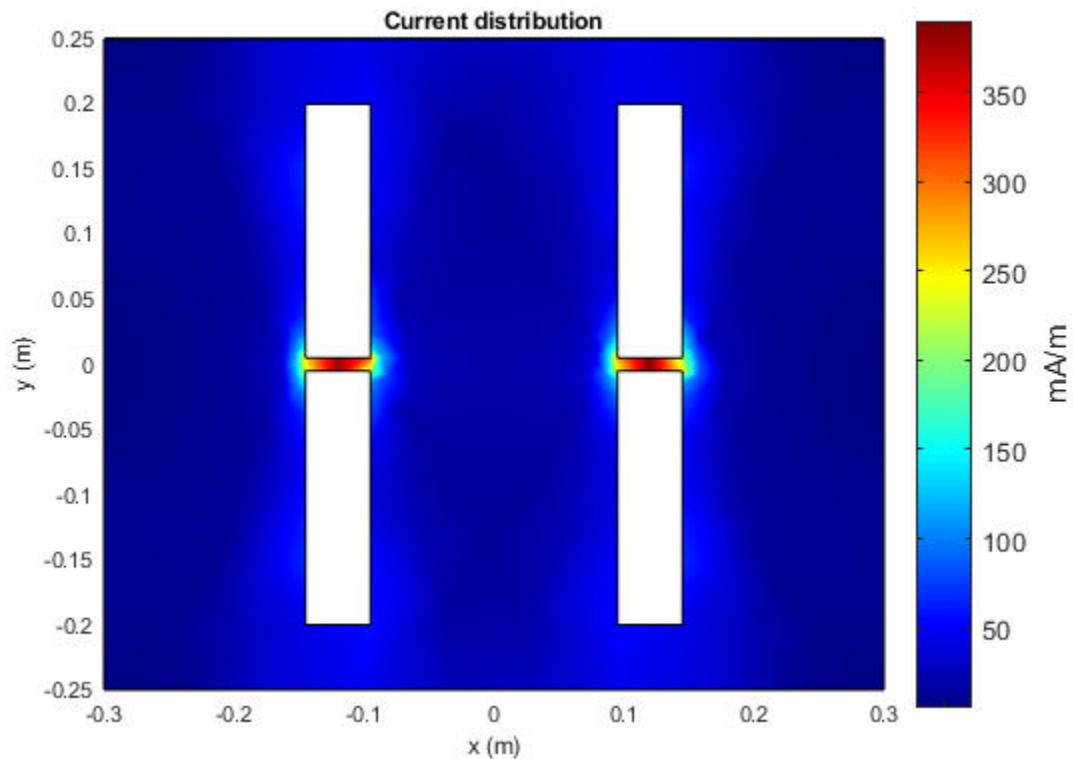

Calculate the impedance of the array using the frequency range of 350 MHz to 450 MHz.

```
figure; impedance(carray, 350e6:5e6:450e6);
```

Visualize the current distribution on the array at 410 MHz.

```
figure; current(carray, 410e6);
```

## createFeed

Create feed locations for custom array

### Syntax

```
createFeed(array)  
createFeed(array,point1a,point1b,point2a,point2b,.....)
```

### Description

$\vec{f}_1$  = FeedLocation1

$\vec{f}_2$  = FeedLocation2

`createFeed(array)` plots a custom array mesh in a figure window. From the figure window, you can specify feed locations by clicking on the mesh and create a custom array. To specify a region for the feed point, select two pairs of points, inside triangles on either side of the air gap.

`createFeed(array,point1a,point1b,point2a,point2b,...)` creates the feed across the triangle edges identified by pairs of points (`point1a` and `point1b`, `point2a`, and `point2b`). After creating the feed, feed location is highlighted when you plot the resulting array mesh.

## Input Arguments

### **array — Custom array mesh**

scalar handle

Custom mesh array, specified as a scalar handle.

### **point1a,point1b — Point pairs to identify feed region**

Cartesian coordinates in meters

Point pairs to identify feed region, specified as Cartesian coordinates in meters. Specify the points in the format  $[x_1, y_1]$ ,  $[x_2, y_2]$ .

Example: `createFeed(c, [0.07, 0.01], [0.05, 0.05], [-0.07, 0.01], [-0.05, 0.05])`. Creates two pairs of feedpoints for a custom array mesh at the x-y coordinates specified.

## Examples

### Two-Feed Custom Array Mesh Using GUI

Create a custom array with two feeds.

Load a 2-D custom mesh. Create a custom array using the points and triangles.

```
load planarmesh.mat;
c = customArrayMesh(p,t,2);

c =
    customArrayMesh with properties:
```

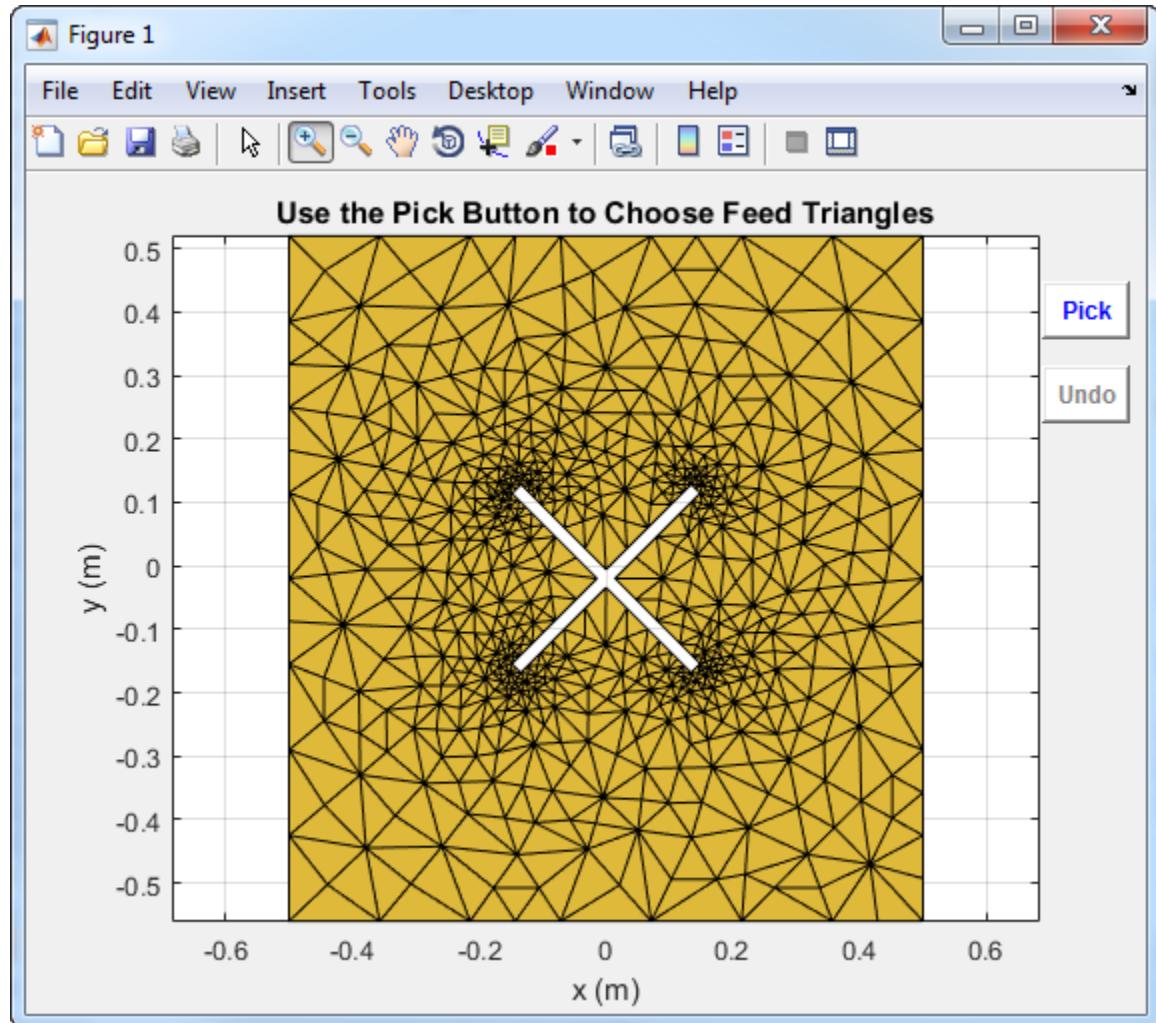

## 5 Methods — Alphabetical List

---

```
    Points: [3x658 double]
    Triangles: [4x1219 double]
    NumFeeds: 2
    FeedLocation: []
    AmplitudeTaper: 1
    PhaseShift: 0
    Tilt: 0
    TiltAxis: [1 0 0]
```

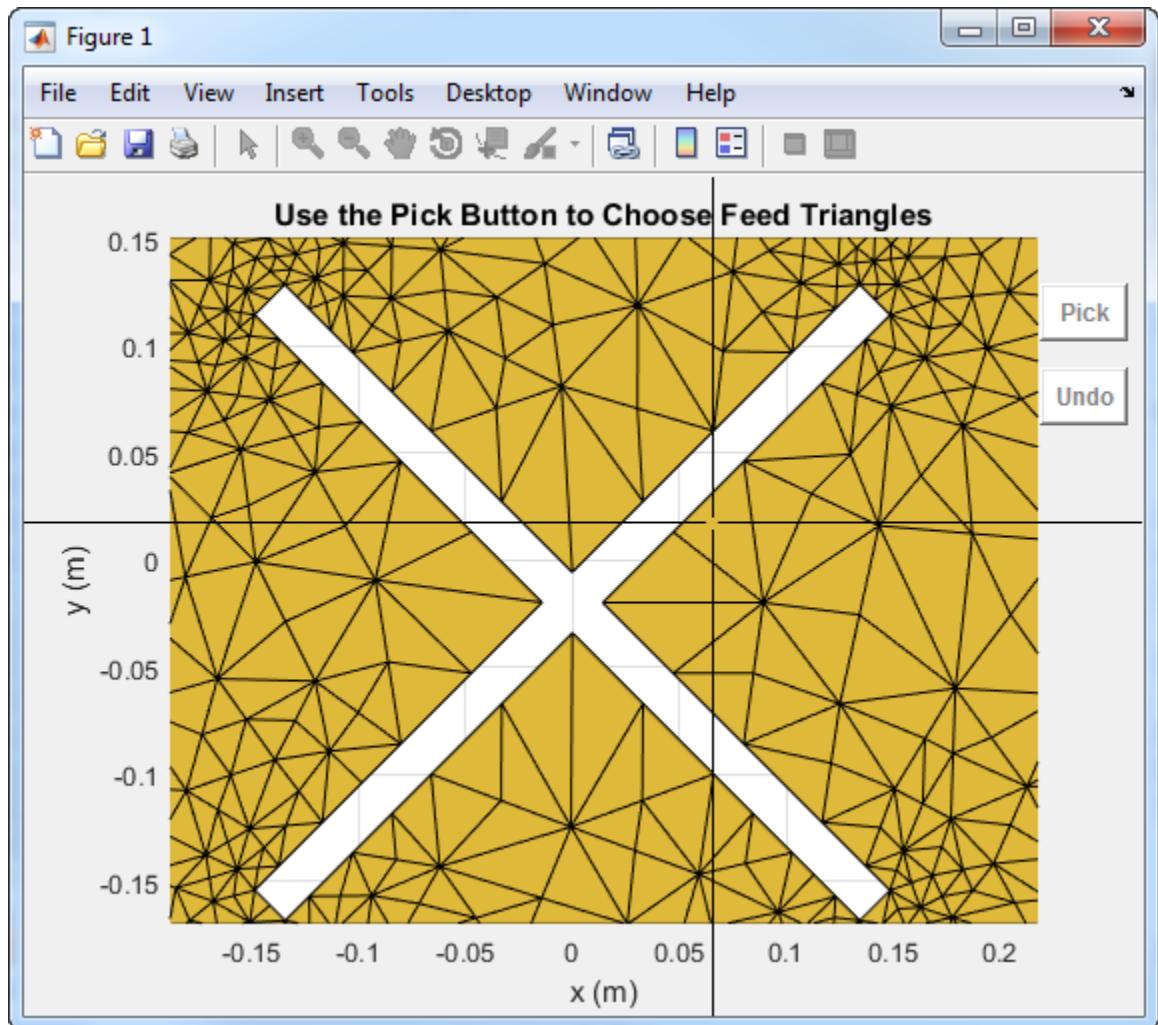

Use the `createFeed` function to view the array mesh structure. In this array mesh view, you see **Pick** and **Undo** buttons. The **Pick** button is highlighted.

```
createFeed(c)
```

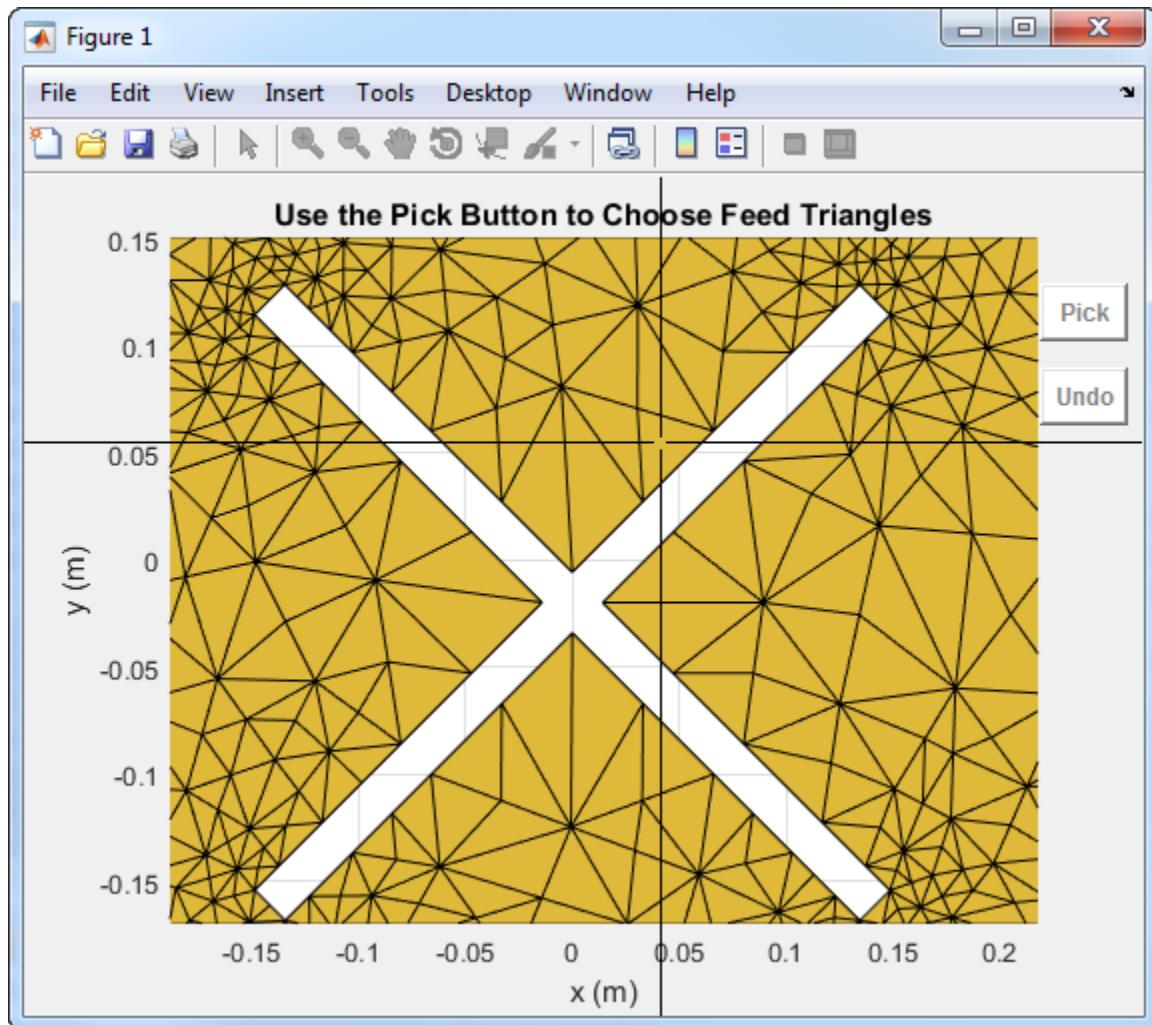

Click **Pick** to display the cross hairs. For an array with two feeds, select two pairs (four points) in the mesh. To specify a feed-region for the, zoom in and select two points each, one inside each triangle on either side of the air gap. Select the points using the cross hairs.

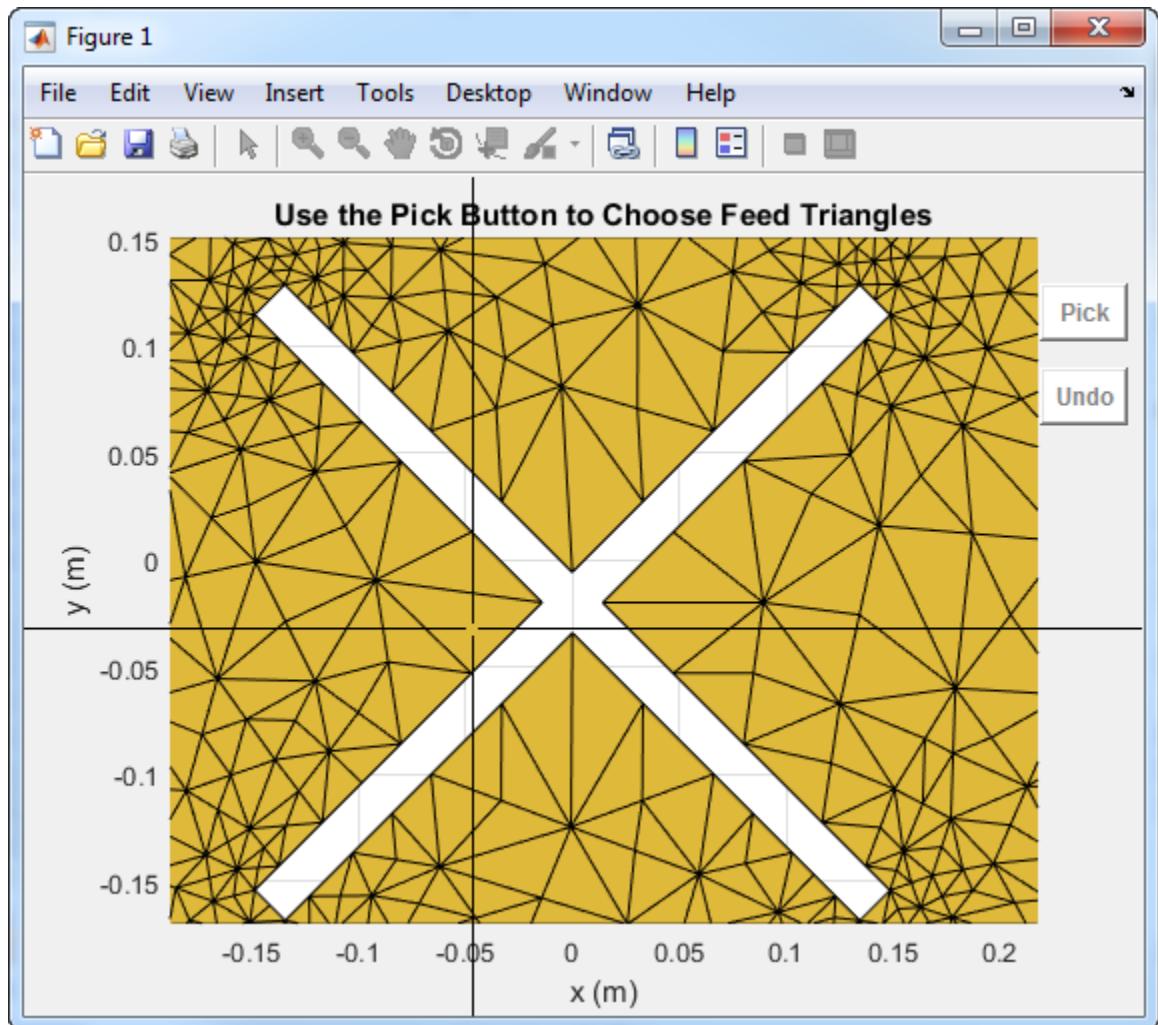

- Select the first triangle for feedpoint 1.

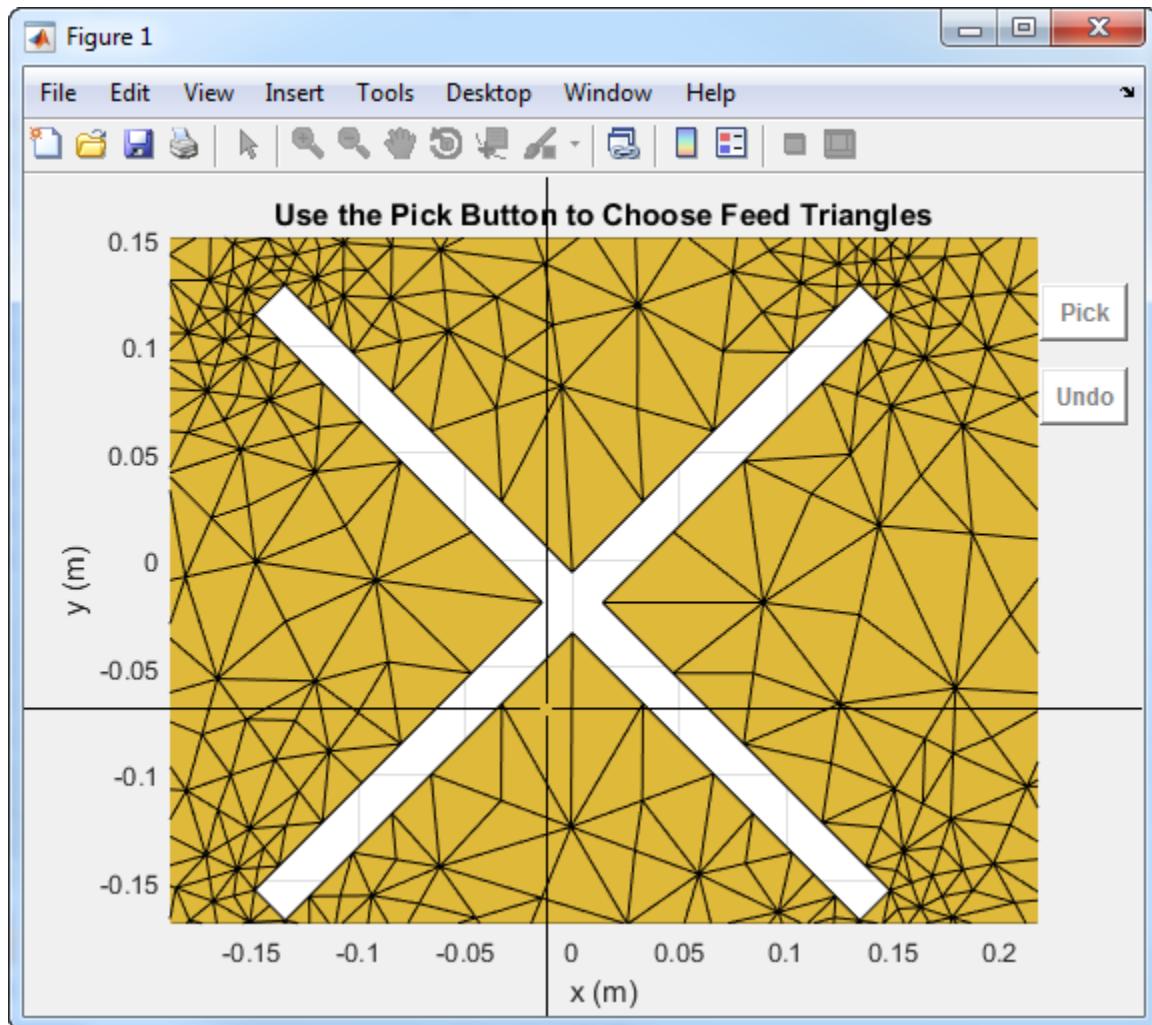

- Select the second triangle on the other side of the air gap for feedpoint 1.

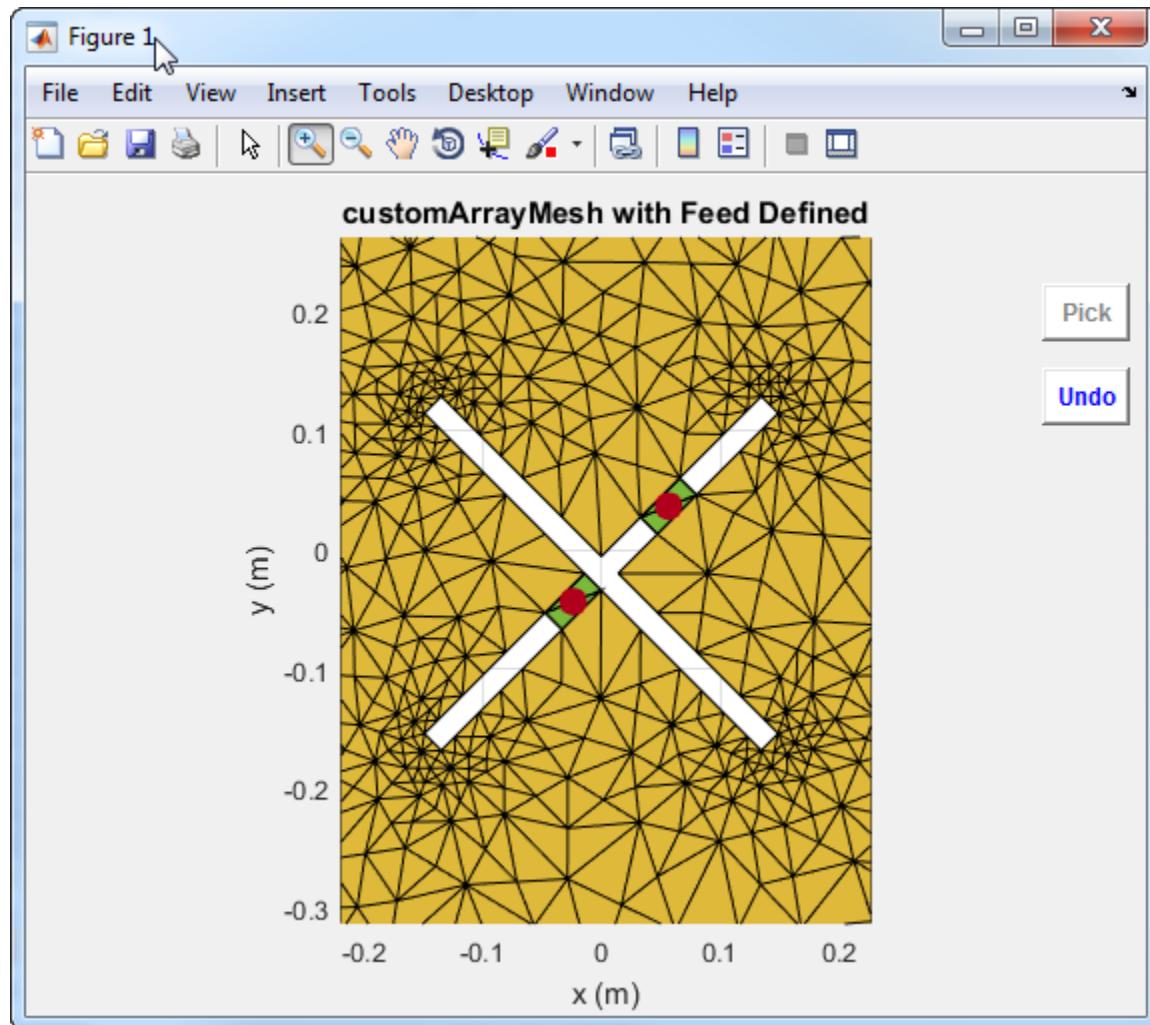

- Select first triangle for feedpoint 2.

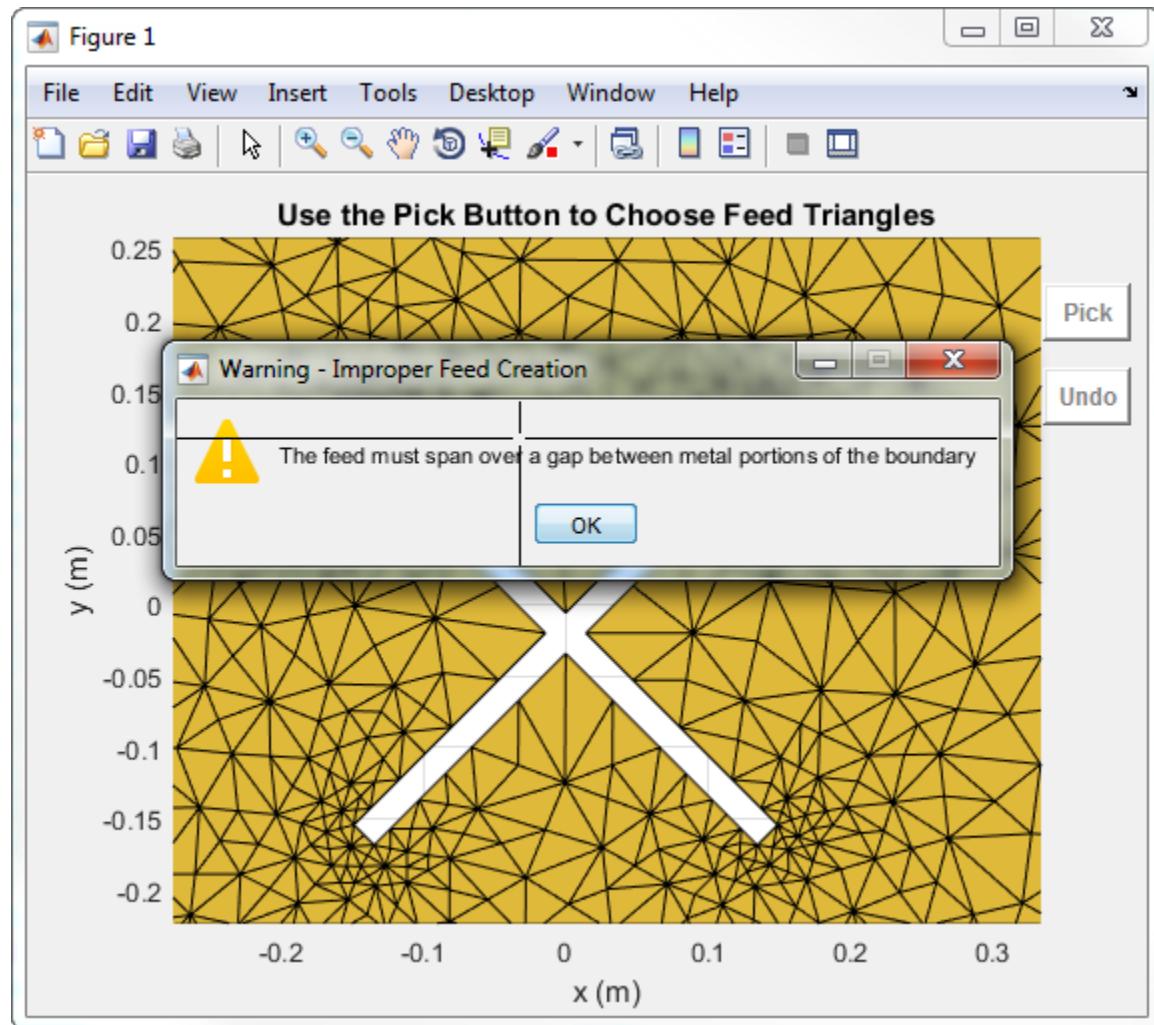

- Select the second triangle on the other side of the air gap for feedpoint 2.

Selecting the fourth triangle creates and displays the array feeds.

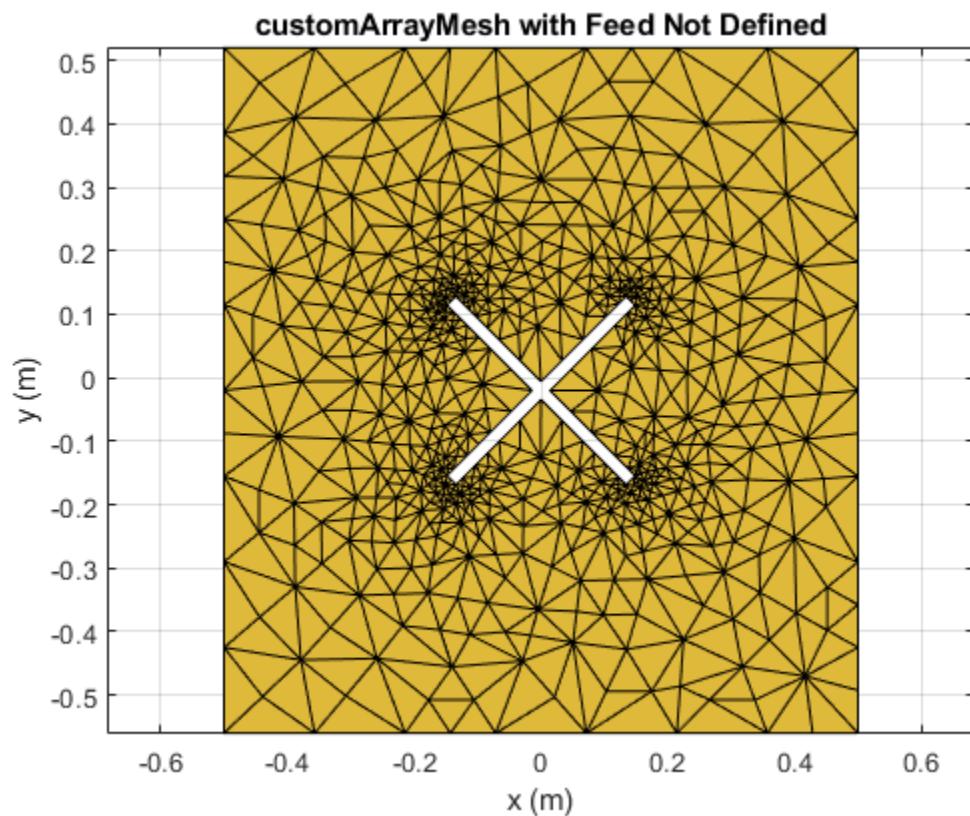

You must select the two triangles on either side of the air gap. Otherwise, the function displays an error message.

## Create Feed for Custom Array Mesh

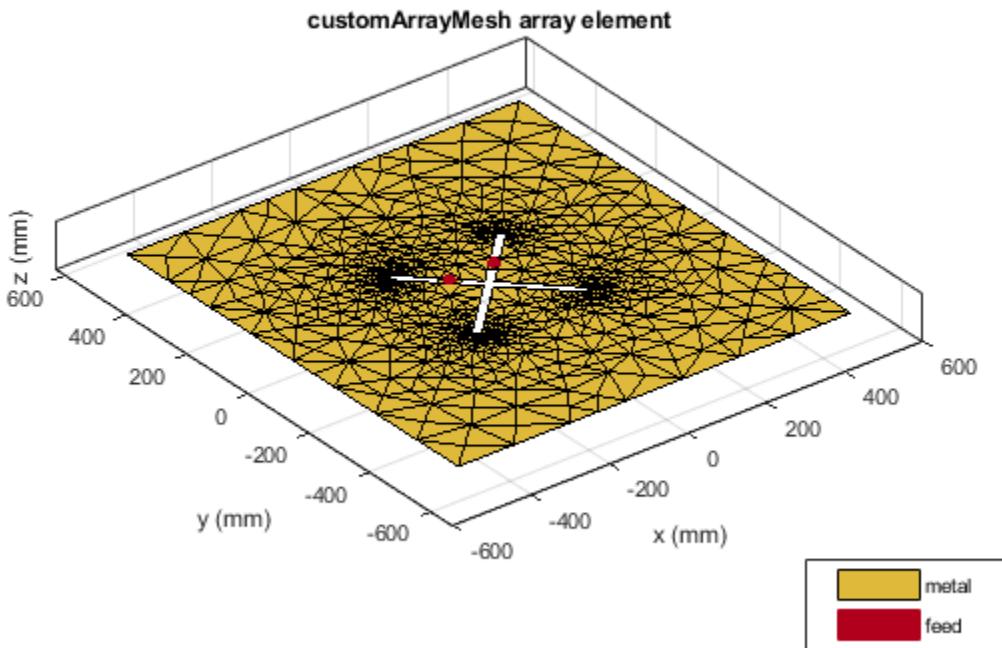

Load a custom mesh and create an array.

```
load planarmesh.mat;
c = customArrayMesh(p, t, 2);
show(c)
```

Create feeds for the custom array mesh.

```
createFeed(c, [0.07,0.01], [0.05,0.05], [-0.07,0.01], [-0.05,0.05]);  
show(c)
```

## See Also

`returnLoss` | `sparameters`

Introduced in R2016a

## impedance

Input impedance of antenna; scan impedance of array

### Syntax

```
impedance(antenna,frequency)
z = impedance(antenna,frequency)

impedance(array,frequency,elementnumber)
z = impedance(array,frequency,elementnumber)
```

### Description

`impedance(antenna,frequency)` calculates the input impedance of an antenna object and plots the resistance and reactance over a specified frequency.

`z = impedance(antenna,frequency)` returns the impedance of the antenna object, over a specified frequency.

`impedance(array,frequency,elementnumber)` calculates and plots the scan impedance of a specified antenna element in an array.

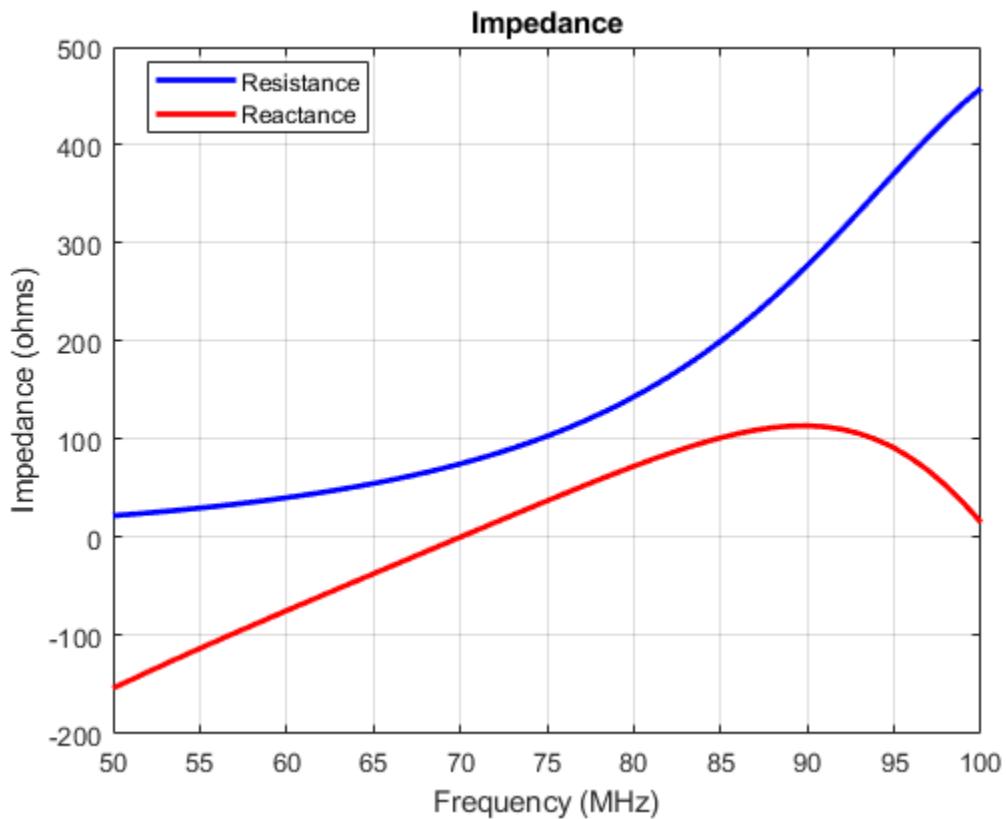

`z = impedance(array,frequency,elementnumber)` returns the scan impedance of a specified antenna element in an array.

### Examples

#### Calculate and Plot Impedance of Antenna

Calculate and plot the impedance of a planar dipole antenna over a frequency range of 50MHz - 100MHz.

```
h = dipole;
impedance (h,50e6:1e6:100e6);
```

### Calculate Scan Impedance of Array

Calculate scan impedance of default linear array over a frequency range of 50MHz to 100MHz.

```
h = linearArray;
z = impedance(h,50e6:1e6:100e6)

z =
    1.0e+02 *
```

4.6313 + 2.2153i	4.6313 + 2.2153i

## Input Arguments

**antenna — Antenna or array object**

scalar handle

Antenna object, specified as a scalar handle.

**array — Array object**

scalar handle

Array object, specified as a scalar handle.

**frequency — Frequency range used to calculate impedance**

vector in Hz

Frequency range to calculate impedance, specified as a vector in Hz.

Example: 50e6:1e6:100e6

Data Types: double

**elementnumber — Antenna element number in array**

scalar

Antenna element number in array, specified as a scalar.

Example: 1

Data Types: double

## Output Arguments

***z* — Input impedance of antenna or scan impedance of array**  
complex number in ohms

Input impedance of antenna or scan impedance of array, returned as a complex number in ohms. The real part of the complex number indicates the resistance. The imaginary part of the complex number indicates the reactance.

`returnLoss`

Introduced in R2015a

# sparameters

S-parameter object

## Syntax

```
sobj = sparameters(antenna, freq, z0)  
sobj = sparameters(array, freq, z0)
```

## Description

`sobj = sparameters(antenna, freq, z0)` calculates the complex s-parameters for an antenna object over specified frequency values and for a given reference impedance,  $z_0$ .

`sobj = sparameters(array, freq, z0)` calculates the complex s-parameters for an array object over specified frequency values and for a given reference impedance,  $z_0$ .

## Examples

### Calculate S-Parameter Matrix For Antenna

Calculate the complex s-parameters for a default dipole at 70MHz frequency.

```
h = dipole  
  
h =  
dipole with properties:  
  
    Length: 2  
    Width: 0.1000  
    FeedOffset: 0  
    Tilt: 0  
    TiltAxis: [1 0 0]  
    Load: [1x1 lumpedElement]
```

```
sparameters (h, 70e6)

ans =
sparameters: S-parameters object

    NumPorts: 1
    Frequencies: 70000000
    Parameters: 0.2001 + 0.0037i
    Impedance: 50

rfparam(obj,i,j) returns S-parameter Sij
```

### Calculate S-parameter Matrix For Array

Calculate the complex s-parameters for a default rectangular array at 70MHz frequency.

```
h = rectangularArray;
sparameters(h,70e6)

ans =
sparameters: S-parameters object

    NumPorts: 4
    Frequencies: 70000000
    Parameters: [4x4 double]
    Impedance: 50

rfparam(obj,i,j) returns S-parameter Sij
```

## Input Arguments

### **antenna — antenna object**

scalar handle

Antenna object, specified as a scalar handle.

**array — array object**

scalar handle

Array object, specified as a scalar handle.

**freq — S-parameter frequencies**

vector of positive real numbers

S-parameter frequencies, specified as a vector of positive real numbers, sorted from smallest to largest.

**z0 — Reference impedance**

50 (default) | positive real scalar

Reference impedance in ohms, specified as a positive real scalar. You cannot specify `z0` if you are importing data from a file. The argument `Z0` is optional and is stored in the `Impedance` property.

When making a deep copy of an S-parameter object, this input argument is not supported. To change the reference impedance of an S-parameters object, use `newref`.

## Output Arguments

**sobj — S-parameter data**

scalar handle

S-parameter data, returned as a scalar handle. `disp(hs)` returns the properties of the object:

- `NumPorts` — Number of ports, specified as an integer. The function calculates this value automatically when you create the object.
- `Frequencies` — S-parameter frequencies, specified as a  $K$ -by-1 vector of positive real numbers sorted from smallest to largest. The function sets this property from the `filename` or `freq` input arguments.
- `Parameters` — S-parameter data, specified as an  $N$ -by- $N$ -by- $K$  array of complex numbers. The function sets this property from the `filename` or `data` input arguments.

- `Impedance` — Reference impedance in ohms, specified as a positive real scalar. The function sets this property from the `filename` or `Z0` input arguments. If no reference impedance is provided, the function uses a default value of 50.

# rfparam

Extract vector of network parameters

## Syntax

```
n_ij = rfparam(hnet,i,j)
abcd_vector = rfparam(habcd,abcdflag)
```

## Description

`n_ij = rfparam(hnet,i,j)` extracts the network parameter vector ( $i,j$ ) from the network parameter object, `hnet`.

`abcd_vector = rfparam(habcd,abcdflag)` extracts the  $A$ ,  $B$ ,  $C$ , or  $D$  vector from ABCD-parameter object, `habcd`.

## Examples

### Create Data Vector From S-Parameter Object

Read in the file `default.s2p` into an `sparameters` object and get the  $S_{21}$  value.

```
S = sparameters('default.s2p');
s21 = rfparam(S,2,1)
```

```
s21 =
-0.6857 + 1.7827i
-0.6560 + 1.7980i
-0.6262 + 1.8131i
-0.5963 + 1.8278i
-0.5664 + 1.8422i

## Input Arguments

**abcdflag — ABCD-parameter index**

'A' | 'B' | 'C' | 'D'

Flag that determines which ABCD parameters the function extracts, specified as 'A', 'B', 'C', or 'D'.

**habcd — 2-port ABCD parameters**

ABCD parameter object

2-port ABCD parameters, specified as an RF Toolbox™ ABCD parameter object. When you specify abcdflag, you must also specify an ABCD parameter object.

**hnet — Network parameters**

network parameter object

Network parameters, specified as an RF Toolbox network parameter object.

**i — Row index**

positive integer

Row index of data to extract, specified as a positive integer.

**j — Column index**

positive integer

Column index of data to extract, specified as a positive integer.

## Output Arguments

### **n\_ij — Network parameters ( $i, j$ )**

vector

Network parameters ( $i, j$ ), returned as a vector. The  $i$  and  $j$  input arguments determine which parameters the function returns.

Example: `S_21 = rfparam(hs, 2, 1)`

### **abcd\_vector — A, B, C, or D-parameters**

vector

$A, B, C$ , or  $D$ -parameters, returned as a vector. The `abcdflag` input argument determines which parameters the function returns. The function supports only 2-port ABCD parameters; thus, the output is always a vector.

Example: `a_vector = rfparam(habcd, 'A')`

## rfplot

Plot S-parameter data

### Syntax

```
rfplot(s_obj)
rfplot(s_obj,i,j)
rfplot(___,lineSpec)
rfplot(___,plotflag)
hline = rfplot(___)
```

### Description

`rfplot(s_obj)` plots the magnitude in dB versus frequency of all S-parameters ( $S_{11}$ ,  $S_{12} \dots S_{NN}$ ) on the current axis. `s_obj` must be an s-parameter object.

`rfplot(s_obj,i,j)` plots the magnitude of  $S_{i,j}$ , in decibels, versus frequency on the current axis.

`rfplot(___,lineSpec)` plots S-parameters using optional line types, symbols, and colors specified by `linespec`.

`rfplot(___,plotflag)` allows to specify the type of plot by using the `plotflag`.

`hline = rfplot(___)` plots the S-parameters and returns the column vector of handles to the line objects, `hline`.

### Examples

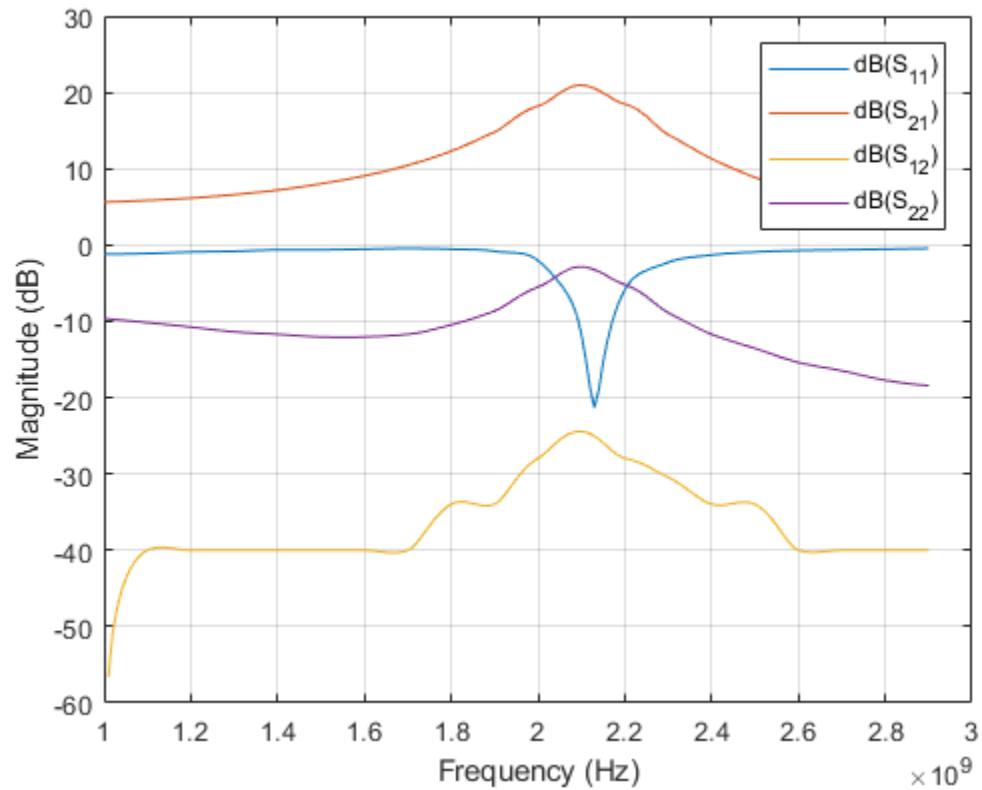

#### Plot S-Parameter Data Using rfplot

##### Create S-parameter

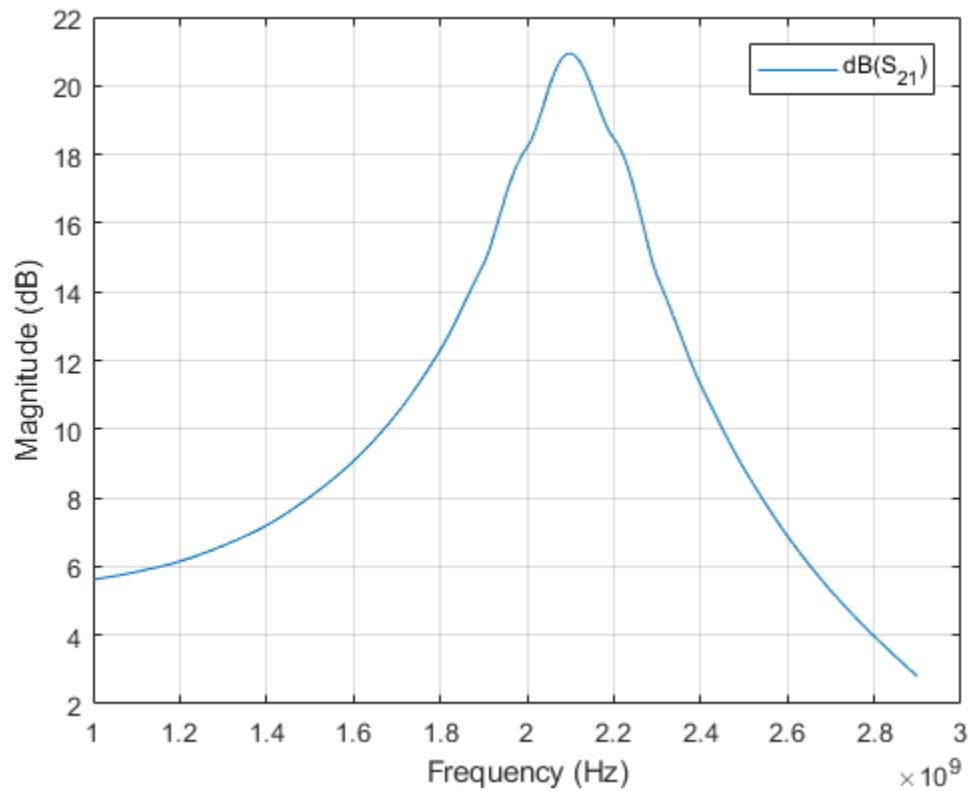

```
hs = sparameters('default.s2p');
```

**Plot all S-parameters**

```
figure;  
rfplot(hs)
```

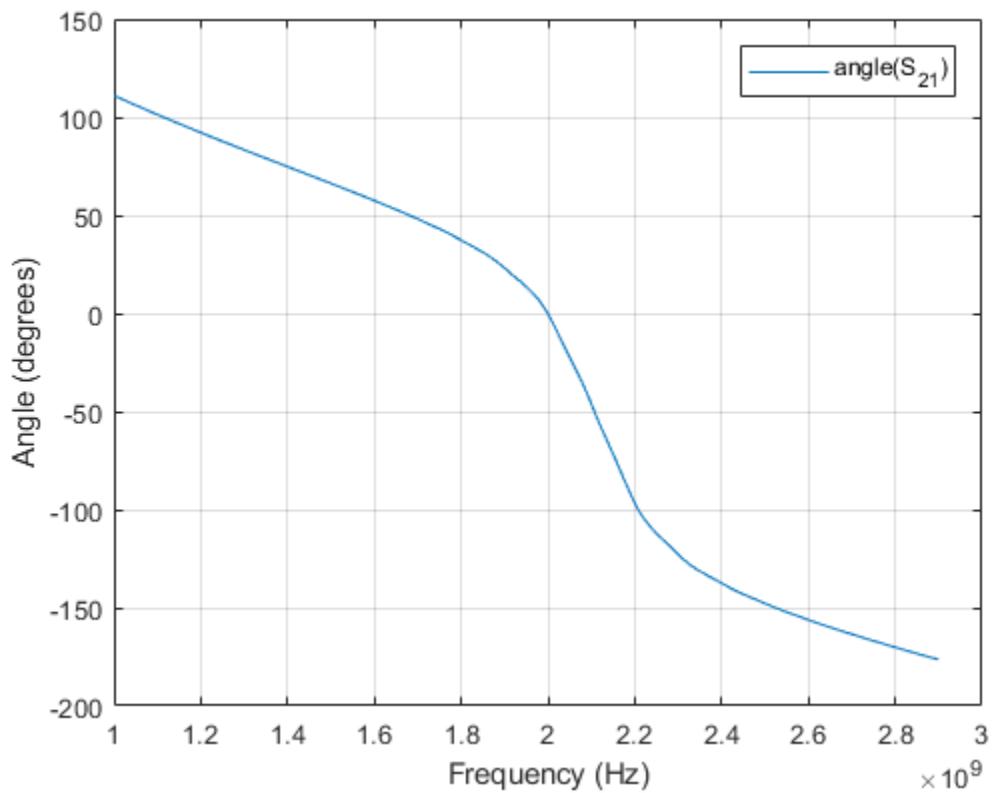

**Plot S21**

```
figure;  
rfplot(hs,2,1)
```

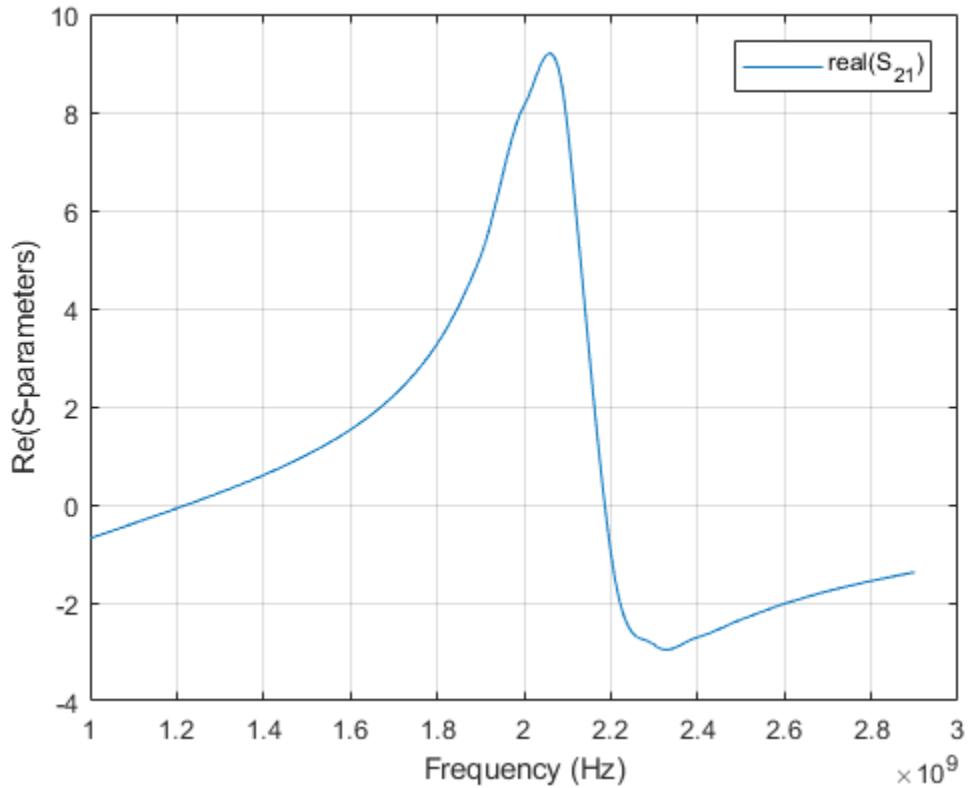

**Plot the angle of S21 in degrees**

```
rfplot(hs,2,1,'angle')
```

Plot the real part of S21

```
rfplot(hs,2,1,'real')
```

## Input Arguments

**s\_obj — S-parameters**

network parameter object

S-parameters, specified as an RF Toolbox network parameter object. To create this type of object, use the `sparameters` function.

**i — Row index**

positive integer

Row index of data to plot, specified as a positive integer.

**j — Column index**

positive integer

Column index of data to plot, specified as a positive integer.

**lineSpec — Line specification**

character array

Line specification, specified as a text input, that modifies the line types, symbols, and colors of the plot. The function takes text inputs in the same format as `plot` command. For more information on line specification values, see `linespec`.

Example: '`-or`'

**plotflag — Plot types**

'`db`' (default)

Plot types, specified as the following values: '`db`', '`real`', '`imag`', '`abs`', '`angle`'.

Example: '`angle`'

## Output Arguments

**hline — Line**

line handle

Line containing the S-parameter plot, returned as a line handle.

`sparameters`

**Introduced before R2006a**

# show

Display antenna or array structure; Display shape as filled patch

## Syntax

```
show(object)
```

```
show(shape)
```

## Description

`show(object)` displays the structure of an antenna or array object.

`show(shape)` displays shape as filled region using patches.

## Examples

### Display Antenna Structure

This example shows how to create a vivaldi antenna and display the antenna structure.

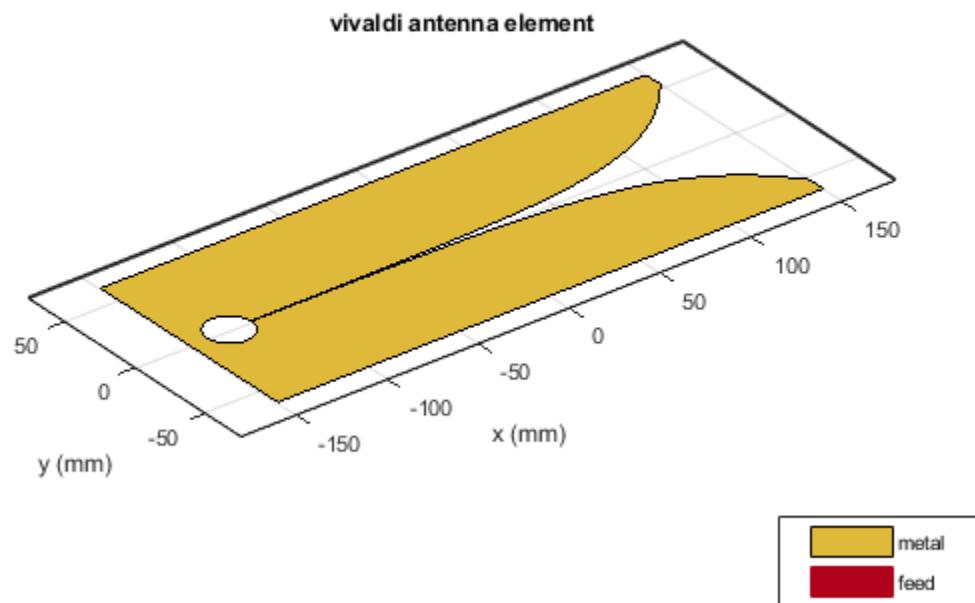

```
h = vivaldi

h =
    vivaldi with properties:

        TaperLength: 0.2430
        ApertureWidth: 0.1050
        OpeningRate: 25
        SlotLineWidth: 5.0000e-04
        CavityDiameter: 0.0240
        CavityToTaperSpacing: 0.0230
        GroundPlaneLength: 0.3000
        GroundPlaneWidth: 0.1250
        FeedOffset: -0.1045
```

```
Tilt: 0  
TiltAxis: [1 0 0]  
Load: [1x1 lumpedElement]
```

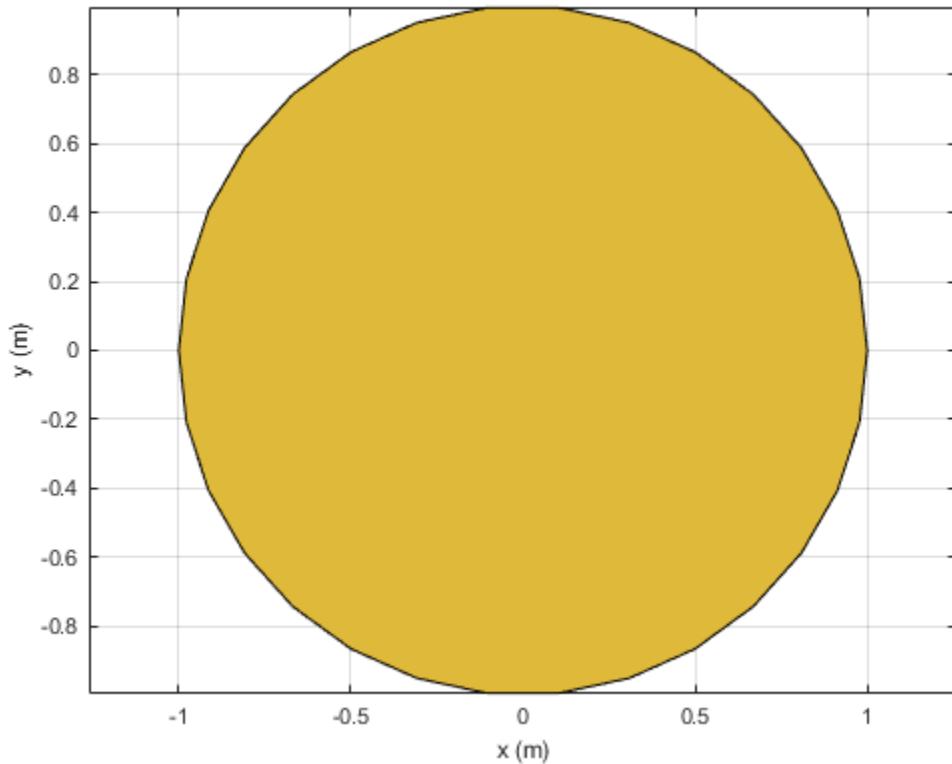

```
show(h)
```

### Show Circle Shape

Create a circular shape and visualize the filled regions.

```
c = antenna.Circle;
show(c);
```

## Input Arguments

**object** — Antenna or array object

scalar handle

Antenna or array object, specified as a scalar handle.

**shape** — Shape created using custom elements and shape objects

object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle. You can create the shapes using `antenna.Circle`, `antenna.Polygon`, or `antenna.Rectangle`.

Example: `c = antenna.Rectangle; show(c)`

# returnLoss

Return loss of antenna; scan return loss of array

## Syntax

```
returnLoss(antenna,frequency,z0)
rl = returnLoss(antenna ,frequency, z0)

returnLoss(array,frequency,elementnumber)
rl = returnLoss(array,frequency,elementnumber)
```

## Description

`returnLoss(antenna,frequency,z0)` calculates and plots the return loss of an antenna, over a specified frequency and a given reference impedance,  $z_0$ .

`rl = returnLoss(antenna ,frequency, z0)` returns the return loss of an antenna.

`returnLoss(array,frequency,elementnumber)` calculates and plots the scan return loss of a specified antenna element in an array.

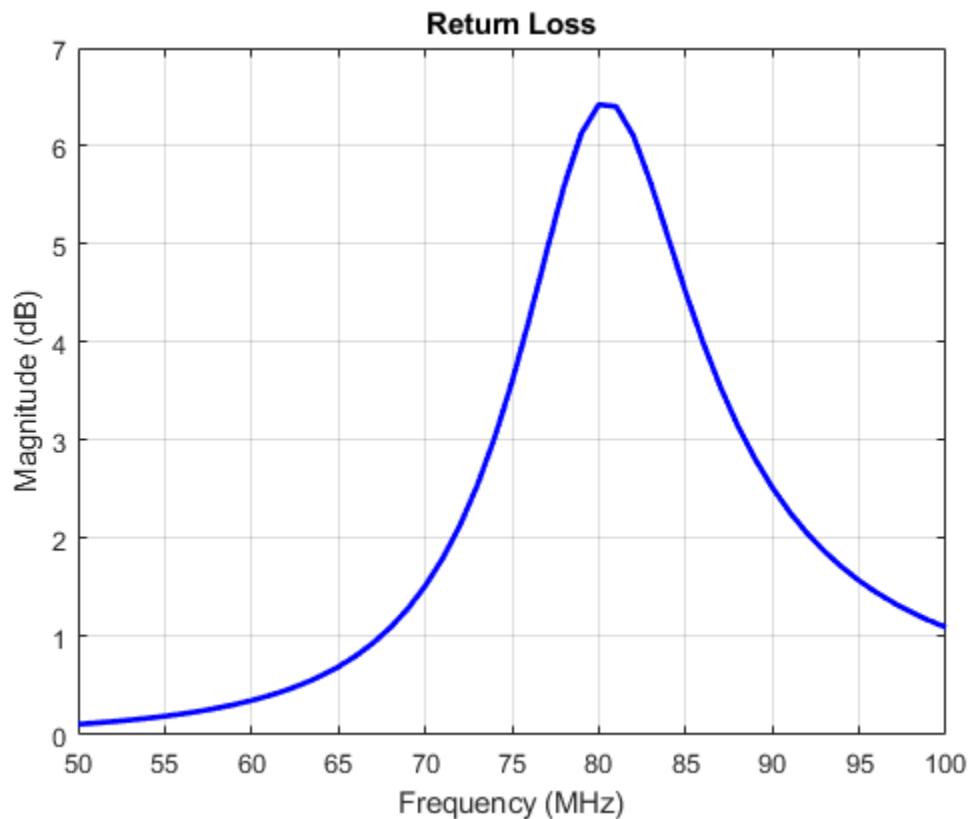

`rl = returnLoss(array,frequency,elementnumber)` returns the scan return loss of a specified antenna element in an array.

## Examples

### Calculate and Plot Return Loss of Antenna

This example shows how to calculate and plot the return loss of a circular loop antenna over a frequency range of 50MHz-100MHz.

```
h = loopCircular;
returnLoss (h, 50e6:1e6:100e6);
```

## Input Arguments

**antenna — Antenna object**

scalar handle

Antenna object, specified as a scalar handle.

**array — array object**

scalar handle

Array object, specified as a scalar handle.

**frequency** — Frequency range used to calculate return loss  
vector in Hz

Frequency range used to calculate return loss, specified as a vector in Hz.

Example: 50e6:1e6:100e6

Data Types: double

**z0** — Reference impedance

50 (default) | scalar in ohms

Reference impedance, specified as a scalar in ohms.

Example: 40

Data Types: double

**elementnumber** — Antenna element number in array

scalar

Antenna element number in array, specified as a scalar.

Example: 1

Data Types: double

## Output Arguments

**r1** — Return loss of antenna object or scan return loss of array object  
vector in dB

Return loss of antenna object or scan return loss of array object, returned as a vector in dB. The return loss is calculated using the formula

$$RL = 20 \log_{10} \left| \frac{(Z - Z_0)}{(Z + Z_0)} \right|$$

where,

- $Z$  = input impedance of antenna or scan impedance of array
- $Z_0$  = reference impedance

## See Also

**Introduced in R2015a**

## pattern

Radiation pattern of antenna or array; Embedded pattern of antenna element in array

### Syntax

```
pattern(object,frequency)
pattern(object,frequency,azimuth,elevation)
pattern(____,Name,Value)

[fieldval,azimuth,elevation] = pattern(object,frequency)
[pat,azimuth,elevation] = pattern(object,frequency,azimuth,
elevation)
[pat,azimuth,elevation] = pattern(____,Name,Value)
```

### Description

`pattern(object,frequency)` plots the 3-D radiation pattern of the antenna or array object over a specified frequency. By default, in Antenna Toolbox, the far-field radius is set to  $100\lambda$ .

`pattern(object,frequency,azimuth,elevation)` plots the radiation pattern of the antenna or array object using the specified azimuth and elevation angles.

`pattern(____,Name,Value)` uses additional options specified by one or more Name, Value pair arguments. You can use any of the input arguments from previous syntaxes.

Use the 'ElementNumber' and 'Termination' property to calculate the embedded pattern of the antenna element in an array connected to a voltage source. The voltage source model consists of an ideal voltage source of 1 volt in series with a source impedance. The embedded pattern includes the effect of mutual coupling due to the other antenna elements in the array.

`[fieldval,azimuth,elevation] = pattern(object,frequency)` returns the field value of an antenna or array object over a specified frequency. azimuth and elevation are the angles at which the pattern function calculates the directivity.

[pat,azimuth,elevation] = pattern(object,frequency,azimuth,elevation) returns the pattern value, pat, value of an antenna or array object at specified frequency. azimuth and elevation are the angles at which the pattern function calculates the directivity.

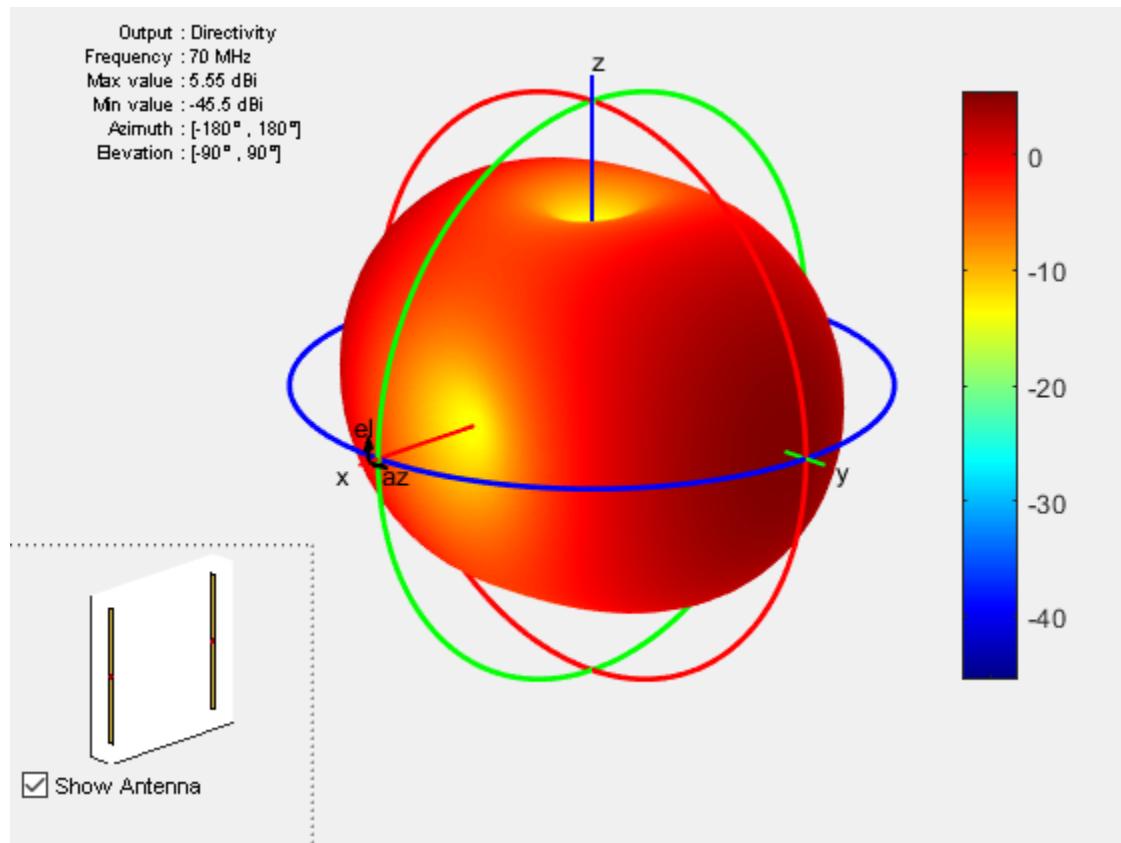

[pat,azimuth,elevation] = pattern(\_\_\_\_,Name,Value) uses additional options specified by one or more Name,Value pair arguments.

## Examples

### Calculate Radiation Pattern of Array

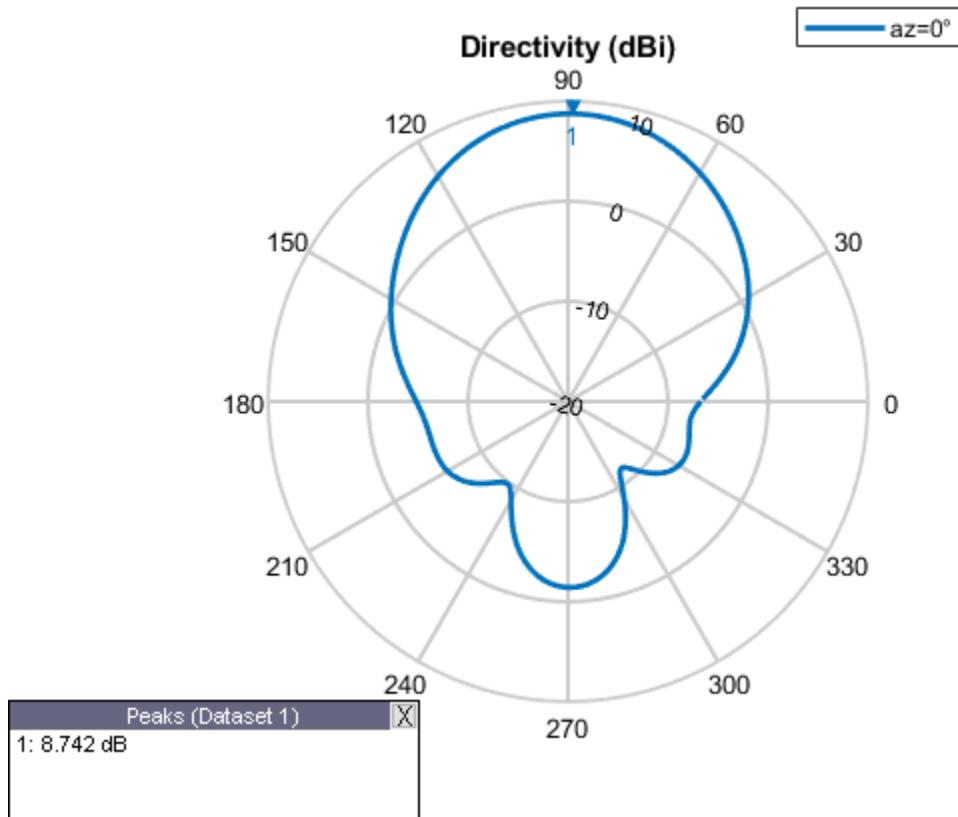

Calculate radiation pattern of default linear array for a frequency of 70 MHZ.

```
l = linearArray;
pattern(l,70e6)
```

Radiation Pattern of Helix in X-Z Plane

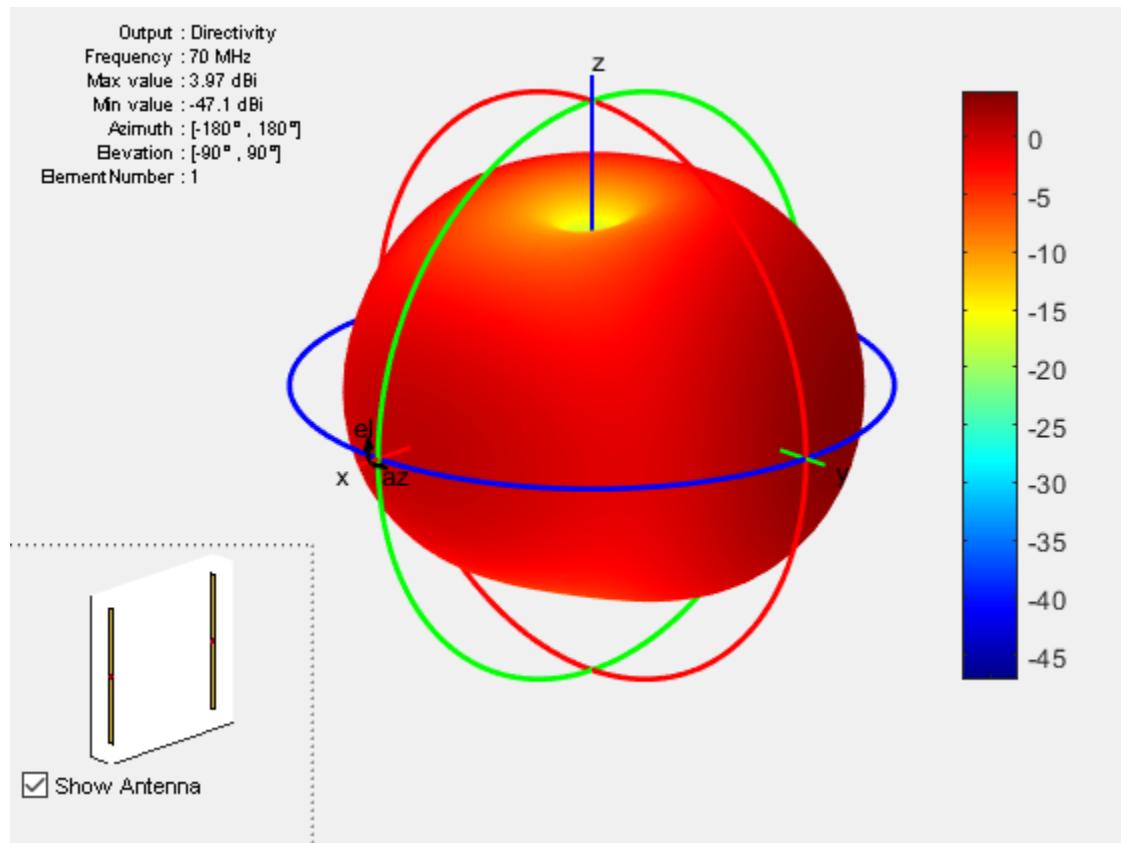

```
h = helix;  
pattern (h, 2e9, 0, 1:1:360);
```

### Embedded Element Pattern of Linear Array

Calculate the embedded element pattern of a linear array. Excite the first antenna element in the array. Terminate all the other antenna elements using a 50-ohm resistance.

```
l = linearArray;
pattern(l, 70e6, 'ElementNumber', 1, 'Termination', 50);
```

### Directivity Value of Helix Antenna.

Calculate the directivity of a helix antenna.

```
h = helix;  
D = pattern(h, 2e9, 0, 1:1:360);
```

Showing the first five directivity values.

```
Dnew = D(1:5)
```

```
Dnew =
```

```
-6.5225  
-6.3032  
-6.0698  
-5.8242  
-5.5686
```

## Input Arguments

**object** — Antenna or array element  
object

Antenna or array element, specified as an objects.

**frequency** — Frequency to calculate or plot antenna or array radiation pattern  
scalar

Frequency to calculate or plot antenna or array radiation pattern, specified as a scalar in Hz.

Example: 70e6

Data Types: double

**azimuth** — Azimuth angles and spacing between angles  
-180:5:180 (default) | vector

Azimuth angles and spacing between the angles to visualize radiation pattern, specified vector in degrees. If the coordinate system is set to uv, then the U values are specified in this parameter. The values of U are between -1 to 1.

Example: 90

Data Types: double

**elevation** — Elevation angles and spacing between angles  
-90:5:90 (default) | vector

Elevation angles and spacing between the angles to visualize radiation pattern, specified vector in degrees. If the coordinate system is set to uv, then the V values are specified in this parameter. The values of V are between -1 to 1.

Example: 0:1:360

Data Types: double

### Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value pair arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'CoordinateSystem', 'uv'

#### **CoordinateSystem — Coordinate system to visualize radiation pattern**

'polar' (default) | 'rectangular' | 'uv'

Coordinate system to visualize radiation pattern, specified as the comma-separated pair consisting of 'CoordinateSystem' and one of these values: 'polar', 'rectangular', 'uv'.

Example: 'CoordinateSystem', 'polar'

Data Types: char

#### **Type — Quantity to plot**

'directivity' | 'gain' | 'efield' | 'power' | 'powerdb'

Quantity to plot, specified as a comma-separated pair consisting of 'Type' and one of these values:

- directivity – Directivity in dBi (lossless antenna or array)
- gain – Gain in dBi (lossy antenna or array)
- efield – Electric field in volt/meter
- power – Power in watts
- powerdb – Power in dB

The default value is 'directivity' for a lossless antenna and 'gain' for a lossy antenna. You cannot plot the 'directivity' of a lossy antenna.

Example: 'Type', 'efield'

Data Types: char

**Normalize — Normalize field pattern**

true (default) | false | boolean

Normalize field pattern, specified as the comma-separated pair consisting of 'Normalize' and either true or false. You cannot use this property if the 'Type' is set to 'directivity'.

Example: 'Normalize', false

Data Types: double

**PlotStyle — 2-D pattern display style when frequency is vector**

'overlay' (default) | 'waterfall'

2-D pattern display style when frequency is vector, specified as the comma-separated pair consisting of 'PlotStyle' and one of these values:

- 'overlay' – Overlay frequency data in a 2-D line plot
- 'waterfall' – Plot frequency data in a waterfall plot

You can use this property when using pattern function with no output arguments.

Example: 'PlotStyle', 'waterfall'

Data Types: char

**Polarization — Field polarization**

'H' | 'V' | 'RHCP' | 'LHCP'

Field polarization, specified as the comma-separated pair consisting of 'Polarization' and one of these values:

- 'H' – Horizontal polarization
- 'V' – Vertical polarization
- 'RHCP' – Right-hand circular polarization
- 'LHCP' – Left-hand circular polarization

By default, you can visualize a combined polarization.

Example: 'Polarization', 'RHCP'

Data Types: char

**ElementNumber — Antenna element in array**

scalar

Antenna element in array, specified as the comma-separated pair consisting of 'ElementNumber' and scalar. This antenna element is connected to the voltage source.

Example: 'ElementNumber',1

Data Types: double

---

**Note** Use this property to calculate the embedded pattern of an array.

---

**Termination — Impedance value for array element termination**

50 (default) | scalar

Impedance value for array element termination, specified as the comma-separated pair consisting of 'Termination' and scalar. The impedance value terminates other antenna elements of an array while calculating the embedded pattern of the antenna connected to the voltage source.

Example: 'Termination',40

Data Types: double

---

**Note** Use this property to calculate the embedded pattern of an array.

---

## Output Arguments

**pat — Radiation pattern of antenna or array or embedded pattern of array**

matrix

Radiation pattern of antenna or array or embedded pattern of array, returned as a matrix of number of elevation values by number of azimuth values. The pattern is one of the following:

- directivity – Directivity in dBi (lossless antenna or array)

- `gain` – Gain in dBi (lossy antenna or array)
- `efield` – Electric field in volt/meter
- `power` – Power in watts
- `powerdb` – Power in dB

Matrix size is number of elevation values multiplied by number of azimuth values.

**azimuth — Azimuth angles to calculate radiation pattern**

vector in degrees

Azimuth angles to calculate radiation pattern, returned as a vector in degrees.

**elevation — Elevation angles to calculate radiation pattern**

vector in degrees

Elevation angles to calculate radiation pattern, returned as a vector in degrees.

## patternAzimuth

Azimuth pattern of antenna or array

### Syntax

```
patternAzimuth(object,frequency,elevation)
patternAzimuth(object,frequency,elevation,Name,Value)

directivity = patternAzimuth(object,frequency,elevation)
directivity = patternAzimuth(object,frequency,elevation,Name,Value)
```

### Description

`patternAzimuth(object,frequency,elevation)` plots the 2-D radiation pattern of the antenna or array object over a specified frequency. Elevation values defaults to zero if not specified.

`patternAzimuth(object,frequency,elevation,Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments.

`directivity = patternAzimuth(object,frequency,elevation)` returns the directivity of the antenna or array object over a specified frequency. Elevation values defaults to zero if not specified.

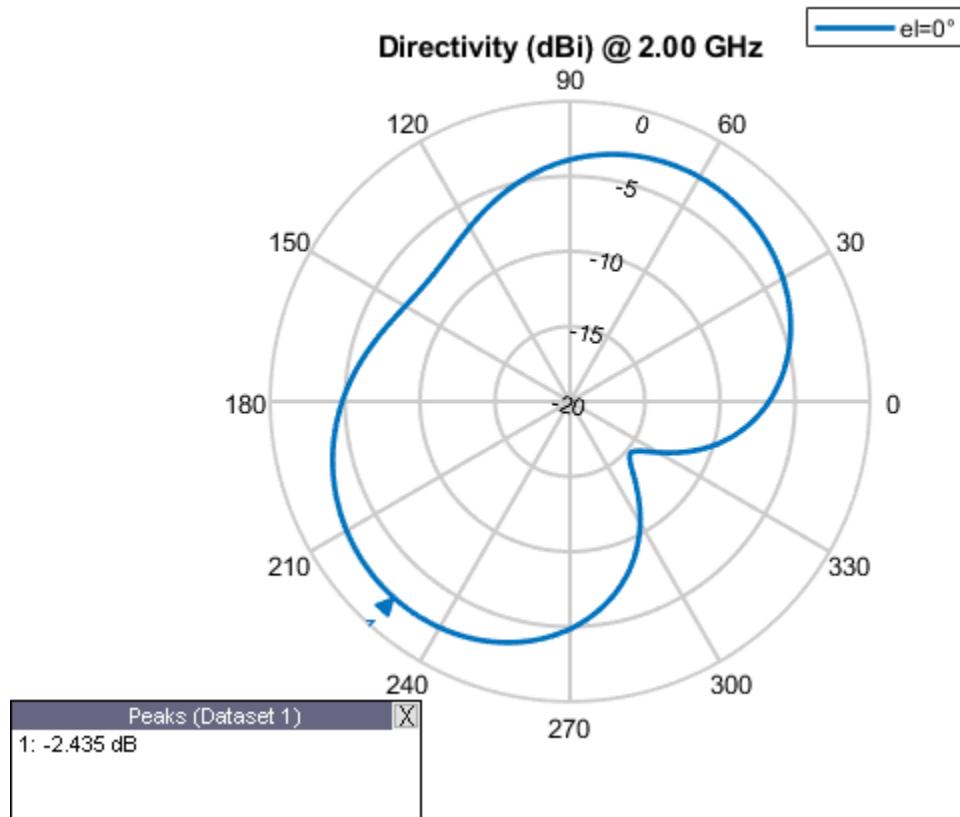

`directivity = patternAzimuth(object,frequency,elevation,Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments.

### Examples

#### Azimuth Radiation Pattern of Helix Antenna

Calculate and plot the azimuth radiation pattern of the helix antenna at 2 GHz.

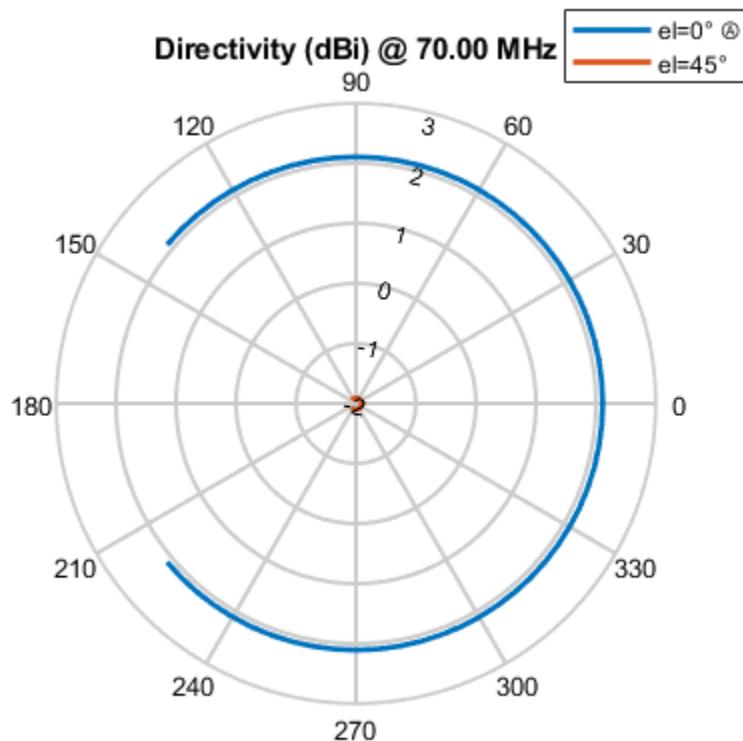

```
h = helix;  
patternAzimuth(h,2e9);
```

### Azimuth Radiation Pattern of Dipole Antenna

Calculate and plot the azimuth radiation pattern of the dipole antenna at 70 MHz at elevation values of 0 and 45.

```
d = dipole;  
patternAzimuth(d,70e6,[0 45], 'Azimuth', -140:5:140);
```

## Input Arguments

**object** — antenna or array object

scalar handle

Antenna or array object, specified as a scalar handle.

**frequency** — Frequency used to calculate charge distribution

scalar in Hz

Frequency used to calculate charge distribution, specified as a scalar in Hz.

Example: 70e6

Data Types: double

**elevation — Elevation angle values**

vector in degrees

Elevation angle values, specified as a vector in degrees.

Example: [0 45]

Data Types: double

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value pair arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Azimuth',2:2:340

**Azimuth — Azimuth angles of antenna**

-180:1:180 (default) | vector in degrees

Azimuth angles of antenna, specified as the comma-separated pair consisting of 'Azimuth' and a vector in degrees.

Example: 'Azimuth',2:2:340

Data Types: double

## Output Arguments

**directivity — Antenna or array directivity**

matrix in dBi

Antenna or array directivity, returned as a matrix in dBi. The matrix size is the product of number of elevation values and number of azimuth values.

## See Also

`pattern` | `patternElevation`

Introduced in R2015a

# patternMultiply

Radiation pattern of array using pattern multiplication

## Syntax

```
patternMultiply(array,frequency)
patternMultiply(array,frequency,azimuth)
patternMultiply(array,frequency,azimuth, elevation)
patternMultiply(____,Name,Value)

[fieldval,azimuth,elevation] = patternMultiply(array,frequency)
[fieldval,azimuth,elevation] = patternMultiply(array,frequency,
azimuth)
[fieldval,azimuth,elevation] = patternMultiply(array,frequency,
azimuth,elevation)
[fieldval,azimuth,elevation] = patternMultiply(____,Name,Value)
```

## Description

`patternMultiply(array,frequency)` plots the 3-D radiation pattern of the array object over a specified frequency. `patternMultiply` calculates the full array pattern without taking the effect of mutual coupling between the different array elements.

`patternMultiply(array,frequency,azimuth)` plots the radiation pattern of the array object for the given azimuth angles. Elevation angles retain default values.

`patternMultiply(array,frequency,azimuth, elevation)` plots the radiation pattern of the array object for the given azimuth and elevation angles.

`patternMultiply(____,Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments. Specify name-value pair arguments after all other input arguments.

`[fieldval,azimuth,elevation] = patternMultiply(array,frequency)` returns the field value such as the directivity of the lossless array in dBi or gain of the

lossy array in dBi at the specified frequency. The size of the field value matrix is number of elevation values x number of azimuth values.

[fieldval,azimuth,elevation] = patternMultiply(array,frequency,azimuth) returns the field value at the specified azimuth angles. Elevation angles retain default values.

[fieldval,azimuth,elevation] = patternMultiply(array,frequency,azimuth,elevation) returns the field value at the specified azimuth angles, and elevation angles.

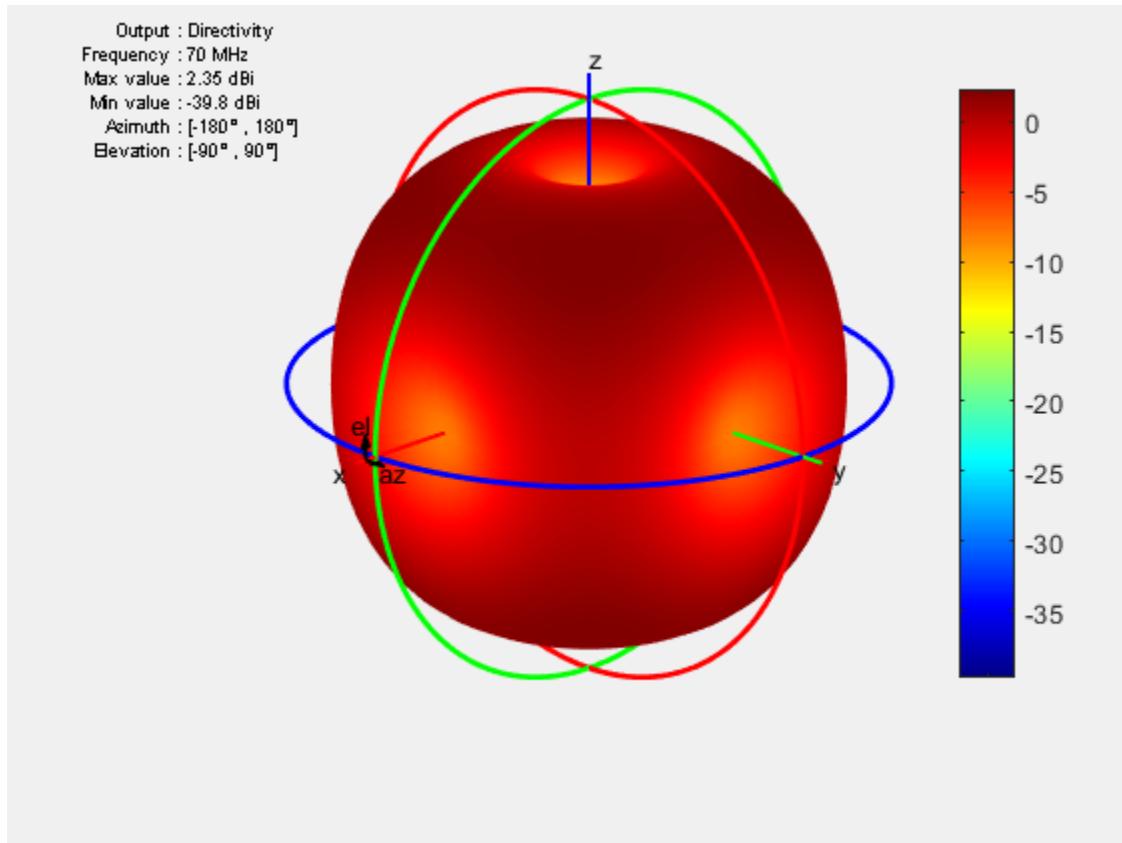

[fieldval,azimuth,elevation] = patternMultiply(\_\_\_,Name,Value) returns the field value using additional options specified by one or more Name,Value pair arguments. Specify name-value pair arguments after all other input arguments.

## Examples

### Radiation Pattern of Rectangular Array

Plot the radiation pattern of a default rectangular array at 70 MHz. Pattern multiplication does not take into consideration the effect of mutual coupling in array elements.

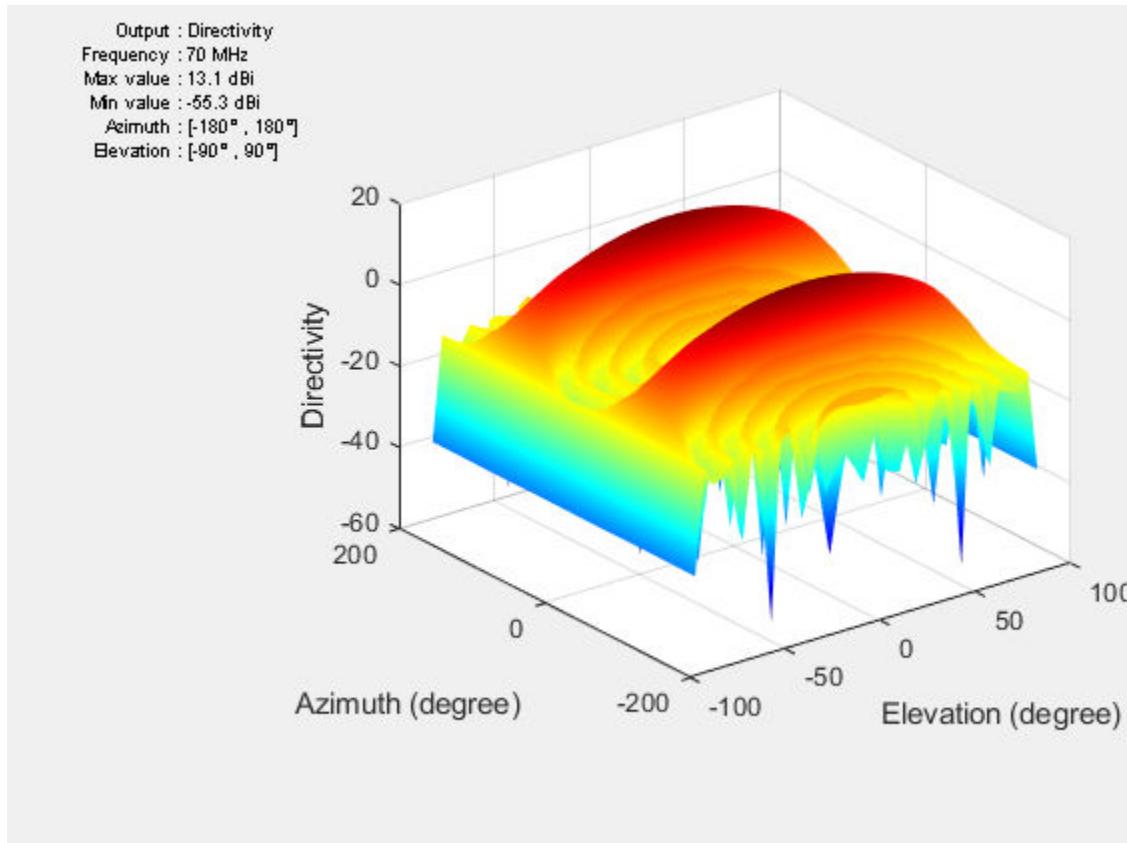

```
h = rectangularArray;
patternMultiply(h,70e6);
```

### Radiation Pattern of Linear Array in Rectangular Coordinates

Plot the radiation pattern of a 10-element linear array at 70 MHz. Visualize the pattern using the rectangular coordinate system.

```
l = linearArray('NumElements',10);
patternMultiply(l,70e6,'CoordinateSystem','rectangular');
```

## Input Arguments

**array** — Input antenna array

object handle

Array object, specified as an object handle.

Example: `r = rectangularArray; patternMultiply(r, 70e6)`. Plot the pattern of a rectangular array.

**frequency** — Frequency used to calculate array pattern

scalar in Hz

Frequency used to calculate array pattern, specified as a scalar in Hz.

Example: 70e6

Data Types: double

**azimuth — Azimuth angle of antenna**

-180:5:180 (default) | vector in degrees

Azimuth angle of the antenna, specified as a vector in degrees.

Example: -90:5:90

Data Types: double

**elevation — Elevation angle of antenna**

-90:5:90 (default) | vector in degrees

Elevation angle of the antenna, specified as a vector in degrees.

Example: 0:1:360

Data Types: double

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value pair arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'CoordinateSystem', rectangular

**CoordinateSystem — Coordinate system of radiation pattern**

'polar' (default) | 'rectangular' | 'uv'

Coordinate system of radiation pattern, specified as the comma-separated pair consisting of 'CoordinateSystem' and one of these values: 'polar', 'rectangular', 'uv'.

Example: 'CoordinateSystem', 'polar'

Data Types: char

**Type — Value to plot**

'directivity' (default) | 'gain' | 'efield' | 'power' | 'powerdb'

Value to plot, specified as a comma-separated pair consisting of 'Type' and one of these values:

- 'directivity' – Radiation intensity in a given direction of antenna in dB
- 'gain' – Radiation intensity in a given direction of antenna, when the antenna has a lossy substrate in dB
- 'efield' – Electric field of antenna in volt/meter
- 'power' – Antenna power in watts
- 'powerdb' – Antenna power in dB

Example: 'Type', 'efield'

Data Types: char

### **Normalize — Normalize field pattern**

true (default) | false | boolean

Normalize field pattern, specified as the comma-separated pair consisting of 'Normalize' and either true or false. For directivity patterns, this property is not applicable.

Example: 'Normalize', false

Data Types: double

### **Polarization — Field polarization**

'H' | 'V' | 'RHCP' | 'LHCP'

Field polarization, specified as the comma-separated pair consisting of 'Polarization' and one of these values:

- 'H' – Horizontal polarization
- 'V' – Vertical polarization
- 'RHCP' – Right-hand circular polarization
- 'LHCP' – Left-hand circular polarization

By default, you can visualize a combined polarization.

Example: 'Polarization', 'RHCP'

Data Types: char

## Output Arguments

**fieldval — Array directivity or gain**  
matrix in dB<sub>i</sub>

Array directivity or gain, returned as a matrix in dB<sub>i</sub>. The matrix size is the product of the number of elevation values and azimuth values.

**azimuth — Azimuth angles**  
vector in degrees

Azimuth angle used to calculate field values, returned as a vector in degrees.

**elevation — Elevation angles**  
vector in degrees

Elevation angles used to calculate field values, returned as a vector in degrees.

## See Also

[pattern](#) | [patternElevation](#)

**Introduced in R2017a**

## patternElevation

Elevation pattern of antenna or array

### Syntax

```
patternElevation(object,frequency,azimuth)
patternElevation(object,frequency,azimuth,Name,Value)

directivity = patternElevation(object,frequency,azimuth)
directivity = patternElevation(object,frequency,azimuth,Name,Value)
```

### Description

`patternElevation(object,frequency,azimuth)` plots the 2-D radiation pattern of the antenna or array object over a specified frequency. Azimuth values defaults to zero if not specified.

`patternElevation(object,frequency,azimuth,Name,Value)` uses additional options specified by one or more `Name, Value` pair arguments.

`directivity = patternElevation(object,frequency,azimuth)` returns the directivity of the antenna or array object at specified frequency. Azimuth values defaults to zero if not specified.

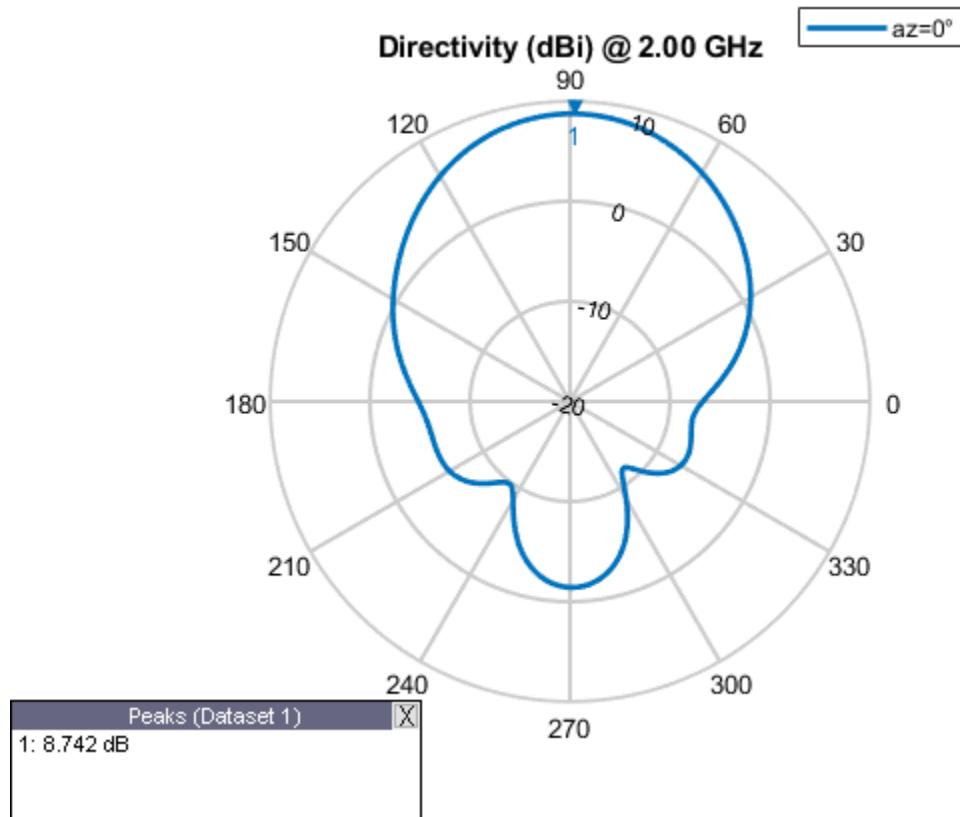

`directivity = patternElevation(object,frequency,azimuth,Name,Value)` uses additional options specified by one or more `Name, Value` pair arguments.

### Examples

#### Elevation Radiation Pattern of Helix

Calculate and plot the elevation pattern of the helix antenna at 2 GHz.

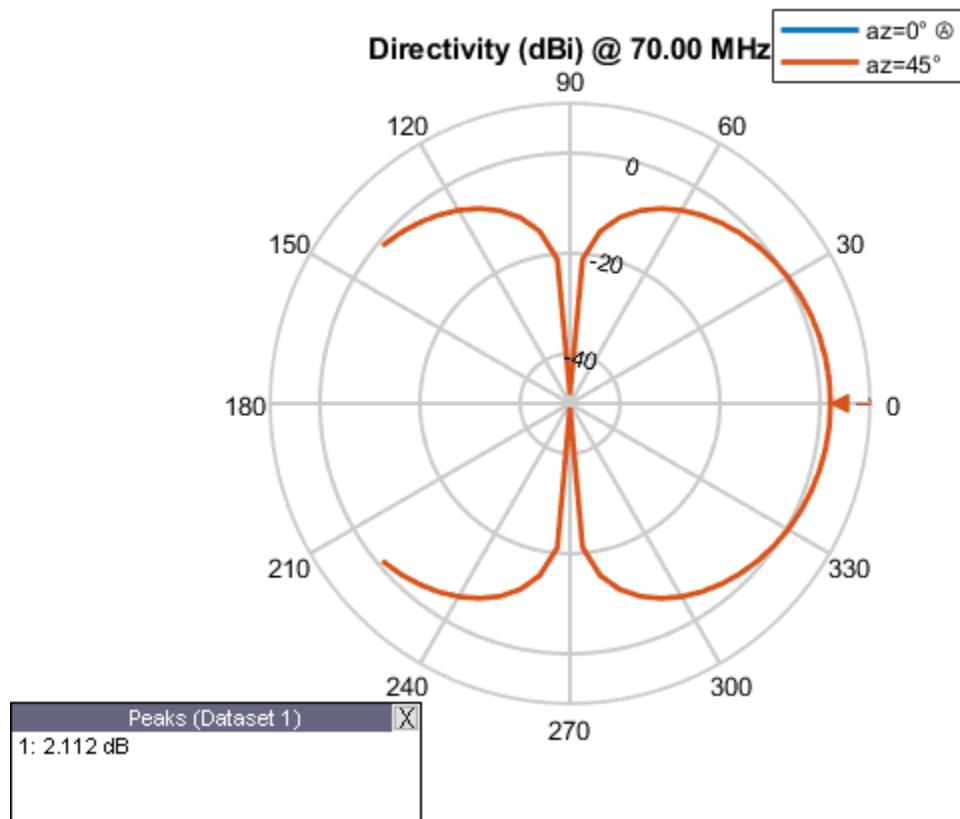

```
h = helix;  
patternElevation (h, 2e9);
```

### Elevation Radiation Pattern of Dipole Antenna

Calculate and plot the elevation radiation pattern of the dipole antenna at 70 MHz at elevation values of 0 and 45.

```
d = dipole;  
patternElevation(d, 70e6, [0 45], 'Elevation', -140:5:140);
```

## Input Arguments

**object** — Antenna or array object

scalar handle

Antenna or array object, specified as a scalar handle.

**frequency** — Frequency used to calculate charge distribution

scalar in Hz

Frequency used to calculate charge distribution, specified as a scalar in Hz.

Example: 70e6

Data Types: double

#### **azimuth — Azimuth angle values**

vector in degrees

Azimuth angle values, specified as a vector in degrees.

Example: [0 45]

Data Types: double

## **Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name, Value pair arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'Elevation', 0:1:360

#### **Elevation — Elevation angles of antenna**

-90:1:90 (default) | vector in degrees

Elevation angles of antenna, specified the comma-separated pair consisting of 'Elevation' and a vector in degrees.

Example: 'Elevation', 0:1:360

Data Types: double

## **Output Arguments**

#### **directivity — Antenna or array directivity**

matrix in dBi

Antenna or array directivity, returned as a matrix in dBi. The matrix size is the product of number of elevation values and number of azimuth values.

## See Also

Introduced in R2015a

# current

Current distribution on metal or dielectric antenna or array surface

## Syntax

```
current(object,frequency)  
i = current(object,frequency)  
  
current(object,frequency,'dielectric')  
i = current(object,frequency,'dielectric')
```

## Description

`current(object,frequency)` calculates and plots the absolute value of the current on the surface of an antenna or array object, at a specified frequency.

`i = current(object,frequency)` returns the  $x$ ,  $y$ ,  $z$  components of the current on the surface of an antenna or array object, at a specified frequency.

`current(object,frequency,'dielectric')` calculates and plots the absolute value of current at a specified frequency value on the dielectric face of the antenna or array.

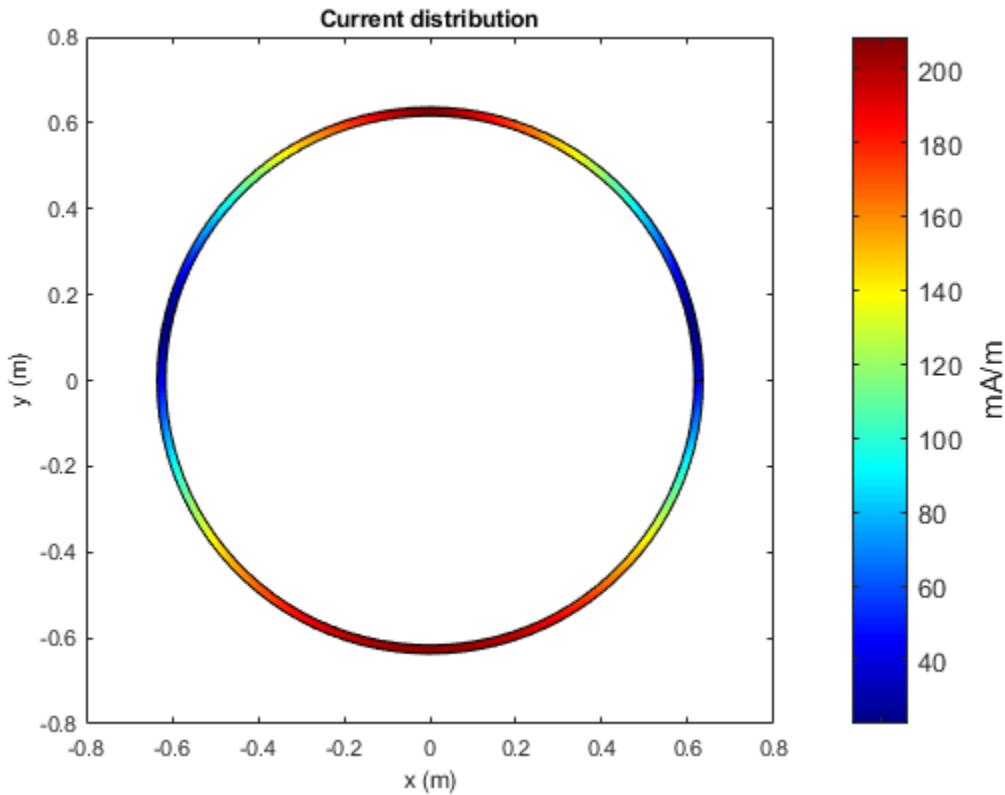

`i = current(object,frequency,'dielectric')` returns the  $x$ ,  $y$ ,  $z$  components of the current on the dielectric surface of an antenna or array object, at a specified frequency.

## Examples

### Calculate and Plot Current Distribution on Antenna Surface

Calculate and plot the current distribution for a circular loop antenna at 70MHz frequency.

```
h = loopCircular;
current(h,70e6);
```

### Calculate Current Distribution of Array

Calculate the current distribution of a default rectangular array at 70MHz frequency.

```
h = rectangularArray;
i = current(h,70e6)

i =

### Current Distribution On Microstrip Patch Antenna

Create a microstrip patch antenna using '**FR4**' as the dielectric substrate.

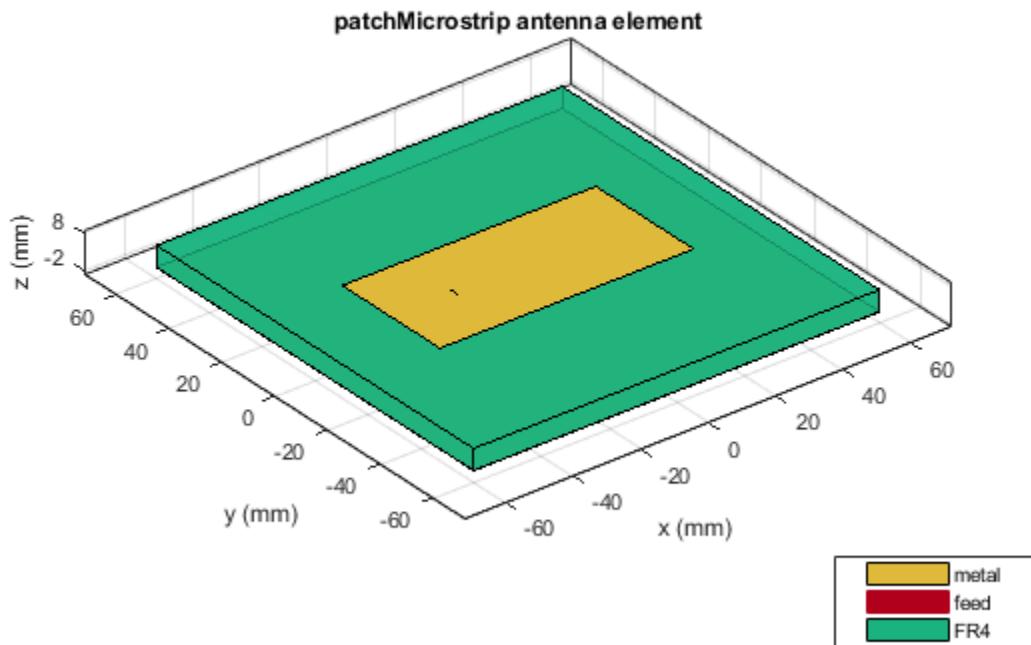

```
d = dielectric('FR4');
pm = patchMicrostrip('Length',75e-3, 'Width',37e-3,
    'GroundPlaneLength',120e-3, 'GroundPlaneWidth',120e-3, ...
    'Substrate',d)
show(pm)
```

```
pm =
```

```
patchMicrostrip with properties:
```

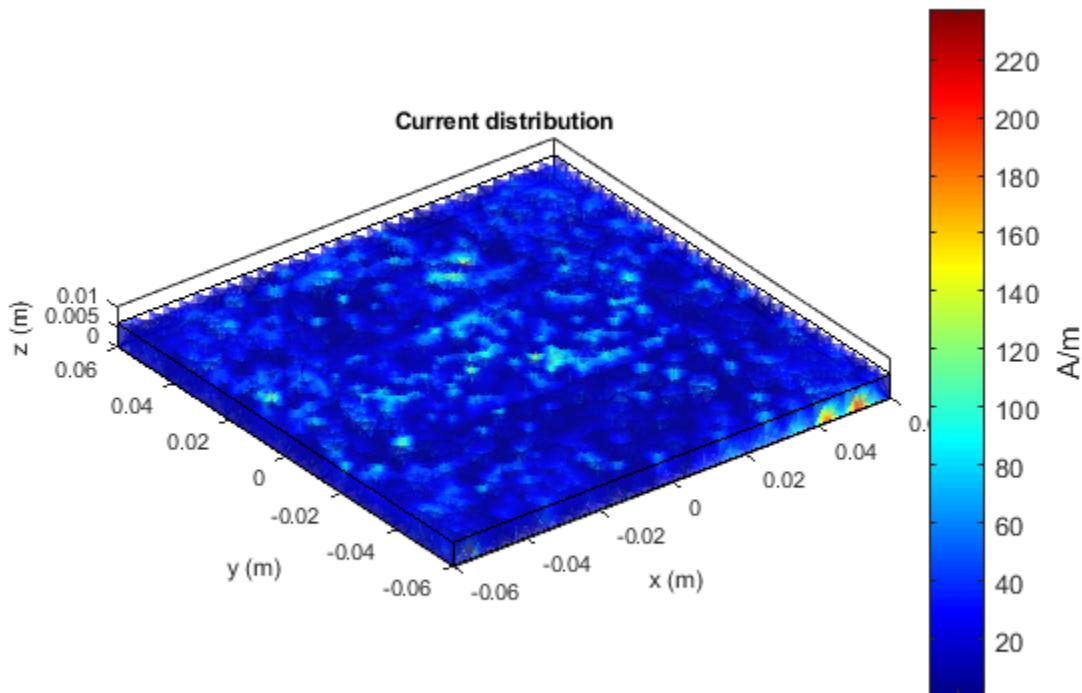

```
Length: 0.0750
Width: 0.0370
Height: 0.0060
Substrate: [1x1 dielectric]
GroundPlaneLength: 0.1200
GroundPlaneWidth: 0.1200
PatchCenterOffset: [0 0]
```

```
FeedOffset: [-0.0187 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

Plot the current distribution on the antenna at a frequency of 1.67 GHz.

```
figure
current(pm,1.67e9,'dielectric')
```

## Input Arguments

**object** — Antenna or array object

scalar handle

Antenna or array object, specified as a scalar handle.

**frequency** — Frequency used to calculate current distribution

scalar in Hz

Frequency to calculate current distribution, specified as a scalar in Hz.

Example: 70e6

Data Types: double

## Output Arguments

### i — x, y, z components of current distribution

3-by- $n$  complex matrix in A/m

$x, y, z$  components of current distribution, returned as a 3-by- $n$  complex matrix in A/m. The value of the current is calculated on every triangle mesh or every dielectric tetrahedron face on the surface of an antenna or array.

## See Also

[axialRatio](#) | [charge](#)

**Introduced in R2015a**

## charge

Charge distribution on metal or dielectric antenna or array surface

### Syntax

```
charge(object,frequency)
```

```
c = charge(object,frequency)
```

```
charge(object,frequency,'dielectric')
```

```
c = charge(object,frequency,'dielectric')
```

### Description

`charge(object,frequency)` calculates and plots the absolute value of the charge on the surface of an antenna or array object surface at a specified frequency.

`c = charge(object,frequency)` returns a vector of charges in C/m on the surface of an antenna or array object, at a specified frequency.

`charge(object,frequency,'dielectric')` calculates and plots the absolute value of charge at a specified frequency value on the dielectric face of the antenna or array.

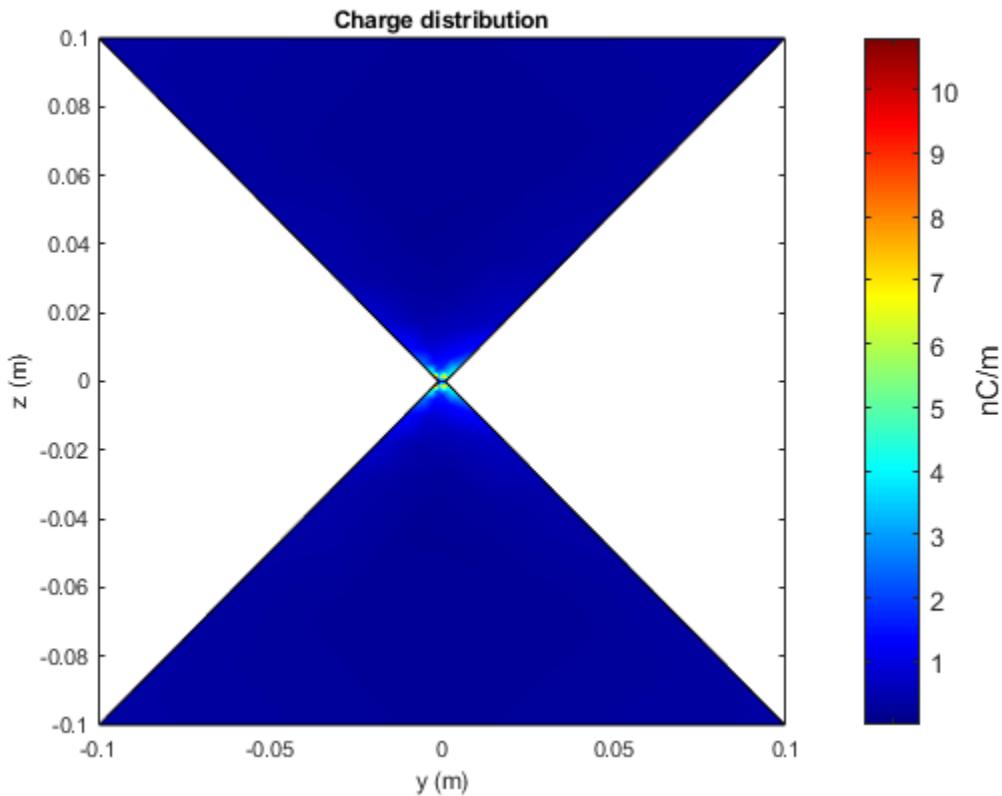

`c = charge(object,frequency,'dielectric')` returns the  $x$ ,  $y$ ,  $z$  components of the charge on the dielectric surface of an antenna or array object, at a specified frequency.

### Examples

#### Calculate and Plot Charge Distribution on Antenna Surface

Calculate and plot the charge distribution on a bowtieTriangular antenna at 70MHz frequency.

```
h = bowtieTriangular;
charge (h, 70e6);
```

### Calculate Charge Distribution of Array

Calculate charge distribution of linear array at 70 MHz frequency.

```
h = linearArray;
h.NumElements = 4;
C = charge(h,70e6);
```

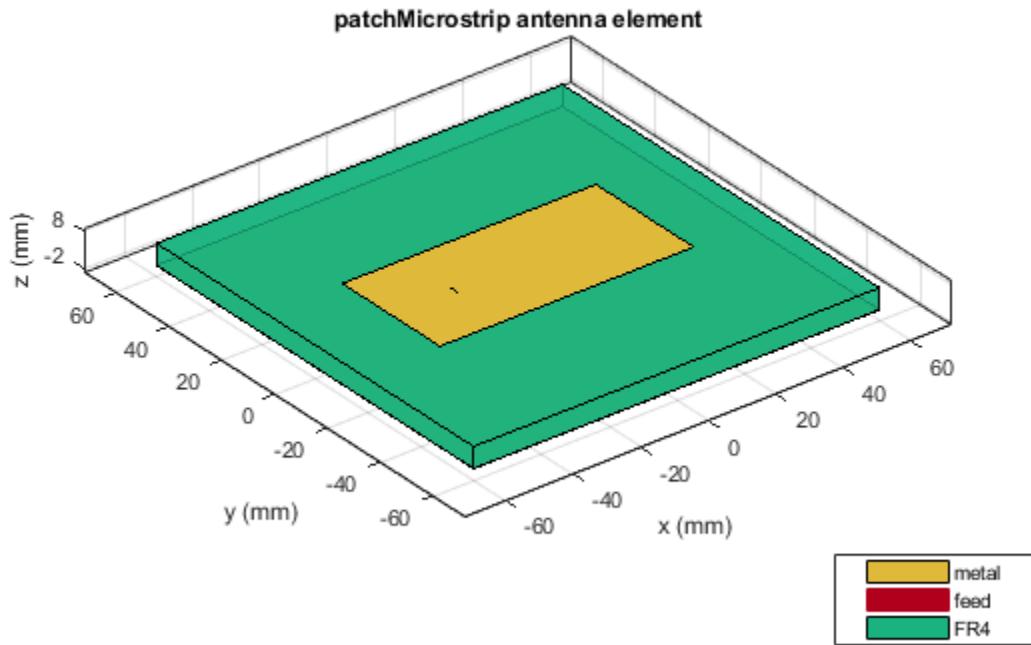

### Charge Distribution On Microstrip Patch Antenna

Create a microstrip patch antenna using 'FR4' as the dielectric substrate.

```
d = dielectric('FR4');
pm = patchMicrostrip('Length',75e-3, 'Width',37e-3,
    'GroundPlaneLength',120e-3, 'GroundPlaneWidth',120e-3, ...
    'Substrate',d)
show(pm)

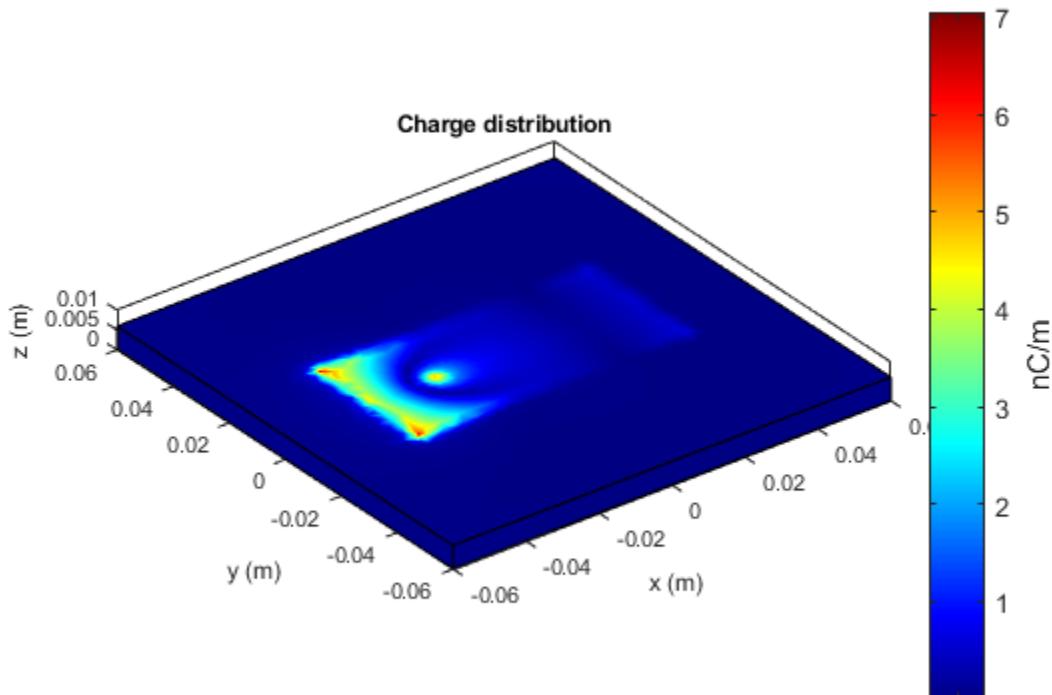

pm =
patchMicrostrip with properties:

    Length: 0.0750
    Width: 0.0370
    Height: 0.0060
    Substrate: [1x1 dielectric]
    GroundPlaneLength: 0.1200
    GroundPlaneWidth: 0.1200
    PatchCenterOffset: [0 0]
    FeedOffset: [-0.0187 0]
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]
```

Plot the charge distribution on the antenna at a frequency of 1.67 GHz.

```
figure  
charge(pm,1.67e9,'dielectric')
```

## Input Arguments

**object** — Antenna or array object

scalar handle

Antenna or array object, specified as a scalar handle.

**frequency** — Frequency used to calculate charge distribution

scalar in Hz

Frequency used to calculate charge distribution, specified as a scalar in Hz.

Example: 70e6

Data Types: double

## Output Arguments

### c — Complex charges

$1 \times n$  vector in C/m

Complex charges, returned as a  $1 \times n$  vector in C/m. This value is calculated on every triangle mesh or every dielectric tetrahedron face on the surface of an antenna or array, of antenna or array.

## See Also

## design

Design prototype antenna for resonance at specified frequency

### Syntax

```
ant = design(antenna,frequency)
```

### Description

`ant = design(antenna,frequency)` designs any antenna object from the antenna library to resonate at the specified frequency.

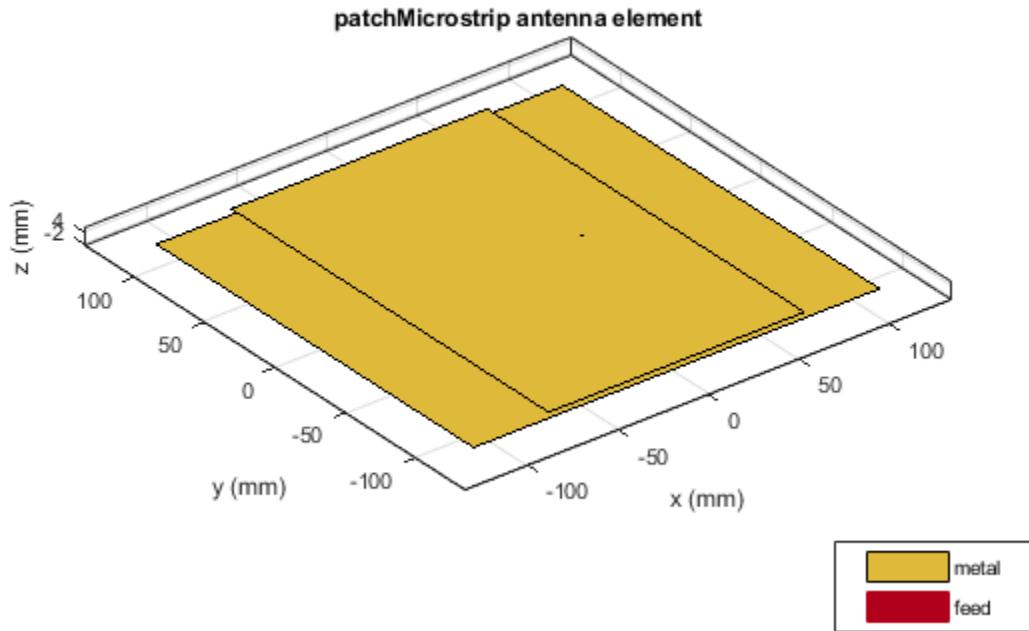

### Examples

#### Prototype Antenna Design

Design a prototype microstrip patch antenna that resonates at a frequency of 1 GHz.

```
p = design(patchMicrostrip,1e9)
p =
  patchMicrostrip with properties:
    Length: 0.1417
    Width: 0.2248
    Height: 0.0030
    Substrate: [1x1 dielectric]
    GroundPlaneLength: 0.2248
    GroundPlaneWidth: 0.2248
    PatchCenterOffset: [0 0]
    FeedOffset: [0.0354 0]
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]
```

```
show(p)
```

Calculate the impedance of the above antenna at the same frequency.

```
Z = impedance(p,1e9)
```

```
Z =  
43.0298 - 4.6092i
```

## Input Arguments

### **antenna** — Antenna object

scalar handle

Antenna object from antenna library, specified as a scalar handle.

Example: `dipole`

### **frequency** — Resonant frequency of antenna

real positive scalar

Resonant frequency of antenna, specified as a real positive scalar.

Example: `55e6`

## Output Arguments

### **ant** — Antenna object with specified reference frequency

scalar handle

Antenna object with specified reference frequency, returned as a scalar handle.

## See Also

`show`

**Introduced in R2016b**

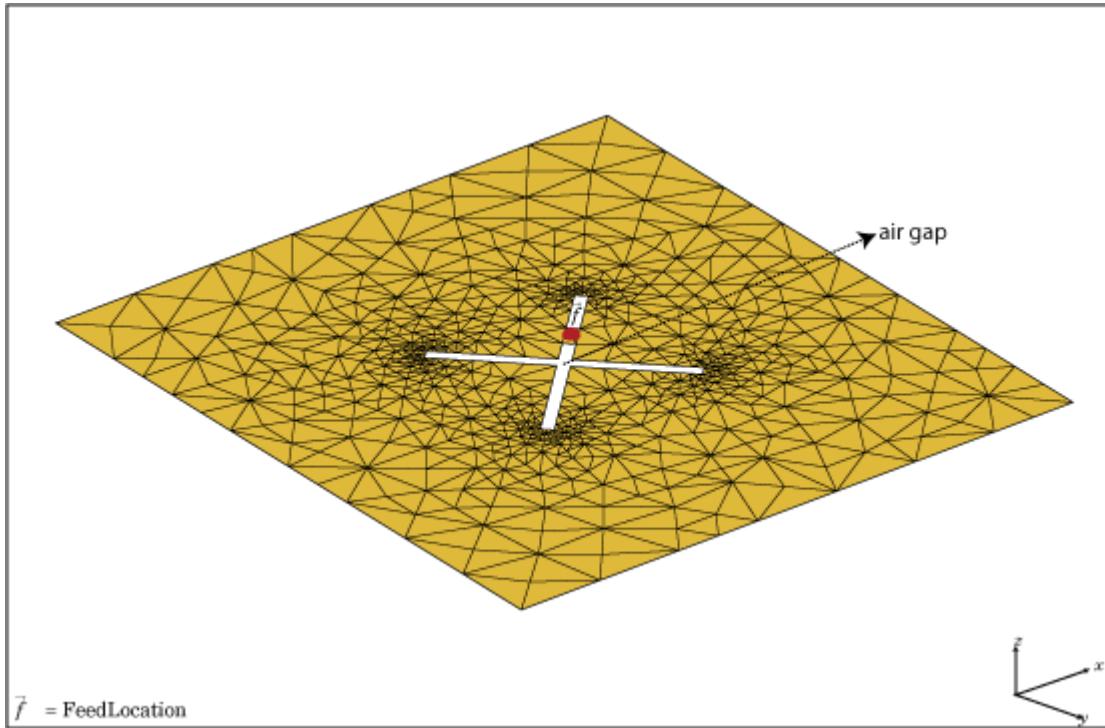

# createFeed

Create feed location for custom antenna

## Syntax

```
createFeed(antenna)
createFeed(antenna,point1,point2)
```

## Description

`createFeed(antenna)` plots a custom antenna mesh in a figure window. From the figure window, you can specify a feed location for the mesh and create a custom antenna.

To specify a region for the feed point, select two points, inside triangles on either side of the air gap or inside triangles that share a common edge.

`createFeed(antenna,point1,point2)` creates the feed across the triangle edges identified by `point1` and `point2`. After the feed is created, when you plot the resulting antenna mesh the feed location is highlighted.

## Input Arguments

### **antenna — Custom antenna mesh**

scalar handle

Custom mesh antenna, specified as a scalar handle.

### **point1,point2 — Points to identify feed region**

Cartesian coordinates in meters

Points to identify feed region, specified as Cartesian coordinates in meters. Specify the points in the format  $[x_1, y_1]$ ,  $[x_2, y_2]$ .

Example: `createFeed(c, [0.07, 0.01], [0.05, 0.05]);`

## Examples

### Create Feed for Custom Mesh Antenna Using Air Gap between Triangles

Load a 2-D custom mesh. Create a custom antenna using the points and triangles.

```
load planarmesh.mat
c = customAntennaMesh(p,t)

c =

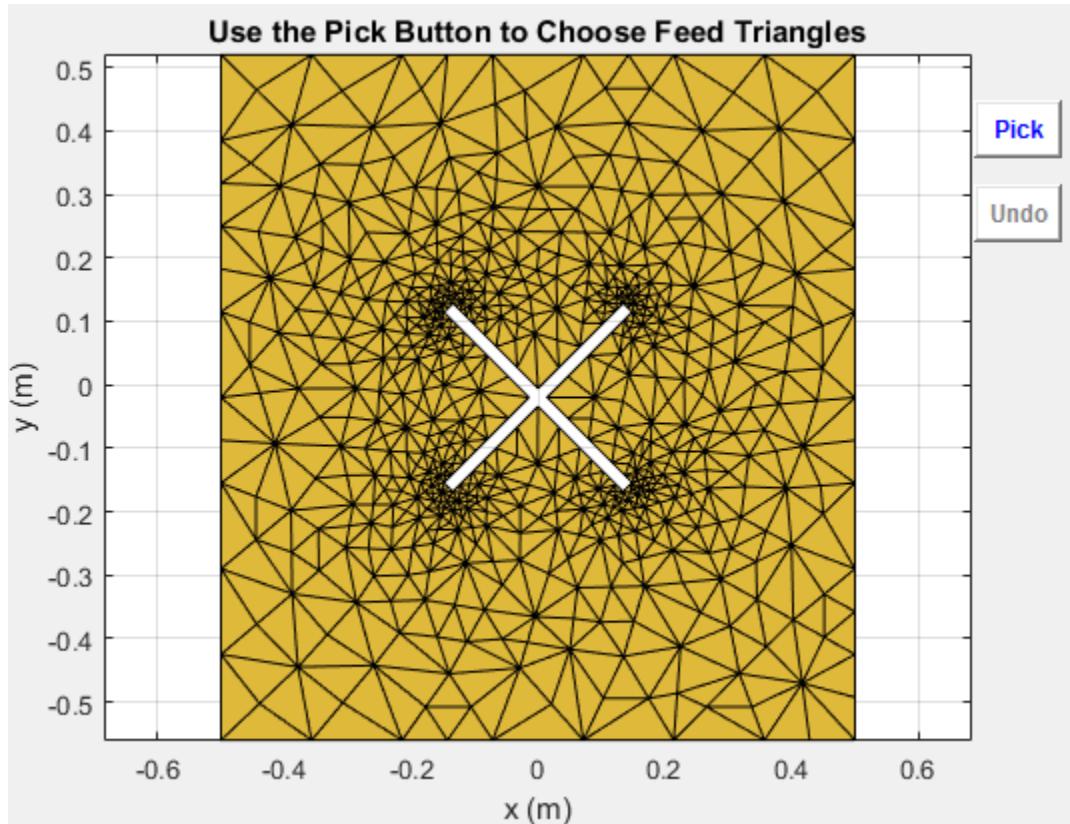

customAntennaMesh with properties:

    Points: [3x658 double]
    Triangles: [4x1219 double]
    FeedLocation: []
```

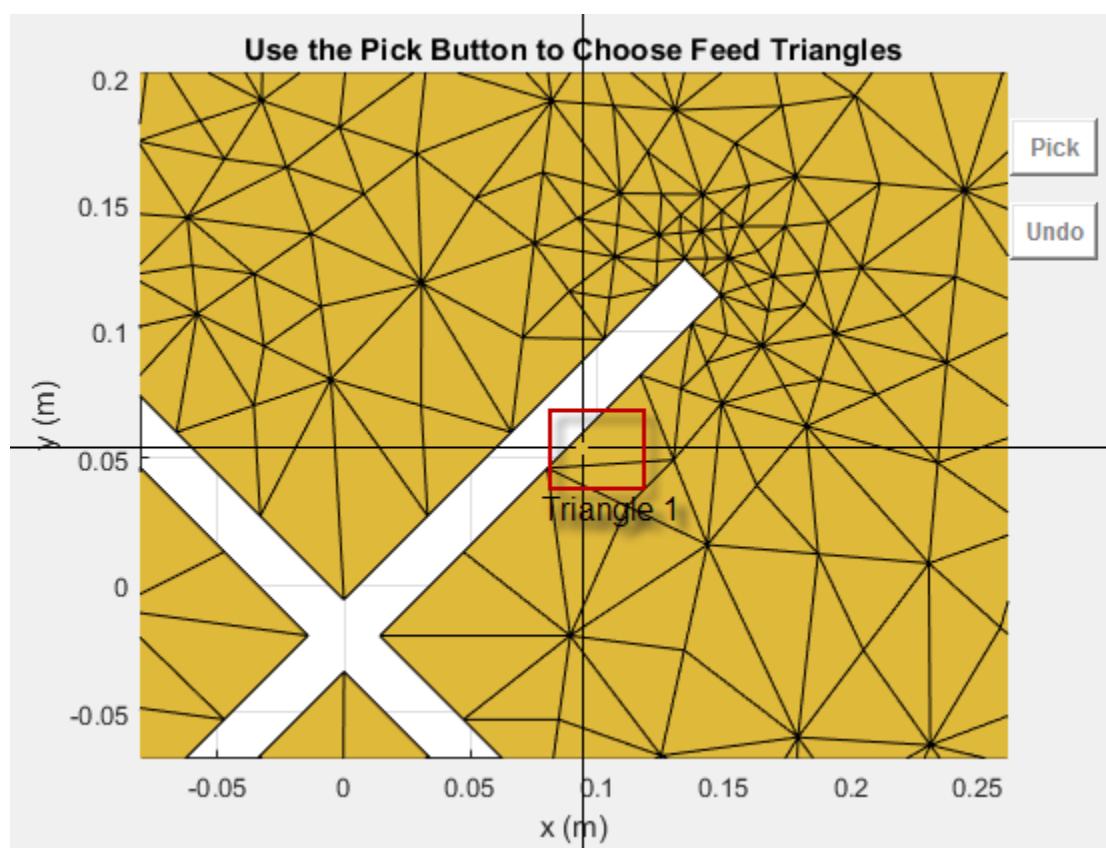

```
Tilt: 0  
TiltAxis: [1 0 0]
```

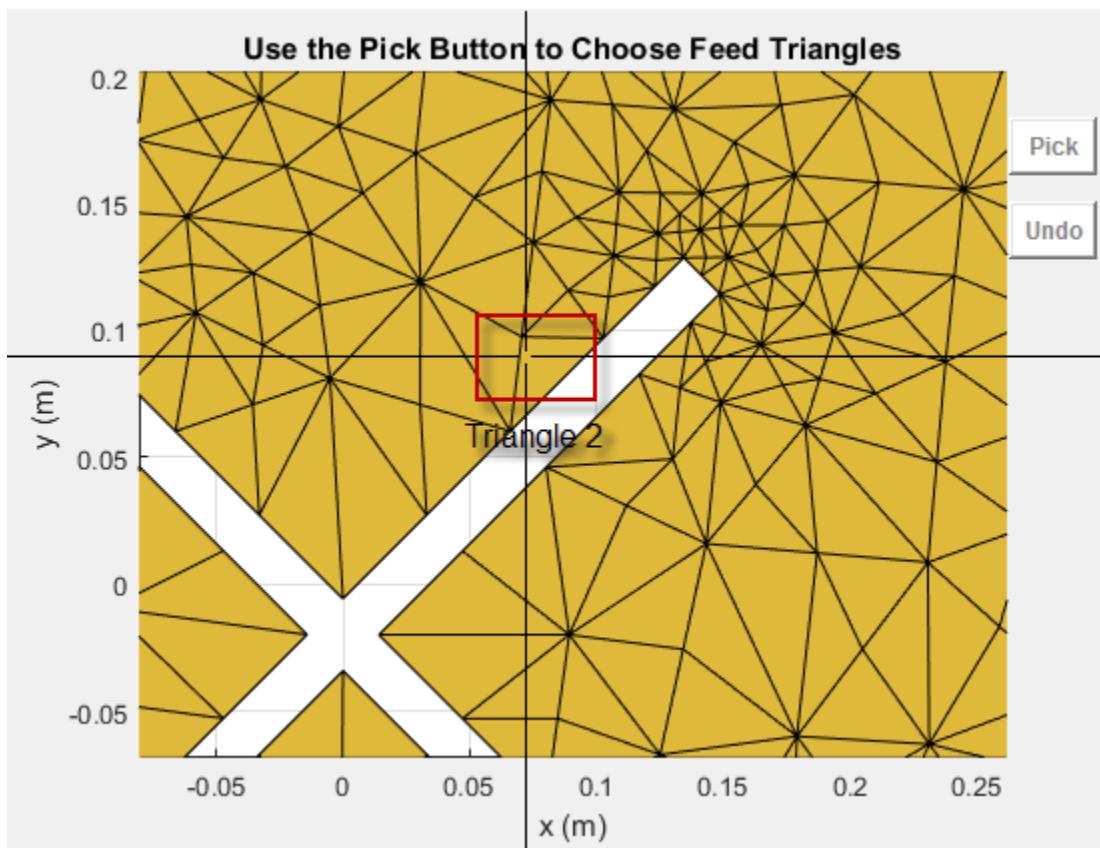

Use the `createFeed` function to view the antenna mesh structure. In this antenna mesh view, you see **Pick** and **Undo** buttons. The **Pick** button is highlighted.

```
createFeed(c)
```

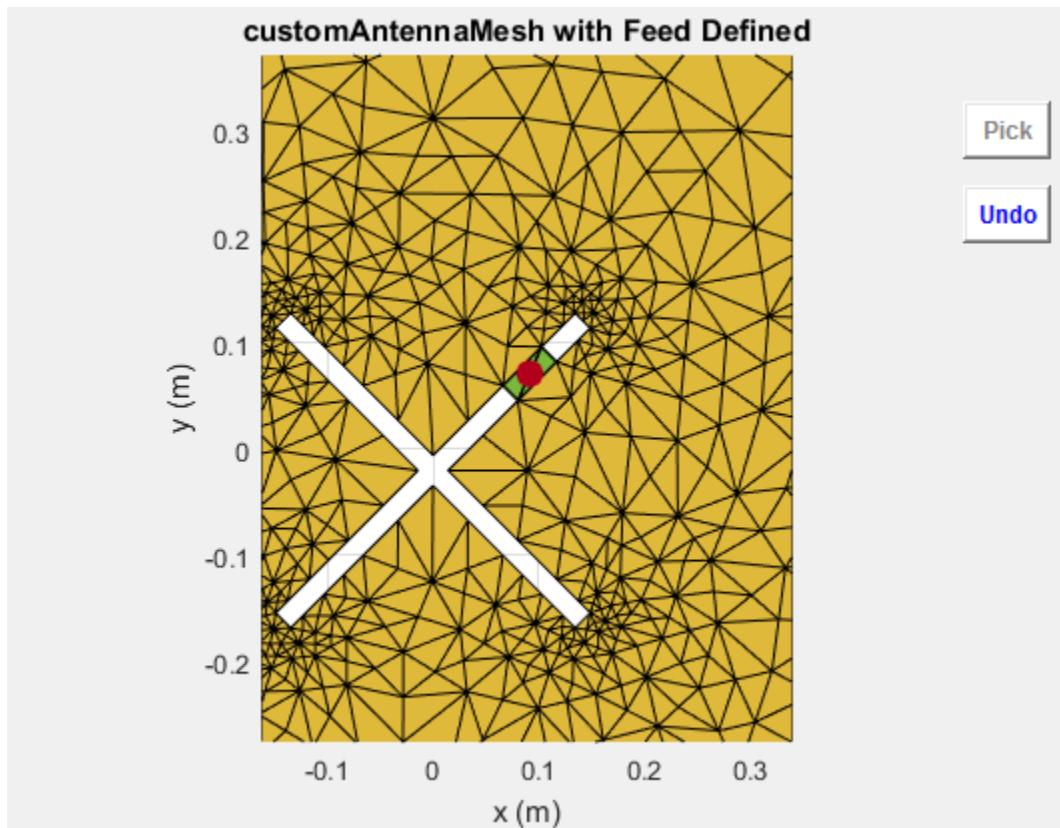

Click **Pick** to display the cross-hairs. To specify a region for the feed point, zoom in and select two points, one inside each triangle on either side of the air gap. Select the points using the crosshairs.

Selecting the second triangle creates and displays the antenna feed.

## Create Feed for Custom Mesh Antenna Using Triangles Sharing Edge

Load a 2-D custom mesh. Create a custom antenna using the points and triangles.

```
load planarmesh.mat
c = customAntennaMesh(p,t)

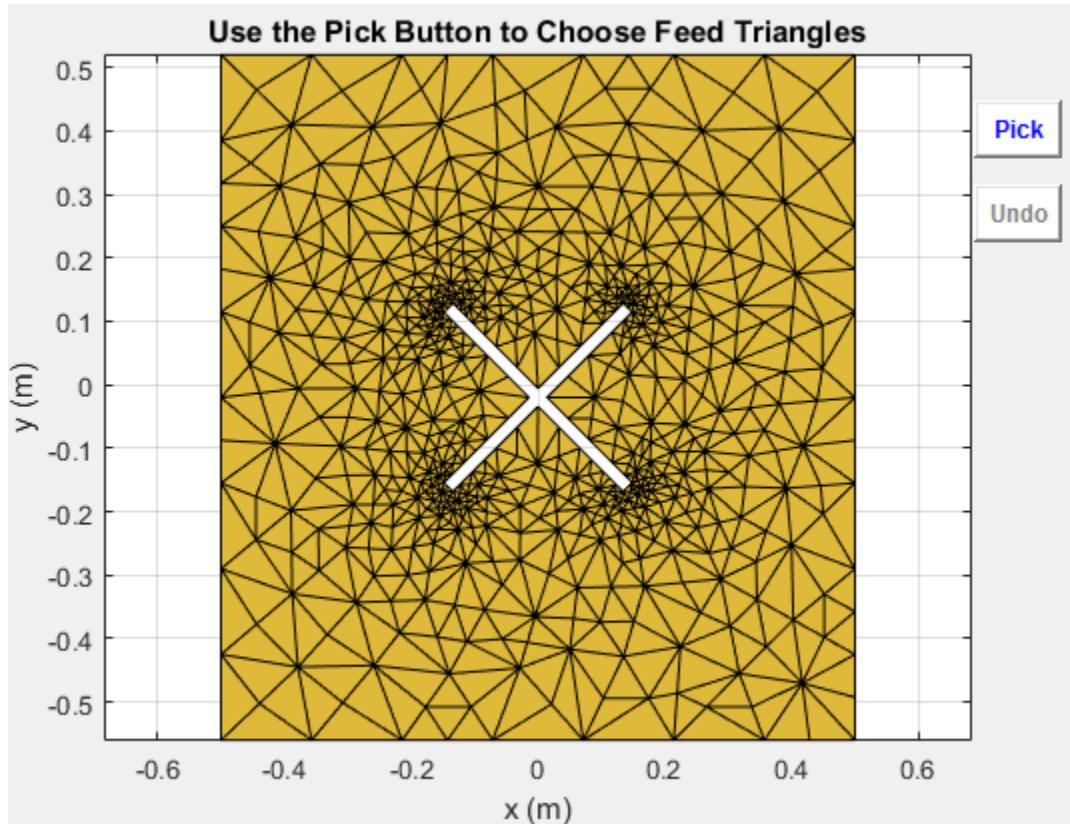

c =
    customAntennaMesh with properties:

        Points: [3x658 double]
        Triangles: [4x1219 double]
        FeedLocation: []
```

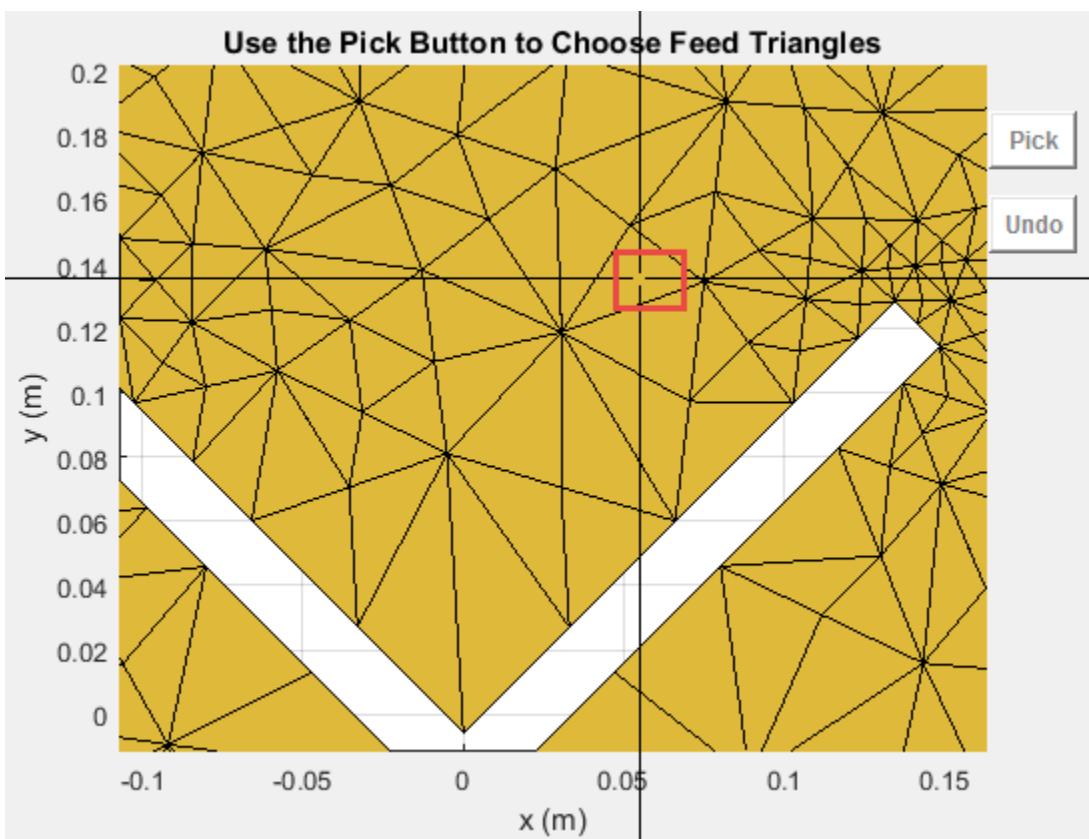

```
Tilt: 0  
TiltAxis: [1 0 0]
```

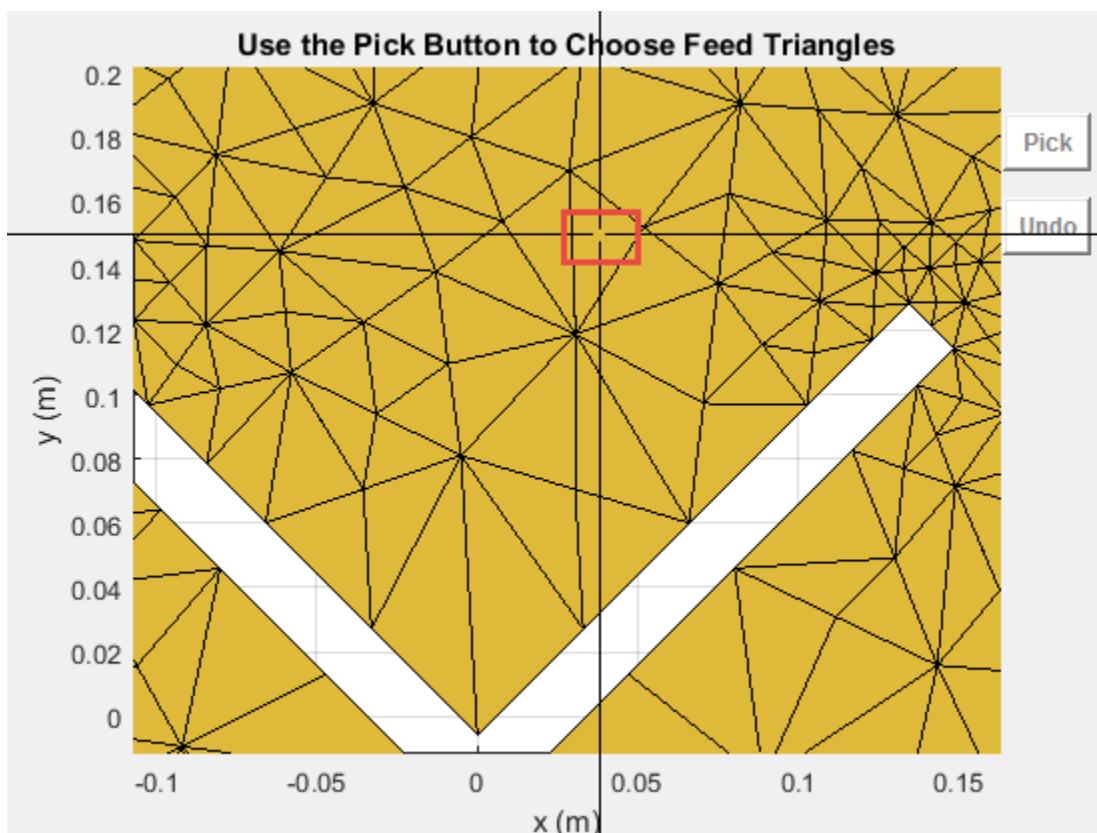

Use the `createFeed` function to view the antenna mesh structure. In this antenna mesh view, you see **Pick** and **Undo** buttons. The **Pick** button is highlighted.

```
createFeed(c)
```

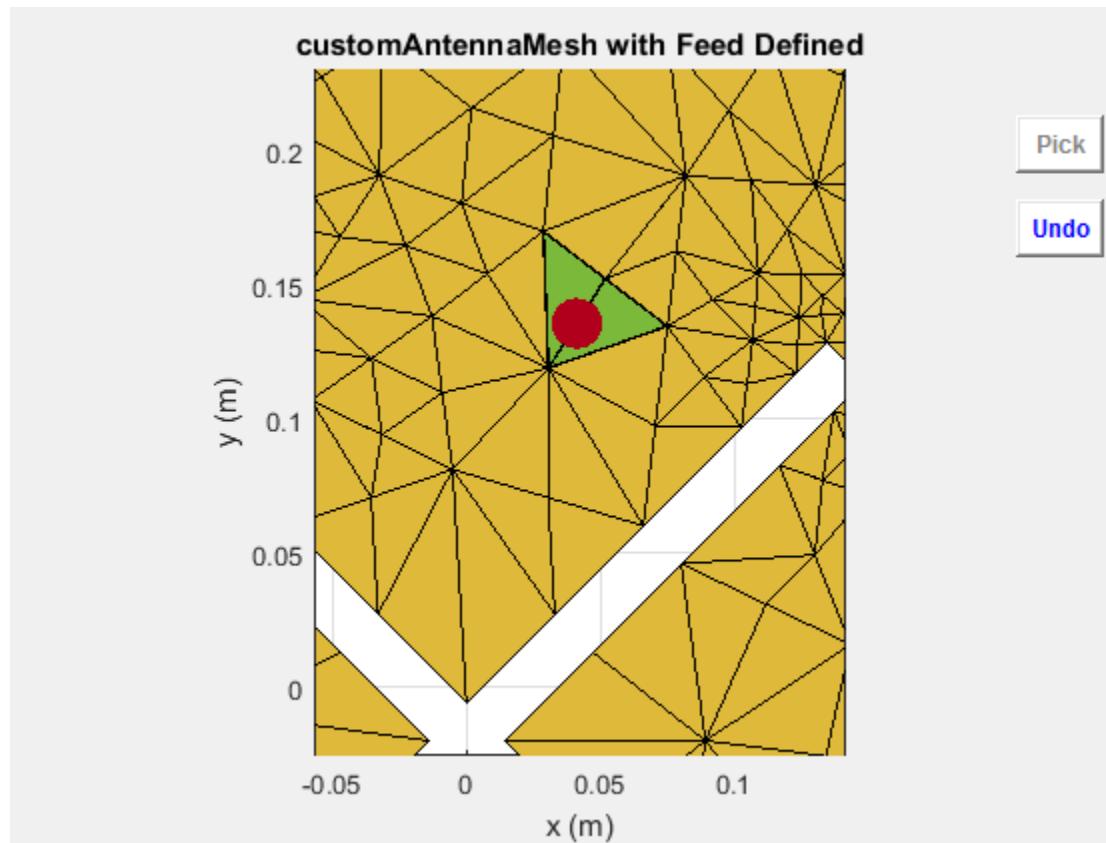

Click **Pick** to display the cross-hairs. To specify a region for the feed point, zoom in and select two points, one inside each triangle sharing an edge. Select the points using the cross-hairs.

Selecting the second triangle creates and displays the antenna feed.

### Create Feed for Custom Antenna Mesh

Load a 2-D custom mesh using the `planarmesh.mat`. Create a custom antenna using the points and triangles.

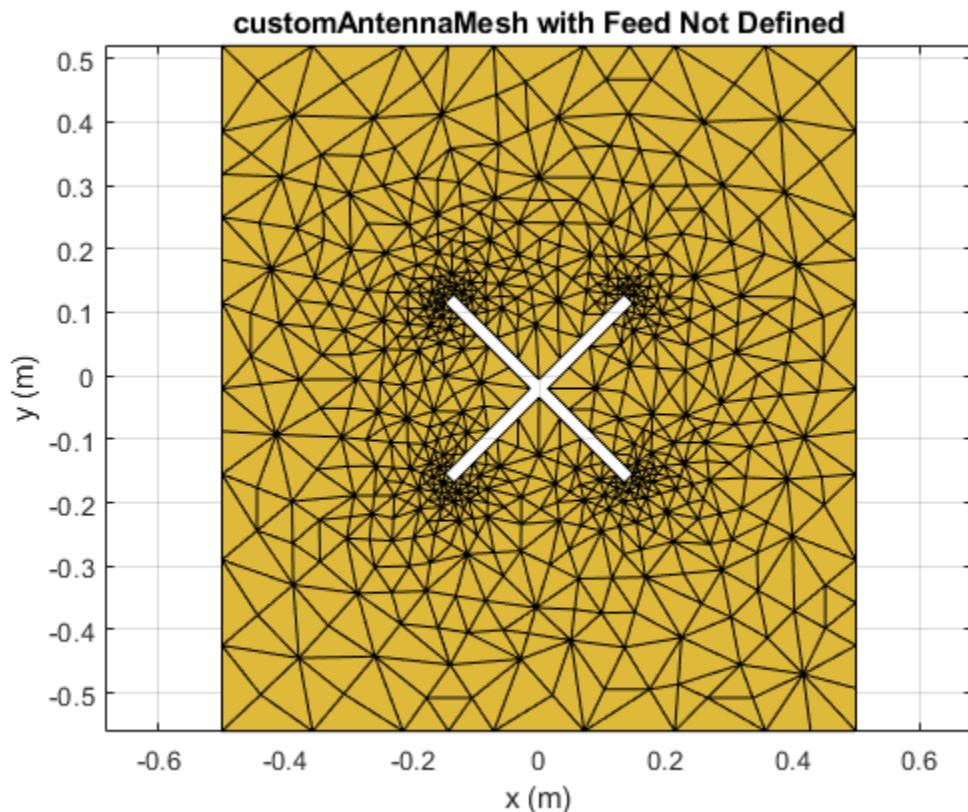

```
load planarmesh.mat
c = customAntennaMesh(p,t)

c =
    customAntennaMesh with properties:

        Points: [3x658 double]
        Triangles: [4x1219 double]
```

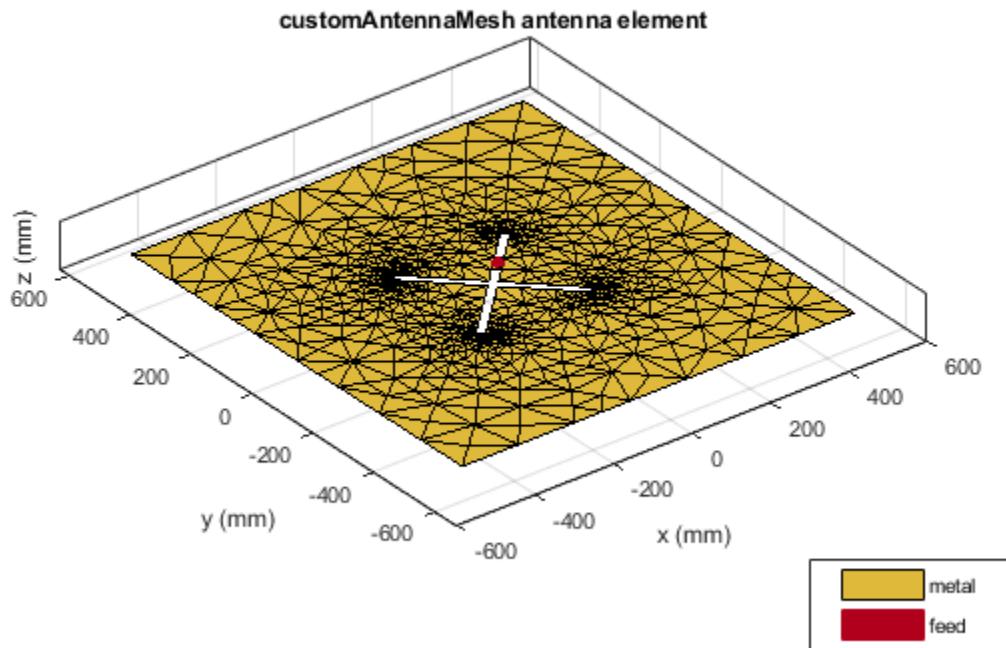

```
FeedLocation: []
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]
```

```
show (c)
```

Create the feed for the custom antenna across the points (0.07,0.01) and (0.05,0.05) meters respectively.

```
createFeed(c, [0.07,0.01], [0.05,0.05])
show(c)
```

# EHfields

Electric and magnetic fields of antennas; Embedded electric and magnetic fields of antenna element in arrays

## Syntax

```
[e,h] = EHfields(object,frequency)
EHfields(object,frequency)

[e,h] = EHfields(object,frequency,points)
EHfields(object, frequency, points)

EHfields(____,Name,Value)
```

## Description

[e,h] = EHfields(object,frequency) calculates the *x*, *y*, and *z* components of electric field and magnetic field of an antenna or array object at a specified frequency.

EHfields(object,frequency) plots the electric and magnetic field vectors at specified frequency values and at specified points in space.

[e,h] = EHfields(object,frequency,points) calculates the *x*, *y*, and *z* components of electric field and magnetic field of an antenna or array object. These fields are calculated at specified points in space and at a specified frequency.

EHfields(object, frequency, points) plots the electric and magnetic field vectors at specified frequency values and at specified points in space.

EHfields(\_\_\_\_,Name,Value) plots the electric and magnetic field vectors with additional options specified by one or more Name Value pair arguments using any of the preceding syntaxes.

Use the 'ElementNumber' and 'Termination' property to calculate the embedded electric and magnetic fields of the antenna element in an array connected to a voltage source. The voltage source model consists of an ideal voltage source of 1 volt in series

with a source impedance. The embedded pattern includes the effect of mutual coupling due to the other antenna elements in the array.

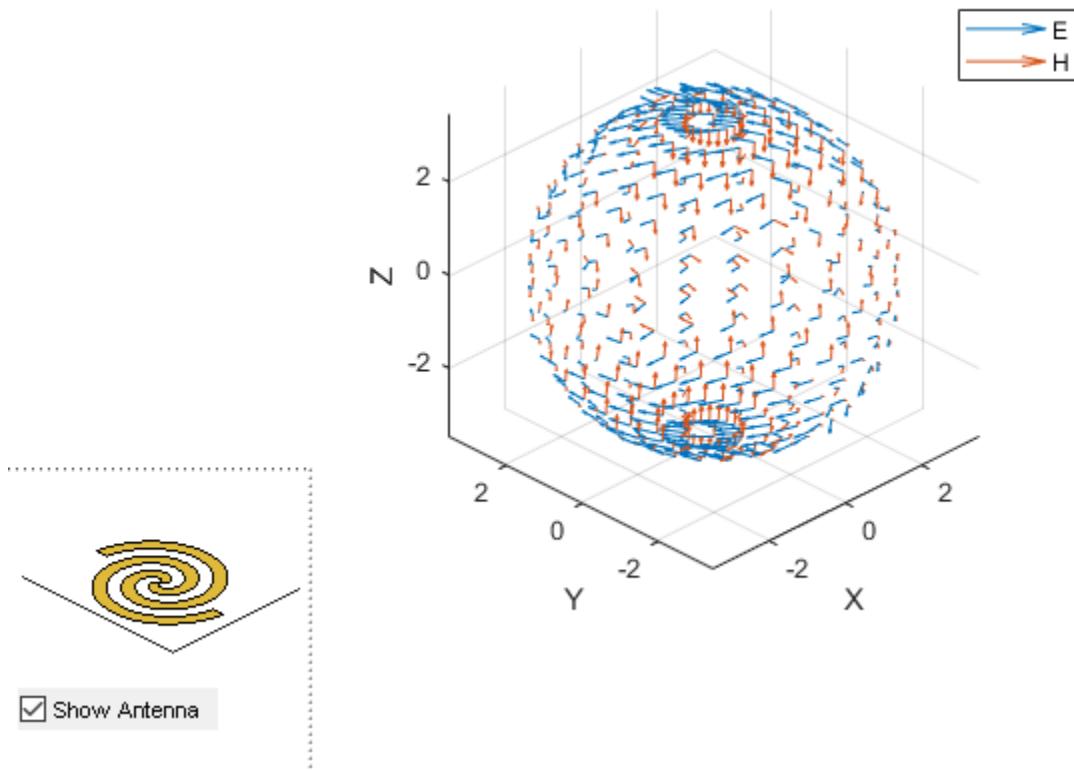

## Examples

### Plot E and H Fields of Antenna

Plot electric and magnetic fields of a default Archimedean spiral antenna.

```
h = spiralArchimedean;  
EHfields(h,4e9)
```

### Electric (E) and Magnetic (H) Field

### Calculate EH Fields of Antenna

Calculate electric and magnetic fields at a point 1m along the z-axis from an Archimedean spiral antenna.

```
h = spiralArchimedean;
[e,h] = EHfields(h, 4e9, [0;0;1])

e =
-0.4283 - 0.2675i
-0.3047 + 0.4377i
0.0000 - 0.0000i
```

```
h =
 0.0008 - 0.0012i
-0.0011 - 0.0007i
-0.0000 - 0.0000i
```

### Plot Electric and Magentic Field Vector of Antenna

Create an Archimedean spiral antenna. Plot electric and magnetic field vector at the z = 1cm plane from the antenna.

```
h = spiralArchimedean;
```

Define points on a rectangular grid in the X-Y plane.

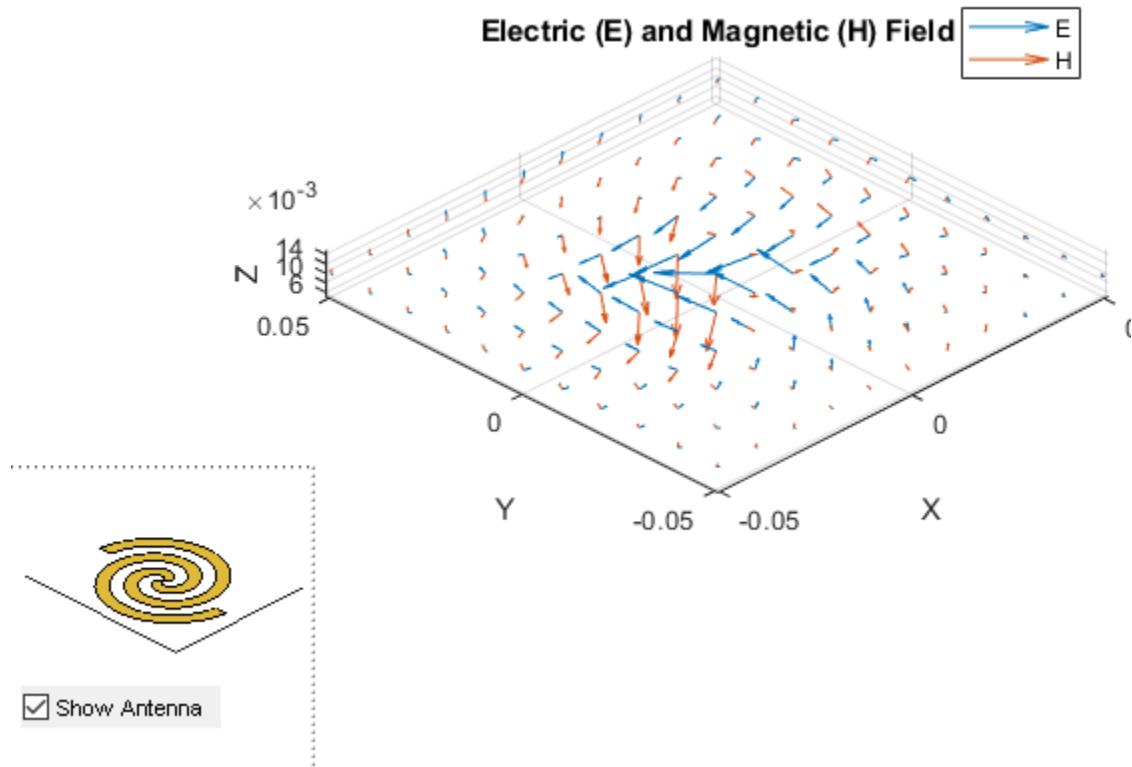

```
[X,Y] = meshgrid(-.05:.01:.05,-.05:.01:.05);
```

Add a z-offset of 0.01.

```
p = [X(:)';Y(:)';.01*ones(1,prod(size(X)))];
```

Plot electric and magnetic field vector at the z = 1cm plane. from the antenna

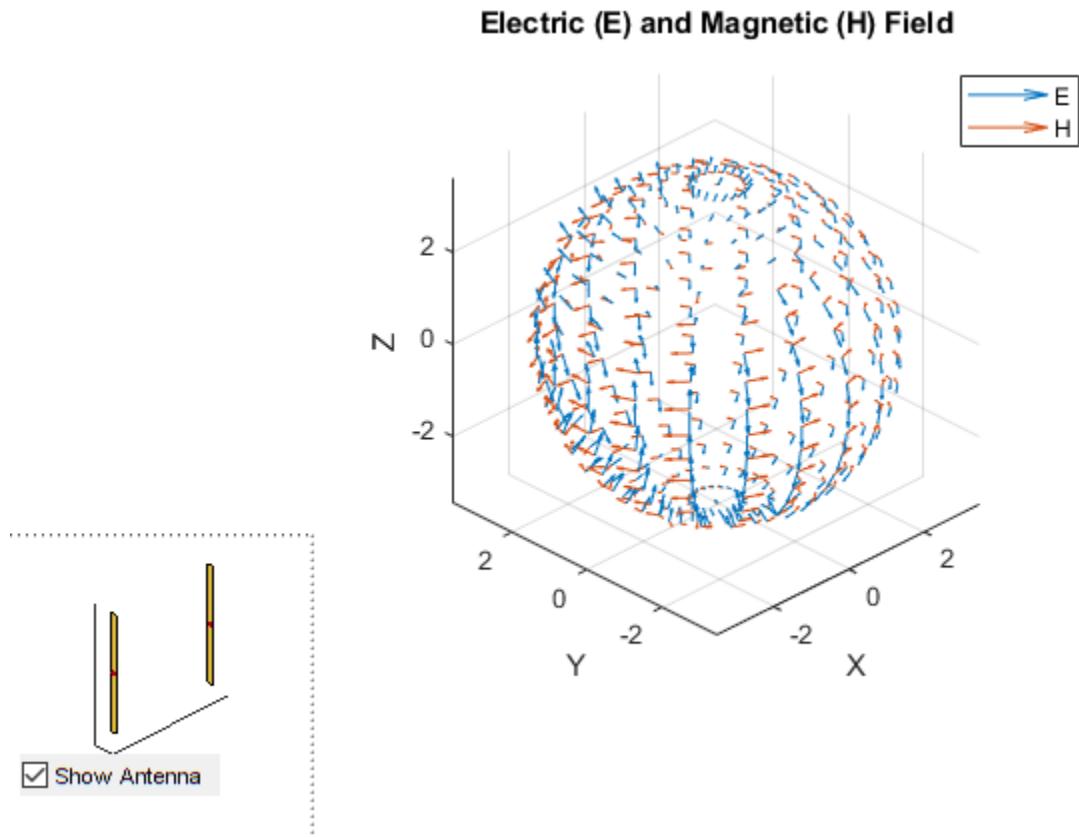

```
EHfields (h,4e9,p)
```

### Embedded Vector Fields of Linear Array

Plot the embedded vector fields of a linear array when the first element is excited and all the other antenna elements are terminated using 50-ohm resistance.

```
l = linearArray;  
EHfields(l, 70e6, 'ElementNumber', 1, 'Termination', 50);
```

## Input Arguments

**object** — Antenna or array object

scalar handle

Antenna or array object, specified as a scalar handle.

Example: `h = spiralArchimedean`

Data Types: `function_handle`

**frequency** — Frequency used to calculate electric and magnetic fields

scalar in Hz

Frequency used to calculate electric and magnetic fields, specified as a scalar in Hz.

Example: 70e6

Data Types: double

#### **points — Cartesian coordinates of points in space**

3-by- $p$  complex matrix

Cartesian coordinates of points in space, specified as a 3-by- $p$  complex matrix.  $p$  is the number of points at which to calculate the E-H field.

Example: [0;0;1]

Data Types: double

## **Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'ScaleFields', [2 0.5] specifies scalar values of the electric and magnetic fields

#### **ScaleFields — Value by which to scale electric and magnetic fields**

two-element vector

Value by which to scale the electric and magnetic fields, specified as the comma-separated pair consisting of 'ScaleFields' and a two-element vector. The first element scales the E field and the second element scales the H-field. A value of 2 doubles the relative length of either field. A value of 0.5 halves the length of either field. A value of 0 plots either field without automatic scaling.

Example: 'ScaleFields',[2 0.5]

Data Types: double

#### **ViewField — Field to display**

'E' | 'H'

Field to display, specified as the comma-separated pair consisting of 'ViewField' and a text input. 'E' displays the electric field and 'H' displays the magnetic field.

Example: 'ViewField', 'E'

Data Types: char

**ElementNumber — Antenna element in array**

scalar

Antenna element in array, specified as the comma-separated pair consisting of 'ElementNumber' and scalar. This antenna element is connected to the voltage source.

---

**Note** Use this property to calculate the embedded pattern of an array.

---

Example: 'ElementNumber',1

Data Types: double

**Termination — Impedance value for array element termination**

50 (default) | scalar

Impedance value for array element termination, specified as the comma-separated pair consisting of 'Termination' and scalar. The impedance value terminates other antenna elements of an array while calculating the embedded pattern of the antenna connected to the voltage source.

---

**Note** Use this property to calculate the embedded pattern of an array.

---

Example: 'Termination',40

Data Types: double

## Output Arguments

**e — x, y, z components of electrical field**

3-by- $p$  complex matrix in V/m

$x, y, z$  components of electrical field, returned as 3-by- $p$  complex matrix in V/m. The dimension  $p$  is the Cartesian coordinates of points in space.

**h — x, y, z components of magnetic field**3-by- $p$  complex matrix in H/m

$x, y, z$  components of magnetic field, returned as a 3-by- $p$  complex matrix in H/m. The dimension  $p$  is the Cartesian coordinates of points in space.

## See Also

[axialRatio](#) | [beamwidth](#)**Introduced in R2015a**

## axialRatio

Axial ratio of antenna

### Syntax

```
axialRatio(antenna,frequency,azimuth,elevation)  
ar= axialRatio(antenna,frequency,azimuth,elevation)
```

### Description

`axialRatio(antenna,frequency,azimuth,elevation)` plots axial ratio of an antenna over a specified frequency, and in the direction specified by azimuth and elevation. Any one among frequency, azimuth, or elevation values must be scalar. If only one of the values are scalar, the plot is 3-D. If two values are scalar, the plot is 2-D.

`ar= axialRatio(antenna,frequency,azimuth,elevation)` returns the axial ratio of an antenna, over the specified frequency, and in the direction specified by, azimuth and elevation.

### Examples

#### Calculate Axial Ratio of Antenna

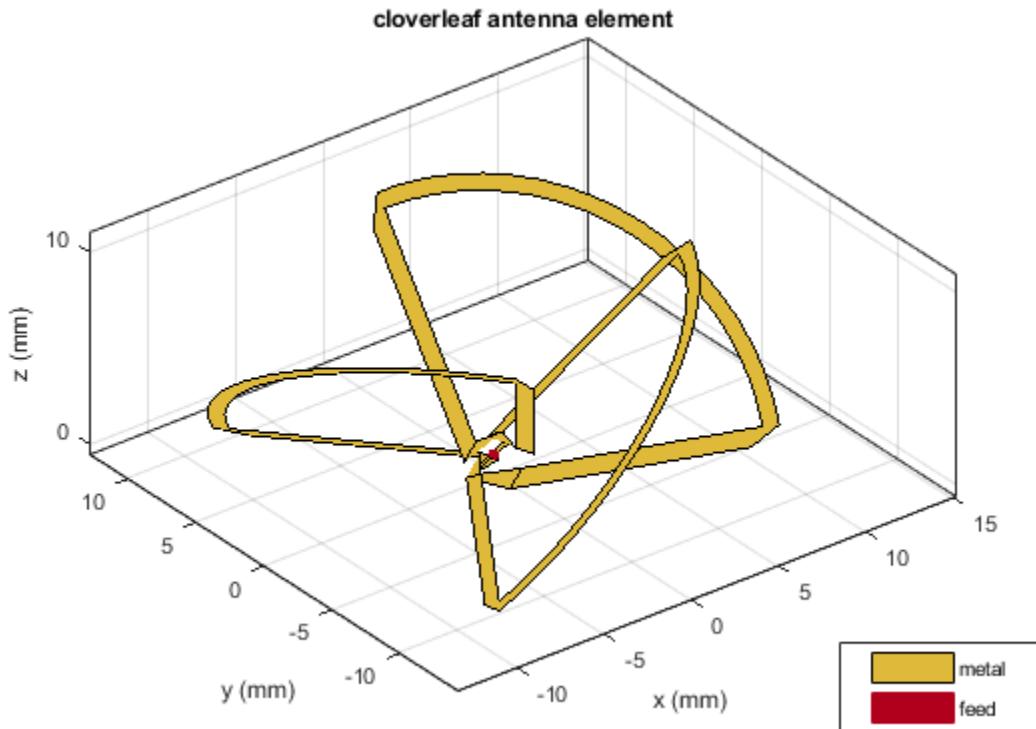

Calculate the axial ratio of an equiangular spiral antenna at azimuth=0 and elevation=0.

```
s = spiralEquiangular;  
ar = axialRatio(s,3e9,0,0)  
  
ar = Inf
```

## Axial Ratio of Cloveleaf Antenna

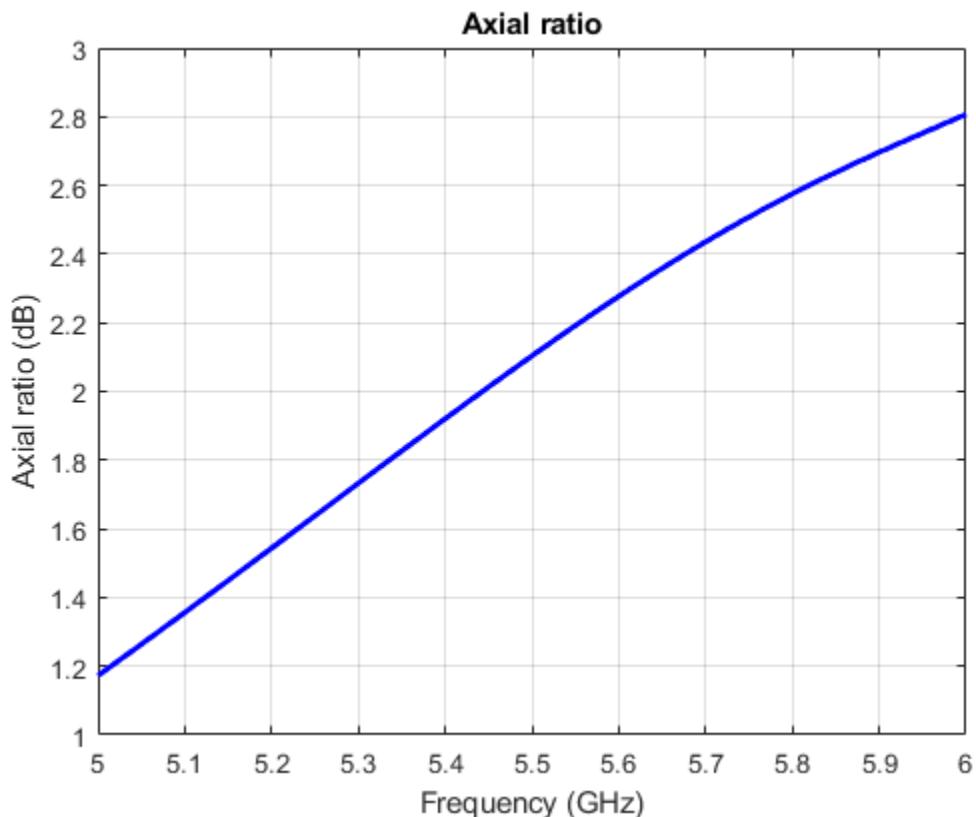

Create a cloverleaf antenna.

```
cl = cloverleaf;
show(cl);
```

Plot the axial ratio of the antenna from 5 GHz to 6 GHz.

```
freq = linspace(5e9,6e9,101);
axialRatio(cl,freq,0,0);
```

You can see from the axial ratio plot that the antenna supports circular polarization over the entire frequency range.

## Input Arguments

**antenna** — Antenna element  
object

Antenna object, specified as an object.

**frequency** — Frequency used to calculate axial ratio  
scalar | vector

Frequency used to calculate axial ratio, specified as a scalar or vector with each element in Hz.

Example: 70e6

Data Types: `double`

**azimuth — Azimuth angle of antenna**

scalar | vector

Azimuth angle of antenna, specified as a scalar or vector with each element in degrees.

**elevation — Elevation angle of antenna**

scalar | vector

Elevation angle of antenna, specified as a scalar or vector with each element in degrees.

## Output Arguments

**ar — Axial ratio of antenna**

scalar in dB

Axial ratio of antenna, returned as a scalar in dB.

## See Also

`beamwidth` | `pattern`

Introduced in R2015a

## beamwidth

Beamwidth of antenna

### Syntax

```
beamwidth(antenna,frequency,azimuth,elevation)
[bw] = beamwidth(antenna,frequency,azimuth,elevation,dBdown)

[bw,angles] = beamwidth(____)
```

### Description

`beamwidth(antenna,frequency,azimuth,elevation)` plots the beamwidth of the input antenna at a specified frequency. The beamwidth is the angular separation at which the magnitude of the directivity pattern decreases by a certain value from the peak of the main beam. The directivity decreases in the direction specified by azimuth and elevation angles of the antenna.

`[bw] = beamwidth(antenna,frequency,azimuth,elevation,dBdown)` returns the beamwidth of the antenna at a specified dBdown value from the peak of the radiation pattern's main beam.

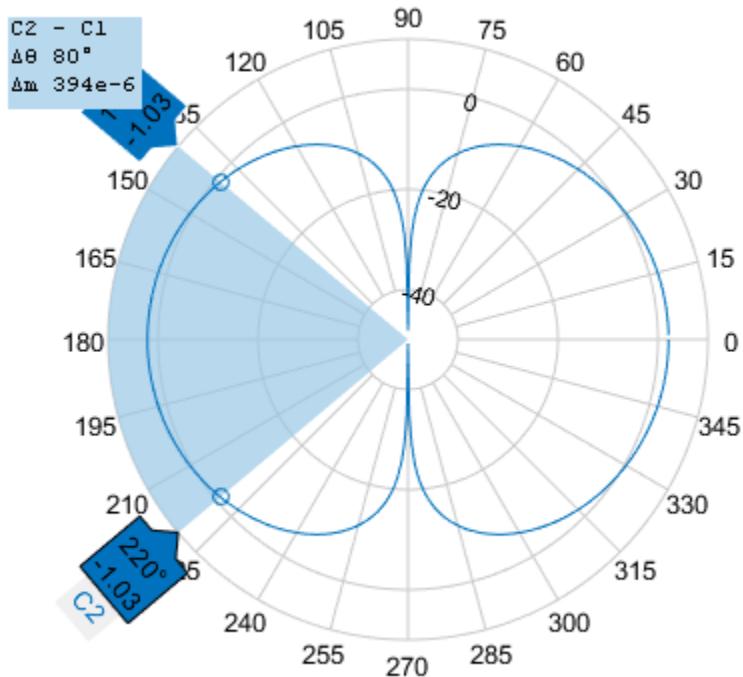

`[bw,angles] = beamwidth(____)` returns the beamwidth and angles (points in a plane) using any input arguments from previous syntaxes.

### Examples

#### Plot Beamwidth of Dipole Antenna

Plot the beamwidth for a dipole antenna at azimuth=0 and elevation=1:1:360 (x-z plane)

```
d = dipole;
beamwidth(d,70e6,0,1:1:360);
```

### Calculate Beamwidth and Angles of Antenna

Calculate the beamwidth of a helix antenna and the angles of the beamwidth. The antenna has an azimuth angle of 1:1:360 degrees, an elevation angle of 0 degrees on the X-Y plane, and a dBdown value of 5 dB.

```

hx = helix;
[bw,angles] = beamwidth(hx,2e9,1:1:360,0,5)

bw = 140
angles =

```

147      287

## Input Arguments

### **antenna** — Antenna object

scalar handle

Antenna object, specified as a scalar handle.

### **frequency** — Frequency used to calculate beamwidth

scalar in Hz

Frequency to calculate beamwidth, specified as a scalar in Hz.

Example: 70e6

Data Types: double

### **azimuth** — Azimuth angle of antenna

scalar in degrees | vector in degrees

Azimuth angle of the antenna, specified as a scalar or vector in degrees. If the elevation angle is specified as a vector, then the azimuth angle must be a scalar.

Example: 3

Data Types: double

### **elevation** — Elevation angle of antenna

scalar in degrees | vector in degrees

Elevation angle of the antenna, specified as a scalar or vector in degrees. If the azimuth angle is specified as a vector, then the elevation angle must be a scalar.

Example: 1:1:360

Data Types: double

### **dBdown** — Power point from peak of main beam of antenna

3 (default) | scalar in dB

Power point from peak of main beam of antenna, specified as a scalar in dB.

Example: 5

Data Types: double

## Output Arguments

### **bw — Beamwidth of antenna**

scalar in degrees

Beamwidth of antenna, returned as a scalar in degrees.

### **angles — Points on plane**

vector in degrees

Points on plane used to measure beamwidth, returned as a vector in degrees.

`axialRatio` | `pattern`

Introduced in R2015a

# mesh

Mesh properties of metal or dielectric antenna or array structure

## Syntax

```
mesh(object)
mesh(shape)
mesh(object,Name,Value)
meshdata = mesh(___,Name,Value)
```

## Description

`mesh(object)` plots the mesh used to analyze antenna or array element.

`mesh(shape)` plots the mesh for the shapes.

`mesh(object,Name,Value)` changes and plots the mesh structure of an antenna or array element, using additional options specified by the name-value pairs. You can also determine the number of unknowns from the number of basis functions in the output.

`meshdata = mesh(___,Name,Value)` returns a mesh structure that specifies the properties used to analyze the antenna or array.

## Examples

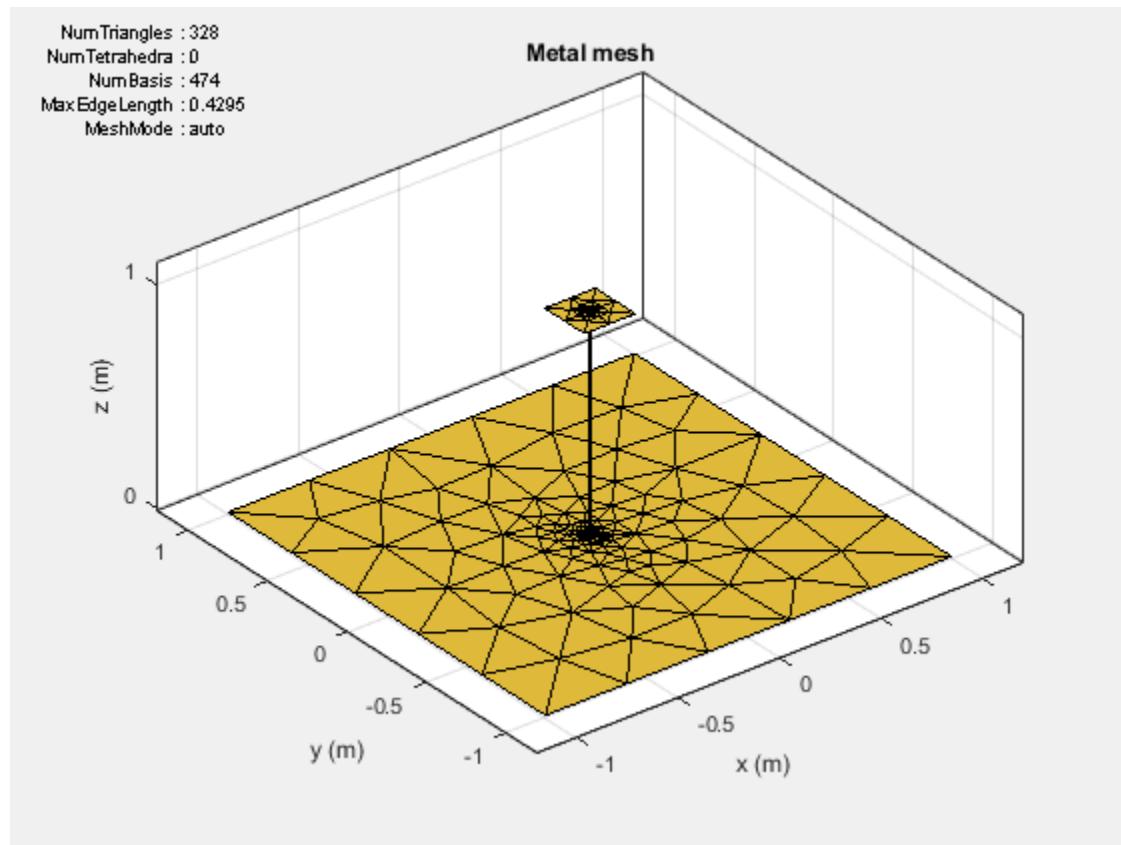

### View Mesh Structure of Antenna

Create and view the mesh structure of a top hat monopole antenna with Maximum edge length of 0.1 m.

```
h = monopoleTopHat;
i = impedance(h,75e6)
mesh(h)
m = mesh(h)
```

```
i =  
2.6400e+02 + 5.9757e+02i
```

```
m =  
struct with fields:  
    NumTriangles: 328  
    NumTetrahedra: 0  
    NumBasis: 474  
    MaxEdgeLength: 0.4295  
    MeshMode: 'auto'
```

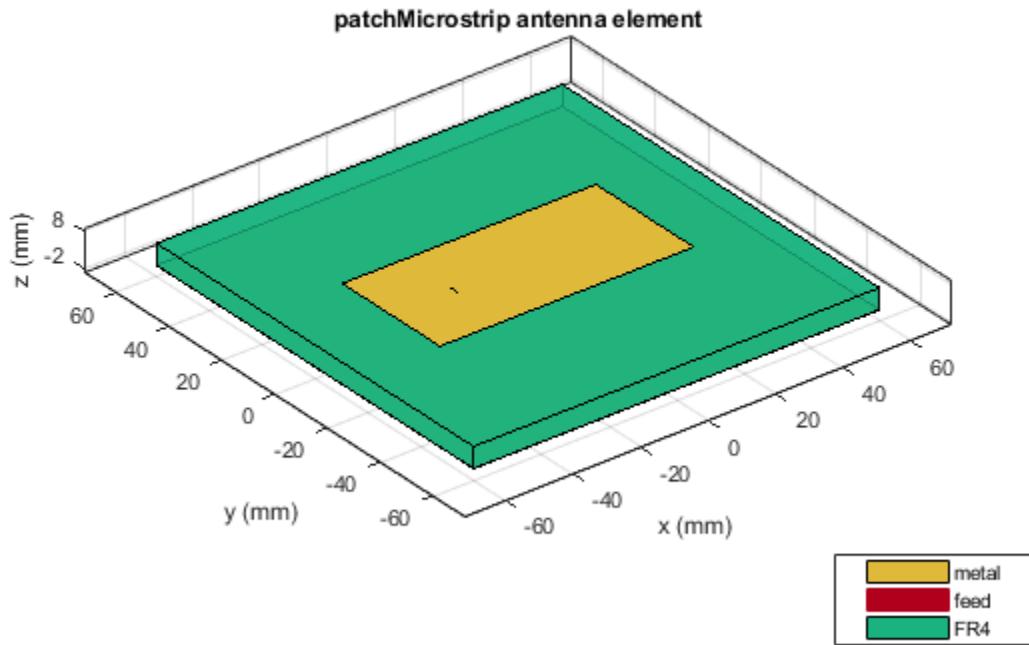

### Mesh Microstrip Patch Metal-Dielectric Antenna

### Radiation Pattern of Microstrip Patch Antenna

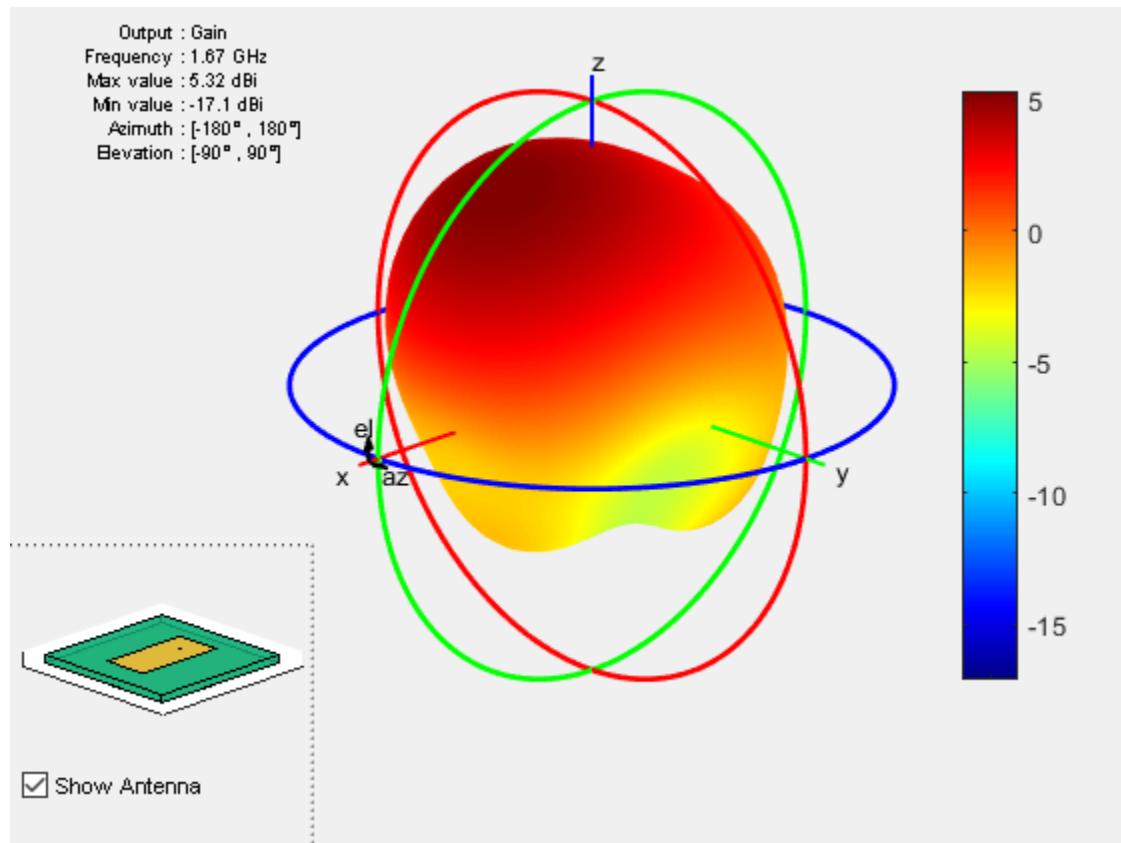

Create a microstrip patch antenna using 'FR4' as the dielectric substrate.

```
d = dielectric('FR4');
pm = patchMicrostrip('Length',75e-3, 'Width',37e-3,
    'GroundPlaneLength',120e-3, 'GroundPlaneWidth',120e-3, ...
    'Substrate',d);
show(pm)
```

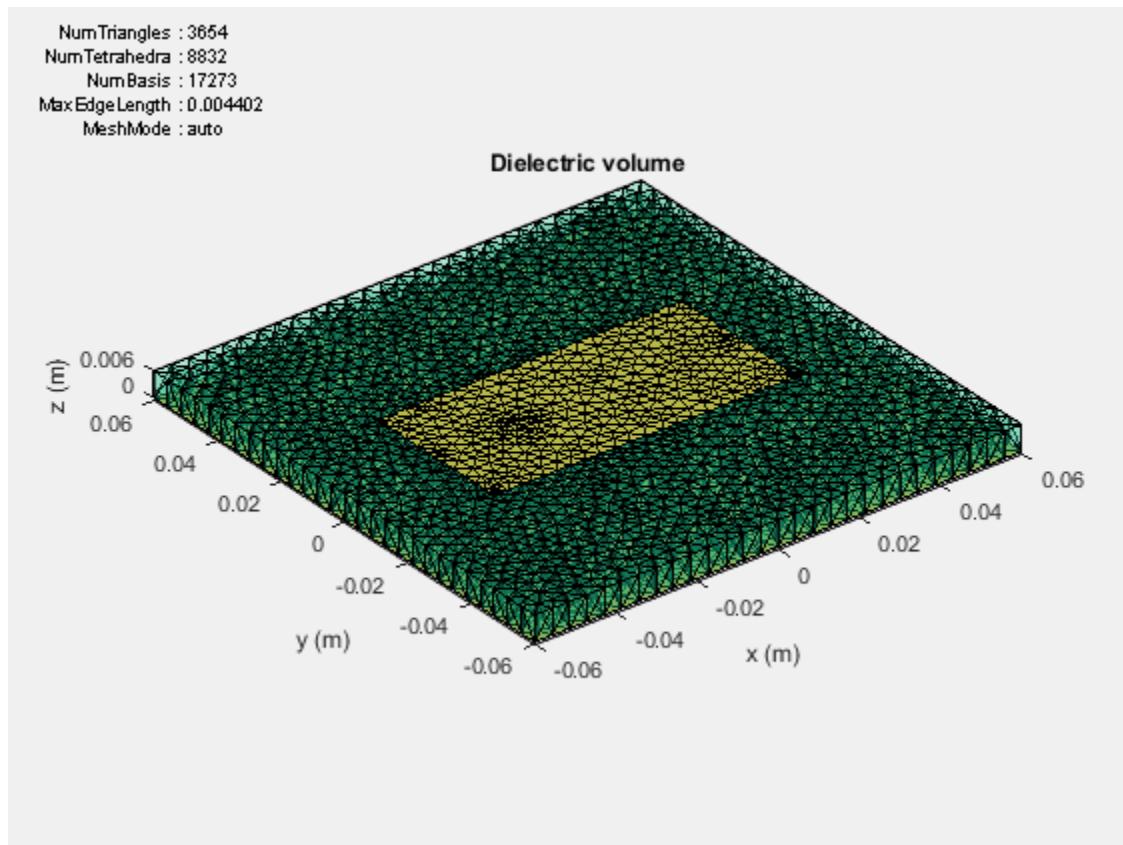

Plot the radiation pattern of the antenna at a frequency of 1.67 GHz.

```
figure  
pattern(pm,1.67e9)
```

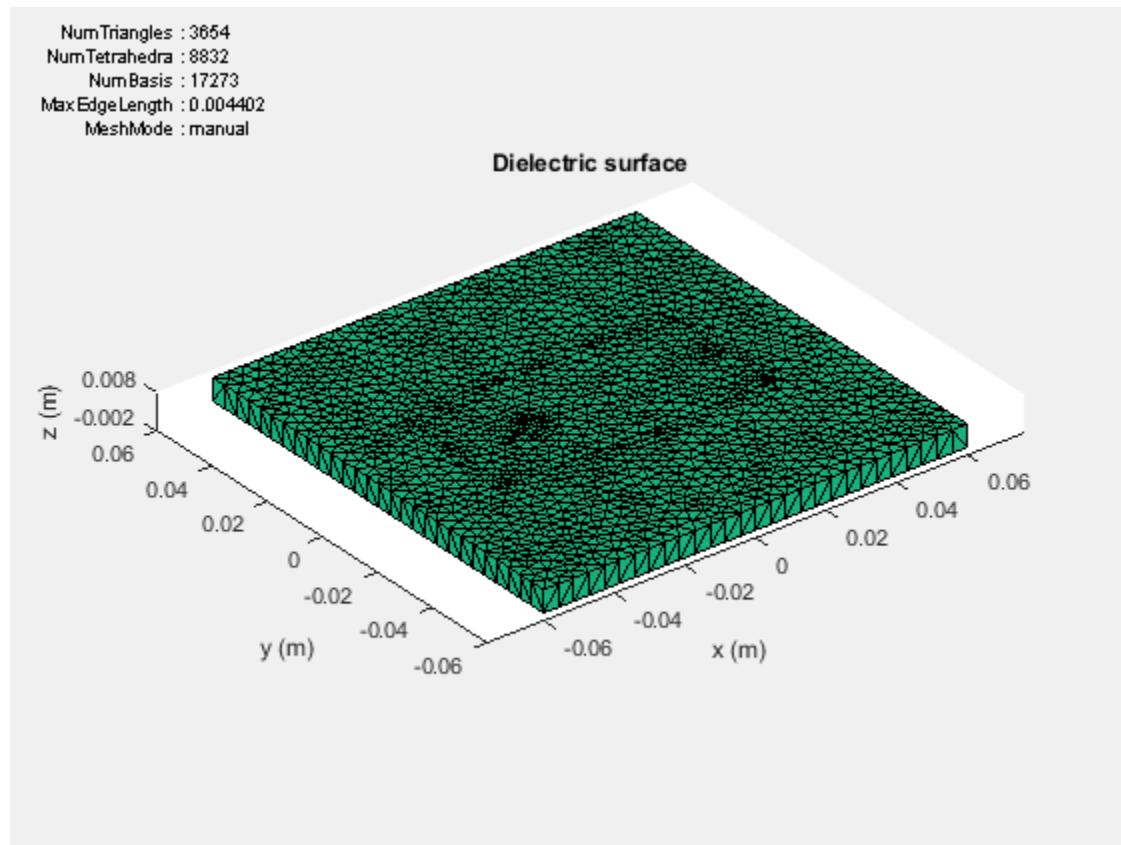

Mesh the whole antenna.

```
figure  
mesh(pm)
```

Mesh only the dielectric surface of the antenna.

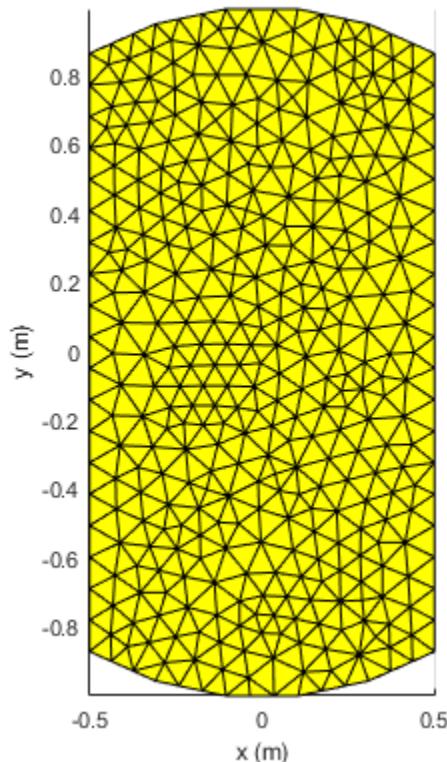

```
figure  
mesh(pm, 'View', 'dielectric surface')
```

### Mesh Arbitrary Shape

Create a rectangular and circular shape, intersect them and mesh at a wavelength of 2 m.

```
r = antenna.Rectangle;  
c = antenna.Circle;  
p = r&c;  
mesh(p,2);
```

## Input Arguments

**object** — Antenna or array element  
object

Antenna or array element, specified as an object.

**shape** — Shape created using custom elements and shape objects  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle. You can create the shapes using `antenna.Circle`, `antenna.Polygon`, or `antenna.Rectangle`.

Example: `c = antenna.Rectangle; mesh(c)`

### Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` pair arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'MaxEdgeLength', 0.1`

**MaxEdgeLength** — Maximum edge length of triangles in mesh  
scalar

Maximum edge length of triangles in mesh, specified as a comma-separated pair consisting of `'MaxEdgeLength'` and a scalar. All triangles in the mesh have sides less than or equal to the `'MaxEdgeLength'` value.

Data Types: `double`

**MinEdgeLength** — Minimum edge length of triangles in mesh  
scalar

Minimum edge length of triangles in mesh, specified as a comma-separated pair consisting of `'MinEdgeLength'` and a scalar. All triangles in the mesh have sides less than or equal to the `'MinEdgeLength'`.

---

**Note** You can use this property only with the `pcbStack` object.

---

Data Types: `double`

**GrowthRate** — Mesh growth rate  
0.7 (default) | scalar

Mesh growth rate, specified as a comma-separated pair consisting of 'GrowthRate' and a scalar. The default value of 0.7 states that the growth rate of the mesh is 70 percent. Growth rate values lie between 0 and 1.

---

**Note** You can use this property only with the `pcbStack` object.

---

Data Types: double

**View — Customize mesh view of antenna or array element**

'all' (default) | 'metal' | 'dielectric surface' | 'dielectric volume'

Customize mesh view of antenna or array element, specified as a comma-separated pair consisting of 'View' and 'all', 'metal', 'dielectric surface', or 'dielectric volume'.

You choose 'dielectric surface' to view the boundary triangle mesh of the dielectric. You choose 'dielectric volume' to view the tetrahedral volume mesh of the dielectric.

Data Types: char

## See Also

`meshconfig` | `plot` | `show`

**Introduced in R2015a**

## layout

Display array layout

### Syntax

```
layout(array)
```

### Description

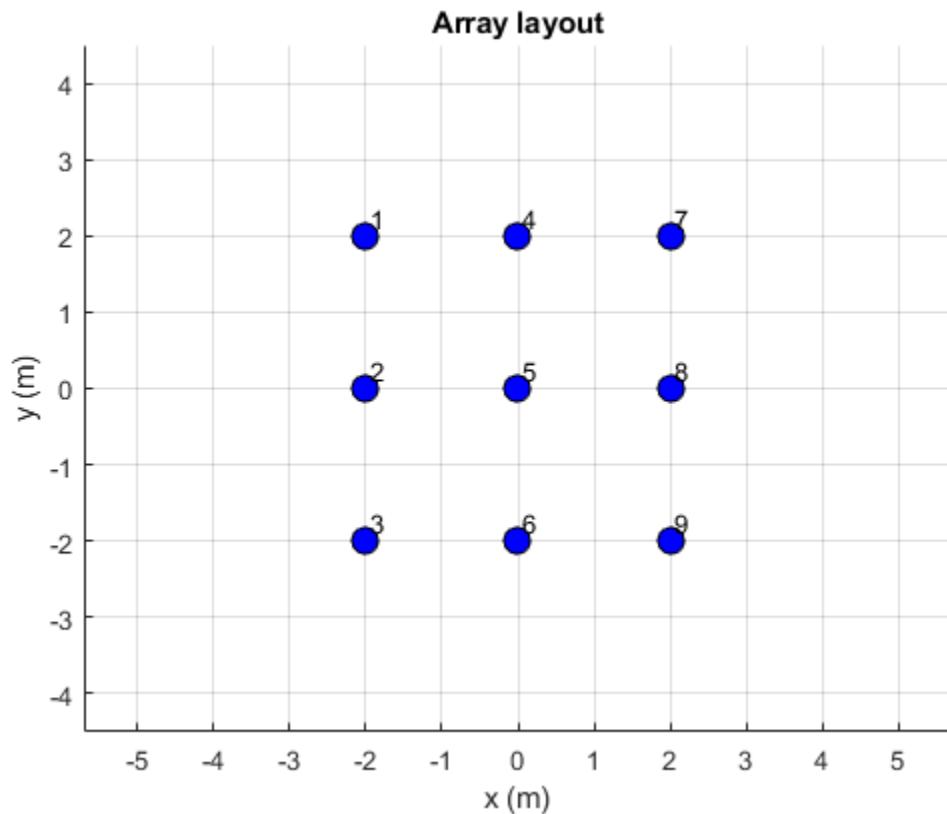

`layout(array)` displays the layout of the array object. The circles in the layout corresponds to antenna feed points within the array.

### Examples

#### Display Array Layout on X-Y Plane

Create and view a 3x3 rectangular array layout on the X-Y plane.

```
h = rectangularArray('Size',[3 3]);  
layout(h)
```

## Input Arguments

**array — Array object**

scalar handle

Array object, specified as a scalar handle.

## See Also

`show`

**Introduced in R2015a**

# **lumpedElement**

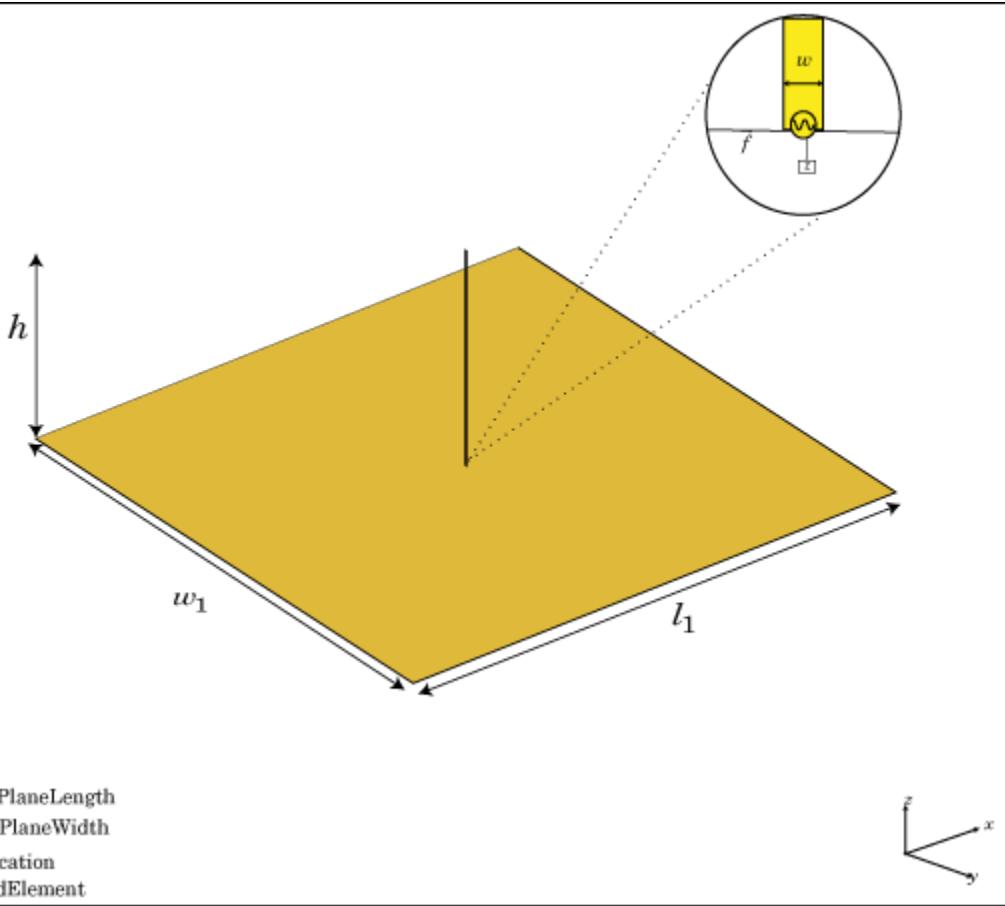

Lumped element circuit to load antenna

## **Syntax**

```
le = lumpedElement  
le = lumpedElement(Name,Value)
```

## **Description**

`le = lumpedElement` creates a lumped element circuit. The default value is an empty `lumpedElement` object.

$h$  = Height

$w$  = Width

$l_1$  = GroundPlaneLength

$w_1$  = GroundPlaneWidth

$\vec{f}$  = FeedLocation

$Z$  = lumpedElement

When you load an antenna using a lumped resistor, capacitor, or inductor, the electrical properties of the antennas changes. These lumped elements are typically added to the antenna feed. You can use lumped elements to increase the bandwidth of the antenna without increasing the size of the antenna.

`le = lumpedElement(Name,Value)` returns the lumped element circuit based on the properties specified by one or more `Name,Value` pair arguments.

## Examples

## Antenna Using Frequency Independent Load

Create a resistor with 50 Ohms of impedance. Any pure resistive load has a nonvariable impedance when the frequency changes.

```
le = lumpedElement('Impedance',50);
```

Create a dipole antennna. Calculate the impedance of the antenna without loading the antenna.

```
d = dipole;
i1 = impedance(d,70e6)

i1 =
75.0112 + 0.5740i
```

Load the antenna using frequency-independent resistor. Calculate the impedance of the antenna. frequency-independent resistor.

```
d.Load = le;
i1e1 = impedance(d,70e6)

i1e1 =
1.2501e+02 + 5.7402e-01i
```

Change the frequency to 85 MHz and calculate the impedance of the antenna.

```
i1e2 = impedance(d,85e6)

i1e2 =
1.9802e+02 + 1.0246e+02i
```

## Antenna With Two Loads at Arbitrary Locations

Create a dipole antenna using one load at antenna feed and one load at location above the antenna feed.

Create a dipole antenna.

```
d = dipole;
```

Create a two lumped elements to load at the dipole antenna.

One lumped element of impedance, 50 Ohms, loads the antenna at the feed.

```
l1 = lumpedElement('Impedance', complex(50, -20), 'Location', 'feed');
```

The second lumped element of complex impedance,  $50 + j \cdot 20$  Ohms, loads the antenna at the top. Locate the load half distance from the feed.

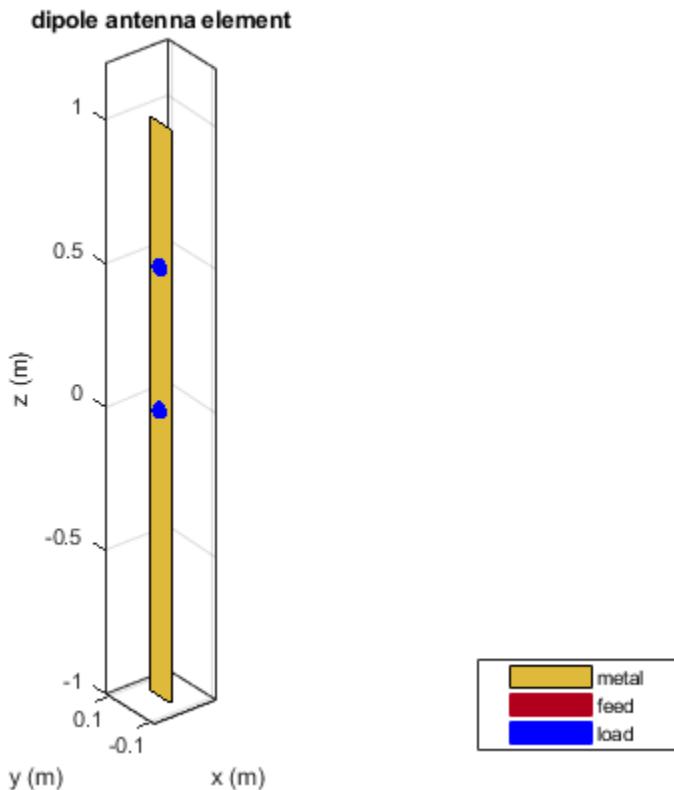

```
l2 = lumpedElement('Impedance', complex(50, -20), 'Location', [0 0 0.5]);
```

Add the two loads to the dipole antenna.

```
d.Load = [l1, l2];
```

View the dipole antenna.

```
show(d);
```

## Input Arguments

### Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Example: 'Frequency', 2e9

**Impedance — Complex impedance of circuit**

real or complex vector of Z-parameters in ohms

Complex impedance of circuit, specified as the comma-separated pair consisting of 'Impedance' and a real or complex vector of z-parameters in ohms.

Example: 'Impedance', complex(75, 30) specifies a complex impedance of 75+i30.

Data Types: double

**Frequency — Frequency of operation**

real vector in Hz

Frequency of operation, specified as the comma-separated pair consisting of 'Frequency' and a real vector in Hz.

Example: 'Frequency', [10e6, 20e6, 30e6]

Data Types: double

**Location — Location of load**

[0 0 0] (default) | Cartesian coordinates

Location of load, specified as the comma-separated pair consisting of 'Location' and Cartesian coordinates.

Example: 'Location', [0 0 0.5]

Data Types: double

## Output Arguments

**le — Lumped element**

lumpedElement object

Lumped element, returned as a lumpedElement object. The real part of the complex number indicates the resistance. The imaginary part of the complex number indicates the reactance.

## See Also

dielectric

**Introduced in R2016b**

### vswr

Voltage standing wave ratio of antenna

### Syntax

```
vswr(antenna,frequency,z0)  
vswrant = vswr(antenna,frequency,z0)
```

### Description

`vswr(antenna,frequency,z0)` calculates and plots the voltage standing wave ratio of an antenna, over specified frequency range, and given reference impedance,  $z_0$ .

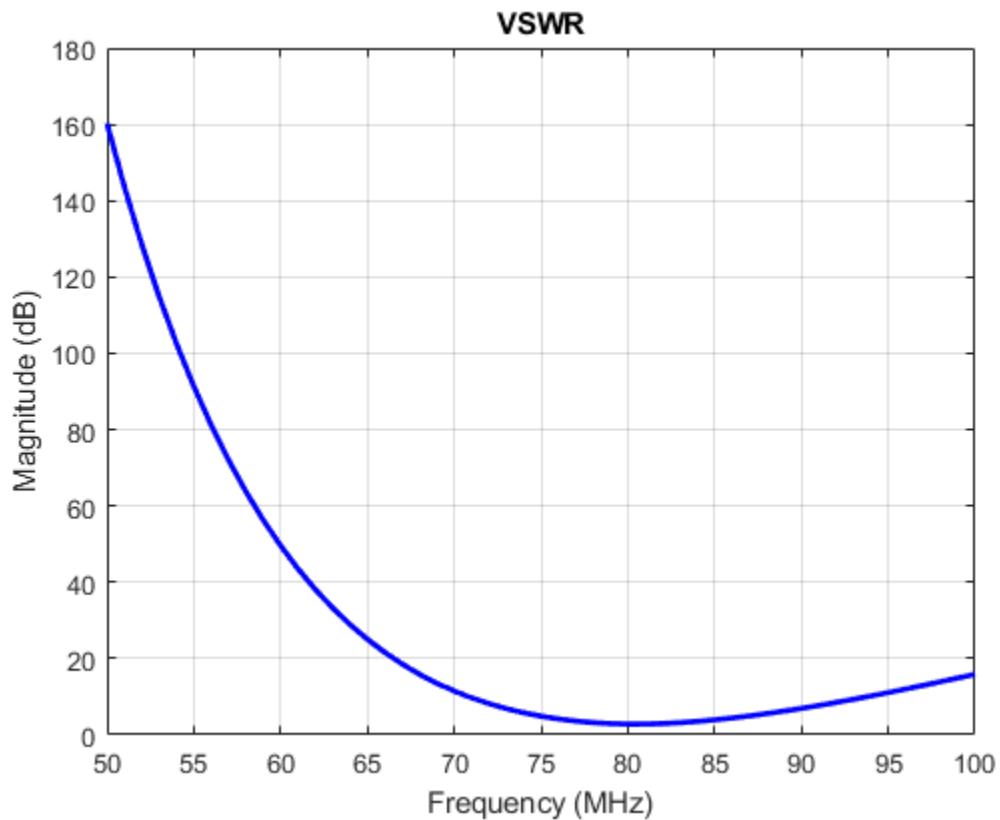

`vswrant = vswr(antenna,frequency,z0)` returns the vswr of the antenna.

### Examples

#### Plot VSWR of Antenna

Plot vswr (voltage standing wave ratio) of a circular loop antenna.

```
h = loopCircular;  
vswr(h,50e6:1e6:100e6,50)
```

### Calculate VSWR of Antenna

Calculate vswr (voltage standing wave ratio) of a helix antenna.

```
h = helix;
hvswr = vswr(h,2e9:1e9:4e9,50)

hvswr =
```

3.6021      6.6238      3.2852

## Input Arguments

### **antenna** — Antenna object

scalar handle

Antenna object, specified as a scalar handle.

### **frequency** — Frequency range used to calculate VSWR

vector in Hz

Frequency range used to calculate VSWR, specified as a vector in Hz. The minimum value of frequency must be 1 kHz.

Example: 50e6:1e6:100e6

Data Types: double

### **z0** — Reference impedance

50 (default) | scalar in dB

Reference impedance, specified as a scalar in dB.

## Output Arguments

### **vswr<sub>ant</sub>** — Voltage standing wave ratio

vector in dB

Voltage standing wave ratio, returned as a vector in dB.

## See Also

impedance

Introduced in R2015a

# correlation

Correlation coefficient between two antennas in array

## Syntax

```
correlation(array,frequency,elem1,elem2,z0)
rho = correlation(array,frequency,elem1,elem2,z0)
```

## Description

`correlation(array,frequency,elem1,elem2,z0)` calculates and plots the correlation coefficient between two antenna elements, `elem1` and `elem2` of an array. The correlation values are calculated for a specified frequency and impedance and for a specified impedance `z0`.

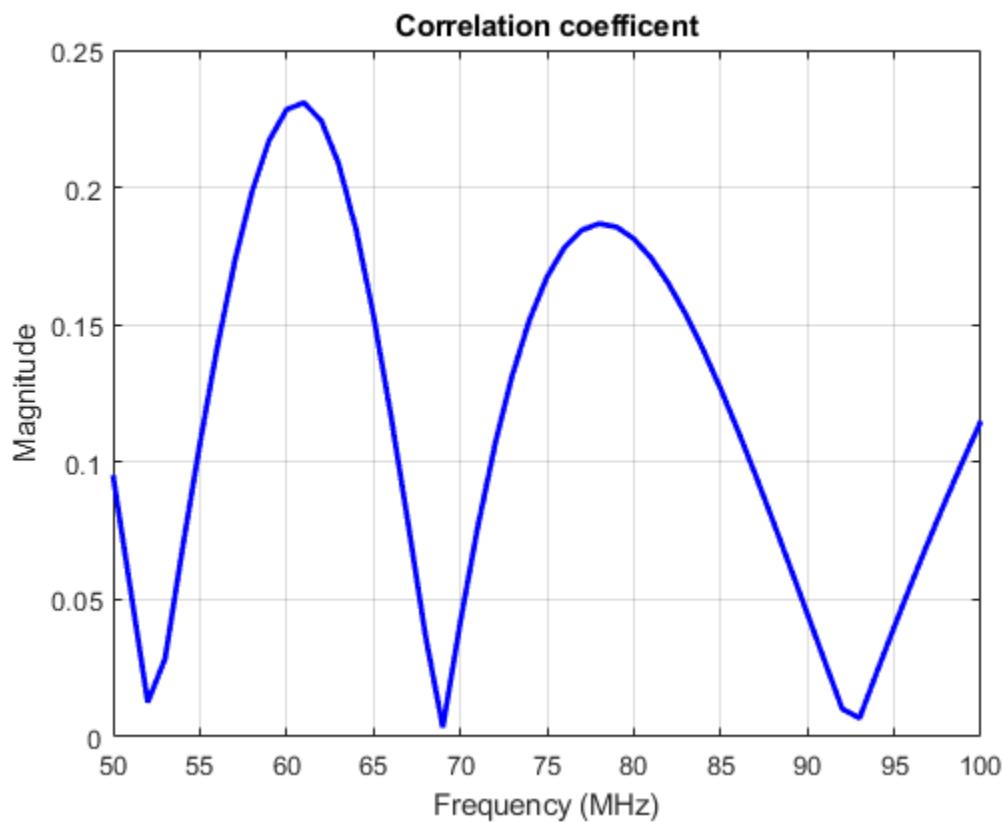

`rho = correlation(array,frequency,elem1,elem2,z0)` returns the correlation coefficient between two antenna elements, `elem1` and `elem2` of an array.

## Examples

### Plot Correlation of Array

Plot the correlation between 1 and 2 antenna elements in a default linear array over a frequency range of 50MHz to 100MHz.

```
h = linearArray;
correlation (h,50e6:1e6:100e6,1,2);
```

### Calculate Correleation Coeffecient of Array

Calculate correlation coeffecient of default rectangular array at a frequency range of 50MHz to 100MHz.

```
h = rectangularArray;
rho = correlation (h, 50e6:1e6:100e6, 1, 2)

rho =
0.1377
```

```
0.1081  
0.0782  
0.0477  
0.0165  
0.0156  
0.0486  
0.0822  
0.1154  
0.1463
```

## Input Arguments

### **array — Array object**

scalar handle

Array object, specified as a scalar handle.

### **frequency — Frequency range used to calculate correlation**

vector in Hz

Frequency range used to calculate correlation, specified as a vector in Hz.

Example: 50e6:1e6:100e6

Data Types: double

### **elem1, elem2 — Antenna elements in an array**

scalar handle

Antenna elements in an array, specified as a scalar handle.

### **z0 — Reference impedance**

50 (default) | scalar in ohms

Reference impedance, specified as a scalar in ohms.

Example: 70

Data Types: double

## Output Arguments

**rho** — Correlation coefficient between two antenna elements of an array  
vector

Correlation coefficient between two antenna elements of an array, returned as a vector.

## See Also

[impedance](#) | [returnLoss](#) | [sparameters](#)

Introduced in R2015a

# cylinder2strip

Cylinder equivalent width approximation

## Syntax

```
w = cylinder2strip(r)
```

## Description

`w = cylinder2strip(r)` calculates the equivalent width of a strip approximation for a cylinder cross section.

## Examples

### Calculate Cylinder to Strip Approximation

Calculate the width of the strip approximation to a cylinder of radius 20 mm.

```
w = cylinder2strip(20e-3)
```

```
w = 0.0800
```

## Input Arguments

### **r — Cylindrical cross-section radius**

scalar in meters | vector in meters

Cylindrical cross-section radius, specified as a scalar or vector in meters.

Example: 20e-3

## Output Arguments

**w — Equivalent width of strip**

scalar | vector

Equivalent width of strip, returned as a scalar or vector.

## See Also

`helixpitch2spacing`

Introduced in R2015a

# helixpitch2spacing

Spacing between turns of helix

## Syntax

```
s = helixpitch2spacing(a,r)
```

## Description

`s = helixpitch2spacing(a,r)` calculates the spacing between the turns of a helix antenna given the pitch angle,  $a$ , and the radius of the helix,  $r$ .

## Examples

### Calculate Spacing Between Helix Turns

Calculate spacing for helix with pitch varying from 12 degrees to 14 degrees in steps of 0.5 and 20 mm radius.

```
s = helixpitch2spacing(12:0.5:14,20e-3)  
s =  
0.0267    0.0279    0.0290    0.0302    0.0313
```

### Calculate Spacing for Helix with Varying Pitch

Calculate spacing for helix with pitch varying from 12 degrees to 14 degrees in steps of 0.5 and radius 20 mm.

```
s = helixpitch2spacing(12:0.5:14,20e-3)
```

```
s =  
0.0267    0.0279    0.0290    0.0302    0.0313
```

### Calculate Spacing of Helix Antenna with Varying Radius

Calculate spacing of a helix that has a pitch of 12 degrees and a radius that varies from 20 mm to 22 mm in steps of 0.5 mm.

```
s = helixpitch2spacing(12,20e-3:0.5e-3:22e-3)  
s =  
0.0267    0.0274    0.0280    0.0287    0.0294
```

### Calculate Spacing of Helix with Varying Pitch and Radius

Calculate spacing for helix with pitch varying from 12 degrees to 14 degrees in steps of 0.5 and radius varying from 20mm to 22mm in steps of 0.5.

```
s = helixpitch2spacing(12:0.5:14,20e-3:0.5e-3:22e-3)  
s =  
0.0267    0.0286    0.0305    0.0324    0.0345
```

## Input Arguments

### a — Pitch angle of helix

scalar in meters | vector in meters

Pitch angle of helix, specified as a scalar or vector in meters.

Example: 12:0.5:14

**r — Radius of helix**

scalar in meters | vector in meters

Radius of helix, specified as a scalar or vector in meters.

Example: 20e-3

---

**Note** If the pitch angle and radius are both vectors, then their lengths must be equal.

---

## Output Arguments

**s — Spacing between helix turns**

scalar in meters | vector in meters

Spacing between helix turns, returned as a scalar or vector in meters.

## See Also

[cylinder2strip](#)

**Introduced in R2015a**

## meshconfig

Change mesh mode of antenna structure

### Syntax

```
meshconfig(antenna,mode)
```

### Description

`meshconfig(antenna,mode)` changes the meshing mode of the antenna according to the text input mode.

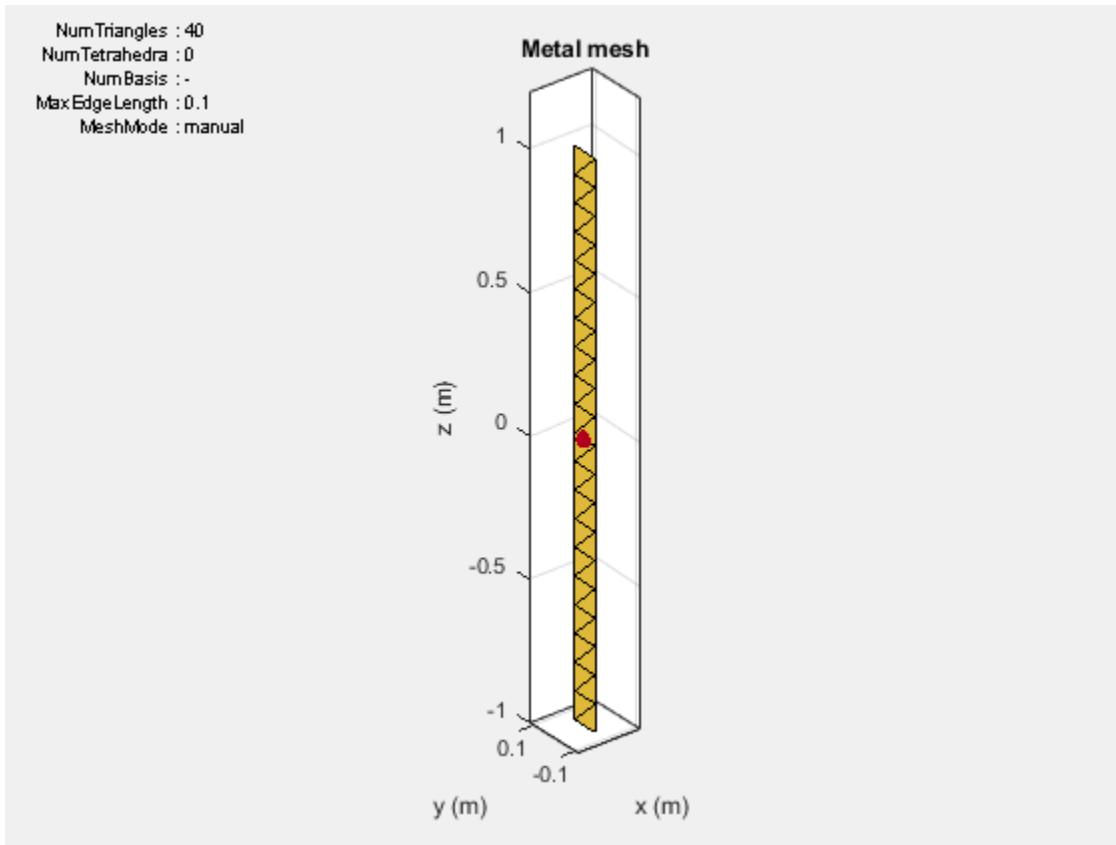

### Examples

#### Change Mesh Configuration of Antenna

Change the mesh configuration of a dipole antenna from auto (default) to manual mode.

```
h = dipole;
meshconfig(h,'manual')
mesh(h,'MaxEdgeLength',0.1)
```

```
ans =
struct with fields:
    NumTriangles: 0
    NumTetrahedra: 0
    NumBasis: []
    MaxEdgeLength: []
    MeshMode: 'manual'
```

## Input Arguments

**antenna** — Antenna object

scalar handle

Antenna object, specified as a scalar handle.

**mode** — Meshing mode

'auto' (default) | 'manual'

Meshing mode, specified as 'auto' or 'manual'.

Data Types: `char`

## See Also

`mesh` | `show`

**Introduced in R2015a**

# numSummationTerms

Change number of summation terms for calculating periodic Green's function

## Syntax

```
numSummationTerms (array, num)
```

## Description

`numSummationTerms (array, num)` changes the number of summation terms used to calculate periodic Green's function of the infinite array. This method calculates  $2 * num + 1$  of the periodic Green's function. The summation is carried out from  $-num$  to  $+num$ . A higher number of terms results in better accuracy but increases the overall computation time.

## Input Arguments

### **array — Infinite array**

scalar handle

Infinite array, specified as a scalar handle.

### **num — Number to calculate summation terms**

10 (default) | scalar

Number to calculate summation terms, specified as a scalar. The summation is carried out from  $-num$  to  $+num$ .

Example: 50

## Examples

### Change Number of Summation Terms in Infinite Array

Create an infinite array with the scan elevation at 45 degrees. Calculate the scan impedance. By default, the number of summation terms used is 21.

```
h = infiniteArray('ScanElevation', 45);
s = impedance(h, 1e9)

s =
91.4577 +76.9232i
```

Change the number of summation terms to 51. Calculate the scan impedance again.

```
numSummationTerms(h, 25)
s = impedance(h, 1e9)

s =
91.6164 +76.9519i
```

Change the number of terms to 101. Increasing the number of summation terms results in a more accurate scan impedance. However, the time required to calculate the scan impedance increases.

```
numSummationTerms(h, 50)
s = impedance(h, 1e9)

s =
91.6654 +76.9543i
```

[“Infinite Arrays”](#)

**Introduced in R2015b**

# feedCurrent

Calculate current at feed for antenna or array

## Syntax

```
feedCurrent(obj, frequency)
```

## Description

`feedCurrent(obj, frequency)` calculates the current at the feed for an antenna or array object at a specified frequency. The feed current when multiplied by the antenna impedance gives the voltage across the antenna.

## Examples

### Feed Current of Monopole Antenna Excited By Plane Wave.

Excite a monopole antenna using plane wave. Calculate the feed current at 75 MHz.

```
h = planeWaveExcitation('Element', monopole, 'Direction', [1 0 0])
cur = feedCurrent(h, 75e6)
```

```
h =
planeWaveExcitation with properties:
```

```
    Element: [1x1 monopole]
    Direction: [1 0 0]
    Polarization: [0 0 1]
```

```
cur =
```

```
0.0132 - 0.0133i
```

### Feed Current of Rounded-Bowtie Antenna

Calculate the feed current of a rounded-bowtie designed for operation at 2.4 GHz.

```
b = design(bowtieRounded,2.4e9);  
If = feedCurrent(b,2.4e9)
```

```
If =  
0.0293 + 0.0001i
```

## Input Arguments

**obj** — Antenna or array object  
object handle

Antenna or array object, specified as an object handle.

**frequency** — Frequency to calculate feed current  
scalar integer in Hz

Frequency to calculate feed current, specified as a scalar integer in Hz.

## See Also

`current`

**Introduced in R2017a**

# fieldsCustom

Plot electric or magnetic fields of antenna

## Syntax

```
fieldsCustom(fields,points)
fieldsCustom(fields,points,scalefield)
qobj = fieldsCustom(___)

fieldsCustom(axeshandle, ___)
```

## Description

`fieldsCustom(fields,points)` plots electric or magnetic field vectors, `fields`, at specified points in space, `points`, in the current axes.

`fieldsCustom(fields,points,scalefield)` scales the field arrows by a scalar value, `scalefield`.

`qobj = fieldsCustom(___)` returns the quiver object, using either of the previous syntaxes.

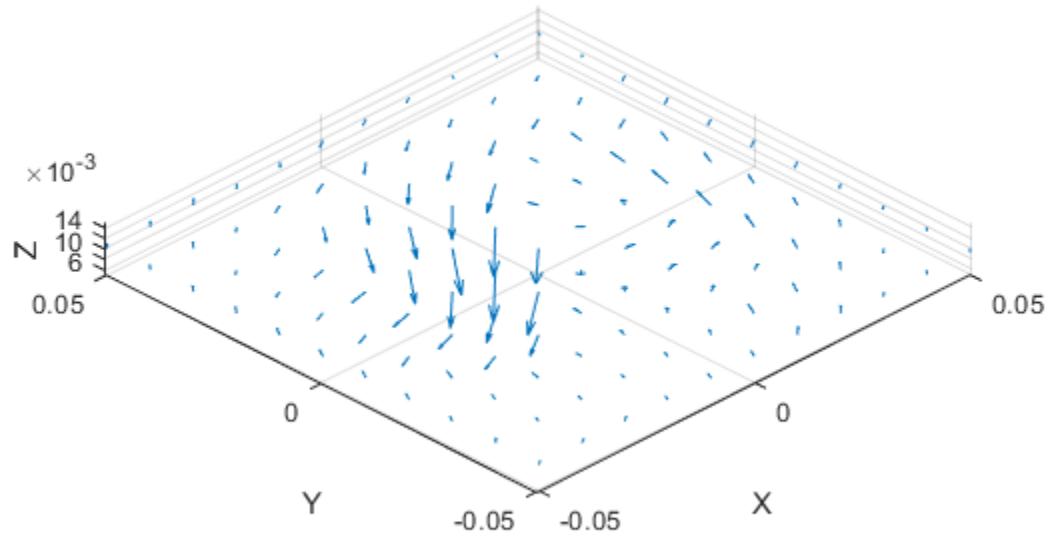

`fieldsCustom(axeshandle, ___)` plots into the axes specified by `axeshandle` instead of the current axes.

## Examples

### Visualize Magnetic Field of Antenna

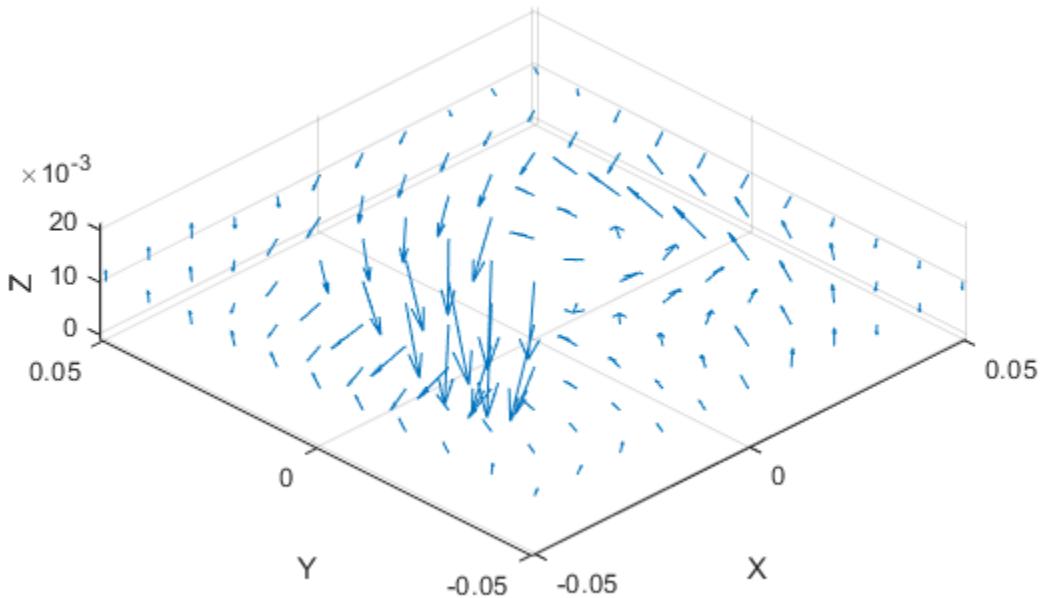

Load and visualize the magnetic field data available in the file `fielddata.mat`.

```
load fielddata
fieldsCustom(H,p)
```

Scale the magnetic field arrows by a factor of 2.

```
figure  
fieldsCustom(H, p, 2)
```

## Input Arguments

**fields — Electric or magnetic field vectors**

3-by-*p* complex matrix

Electric or magnetic field vectors, specified as a 3-by-*p* complex matrix. *p* is the number of points in space.

Data Types: double

**points — x, y, z coordinates in space**

3-by-*p* real matrix

x, y, z coordinates in space, specified as a 3-by-*p* real matrix. *p* is the number of points in space.

Data Types: double

**axeshandle — Axes object**

object handle

Axes object, specified as an object handle.

Data Types: char

**scalefield — Value by which to scale field arrows**

0.9 (default) | scalar

Value by which to scale the field arrows, specified as a scalar. A value of 2 doubles the relative length of the field arrows. A value of 0.5 halves the length of the field arrows. A value of 0 plots the field arrows without automatic scaling.

Example: 2

Data Types: double

## Output Arguments

**qobj — Electric or magnetic field plot**

quiver object handle

Electric or magnetic field plot, returned as quiver object handle.

## See Also

EHfields | pattern | patternCustom

Introduced in R2016a

# patternCustom

Plot radiation pattern

## Syntax

```
patternCustom(magE,theta,phi)
patternCustom(magE,theta,phi,Name,Value)
hplot = patternCustom(____)
```

## Description

`patternCustom(magE,theta,phi)` plots the 3-D radiation pattern of an antenna magnitude, `magE` over the specified `phi` and `theta` angle vectors.

`patternCustom(magE,theta,phi,Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments.

`hplot = patternCustom(____)` returns handles of the lines or surface in the figure window. This syntax accepts any combination of arguments from the previous syntaxes

## Examples

### Visualize 3-D Electric Field Pattern of Dipole

Calculate the magnitude, azimuth, and elevation angles of a dipole's electric field at 75 MHz.

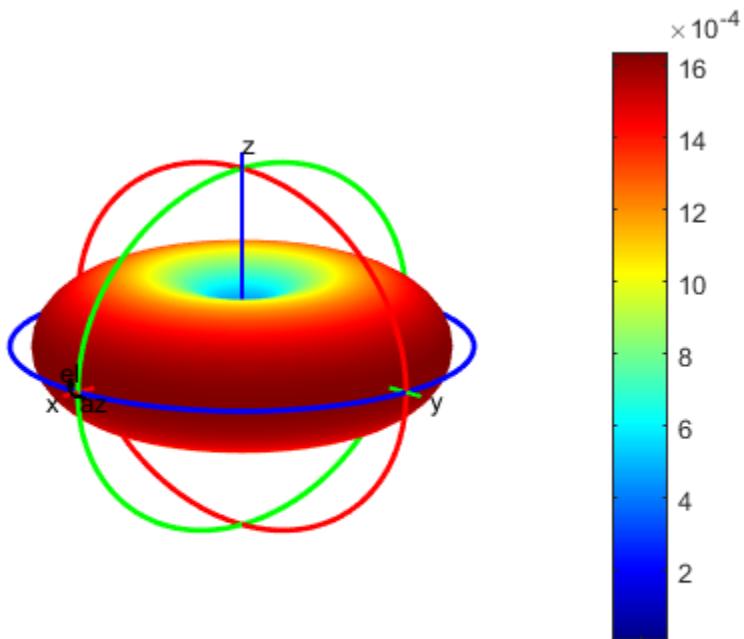

```
d = dipole;
[efield,az,el] = pattern(d, 75e6, 'Type', 'efield');
```

Extract the theta and phi angles of the electric field magnitude of the antenna.

```
phi = az';  
theta = (90-el);  
MagE = efield';
```

Plot the 3-D electric field pattern.

```
patternCustom(MagE,theta,phi);
```

### Visualize 2-D Radiation Patterns of Helix Directivity

Calculate the magnitude, azimuth, and elevation angles of a helix's directivity at 2 GHz.

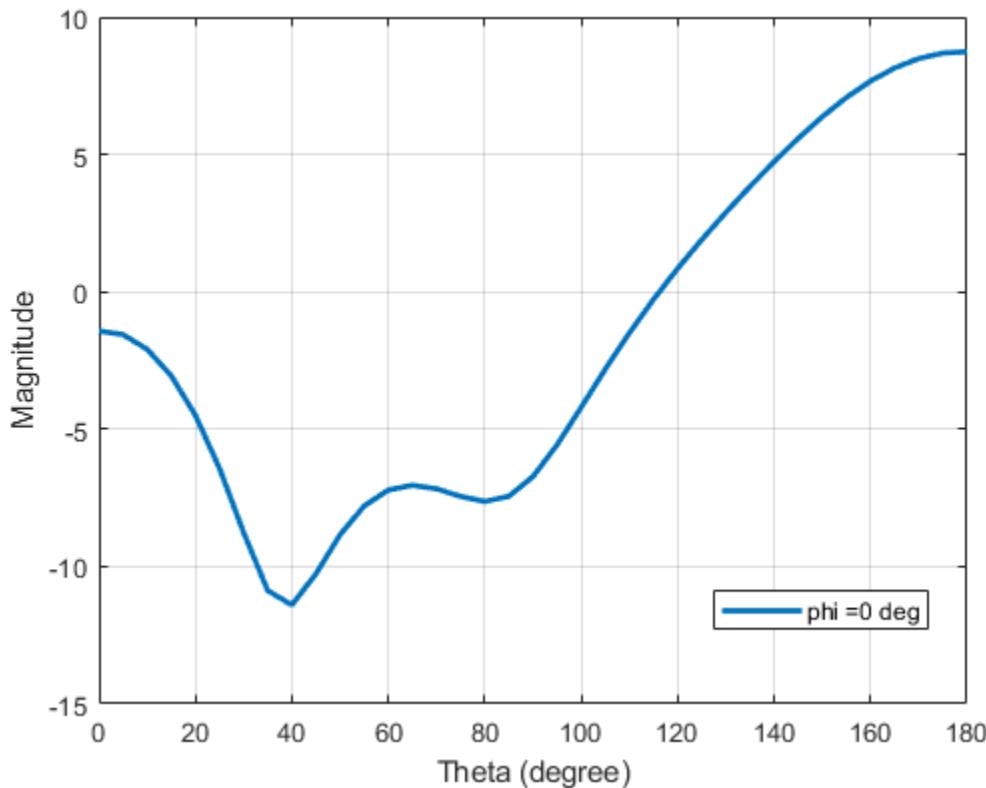

```
h = helix;
[D,az,el] = pattern(h,2e9);
```

Extract theta and phi angles of the directivity magnitude.

```
phi = az';
theta = (90-el);
MagE = D';
```

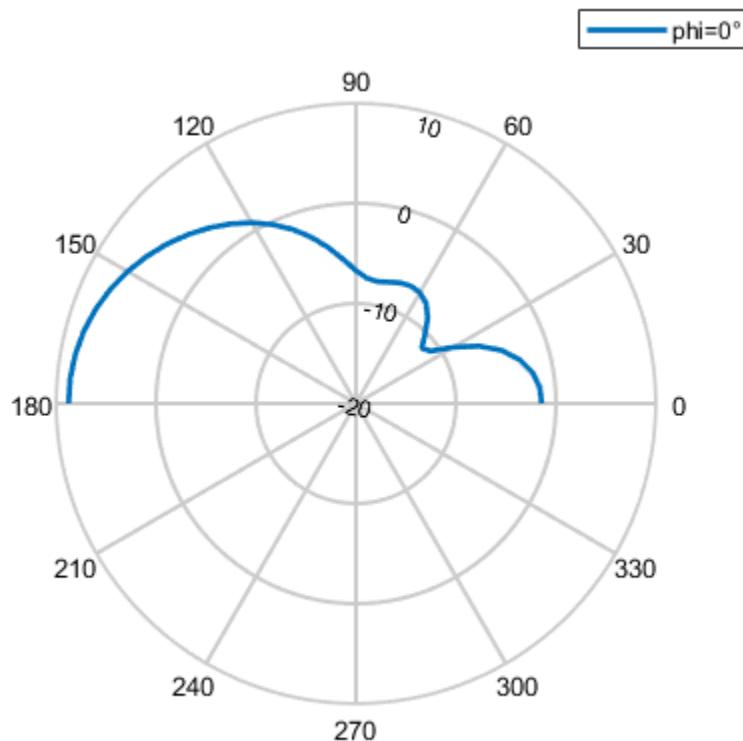

Plot 2-D phi slice of the antenna in rectangular coordinates.

```
figure;
patternCustom(MagE,theta,phi,'CoordinateSystem','rectangular',...
    'Slice','phi','SliceValue',0);
```

Plot 2-D phi slice of the antenna in polar coordinates.

```
figure;
patternCustom(MagE, theta, phi,'CoordinateSystem','polar',...
    'Slice','phi','SliceValue',0);
```

### Visualize Radiation Patterns from Antenna Data File

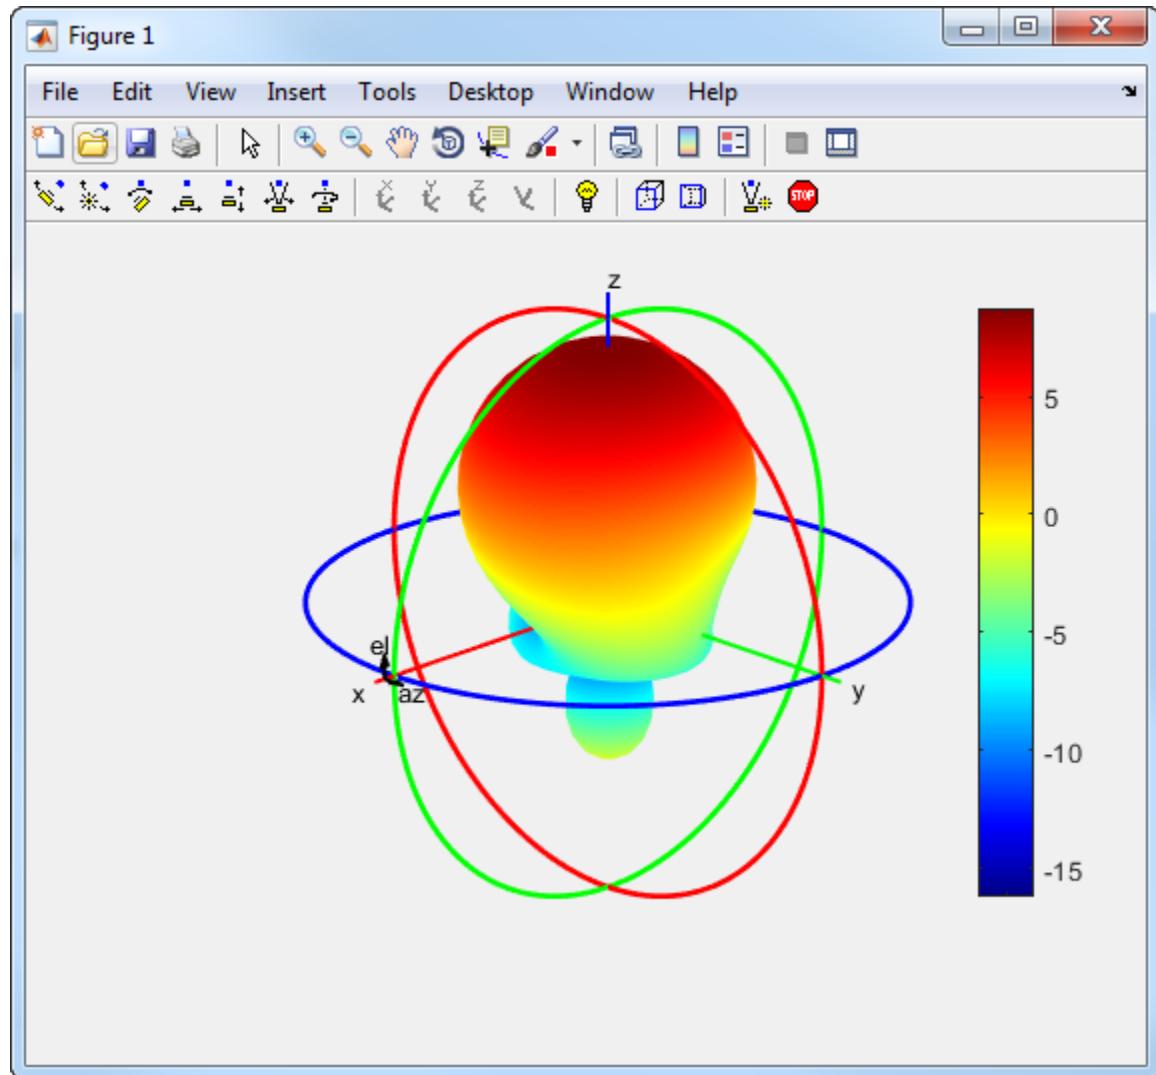

Consider a helix antenna data file in .csv format. This file contains the magnitude of the antenna directivity in phi and theta angles. Read the file .

Read the .csv data file.

```
helixdata = csvread('antennadata_test.csv',1,0);
```

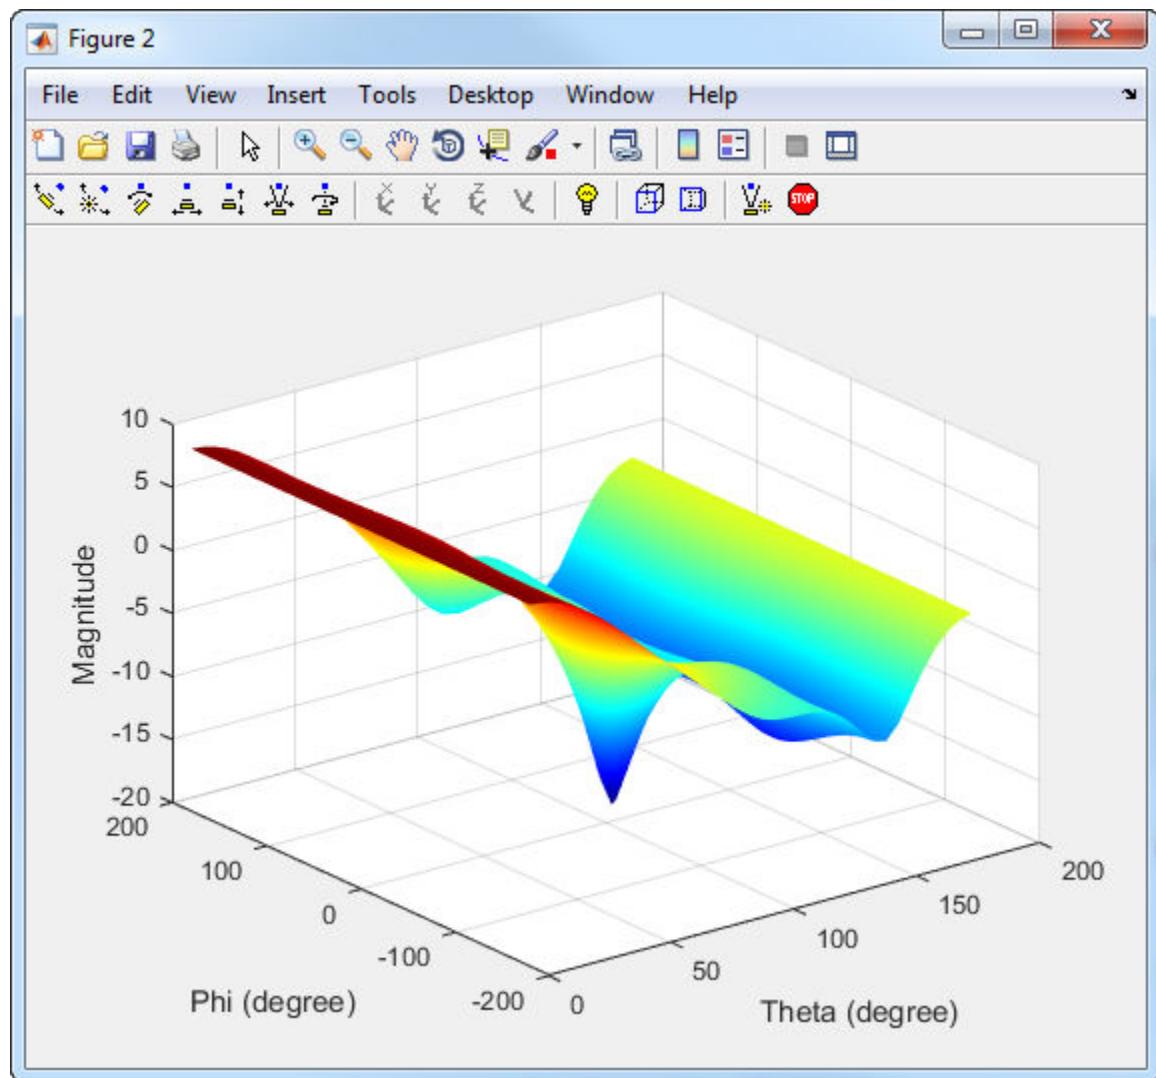

Use patternCustom to extract the magnitude of directivity, and the phi, and theta angle values. Plot the 3-D polar radiation pattern.

```
patternCustom(helixdata(:,3), helixdata(:,2), helixdata(:,1));
```

Use the same data to plot the 3-D rectangular radiation pattern.

```
figure  
patternCustom(helixdata(:,3),helixdata(:,2),helixdata(:,1),...  
'CoordinateSystem','rectangular');
```

## Input Arguments

**magE** — Magnitude of plotted quantity  
real vector | matrix

Magnitude of plotted quantity, specified as one of the following:

- A  $N$ -by-1 real vector.  $N$  is the same size as the theta and phi angle vectors.
- A  $M$ -by- $R$  matrix.  $M$  is the same size as the theta angle vector and  $R$  is the same size as the phi angle vector.

Data quantities plotted include directivity, E-fields, H-fields, or power of an antenna or array object.

Data Types: double

### **theta — Theta angles in spherical coordinates**

vector in degrees

Theta angles in spherical coordinates, specified as a vector in degrees.

Data Types: double

### **phi — Phi angles in spherical coordinates**

vector in degrees

Phi angles in spherical coordinates, specified as a vector in degrees.

Data Types: double

## **Name-Value Pair Arguments**

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'CoordinateSystem', 'rectangular'

### **CoordinateSystem — Coordinate system of radiation pattern**

'polar' (default) | 'rectangular'

Coordinate system of radiation pattern, specified as the comma-separated pair consisting of 'CoordinateSystem' and one of these values: 'polar', 'rectangular'.

Example: 'CoordinateSystem', 'polar'

Data Types: char

**Slice — Plane to visualize 2-D data**

'theta' | 'phi'

Plane to visualize 2-D data, specified as a comma-separated pair consisting of 'Slice' and 'theta' or 'phi'.

Example: 'Slice','phi'

Data Types: char

**SliceValue — Angle values for slice**

scalar | vector

Angle values for slice, specified as a comma-separated pair consisting of 'SliceValue' and a scalar or a vector.

## Output Arguments

**hplot — Lines or surfaces in figure window**

object handle

Lines or surfaces in figure window, returned as object handle.

## msiread

Read MSI planet antenna file

### Syntax

```
msiread(fname)
[horizontal] = msiread(fname)
[horizontal,vertical] = msiread(fname)
[horizontal,vertical,optional] = msiread(fname)
```

### Description

`msiread(fname)` reads an MSI planet antenna file in `.pln`, or `.msi` formats.

`[horizontal] = msiread(fname)` reads the file and returns a structure containing horizontal gain data.

`[horizontal,vertical] = msiread(fname)` reads the file and returns structures containing horizontal and vertical gain data.

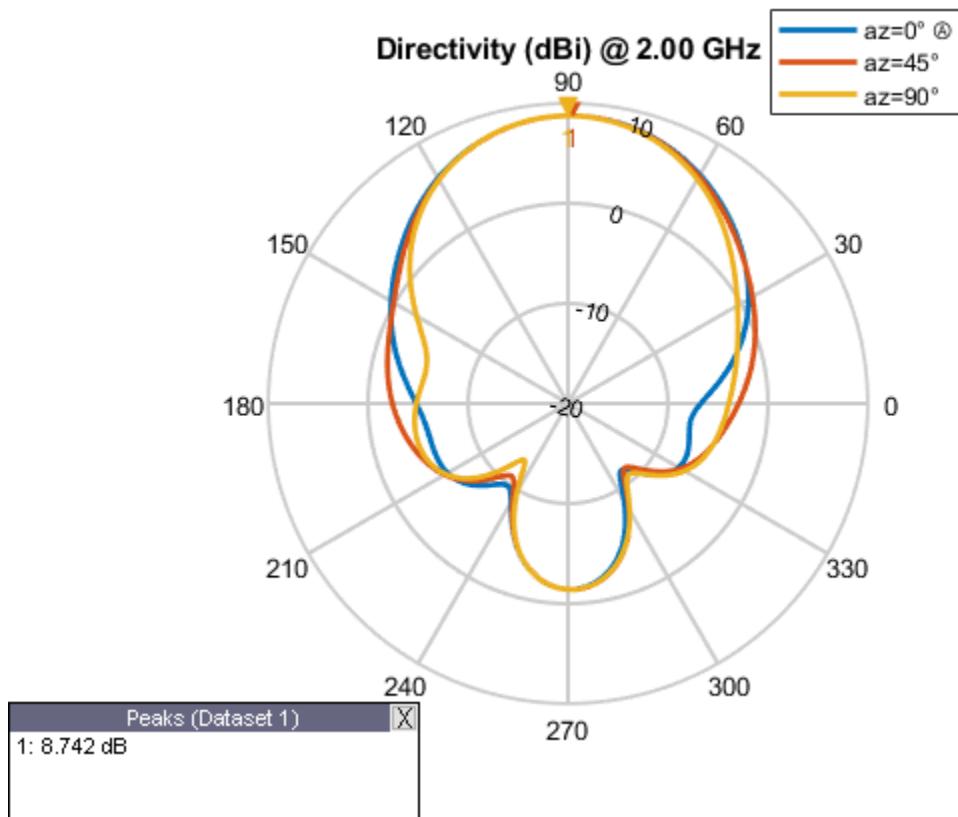

`[horizontal,vertical,optional] = msiread(fname)` reads the file and returns structures containing horizontal gain data, vertical gain data, and all additional data in the file.

### Examples

#### Write and Read MSI Antenna Data File

Create a helix antenna and plot the elevation pattern at 2 GHz.

```
h = helix;
patternElevation(h,2e9,[0 45 90],'Elevation',0:1:360);
```

Write the elevation pattern of the helix antenna in an MSI Planet Antenna file.

```
msiwrite(h, 2e9, 'helix', 'Name', 'Helix Antenna Specifications')
```

The msiwrite function saves a file named helix.plnto the default MATLAB™ folder.

```
NAME Helix Antenna Specifications
FREQUENCY 2000.0
GAIN 8.74 dBi
HORIZONTAL 360
0.00 13.56
1.00 13.48
2.00 13.39
3.00 13.30
```

```
4.00 13.22
5.00 13.13
```

Read the MSI antenna data file created.

```
msiread helix.pln

ans =
struct with fields:

PhysicalQuantity: 'Gain'
    Magnitude: [360x1 double]
        Units: 'dBi'
        Azimuth: [360x1 double]
    Elevation: 0
    Frequency: 2.0000e+09
        Slice: 'Elevation'
```

### Read Horizontal, Vertical and Optional Data from Antenna File

Read horizontal, vertical and optional data from the antenna data file **Test\_file\_demo.pln**.

```
[Horizontal,Vertical,Optional] = msiread('Test_file_demo.pln')

Horizontal =
struct with fields:

PhysicalQuantity: 'Gain'
    Magnitude: [360x1 double]
        Units: 'dBd'
        Azimuth: [360x1 double]
    Elevation: 0
    Frequency: 659000000
        Slice: 'Elevation'

Vertical =
```

```
struct with fields:  
  
PhysicalQuantity: 'Gain'  
    Magnitude: [360x1 double]  
        Units: 'dBd'  
        Azimuth: 0  
        Elevation: [360x1 double]  
        Frequency: 659000000  
            Slice: 'Azimuth'
```

Optional =

```
struct with fields:  
  
    name: 'Sample.pln'  
        make: 'Sample 4DR-16-2HW'  
        frequency: 659000000  
            h_width: 180  
            v_width: 7.3000  
        front_to_back: 34  
            gain: [1x1 struct]  
            tilt: 'MECHANICAL'  
        polarization: 'POL_H'  
            comment: 'Ch-45 0 deg dt'  
        scaling_mode: 'AUTOMATIC'
```

- “Read, Visualize and Write MSI Planet Antenna Files”

## Input Arguments

### **fname — Name of MSI file**

character vector

Name of MSI file, specified as a character vector. The files must be a .pln or .msi format.

## Output Arguments

### **horizontal — Horizontal gain data**

structure

Horizontal gain data, returned as a structure containing the following fields:

- **PhysicalQuantity** — Quantity specified in the MSI file, returned as one of the values: 'E-field', 'H-field', 'directivity', 'power', 'powerdB', or 'Gain'.
- **Magnitude** — Magnitude values of the quantity specified in the MSI file, returned as a real vector of size  $N$ -by-1 where  $N$  is same size as theta and phi angles.
- **Units** — Units of the quantity specified in the MSI file, returned as one of the values: 'dBi', 'dB', 'V/m', 'watts', or 'dBd'.
- **Azimuth** — Azimuth angles specified in the MSI file, returned as a scalar or a vector in degrees.
- **Elevation** — Elevation angles specified in the MSI file, returned as a scalar or a vector in degrees.
- **Frequency** — Frequency specified in the MSI file, returned as a scalar or a vector in Hertz.
- **Slice** — Type of data set variation, returned as text. The variations are 'Azimuth' or 'Elevation'.

### **vertical — Vertical gain data**

structure

Vertical gain data, returned as a structure containing the following fields:

- **PhysicalQuantity** — Quantity specified in the MSI file, returned as one of the values: 'E-field', 'H-field', 'directivity', 'power', 'powerdB', or 'Gain'.
- **Magnitude** — Magnitude values of the quantity specified in the MSI file, returned as a real vector of size  $N$ -by-1 where  $N$  is same size as theta and phi angles.
- **Units** — Units of the quantity specified in the MSI file, returned as one of the values: 'dBi', 'dB', 'V/m', 'watts', or 'dBd'.
- **Azimuth** — Azimuth angles specified in the MSI file, returned as a scalar or a vector in degrees.
- **Elevation** — Elevation angles specified in the MSI file, returned as a scalar or a vector in degrees.

- Frequency — Frequency specified in the MSI file, returned as a scalar or a vector in Hertz.
- Slice — Type of data set variation, returned as text. The variations are Azimuth or Elevation.

**optional — Additional data**

structure

Additional data, returned as a structure containing (but not limited to): Name, Make, Frequency, H\_width, V\_width, Front\_to\_back, Gain, Tilt, Polarization, Comment.

## See Also

[msiwrite](#)

## Topics

“Read, Visualize and Write MSI Planet Antenna Files”

**Introduced in R2016a**

## msiwrite

Write data in MSI planet antenna file format

### Syntax

```
msiwrite(fname,dataSlice1,dataSlice2)
msiwrite(fname,dataSlice1,dataSlice2,optional)

msiwrite(objname,frequency, fname)
msiwrite(objname,frequency, fname, Name, Value)
```

### Description

`msiwrite(fname,dataSlice1,dataSlice2)` writes the data from structures `dataSlice1` and `dataSlice2` to an MSI planet antenna file called `fname`.

`msiwrite(fname,dataSlice1,dataSlice2,optional)` writes the data from structures `dataSlice1`, `dataSlice2`, and `optional` to an MSI planet antenna file called `fname`.

`msiwrite(objname,frequency, fname)` writes calculated data of an antenna or array object at a specified frequency to an MSI planet antenna file called `fname`.

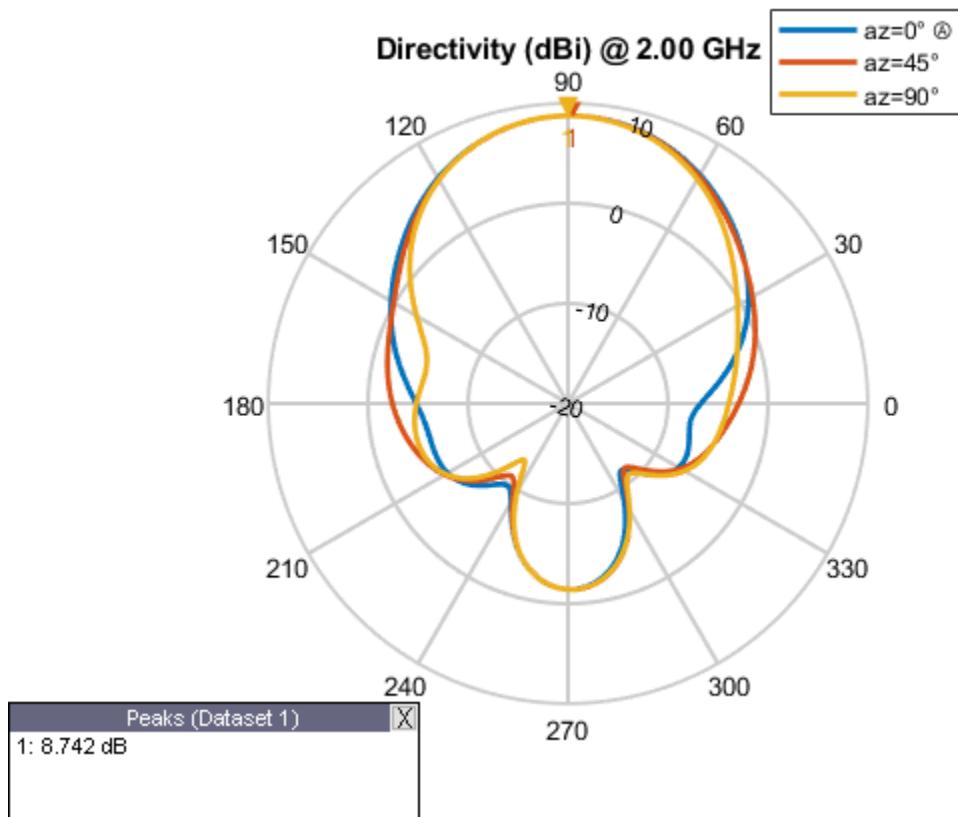

`msiwrite(objname,frequency, fname, Name, Value)` uses additional options specified by one or more `Name, Value` pair arguments.

### Examples

#### Write and Read MSI Antenna Data File

Create a helix antenna and plot the elevation pattern at 2 GHz.

```
h = helix;
patternElevation(h,2e9,[0 45 90], 'Elevation', 0:1:360);
```

Write the elevation pattern of the helix antenna in an MSI Planet Antenna file.

```
msiwrite(h, 2e9, 'helix', 'Name', 'Helix Antenna Specifications')
```

The msiwrite function saves a file named helix.plnto the default MATLAB™ folder.

```
NAME Helix Antenna Specifications
FREQUENCY 2000.0
GAIN 8.74 dBi
HORIZONTAL 360
0.00 13.56
1.00 13.48
2.00 13.39
3.00 13.30
```

```
4.00 13.22
5.00 13.13
```

Read the MSI antenna data file created.

```
msiread helix.pln
```

```
ans =
struct with fields:
    PhysicalQuantity: 'Gain'
        Magnitude: [360x1 double]
            Units: 'dBi'
            Azimuth: [360x1 double]
            Elevation: 0
            Frequency: 2.0000e+09
            Slice: 'Elevation'
```

- “Read, Visualize and Write MSI Planet Antenna Files”

## Input Arguments

### **fname — Name of MSI file**

.pln (default) | character vector

Name of MSI file, specified as a character vector. By default, `msiwrite` writes the MSI planet antenna file that has a .pln format.

### **dataslice1 — Horizontal or vertical gain data**

structure

Horizontal or vertical gain data, specified as a structure containing the following fields:

- `PhysicalQuantity` — Measured quantity in the MSI file: E-field, H-field, directivity, power, powerdB, or, gain.
- `Magnitude` — Magnitude values of the measured quantity.
- `Units` — Units of the measured quantity.

- Azimuth — Azimuth angles.
- Elevation — Elevation angles.
- Frequency — Frequency of operation.
- Slice — Type of data set variation: Azimuth, or Elevation.

**dataslice2 — Horizontal or vertical gain data**

structure

Horizontal or vertical gain data, specified as a structure containing the following fields:

- PhysicalQuantity — Measured quantity in the MSI file: E-field, H-field, directivity, power, powerdB, or, gain.
- Magnitude — Magnitude values of the measure quantity.
- Units — Units of the measured quantity.
- Azimuth — Azimuth angles.
- Elevation — Elevation angles.
- Frequency — Frequency of operation.
- Slice — Type of data set variation: Azimuth, or Elevation.

**optional — Additional data**

structure

Additional data, specified as a structure containing the following fields: Name, Make, Frequency, H\_width, V\_width, Front\_to\_back, Gain, Tilt, Polarization, Comment.

**objname — Antenna or array object**

antenna or array handle

Antenna or array object, specified as an antenna or array handle.

**frequency — Frequency of operation of antenna or array object**

positive numeric scalar

Frequency of operation of antenna or array object, specified as a positive numeric scalar.

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Example: 'Comment', 'horn antenna'

### **Name — Title of file**

character vector

Title of file in the first line, specified as the comma-separated pair consisting of 'Name' and a character vector.

Example: 'Name', 'Designed Helix Antenna in MATLAB'

Data Types: char

### **Comment — Comments about antenna or array data file**

character array

Comments about an antenna or array data file, specified as the comma-separated pair consisting of 'Comment' and a character array.

Example: 'Comment', 'This antenna is for space simulations.'

Data Types: char

# dielectric

Dielectric material for use as substrate

## Syntax

```
d = dielectric(material)
d = dielectric(Name,Value)
```

## Description

`d = dielectric(material)` returns dielectric materials for use as a substrate in antenna elements.

`d = dielectric(Name,Value)` returns dielectric materials, based on the properties specified by one or more `Name,Value` pair arguments.

## Examples

### PIFA Antenna with Dielectric Substrate

Use a Teflon dielectric material as a substrate for a PIFA antenna. View the antenna.

```
d = dielectric('Teflon')
d =
    dielectric with properties:

        Name: 'Teflon'
        EpsilonR: 2.1000
        LossTangent: 2.0000e-04
        Thickness: 0.0060

For more materials see catalog

p = pifa('Height',0.0060,'Substrate',d)
```

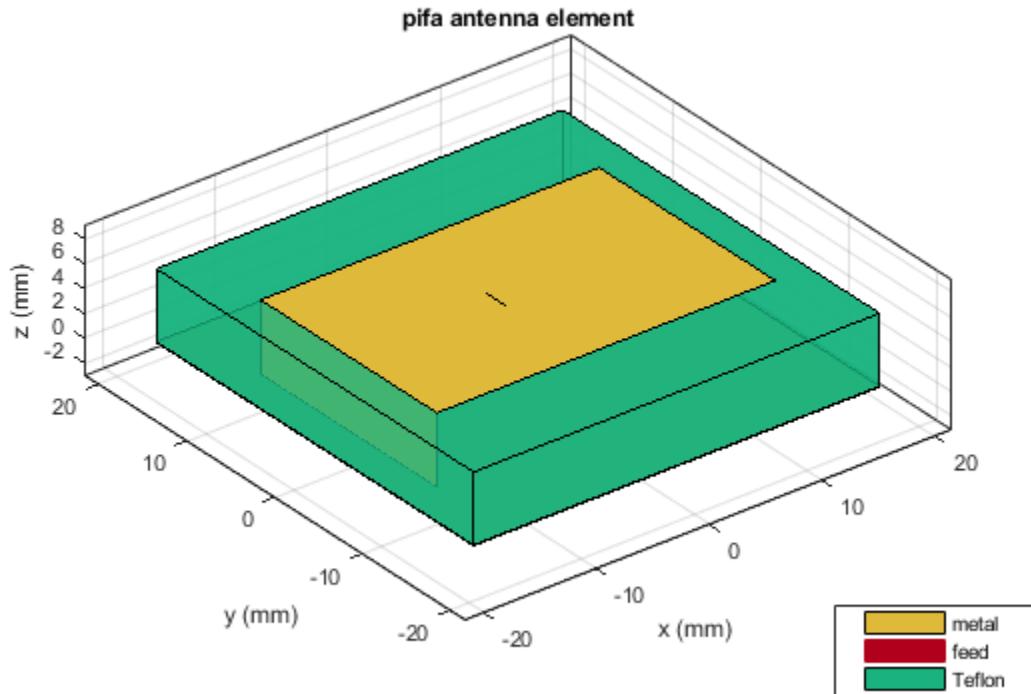

## 5 Methods — Alphabetical List

---

```
p =
  pifa with properties:

    Length: 0.0300
    Width: 0.0200
    Height: 0.0060
    Substrate: [1x1 dielectric]
    GroundPlaneLength: 0.0360
    GroundPlaneWidth: 0.0360
    PatchCenterOffset: [0 0]
    ShortPinWidth: 0.0200
    FeedOffset: [-0.0020 0]
    Tilt: 0
    TiltAxis: [1 0 0]
    Load: [1x1 lumpedElement]

show(p)
```

### Custom Dielectric Properties

Create a patch microstrip antenna using a substrate with a relative permittivity of 2.70, a loss tangent of 0.002 and a thickness of 0.008 m. View the antenna.

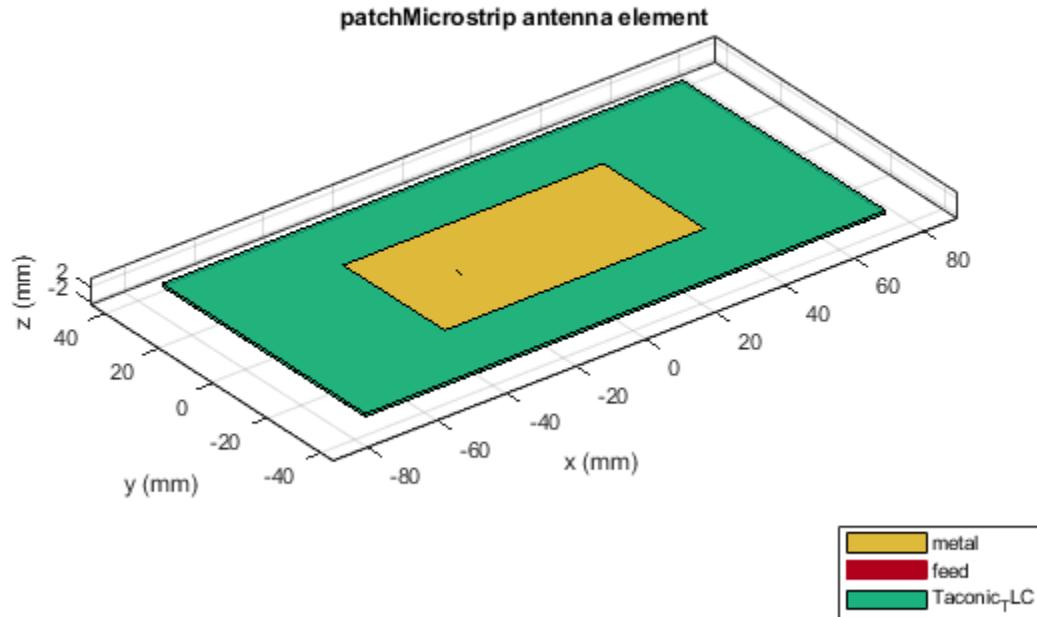

```
t = dielectric('Name','Taconic_TLC','EpsilonR',2.70,'LossTangent',0.002,...  
    'Thickness',0.0008);  
p = patchMicrostrip('Height',0.0008,'Substrate',t)  
  
p =  
patchMicrostrip with properties:
```

## 5 Methods — Alphabetical List

---

```
Length: 0.0750
Width: 0.0375
Height: 8.0000e-04
Substrate: [1x1 dielectric]
GroundPlaneLength: 0.1500
GroundPlaneWidth: 0.0750
PatchCenterOffset: [0 0]
FeedOffset: [-0.0187 0]
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]

show(p)
```

### Patch Antenna with Air Gap between Groundplane and Dielectric

Create a microstrip patch antenna.

```
p = patchMicrostrip;
```

For properties of air and teflon dielectrics use Dielectric Catalog.

```
openDielectricCatalog
```

## 5 Methods — Alphabetical List

Use Teflon as a dielectric substrate. There is an air gap between the patch groundplane and the dielectric.

```
sub = dielectric('Name',{'Air','Teflon'},'EpsilonR',[1 2.1],...
    'Thickness',[.002 .004],'LossTangent',[0 2e-04]);
```

Add the substrate to the patch antenna.

```
p.Substrate = sub;
figure
show(p)
```

### Three Layer Dielectric Substrate between Patch and Ground Plane

Create a microstrip patch antenna.

```
p = patchMicrostrip;
```

For dielectric properties, use the Dielectric Catalog.

```
openDielectricCatalog
```

## 5 Methods — Alphabetical List

Use FR4, Teflon and Foam as the three layers of the substrate.

```
sub = dielectric('Name',{'FR4','Teflon','Foam'},'EpsilonR',...
    [4.80 2.10 1.03], 'Thickness',[0.002 0.004 0.001],...
    'LossTangent',[0.0260 2e-04 1.5e-04]);
```

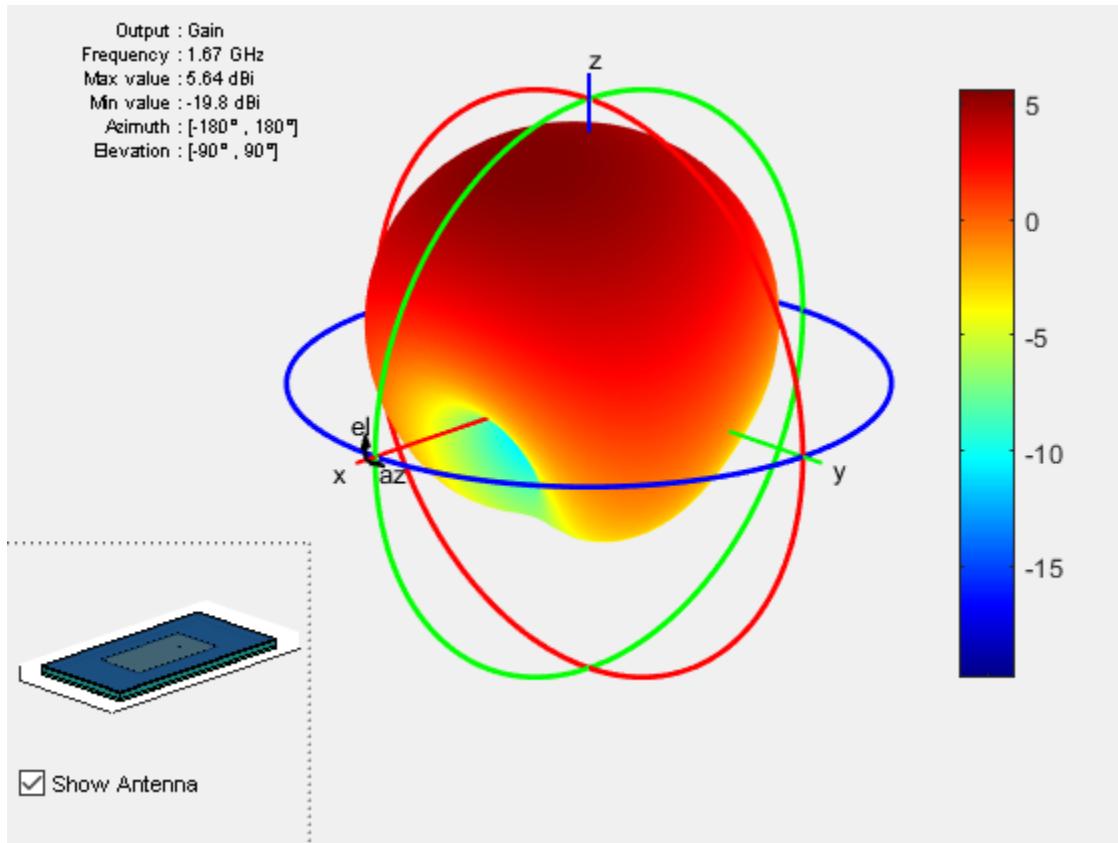

Add the three layer substrate to the patch antenna.

```
p.Substrate = sub;
figure
show(p)
```

Plot the radiation pattern of the antenna.

```
figure  
pattern(p,1.67e9)
```

### Infinite Reflector Backed Dielectric Substrate Antenna

Design a dipole antenna backed by a dielectric substrate and an infinite reflector.

Create a dipole antenna of length, 0.15 m, and width, 0.015 m.

```
d = dipole('Length',0.15,'Width',0.015, 'Tilt',90,'TiltAxis',[0 1 0]);
```

Create a reflector using the dipole antenna as an exciter and the dielectric, teflon as the substrate.

```
t = dielectric('Teflon')
rf = reflector('Exciter',d,'Spacing',7.5e-3,'Substrate',t);
```

```
t =
```

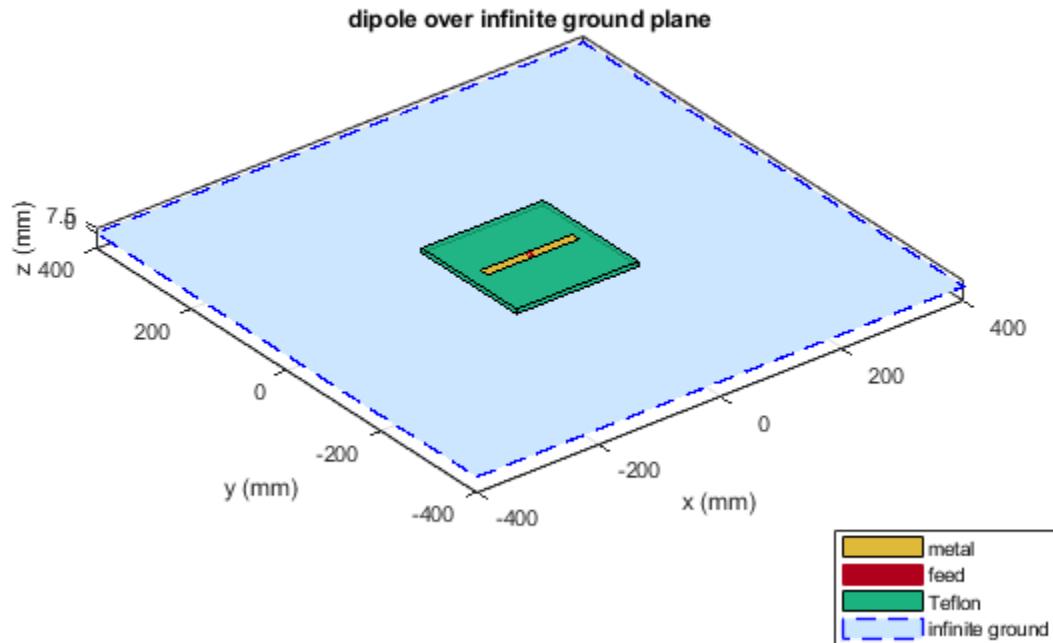

```
dielectric with properties:
```

```
Name: 'Teflon'  
EpsilonR: 2.1000  
LossTangent: 2.0000e-04  
Thickness: 0.0060
```

For more materials see <a href="matlab:openDielectricCatalog">catalog</a>

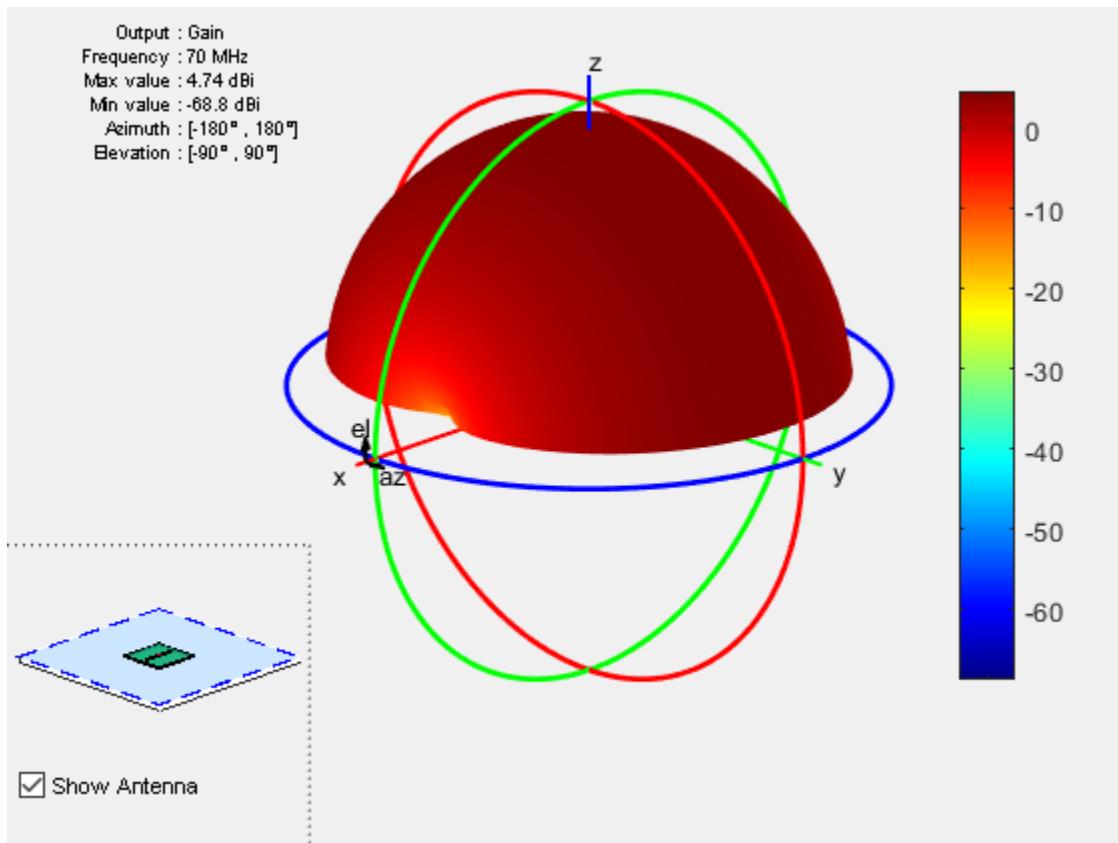

Set the groundplane length of the reflector to inf. View the structure.

```
rf.GroundPlaneLength = inf;  
show(rf)
```

Calculate the radiation pattern of the antenna at 70 MHz.

```
pattern(rf, 70e6)
```

### Antenna On Dilectric Substrate - Compare Gain Values

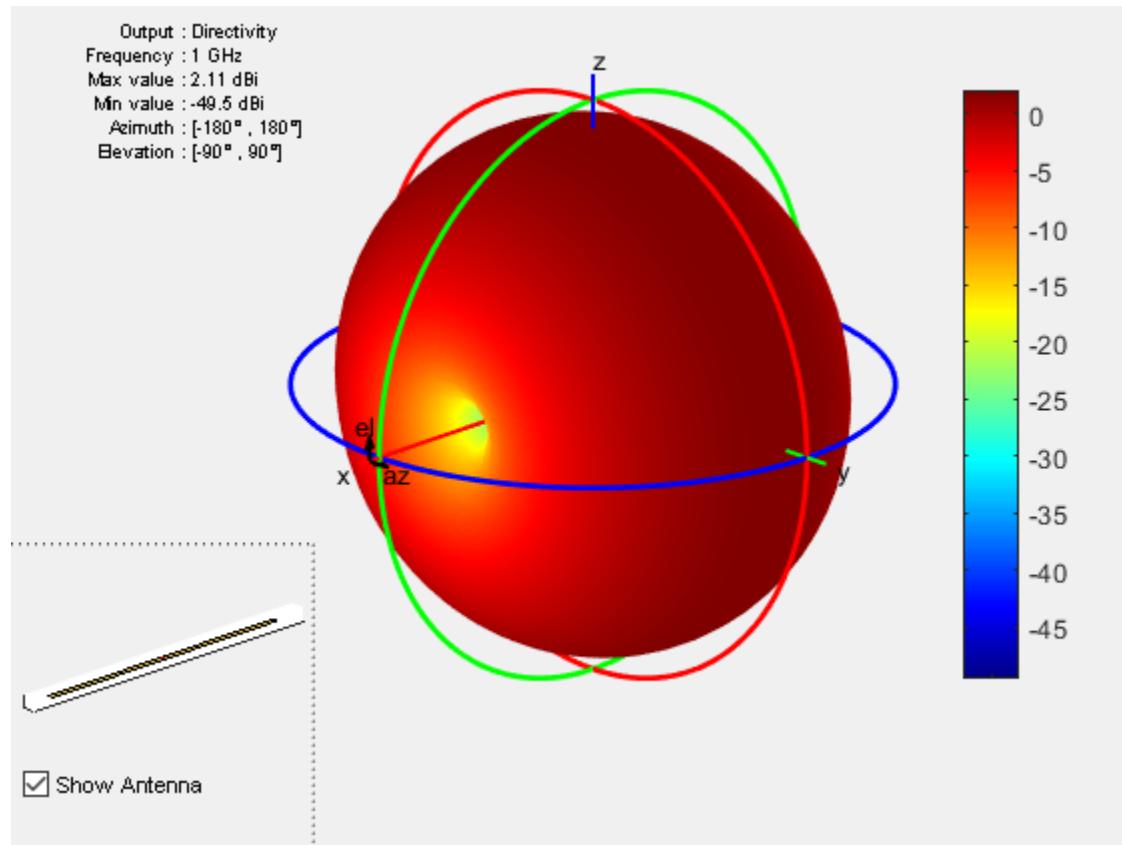

Compare the gain values of a dipole antenna in free space and dipole antenna on a substrate.

Design a dipole antenna at 1 GHz.

```
d = design(dipole,1e9);
l_by_w = d.Length/d.Width;
d.Tilt = 90;
d.TiltAxis = [0 1 0];
```

Plot the radiation pattern of the dipole in free space at 1GHz.

```
figure  
pattern(d,1e9);
```

Use FR4 as the dielectric substrate.

```
t = dielectric('FR4')  
eps_r = t.EpsilonR;  
lambda_0 = physconst('lightspeed')/1e9;  
lambda_d = lambda_0/sqrt(eps_r);
```

```
t =
```

```
dielectric with properties:
```

```
Name: 'FR4'  
EpsilonR: 4.8000  
LossTangent: 0.0260  
Thickness: 0.0060
```

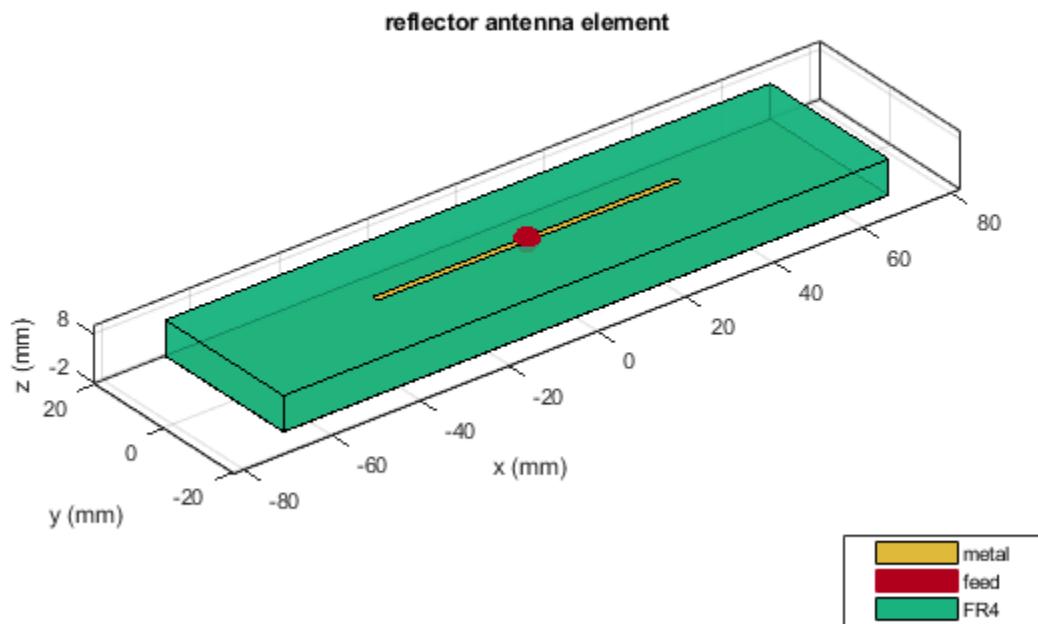

For more materials see <a href="matlab:openDielectricCatalog">catalog</a>

Adjust the length of the dipole based on the wavelength.

```
d.Length = lambda_d/2;  
d.Width = d.Length/l_by_w;
```

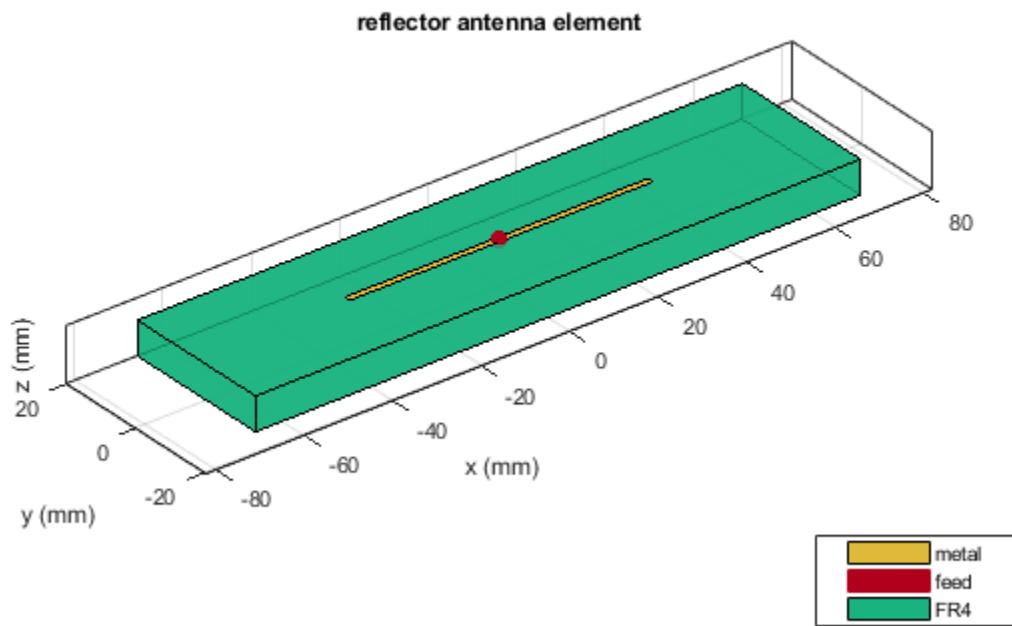

Design a reflector at 1 GHz with the dipole as the excitor and FR4 as the substrate.

```
rf = design(reflector,1e9);  
rf = reflector('Exciter',d,'Spacing',7.5e-3,'Substrate',t);  
rf.GroundPlaneLength = lambda_d;  
rf.GroundPlaneWidth = lambda_d/4;  
figure  
show(rf)
```

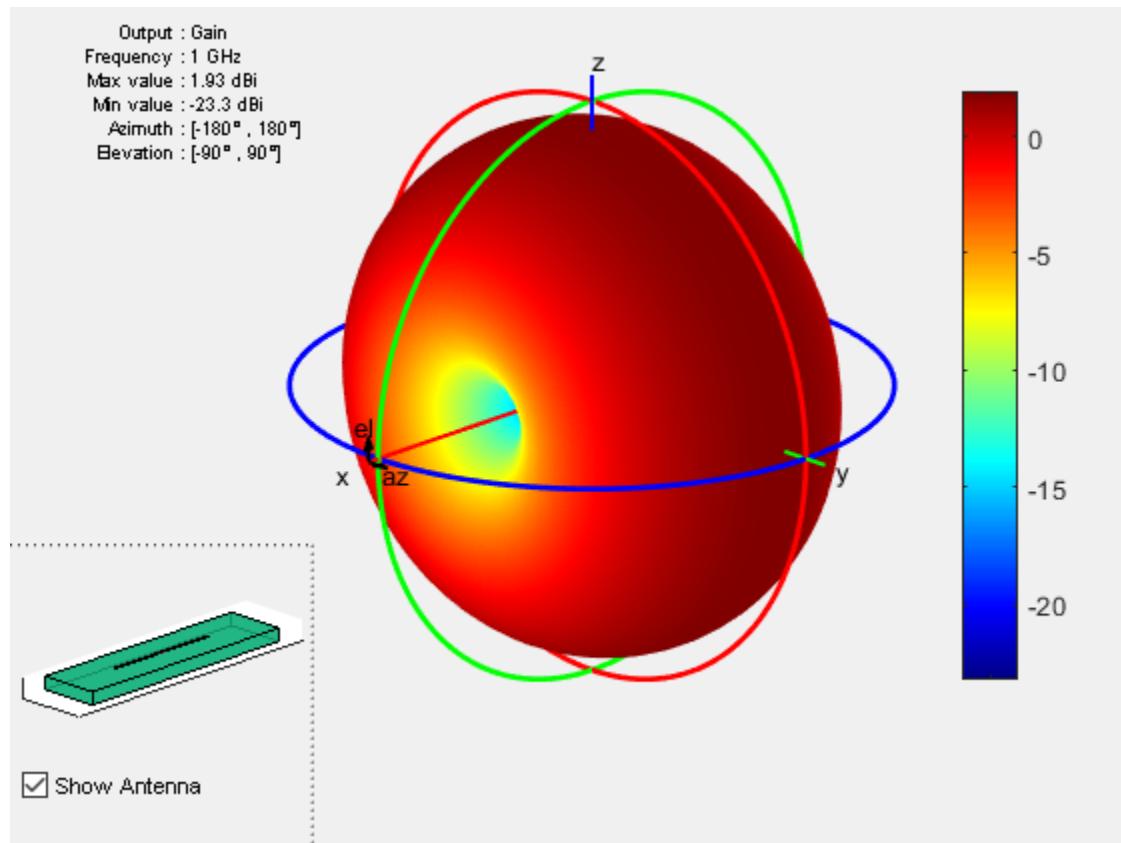

Remove the groundplane for plotting the gain of the dipole on the substrate.

```
rf.GroundPlaneLength = 0;  
show(rf)
```

Plot the radiation pattern of the dipole on the substrate at 1 GHz.

```
figure  
pattern(rf,1e9);
```

Compare the gain values.

- Gain of the dipole in free space = 2.11 dBi
- Gain of the dipole on substrate = 1.93 dBi

## Input Arguments

**material** — Material from dielectric catalog  
'Air' (default)

Material from the dielectric catalog, specified as one of the values from the DielectricCatalog.

Example: 'FR4'

Data Types: char

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Example: 'Name','Air'

### **Name — Name of dielectric material**

character vector

Name of the dielectric material you want to specify in the output, specified as the comma-separated pair consisting of 'Name' and a character vector.

Example: 'Name','Taconic\_TLC'

Data Types: char

### **EpsilonR — Relative permittivity of dielectric material**

1 | vector

Relative permittivity of the dielectric material, specified as the comma-separated pair consisting of 'EpsilonR' and vector.

Example: 'EpsilonR',4.8000

Data Types: double

### **LossTangent — Loss in dielectric material**

0 (default) | vector

Loss in the dielectric material, specified as the comma-separated pair consisting of 'LossTangent' and vector.

Example: 'LossTangent',0.0260

Data Types: double

**Thickness — Thickness of dielectric material**

0.0060 (default) | vector in meters

Thickness of the dielectric material along default z-axis, specified as the comma-separated pair consisting of 'Thickness' and vector in meters. This property applies only when you call the function with no output arguments.

Example: 'Thickness', 0.05

Data Types: double

## Output Arguments

**d — Dielectric material**

object handle

Dielectric material, returned as an object handle. You can use the dielectric material object handle to add dielectric material to an antenna.

# DielectricCatalog

Catalog of dielectric materials

## Syntax

```
dc = DielectricCatalog
```

## Description

`dc = DielectricCatalog` creates an object handle for the dielectric catalog.

- To open the dielectric catalog, use `open(dc)`
- To know the properties of a dielectric material from the dielectric catalog, use `s = find(dc, name)`.

## Examples

### Use Dielectric Catalog Element in Cavity

Open the dielectric catalog.

```
dc = DielectricCatalog;  
open(dc)
```

## 5 Methods — Alphabetical List

    Height: 0.0060
    Spacing: 0.0060
EnableProbeFeed: 0
    Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]

```

## Input Arguments

### **name — Name of dielectric material**

'Air' (default) | character vector

Name of a dielectric material from the dielectric catalog, specified as a character vector.

Example: 'FR4'

Data Types: char

### **dc — Dielectric catalog**

object handle

Dielectric catalog, specified as an object handle.

Data Types: char

## Output Arguments

**dc — Dielectric catalog**

object handle

Dielectric catalog, returned as an object handle.

**s — Parameters of dielectric material**

structure

Parameters of a dielectric material from the dielectric catalog, returned as a structure.

# hornangle2size

Equivalent flare width and height from flare angles

## Syntax

```
[flarewidth,flareheight]= hornangle2size(width,height,flarelength,  
angleE,angleH)
```

## Description

[flarewidth,flareheight]= hornangle2size(width,height,flarelength, angleE, angleH) calculates the equivalent flarewidth and flareheight for a rectangular horn antenna from its flare angles, angleE, and angleH.

## Examples

### Calculate Flare Width and Flare Height of Horn Antenna

Calculate the flare width and the flare height of a horn antenna with

- Width of the waveguide = 0.0229 m
- Height of the waveguide = 0.0102 m
- Flare length of the horn = 0.2729 m
- Flare angle in the E-plane = 12.2442 degrees
- Flare angle in the H-plane = 14.4712 degrees

```
width = 0.0229;  
height = 0.0102;  
flarelength = 0.2729;  
angleE = 12.2442;  
angleH = 14.4712;  
[flarewidth,flareheight] = hornangle2size(width,height,flarelength,...  
angleE,angleH)
```

```
flarewidth = 0.1638
```

```
flareheight = 0.1286
```

## Input Arguments

### **width — Rectangular waveguide width**

scalar in meters

Rectangular waveguide width, specified as the comma-separated pair consisting of 'Width' and a scalar in meters.

Data Types: double

### **height — Rectangular waveguide height**

scalar in meters

Rectangular waveguide height, specified as the comma-separated pair consisting of 'Height' and a scalar in meters.

Data Types: double

### **flarelength — Flare length of horn**

scalar in meters

Flare length of horn, specified as the comma-separated pair consisting of 'FlareLength' and a scalar in meters.

Data Types: double

### **angleE — Flare angle in E-plane**

scalar in degrees

Flare angle in E-plane of the horn, specified as a scalar in degrees.

Data Types: double

### **angleH — Flare angle in H-plane**

scalar in meters

Flare angle in H-plane of the horn, specified as a scalar in degrees.

Data Types: double

## Output Arguments

### **flarewidth — Flare width of horn**

scalar in meters

Flare width of horn, returned as a scalar in meters.

Data Types: double

### **flareheight — Flare height of horn**

scalar in meters

Flare height of horn, returned as a scalar in meters.

Data Types: double

## See Also

**Introduced in R2016a**

## add

**Class:** polarpattern

Add data to polar plot

### Syntax

```
add(p,d)  
add(p,angle,magnitude)
```

### Description

`add(p,d)` adds new antenna data to the polar plot, `p` based on the real amplitude values, `data`.

`add(p,angle,magnitude)` adds data sets of angle vectors and corresponding magnitude matrices to polar plot `p`.

### Input Arguments

**p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

**data — Antenna or array data**

real length- $M$  vector | real  $M$ -by- $N$  matrix | real  $N$ - $D$  array | complex vector or matrix

Antenna or array data, specified as one of the following:

- A real length- $M$  vector, where  $M$  contains the magnitude values with angles assumed

to be  $\frac{(0:M-1)}{M} \times 360^\circ$  degrees.

- A real  $M$ -by- $N$  matrix, where  $M$  contains the magnitude values and  $N$  contains the independent data sets. Each column in the matrix has angles taken from the vector

$$\frac{(0 : M - 1)}{M} \times 360^\circ \text{ degrees. The set of each angle can vary for each column.}$$

- A real  $N$ -D array, where  $N$  is the number of dimensions. Arrays with dimensions 2 and greater are independent data sets.
- A complex vector or matrix, where `data` contains Cartesian coordinates  $((x,y)$  of each point. `x` contains the real part of `data` and `y` contains the imaginary part of `data`.

When `data` is in a logarithmic form such as dB, magnitude values can be negative. In this case, `polarpattern` plots the lowest magnitude values at the origin of the polar plot and highest magnitude values at the maximum radius.

#### **angle — Set of angles**

vector in degrees

Set of angles, specified as a vector in degrees.

#### **magnitude — Set of magnitude values**

vector | matrix

Set of magnitude values, specified as a vector or a matrix. For a matrix of magnitude values, each column is an independent set of magnitude values and corresponds to the same set of angles.

## Examples

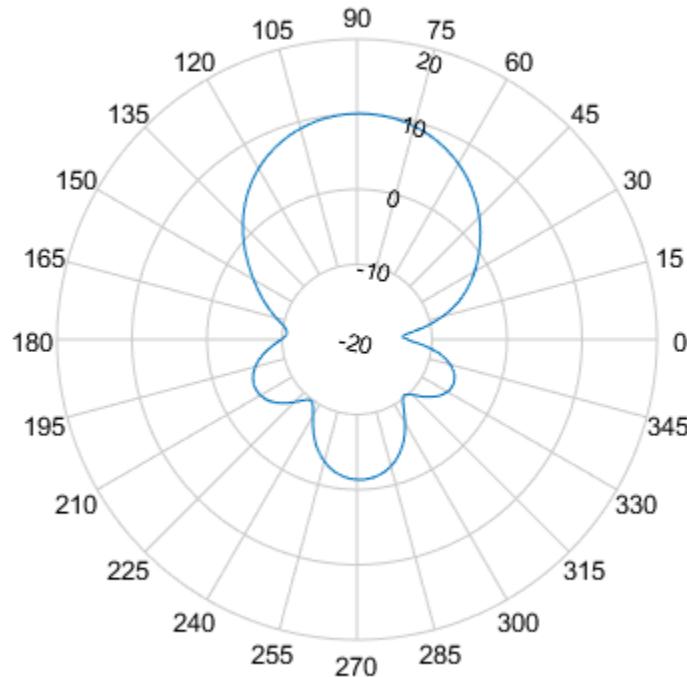

### Add Data To Polar Plot

Create a helix antenna that has 28 mm radius, a 1.2 mm width, and 4 turns. Calculate the directivity of the antenna at 1.8 GHz.

```
hx = helix('Radius',28e-3,'Width',1.2e-3,'Turns',4);
H = pattern(hx, 1.8e9,0,0:1:360);
```

Plot the polar pattern.

```
P = polarpattern(H);
```

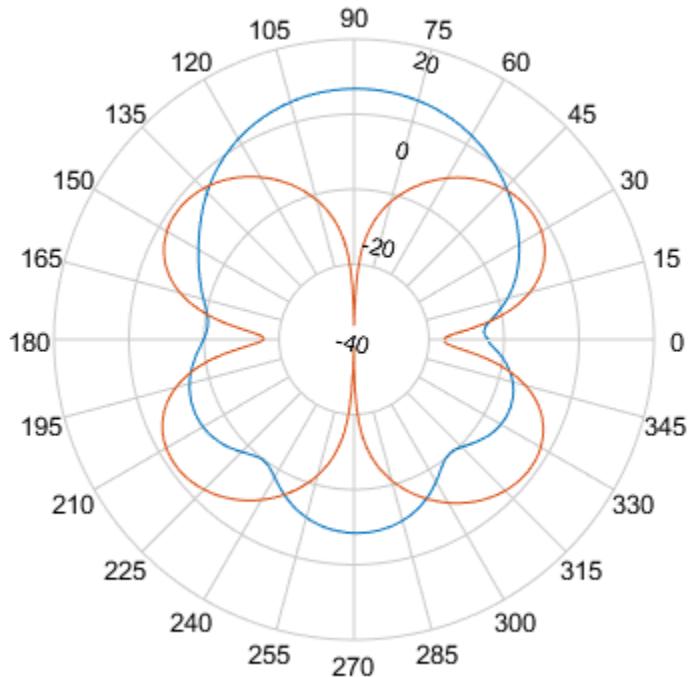

Create a dipole antenna and calculate the directivity at 270 MHz.

```
d = dipole;  
D = pattern(d,270e6,0,0:1:360);
```

Add the directivity of the dipole to the existing polar plot of helix antenna.

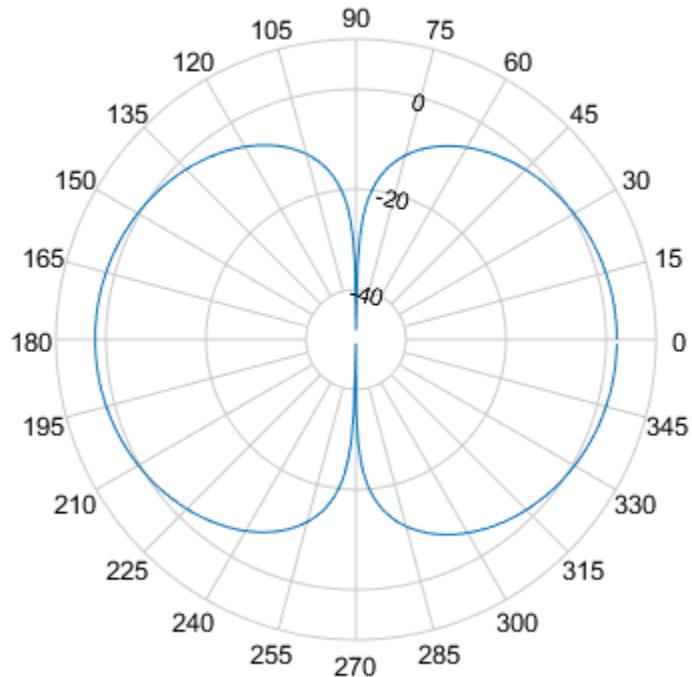

```
add(P,D);
```

### Add Angle and Magnitude Data to Polar Pattern

Create a dipole and plot the polar pattern of its directivity at 75 MHz.

```
d = dipole;
D = pattern(d, 75e6, 0, 0:1:360);
P = polarpattern(D);
```

Create a cavity antenna. Calculate the directivity of the antenna at 1 GHz. Write the directivity of the antenna to `cavity.pln` using the `msiwrite` function.

```
c = cavity;  
msiwrite(c,1e9,'cavity','Name','Cavity Antenna Specifications');
```

Read the data from `cavity.pln` to `Horizontal`, `Vertical` and `Optional` structures using the `msiread` function.

```
[Horizontal,Vertical,Optional] = msiread('cavity.pln')
```

```
Horizontal =
```

```
struct with fields:
```

```
PhysicalQuantity: 'Gain'  
    Magnitude: [360x1 double]  
        Units: 'dBi'  
        Azimuth: [360x1 double]  
        Elevation: 0  
        Frequency: 1.0000e+09  
        Slice: 'Elevation'
```

```
Vertical =
```

```
struct with fields:
```

```
PhysicalQuantity: 'Gain'  
    Magnitude: [360x1 double]  
        Units: 'dBi'  
        Azimuth: 0  
        Elevation: [360x1 double]  
        Frequency: 1.0000e+09  
        Slice: 'Azimuth'
```

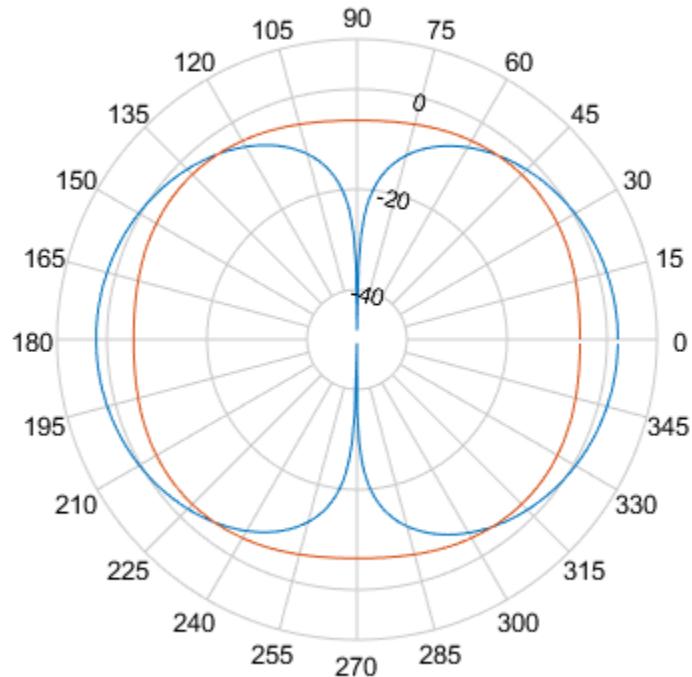

```
Optional =
```

```
struct with fields:
```

```
    name: 'Cavity Antenna Specifications'  
    frequency: 1.0000e+09  
    gain: [1x1 struct]
```

Add horizontal directivity data of the cavity antenna to the existing polar pattern of the dipole.

```
add(P,Horizontal.Azimuth,Horizontal.Magnitude);
```

| [showSpan](#)

**Introduced in R2016a**

# addCursor

**Class:** polarpattern

Add cursor to polar plot angle

## Syntax

```
addCursor(p,angle)
addCursor(p,angle,index)
id = addCursor(____)
```

## Description

`addCursor(p,angle)` adds a cursor to the active polar plot, `p`, at the data point closest to the specified angle. Angle units are in degrees.

The first cursor added is called '`C1`', the second '`C2`', and so on.

`addCursor(p,angle,index)` adds a cursor at a specified data set `index`. `index` can be a vector of indices.

`id = addCursor(____)` returns a cell array with one ID for each cursor created. You can specify any of the arguments from the previous syntaxes.

## Input Arguments

### **p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

### **angle — Angle values**

scalar in degrees | vector in degrees

Angle values at which the cursor is added, specified as a scalar or a vector in degrees.

**index — Data set index**

scalar | vector

Data set index, specified as a scalar or a vector.

## Examples

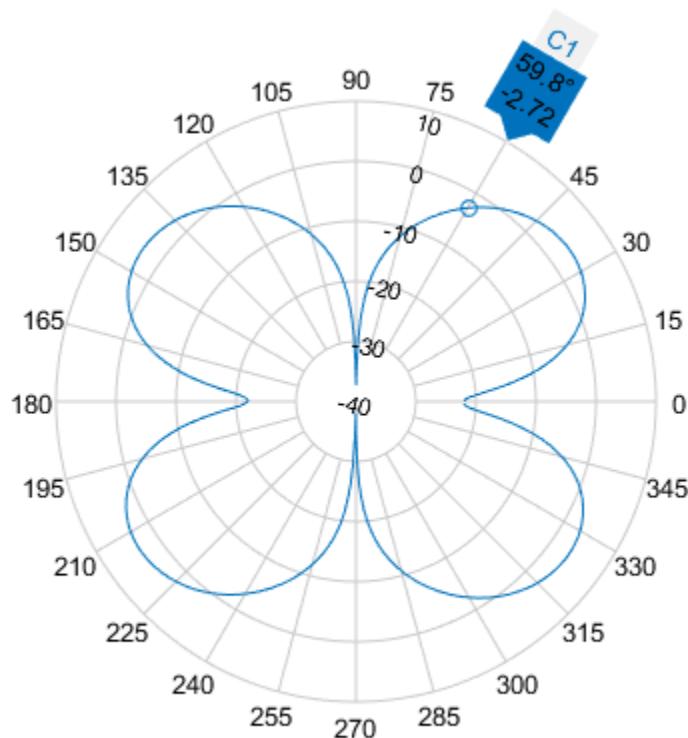

### Add Cursor to Plot

Create a dipole antenna and calculate its directivity at 270 MHz.

```
d = dipole;
D = pattern(d,270e6,0,0:1:360);
```

Add a cursor to the polar plot at approximately 60 degrees. To place the cursor at 60 degrees, move it there by placing the pointer on the cursor and dragging.

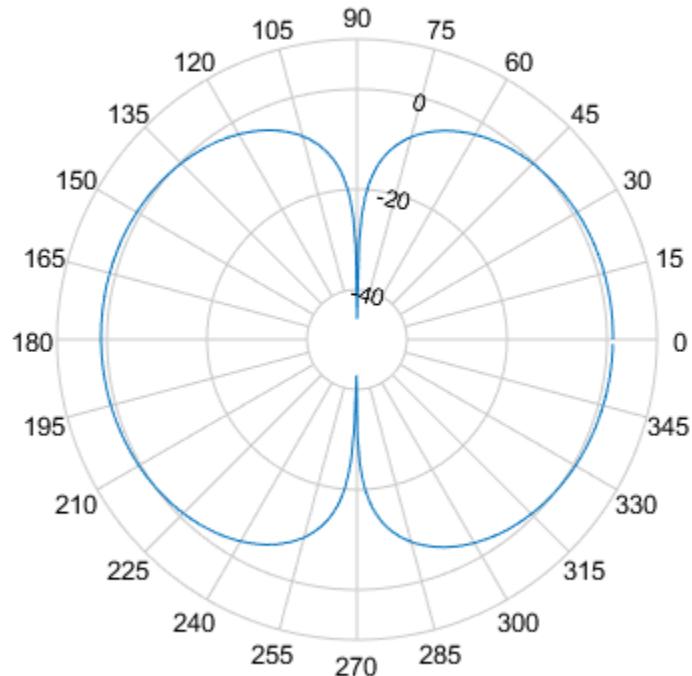

```
p = polarpattern(D);
addCursor(p,60);
```

### Add Cursors to Two Data Sets

Create a top-hat monopole and plot its directivity at 75 MHz.

```
m = monopoleTopHat;
M = pattern(m, 75e6, 0, 0:1:360);
P = polarpattern(M);
```

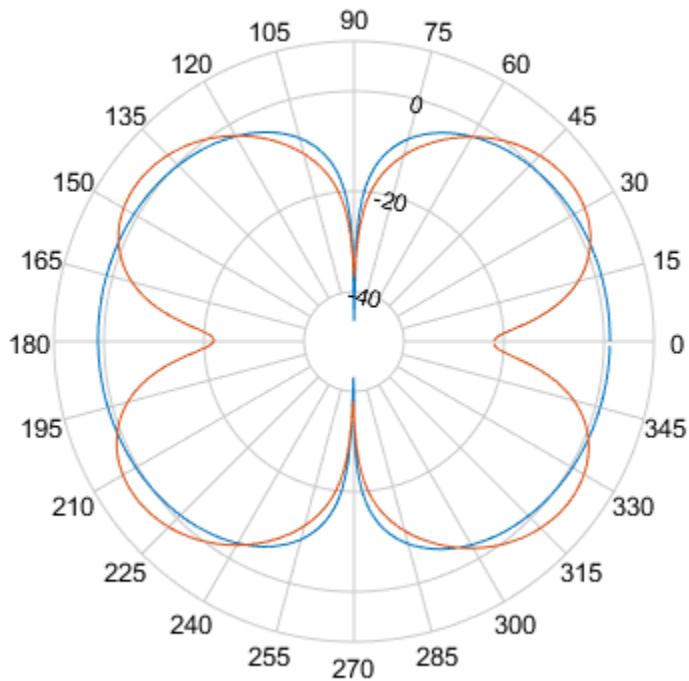

Create a dipole antenna and calculate its directivity at 270 MHz.

```
d = dipole;  
D = pattern(d, 270e6, 0, 0:1:360);
```

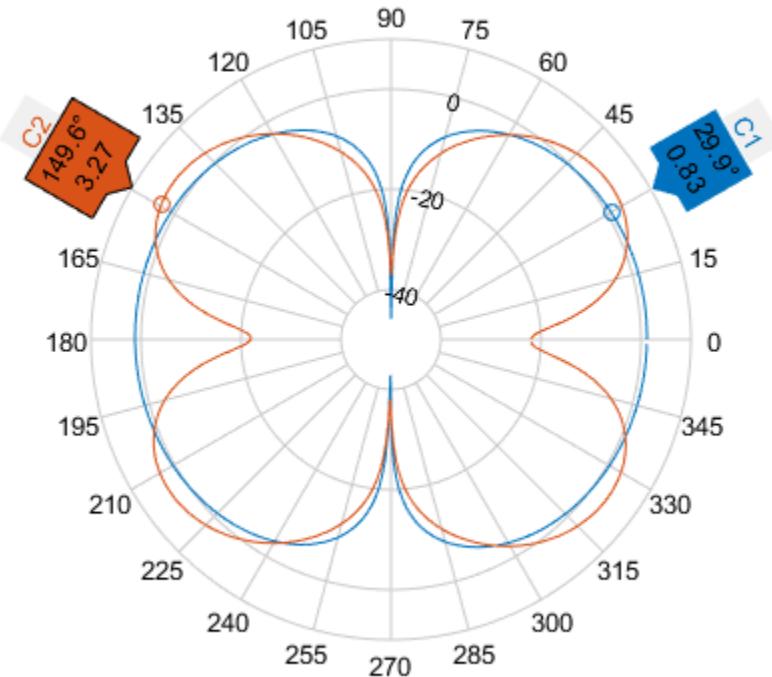

Add the directivity pattern of the dipole to the polar plot of the top-hat monopole.

```
add(P, D);
```

Add a cursor at approximately 30 degrees to the top-hat monopole polar pattern (data set 1) and at approximately 150 degrees to the dipole polar pattern (data set 2).

```
addCursor(P, [30 150], [1 2]);
```

# animate

**Class:** polarpattern

Replace existing data with new data for animation

## Syntax

```
animate(p,data)
animate(p,angle,magnitude)
```

## Description

`animate(p,data)` removes all the current data from polar plot, `p` and adds new data, based on real amplitude values, `data`.

`animate(p,angle,magnitude)` removes all the current data polar plot, `p` and adds new data sets of angle vectors and corresponding magnitude matrices.

## Input Arguments

### **p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

### **data — Antenna or array data**

real length- $M$  vector | real  $M$ -by- $N$  matrix | real  $N$ - $D$  array | complex vector or matrix

Antenna or array data, specified as one of the following:

- A real length- $M$  vector, where  $M$  contains the magnitude values with angles assumed

to be  $\frac{(0:M-1)}{M} \times 360^\circ$  degrees.

- A real  $M$ -by- $N$  matrix, where  $M$  contains the magnitude values and  $N$  contains the independent data sets. Each column in the matrix has angles taken from the vector  $\frac{(0 : M - 1)}{M} \times 360^\circ$  degrees. The set of each angle can vary for each column.
- A real  $N$ -D array, where  $N$  is the number of dimensions. Arrays with dimensions 2 and greater are independent data sets.
- A complex vector or matrix, where data contains Cartesian coordinates  $((x,y)$  of each point.  $x$  contains the real part of data and  $y$  contains the imaginary part of data.

When data is in a logarithmic form such as dB, magnitude values can be negative. In this case, `polarpattern` plots the lowest magnitude values at the origin of the polar plot and highest magnitude values at the maximum radius.

### **angle — Set of angles**

vector in degrees

Set of angles, specified as a vector in degrees.

### **magnitude — Set of magnitude values**

vector | matrix

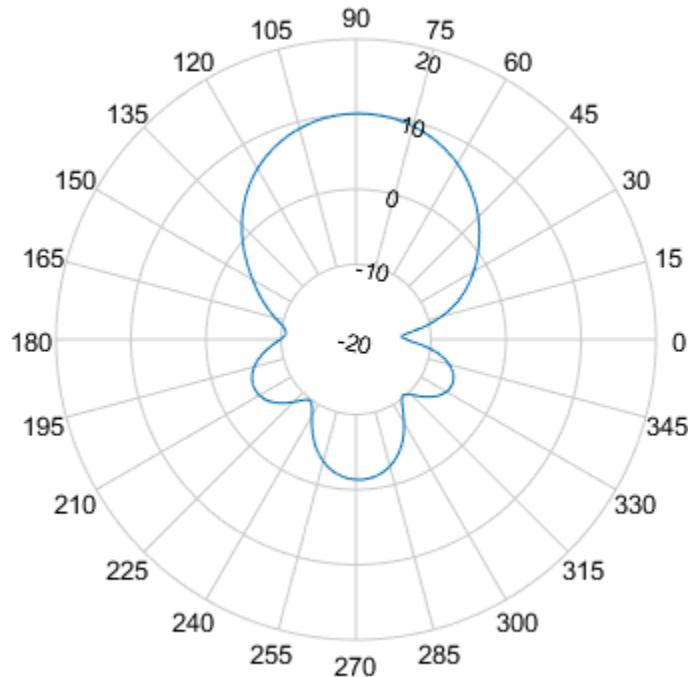

Set of magnitude values, specified as a vector or a matrix. For a matrix of magnitude values, each column is an independent set of magnitude values and corresponds to the same set of angles.

## Examples

### **Replace Existing Polar Plot Data For Animation**

Create a helix antenna that has a 28 mm radius, a 1.2 mm width, and 4 turns. Plot the directivity of the antenna at 1.8 GHz.

```
hx = helix('Radius',28e-3,'Width',1.2e-3,'Turns',4);  
H = pattern(hx, 1.8e9,0,0:1:360);  
P = polarpattern(H);
```

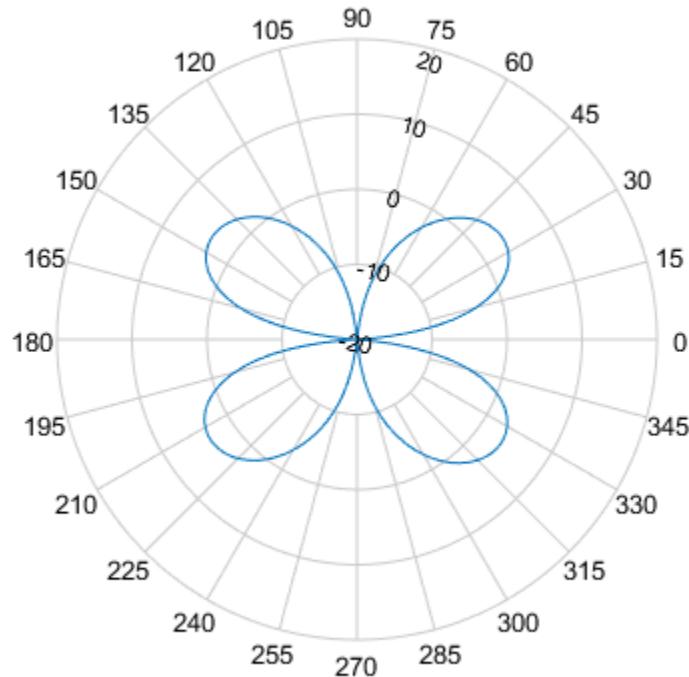

Create a dipole antenna and calculate its directivity at 270 MHz.

```
d = dipole;  
D = pattern(d,270e6,0,0:1:360);
```

Replace the existing polar plot of the helix antenna with the directivity of the dipole using the `animate` method.

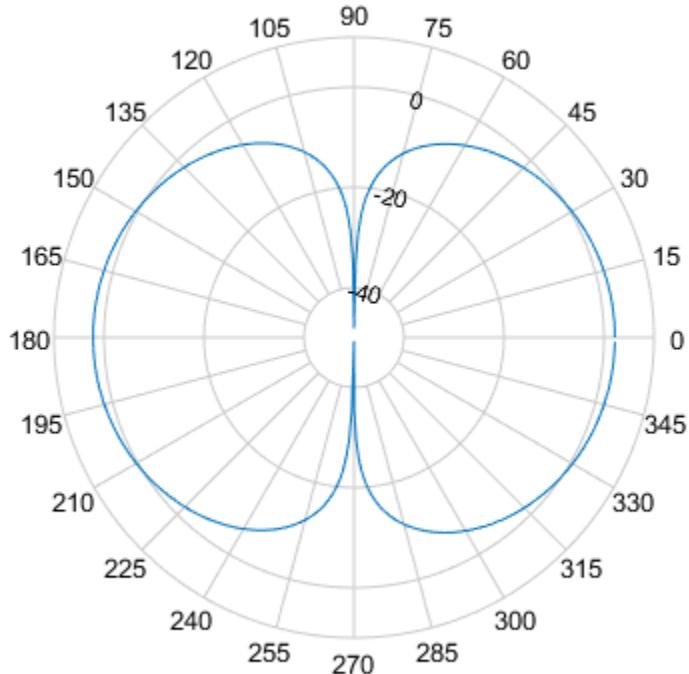

```
animate(P,D);
```

### Animate Using Cavity Data

Create a default dipole antenna and plot the polar pattern of its directivity at 1 GHz.

```
d = dipole;
D = pattern(d, 75e6, 0, 0:1:360);
P = polarpattern(D);
```

Create a default cavity antenna. Calculate the directivity of the antenna and write the data to `cavity.pln` using the `msiwrite` function.

```
c = cavity;  
msiwrite(c,2.8e9,'cavity','Name','Cavity Antenna Specifications');
```

Read the cavity specifications file into `Horizontal`, `Vertical` and `Optional` structures using the `msiread` function.

```
[Horizontal,Vertical,optional]= msiread('cavity.pln')
```

```
Horizontal =
```

## createLabels

**Class:** polarpattern

Create legend labels for polar plot

### Syntax

```
createLabels(p,format,array)
```

### Description

`createLabels(p,format,array)` adds the specified `format` label to each `array` of the polar plot `p`. The labels are stored as a cell array in the `LegendLabels` property of `p`.

### Input Arguments

**p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

**format — Format for legend label**

cell array

Format for legend label added to the polar plot, specified as a cell array. For more information on legend label format see, `legend`.

Data Types: `char`

**array — Values to apply to format**

array

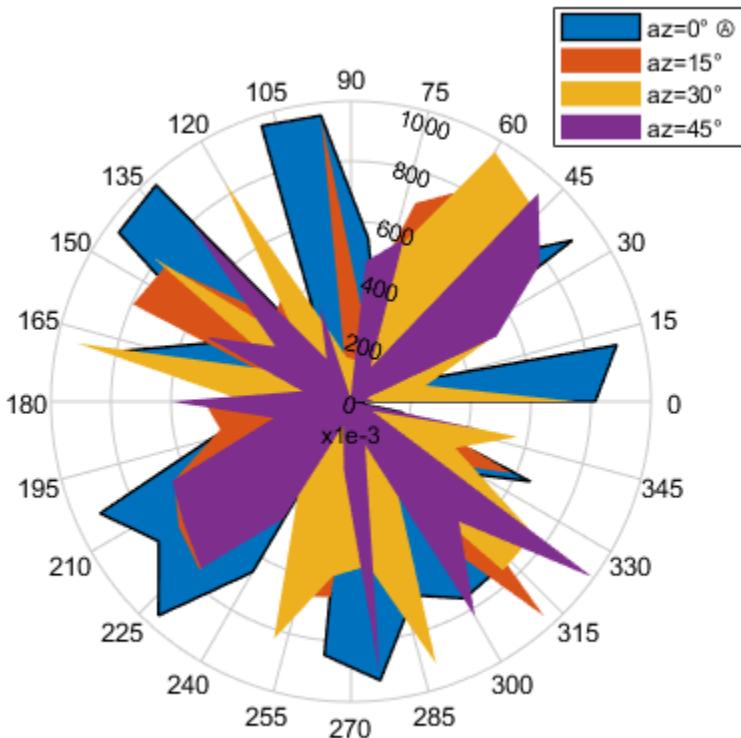

Values to apply to `format`, specified as an array. The values can be an array of angles or array of magnitude.

## Examples

### Add Legend Label to Polar Plot

Create a polar plot of unique values. Generate a legend label for this plot.

```
p = polarpattern(rand(30,4), 'Style', 'filled');  
createLabels(p, 'az=%d#deg', 0:15:45)
```

**Introduced in R2016a**

# findLobes

**Class:** polarpattern

Main, back, and side lobe data

## Syntax

```
L = findLobes(p)  
L = findLobes(p,index)
```

## Description

`L = findLobes(p)` returns a structure, `L`, defining the main, back, and side lobes of the antenna or array radiation pattern in the specified polar plot, `p`.

`L = findLobes(p,index)` returns the radiation pattern lobes from the data set specified in `index`.

## Input Arguments

**p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

**index — Index of data set**

scalar

Index of data set, specified as a scalar.

## Examples

### Find Main, Back, and Side Lobes

Create a dipole antenna and calculate its directivity at 270 MHz.

```
d = dipole;
D = pattern(d,270e6,0,0:1:360);
```

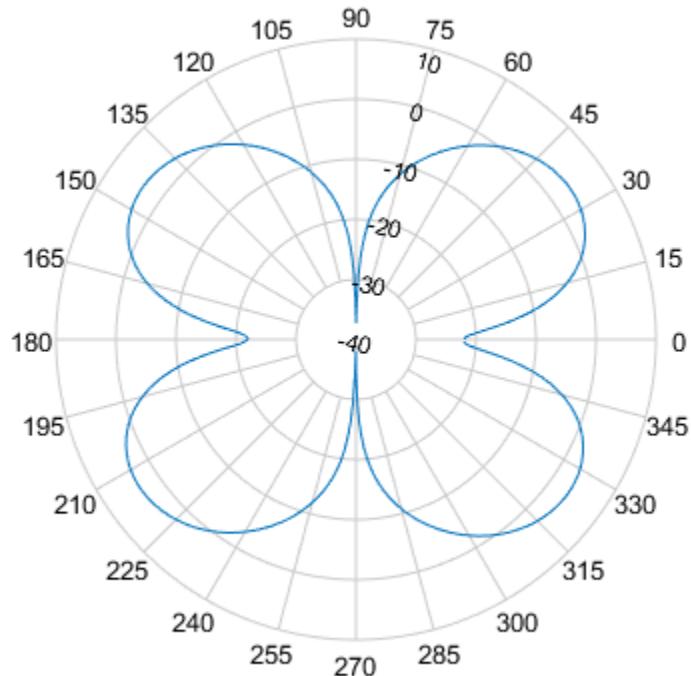

Create a polar plot of the dipole directivity. Find the main, back, and side lobes of the dipole antenna.

```
p = polarpattern(D);
L = findLobes(p)
```

```
L =
```

```
struct with fields:
```

```
mainLobe: [1x1 struct]
backLobe: [1x1 struct]
sideLobes: [1x1 struct]
    FB: 0.0033
    SLL: 0
    HPBW: 30.9141
    FNBW: 89.7507
    FBIdx: [326 145.5000]
    SLLIdx: [326 216]
    HPBWIIdx: [202 233]
    HPBWAng: [200.4432 231.3573]
    FNBTWIIdx: [271 361]
```

Inspect main, back, and side lobe data.

```
MainLobe = L.mainLobe  
BackLobe = L.backLobe  
SideLobe = L.sideLobes
```

```
MainLobe =  
  
struct with fields:  
  
    index: 326  
magnitude: 3.6568  
    angle: 324.0997
```

```
extent: [271 361]

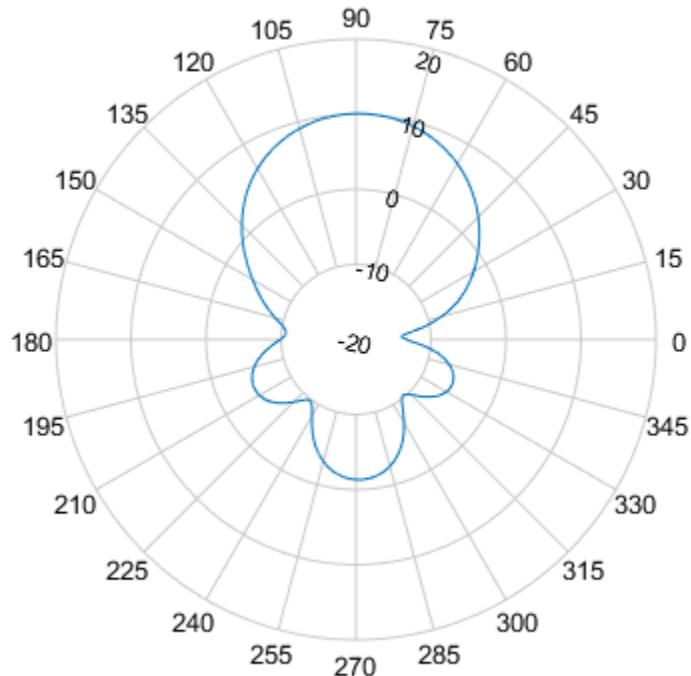

BackLobe =
    struct with fields:
        magnitude: 3.6534
        angle: 144.0997
        extent: [91 181]
        index: 145.5000

SideLobe =
    struct with fields:
        index: 216
        magnitude: 3.6568
        angle: 214.4044
        extent: [2x2 double]
```

### Find Lobes in Two Data Sets

Create a helix antenna that has a 28 mm radius, a 1.2 mm width, and 4 turns. Calculate and plot the directivity of the antenna at 1.8 GHz.

```
hx = helix('Radius',28e-3,'Width',1.2e-3,'Turns',4);
H = pattern(hx, 1.8e9,0,0:1:360);
P = polarpattern(H);
```

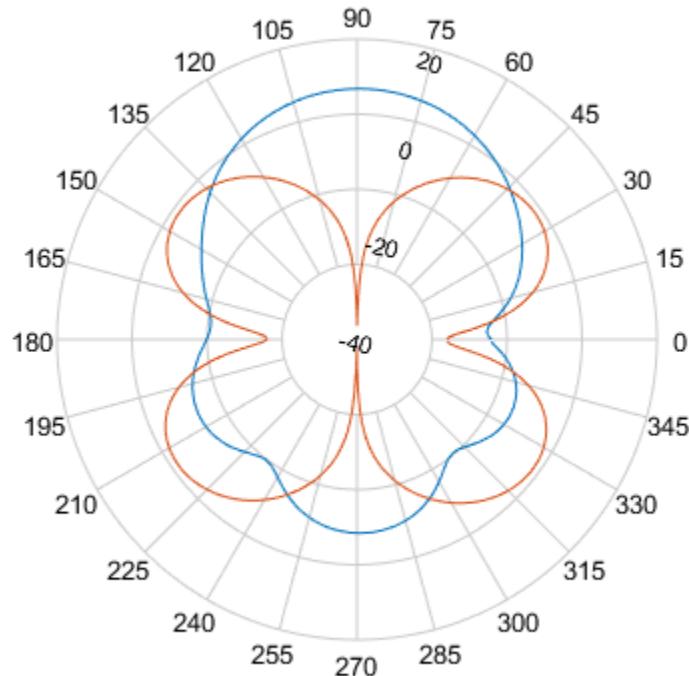

Create a dipole antenna and calculate the directivity at 270 MHz.

```
d = dipole;  
D = pattern(d,270e6,0,0:1:360);
```

Add the directivity of the dipole to the existing polar plot.

```
add(P,D);
```

Find the main, back, and side lobes of helix antenna.

```
L = findLobes(P,1)
```

```
L =
```

```
struct with fields:
```

```
mainLobe: [1x1 struct]
backLobe: [1x1 struct]
sideLobes: [1x1 struct]
    FB: 11.4614
    SLL: 11.4074
```

```
HPBW: 56.8421
FNBW: 171.5235
FBIdx: [90 270.5000]
SLLIdx: [90 273]
HPBWIIdx: [61 118]
HPBWAng: [59.8338 116.6759]
FNWBWIIdx: [4 176]
```

**Introduced in R2016a**

## replace

**Class:** polarpattern

Replace polar plot data with new data

### Syntax

```
replace(p,data)
replace(p,angle,magnitude)
```

### Description

`replace(p,data)` removes all data from polar plot, `p` and adds new data based on real amplitude values, `data`.

`replace(p,angle,magnitude)` removes all the current data and adds new data sets of angle vectors and corresponding magnitude matrices to the polar plot, `p`.

### Input Arguments

#### **p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

#### **data — Antenna or array data**

real length- $M$  vector | real  $M$ -by- $N$  matrix | real  $N$ - $D$  array | complex vector or matrix

Antenna or array data, specified as one of the following:

- A real length- $M$  vector, where  $M$  contains the magnitude values with angles assumed

to be  $\frac{(0:M-1)}{M} \times 360^\circ$  degrees.

- A real  $M$ -by- $N$  matrix, where  $M$  contains the magnitude values and  $N$  contains the independent data sets. Each column in the matrix has angles taken from the vector  $\frac{(0 : M - 1)}{M} \times 360^\circ$  degrees. The set of each angle can vary for each column.
- A real  $N$ -D array, where  $N$  is the number of dimensions. Arrays with dimensions 2 and greater are independent data sets.
- A complex vector or matrix, where `data` contains Cartesian coordinates  $((x,y)$  of each point. `x` contains the real part of `data` and `y` contains the imaginary part of `data`.

When `data` is in a logarithmic form such as dB, magnitude values can be negative. In this case, `polarpattern` plots the lowest magnitude values at the origin of the polar plot and highest magnitude values at the maximum radius.

#### **angle — Set of angles**

vector in degrees

Set of angles, specified as a vector in degrees.

#### **magnitude — Set of magnitude values**

vector | matrix

Set of magnitude values, specified as a vector or a matrix. For a matrix of magnitude values, each column is an independent set of magnitude values and corresponds to the same set of angles.

## Examples

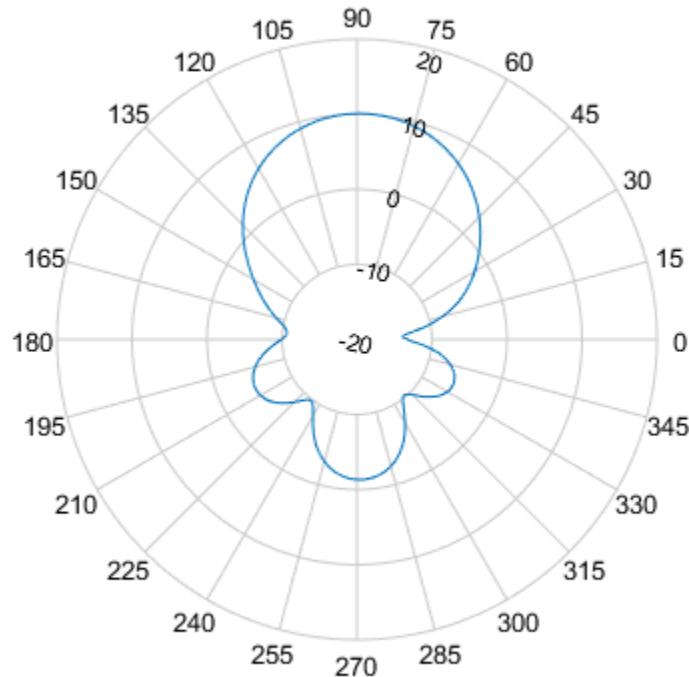

### Replace Polar Plot Data with New Data

Create a helix antenna that has a 28 mm radius, a 1.2 mm width, and 4 turns. Calculate the directivity of the antenna at 1.8 GHz.

```
hx = helix('Radius',28e-3,'Width',1.2e-3,'Turns',4);
H = pattern(hx, 1.8e9,0,0:1:360);
```

Plot the polar pattern.

```
P = polarpattern(H);
```

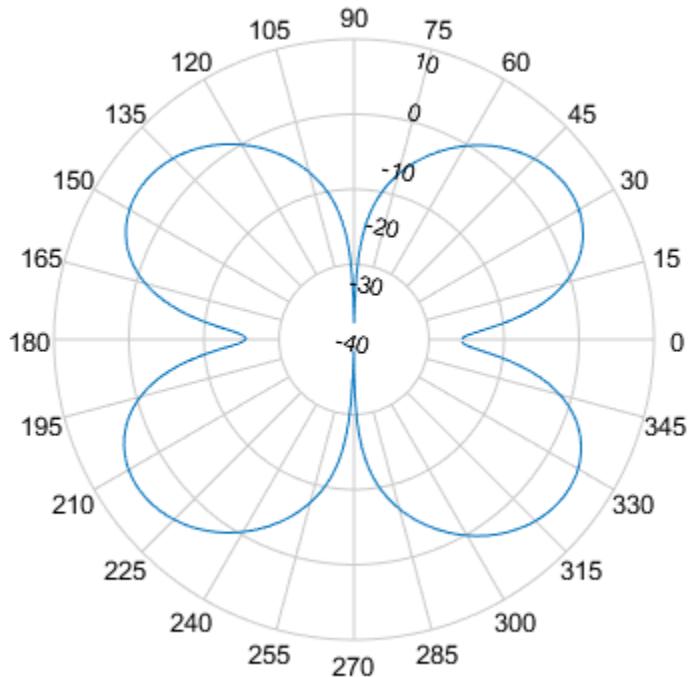

Create a dipole antenna and calculate its directivity at 270 MHz.

```
d = dipole;  
D = pattern(d, 270e6, 0, 0:1:360);
```

Replace the existing polar plot of the helix antenna with the directivity of the dipole.

```
replace(P, D);
```

## See Also

[add](#) | [addCursor](#) | [animate](#) | [createLabels](#) | [findLobes](#) | [showPeaksTable](#) | [showSpan](#)

**Introduced in R2016a**

## showPeaksTable

**Class:** polarpattern

Show or hide peak marker table

### Syntax

```
showPeaksTable(p,vis)
```

### Description

`showPeaksTable(p,vis)` shows or hides a table of the peak values. By default, the peak values table is visible.

### Input Arguments

**p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

**vis — Show or hide peaks table**

0 | 1

Show or hide peaks table, specified as 0 or 1.

### Examples

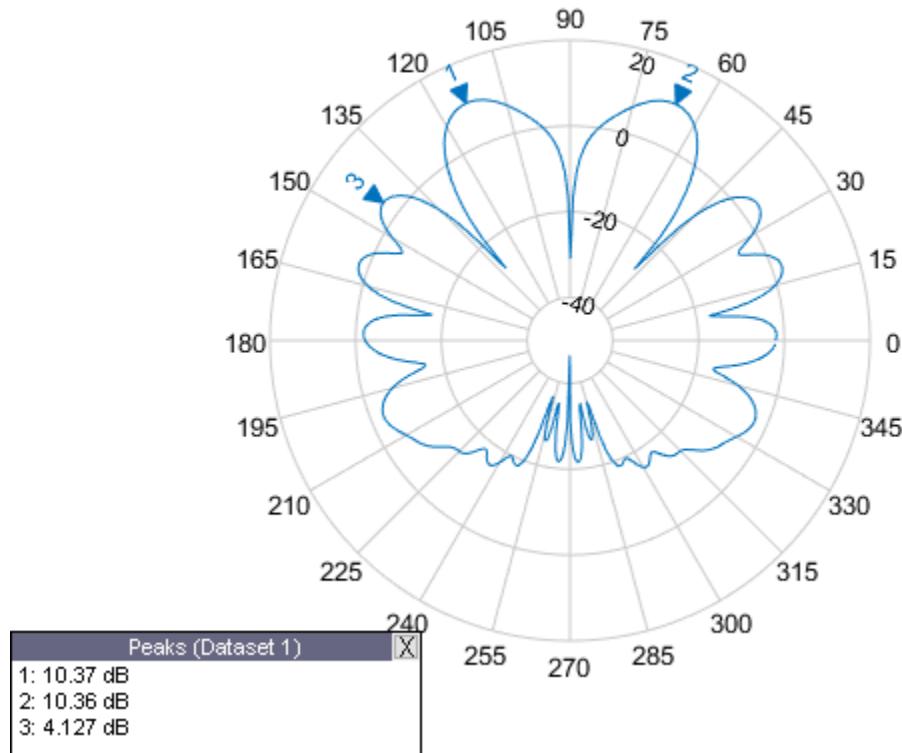

#### Peaks of Antenna in Polar Pattern

Create a monopole antenna and calculate the directivity at 1 GHz.

```
m = monopole;  
M = pattern(m,1e9,0,0:1:360);
```

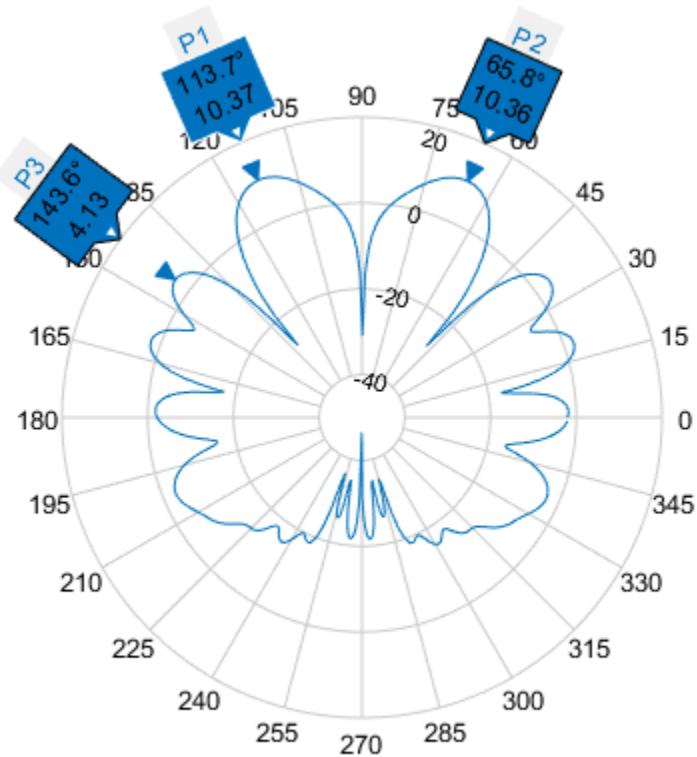

Plot the polar pattern and show three peaks of the antenna. When creating a `polarpattern` plot, if you specify the `Peaks` property, the peaks table is displayed by default.

```
P = polarpattern(M, 'Peaks', 3);
```

Hide the table. When the peaks table is hidden, the peak markers display the peak values.

```
showPeaksTable(P, 0);
```

## See Also

[add](#) | [addCursor](#) | [animate](#) | [createLabels](#) | [findLobes](#) | [replace](#) | [showSpan](#)

Introduced in R2016a

# showSpan

**Class:** polarpattern

Show or hide angle span between two markers

## Syntax

```
showSpan(p,id1,id2)
showSpan(p,id1,id2,true)
showSpan(p,vis)
showSpan(p)
d = showSpan(____)
```

## Description

`showSpan(p,id1,id2)` displays the angle span between two angle markers, `id1` and `id2`. The angle span is calculated counterclockwise.

`showSpan(p,id1,id2,true)` automatically reorders the angle markers such that the initial angle span is less than or equal to 180° counterclockwise.

`showSpan(p,vis)` sets angle span visibility by setting `vis` to `true` or `false`.

`showSpan(p)` toggles the angle span display on and off.

`d = showSpan(____)` returns angle span details in a structure, `d` using any of the previous syntaxes.

## Input Arguments

**p — Polar plot**

scalar handle

Polar plot, specified as a scalar handle.

**id1, id2 — Cursor or peak marker identifiers**

character vector

Cursor or peak marker identifiers, specified as character vector. Adding cursors to the polar plot creates cursor marker identifiers. Adding peaks to the polar plot creates peak marker identifiers.

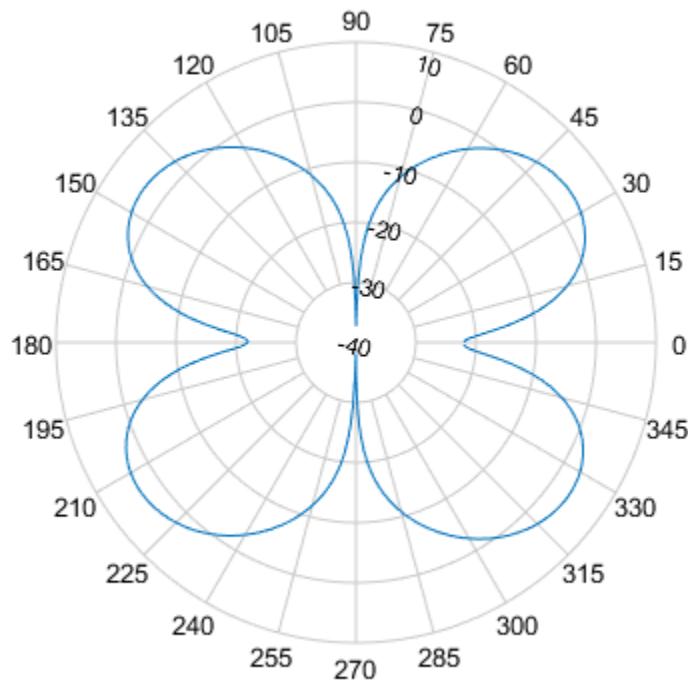

Example: `showspan(p, 'C1', 'C2')`. Displays the angle span between cursors, C1 and C2 in polar plot, p.

## Examples

### Show Angle Span

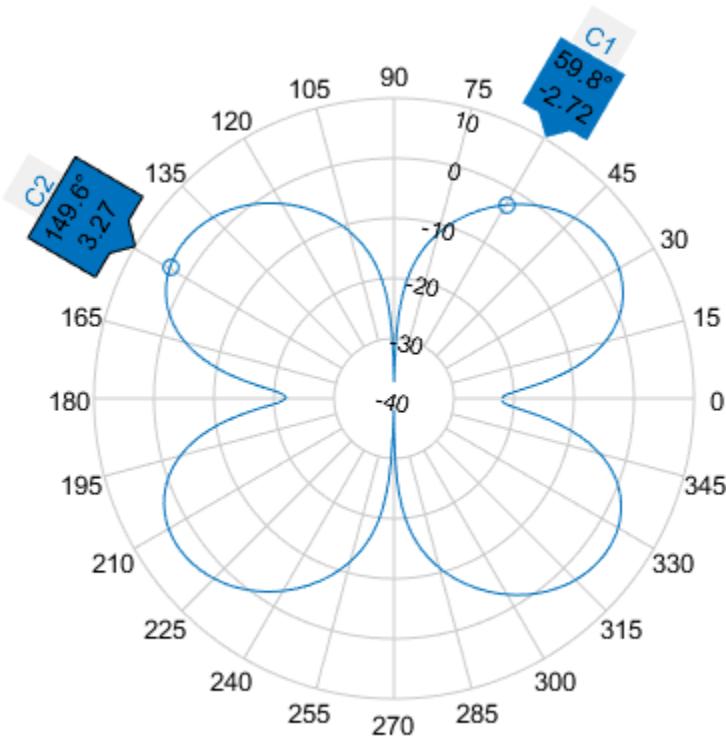

Create a dipole antenna and plot the directivity at 270 MHz.

```
d = dipole;
D = pattern(d,270e6,0,0:1:360);
p = polarpattern(D);
```

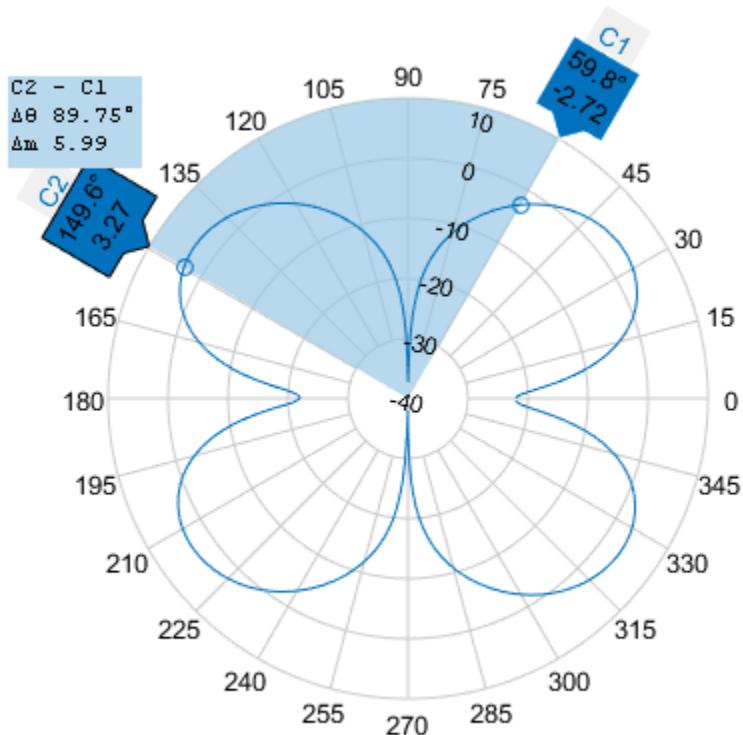

Add cursors to the polar plot at approximately 60 and 150 degrees.

```
addCursor(p, [60 150]);
```

Show the angle span between the two angles.

```
showSpan(p, 'C1', 'C2');
```

## arrayFactor

Array factor in dB

### Syntax

```
arrayFactor(object,frequency)
arrayFactor(object,frequency,azimuth,elevation)
arrayFactor(____,Name,Value)

[af] = arrayFactor(object,frequency)
[af,azimuth,elevation] = arrayFactor(____)
[af,azimuth,elevation] = arrayFactor(____,Name,Value)
```

### Description

`arrayFactor(object,frequency)` plots the 3-D array factor over the specified frequency value in dB.

`arrayFactor(object,frequency,azimuth,elevation)` plots the array factor over the specified frequency, azimuth, and elevation values.

`arrayFactor(____,Name,Value)` plots the array factor using additional options specified by one or more `Name,Value` pair arguments. Specify name-value pair arguments after all other input arguments.

`[af] = arrayFactor(object,frequency)` returns the 3-D array factor over the specified frequency value.

`[af,azimuth,elevation] = arrayFactor(____)` returns the array factor at the specified frequency, azimuth, and elevation values.

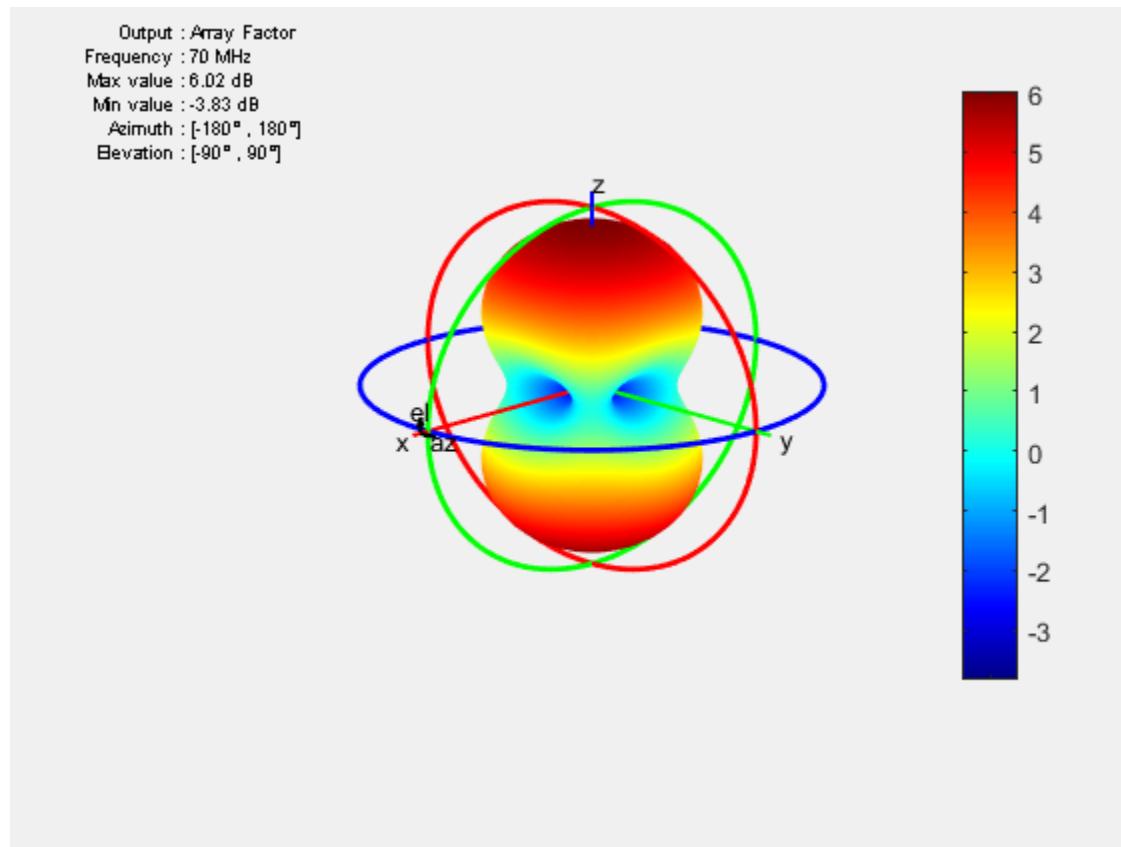

`[af,azimuth,elevation] = arrayFactor(____,Name,Value)` returns the array factor using additional options specified by one or more `Name,Value` pair arguments. Specify name-value pair arguments after all other input arguments.

## Examples

### Plot Array Factor

Plot the array factor of a default rectangular array at a frequency of 70 MHz.

```
ra = rectangularArray;  
arrayFactor(ra, 70e6);
```

## Input Arguments

**object** — Input antenna array  
object handle

Input antenna array object, specified as an object handle.

Example: `r = rectangularArray; arrayFactor (r,70e6)`. Calculates the array factor of a rectangular array.

**frequency** — Frequency value used to calculate array factor  
scalar in Hz

Frequency value used to calculate array factor, specified as a scalar in Hz.

Example: `70e6`

Data Types: `double`

**azimuth — Azimuth angle of antenna**

`-180:5:180` (default) | vector in degrees

Azimuth angle of the antenna, specified as a vector in degrees.

Example: `-90:5:90`

Data Types: `double`

**elevation — Elevation angle of antenna**

`-90:5:90` (default) | vector in degrees

Elevation angle of the antenna, specified as a vector in degrees.

Example: `0:1:360`

Data Types: `double`

## Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` pair arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'CoordinateSystem', 'rectangular'`

**CoordinateSystem — Coordinate system of array factor**

`'polar'` (default) | `'rectangular'` | `'uv'`

Coordinate system of array factor, specified as the comma-separated pair consisting of `'CoordinateSystem'` and one of these values: `'polar'`, `'rectangular'`, `'uv'`.

Example: `'CoordinateSystem', 'polar'`

Data Types: `char`

## Output Arguments

### **af — Array factor**

matrix in dB

Array factor, returned as a matrix in dB. The matrix size is the product of number of elevation values and number of azimuth values.

### **azimuth — Azimuth values**

vector in degrees

Azimuth values used to calculate the array factor, returned as a vector in degrees.

### **elevation — Elevation values**

vector in degrees

Elevation values used to calculate the array factor, returned as a vector in degrees.

## Introduced in R2017a

# angle

Angle between sites

## Syntax

```
[az,el] = angle(site1,site2)
[az,el] = angle(site1,site2,path)
```

## Description

[az,el] = angle(site1,site2) returns the azimuth and elevation angles between site 1 and site 2.

[az,el] = angle(site1,site2,path) returns the angles using a specified path type, either Euclidean or geodesic.

## Examples

### Angle Between Sites

Create transmitter and receiver sites.

```
tx = txsite('Name','MathWorks','Latitude',42.3001,'Longitude',-71.3504);
rx = rxsite('Name','Fenway Park','Latitude',42.3467,'Longitude',-71.0972);
```

Get the azimuth and elevation angles between the sites.

```
[az,el] = angle(tx,rx)
```

```
az =
```

```
14.0142
```

```
el =  
-0.1204
```

Get the azimuth angle between sites in degrees clockwise from North.

```
azFromEast = angle(tx,rx); % Unit: degrees counter-clockwise from East  
azFromNorth = -azFromEast + 90 % Convert angle to clockwise from North
```

```
azFromNorth =  
75.9858
```

### Angle Between Sites When Path is Geodesic

Create transmitter and receiver sites.

```
tx = txsite('Name','MathWorks','Latitude',42.3001,'Longitude',-71.3504);  
rx = rxsite('Name','Fenway Park','Latitude',42.3467,'Longitude',-71.0972);
```

Get the azimuth and elevation angles between the sites.

```
[az,el] = angle(tx,rx,'geodesic')
```

```
az =  
14.0142  
  
el =  
0
```

## Input Arguments

**site1,site2 — Transmitter or receiver site**  
txsite or rxsite object

---

Transmitter or receiver site, specified as a `txsite` or `rxsite` object. You can use array inputs to specify multiple sites.

**path — Measurement path type**

'euclidean' or 'geodesic'

Measurement path type, specified as one of the following:

- 'euclidean': Uses the shortest path through space connecting the antenna center positions of the site 1 and site 2.
- 'geodesic': Uses the shortest path on the surface of the earth connecting the latitude and longitude locations of site 1 and site 2. This path uses Earth ellipsoid model WGS-84.

Data Types: `char`

## Output Arguments

**az — Azimuth angle between site 1 and site 2**

*M*-by-*N* arrays

Azimuth angle between site 1 and site 2, returned as *M*-by-*N* arrays in degrees. *M* is the number of sites in sites 2 and *N* is the number of sites in sites 1. The values range from -180 to 180.

**e1 — Elevation angle between site 1 and site 2**

*M*-by-*N* arrays

Elevation angle between site 1 and site 2, returned as *M*-by-*N* arrays in degrees. *M* is the number of sites in sites 2 and *N* is the number of sites in sites 1. The values range from -90 to 90.

When the path type specified is 'geodesic', elevation angle is always zero.

## See Also

`distance`

**Introduced in R2017b**

# coverage

Display coverage map

## Syntax

```
coverage(tx)
coverage(tx,propmodel)
coverage(tx,rx)
coverage(tx,rx,propmodel)
coverage(____,Name,Value,____)
```

## Description

`coverage(tx)` displays the coverage map for the transmitter site. Each colored contour of the map defines an area where the corresponding signal strength is transmitted to the mobile receiver.

`coverage(tx,propmodel)` displays the coverage map based on the specified propagation model.

---

**Note** Signal strength is computed using a propagation model that disregards the curvature of the Earth, terrain, or other obstacles.

---

`coverage(tx,rx)` displays the coverage map based on the receiver site properties.

`coverage(tx,rx,propmodel)` displays the coverage map based on the receiver site properties and specified propagation model.

`coverage(____,Name,Value,____)` displays the coverage map using additional options specified by the Name,Value pairs.

## Examples

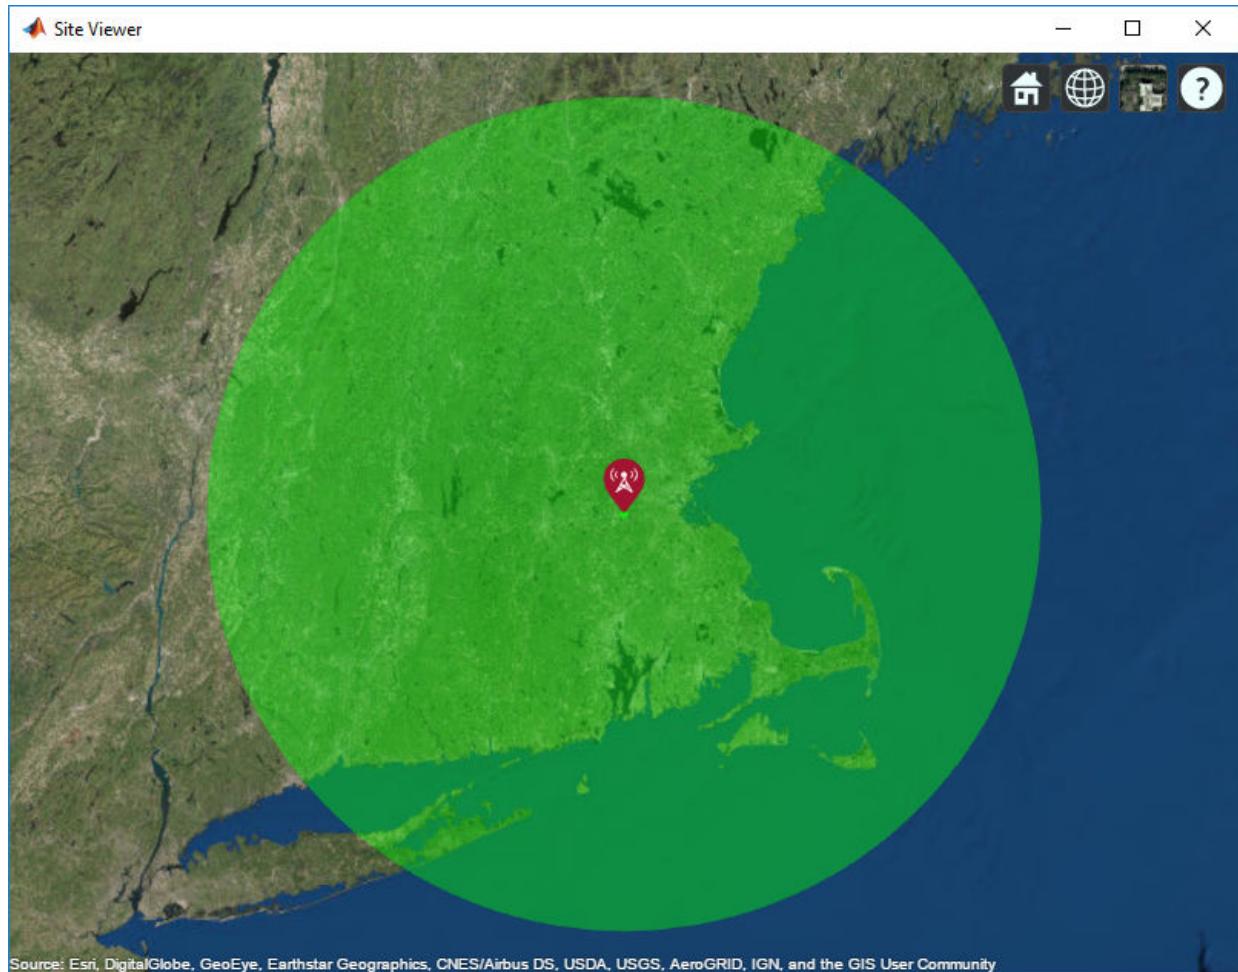

### Coverage Map of Transmitter

Create a transmitter site at MathWorks headquarters.

```
tx = txsite('Name','MathWorks', ...
    'Latitude', 42.3001, ...
    'Longitude', -71.3503);
```

Show the coverage map.

```
coverage(tx)
```

### Coverage Map Using Transmitter and Receiver.

Create a transmitter site at MathWorks headquarters.

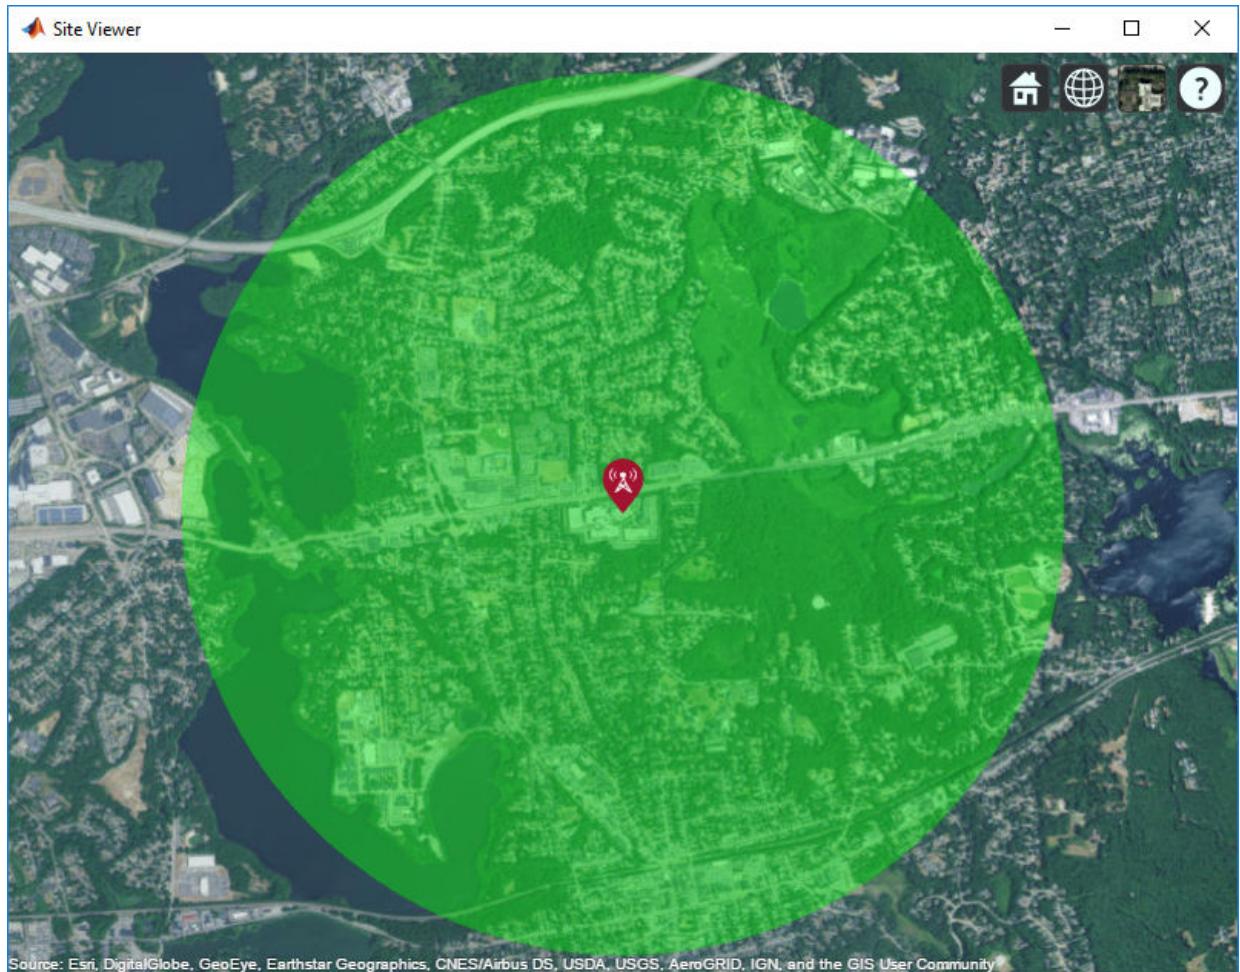

```
tx = txsite('Name','MathWorks', ...
    'Latitude', 42.3001, ...
    'Longitude', -71.3503);
```

Create a receiver site at Fenway Park with an antenna height of 1.2 m and system loss of 10 dB.

```
rx = rxsite('Name','Fenway Park', ...
    'Latitude',42.3467, ...
    'Longitude',-71.0972,'AntennaHeight',1.2,'SystemLoss',10);
```

Calculate the coverage area of the transmitter using a close-in propagation model.

```
coverage(tx,rx,'PropagationModel','closein')
```

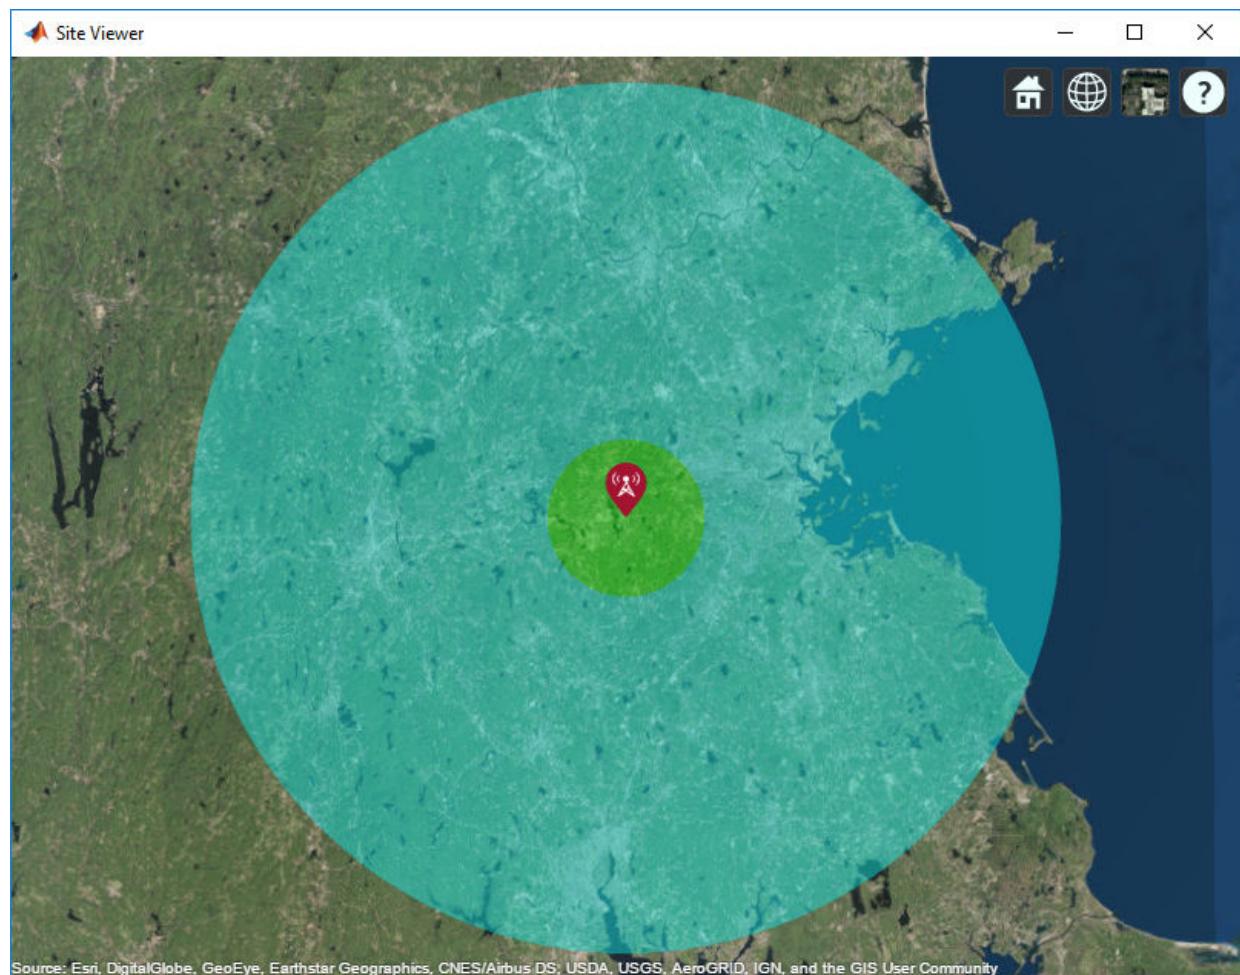

### Coverage Map for Strong and Weak Signals

Define strong and weak signal strengths with corresponding colors.

```
strongSignal = -75;  
strongSignalColor = "green";  
weakSignal = -90;  
weakSignalColor = "cyan";
```

Create a transmitter site and display the coverage map.

```
tx = txsite('Name','MathWorks','Latitude', 42.3001,'Longitude', -71.3503);  
coverage(tx,'SignalStrengths',[strongSignal,weakSignal], ...  
'Colors', [strongSignalColor,weakSignalColor])
```

## Coverage Map of Directional Antenna in Rain

Define a Yagi-Uda antenna designed for a transmitter frequency of 4.5 GHz. Tilt the antenna to direct radiation in the XY-plane (i.e., geographic azimuth).

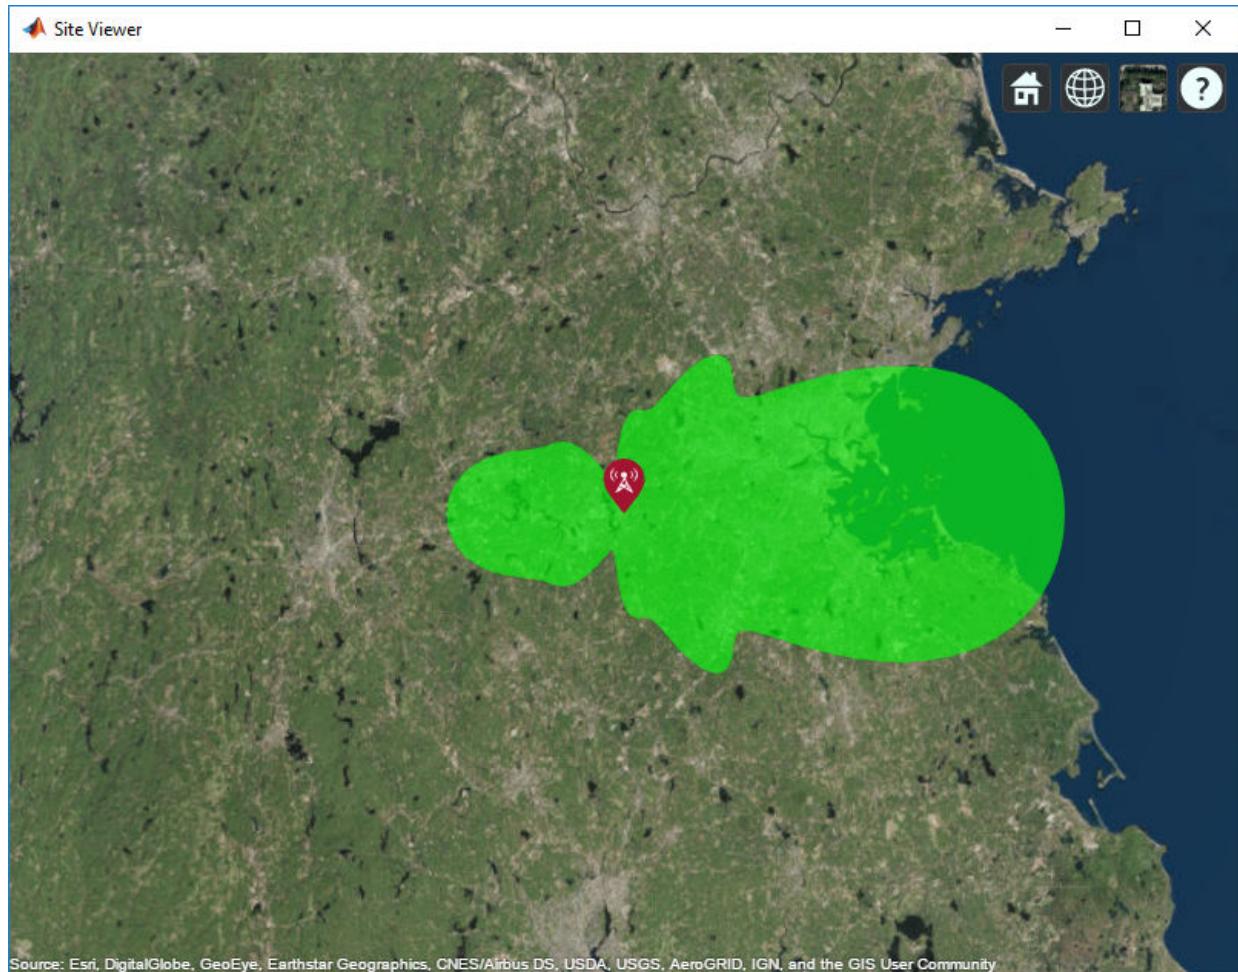

```
fq = 4.5e9;
y = design(yagiUda,fq);
y.Tilt = 90;
y.TiltAxis = 'y';
```

Create a transmitter site with this directional antenna.

```
tx = txsite('Name','MathWorks',...
    'Latitude', 42.3001, ...
    'Longitude', -71.3503, ...
    'Antenna', y, ...
    'AntennaHeight', 60, ...
    'TransmitterFrequency', fq, ...
    'TransmitterPower', 10);
```

Display the coverage map using the rain propagation model. The map pattern points east, which corresponds to default antenna angle value of 0 degrees.

```
coverage(tx,'rain','SignalStrengths',-90)
```

### Combined Coverage Map of Multiple Transmitters

Define the names and the locations of sites around Boston.

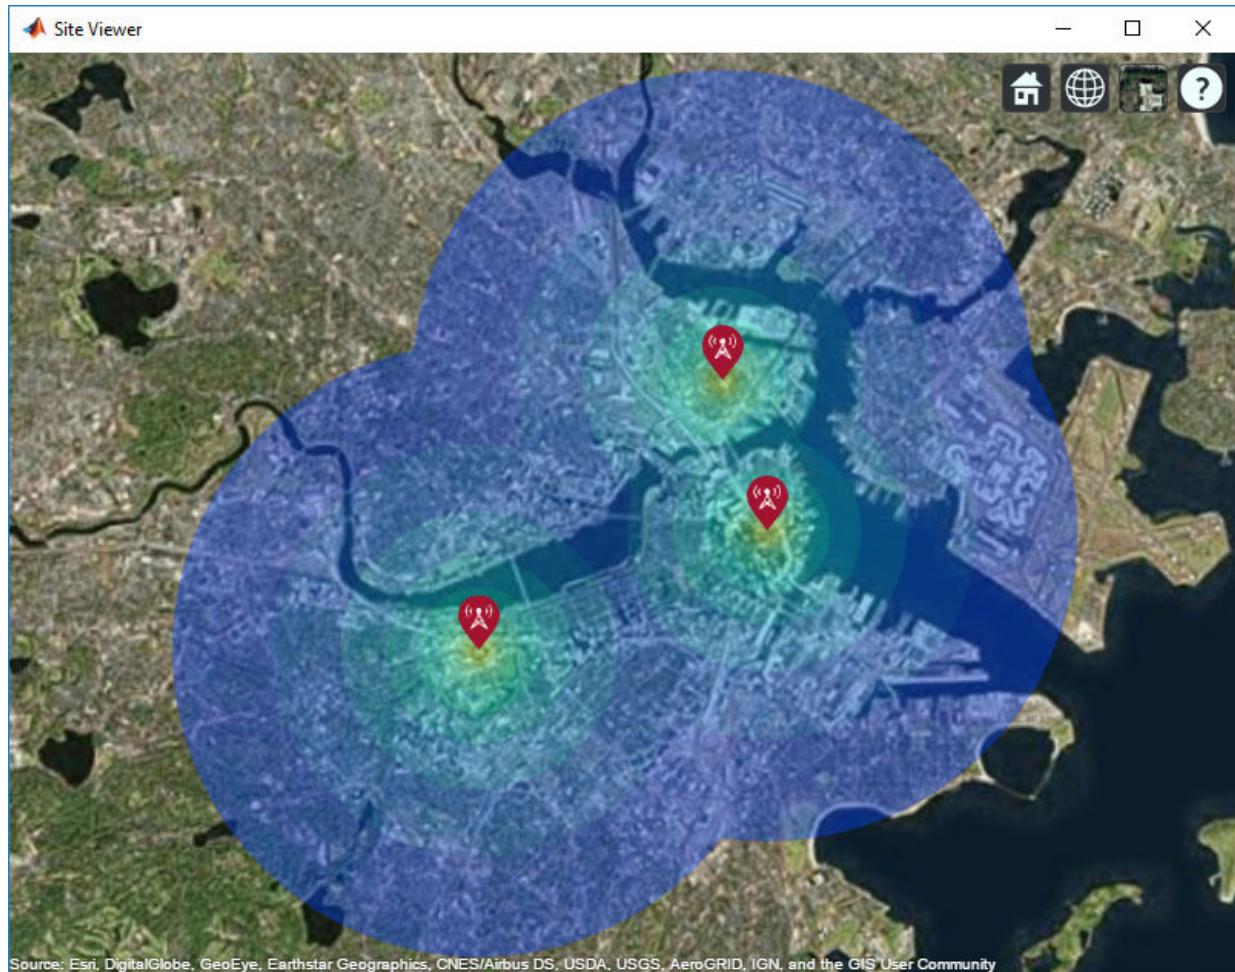

```
names = ["Fenway Park", "Faneuil Hall", "Bunker Hill Monument"];
lats = [42.3467, 42.3598, 42.3763];
lons = [-71.0972, -71.0545, -71.0611];
```

Create the transmitter site array.

```
txs = txsite('Name', names, ...
    'Latitude', lats, ...
    'Longitude', lons, ...
    'TransmitterFrequency', 2.5e9);
```

Display the combined coverage map for multiple signal strengths, using close-in propagation model.

```
coverage(txs, 'close-in', 'SignalStrengths', -100:5:-60)
```

## Input Arguments

### **tx — Transmitter site**

`txsite` object | array of `txsite` objects

Transmitter site, specified as a `txsite` object. You can use array inputs to specify multiple sites.

**rx — Receiver site**

rxtsite object

Receiver site, specified as an rxtsite object. You can also use the name-value pairs 'ReceiverGain' and 'ReceiverAntennaHeight' to specify the receiver values.

**propmodel — Propagation model**

character vector | string

Propagation model, specified as a character vector or string. You can also use the name value pair 'PropagationModel' to specify this parameter. You can also use the propagationModel function to define this input.

Data Types: char | string

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Example: 'Type', 'power'

**Type — Type of signal strength to compute**

'power' (default) | 'efield'

Type of signal strength to compute, specified as 'power' or 'efield'.

Power is expressed in power units (dBm) of the signal at the receiver input. E-field is expressed in electric field strength units (dB $\mu$ V/m) of signal wave incident on the antenna.

Data Types: char

**SignalStrengths — Signal strengths to display on coverage map**

numeric vector

Signal strengths to display on coverage map, specified as a numeric vector.

Each strength uses different colored filled contour on the map. The default value is -100 dBm if the 'Type' name-value pair is 'power' and 40 dB $\mu$ V/m if 'Type' is 'efield'.

**Note** Signal strength is computed using a propagation model that disregards the curvature of the Earth, terrain, or other obstacles.

---

Data Types: char

**PropagationModel — Propagation model**

'freespace' (default) | 'close-in' | 'rain' | 'gas' | 'fog' | propagation model object

Propagation model to use for the path loss calculation, specified as 'freespace', 'close-in', 'rain', 'gas', 'fog', or a propagation model object. You can also use the `propagationModel` function to define this input.

Data Types: char

**MaxRange — Maximum range from site location**

'auto' (default) | numeric scalar

Maximum range from site location to include in coverage map region, specified as a numeric scalar in meters.

The maximum range of 'auto' computes a value that includes all 'SignalStrengths' in the coverage map region.

Data Types: char | double

**Resolution — Resolution of coverage map**

'auto' (default) | numeric scalar

Resolution of coverage map, specified as a numeric scalar in meters.

The resolution of 'auto' computes the maximum value scaled to 'MaxRange'. Decreasing the resolution increases the quality of the coverage map and the time required to create it.

Data Types: char | double

**ReceiverGain — Mobile receiver gain**

2.1 (default) | numeric scalar

Mobile receiver gain, specified as a numeric scalar in dB. The receiver gain value includes the mobile receiver antenna gain and system loss.

The receiver gain computes received signal strength when the 'Type' is 'power'.

Data Types: char | double

**ReceiverAntennaHeight** — Mobile receiver antenna height above ground elevation  
1 (default) | numeric scalar

Mobile receiver antenna height above ground elevation, specified as a numeric scalar in meters.

Data Types: double

**Colors** — Colors of filled contours on coverage map

M-by-3 array of RGB triplets | array of strings | cell array of character vectors

Filled contours color of coverage map, specified as an *M*-by-3 array of RGB triplets, an array of strings, or a cell array of character vectors.

Colors are assigned element-wise to 'SignalStrengths' values for coloring the corresponding filled contours.

'Colors' cannot be used with 'ColorLimits' or 'ColorMap'.

Data Types: char | string | double

**ColorLimits** — Color limits for colormap

two-element vector

Color limits for colormap, specified as a two-element vector of type [min max].

The color limits indicate the signal level values that map to the first and last colors on the colormap.

The default value is [-120 -5] if the 'Type' name-value pair is 'power' and [20 135] if 'Type' is 'efields'.

'ColorLimits' cannot be used with 'Color'.

Data Types: double

**ColorMap** — Colormap filled contours for coverage map

'jet' (default) | predefined color map | *M*-by-3 array of RGB triplets

Colormap filled contours on coverage map, specified as a predefined colormap or  $M$ -by-3 array of RGB triplets, where  $M$  defines individual colors.

'ColorMap' cannot be used with 'Colors'.

Data Types: char | double

**Transparency — Transparency of coverage map**

0 . 4 (default) | numeric scalar

Transparency of coverage map, specified as a numeric scalar in the range 0 to 1. 0 is completely transparent and 1 is completely opaque.

Data Types: double

**Introduced in R2017b**

# distance

Distance between sites

## Syntax

```
d = distance(site1,site2)
d = distance(site1,site2,path)
```

## Description

`d = distance(site1,site2)` returns the distance in meters between site1 and site2.

`d = distance(site1,site2,path)` returns the distance using a specified path type, either Euclidean or geodesic.

## Examples

### Distance Between Transmitter and Receiver Site

Create transmitter and receiver sites.

```
tx = txsite('Name','MathWorks','Latitude',42.3001,'Longitude',-71.3504);
rx = rxsite('Name','Fenway Park','Latitude',42.3467,'Longitude',-71.0972);
```

Get the Euclidean distance in km between the sites.

```
dme = distance(tx,rx)
dkm = dme / 1000
```

```
dme =
```

```
2.1504e+04
```

```
dkm =  
21.5036
```

Get the geodesic distance between the two sites.

```
dmg = distance(tx,rx,'geodesic')
```

```
dmg =  
2.1504e+04
```

## Input Arguments

### **site1,site2 — Transmitter or receiver site**

txsite or rxsite object

Transmitter or receiver site, specified as a txsite or rxsite. You can use array inputs to specify multiple sites.

### **path — Measurement path type**

'euclidean' | 'geodesic'

Measurement path type, specified as one of the following:

- 'euclidean': Uses the shortest path through space that connects the antenna center positions of the site 1 and site 2.
- 'geodesic': Uses the shortest path on the surface of the earth that connects the latitude and longitude locations of site 1 and site 2. This path uses Earth ellipsoid model WGS-84.

Data Types: char

## Output Arguments

### **d — Distance between sites**

M-by-N numeric array

Distance between sites, returned as  $M$ -by- $N$  arrays in degrees.  $M$  is the number of sites in site 2 and  $N$  is the number of sites in site 1.

**Introduced in R2017b**

## hide

Hide site location on map

### Syntax

```
hide(site)
```

### Description

`hide(site)` hides the site location of the antenna site on a map.

## Examples

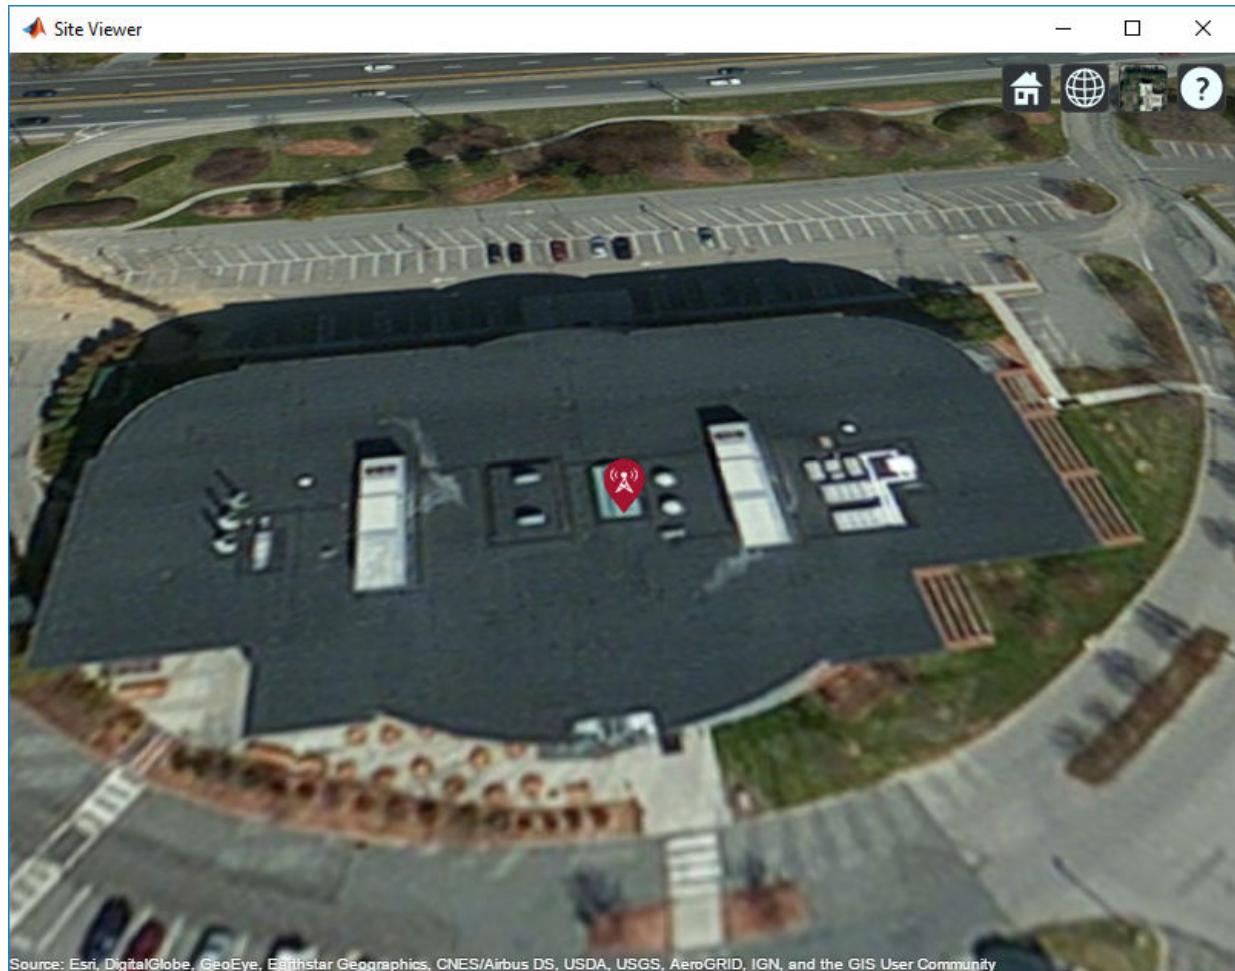

### Show and Hide Transmitter Site

Create a transmitter site.

```
tx = txsite('Name','MathWorks Apple Hill',...
    'Latitude',42.3001, ...
    'Longitude',-71.3504);
```

Show the transmitter site.

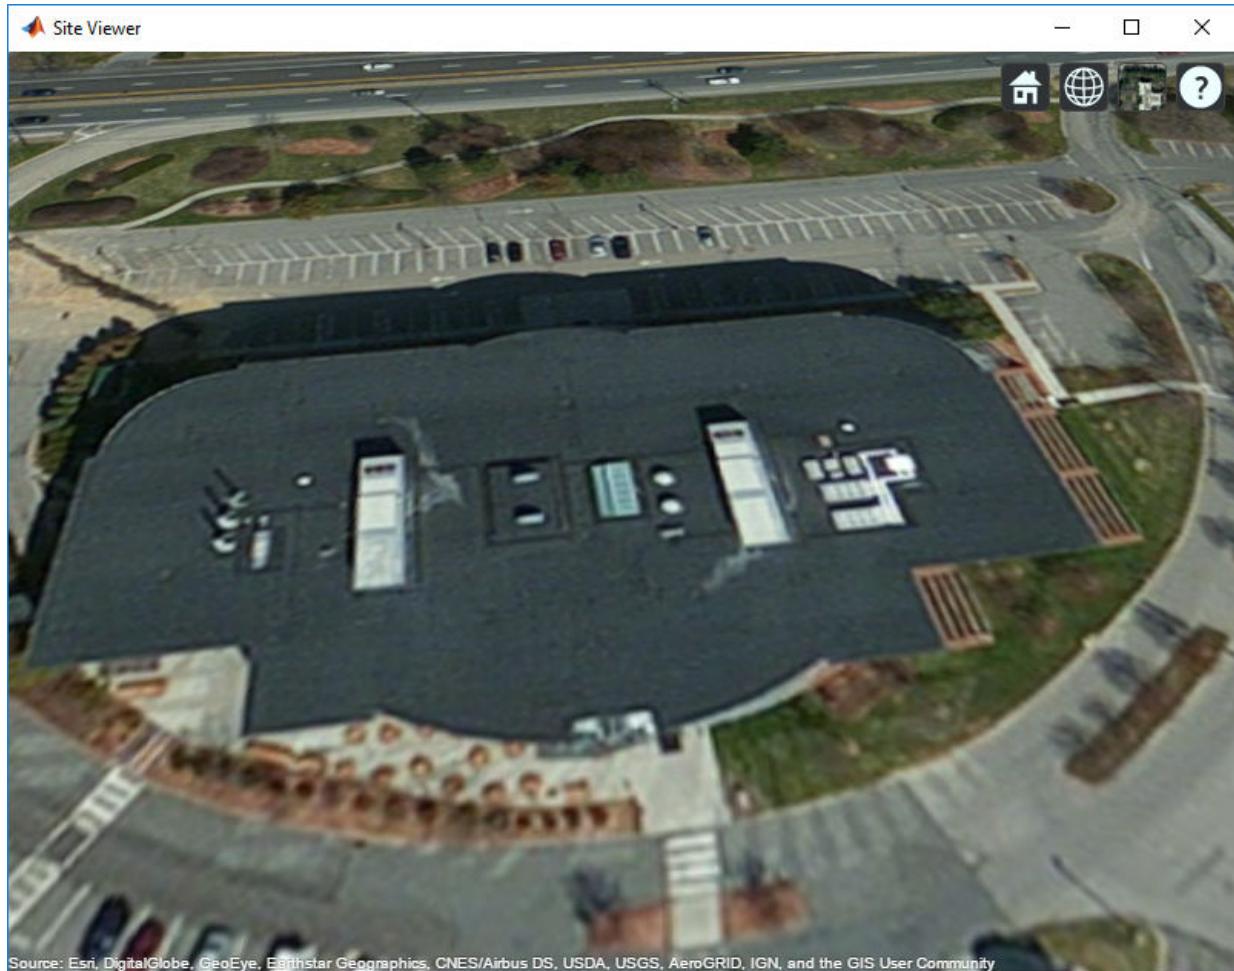

```
show(tx)
```

Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

Hide the transmitter site.

```
hide(tx)
```

Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

## Input Arguments

### **site — Transmitter or receiver site**

`txsite` or `rxsite` object | array of `txsite` or `rxsite` objects

Transmitter or receiver site, specified as a `txsite` or `rxsite` object or an array of `txsite` or `rxsite` objects.

## See Also

[show](#)

**Introduced in R2017b**

## link

Display communication link on map

### Syntax

```
link(rx,tx)
link(rx,tx,propmodel)
link(___,Name,Value)
status = link(___)
```

### Description

`link(rx,tx)` plots a one-way point-to-point communication link between a receiver site and transmitter site. The plot is color coded to identify the link success status.

`link(rx,tx,propmodel)` plots the communication link based on the specified propagation model.

---

**Note** Signal strength is computed using a propagation model that disregards the curvature of the Earth, terrain, or other obstacles.

---

`link(___,Name,Value)` plots a communication link using additional options specified by `Name,Value` pairs.

`status = link(____)` returns the success status of the communication link as `true` or `false`.

## Examples

### Communication Link Between Transmitter and Receiver

Create a transmitter site.

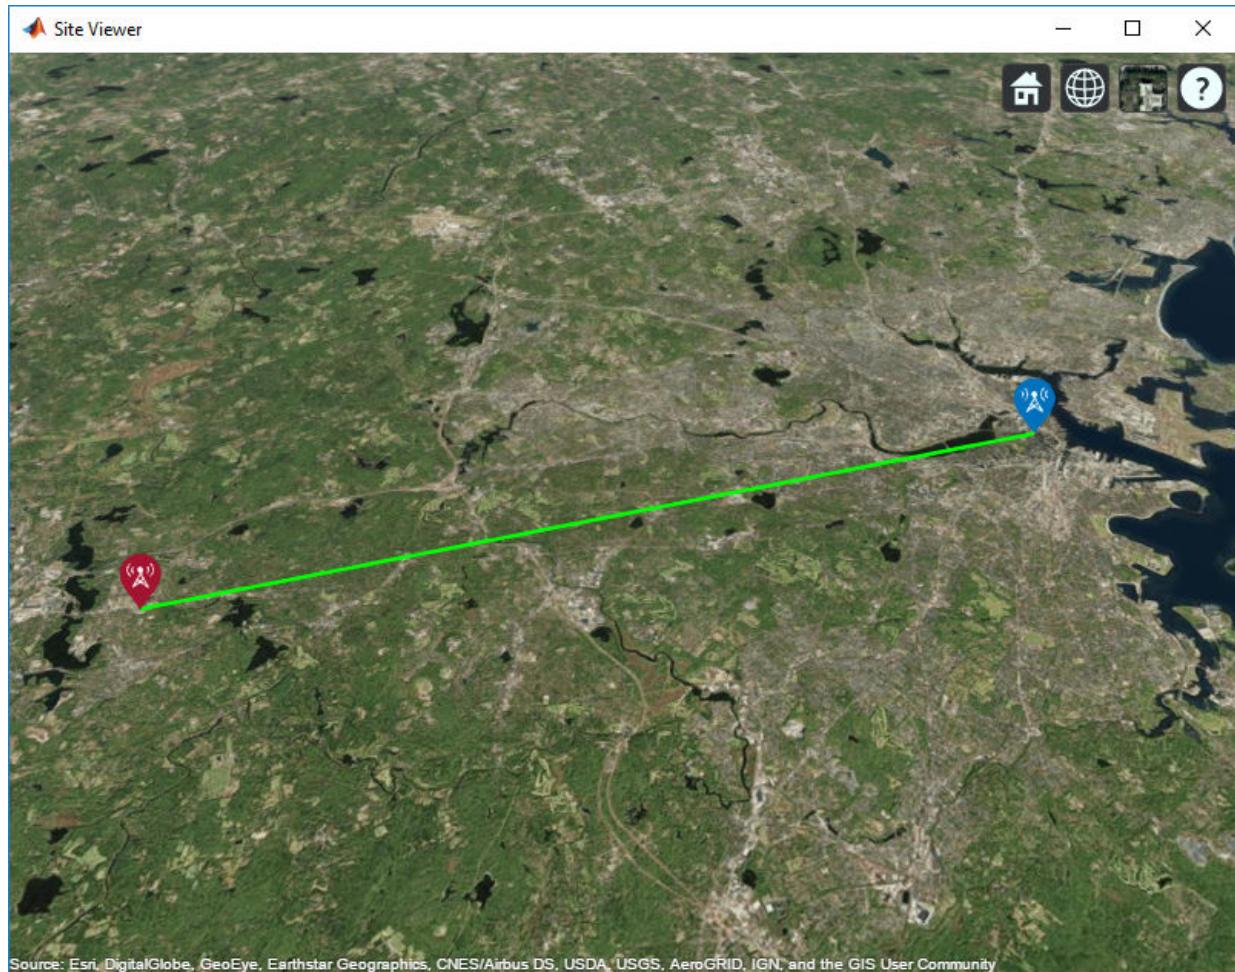

```
tx = txsite('Name','MathWorks', ...
    'Latitude', 42.3001, ...
    'Longitude', -71.3503);
```

Create a receiver site with sensitivity defined in dBm.

```
rx = rxsite('Name','Boston', ...
    'Latitude', 42.3601, ...
    'Longitude', -71.0589, ...
    'ReceiverSensitivity', -90);
```

Plot the communication link between the transmitter and the receiver.

```
link(rx,tx)
```

Source: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

## Input Arguments

### **rx — Receiver site**

rxsite object | array of rxsite objects

Receiver site, specified as a rxsite object. You can use array inputs to specify multiple sites.

**tx — Transmitter site**

txsite object | array of txsite objects

Transmitter site, specified as a txsite object. You can use array inputs to specify multiple sites.

**propmodel — Propagation model**

character vector | string

Propagation model, specified as a character vector or string. You can also use the name-value pair 'PropagationModel' to specify this parameter.

Data Types: char | string

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name<sub>1</sub>, Value<sub>1</sub>, ..., Name<sub>N</sub>, Value<sub>N</sub>.

Example: 'Type', 'power'

**PropagationModel — Propagation model**

'freespace' (default) | 'close-in' | 'rain' | 'gas' | 'fog' | propagation model object

Propagation model to use for path loss calculation, specified as 'freespace', 'close-in', 'rain', 'gas', 'fog', or a propagation model object.

Data Types: char

**SuccessColor — Color of successful links**

'green' (default) | RGB triplet | character vector

Color of successful links, specified as an RGB triplet or character vector.

Data Types: char | double

**FailColor — Color of unsuccessful links**

'red' (default) | RGB triplet | character vector

Color of unsuccessful links, specified as RGB triplet or character vector.

Data Types: `char` | `double`

## Output Arguments

**`status` — Success status of communication link**

*M*-by-*N* array

Success status of communication links, returned as an *M*-by-*N* arrays. *M* is the number of transmitter sites and *N* is the number of receiver sites.

`coverage` | `propagationModel` | `sigstrength`

**Introduced in R2017b**

# propagationModel

Create RF propagation model

## Syntax

```
pm = propagationModel(modelname)
pm = propagationModel(___,Name,Value)
```

## Description

`pm = propagationModel(modelname)` creates an RF propagation model for the specified model.

---

**Note** Signal strength is computed using a propagation model that disregards the curvature of the Earth, terrain, or other obstacles.

---

`pm = propagationModel(___,Name,Value)` sets properties using one or more name-value pairs. For example, `pm = propagationModel('rain','RainRate',96)` creates a rain propagation model with a rain rate of 96 mm/h. Enclose each property name in quotes.

## Examples

### Signal Strength of Receiver in Heavy Rain

Specify transmitter and receiver sites.

```
tx = txsite('Name','MathWorks Apple Hill',...
    'Latitude',42.3001, ...
    'Longitude',-71.3504, ...
    'TransmitterFrequency', 2.5e9);
```

```
rx = rxsite('Name','Fenway Park',...
    'Latitude',42.3467, ...
    'Longitude',-71.0972);
```

Create the propagation model for a heavy rainfall rate.

```
pm = propagationModel('rain','RainRate',50)
```

```
pm =
```

Rain with properties:

```
RainRate: 50
Tilt: 0
```

Calculate the signal strength at the receiver using the rain propagation model.

```
ss = sigstrength(rx,tx,pm)
```

```
ss =
```

-82.2937

## Input Arguments

### **modelname — Type of propagation model**

```
'freespace' | 'rain' | 'gas' | 'fog' | 'close-in'
```

Type of propagation model, specified as one of the following:

- 'freespace' - Free space propagation model
- 'rain' - Rain propagation model
- 'gas' - Gas propagation model
- 'fog' - Fog propagation model
- 'close-in' - Close-in propagation model

You can use the following functions on RF propagation models:

- `range` - Calculate the range of the radio wave under different propagation scenarios.
- `pathloss` - Calculate the path loss between the transmitter and receiver sites under different propagation scenarios.

Data Types: `char`

## Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: `'RainRate', 96`

### Rain

#### **RainRate — Rain rate**

95 (default) | positive scalar

Rain rate, specified as a positive scalar in millimeters per hour (mm/h).

#### **Dependencies**

To specify `'RainRate'`, you must specify the `'rain'` propagation model.

Data Types: `double`

#### **Tilt — Polarization tilt angle of the signal**

0 (default) | scalar

Polarization tilt angle of the signal, specified as scalar in degrees.

#### **Dependencies**

To specify `'Tilt'`, you must specify the `'rain'` propagation model.

Data Types: `char`

### Gas

#### **Temperature — Air temperature**

15 (default) | scalar

Air temperature, specified as a scalar in Celsius (C).

### Dependencies

To specify 'Temperature', you must specify the 'gas' propagation model.

Data Types: double

### AirPressure — Dry air pressure

101300 (default) | scalar

Dry air pressure, specified as a scalar in pascals (Pa).

### Dependencies

To specify 'AirPressure', you must specify the 'gas' propagation model.

Data Types: double

### WaterDensity — Water vapour density

7.5 (default) | scalar

Water vapour density, specified as a scalar in grams per cubic meter (g/m<sup>3</sup>).

### Dependencies

To specify 'WaterDensity', you must specify the 'gas' propagation model.

Data Types: double

### Fog

#### Temperature — Air temperature

15 (default) | scalar

Air temperature, specified as a scalar in Celsius (C).

### Dependencies

To specify 'Temperature', you must specify the 'fog' propagation model.

Data Types: double

### WaterDensity — Liquid water density

0.5 (default) | scalar

Liquid water density, specified as a scalar in grams per cubic meter ( $\text{g}/\text{m}^3$ ).

#### Dependencies

To specify 'WaterDensity', you must specify the 'fog' propagation model.

Data Types: double

#### close-in

##### **ReferenceDistance — Free-space reference distance**

1 (default) | scalar

Free-space reference distance, specified as a scalar in meters.

#### Dependencies

To specify 'ReferenceDistance', you must specify the 'close-in' propagation model.

Data Types: double

##### **PathLossExponent — Path loss exponent**

2.9 (default) | scalar

Path loss exponent, specified as a scalar.

#### Dependencies

To specify 'PathLossExponent', you must specify the 'close-in' propagation model.

Data Types: double

##### **Sigma — Standard deviation**

5.7 (default) | scalar

Standard deviation of the zero-mean Gaussian random variable, specified as a scalar in decibels (dB).

#### Dependencies

To specify 'Sigma', you must specify the 'close-in' propagation model.

Data Types: double

**NumDataPoints — Number of data points**

1869 (default) | integer

Number of data points of zero-mean Gaussian random variable, specified as an integer.

**Dependencies**

To specify 'NumPoints', you must specify the 'close-in' propagation model.

Data Types: double

## See Also

**Introduced in R2017b**

# sigstrength

Signal strength due to transmitter

## Syntax

```
ss = sigstrength(rx,tx)
ss = sigstrength(rx,tx,propmodel)
ss = sigstrength(___,Name,Value)
```

## Description

`ss = sigstrength(rx,tx)` returns the signal strength at the receiver site due to the transmitter site.

`ss = sigstrength(rx,tx,propmodel)` returns the signal strength at the receiver site using the specified propagation model. Specifying propagation model is same as specifying the 'PropagationModel' name-value pair.

---

**Note** Signal strength is computed using a propagation model that disregards the curvature of the Earth, terrain, or other obstacles.

---

`ss = sigstrength(___,Name,Value)` returns the signal strength using additional options specified by Name, Value pairs and either of the previous syntaxes.

## Examples

### Received Power and Link Margin at Receiver

Create a transmitter site.

```
tx = txsite('Name','MathWorks', ...
    'Latitude', 42.3001, ...
    'Longitude', -71.3503);
```

Create a receiver site with sensitivity defined (in dBm).

```
rx = rxsite('Name','Boston', ...
    'Latitude', 42.3601, ...
    'Longitude', -71.0589, ...
    'ReceiverSensitivity', -90);
```

Calculate the received power and link margin. Link margin is the difference between the receiver's sensitivity and the received power.

```
ss = sigstrength(rx,tx)
margin = abs(rx.ReceiverSensitivity - ss)
```

```
ss =
-81.7450

margin =
8.2550
```

## Input Arguments

### **rx — Receiver site**

`rxsite` object | array of `rxsite` objects

Receiver site, specified as a `rxsite` object. You can use array inputs to specify multiple sites.

### **tx — Transmitter site**

`txsite` object | array of `txsite` objects

Transmitter site, specified as a `txsite` object. You can use array inputs to specify multiple sites.

**propmodel — Propagation model**

character vector | string

Propagation model, specified as a character vector or string. You can also use the name-value pair 'PropagationModel' to specify this parameter. You can also use the propagationModel function to define this input.

Data Types: char | string

## Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

Example: 'Type', 'power'

**Type — Type of signal strength to compute**

'power' (default) | 'efield'

Type of signal strength to compute, specified as 'power' or 'efield'.

Power is expressed in power units (dBm).of signal at receiver input. E-Field is expressed in electric field strength units (dBuV/m) of signal wave incident on antenna.

Data Types: char | string

**PropagationModel — Propagation model**

'freespace' (default) | 'close-in' | 'rain' | 'gas' | 'fog' | propagation model object

Propagation model to use for path loss calculation, specified as 'freespace', 'close-in', 'rain', 'gas', 'fog', or a propagation model object. You can also use the propagationModel function to define this input.

Data Types: char | string

## Output Arguments

### **ss — Signal strength**

*M*-by-*N* array

Signal strength, returned as *M*-by-*N* array. *M* is the number of TX sites and *N* is the number of RX sites.

# add

Boolean unite operation on two shapes

## Syntax

```
c = add(shape1,shape2)
```

## Description

`c = add(shape1,shape2)` unites shape1 and shape2 using the add operation. You can also use the + to add the two shapes together.

## Examples

### Add Two Circles

Create and view a default circle.

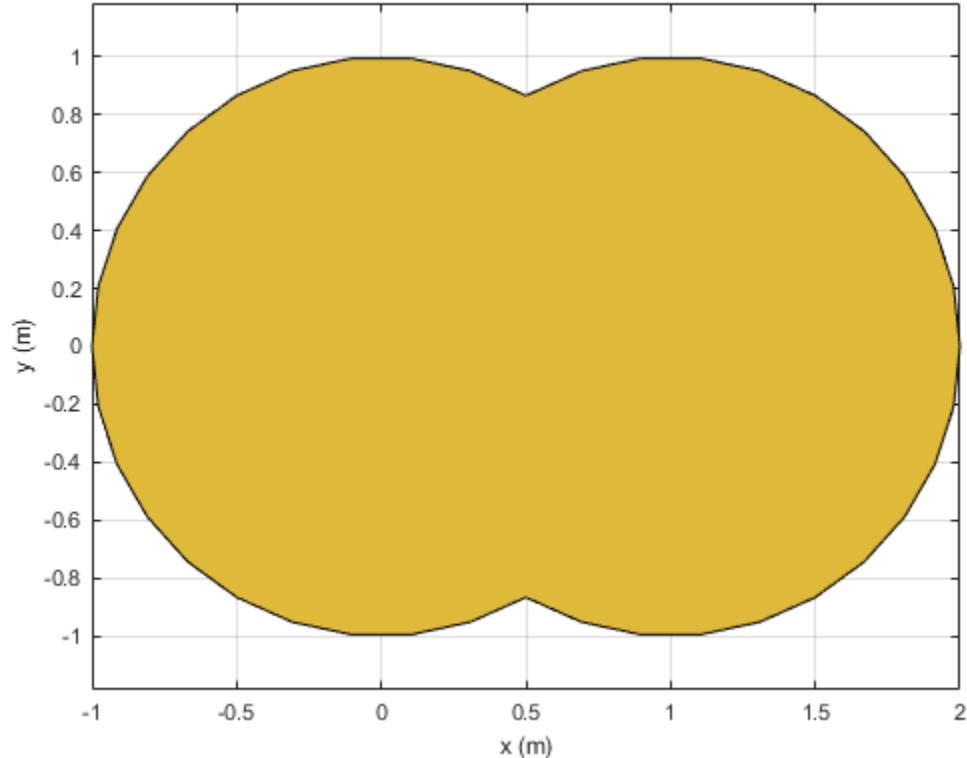

```
circle1 = antenna.Circle;
```

Create a circle with a radius of 1 m. The center of the circle is at [1 0].

```
circle2 = antenna.Circle('Center',[1 0], 'Radius',1);
```

Add the two circles.

```
add(circle1,circle2)
```

### Add Two Shapes

Create circle with a radius of 1 m. The center of the circle is at [1 0].

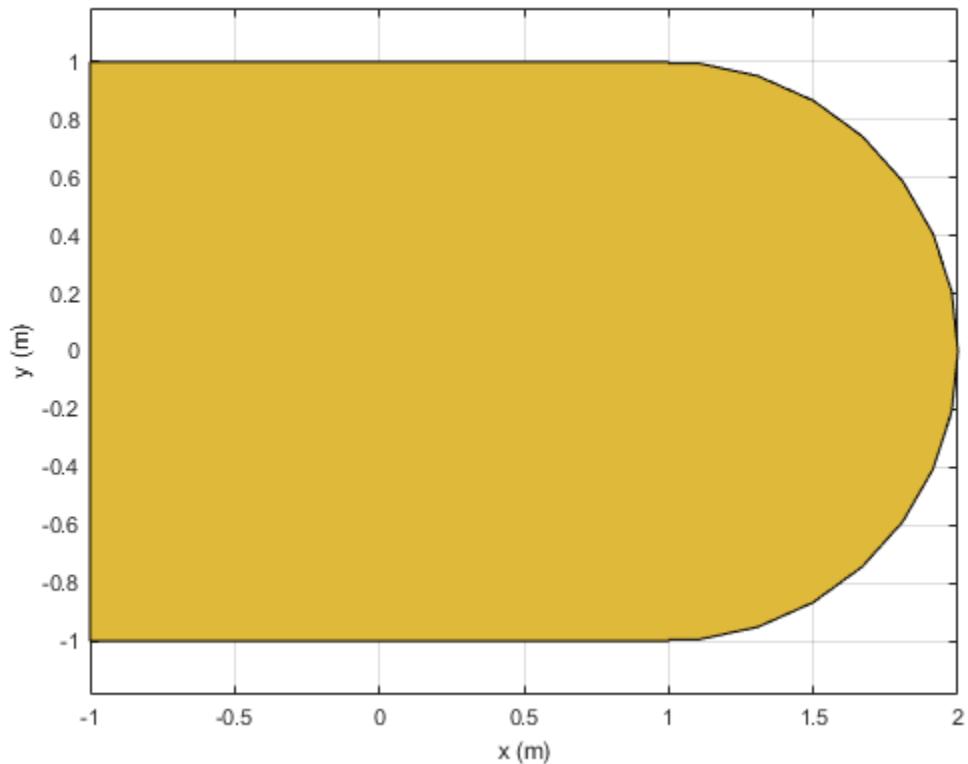

```
circle1 = antenna.Circle('Center',[1 0], 'Radius',1);
```

Create a rectangle with a length of 2 m and a width of 4 m centered at the origin.

```
rect1 = antenna.Rectangle('Length',2, 'Width',2);
```

Add the two shapes together using the + function.

```
polygon1 = circle1+rect1  
  
polygon1 =  
  Polygon with properties:  
  
    Name: 'mypolygon'  
Vertices: [60x3 double]  
  
show(polygon1)
```

## Input Arguments

**shape1, shape2 — Shapes created using custom elements and shape objects**  
object handle

Shapes created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `c = add(rectangle1, rectangle2)` where `rectangle1` and `rectangle2` are shapes created using `antenna.Rectangle` object.

## area

Calculate area of shape in sq.m

### Syntax

```
a = area(shape)
```

### Description

`a = area(shape)` calculate area of the shape in units sq.m.

### Examples

#### Create Notched Rectangle

Create a rectangle with a length of 0.15 m, and a width of 0.15 m.

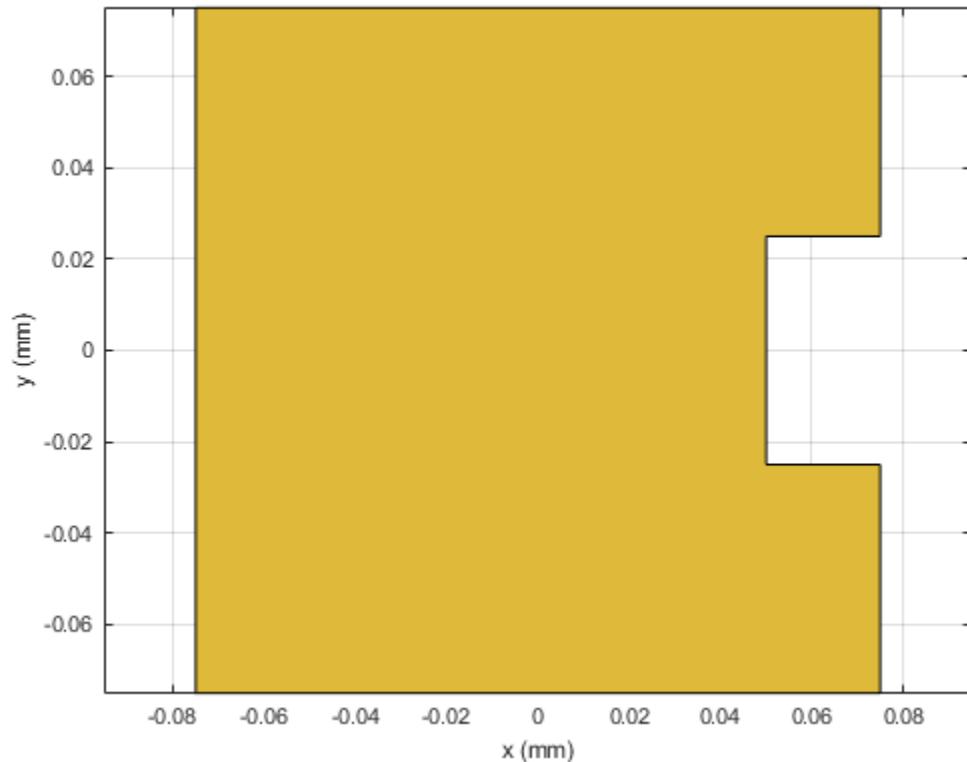

```
r = antenna.Rectangle('Length',0.15,'Width',0.15);
```

Create a second rectangle with a length of 0.05 m, and a width of 0.05 m. Set the center of the second rectangle at half the length of the first rectangle r.

```
n = antenna.Rectangle('Center',[0.075,0], 'Length',0.05,'Width',0.05);
```

Create and view a notched rectangle by subtracting n from r.

```
rn = r-n;
show(rn)
```

Calculate the area of the notched rectangle.

```
area(rn)
```

```
ans =
```

---

0.0213

## Input Arguments

**shape — Shape created using custom elements and shape objects**  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `c = area(rectangle)` where rectangle is created using `antenna.Rectangle` object.

Data Types: char

## See Also

## intersect

Boolean intersection operation on two shapes

### Syntax

```
c = intersect(shape1,shape2)
```

### Description

`c = intersect(shape1,shape2)` intersect `shape1` and `shape2` using the `intersect` operation. You can also use the `&` to intersect the two shapes.

### Examples

#### Intersect Rectangle and Circle

Create a default rectangle.

```
r = antenna.Rectangle;
```

Create a default circle.

```
c = antenna.Circle;
```

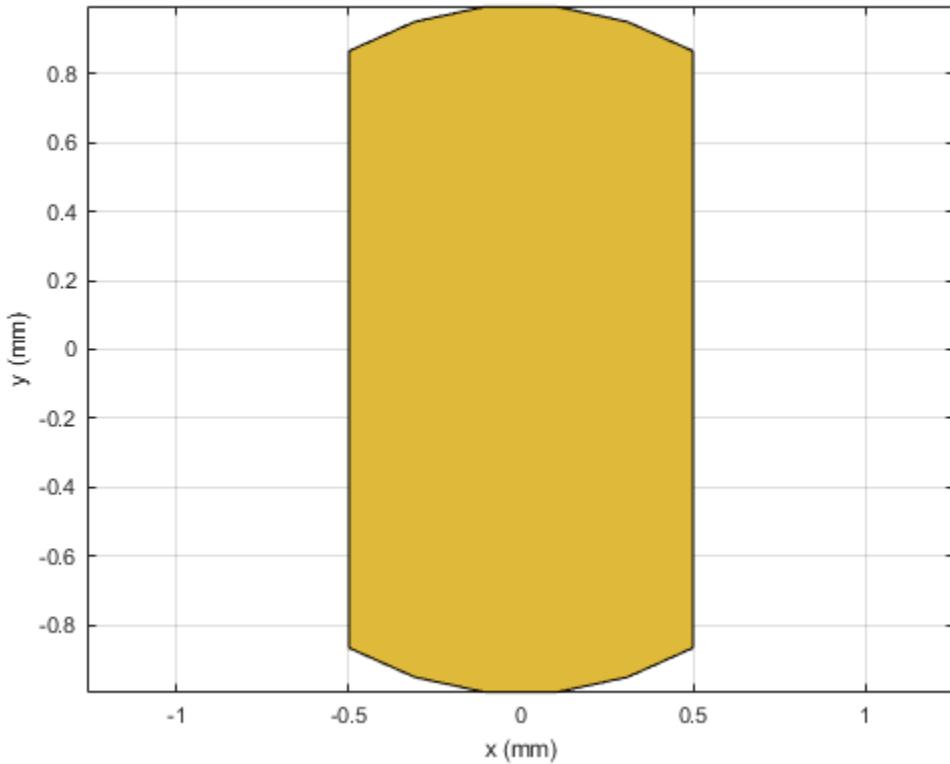

Use `intersect` to combine the shared surfaces of the rectangle and the circle.

```
rc = intersect(r,c)
show(rc)
axis equal
```

```
rc =
```

Polygon with properties:

Name: 'mypolygon'  
Vertices: [30x3 double]

## Input Arguments

**shape1, shape2 — Shapes created using custom elements and shape objects**  
object handle

Shapes created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `c = intersect(rectangle1, rectangle2)` where `rectangle1` and `rectangle2` are shapes created using `antenna.Rectangle` object.

## See Also

`add` | `area` | `mesh` | `plot` | `rotate` | `rotateX` | `rotateY` | `rotateZ` | `show` |  
`subtract` | `translate`

**Introduced in R2017a**

## rotate

Rotate shape about axis and angle

### Syntax

```
rotate(shape,angle,axis1, axis2)
c = rotate(shape,angle, axis1, axis2)
```

### Description

`rotate(shape,angle, axis1, axis2)` rotate shape about an axes object and angle.

`c = rotate(shape,angle, axis1, axis2)` rotate shape about an axes object and angle.

## Examples

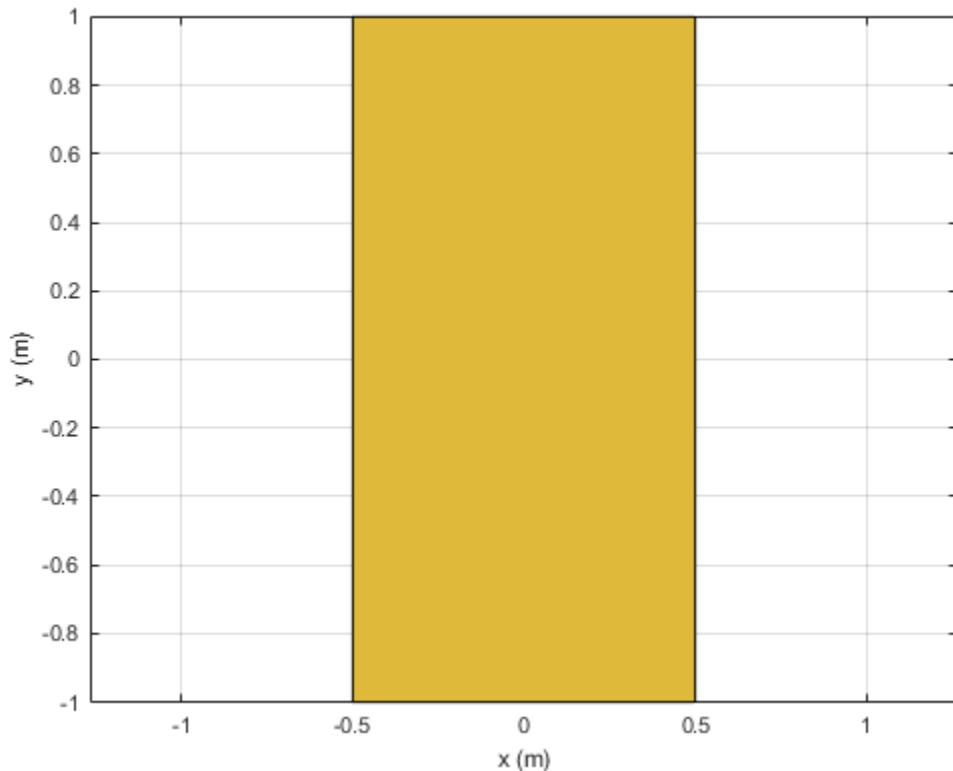

### Rotate Rectangle

Create a rectangle shape.

```
r = antenna.Rectangle;
show(r)
axis equal
```

## 5 Methods — Alphabetical List

---

Rotate the rectangle at 45 degrees about the Z-axis.

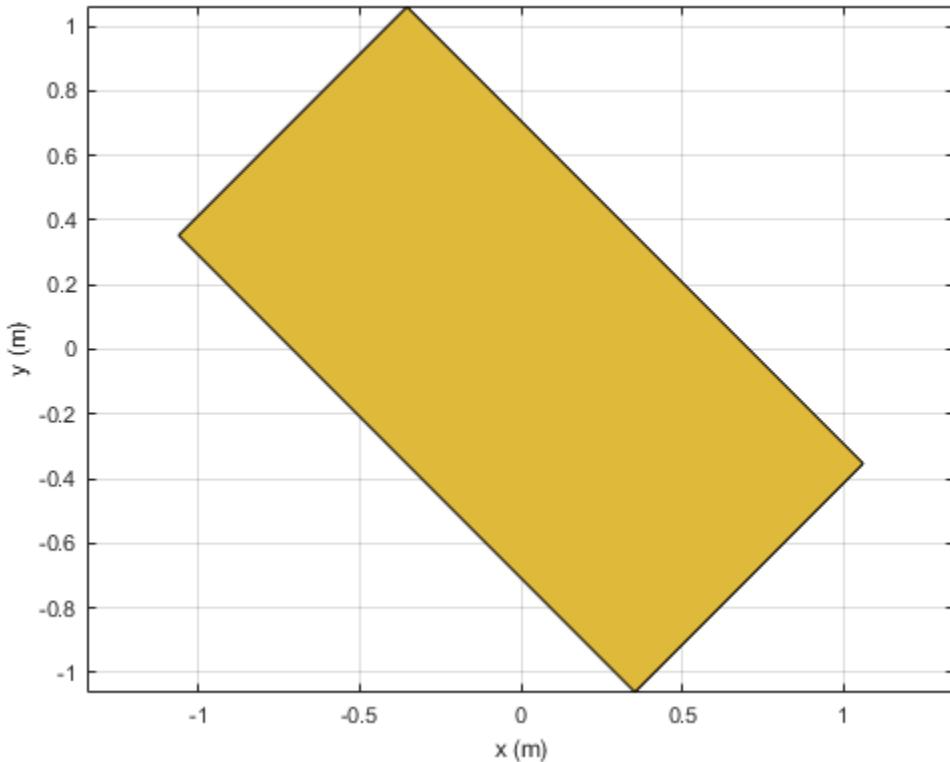

```
r1 = rotate(r, 45, [0 0 0], [0 0 1])
show(r1)
```

```
r1 =
```

Rectangle with properties:

```
Name: 'myrectangle'
Center: [0 0]
Length: 1
Width: 2
```

NumPoints: 2

## Input Arguments

**shape — Shape created using custom elements and shape objects**  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `area(rectangle)` where rectangle is created using `antenna.Rectangle` object.

### **axis1, axis2 — Axis of rotation**

two three-element vector of Cartesian coordinates in meters

Axis of rotation, specified as two unique three-element vectors of Cartesian coordinates in meters

Example: `rotate(rectangle, 45, [0 0 0], [0 0 1])` where rectangle is created using `antenna.Rectangle` object.

Data Types: double

### **angle — Angle of rotation**

scalar

Angle of rotation, specified as a scalar in degrees

Example: `rotate(rectangle, 45, [0 0 1], [0 0 0])` rotates the rectangle around X-axis by 45 degrees.

Data Types: double

## See Also

# subtract

Boolean subtraction operation on two shapes

## Syntax

```
c = subtract(shape1,shape2)
```

## Description

`c = subtract(shape1,shape2)` subtracts `shape1` and `shape2` using the `subtract` operation. You can also use the `-` to subtract the two shapes.

## Examples

### Create Notched Rectangle

Create a rectangle with a length of 0.15 m, and a width of 0.15 m.

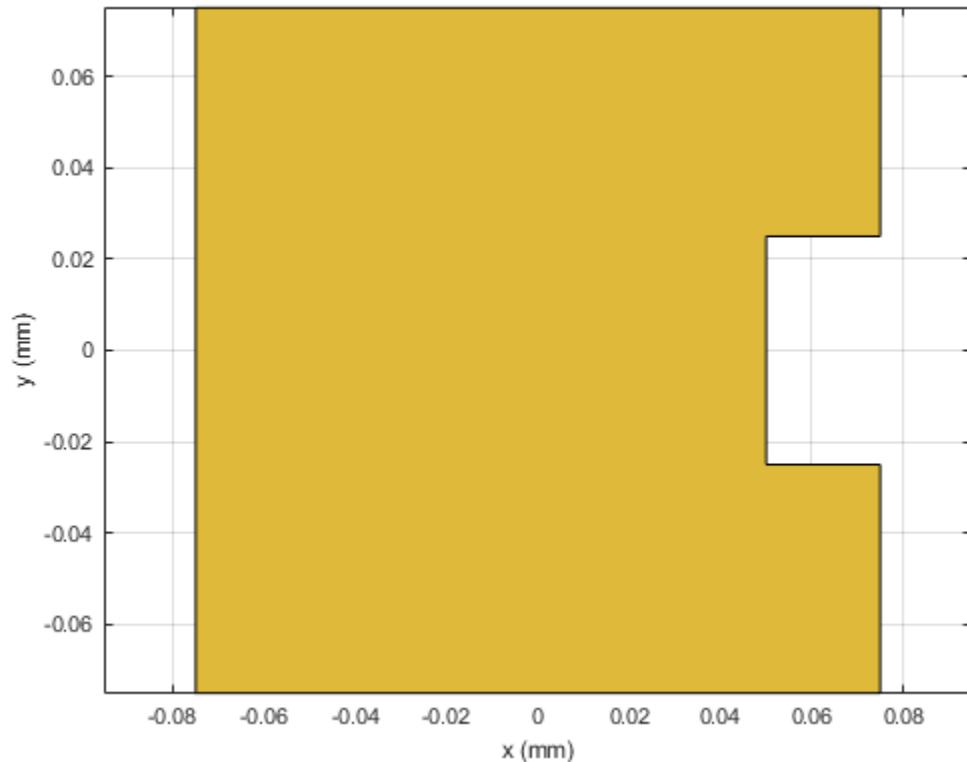

```
r = antenna.Rectangle('Length',0.15,'Width',0.15);
```

Create a second rectangle with a length of 0.05 m, and a width of 0.05 m. Set the center of the second rectangle at half the length of the first rectangle `r`.

```
n = antenna.Rectangle('Center',[0.075,0], 'Length',0.05, 'Width',0.05);
```

Create and view a notched rectangle by subtracting `n` from `r`.

```
rn = r-n;
show(rn)
```

Calculate the area of the notched rectangle.

```
area(rn)
```

```
ans =
```

0.0213

## Input Arguments

**shape1, shape2 — Shapes created using custom elements and shape objects**  
object handle

Shapes created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `c = subtract(rectangle1, rectangle2)` where `rectangle1` and `rectangle2` are shapes created using `antenna.Rectangle` object.

## See Also

# gerberWrite

Generate Gerber files

## Syntax

```
gerberWrite(designobject)
gerberWrite(designobject,rfconnector)
gerberWrite(designobject,writer)
gerberWrite(designobject,writer,rfconnector)
[a,g] = gerberWrite(designobject,writer,rfconnector)
```

## Description

`gerberWrite(designobject)` creates a Gerber file from PCB specification files, such as `PCBWriter` object or `pcbStack` object.

`gerberWrite(designobject,rfconnector)` creates Gerber file using specified RF connector.

`gerberWrite(designobject,writer)` creates a Gerber file using specified PCB writer services.

`gerberWrite(designobject,writer,rfconnector)` creates a Gerber file using specified PCB writer and connector services.

`[a,g] = gerberWrite(designobject,writer,rfconnector)` creates a Gerber file using specified PCB writer and connector services.

---

**Note** You can only use output arguments if the `designobject` is a `pcbStack` object.

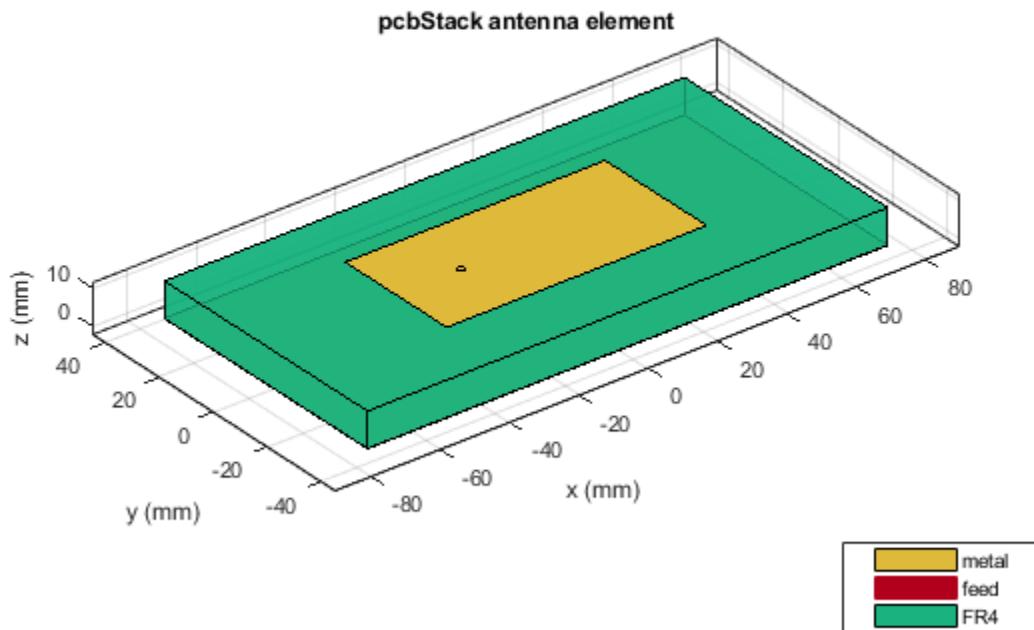

---

## Examples

## Antenna Gerber Files from PCB Stack

Create a patch antenna with FR4 as dielectric material using |pcbStack| object.

```
p = pcbStack;
d = dielectric('FR4');
p.Layers = {p.Layers{1},d,p.Layers{2}};
p.FeedLocations(3:4) = [1 3];
show(p)
```

Use a Cinch SMA for feeding the antenna. Use the Mayhew Labs PCB viewer as the 3-D viewer. Change the file name of the Mayhew Writer services to `antenna_design_file`.

## 5 Methods — Alphabetical List

---

```
C = PCBConnectors.SMA_Cinch;
W = PCBServices.MayhewWriter;
W.Filename = 'antenna_design_file';
```

Generate the Gerber-format files.

```
[A,g] = gerberWrite(p,W,C)
```

```
A =
```

PCBWriter with properties:

```
Design: [1x1 struct]
Writer: [1x1 PCBServices.MayhewWriter]
Connector: [1x1 PCBConnectors.SMA_Cinch]

PCBMargin: 5.0000e-04
Soldermask: 'both'
Solderpaste: 1
```

See [info\(A\)](matlab:info(A)) for details

```
g =
```

```
'\\fs-56-ah\vmgr$\home06\vgopalak\Documents\MATLAB\examples\antenna-ex96485213\ante
```

## Show Antenna PCB Design Using Mayhew Manufacturing Service

Create a coplanar inverted F antenna.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Use this antenna in creating a `pcbStack` object.

```
p = pcbStack(fco)
```

```
p =  
  
pcbStack with properties:  
  
    Name: 'Coplanar Inverted-F'  
    Revision: 'v1.0'  
    BoardShape: [1×1 antenna.Rectangle]  
BoardThickness: 0.0013  
    Layers: {[1×1 antenna.Polygon]}  
FeedLocations: [0 0.0500 1]  
FeedDiameter: 5.0000e-04  
ViaLocations: []  
ViaDiameter: []  
FeedViaModel: 'strip'

See <a href="matlab:info(PW)">info</a> for details

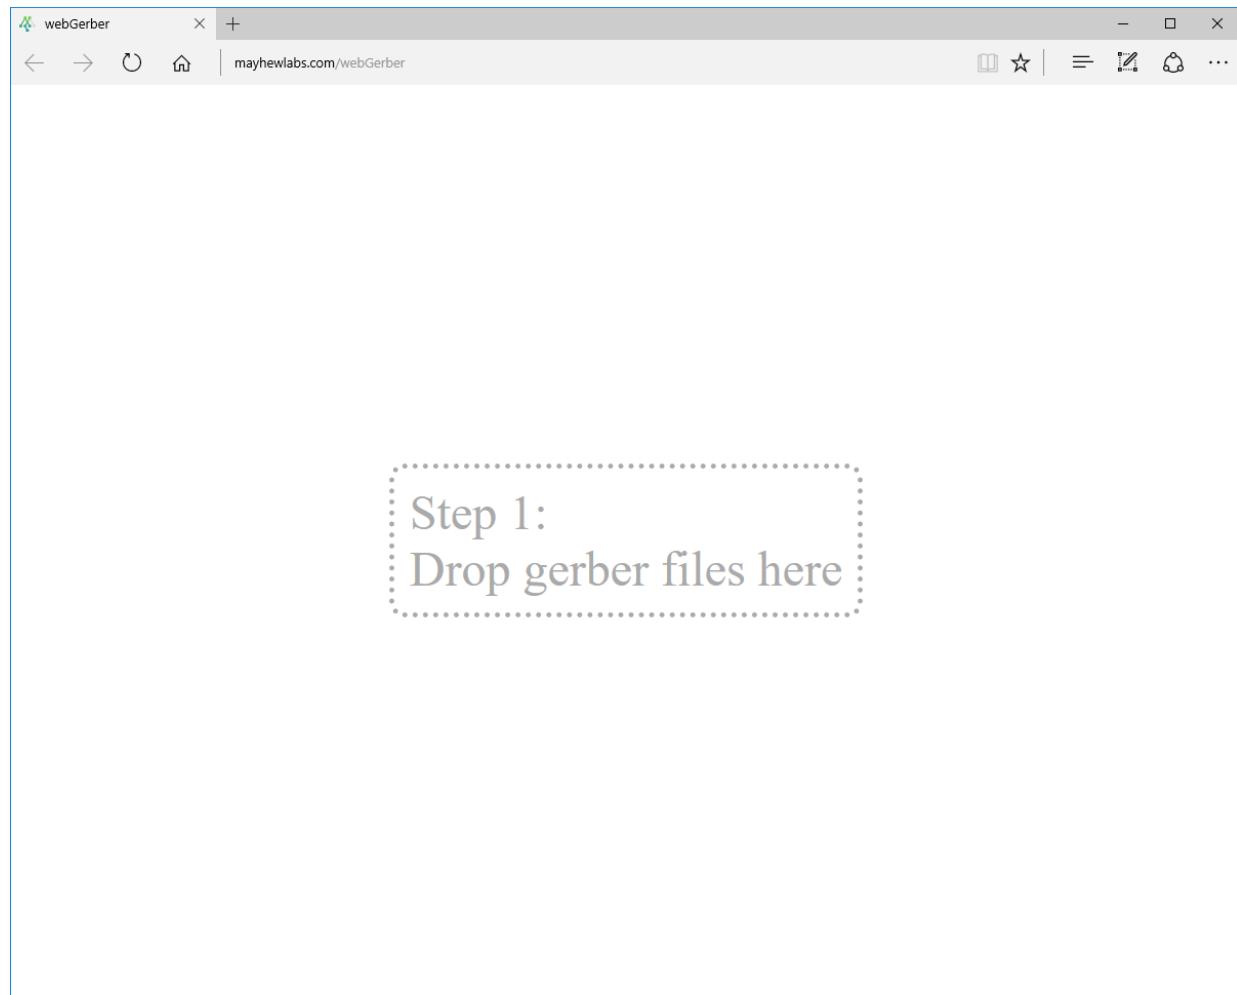

Use the gerberWrite method to create gerber files from the antenna design files. The files generated are then send to the Mayhew writer manufacturing service.

`gerberWrite(PW)`

By default, the folder containing the gerber files is called "untitled" and is located in your MATLAB folder. Running this example automatically opens up the Mayhew Labs PCB manufacturing service in your internet browser.

## 5 Methods — Alphabetical List

---

Drag and drop all your files from the "untitled" folder.

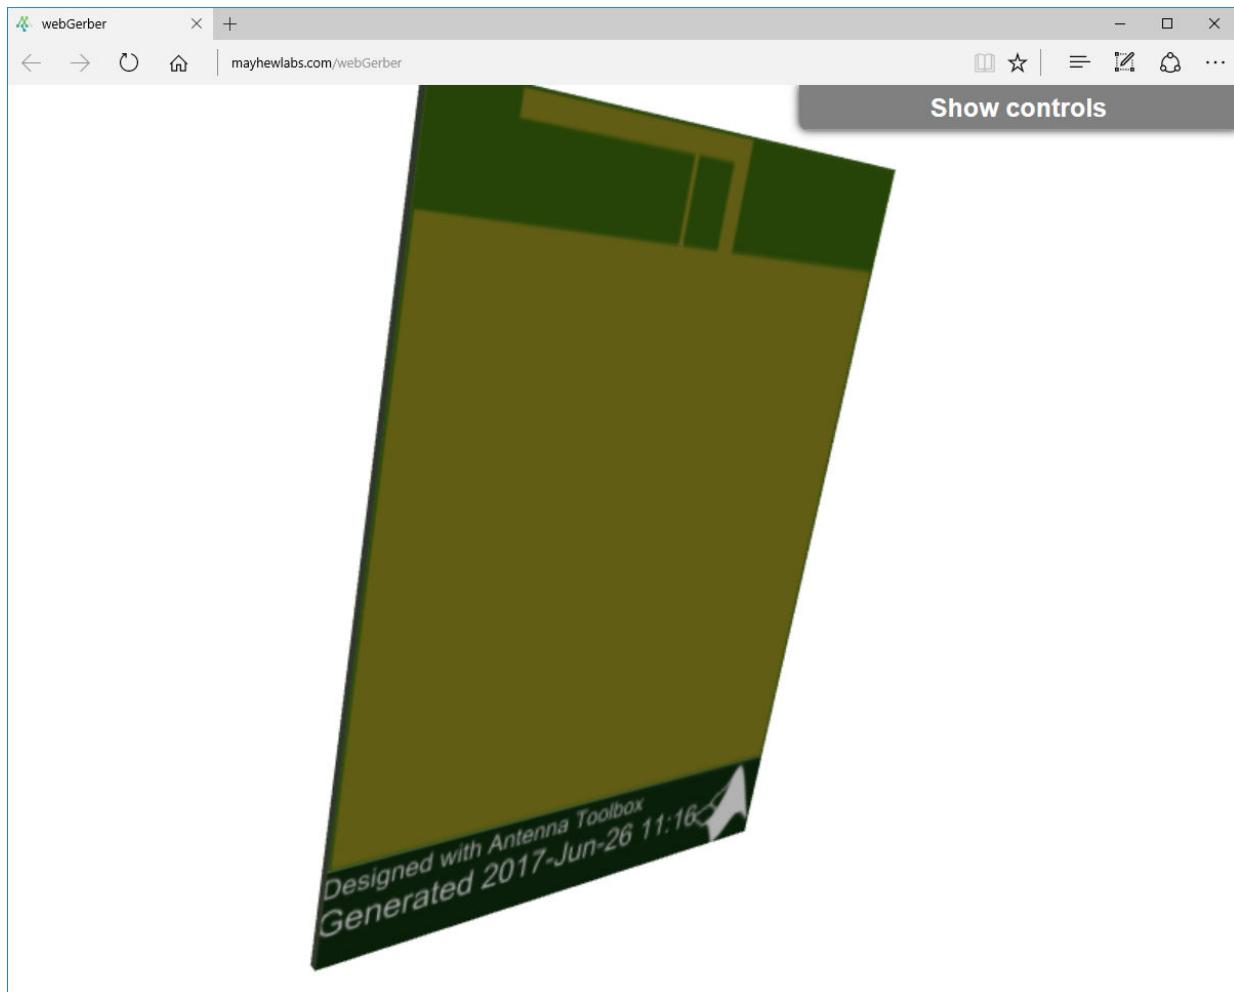

The screenshot shows a web browser window titled "webGerber" with the URL "mayhewlabs.com/webGerber". The main content area displays a list of Gerber files on the left and their corresponding layers on the right. A dotted-line box highlights the title and the list.

File	Layer
untitled.gtl	Top copper
untitled.gto	Top silk-screen
untitled.gts	Top solder mask
untitled.ipc	No layer
untitled.txt	Drill
untitled.dri	No layer
untitled.gbl	Bottom copper
untitled.gbo	Bottom silk-screen
untitled.gbp	Bottom solder paste
untitled.gbs	Bottom solder mask
untitled.gpi	No layer

**Step 2:**  
Select the layers corresponding to the gerber files

**Done**

Click **Done** to view your Antenna PCB.

## Input Arguments

**designobject** — Antenna design geometry file  
pcbStack object | PCBWriter object

Antenna design geometry file, specified as a `pcbStack` object or `PCBWriter` object.

Example: `p1 = pcbStack` creates a PCB stack object.`p1 gerberWrite(p1)` creates a Gerber file using `p1`.

Example: `p1 = pcbStack` creates a PCB stack object.`p1 a = PCBWriter(p1)`, creates a `PCBWriter` object, `a. gerberWrite(a)`, creates a Gerber file using `a`.

**rfconnector — RF connector type**

`PCBConnector` object

RF connector type, specified as a `PCBConnector` object.

Example: `c = PCBCConnectors.SMA_Cinch; gerberWrite(p1, c)` uses SMA\_Cinch RF connector at the feedpoint.

**writer — PCB service**

`PCBServices` object

PCB service, specified as a `PCBServices` object.

Example: `s = PCBServices.MayhewWriter; gerberWrite(p1, s)` uses Mayhew Labs PCB service to create and view the PCB design.

## Output Arguments

---

**Note** You can only use output arguments if the `designobject` is a `pcbStack` object.

---

**a — PCBWriter object**

object handle

`PCBWriter` object that generated the Gerber files, returned as an object handle.

**g — Path to generated Gerber files folder**

character vector

Path to generated Gerber files folder, returned as character vector.

# show

Show site location on map

## Syntax

```
show(site)
show(site,'Icon',icon)
```

## Description

`show(site)` displays the location of transmitter or receiver site on a map using a marker.

`show(site,'Icon',icon)` uses icon as the marker to display the site. This syntax is a name-value pair.

## Examples

### Default Receiver Site

Create and show the default receiver site.

```
rx = rxsite
show(rx)
```

```
rx =
```

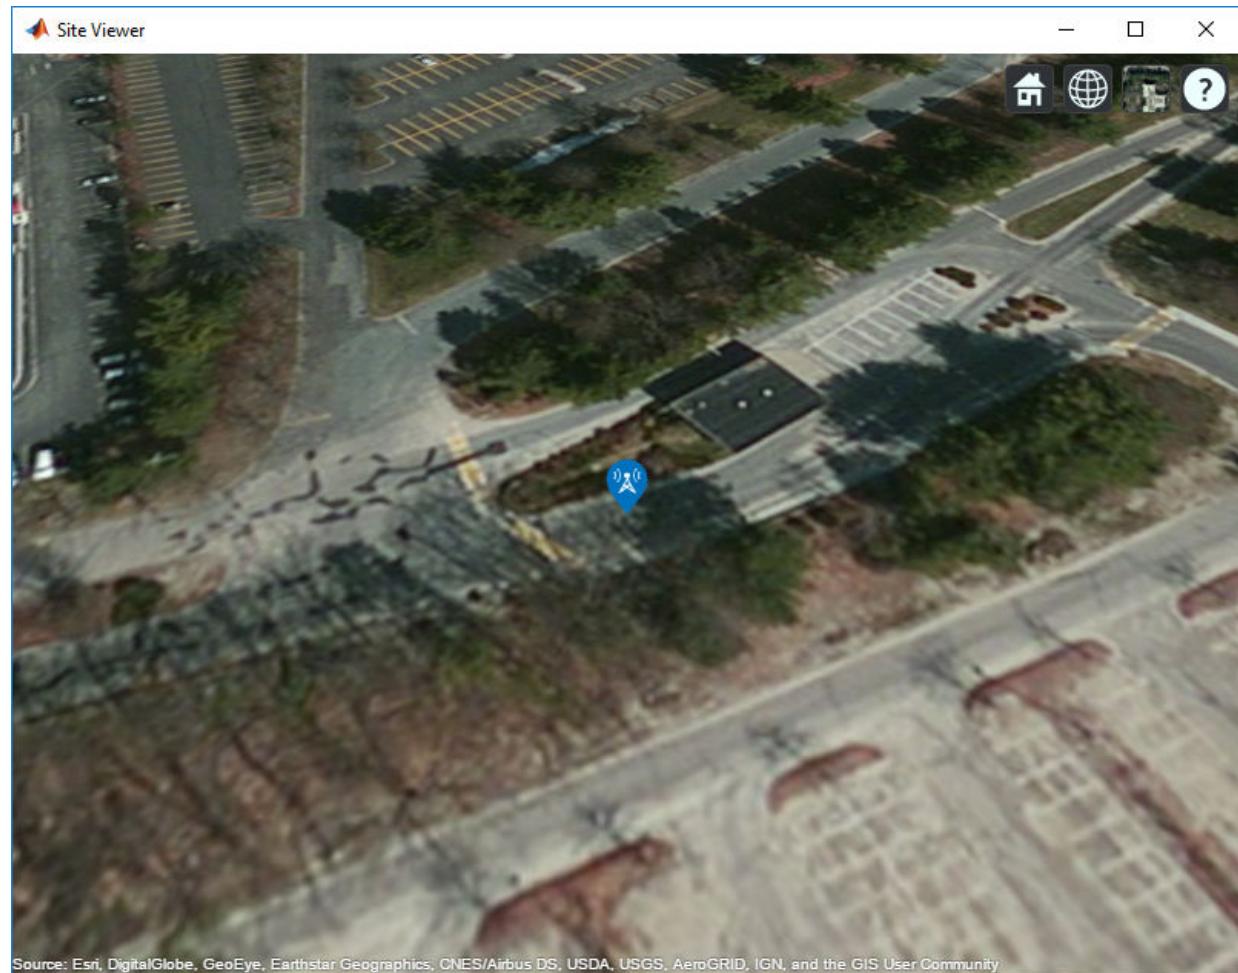

```
    rxsite with properties:
```

```
        Name: 'Site 1'
        Latitude: 42.3021
        Longitude: -71.3764
        Antenna: [1×1 dipole]
        AntennaAngle: 0
```

## 5 Methods — Alphabetical List

---

```
AntennaHeight: 1  
SystemLoss: 0  
ReceiverSensitivity: -100
```

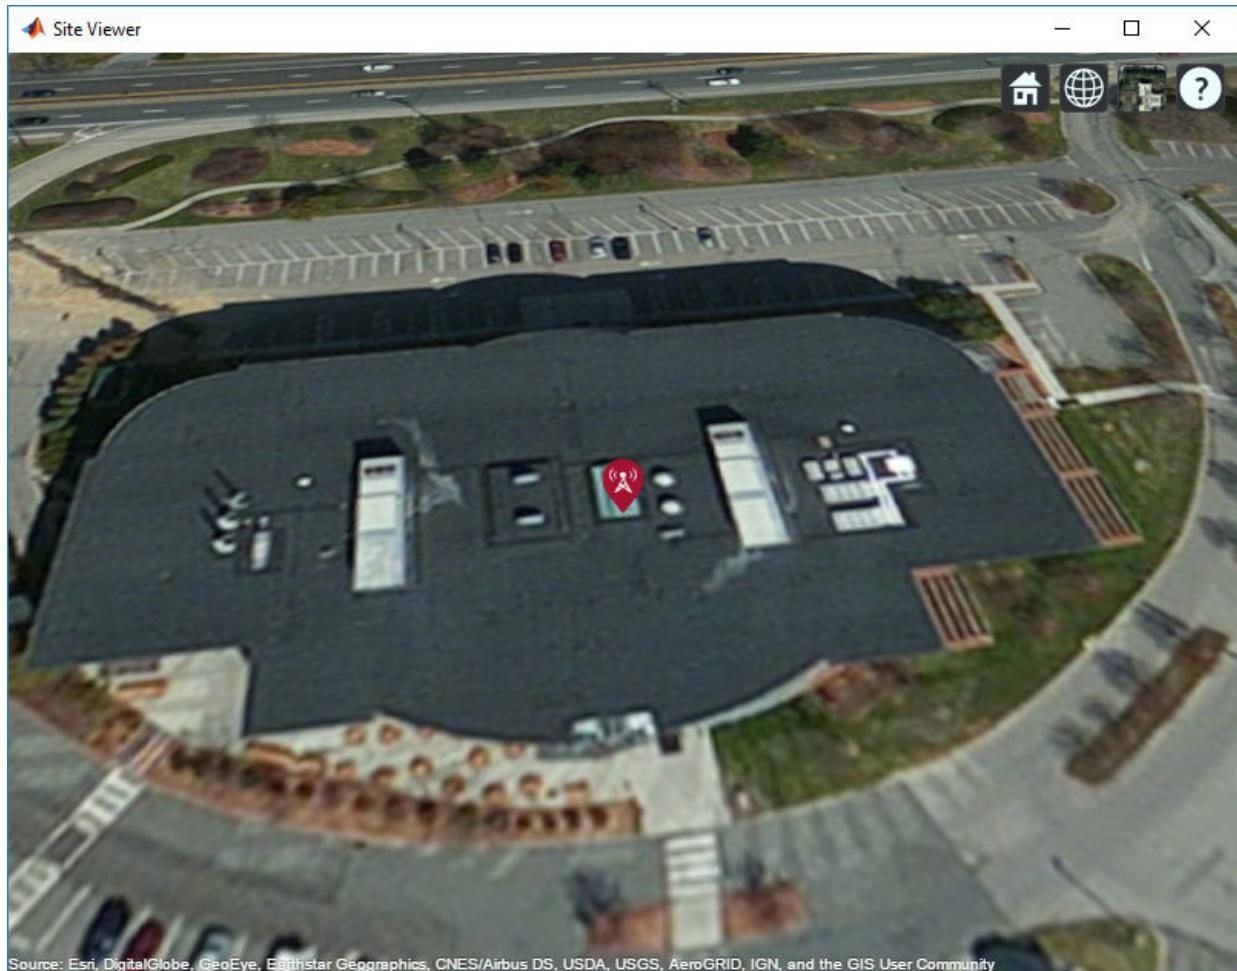

### Show and Hide Transmitter Site

Create a transmitter site.

```
tx = txsite('Name','MathWorks Apple Hill',...
    'Latitude',42.3001, ...
    'Longitude',-71.3504);
```

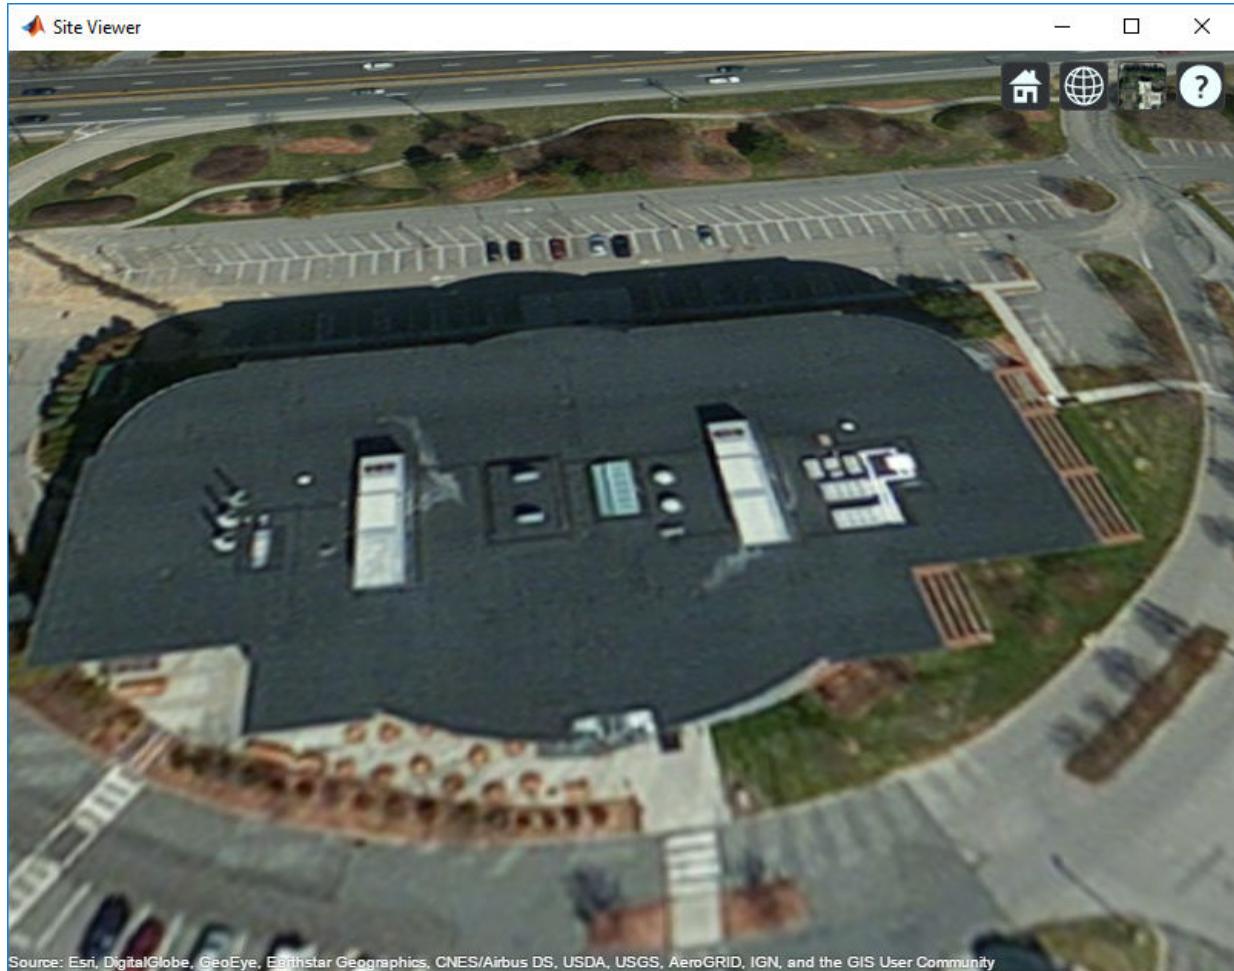

Show the transmitter site.

```
show(tx)
```

Hide the transmitter site.

```
hide(tx)
```

## Input Arguments

**site** — Transmitter or receiver site

txsite or rxsite object | array of txsite or rxsite objects

Transmitter or receiver site, specified as a `txsite` or `rxsite` object or an array of `txsite` or `rxsite` objects.

**icon — Name or path of .png or .svg file**

character vector or string

Name or path of .png or .svg file, specified as a character vector or string.

Data Types: `char` | `string`

## See Also

hide

**Introduced in R2017b**

## range

Range of radio wave propagation

### Syntax

```
r = range(propmodel,tx,pl)
```

### Description

`r = range(propmodel,tx,pl)` returns the range of radio wave propagation from the transmitter site.

### Examples

#### Range of Transmitter In Heavy Rain

Specify transmitter and receiver sites.

```
tx = txsite('Name','MathWorks Apple Hill',...
    'Latitude',42.3001, ...
    'Longitude',-71.3504, ...
    'TransmitterFrequency', 2.5e9);

rx = rxsite('Name','Fenway Park',...
    'Latitude',42.3467, ...
    'Longitude',-71.0972);
```

Create the propagation model for heavy rainfall rate.

```
pm = propagationModel('rain','RainRate',50)
```

```
pm =
```

Rain with properties:

```
RainRate: 50  
Tilt: 0
```

Calculate the range of transmitter using the rain propagation model and a path loss of 127 dB.

```
r = range(pm, tx, 127)
```

```
r =
```

```
2.1123e+04
```

## Input Arguments

### **propmodel — Propagation model**

character vector or string

Propagation model, specified as a character vector or string.

Data Types: char

### **tx — Transmitter site**

txsite object

Transmitter site, specified as a txsite object. You can use array inputs to specify multiple sites.

Data Types: char

### **p1 — Path loss**

scalar

Path loss, specified as a scalar in decibels.

Data Types: double

## Output Arguments

### **r — range**

scalar |  $M$ -by-1 arrays

Range, returned as a scalar or  $M$ -by-1 array with each element in meters.  $M$  is the number of TX sites.

Range is the maximum distance for which the path loss does not exceed the value of specified pl.

## See Also

`pathloss` | `propagationModel`

**Introduced in R2017b**

# pathloss

Path loss of radio wave propagation

## Syntax

```
pl = pathloss(propmodel,rx,tx)
```

## Description

`pl = pathloss(propmodel,rx,tx)` returns the path loss of radio wave propagation at the receiver site from the transmitter site.

## Examples

### Path Loss of Receiver In Heavy Rain

Specify transmitter and receiver sites.

```
tx = txsite('Name','MathWorks Apple Hill',...
    'Latitude',42.3001, ...
    'Longitude',-71.3504, ...
    'TransmitterFrequency', 2.5e9);

rx = rxsite('Name','Fenway Park',...
    'Latitude',42.3467, ...
    'Longitude',-71.0972);
```

Create the propagation model for heavy rainfall rate.

```
pm = propagationModel('rain','RainRate',50)
```

```
pm =
```

Rain with properties:

```
RainRate: 50  
Tilt: 0
```

Calculate the pathloss at receiver using the rain propagation model.

```
pl = pathloss(pm,rx,tx)
```

```
pl =
```

```
127.1558
```

## Input Arguments

### **propmodel — Propagation model**

character vector or string

Propagation model, specified as a character vector or string.

Data Types: char

### **rx — Receiver site**

rxsite object

Receiver site, specified as a rxsite object. You can use array inputs to specify multiple sites.

Data Types: char

### **tx — Transmitter site**

txsite object

Transmitter site, specified as a txsite object. You can use array inputs to specify multiple sites.

Data Types: char

## Output Arguments

### p1 — Path loss

scalar |  $M$ -by- $N$  arrays

Path loss, returned as a scalar or  $M$ -by- $N$  arrays with each element in decibels.  $M$  is the number of TX sites and  $N$  is the number of RX sites.

Path loss is computed along the shortest path shortest path through space connecting the transmitter and receiver antenna centers.

## See Also

`propagationModel` | `range`

**Introduced in R2017b**

## openFolder

Open file browser to generated Gerber file folder

### Syntax

```
openFolder(pcbWriterobject)
```

### Description

`openFolder(pcbWriterobject)` opens the parent folder to the PCB writer Gerber design files. You use this function once the Gerber files are generated from the PCB Writer object using the `gerberWrite` function.

## Examples

### Location of Gerber Files

Create a coplanar inverted F antenna.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Use this antenna in creating a pcb stack object.

```
p = pcbStack(fco);
```

Use a SMA\_Cinch as an RF connector and Mayhew Writer as a manufacturing service.

```
c = PCBConnectors.SMA_Cinch;
s = PCBServices.MayhewWriter;
```

Create an antenna design file using PCBWriter.

```
PW = PCBWriter(p,s,c);
```

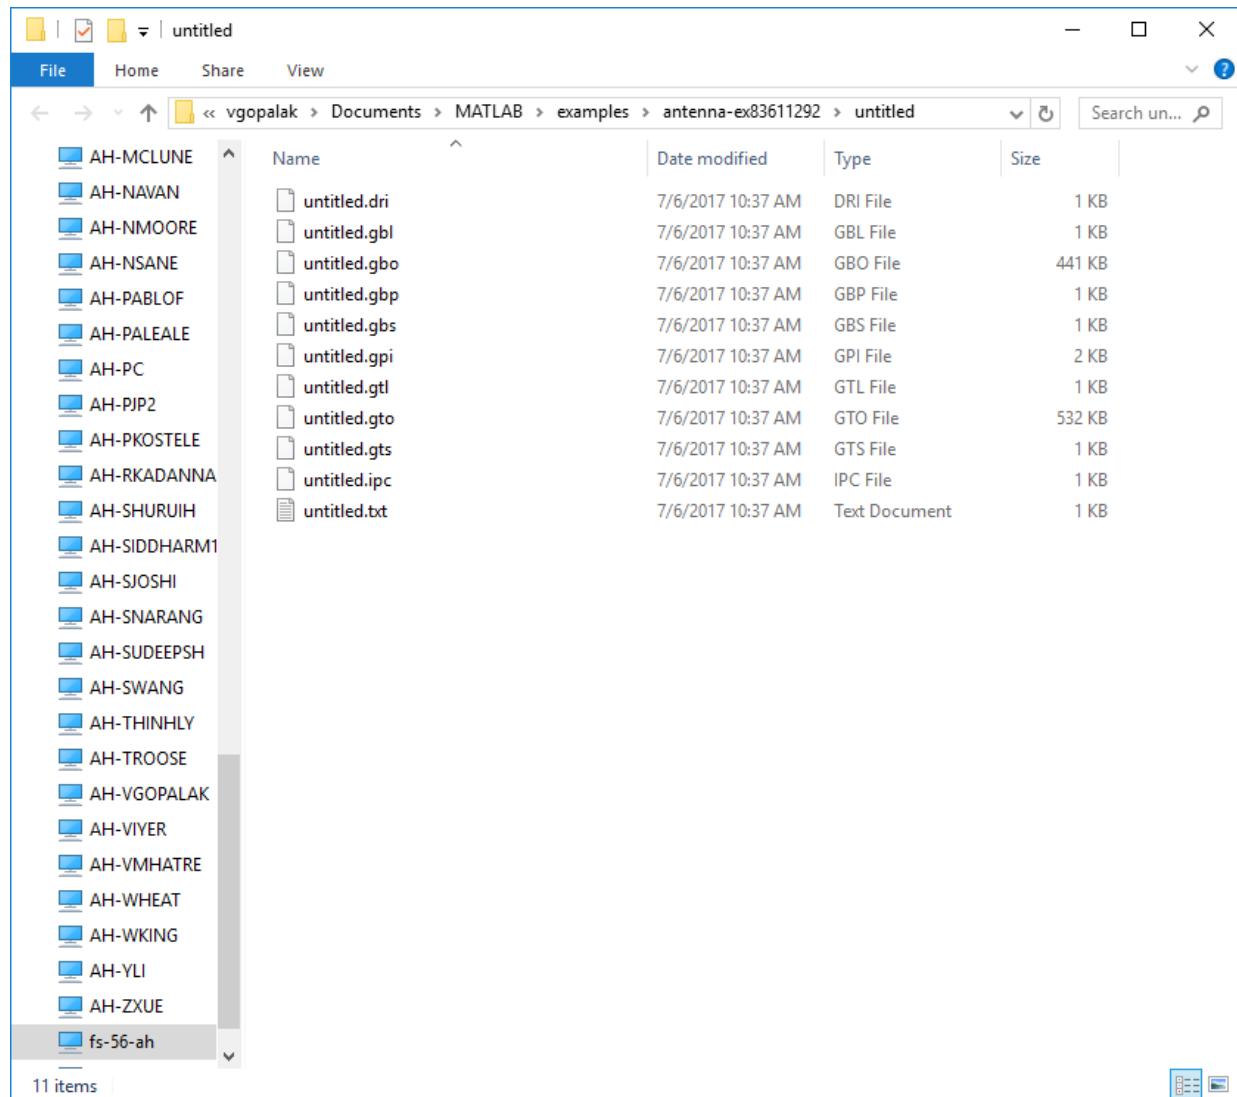

Use the gerberWrite method to create Gerber files from the antenna design files.

```
gerberWrite(PW)
```

Open the folder that contains the Gerber files.

```
openFolder(PW)
```

## 5 Methods — Alphabetical List

## Input Arguments

**pcbWriterobject** — Antenna design files

PCBWriter object

Antenna design files specified as a `PCBWriter` object.

Example: `p1 = pcbStack` creates a PCB stack object.`p1 a = PCBWriter(p1)`.

## See Also

`gerberWrite` | `info` | `sendTo`

**Introduced in R2017b**

## info

Display information about antenna or array

### Syntax

```
info(antenna)  
info(array)
```

### Description

`info(antenna)` displays information about antenna element. as a structure:

- `isSolved` – Logical specifying if an antenna is solved.
- `isMeshed` – Logical specifying if an antenna is meshed.
- `MeshingMode` – String specifying the meshing mode.
- `HasSubstrate` – Logical specifying if an antenna uses a substrate.
- `HasLoad` – Logical specifying if an antenna has a load
- `PortFrequency` – Scalar or vector of frequencies used for port analysis.
- `FieldFrequency` – Scalar or vector of frequencies used for field analysis.
- `MemoryEstimate` – Approximate memory requirement for solving the antenna.

`info(array)` displays information about array element as a structure::

- `isSolved` – Logical specifying if an array is solved.
- `isMeshed` – Logical specifying if an array is meshed.
- `MeshingMode` – String specifying the meshing mode.
- `HasSubstrate` – Logical specifying if an array uses a substrate.
- `HasLoad` – Logical specifying if an array has a load
- `PortFrequency` – Scalar or vector of frequencies used for port analysis.
- `FieldFrequency` – Scalar or vector of frequencies used for field analysis.

- `MemoryEstimate` – Approximate memory requirement for solving the array.

## Examples

### Antenna Information

Create a dipole antenna and calculate the impedance at 70 MHz.

```
d = dipole;
Z = impedance(d, 70e6)
```

```
Z =
75.0112 + 0.5740i
```

Display all the information about the dipole antenna.

```
info(d)
```

```
ans =
struct with fields:
    IsSolved: "true"
    IsMeshed: "true"
    MeshingMode: "auto"
    HasSubstrate: "false"
    HasLoad: "false"
    PortFrequency: 70000000
    FieldFrequency: []
    MemoryEstimate: "740 MB"
```

## Input Arguments

### `antenna` — Antenna element

antenna object

Antenna element, specified as an antenna object.

Example: `d = dipole;`

**array — Array element**

array object

Array element, specified as an array object.

Example: `d = dipole;`

## See Also

`show`

**Introduced in R2017b**

# sendTo

Export generated Gerber Files to service provider

## Syntax

```
sendTo(pcbWriterobject)
```

## Description

`sendTo(pcbWriterobject)` opens the manufacturing service browser page on your default web browser and opens the folder containing the Gerber files.

For example, if the manufacturing service is MayhewWriter, then `sendTo` action opens the Mayhew Labs online PCB viewer in your default web browser. This function also opens the folder containing the Gerber files. This simplifies use of the service, enabling you to drag and drop the files to the website and view the design.

## Examples

### Open Manufacturing Service Website

Create a coplanar inverted F antenna.

```
fco = invertedFcoplanar('Height',14e-3,'GroundPlaneLength', 100e-3, ...
    'GroundPlaneWidth', 100e-3);
```

Use this antenna in creating a pcb stack object.

```
p = pcbStack(fco);
```

Use a SMA\_Cinch as an RF connector and Mayhew Writer as a manufacturing service.

```
c = PCBConnectors.SMA_Cinch;
s = PCBServices.MayhewWriter;
```

Create an antenna design file using PCBWriter.

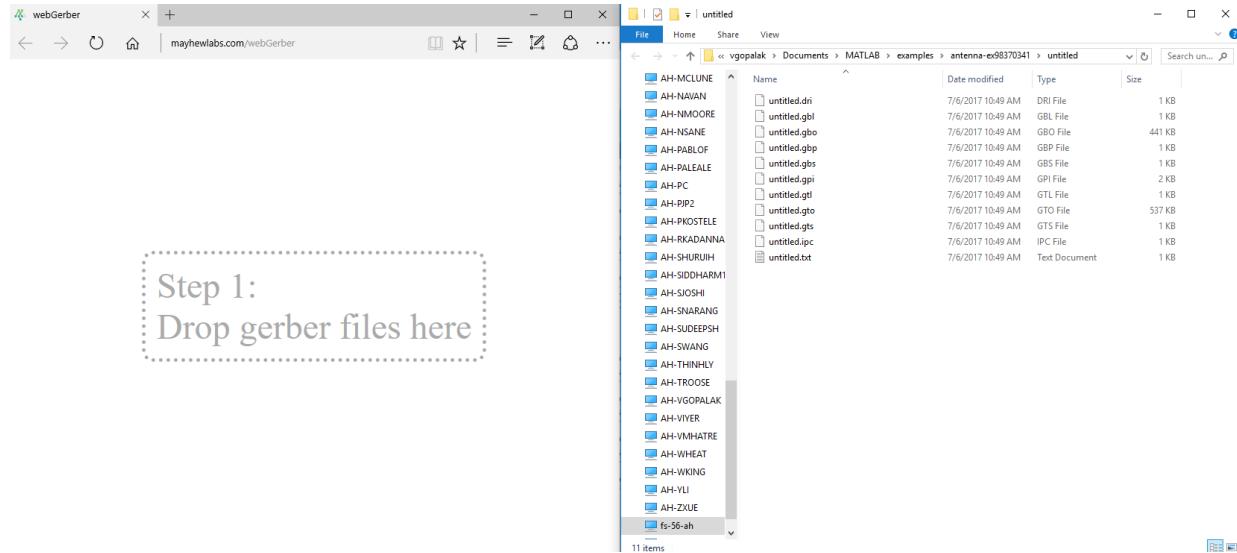

```
PW = PCBWriter(p,s,c);
```

Use the gerberWrite method to create Gerber files from the antenna design files.

```
gerberWrite(PW)
```

Open the manufacturing service website to send the Gerber files.

```
sendTo(PW)
```

## Input Arguments

### **pcbWriterobject — Antenna design files**

PCBWriter object

Antenna design files, specified as a PCBWriter object.

Example: `p1 = pcbStack` creates a PCB stack object.`p1.a = PCBWriter(p1)`.

## getLowPassLocs

Feeding location to operate birdcage as lowpass coil

### Syntax

```
getLowPassLocs(birdcageantenna)
```

### Description

`getLowPassLocs(birdcageantenna)` returns all the feed locations on the birdcage to operate the antenna as a lowpass coil. The feeding locations are located in the center of the rungs. Use this function to find the `FeedLocations` property value for `birdcage`.

### Examples

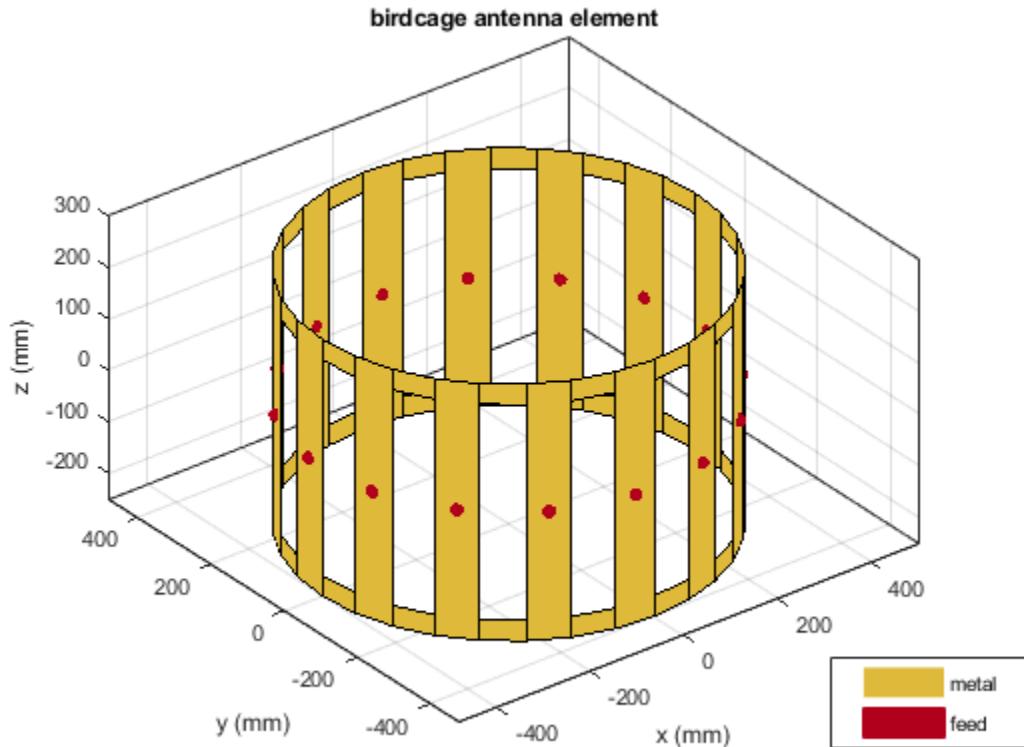

#### Birdcage as Lowpass Coil

```
b = birdcage;
b.FeedLocations = getLowPassLocs(b)
show(b)
```

```
b =
birdcage with properties:
```

```
    NumRungs: 16
    CoilRadius: 0.4000
    CoilHeight: 0.0400
    RungHeight: 0.4600
    ShieldRadius: 0
    ShieldHeight: 0
    Phantom: []
    FeedLocations: [16×3 double]
    FeedVoltage: 1
```

```
FeedPhase: 0
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

## Input Arguments

**birdcageantenna** — Birdcage antenna object

Birdcage antenna, specified as an object.

Example: `b = birdcage b.FeedLocations = getLowPassLocs(b)`

## See Also

**Introduced in R2017b**

# getHighPassLocs

Feeding location to operate birdcage as highpass coil

## Syntax

```
getHighPassLocs(birdcageantenna)
```

## Description

`getHighPassLocs(birdcageantenna)` returns all the feed locations on the birdcage to operate the antenna as a highpass coil. The feeding locations are along the circumference on the upper and lower coils of the birdcage. Use this function to find the `FeedLocations` property value for `birdcage`.

## Examples

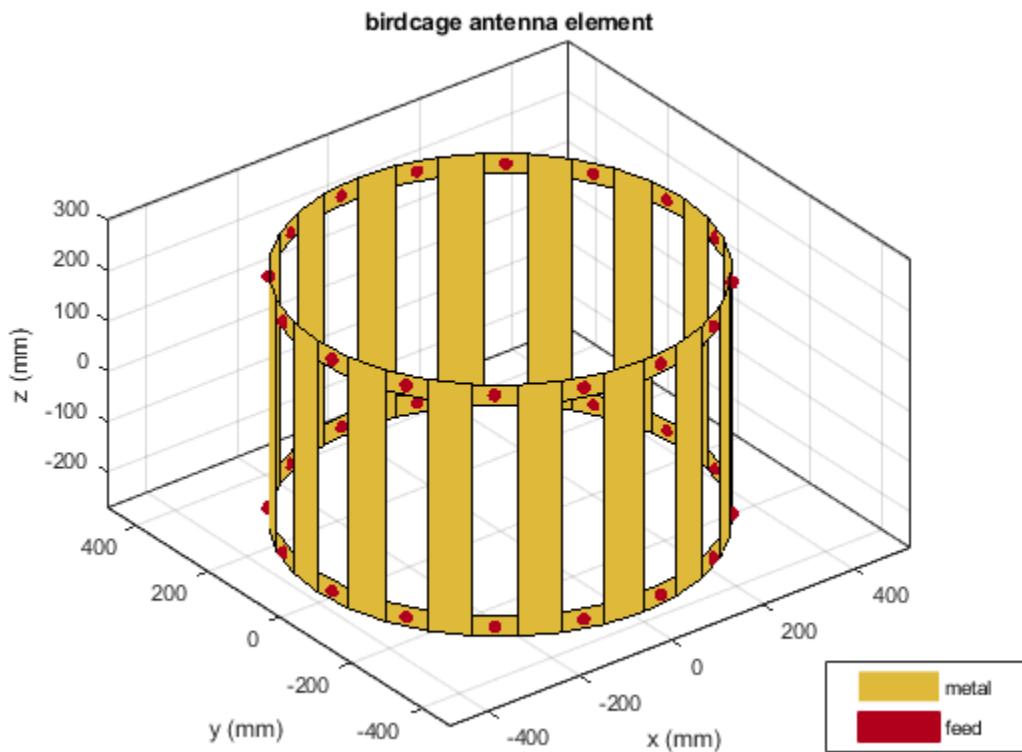

### Birdcage as Highpass Coil

```
b = birdcage;
b.FeedLocations = getHighPassLocs(b)
show(b)
```

```
b =
birdcage with properties:

    NumRungs: 16
    CoilRadius: 0.4000
    CoilHeight: 0.0400
    RungHeight: 0.4600
    ShieldRadius: 0
    ShieldHeight: 0
    Phantom: []
    FeedLocations: [32×3 double]
```

```
FeedVoltage: 1
FeedPhase: 0
Tilt: 0
TiltAxis: [1 0 0]
Load: [1x1 lumpedElement]
```

## Input Arguments

**birdcageantenna** — Birdcage antenna object

Birdcage antenna, specified as an object.

Example: `b = birdcage b.FeedLocations = getHighPassLocs (b)`

## See Also

**Introduced in R2017b**

## rotateX

Rotate shape about X-axis and angle

### Syntax

```
rotateX(shape,angle)  
c =c rotateX(shape,angle)
```

### Description

`rotateX(shape,angle)` rotate shape about an axes object and angle.

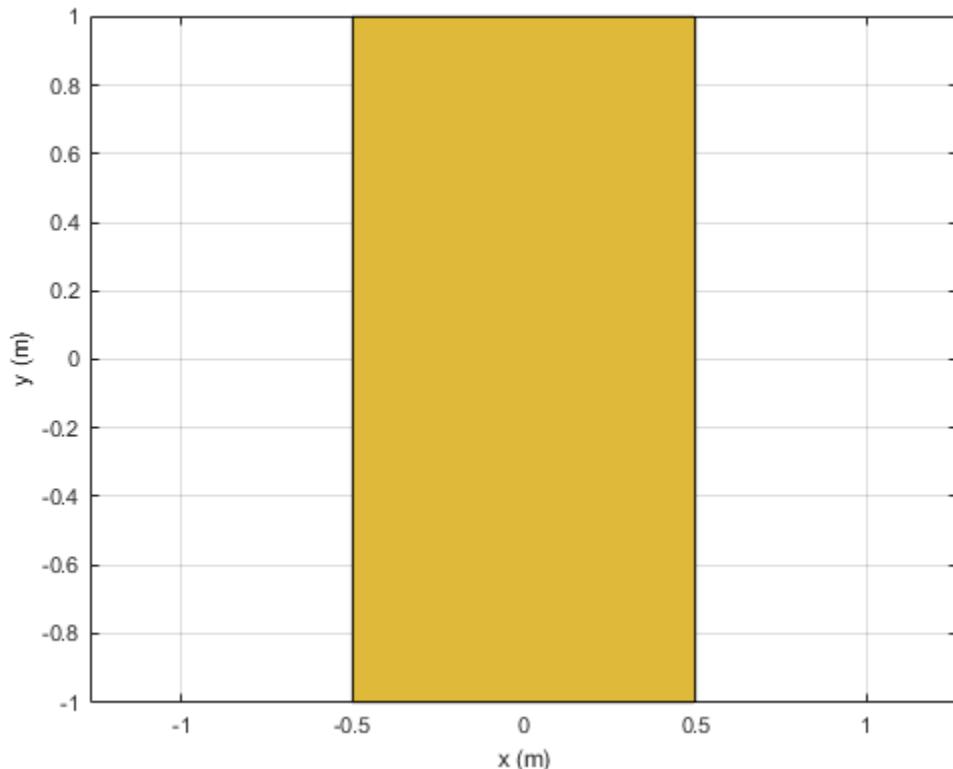

`c =c rotateX(shape,angle)` rotate shape about an axes object and angle.

### Examples

#### Rotate Rectangle About X-Axis

Create a rectangle shape.

```
r = antenna.Rectangle;  
show(r)  
axis equal
```

Rotate the rectangle at 45 degrees about the x-axis.

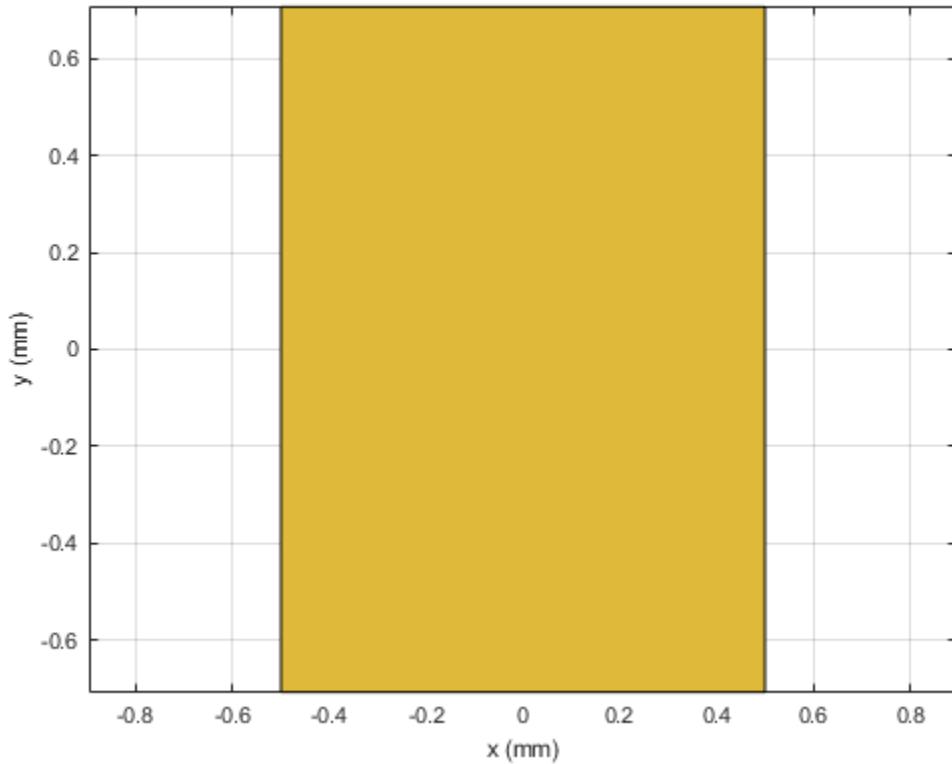

```
r1 = rotateX(r, 45)
show(r1)
axis equal
```

```
r1 =
```

Rectangle with properties:

```
Name: 'myrectangle'
Center: [0 0]
Length: 1
```

Width: 2  
NumPoints: 2

## Input Arguments

**shape** — Shape created using custom elements and shape objects  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

---

Example: `area(rectangle)` where rectangle is created using `antenna.Rectangle` object.

**angle — Angle of rotation**

scalar

Angle of rotation, specified as a scalar in degrees

Example: `rotateX(rectangle, 45)` rotates the rectangle around X-axis by 45 degrees.

Data Types: double

## See Also

`add` | `area` | `intersect` | `mesh` | `plot` | `rotate` | `rotateY` | `rotateZ` | `scale` |  
`show` | `subtract` | `translate`

**Introduced in R2017a**

## rotateY

Rotate shape about Y-axis and angle

### Syntax

```
rotateY(shape,angle)  
c = rotateY(shape,angle)
```

### Description

`rotateY(shape,angle)` rotate shape about the Y-axis and angle.

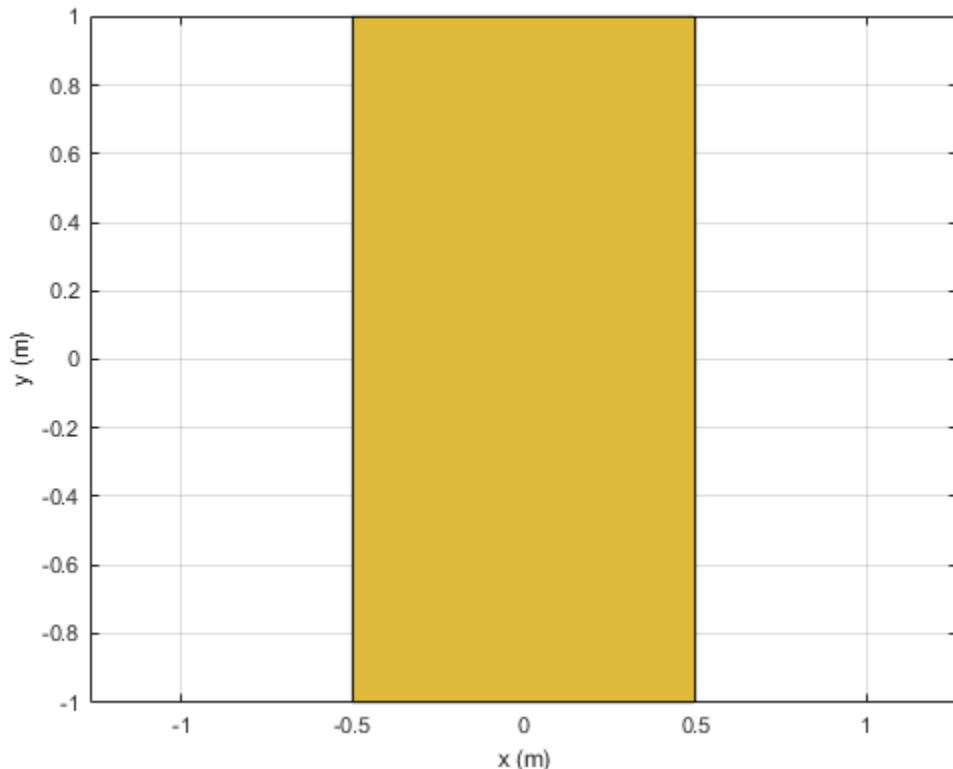

`c = rotateY(shape,angle)` rotate shape about the Y-axis and angle.

### Examples

#### Rotate Rectangle About Y-Axis

Create a rectangle shape.

```
r = antenna.Rectangle;  
show(r)  
axis equal
```

Rotate the rectangle at 45 degrees about the Y-axis.

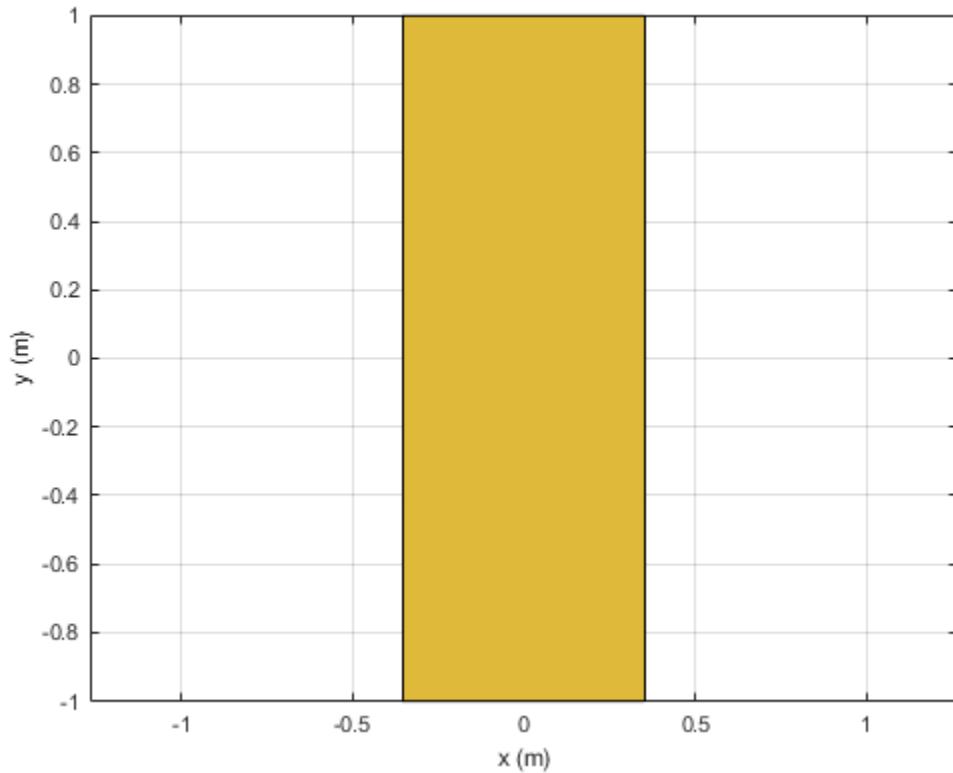

```
r1 = rotateY(r, 45)
show(r1)
axis equal
```

```
r1 =
```

Rectangle with properties:

```
Name: 'myrectangle'
Center: [0 0]
Length: 1
```

Width: 2  
NumPoints: 2

## Input Arguments

**shape** — Shape created using custom elements and shape objects  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

---

Example: `rotateY(rectangle)` where `rectangle` is created using `antenna.Rectangle` object.

**angle — Angle of rotation**

scalar

Angle of rotation, specified as a scalar in degrees

Example: `rotateY(rectangle, 45)` rotates the rectangle around Y-axis by 45 degrees.

Data Types: double

## See Also

`add` | `area` | `intersect` | `mesh` | `plot` | `rotate` | `rotateX` | `rotateZ` | `scale` |  
`show` | `subtract` | `translate`

**Introduced in R2017a**

## rotateZ

Rotate shape about Z-axis and angle

### Syntax

```
rotateZ(shape,angle)
c = rotateZ(shape,angle)
```

### Description

`rotateZ(shape,angle)` rotate shape about the Z-axis and angle.

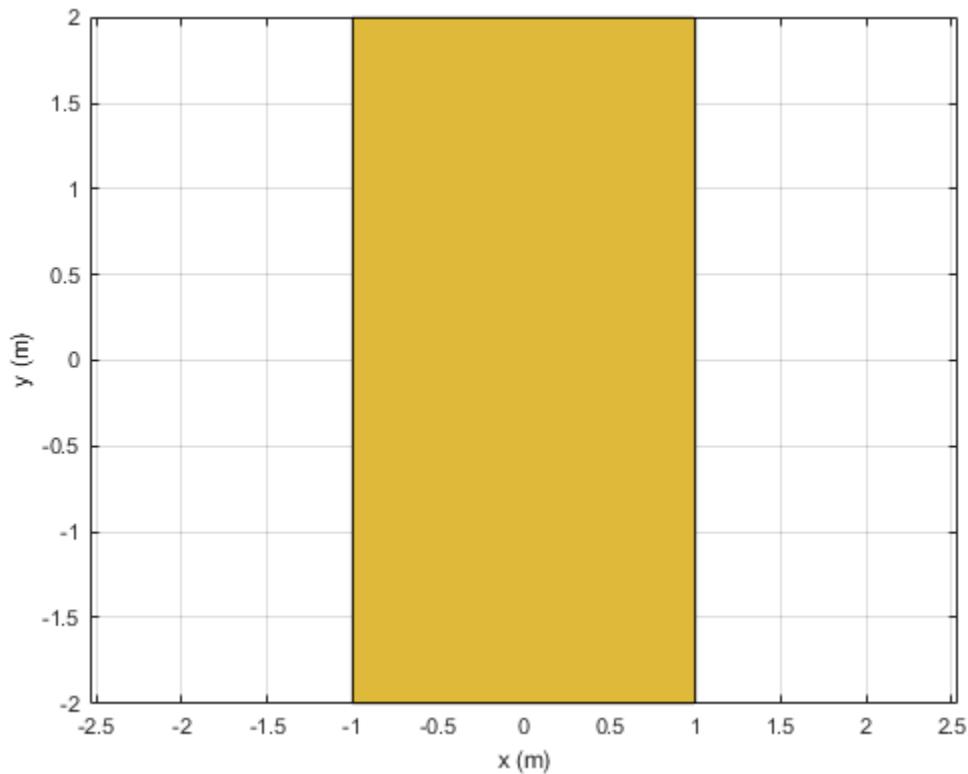

`c = rotateZ(shape,angle)` rotate shape about the Z-axis and angle.

### Examples

#### Create and Rotate Rectangle Using Specified Properties

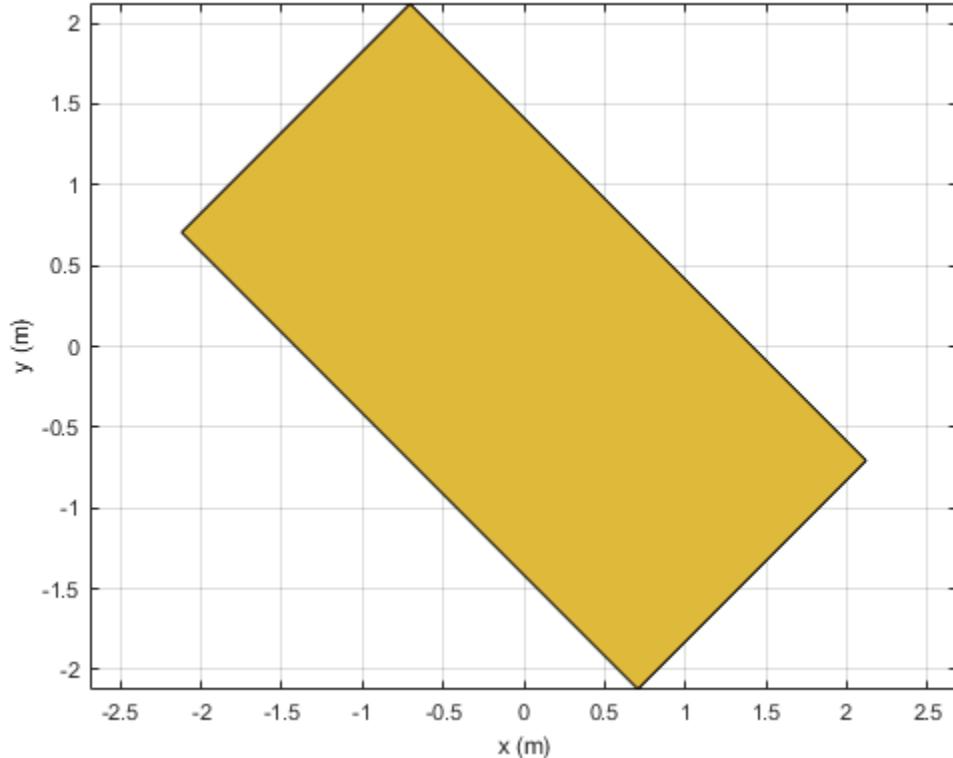

Create and view a rectangle with a length of 2 m and a width of 4 m.

```
r2 = antenna.Rectangle('Length',2,'Width',4);
show(r2)
axis equal
```

Rotate the rectangle.

```
rotateZ(r2, 45);  
show(r2)
```

## Input Arguments

**shape** — Shape created using custom elements and shape objects  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `rotateZ(rectangle)` where rectangle is created using `antenna.Rectangle` object.

**angle — Angle of rotation**

scalar

Angle of rotation, specified as a scalar in degrees

Example: `rotateZ(rectangle, 45)` rotates the rectangle around Z-axis by 45 degrees.

Data Types: `double`

## See Also

`add` | `area` | `intersect` | `mesh` | `plot` | `rotate` | `rotateX` | `rotateY` | `scale` |  
`show` | `subtract` | `translate`

**Introduced in R2017a**

## translate

Move shape to new location

### Syntax

```
c = translate(shape,locationpoints)
```

### Description

`c = translate(shape,locationpoints)` moves the shape to a new specified location using a translation vector.

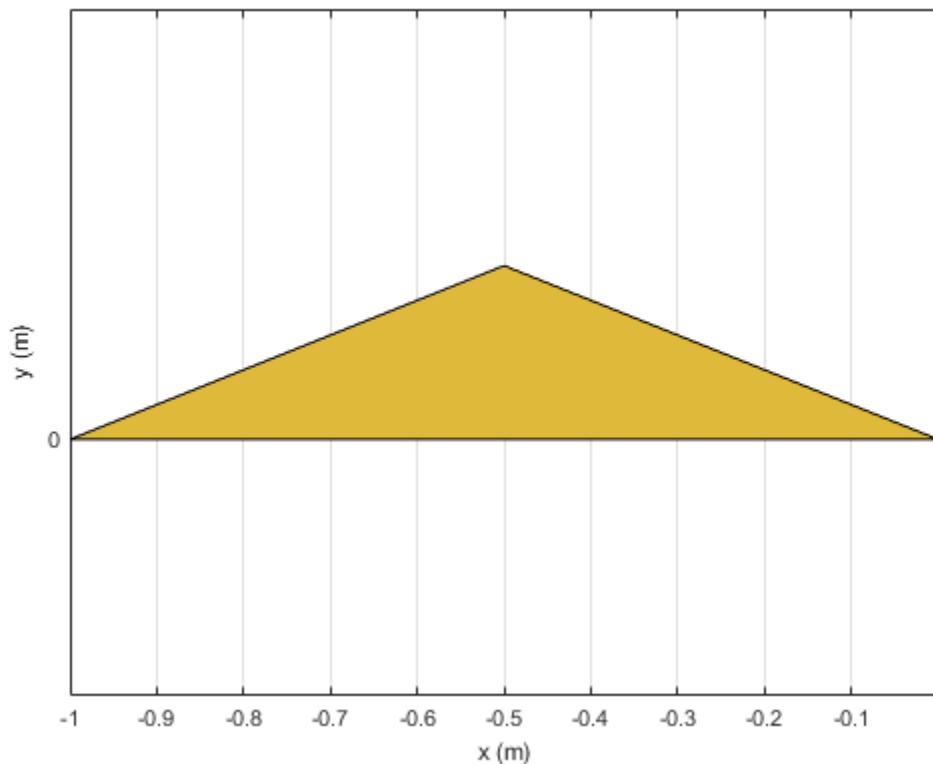

## Examples

### Create and Transform Polygon

Create a polygon using `antenna.Polygon` with vertices at `[-1 0 0;-0.5 0.2 0;0 0 0]` and view it.

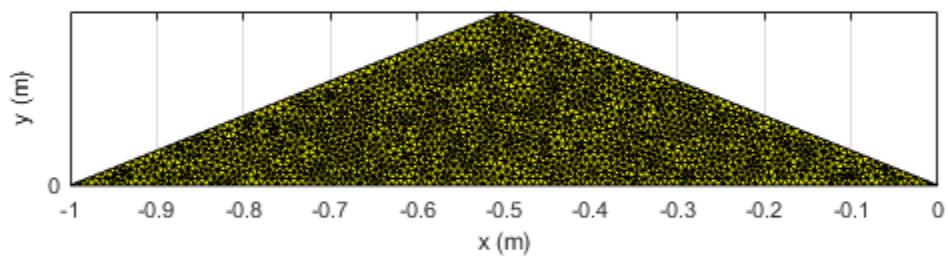

```
p = antenna.Polygon('Vertices', [-1 0 0;-0.5 0.2 0;0 0 0])
p =
  Polygon with properties:
    Name: 'mypolygon'
    Vertices: [3x3 double]

show(p);axis equal
```

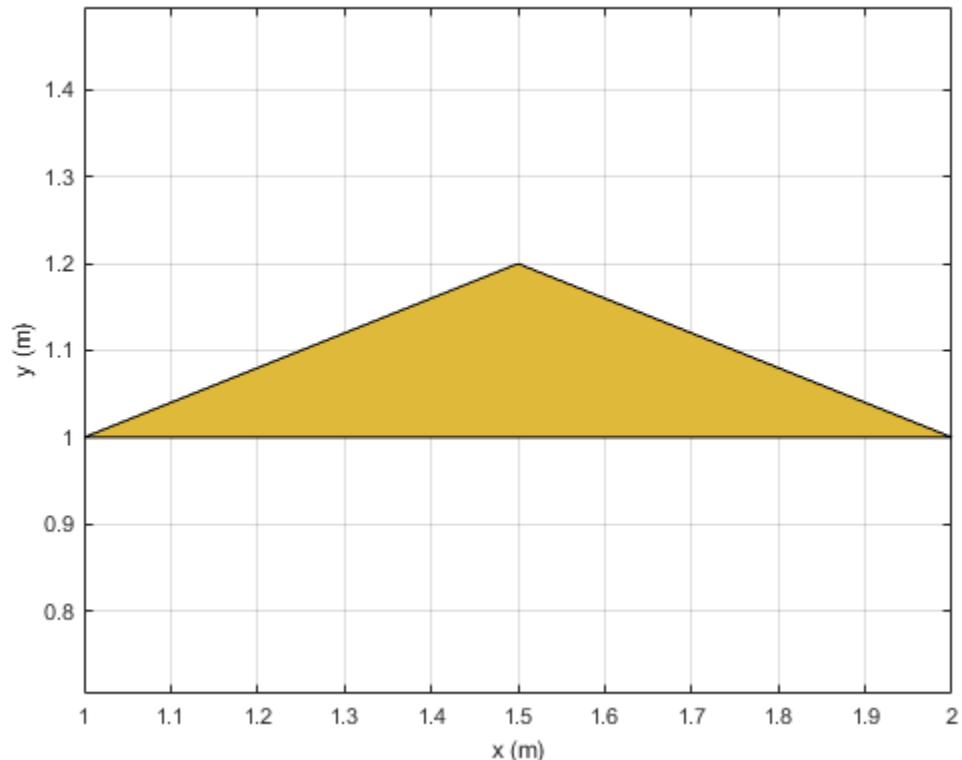

Mesh the polygon and view it.

```
mesh(p, 0.2);
```

Move the polygon to a new location on the X-Y plane.

```
translate(p, [2,1,0]); axis equal
```

## Input Arguments

**shape — Shape created using custom elements and shape objects**  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `c = translate(rectangle1, [2 1 0])` where `rectangle1` is created using `antenna.Rectangle` object.

**locationpoints** — Translation vector  
vector

Translation vector, specified as a vector.

Data Types: double

## See Also

**Introduced in R2017a**

# plot

Plot boundary of shape

## Syntax

```
p = plot(shape,varargin)
```

## Description

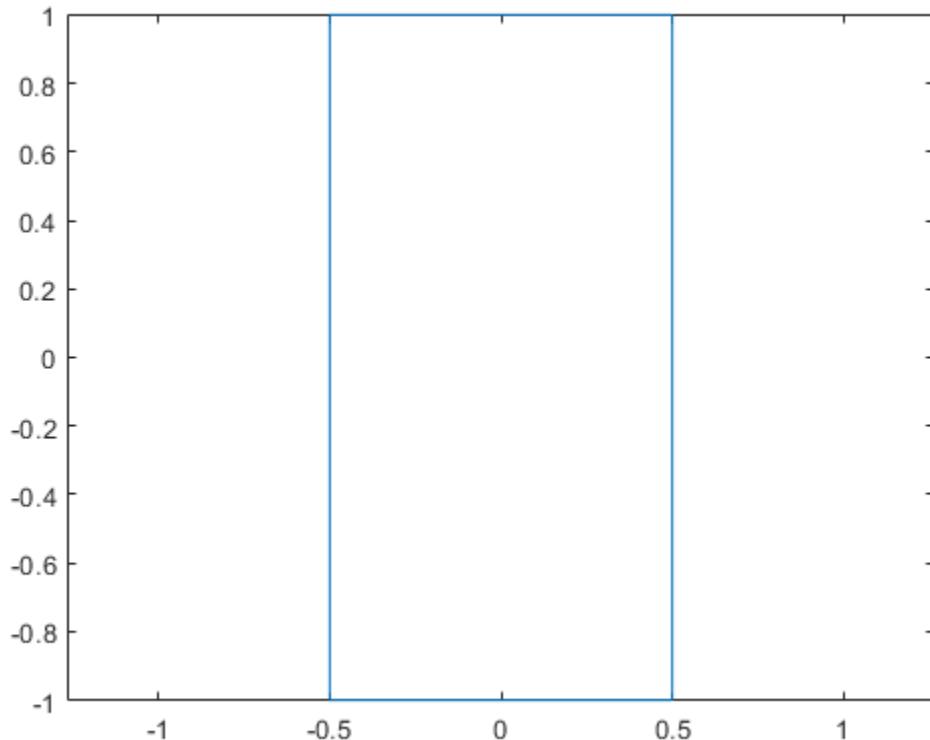

`p = plot(shape,varargin)` plots the boundary of the shape and returns the line handle.

## Examples

### Plot Rectangle Shape

Create a rectangular shape and plot it.

```
r = antenna.Rectangle;
p = plot(r);
```

## Input Arguments

**shape** — Shape created using custom elements and shape objects  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `plot(rectangle)` where `rectangle` is created using `antenna.Rectangle` object.

## See Also

[mesh](#) | [show](#)

**Introduced in R2017a**

## scale

Change the size of the shape by a fixed amount

### Syntax

```
c = scale(shape,scaling)
```

### Description

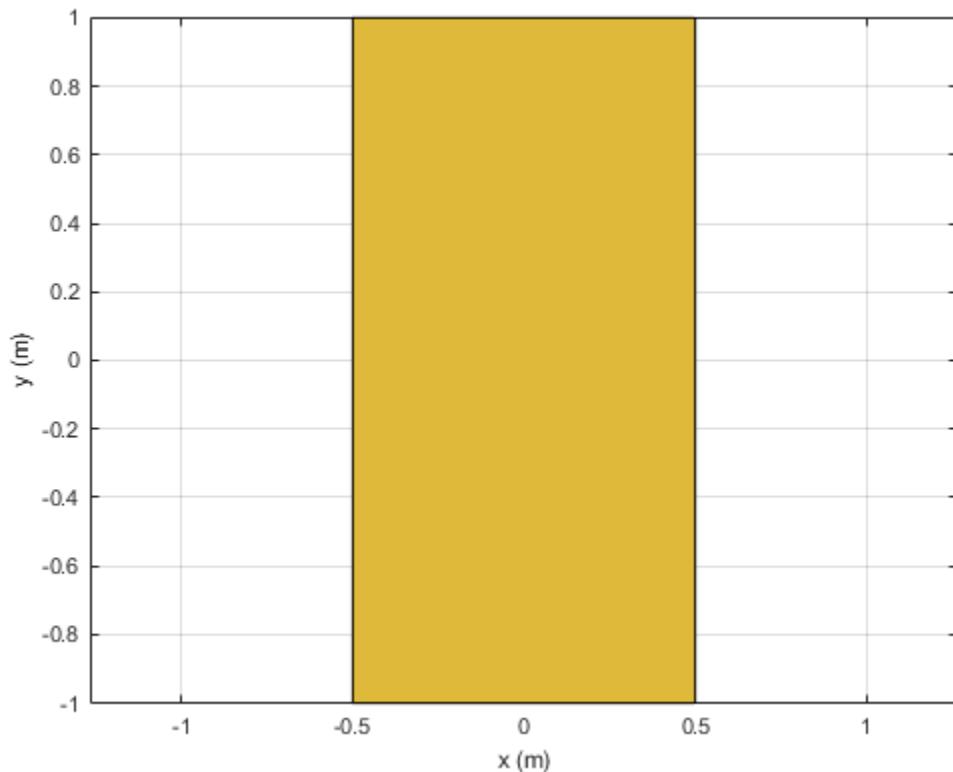

`c = scale(shape,scaling)` scales the shape by a constant factor

### Examples

#### Scale Rectangle Shape

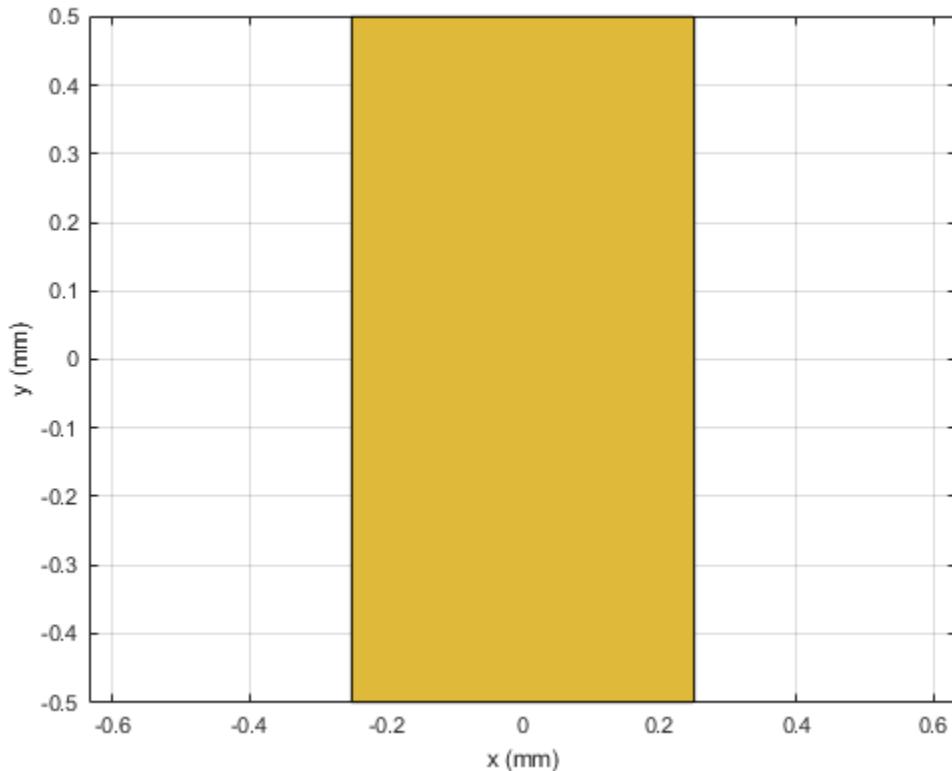

Create a rectangular shape.

```
r = antenna.Rectangle;
show(r)
axis equal
```

Shrink the rectangle by 50%.

```
scale(r,0.5);
```

## Input Arguments

**shape** — Shape created using custom elements and shape objects  
object handle

Shape created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `c = scale(rectangle1, 0.5)` where `rectangle1` is created using `antenna.Rectangle` object.

**scaling — Constant factor to change shape size**

scalar

Constant factor to change shape size, specified as a scalar.

Data Types: `double`

## See Also

## plus

Shape1 + Shape2

### Syntax

```
c = plus(shape1, shape2)
```

### Description

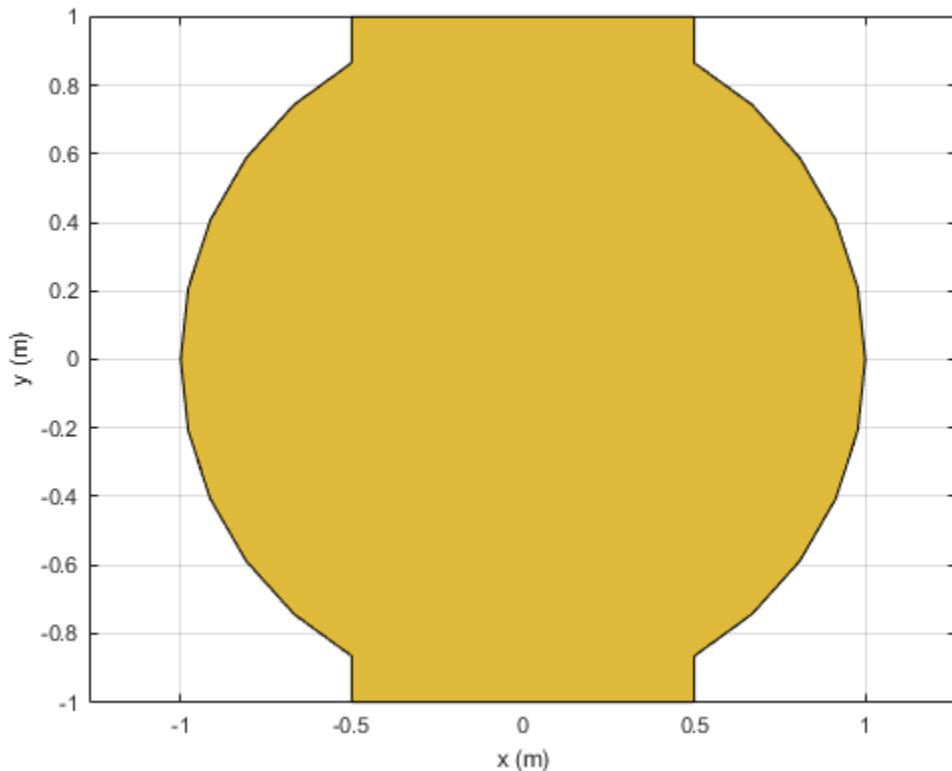

c = plus(shape1, shape2) calls the syntax shape1 + shape2 to unite two shapes.

### Examples

#### Unite Rectangle and Circle

Create a rectangular and circular shape and unite them.

```
r = antenna.Rectangle;  
c = antenna.Circle;  
r+c;
```

## Input Arguments

**shape1, shape2 — Shapes created using custom elements and shape objects**  
object handle

Shapes created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `rectangle1+rectangle2` where `rectangle1` and `rectangle2` are shapes created using `antenna.Rectangle` object.

## See Also

`add` | `area` | `intersect` | `mesh` | `plot` | `rotate` | `rotateX` | `rotateY` | `rotateZ` |  
`scale` | `show` | `subtract` | `translate`

**Introduced in R2017a**

## minus

Shape1 - Shape2

### Syntax

```
c = minus(shape1, shape2)
```

### Description

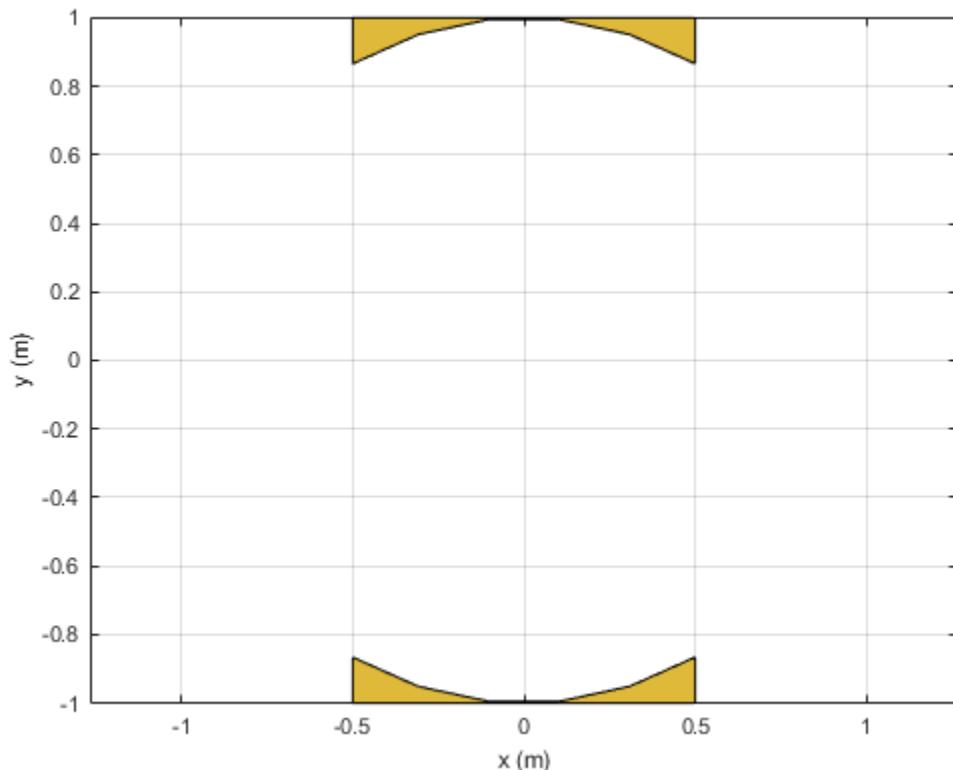

c = minus(shape1, shape2) calls the syntax shape1 - shape2 to subtract two shapes.

### Examples

#### Subtract Rectangle and Circle

Create a rectangular and circular shape and subtract them.

```
r = antenna.Rectangle;
c = antenna.Circle;
r-c;
```

## Input Arguments

**shape1, shape2 — Shapes created using custom elements and shape objects**  
object handle

Shapes created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `rectangle1-rectangle2` where `rectangle1` and `rectangle2` are shapes created using `antenna.Rectangle` object.

## See Also

add | area | intersect | mesh | plot | rotate | rotateX | rotateY | rotateZ |  
scale | show | subtract | translate

**Introduced in R2017a**

## and

Shape1 & Shape2

## Syntax

```
c = and(shape1,shape2)
```

## Description

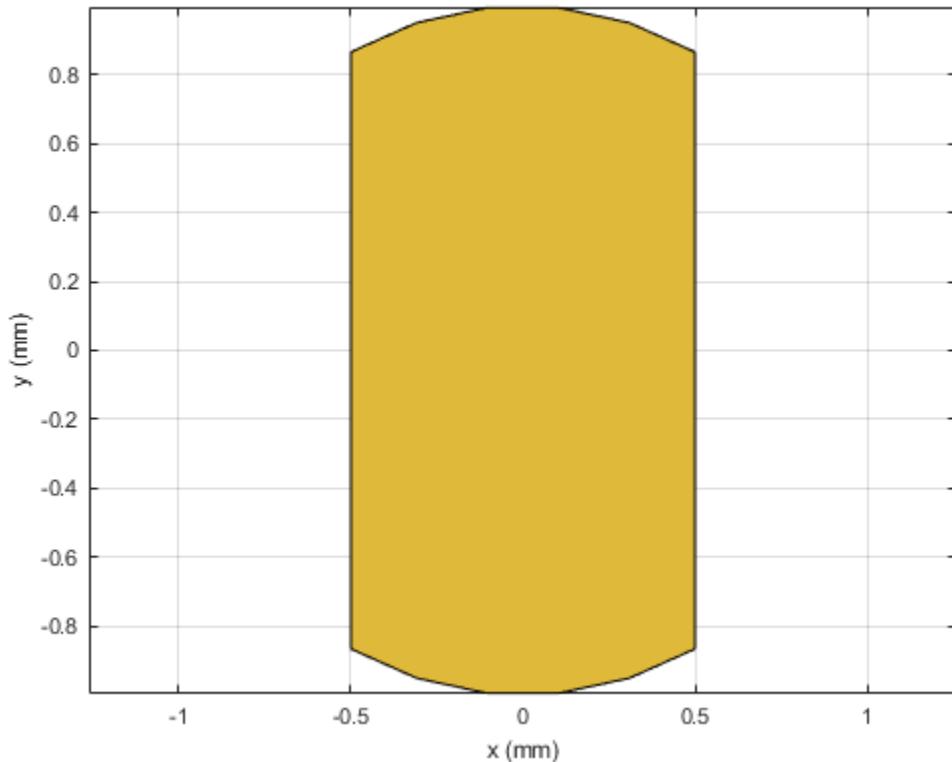

c = and(shape1,shape2) calls the syntax shape1 & shape2 to intersect two shapes.

## Examples

### Intersect Rectangle and Circle

Create a rectangular and circular shape and intersect them.

```
r = antenna.Rectangle;  
c = antenna.Circle;  
r&c;
```

## Input Arguments

**shape1, shape2 — Shapes created using custom elements and shape objects**  
object handle

Shapes created using custom elements and shape objects of Antenna Toolbox, specified as an object handle.

Example: `rectangle1&rectangle2` where `rectangle1` and `rectangle2` are shapes created using `antenna.Rectangle` object.

# add

Add additional data to existing Smith chart

## Syntax

```
add(plot,data)
add(plot,frequency,data)
```

## Description

`add(plot,data)` adds data to an existing Smith chart.

`add(plot,frequency,data)` adds data to an existing Smith chart based on multiple data sets containing frequencies corresponding to columns of data matrix.

## Examples

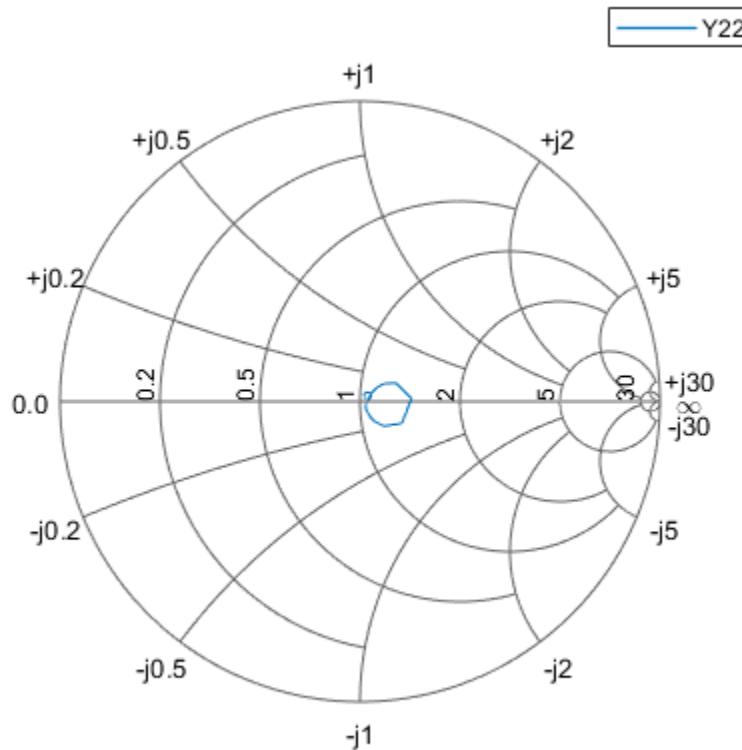

### Add Z-Parameter Data to Existing Smith Plot

Read S-parameter data.

```
amp = read(rfckt.amplifier,'default.s2p');
Sa = sparameters(amp);
```

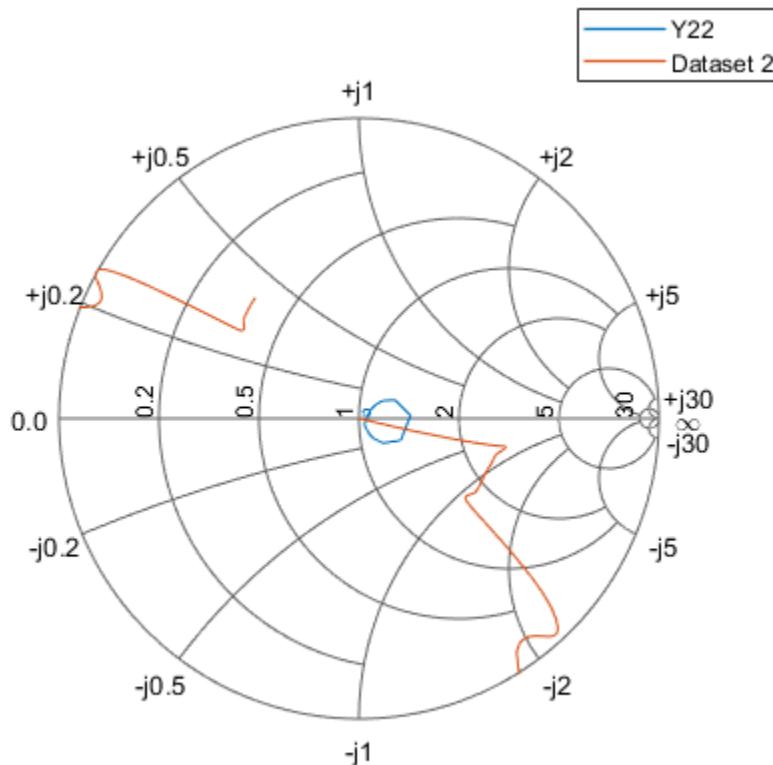

Convert to Y-parameter data and plot it on a smith plot.

```
Ya = yparameters(Sa);
smithplot(Ya,2,2)
```

Add Z-parameter data to the same plot.

```
Za = zparameters(Sa);
Z12 = rfparam(Za,1,2);
Freq = Za.Frequencies;
s = smithplot('gco');
add(s, Freq, Z12);
```

## Input Arguments

**plot — Smith chart**

function handle

Smith chart handle, specified as a function handle. If the handle of the Smith chart is not retained during creation, it is obtained by using the command `p = smithplot('gco')`.

Data Types: `double`

**data — Input data**

complex vector | complex matrix

Input data, specified as a complex vector or complex matrix.

For a matrix  $D$ , the columns of  $D$  are independent datasets. For  $N$ -by- $D$  arrays, dimensions 2 and greater are independent datasets.

Data Types: `double`

Complex Number Support: Yes

**frequency — Frequency data**

real vector

Frequency data, specified as a real vector.

Data Types: `double`

## See Also

`replace` | `smithplot`

**Introduced in R2017b**

# replace

Remove current data and add new data to Smith chart

## Syntax

```
replace(plot,data)
replace(plot,frequency,data)
```

## Description

`replace(plot,data)` removes all current data and adds new data to the Smith chart.

`replace(plot,frequency,data)` removes all current data and adds new data to the Smith chart based on multiple data sets containing frequencies corresponding to columns of the data matrix.

## Examples

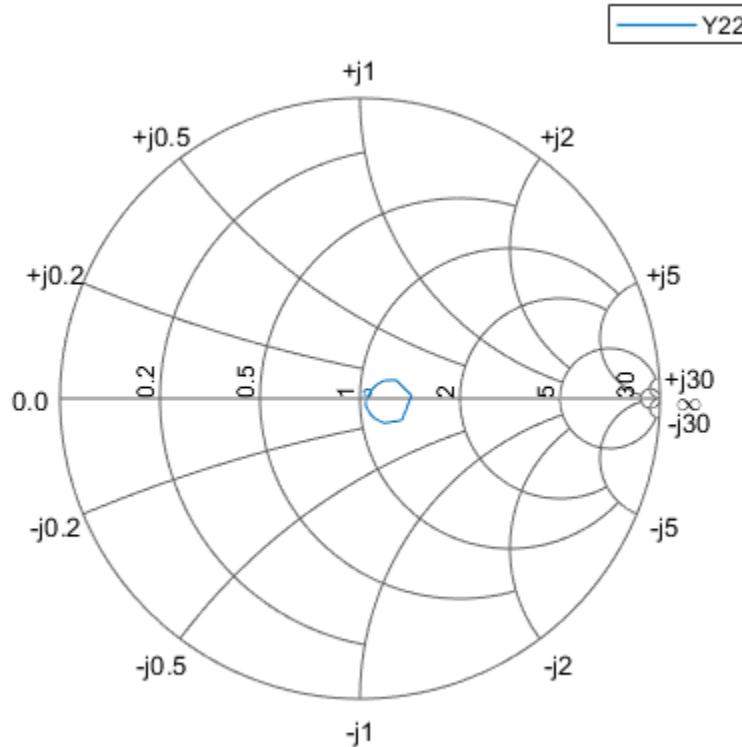

### Replace Z-Parameter Data On Existing Smith Plot

Read S-parameter data.

```
amp = read(rfckt.amplifier,'default.s2p');
Sa = sparameters(amp);
```

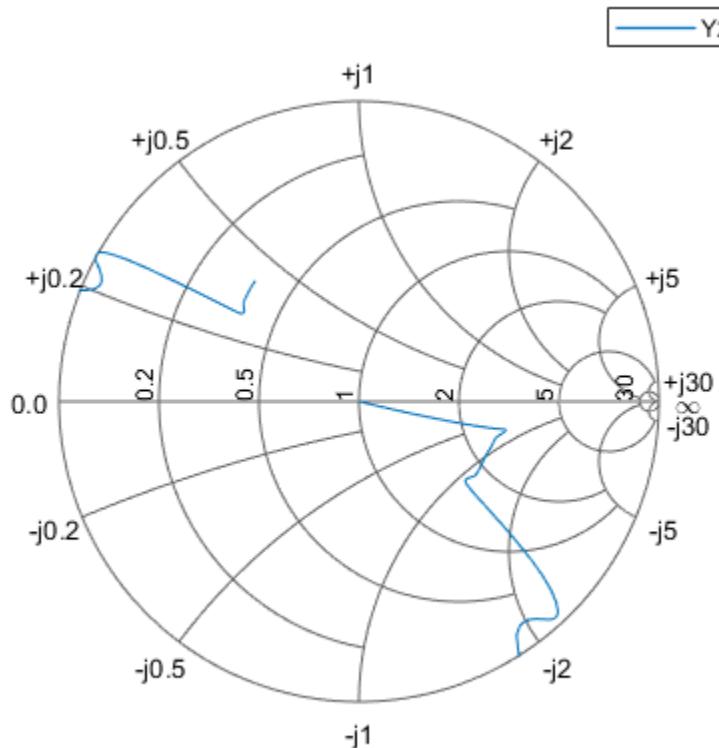

Convert to Y-parameter data and plot it on a smith plot.

```
Ya = yparameters(Sa);
smithplot(Ya,2,2)
```

Replace Y-parameter data to with Z-Parameter data.

```
Za = zparameters(Sa);
Z12 = rfparam(Za,1,2);
Freq = Za.Frequencies;
s = smithplot('gco');
replace(s, Freq, Z12);
```

## Input Arguments

**plot — Smith plot**

function handle

Smith chart handle, specified as a function handle. If the handle of the Smith chart is not retained during creation, it is obtained by using the command `p = smithplot('gco')`.

Data Types: `double`

**data — Input data**

complex vector | complex matrix

Input data, specified as a complex vector or complex matrix.

For a matrix  $D$ , the columns of  $D$  are independent datasets. For  $N$ -by- $D$  arrays, dimensions 2 and greater are independent datasets.

Data Types: `double`

Complex Number Support: Yes

**frequency — Frequency data**

real vector

Frequency data, specified as a real vector.

Data Types: `double`

## See Also

`add` | `smithplot`

**Introduced in R2017b**

# smithplot

Plot of measurement data on Smith chart

## Syntax

```
smithplot(data)
smithplot(frequency,data)
smithplot(ax, ____)
smithplot(hnet)
smithplot(hnet,i,j)
p = smithplot( ____ )
p = smithplot('gco')
smithplot( ____ ,Name,Value)
```

## Description

`smithplot(data)` creates a Smith chart based on input data values.

---

**Note** The Smith chart is commonly used to display the relationship between a reflection coefficient, typically given as  $S_{11}$  or  $S_{22}$ , and a normalized impedance

---

`smithplot(frequency,data)` creates a Smith chart based on frequency and data values.

`smithplot(ax, ____ )` creates a Smith chart with a user defined axes handle, `ax`, instead of the current axes handle. Axes handles are not supported for network parameter objects.

`smithplot(hnet)` plots all the network parameter objects in `hnet`.

`smithplot(hnet,i,j)` plots the  $(i,j)$ th parameter of a network parameter object, `hnet`.

`p = smithplot( ____ )` returns a Smith chart function handle so you can customize the plot and add measurements.

`p = smithplot('gco')` returns a Smith chart function handle of the current plot. This syntax is useful when the function handle, `p` was not returned or retained.

`smithplot(____,Name,Value)` creates a Smith chart, with additional properties specified by one or more name-value pair arguments. `Name` is the property name and `Value` is the corresponding property value. You can specify several name-value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`. Properties not specified retain their default values. To list all the property `Name,Value` pairs, use `details(p)`. You can use the properties to extract any data from the Smith chart. For example, `p = smithplot(data,'GridType','Z')` displays the impedance data grid on the Smith chart.

For a list of properties, see [SmithPlot Properties](#).

## Examples

### Smithplot of S-Parameters Data

Plot the Smith plot of s-parameters data file, `passive.s2p`.

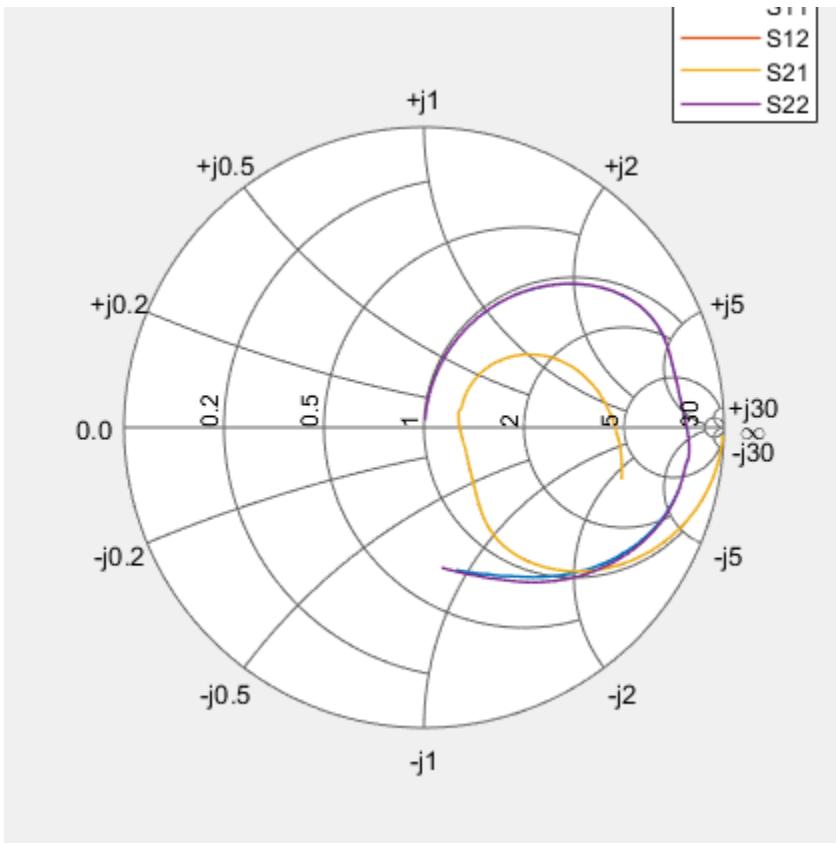

```
data = sparameters('passive.s2p')

data =
    sparameters: S-parameters object

    NumPorts: 2
    Frequencies: [202×1 double]
    Parameters: [2×2×202 double]
    Impedance: 50

    rfparam(obj,i,j) returns S-parameter Sij

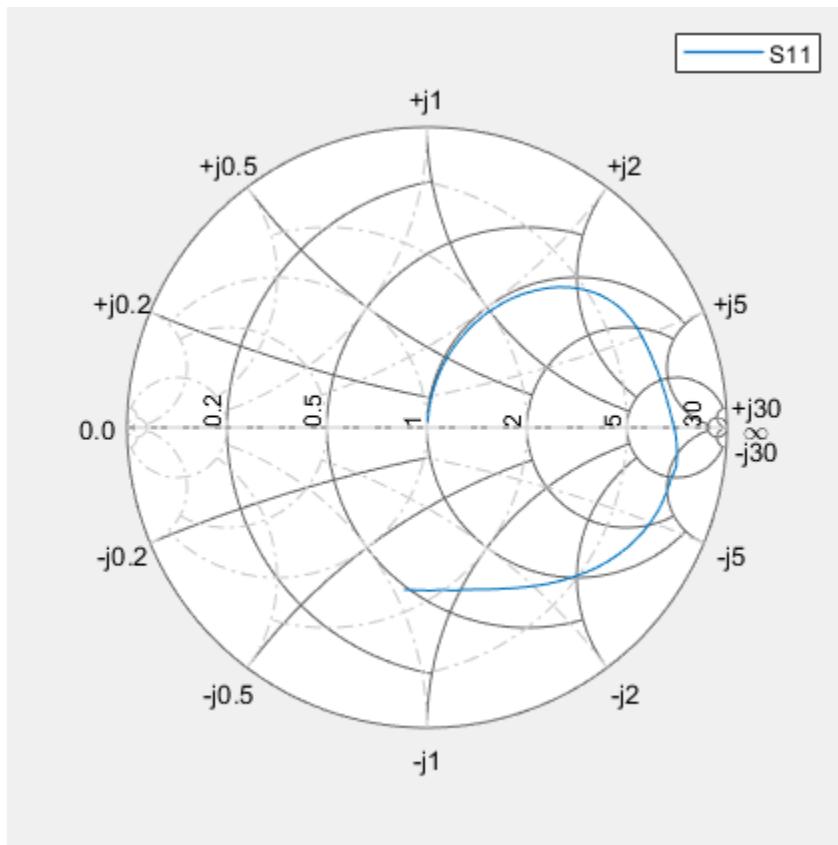

smithplot(data);
```

### Smith Plot of (i,j)th Parameter of S-Parameter Data

Plot the smith chart of  $S_{11}$  of s-parameter data file using an impedance of 75 ohms.

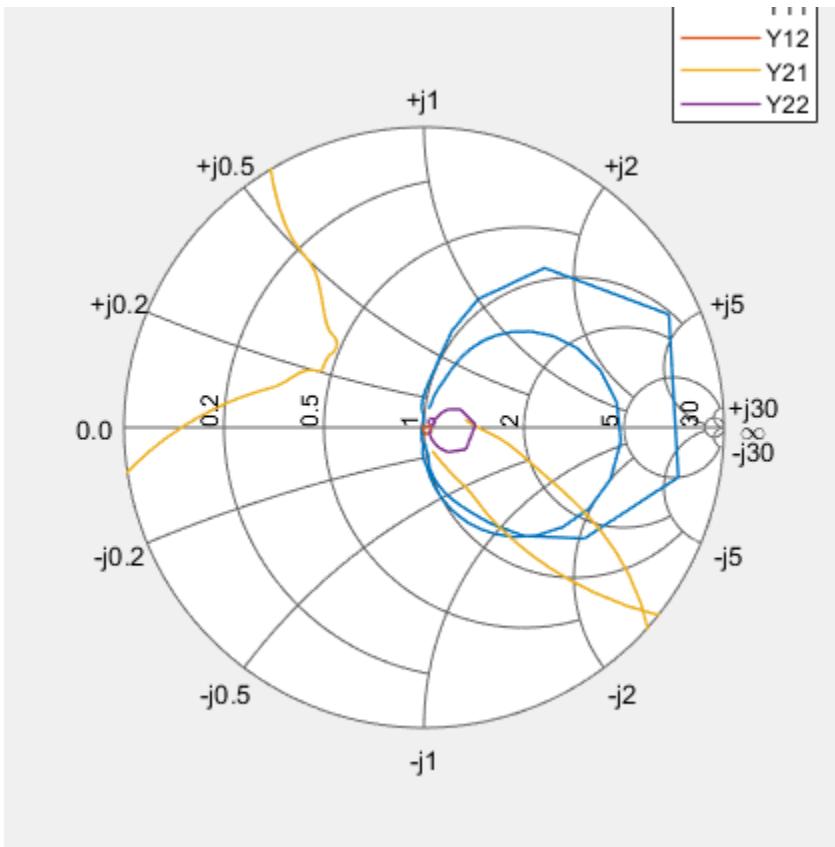

```
data = sparameters('passive.s2p') ;
s = sparameters(data, 75);
p = smithplot(s,1,1, 'GridType', 'ZY');
```

### Smith Plot of Y-Parameters Data

Plot the smith chart of Y-Parameters data.

```
amp = read(rfckt.amplifier, 'default.s2p');
Ya = yparameters(amp);
smithplot(Ya);
```

## Input Arguments

### **data — Input data**

complex vector | complex matrix

Input data, specified as a complex vector or complex matrix.

For a matrix  $D$ , the columns of  $D$  are independent datasets. For  $N$ -by- $D$  arrays, dimensions 2 and greater are independent datasets.

Data Types: `double`

Complex Number Support: Yes

**frequency — Frequency data**

real vector

Frequency data, specified as a real vector.

Data Types: `double`

**hnet — Network parameter object**

RF Toolbox network parameter object

Network parameter object, specified as an RF Toolbox network parameter object.

Data Types: `double`

## Output Arguments

**p — Smith chart function handle**

object

Smith chart function handle, returned as an object to customize the plot and add measurements using MATLAB commands.

# PolarPattern Properties

Control appearance and behavior of polar plot

## Description

Polar pattern properties control the appearance and behavior of the polar pattern object. By changing property values, you can modify certain aspects of the polar plot. To change the default properties use:

```
p = polarpattern(____,Name,Value)
```

To view all the properties of the polar pattern object use:

```
details(p)
```

You can also interact with the polar plot to change the properties. For more information, see “Interact with Polar Plot”.

## Properties

### Antenna Metrics

**'AntennaMetrics'** — Show antenna metric

0 (default) | 1

Show antenna metrics, specified as a comma-separated pair consisting of 'AntennaMetrics' and 0 or 1. Antenna metric displays main, back, and side lobes of antenna/array pattern passed as input.

Data Types: logical

**'Peaks'** — Maximum number of peaks to compute for each data set

positive integer | vector of integers

Maximum number of peaks to compute for each data set, specified as a comma-separated pair consisting of 'Peaks' and a positive scalar or vector of integers.

Data Types: double

### Angle Properties

#### 'AngleAtTop' — Angle at top of polar plot

90 (default) | scalar in degrees

Angle at the top of the polar plot, specified as a comma-separated pair consisting of 'AngleAtTop' and a scalar in degrees.

Data Types: double

#### 'AngleLim' — Visible polar angle span

[0 360] (default) | 1-by-2 vector of real values

Visible polar angle span, specified as a comma-separated pair consisting of 'AngleLim' and a 1-by-2 vector of real values.

Data Types: double

#### 'AngleLimVisible' — Show interactive angle limit cursors

0 (default) | 1

Show interactive angle limit cursors, specified as a comma-separated pair consisting of 'AngleLimVisible' and 0 or 1.

Data Types: logical

#### 'AngleDirection' — Direction of increasing angle

'ccw' (default) | 'cw'

Direction of increasing angle, specified as a comma-separated pair consisting of 'AngleDirection' and 'ccw' (counterclockwise) or 'cw' (clockwise).

Data Types: char

#### 'AngleResolution' — Number of degrees between radial lines

15 (default) | scalar in degrees

Number of degrees between radial lines depicting angles in the polar plot, specified as a comma-separated pair consisting of 'AngleResolution' and a scalar in degrees.

Data Types: double

**'AngleTickLabelRotation' — Rotate angle tick labels**

0 (default) | 1

Rotate angle tick labels, specified as a comma-separated pair consisting of 'AngleTickLabelRotation' and 0 or 1.

Data Types: logical

**'AngleTickLabelVisible' — Show angle tick labels**

1 (default) | 0

Show angle tick labels, specified as a comma-separated pair consisting of 'AngleTickLabelVisible' and 0 or 1.

Data Types: logical

**'AngleTickLabelFormat' — Format for angle tick labels**

360 (default) | 180

Format for angle tick labels, specified as a comma-separated pair consisting of 'AngleTickLabelFormat' and 360 degrees or 180 degrees.

Data Types: double

**'AngleFontSizeMultiplier' — Scale factor of angle tick font**

1 (default) | numeric value greater than zero

Scale factor of angle tick font, specified as a comma-separated pair consisting of 'AngleFontSizeMultiplier' and a numeric value greater than zero.

Data Types: double

**'Span' — Show angle span measurement**

0 (default) | 1

Show angle span measurement, specified as a comma-separated pair consisting of 'Span' and 0 or 1.

Data Types: logical

**'ZeroAngleLine' — Highlight radial line at zero degrees**

0 (default) | 1

Highlight radial line at zero degrees, specified as a comma-separated pair consisting of 'ZeroAngleLine' and 0 or 1.

Data Types: logical

**'DisconnectAngleGaps'** — Show gaps in line plots with nonuniform angle spacing  
1 (default) | 0

Show gaps in line plots with nonuniform angle spacing, specified as a comma-separated pair consisting of 'DisconnectAngleGaps' and 0 or 1.

Data Types: logical

### Magnitude Properties

**'MagnitudeAxisAngle'** — Angle of magnitude tick label radial line  
75 (default) | real scalar in degrees

Angle of magnitude tick label radial line, specified as a comma-separated pair consisting of 'MagnitudeAxisAngle' and real scalar in degrees.

Data Types: double

**'MagnitudeTick'** — Magnitude ticks  
[0 0.2 0.4 0.6 0.8] (default) | 1-by-N vector

Magnitude ticks, specified as a comma-separated pair consisting of 'MagnitudeTick' and a 1-by-N vector, where N is the number of magnitude ticks.

Data Types: double

**'MagnitudeTickLabelVisible'** — Show magnitude tick labels  
1 (default) | 0

Show magnitude tick labels, specified as a comma-separated pair consisting of 'MagnitudeTickLabelVisible' and 0 or 1.

Data Types: logical

**'MagnitudeLim'** — Minimum and maximum magnitude limits  
[0 1] (default) | two-element vector of real values

Minimum and maximum magnitude limits, specified as a comma-separated pair consisting of 'MagnitudeLim' and a two-element vector of real values.

Data Types: double

**'MagnitudeLimMode'** — Determine magnitude dynamic range  
'auto' (default) | 'manual'

Determine magnitude dynamic range, specified as a comma-separated pair consisting of 'MagnitudeLimMode' and 'auto' or 'manual'.

Data Types: char

**'MagnitudeAxisAngleMode'** — Determine angle for magnitude tick labels  
'auto' (default) | 'manual'

Determine angle for magnitude tick labels, specified as a comma-separated pair consisting of 'MagnitudeAxisAngleMode' and 'auto' or 'manual'.

Data Types: char

**'MagnitudeTickMode'** — Determine magnitude tick locations  
'auto' (default) | 'manual'

Determine magnitude tick locations, specified as a comma-separated pair consisting of 'MagnitudeTickMode' and 'auto' or 'manual'.

Data Types: char

**'MagnitudeUnits'** — Magnitude units  
'dB' | 'dBLoss'

Magnitude units, specified as a comma-separated pair consisting of 'MagnitudeUnits' and 'db' or 'dBLoss'.

Data Types: char

**'MagnitudeFontSizeMultiplier'** — Scale factor of magnitude tick font  
0.9000 (default) | numeric value greater than zero

Scale factor of magnitude tick font, specified as a comma-separated pair consisting of 'MagnitudeFontSizeMultiplier' and a numeric value greater than zero.

Data Types: double

## Miscellaneous Properties

### 'NormalizeData' — Normalize each data trace to maximum value

0 (default) | 1

Normalize each data trace to maximum value, specified as a comma-separated pair consisting of 'NormalizeData' and 0 or 1.

Data Types: logical

### 'ConnectEndpoints' — Connect first and last angles

0 (default) | 1

Connect first and last angles, specified as a comma-separated pair consisting of 'ConnectEndpoints' and 0 or 1.

Data Types: logical

### 'Style' — Style of polar plot display

'line' (default) | 'filled'

Style of polar plot display, specified as a comma-separated pair consisting of 'Style' and 'line' or 'filled'.

Data Types: char

### 'TemporaryCursor' — Create temporary cursor

0 (default) | 1

Create a temporary cursor, specified as a comma-separated pair consisting of 'TemporaryCursor' and 0 or 1.

Data Types: logical

### 'ToolTips' — Show tool tips

1 (default) | 0

Show tool tips when you hover over a polar plot element, specified as a comma-separated pair consisting of 'ToolTips' and 0 or 1.

Data Types: logical

### 'ClipData' — Clip data to outer circle

0 (default) | 1

Clip data to outer circle, specified as a comma-separated pair consisting of 'ClipData' and 0 or 1.

Data Types: logical

**'NextPlot' — Directive on how to add next plot**

'replace' (default) | 'new' | 'add'

Directive on how to add next plot, specified as a comma-separated pair consisting of 'NextPlot' and one of the values in the table:

Property Value	Effect
'new'	Creates a figure and uses it as the current figure.
'add'	Adds new graphics objects without clearing or resetting the current figure.
'replace'	Removes all axes objects and resets figure properties to their defaults before adding new graphics objects.

**Legend and Title Properties**

**'LegendLabels' — Data tables for legend annotation**

character vector | cell array of character vectors

Data tables for legend annotation, specified as a comma-separated pair consisting of 'LegendLabels' and a character vector or cell array of character vectors.

Data Types: char

**'LegendVisible' — Show legend label**

0 (default) | 1

Show legend label, specified as a comma-separated pair consisting of 'LegendVisible' and 0 or 1.

Data Types: logical

**'TitleTop' — Title to display above the polar plot**

character vector

Title to display above the polar plot, specified as a comma-separated pair consisting of 'TitleTop' and a character vector.

Data Types: char

**'TitleBottom'** — Title to display below the polar plot  
character vector

Title to display below the polar plot, specified as a comma-separated pair consisting of 'TitleBottom' and a character vector.

Data Types: char

**'TitleTopOffset'** — Offset between top title and angle ticks  
0.1500 (default) | scalar

Offset between top title and angle ticks, specified as a comma-separated pair consisting of 'TitleTopOffset' and a scalar. The value must be in the range [-0.5,0.5].

Data Types: double

**'TitleBottomOffset'** — Offset between bottom title and angle ticks  
0.1500 (default) | scalar

Offset between bottom title and angle ticks, specified as a comma-separated pair consisting of 'TitleBottomOffset' and a scalar. The value must be in the range [-0.5,0.5].

Data Types: double

**'TitleTopFontSizeMultiplier'** — Scale factor of top title font  
1.1000 (default) | numeric value greater than zero

Scale factor of top title font, specified as a comma-separated pair consisting of 'TitleTopFontSizeMultiplier' and a numeric value greater than zero.

Data Types: double

**'TitleBottomFontSizeMultiplier'** — Scale factor of bottom title font  
0.9000 (default) | numeric value greater than zero

Scale factor of bottom title font, specified as a comma-separated pair consisting of 'TitleBottomFontSizeMultiplier' and a numeric value greater than zero.

Data Types: double

**'TitleTopFontWeight'** — Thickness of top title font

'bold' (default) | 'normal'

Thickness of top title font, specified as a comma-separated pair consisting of 'TitleTopFontWeight' and 'bold' or 'normal'.

Data Types: char

**'TitleBottomFontWeight'** — Thickness of bottom title font

'normal' (default) | 'bold'

Thickness of bottom title font, specified as a comma-separated pair consisting of 'TitleBottomFontWeight' and 'bold' or 'normal'.

Data Types: char

**'TitleTopTextInterpreter'** — Interpretation of top title characters

'none' (default) | 'tex' | 'latex'

Interpretation of top title characters, specified as a comma-separated pair consisting of 'TitleTopTextInterpreter' and:

- 'tex' — Interpret using a subset of TeX markup
- 'latex' — Interpret using LaTeX markup
- 'none' — Display literal characters

### TeX Markup

By default, MATLAB supports a subset of TeX markup. Use TeX markup to add superscripts and subscripts, modify the text type and color, and include special characters in the text.

This table lists the supported modifiers when the `TickLabelInterpreter` property is set to 'tex', which is the default value. Modifiers remain in effect until the end of the text, except for superscripts and subscripts which only modify the next character or the text within the curly braces {}.

Modifier	Description	Example
<code>^{ }</code>	Superscript	<code>'text^{superscript}'</code>
<code>_{ }</code>	Subscript	<code>'text_{subscript}'</code>

Modifier	Description	Example
\bf	Bold font	'\bf text'
\it	Italic font	'\it text'
\sl	Oblique font (rarely available)	'\sl text'
\rm	Normal font	'\rm text'
\fontname{specifier}	Set specifier as the name of a font family to change the font style. You can use this with other modifiers.	'\fontname{Courier} text'
\fontsize{specifier}	Set specifier as a scalar numeric value to change the font size.	'\fontsize{15} text'
\color{specifier}	Set specifier as one of these colors: red, green, yellow, magenta, blue, black, white, gray, darkGreen, orange, or lightBlue.	'\color{magenta} text'
\color[rgb]{specifier}	Set specifier as a three-element RGB triplet to change the font color.	'\color[rgb]{0,0.5,0.5} text'

### LaTeX Markup

To use LaTeX markup, set the `TickLabelInterpreter` property to 'latex'. The displayed text uses the default LaTeX font style. The `FontName`, `FontWeight`, and `FontAngle` properties do not have an effect. To change the font style, use LaTeX markup within the text.

The maximum size of the text that you can use with the LaTeX interpreter is 1200 characters. For multiline text, the maximum size reduces by about 10 characters per line.

For more information about the LaTeX system, see The LaTeX Project website at <http://www.latex-project.org/>.

Data Types: `char`

### 'TitleBottomTextInterpreter' — Interpretation of bottom title characters

'none' (default) | 'tex' | 'latex'

Interpretation of bottom title characters, specified as a comma-separated pair consisting of 'TitleBottomTextInterpreter' and:

- 'tex' — Interpret using a subset of TeX markup
- 'latex' — Interpret using LaTeX markup
- 'none' — Display literal characters

### TeX Markup

By default, MATLAB supports a subset of TeX markup. Use TeX markup to add superscripts and subscripts, modify the text type and color, and include special characters in the text.

This table lists the supported modifiers when the `TickLabelInterpreter` property is set to 'tex', which is the default value. Modifiers remain in effect until the end of the text, except for superscripts and subscripts which only modify the next character or the text within the curly braces {}.

Modifier	Description	Example
<code>^{ }</code>	Superscript	<code>'text^{superscript}'</code>
<code>_{ }</code>	Subscript	<code>'text_{subscript}'</code>
<code>\bf</code>	Bold font	<code>'\bf text'</code>
<code>\it</code>	Italic font	<code>'\it text'</code>
<code>\sl</code>	Oblique font (rarely available)	<code>'\sl text'</code>
<code>\rm</code>	Normal font	<code>'\rm text'</code>
<code>\fontname{specifier}</code>	Set specifier as the name of a font family to change the font style. You can use this with other modifiers.	<code>'\fontname{Courier} text'</code>
<code>\fontsize{specifier}</code>	Set specifier as a scalar numeric value to change the font size.	<code>'\fontsize{15} text'</code>

Modifier	Description	Example
<code>\color{specifier}</code>	Set specifier as one of these colors: red, green, yellow, magenta, blue, black, white, gray, darkGreen, orange, or lightBlue.	'\color{magenta} text'
<code>\color[rgb]{specifier}</code>	Set specifier as a three-element RGB triplet to change the font color.	'\color[rgb]{0,0.5,0.5} text'

### LaTeX Markup

To use LaTeX markup, set the `TickLabelInterpreter` property to 'latex'. The displayed text uses the default LaTeX font style. The `FontName`, `FontSize`, and `FontAngle` properties do not have an effect. To change the font style, use LaTeX markup within the text.

The maximum size of the text that you can use with the LaTeX interpreter is 1200 characters. For multiline text, the maximum size reduces by about 10 characters per line.

For more information about the LaTeX system, see The LaTeX Project website at <http://www.latex-project.org/>.

Data Types: `char`

### Grid Properties

#### `'GridOverData'` — Draw grid over data plots

0 (default) | 1

Draw grid over data plots, specified as a comma-separated pair consisting of '`GridOverData`' and 0 or 1.

Data Types: `logical`

#### `'DrawGridToOrigin'` — Draw radial lines within innermost circle

0 (default) | 1

Draw radial lines within innermost circle of the polar plot, specified as a comma-separated pair consisting of '`DrawGridToOrigin`' and 0 or 1.

Data Types: logical

**'GridAutoRefinement' — Increase angle resolution**

0 (default) | 1

Increase angle resolution in the polar plot, specified as a comma-separated pair consisting of 'GridAutoRefinement' and 0 or 1. This property increases angle resolution by doubling the number of radial lines outside each magnitude.

Data Types: logical

**'GridWidth' — Width of grid lines**

0.5000 (default) | positive scalar

Width of grid lines, specified as a comma-separated pair consisting of 'GridWidth' and a positive scalar.

Data Types: double

**'GridVisible' — Show grid lines**

1 (default) | 0

Show grid lines, including magnitude circles and angle radii, specified as a comma-separated pair consisting of 'GridVisible' and 0 or 1.

Data Types: logical

**'GridForegroundColor' — Color of foreground grid lines**

[0.8000 0.8000 0.8000] (default) | 'none' | character vector of color names

Color of foreground grid lines, specified as a comma-separated pair consisting of 'GridForegroundColor' and an RGB triplet, character vector of color names, or 'none'.

An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.4 0.6 0.7]. Alternatively, you can specify some common colors by name. This table lists the long and short color name options and the equivalent RGB triplet values.

Option	Description	Equivalent RGB Triplet
'red' or 'r'	Red	[1 0 0]

Option	Description	Equivalent RGB Triplet
'green' or 'g'	Green	[0 1 0]
'blue' or 'b'	Blue	[0 0 1]
'yellow' or 'y'	Yellow	[1 1 0]
'magenta' or 'm'	Magenta	[1 0 1]
'cyan' or 'c'	Cyan	[0 1 1]
'white' or 'w'	White	[1 1 1]
'black' or 'k'	Black	[0 0 0]

Data Types: double | char

**'GridBackGroundColor' — Color of background grid lines**

'w' (default) | character vector of color names | 'none'

Color of background grid lines, specified as a comma-separated pair consisting of 'GridBackGroundColor' and an RGB triplet, character vector of color names, or 'none'.

An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.4 0.6 0.7]. Alternatively, you can specify some common colors by name. This table lists the long and short color name options and the equivalent RGB triplet values.

Option	Description	Equivalent RGB Triplet
'red' or 'r'	Red	[1 0 0]
'green' or 'g'	Green	[0 1 0]
'blue' or 'b'	Blue	[0 0 1]
'yellow' or 'y'	Yellow	[1 1 0]
'magenta' or 'm'	Magenta	[1 0 1]
'cyan' or 'c'	Cyan	[0 1 1]
'white' or 'w'	White	[1 1 1]
'black' or 'k'	Black	[0 0 0]

Data Types: double | char

### Marker, Color, Line, and Font Properties

#### 'Marker' — Marker symbol

'none' (default) | character vector of symbols

Marker symbol, specified as a comma-separated pair consisting of 'Marker' and either 'none' or one of the symbols in this table. By default, a line does not have markers. Add markers at selected points along the line by specifying a marker.

Value	Description
'o'	Circle
'+'	Plus sign
'*'	Asterisk
'. '	Point
'x'	Cross
'square' or 's'	Square
'diamond' or 'd'	Diamond
'^'	Upward-pointing triangle
'v'	Downward-pointing triangle
Right-pointing triangle	
'<'	Left-pointing triangle
'pentagram' or 'p'	Five-pointed star (pentagram)
'hexagram' or 'h'	Six-pointed star (hexagram)
'none'	No markers

#### 'MarkerSize' — Marker size

6 (default) | positive value

Marker size, specified as a comma-separated pair consisting of 'MarkerSize' and a positive value in point units.

Data Types: double

#### 'ColorOrder' — Colors to use for multiline plots

seven predefined colors (default) | three-column matrix of RGB triplets

Colors to use for multiline plots, specified as a comma-separated pair consisting of 'ColorOrder' and a three-column matrix of RGB triplets. Each row of the matrix defines one color in the color order.

Data Types: double

**'ColorOrderIndex'** — Next color to use in color order

1 (default) | positive integer

Next color to use in color order, specified as a comma-separated pair consisting of 'ColorOrderIndex' and a positive integer. New plots added to the axes use colors based on the current value of the color order index.

Data Types: double

**'EdgeColor'** — Color of data lines

'k' (default) | RGB triplet vector

Color of data lines, specified as a comma-separated pair consisting of 'EdgeColor' and a character vector of color names or RGB triplet vector.

An RGB triplet is a three-element row vector whose elements specify the intensities of the red, green, and blue components of the color. The intensities must be in the range [0,1]; for example, [0.4 0.6 0.7]. Alternatively, you can specify some common colors by name. This table lists the long and short color name options and the equivalent RGB triplet values.

Option	Description	Equivalent RGB Triplet
'red' or 'r'	Red	[1 0 0]
'green' or 'g'	Green	[0 1 0]
'blue' or 'b'	Blue	[0 0 1]
'yellow' or 'y'	Yellow	[1 1 0]
'magenta' or 'm'	Magenta	[1 0 1]
'cyan' or 'c'	Cyan	[0 1 1]
'white' or 'w'	White	[1 1 1]
'black' or 'k'	Black	[0 0 0]

Data Types: double | char

**'LineStyle' — Line style of the plot**

'-' (default) | '--' | ':' | '-.' | 'none'

Line style of the plot, specified as a comma-separated pair consisting of 'LineStyle' and one of the symbols in the table:

Symbol	Line Style	Resulting Line
' - '	Solid line	
' -- '	Dashed line	
' : '	Dotted line	
' - . '	Dash-dotted line	
'none'	No line	No line

**'LineWidth' — Line width of plot**

1 (default) | positive scalar

Line width of the plot, specified as a comma-separated pair consisting of 'LineWidth' and a positive scalar.

**'FontSize' — Font size of text in plot**

10 (default) | positive scalar

Font size of text in the plot, specified as a comma-separated pair consisting of 'FontSize' and a positive scalar.

**'FontSizeAutoMode' — Set font size**

'auto' (default) | 'manual'

Set font size, specified as a comma-separated pair consisting of 'FontSizeAutoMode' and 'auto' or 'manual'.

Data Types: char
