Getting Started

- “MATLAB Compiler Product Description” on page 1-2
- “Appropriate Tasks for MATLAB Compiler Products” on page 1-3
- “Create Standalone Application from MATLAB” on page 1-6

MATLAB Compiler Product Description

Build standalone applications from MATLAB programs

MATLAB Compiler lets you share MATLAB programs as standalone applications. You can also create Microsoft® Excel® add-ins and integrate them into Excel spreadsheets on a Windows® platform.

When used along with MATLAB Compiler SDK™, you can package MATLAB programs into software components for integration with other programming languages. Large-scale deployment to enterprise systems is supported through MATLAB Production Server™.

All applications created with MATLAB Compiler use the MATLAB Runtime, which enables royalty-free deployment to users who do not need MATLAB. You can package the MATLAB Runtime with the application, or have your users download it during installation.

Learn more about MATLAB Compiler support for MATLAB and toolboxes.

Key Features

- Packaging of your MATLAB programs as standalone applications
- Creation of Microsoft Excel add-ins for integration with Excel spreadsheets
- Royalty-free distribution of applications to users who do not need MATLAB
- Encryption of MATLAB code to protect your intellectual property
- Deployment of MATLAB code against Hadoop® and Spark™

Appropriate Tasks for MATLAB Compiler Products

MATLAB Compiler generates standalone applications and Excel add-ins. MATLAB Compiler SDK generates C/C++ shared libraries, deployable archives for use with MATLAB Production Server, Java® packages, .NET assemblies, and COM components.

While MATLAB Compiler and MATLAB Compiler SDK let you run your MATLAB application outside the MATLAB environment, it is not appropriate for all external tasks you may want to perform. Some tasks require other products or MATLAB external interfaces. Use the following table to determine if MATLAB Compiler or MATLAB Compiler SDK is appropriate to your needs.

MATLAB Compiler Task Matrix

Task	MATLAB Compiler and MATLAB Compiler SDK	MATLAB Coder™	Simulink®	HDL Coder™	MATLAB External Interfaces
Package MATLAB applications for deployment to users who do not have MATLAB	■				
Package MATLAB applications for deployment to MATLAB Production Server	■				
Build non-MATLAB applications that include MATLAB functions	■				
Generate readable and portable C/C++ code from MATLAB code		■			
Generate MEX functions from MATLAB code for code verification and acceleration.		■			
Integrate MATLAB code into Simulink			■		
Generate hardware description language (HDL) from MATLAB code				■	
Integrate custom C code into MATLAB with MEX files					■

Task	MATLAB Compiler and MATLAB Compiler SDK	MATLAB Coder™	Simulink®	HDL Coder™	MATLAB External Interfaces
Call MATLAB from C and Fortran programs					■

For information on MATLAB Coder, see “MATLAB Coder”.

For information on Simulink, see “Simulink”.

For information on HDL Coder, see “HDL Coder”.

For information on MATLAB external interfaces, see “MATLAB API for Other Languages” (MATLAB).

Create Standalone Application from MATLAB

In this section...

“Create Standalone Application from MATLAB code” on page 1-6

“Install MATLAB Generated Standalone Application” on page 1-9

Create Standalone Application from MATLAB code

This example shows how to generate a standalone application from MATLAB. You package a pre-written function that prints a magic square to a computer’s command console. The MATLAB Compiler produces an installer that installs the standalone application and all of the required dependencies on a target system. The target system does not require a licensed copy of MATLAB.

- 1 In MATLAB, examine the MATLAB code that you want deployed as a standalone application.

- a Open `magicsquare.m`.

```
function magicsquare(n)
if ischar(n)
    n = str2num(n);
end
disp(magic(n))
```

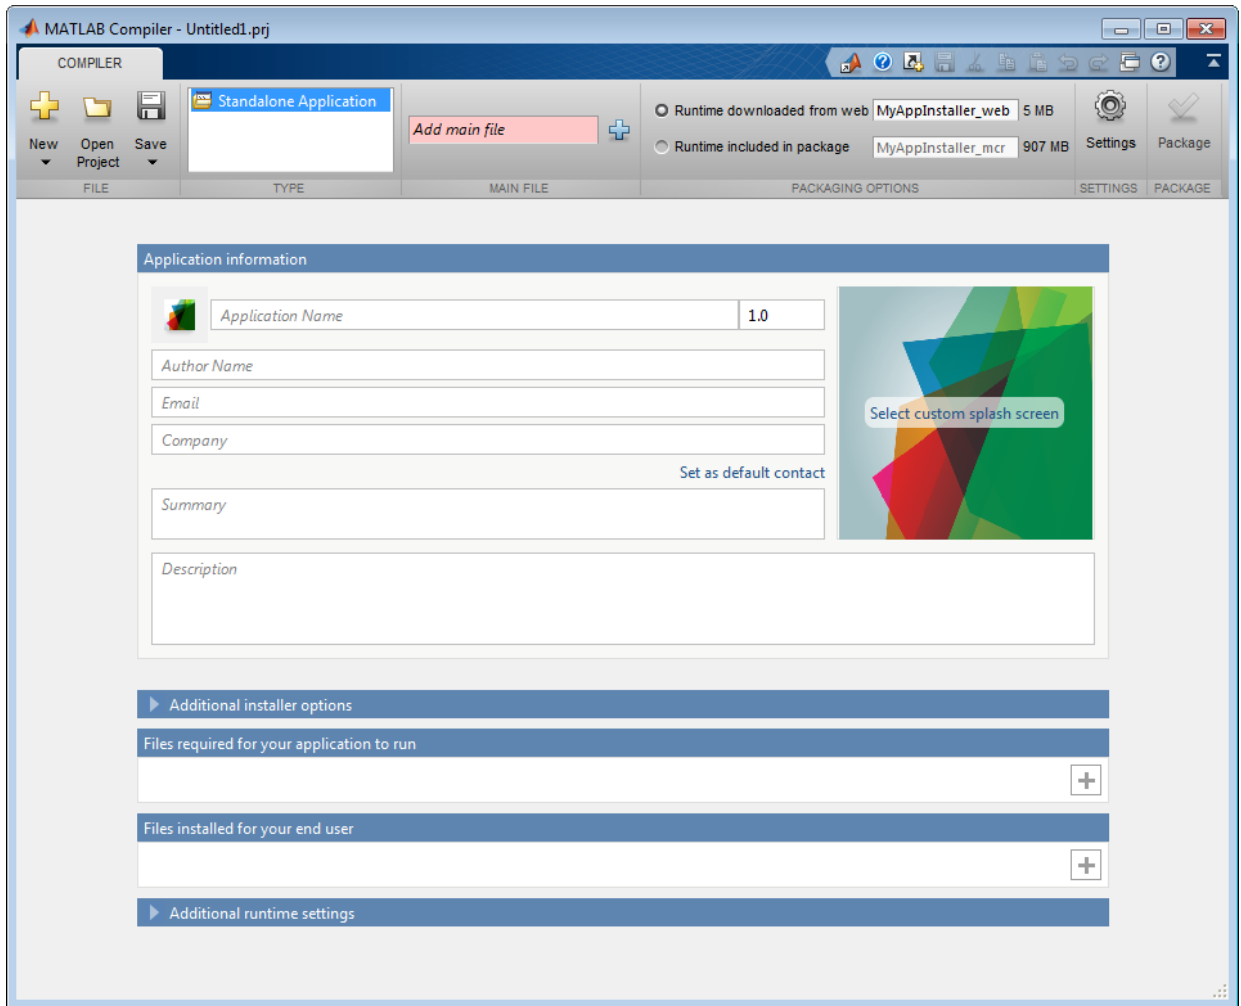

- b At the MATLAB command prompt, enter `magicsquare(5)`.

The output appears as follows:

```
17    24     1     8    15
23     5     7    14    16
 4     6    13    20    22
10    12    19    21     3
11    18    25     2     9
```

- 2 Open the **Application Compiler**.

- a On the toolstrip select the **Apps** tab.
 - b Click the arrow at the far right of the tab to open the apps gallery.
 - c Click **Application Compiler** to open the **MATLAB Compiler** project window.

- 3 Specify the main file of the MATLAB application you want to deploy.
 - a In the **Main File** section of the toolbar, click the plus button.

Note If the **Main File** section of the toolbar is collapsed, you can expand it by clicking the down arrow.

- b In the file explorer that opens, locate and select the `magicsquare.m` file.

`magicsquare.m` is located in `matlabroot\extern\examples\compiler`.

- c Click **Open** to select the file and close the file explorer.

magicsquare.m is added to the list of main files and the plus button will be replaced by a minus button.

- 4 In the **Packaging Options** section of the toolstrip, verify that the **Runtime downloaded from web** check box is selected.

Note If the **Packaging Options** section of the toolstrip is collapsed, you can expand it by clicking the down arrow.

This option creates an application installer that automatically downloads the MATLAB Runtime and installs it along with the deployed MATLAB application.

- 5 Explore the main body of the **MATLAB Compiler** project window.

The project window is divided into the following areas:

- **Application Information** — Editable information about the deployed application. This information is used by the generated installer to populate the installed application's metadata. See “Customize the Installer” on page 4-2.
- **Additional Installer Options** — The default installation path for the generated installer. See “Customize the Installer” on page 4-2.
- **Files required for your application** — Additional files required by the generated application. These files will be included in the generated application installer. See “Manage Required Files in Compiler Project” on page 4-6.
- **Files installed for your end user** — Files that are installed with your application. These files include:
 - Generated `readme.txt`
 - Generated executable for the target platform

See “Specify Files to Install with Application” on page 4-8

- **Additional Runtime Settings** — Platform specific options for controlling the generated executable. See “Customize Application Runtime Settings” on page 3-7.
- 6 Click **Package**.

The Package window opens while the application is being generated.

- 7 Select the **Open output folder when process completes** check box.

When the deployment process is complete a file explorer opens and displays the generated output.

It should contain:

- `for_redistribution` folder contains the file that installs the application and the MATLAB Runtime.
- `for_testing` folder contains all the artifacts created by `mcc` like binaries and jar, header, and source files for a specific target. Use these files to test the installation.
- `for_redistribution_files_only` folder contains the files required for redistribute of the application. Distribute these files to users that have MATLAB or MATLAB Runtime installed on their machines.
- `PackagingLog.txt` is a log file generated by the compiler.

- 8 Click **Close** on the Package window.

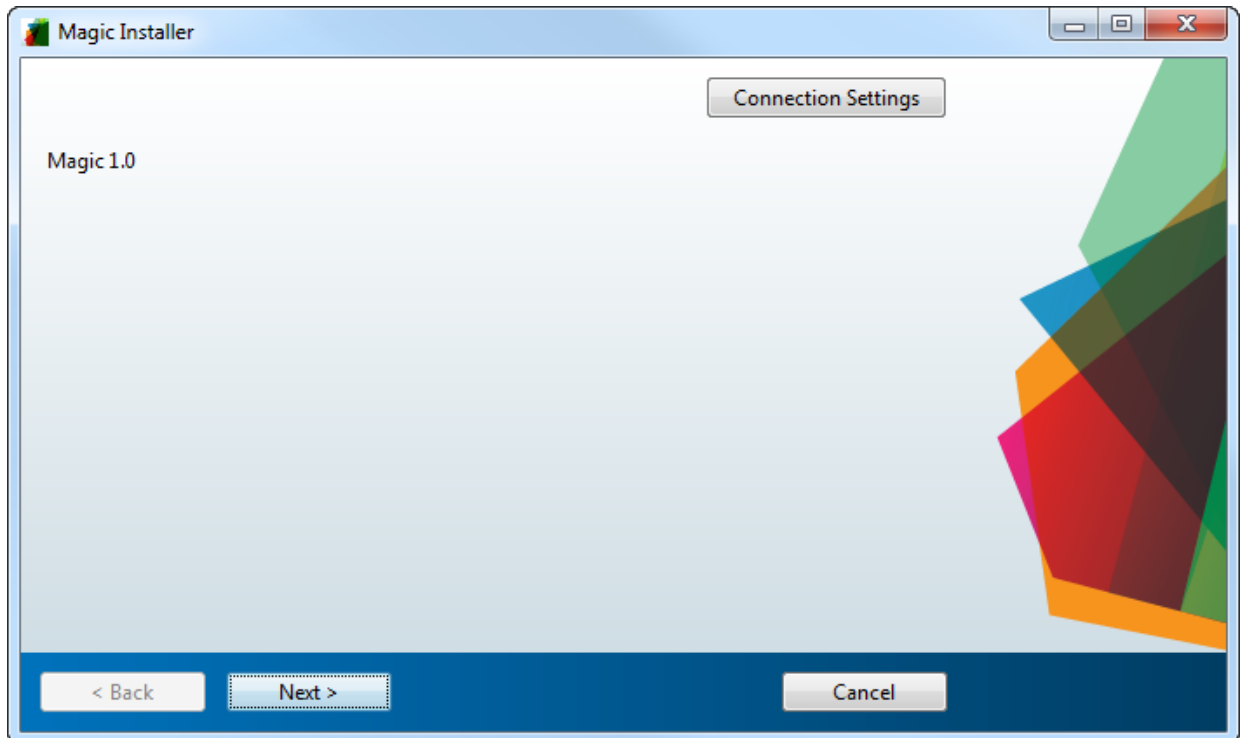

Install MATLAB Generated Standalone Application

This example shows how to install the standalone application you created in “Create Standalone Application from MATLAB code” on page 1-6.

- 1 Locate the `MyAppInstaller_web` executable in the `for_redistribution` folder created by the MATLAB Compiler.

Note The file extension varies depending on the platform on which the installer was generated.

- 2 Double click the installer to run it.

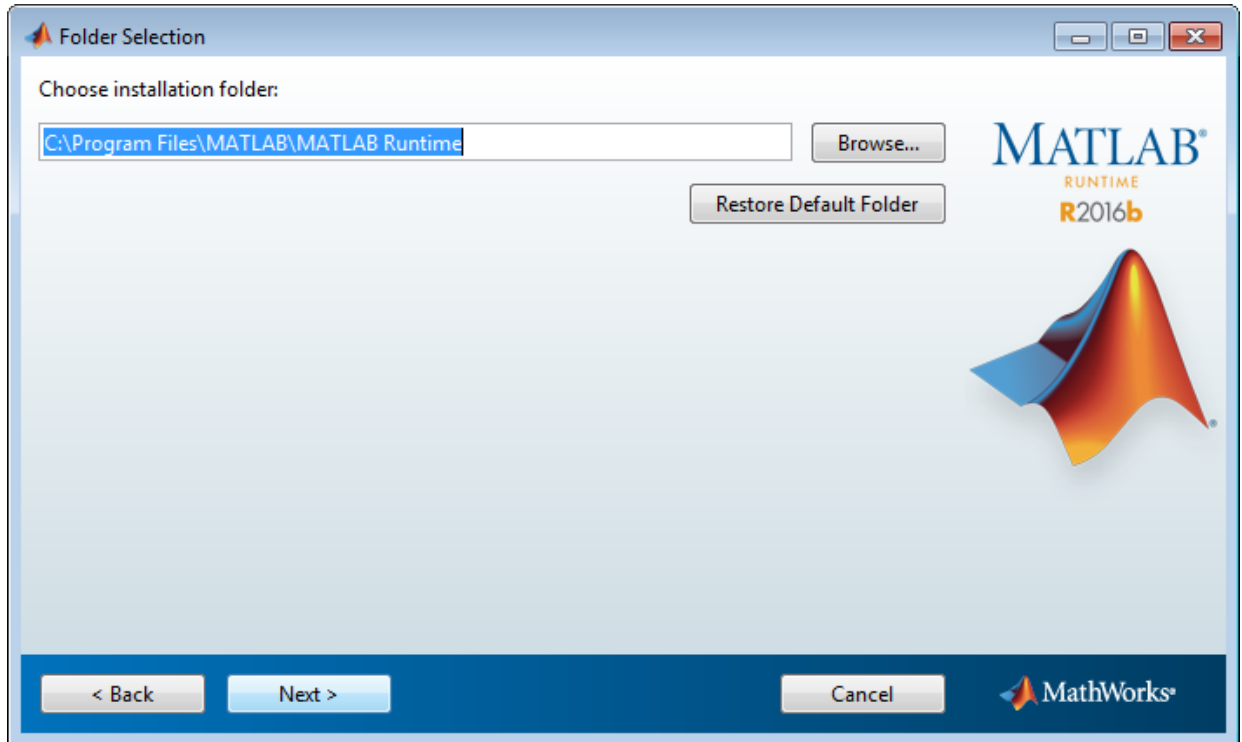

Note Any information entered in the MATLAB Compiler project window's **Application Information** appears on this window.

- 3 If you connect to the internet using a proxy server, enter the server's settings.
 - a Click **Connection Settings**.
 - b Enter the proxy server settings in the provided window.
 - c Click **OK**.
- 4 Click **Next** to advance to the Installation Options page.

Note On Linux® and Mac OS X you will not have the option of adding a desktop shortcut.

- 5 Click **Next** to advance to the Required Software page.

If asked about creating the destination folder, click **Yes**.

Note If the correct version of the MATLAB Runtime exists on the system, this page displays a message that indicates you do not need to install a new version.

If you receive this message, skip to “step 10” on page 1-11.

-
- 6 Click **Next** to advance to the License Agreement page.

If asked about creating the destination folder, click **Yes**.

- 7 Read the license agreement.
- 8 Check **Yes** to accept the license.
- 9 Click **Next** to advance to the Confirmation page.
- 10 Click **Install**.

The installer installs the MATLAB generated application. If needed, it also downloads and installs the MATLAB Runtime.

- 11 Click **Finish**.
- 12 Run your standalone application.
 - a Open a terminal window.
 - b Navigate to the folder into which you installed the application.

If you accepted the default settings, you can find the folder in one of the following locations:

Windows	C:\Program Files\magicsquare
Mac OS X	/Applications/magicsquare
Linux	/usr/magicsquare

- c Run the application using the one of the following commands:

Windows	application\magicsquare 5
Mac OS X	./magicsquare.app/Contents/MacOS/magicsquare 5
Linux	./magicsquare 5

A 5-by-5 magic square is displayed in the console:

```
17    24     1     8    15
23     5     7    14    16
 4     6    13    20    22
10    12    19    21     3
11    18    25     2     9
```

MATLAB Runtime Additional Info

Differences Between MATLAB and MATLAB Runtime

The MATLAB Runtime differs from MATLAB in several important ways:

- In the MATLAB Runtime, MATLAB files are encrypted and immutable.
- MATLAB has a desktop graphical interface. The MATLAB Runtime has all the MATLAB functionality without the graphical interface.
- The MATLAB Runtime is version-specific. You must run your applications with the version of the MATLAB Runtime associated with the version of MATLAB Compiler SDK with which it was created. For example, if you compiled an application using version 6.3 (R2016b) of MATLAB Compiler, users who do not have MATLAB installed must have version 9.1 of the MATLAB Runtime installed. Use `mcrversion` to return the version number of the MATLAB Runtime.
- The MATLAB paths in a MATLAB Runtime instance are fixed and cannot be changed. To change them, you must first customize them within MATLAB.

Performance Considerations and the MATLAB Runtime

MATLAB Compiler SDK was designed to work with a large range of applications that use the MATLAB programming language. Because of this, run-time libraries are large.

Since the MATLAB Runtime technology provides full support for the MATLAB language, including the Java programming language, starting a compiled application takes approximately the same amount of time as starting MATLAB. The amount of resources consumed by the MATLAB Runtime is necessary in order to retain the power and functionality of a full version of MATLAB.

Calls into the MATLAB Runtime are serialized so calls into the MATLAB Runtime are threadsafe. This can impact performance.

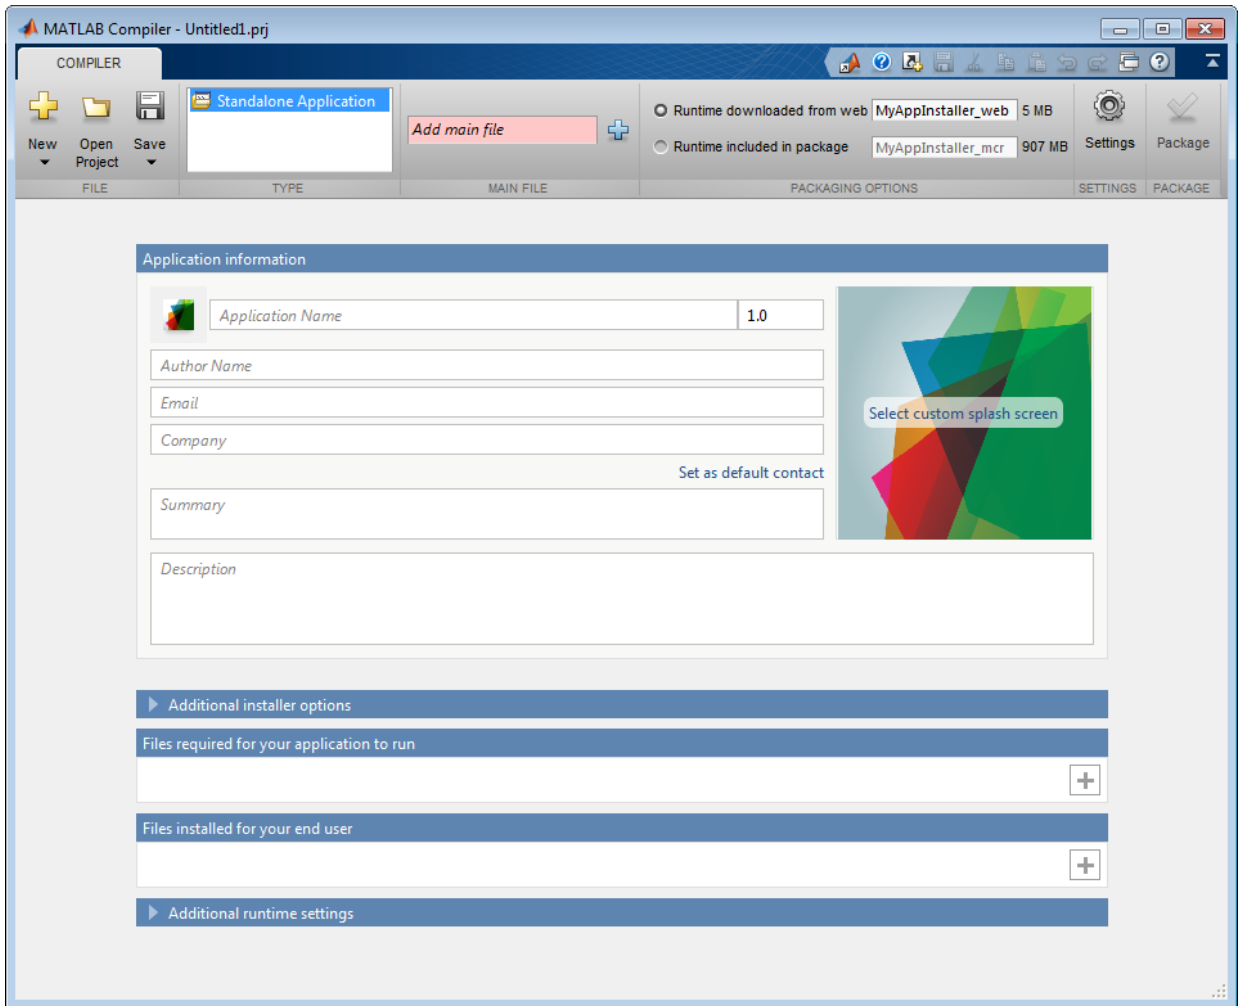

Deploying Standalone Applications

- “Package Standalone Application with Application Compiler App” on page 3-2
- “Customize Application Runtime Settings” on page 3-7
- “Create Standalone Application from Command Line” on page 3-8
- “Standalone Applications and Arguments” on page 3-10
- “Use Parallel Computing Toolbox in Deployed Applications” on page 3-14
- “Integrate Application with Mac OS X Finder” on page 3-17

Package Standalone Application with Application Compiler App

To compile MATLAB code into a standalone application:

- 1 Open the **Application Compiler**.
 - a On the toolstrip select the **Apps** tab.
 - b Click the arrow at the far right of the tab to open the apps gallery.
 - c Click **Application Compiler** to open the **MATLAB Compiler** project window.

Note To open an existing project, select it from the **MATLAB Current Folder** panel.

Note You can also launch the standalone compiler using the `applicationCompiler` function.

2 Specify the main file of the MATLAB application you want to deploy.

a In the **Main File** section of the toolstrip, click the plus button.

Note If the **Main File** section of the toolstrip is collapsed, you can expand it by clicking the down arrow.

b In the file explorer that opens, locate and select the MATLAB file.

c Click **Open** to select the file and close the file explorer.

The selected file's name is added to the list of main files and the plus button will be replaced by a minus button. The file name is used as the default application name.

3 In the **Packaging Options** section of the toolstrip, specify how the installer will deliver the MATLAB Runtime with the application.

Note If the **Packaging Options** section of the toolstrip is collapsed, you can expand it by clicking the down arrow.

You can select one or both of the following options:

- **Runtime downloaded from web** — Generates an installer that downloads the MATLAB Runtime installer from the Web.
- **Runtime included in package** — Generates an installer that includes the MATLAB Runtime installer.

Note Selecting both options creates two installers.

Regardless of what options are selected the generated installer scans the target system to determine if there is an existing installation of the appropriate MATLAB Runtime. If there is not, the installer installs the MATLAB Runtime.

4 Specify the name of any generated installers.

5 In the **Application Information** and **Additional Installer Options** sections of the compiler, customize the look and feel of the generated installer.

You can change the information used to identify the application data used by the installer:

- Splash screen

Note On Windows, the splash screen will be displayed when the compiled application starts in addition to when the installer runs.

- Application icon
- Application version
- Name and contact information of the application’s author
- Brief summary of the application’s purpose
- Detailed description of the application

You can also change the default location into which the application is installed and provide some notes to the installer.

All of the provided information is displayed as the installer runs.

For more information see “Customize the Installer” on page 4-2.

- 6** In the **Files required for your application to run** section of the compiler, verify that all of the files required to run the MATLAB application are listed.

Note These files are compiled into the generated binaries along with the main file.

Note For Standalone Applications with MapReduce, you can find the map function and the reduce function in the current directory. If the map function and the reduce function are not available in current directory, you must include them in the MATLAB search path.

In general the built-in dependency checker automatically populates this section with the appropriate files. However, you can manually add any files it missed.

For more information see “Manage Required Files in Compiler Project” on page 4-6.

- 7** In the **Files installed for your end user** section of the compiler, verify that any additional non-MATLAB files you want installed with the application are listed.

Note These files are placed in the applications folder of the installed application.

This section automatically lists:

- Generated executable
- (Linux) Shell script for launching the application
- Readme file

You can manually add files to the list. Additional files can include documentation, sample data files, and examples to accompany the application.

For more information see “Specify Files to Install with Application” on page 4-8.

- 8 In the **Additional Runtime Settings** section of the compiler, specify some of the advanced runtime behaviors for the application.

These behaviors include:

- (Windows) if a command window is required to run the application
- if the application generates a log file

For more information see “Customize Application Runtime Settings” on page 3-7.

- 9 Click **Settings** to customize the flags passed to the compiler and the folders where the generated files are written.
- 10 Click **Package** to compile the MATLAB code and generate the installers.
- 11 Verify the contents of the generated output:

- `for_redistribution` folder contains the file that installs the application and the MATLAB Runtime.
- `for_testing` folder contains all the artifacts created by `mcc` like binaries and jar, header, and source files for a specific target. Use these files to test the installation.
- `for_redistribution_files_only` folder contains the files required for redistribute of the application. Distribute these files to users that have MATLAB or MATLAB Runtime installed on their machines.
- `PackagingLog.txt` is a log file generated by the compiler.

See Also

Customize Application Runtime Settings

In **Additional Runtime Settings**, you can change the following run-time settings for the compiled application:

- On Windows if a command window is opened when you double-click the application from the file explorer

Note If the application generates output to the console or requires command line input, you must unselect this option.

- If the application generates a MATLAB log file

By default, all of these settings are set to false. When you double-click a compiled application in the Windows file explorer, the application's window opens without a command prompt and will not generate a log file.

Create Standalone Application from Command Line

In this section...
“Execute Compiler Projects with <code>deploytool</code> ” on page 3-8
“Create Standalone Application with <code>mcc</code> ” on page 3-8

You can compile standalone applications at the MATLAB prompt or your system prompt using either of these commands.

- `deploytool` invokes the Application Compiler app to execute a saved compiler project.
- `mcc` invokes the MATLAB Compiler to compile code at the prompt.

Execute Compiler Projects with `deploytool`

The `deploytool` command has two flags to invoke one of the compiler apps without opening a window.

- `-build project_name` — Invoke the correct compiler app to build the project and not generate an installer.
- `-package project_name` — Invoke the correct compiler app to build the project and generate an installer.

For example, `deploytool -package magicsquare` generates the binary files defined by the `magicsquare` project and packages them into an installer that you can distribute to others.

Create Standalone Application with `mcc`

The `mcc` command invokes the MATLAB compiler to compile code at the prompt and provides fine-level control compiling an application. It does not package the results in an installer.

To invoke the compiler to generate an application, use `mcc` with either the `-m` or the `-e` flag. Both flags compile a MATLAB function and generate a standalone executable. The `-m` flag creates a standard executable that runs at a system command line. On Windows, the `-e` flag generates an executable that does not open a command prompt when double-clicked from the Windows file explorer.

Use the following `mcc` options to compile standalone applications.

Option	Description
<code>-W main -T link:exe</code>	Generate a standard executable equivalent to using <code>-m</code> .
<code>-W WinMain -T link:exe</code>	Generate an executable that does not open a command prompt when double-clicked from the Windows file explorer equivalent to using <code>-e</code> .
<code>-a filePath</code>	Add any files on the path to the generated binaries.
<code>-d outFolder</code>	Specify the folder for the compiled applications.
<code>-o fileName</code>	Specify the name of the generated executable file.

Standalone Applications and Arguments

In this section...
“Overview” on page 3-10
“Pass File Names, Numbers or Letters, Matrices, and MATLAB Variables” on page 3-10
“Run Standalone Applications that Use Arguments” on page 3-11

Overview

You can create a standalone to simply run the application without passing or retrieving any arguments to or from it.

However, arguments can be passed to standalone applications created using MATLAB Compiler in the same way that input arguments are passed to any console-based application.

The following are example commands used to execute an application called `filename` from Windows or Linux command prompt with different types of input arguments.

Pass File Names, Numbers or Letters, Matrices, and MATLAB Variables

To Pass....	Use This Syntax....	Notes
A file named <code>helpfile</code>	<code>filename helpfile</code>	
Numbers or letters	<code>filename 1 2 3 a b c</code>	Do <i>not</i> use commas or other separators between the numbers and letters you pass.
Matrices as input	<code>filename "[1 2 3]" "[4 5 6]"</code>	Place double quotes around input arguments to denote a blank space.
MATLAB variables	<pre>for k=1:10 cmd = ['filename ', num2str(k)]; system(cmd); end</pre>	To pass a MATLAB variable to a program as input, you must first convert it to a character vector.

Run Standalone Applications that Use Arguments

You call a standalone application that uses arguments from MATLAB with any of the following commands:

- `SYSTEM`
- `DOS`
- `UNIX`
- `!`

To pass the contents of a MATLAB variable to the program as an input, the variable must first be converted to a character vector. For example:

Using `SYSTEM`, `DOS`, or `UNIX`

Specify the entire command to run the application as a character vector (including input arguments). For example, passing the numbers and letters `1 2 3 a b c` could be executed using the `SYSTEM` command, as follows:

```
system('filename 1 2 3 a b c')
```

Using the `!` (bang) Operator

You can also use the `!` (bang) operator, from within MATLAB, as follows:

```
!filename 1 2 3 a b c
```

When you use the `!` (bang) operator, the remainder of the input line is interpreted as the `SYSTEM` command, so it is not possible to use MATLAB variables.

Using a Windows System

To run a standalone application by double clicking on it, you create a batch file that calls the standalone application with the specified input arguments. For example:

```
rem This is main.bat file which calls  
rem filename.exe with input parameters  
  
filename "[1 2 3]" "[4 5 6]"  
@echo off  
pause
```

The last two lines of code in `main.bat` are added so that the window displaying your output stays open until you press a key.

Once you save this file, you run your code with the arguments specified above by double clicking on the icon for `main.bat`.

Using a MATLAB File You Plan to Deploy

When running MATLAB files that use arguments that you also plan to deploy with MATLAB Compiler, keep the following in mind:

- The input arguments you pass to your executable from a system prompt will be received as character vector input. Thus, if you expect the data in a different format (for example, double), you must first convert the character vector input to the required format in your MATLAB code. For example, you can use `STR2NUM` to convert the character vector input to numerical data.
- You cannot return values from your standalone application to the user. The only way to return values from compiled code is to either display it on the screen or store it in a file.

In order to have data displayed back to the screen, do one of the following:

- Unsuppress the commands that yield your return data. Do not use semicolons to unsuppress.
- Use the `DISP` command to display the variable value, then redirect the outputs to other applications using redirects (the `>` operator) or pipes (`|`) on non-Windows systems.

Taking Input Arguments and Displaying to a Screen Using a MATLAB File

Here are two ways to use a MATLAB file to take input arguments and display data to the screen:

Method 1

```
function [x,y]=foo(z);  
  
if ischar(z)  
z=str2num(z);  
else  
z=z;  
end
```

```
x=2*z  
y=z^2;  
disp(y)
```

Method 2

```
function [x,y]=foo(z);  
  
if isdeployed  
z=str2num(z);  
end  
x=2*z  
y=z^2;  
disp(y)
```

Use Parallel Computing Toolbox in Deployed Applications

In this section...

“Pass Parallel Computing Toolbox Profile at Run Time” on page 3-14
--

“Embed Parallel Computing Toolbox Profile” on page 3-15

There are three ways to pass a cluster profile to a standalone application that uses the Parallel Computing Toolbox:

- 1 Save the cluster profile to your MATLAB preferences.

The cluster profile will be automatically bundled with the generated application and available to the Parallel Computing Toolbox code.

- 2 Pass the cluster profile location to the application at run time.

This option is useful if your application is run against different clusters.

- 3 Embed the cluster profile in the application.

Pass Parallel Computing Toolbox Profile at Run Time

You can deploy standalone application in a cluster environment using the Parallel Computing Toolbox by passing the cluster profile to the compiled application at run time.

To deploy a standalone application written with Parallel Computing Toolbox:

- 1 In the Home tab, in the Environment section, select **Parallel > Manage Cluster Profiles**.
- 2 In the **Cluster Profile Manager** dialog, select a profile, and in the **Manage** section, click **Export**.
- 3 Compile the application.

Note If you are using the GPU feature of Parallel Computing Toolbox, you need to add the PTX and CU files.

- 4 Write a shell script that calls the application using the `-mcruserdata ParallelProfile:profile` flag.

```
myApp -mcruserdata ParallelProfile:C:\myprofile.settings
```

Use the full path name for the cluster profile file to specify *profile*.

5 Distribute the following files to application users:

- Generated installer
- Cluster profile
- Script that starts the application using the cluster profile

Users of the application must have access to the cluster specified in the profile.

Note As of R2012a, Parallel Configurations and MAT files have been replaced with Parallel Profiles. For more information, see the release notes for the Deployment products and Parallel Computing Toolbox.

To use existing MAT files and ensure backward compatibility with this change, issue a command such as the following, in the above example:

```
pct_Compiled.exe 200 -mcruserdata  
    ParallelProfile:C:\work9b\pctdeploytool\pct_Compiled\distrib\myconfig.mat
```

If you continue to use MAT files, remember to specify the full path to the MAT file.

Embed Parallel Computing Toolbox Profile

You can deploy standalone applications in a cluster environment using Parallel Computing Toolbox by including the cluster profile with the compiled application.

You can use the default configuration from settings. The steps are similar to using a standard compiled application with the following additional steps.

To deploy a standalone application written with Parallel Computing Toolbox:

- 1 Write a MATLAB function that uses `setmcruserdata` to load the cluster profile and pass it to the MATLAB Runtime.

```
function run_parallel_func  
setmcruserdata('ParallelProfile', 'profile')  
a = parallel_func  
end
```

- 2 In the Home tab, in the Environment section, select **Parallel > Manage Cluster Profiles**.
- 3 In the **Cluster Profile Manager** dialog, select a profile, and in the **Manage** section, click **Export**.

- The saved cluster profile should match the *profile* value in `setmcruserdata`.
- 4 Compile the application.
 - a Use the `run_parallel_funct` as the main file for the application.
 - b In the **Files required for your application to run** field of the Application Compiler app, include the cluster profile and the MATLAB function for `parallel_funct`.

If you are using the GPU feature of Parallel Computing Toolbox, you need to manually add the PTX and CU files.

- 5 Distribute the generated installer to application users.

Users of the application must have access to the cluster specified in the profile.

Integrate Application with Mac OS X Finder

In this section...

“Overview” on page 3-17

“Installing the Macintosh Application Launcher Preference Pane” on page 3-17

“Configuring the Installation Area” on page 3-17

“Launching the Application” on page 3-20

Overview

Macintosh graphical applications, launched through the Mac OS X finder utility, require additional configuration if MATLAB software or the MATLAB Runtime were not installed in default locations.

Installing the Macintosh Application Launcher Preference Pane

Install the Macintosh Application Launcher preference pane, which gives you the ability to specify your installation area.

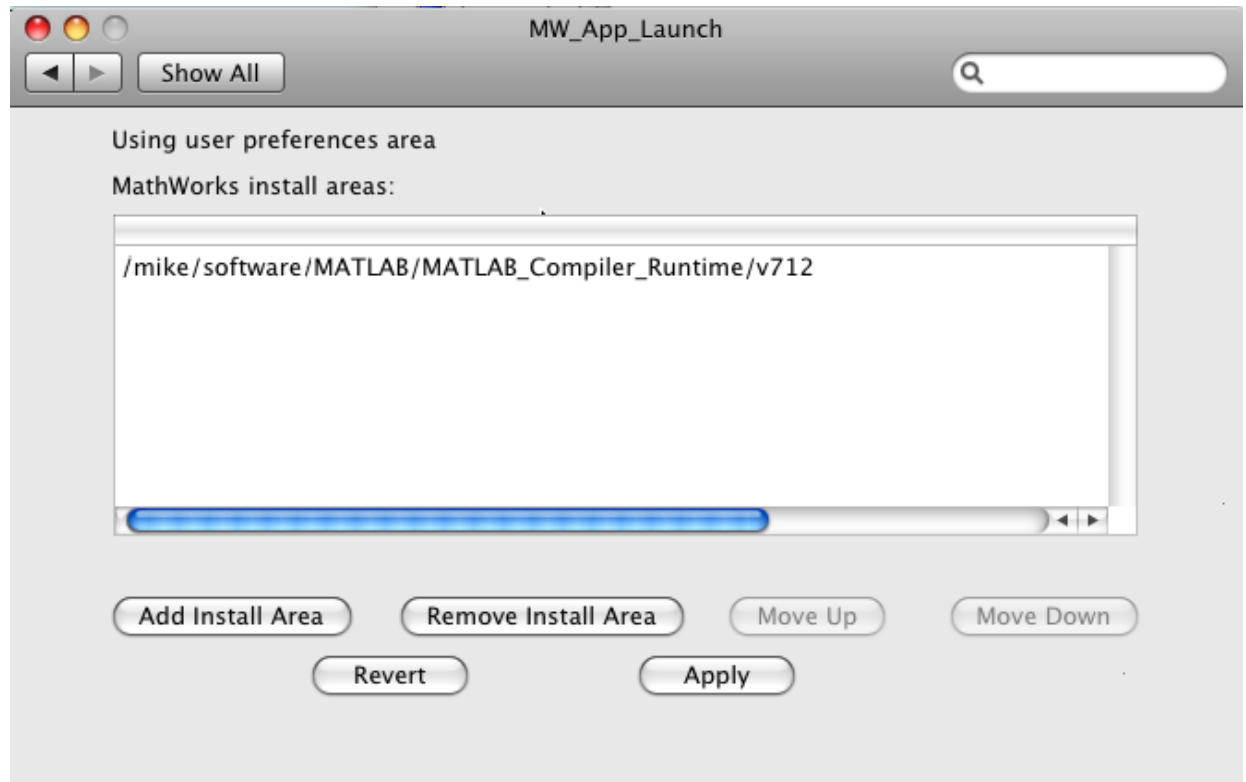

- 1 In the Mac OS X Finder, navigate to `install_area/toolbox/compiler/maci64`.
- 2 Double-click on **MW_App_Launch.prefPane**.

Note The Macintosh Application Launcher manages only *user* preference settings. If you copy the preferences defined in the launcher to the Macintosh System Preferences area, the preferences are still manipulated in the User Preferences area.

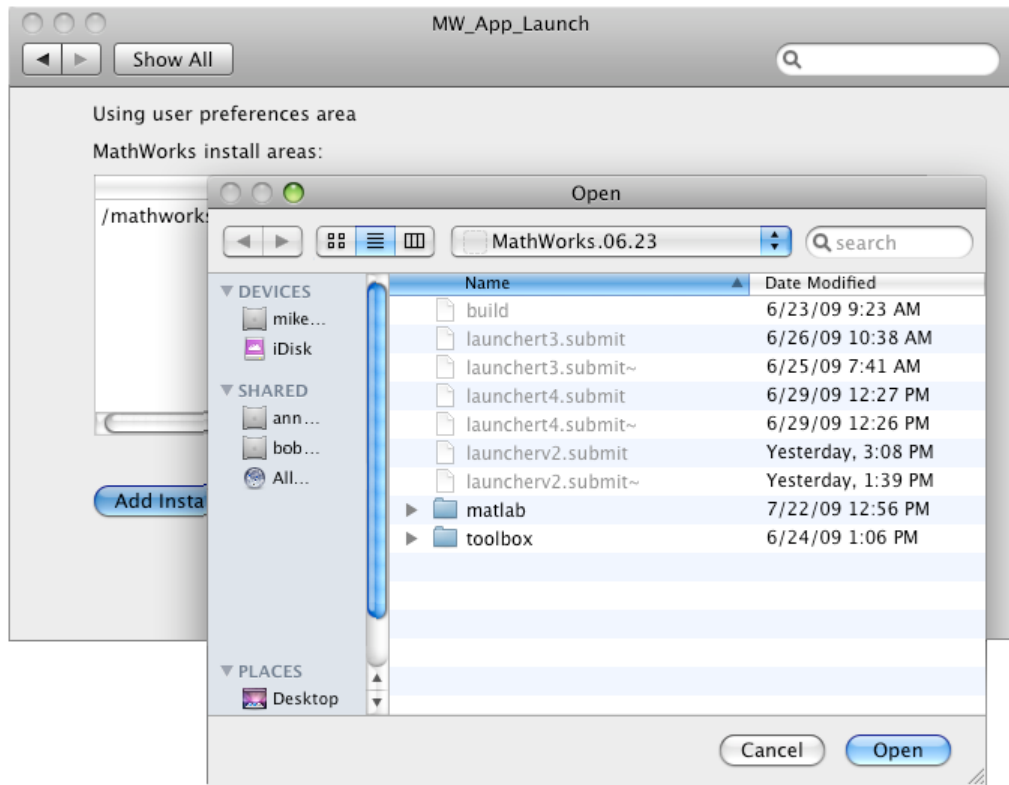

Configuring the Installation Area

Once the preference pane is installed, you configure the installation area.

- 1 Launch the preference pane by clicking on the apple logo in the upper left corner of the desktop.
- 2 Click on **System Preferences**. The **MW_App_Launch** preference pane appears in the **Other** area.

- 3 Click **Add Install Area** to define an installation area on your system.
- 4 Define the default installation path by browsing to it.
- 5 Click **Open**.

Modifying Your Installation Area

Occasionally, you remove an installation area, define additional areas or change the order of installation area precedence.

You can use the following options in MathWorks® Application Launcher to modify your installation area:

- **Add Install Area** — Defines the path on your system where your applications install by default.
- **Remove Install Area** — Removes a previously defined installation area.
- **Move Up** — After selecting an installation area, click this button to move the defined path up the list. Binaries defined in installation areas at the top of the list have precedence over all succeeding entries.

- **Move Down** — After selecting an installation area, click this button to move the defined path down the list. Binaries defined in installation areas at the top of the list have precedence over all succeeding entries.
- **Apply** — Saves changes and exits MathWorks Application Launcher.
- **Revert** — Exits MathWorks Application Launcher without saving any changes.

Launching the Application

When you create a Macintosh application, a Macintosh bundle is created. If the application does not require standard input and output, launch the application by clicking on the bundle in the Mac OS X Finder utility.

The location of the bundle is determined by whether you use `mcc` or `applicationCompiler` to build the application:

- If you use `applicationCompiler`, the application bundle is placed in the compiled application's `for_redistribution` folder.
- If you use `mcc`, the application bundle is placed in the current working directory or in the output directory as specified by the `mcc -o` switch.

Customizing a Compiler Project

- “Customize the Installer” on page 4-2
- “Manage Required Files in Compiler Project” on page 4-6
- “Specify Files to Install with Application” on page 4-8
- “Manage Support Packages” on page 4-9

Customize the Installer

In this section...

- “Change the Application Icon” on page 4-2
- “Add Application Information” on page 4-3
- “Change the Splash Screen” on page 4-3
- “Change the Installation Path” on page 4-4
- “Change the Logo” on page 4-4
- “Edit the Installation Notes” on page 4-5

Change the Application Icon

The application icon is used for the generated installer. For standalone applications, it is also the application's icon.

You can change the default icon in **Application Information**. To set a custom icon:

- 1 Click the graphic to the left of the **Application name** field.

A window previewing the icon opens.

- 2 Click **Select icon**.
- 3 Using the file explorer, locate the graphic file to use as the application icon.
- 4 Select the graphic file.

- 5 Click **OK** to return to the icon preview.
- 6 Select **Use mask** to fill any blank spaces around the icon with white.
- 7 Select **Use border** to add a border around the icon.
- 8 Click **Save and Use** to return to the main window.

Add Application Information

The **Application Information** section of the app allows you to provide these values:

- Name

Determines the name of the installed MATLAB artifacts. For example, if the name is `foo`, the installed executable would be `foo.exe`, the Windows start menu entry would be **foo**. The folder created for the application would be `InstallRoot/foo`.

The default value is the name of the first function listed in the **Main File(s)** field of the app.

- Version

The default value is 1.0.

- Author name
- Support e-mail address
- Company name

Determines the full installation path for the installed MATLAB artifacts. For example, if the company name is `bar`, the full installation path would be `InstallRoot/bar/ApplicationName`.

- Summary
- Description

This information is all optional and, unless otherwise stated, is only used for display purposes. It appears on the first page of the installer. On Windows systems, this information is also displayed in the Windows **Add/Remove Programs** control panel.

Change the Splash Screen

The installer's splash screen displays after the installer is started. It is displayed, along with a status bar, while the installer initializes.

You can change the default image by clicking the **Select custom splash screen** link in **Application Information**. When the file explorer opens, locate and select a new image.

Note You can drag and drop a custom image onto the default splash screen.

Change the Installation Path

Default Installation Paths lists the default path the installer will use when installing the compiled binaries onto a target system.

Default Installation Paths

Windows	C:\Program Files\ <i>companyName</i> \ <i>appName</i>
Mac OS X	/Applications/ <i>companyName</i> / <i>appName</i>
Linux	/usr/ <i>companyName</i> / <i>appName</i>

You can change the default installation path by editing the **Default installation folder** field under **Additional Installer Options**.

The **Default installation folder** field has two parts:

- root folder — A drop down list that offers options for where the install folder is installed. Custom Installation Roots lists the optional root folders for each platform.

Custom Installation Roots

Windows	C:\Users\ <i>userName</i> \AppData
Linux	/usr/local

- install folder — A text field specifying the path appended to the root folder.

Change the Logo

The logo displays after the installer is started. It is displayed on the right side of the installer.

You change the default image by clicking the **Select custom logo** link in **Additional Installer Options**. When the file explorer opens, locate and select a new image.

Note You can drag and drop a custom image onto the default logo.

Edit the Installation Notes

Installation notes are displayed once the installer has successfully installed the packaged files on the target system. They can provide useful information concerning any additional set up that is required to use the installed binaries or simply provide instructions for how to run the application.

The field for editing the installation notes is in **Additional Installer Options**.

Manage Required Files in Compiler Project

In this section...
“Dependency Analysis” on page 4-6
“Using the Compiler Apps” on page 4-6
“Using mcc” on page 4-6

Dependency Analysis

The compiler uses a dependency analysis function to automatically determine what additional MATLAB files are required for the application to compile and run. These files are automatically compiled into the generated binary. The compiler does not generate any wrapper code allowing direct access to the functions defined by the required files.

Using the Compiler Apps

If you are using one of the compiler apps, the required files discovered by the dependency analysis function are listed in the **Files required by your application to run** field.

To add files:

- 1 Click the plus button in the field.
- 2 Select the desired file from the file explorer.
- 3 Click **OK**.

To remove files:

- 1 Select the desired file.
- 2 Press the **Delete** key.

Caution Removing files from the list of required files may cause your application to not compile or to not run properly when deployed.

Using mcc

If you are using `mcc` to compile your MATLAB code, the compiler does not display a list of required files before running. Instead, it compiles all of the required files that are

discovered by the dependency analysis function and adds them to the generated binary file.

You can add files to the list by passing one, or more, `-a` arguments to `mcc`. The `-a` arguments add the specified files to the list of files to be added into the generated binary. For example, `-a hello.m` adds the file `hello.m` to the list of required files and `-a ./foo` adds all of the files in `foo`, and its subfolders, to the list of required files.

Specify Files to Install with Application

The compiler apps package files to install along with the ones it generates. By default the installer includes a readme file with instructions on installing the MATLAB Runtime and configuring it.

These files are listed in the **Files installed for your end user** section of the app.

To add files to the list:

- 1 Click the plus button in the field.
- 2 Select the desired file from the file explorer.
- 3 Click **OK** to close the file explorer.

Jar files are added to the application classpath in the same ways as if the user called `javaaddpath`.

To remove files from the list:

- 1 Select the desired file.
- 2 Press the **Delete** key.

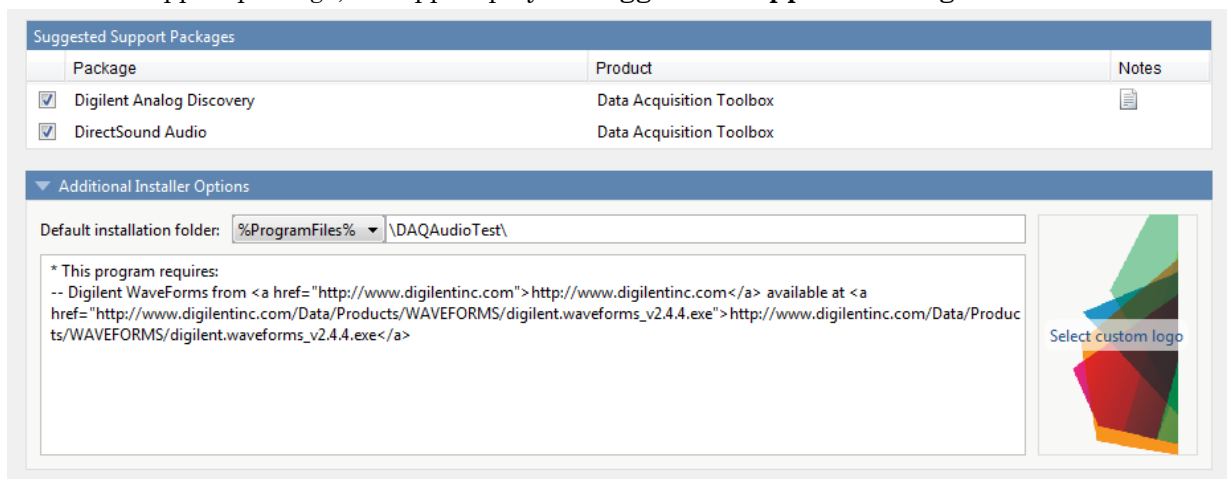

Caution Removing the binary targets from the list results in an installer that does not install the intended functionality.

When installed on a target computer, the files listed in the **Files installed for your end user** are placed in the `application` folder.

Manage Support Packages

Using a Compiler App

Many MATLAB toolboxes use support packages to interact with hardware or to provide additional processing capabilities. If your MATLAB code uses a toolbox with an installed support package, the app displays a **Suggested Support Packages** section.

The list displays all installed support packages that your MATLAB code requires. The list is determined using these criteria:

- the support package is installed
- your code has a direct dependency on the support package
- your code is dependent on the base product of the support package
- your code is dependent on at least one of the files listed as a dependency in the `mcc.xml` file of the support package, and the base product of the support package is MATLAB

Deselect support packages that are not required by your application.

Some support packages require third-party drivers that the compiler cannot package. In this case, the compiler adds the information to the installation notes. You can edit installation notes in the **Additional Installer Options** section of the app. To remove the installation note text, deselect the support package with the third-party dependency.

Caution Any text you enter beneath the generated text will be lost if you deselect the support package.

Using the Command Line

Many MATLAB toolboxes use support packages to interact with hardware or to provide additional processing capabilities. If your MATLAB code uses a toolbox with an installed support package, use the `-a` flag with `mcc` command when packaging your MATLAB code to specify supporting files in the support package folder. For example, if your function uses the OS Generic Video Interface support package, run the following command:

```
mcc -m -v test.m -a C:\MATLAB\SupportPackages\R2016b\toolbox\daq\supportpackages\daqau
```

Some support packages require third-party drivers that the compiler cannot package. In this case, you are responsible for downloading and installing the required drivers.

MATLAB Code Deployment

- “Differences Between Compiler Apps and Command Line” on page 5-2
- “How Does MATLAB Deploy Functions?” on page 5-3
- “Dependency Analysis” on page 5-4
- “MEX-Files, DLLs, or Shared Libraries” on page 5-6
- “Deployable Archive” on page 5-7
- “Write Deployable MATLAB Code” on page 5-10
- “Calling Shared Libraries in Deployed Applications” on page 5-14
- “MATLAB Data Files in Compiled Applications” on page 5-16

Differences Between Compiler Apps and Command Line

You perform the same functions using either the compiler apps or the `mcc` command-line interface. The interactive menus and dialogs used in the compiler apps build `mcc` commands that are customized to your specification. As such, your MATLAB code is processed the same way as if you were compiling it using `mcc`.

Compiler app advantages include:

- You perform related deployment tasks with a single intuitive interface.
- You maintain related information in a convenient project file.
- Your project state persists between sessions.
- You load previously stored compiler projects from a prepopulated menu.
- Package applications for distribution.

How Does MATLAB Deploy Functions?

To deploy MATLAB functions, the compiler performs these tasks:

- 1 Analyzes files for dependencies using a dependency analysis function. Dependencies affect deployability and originate from functions called by the file. Deployability is affected by:

- File type — MATLAB, Java, MEX, and so on.
- File location — MATLAB, MATLAB toolbox, user code, and so on.

For more information about how the compiler does dependency analysis, see “Dependency Analysis” on page 5-4.

- 2 Validates MEX-files. In particular, `mexFunction` entry points are verified.

For more details about MEX-file processing, see “MEX-Files, DLLs, or Shared Libraries” on page 5-6.

- 3 Creates a deployable archive from the input files and their dependencies.

For more details about deployable archives see “Deployable Archive” on page 5-7.

- 4 Generates target-specific wrapper code.
- 5 Generates target-specific binary package.

For library targets such as C++ shared libraries, Java packages, or .NET assemblies, the compiler invokes the required third-party compiler.

Dependency Analysis

In this section...
“Function Dependency” on page 5-4
“Data File Dependency” on page 5-4

MATLAB Compiler uses a dependency analysis function to determine the list of necessary files to include in the generated package. Sometimes, this process generates a large list of files, particularly when MATLAB object classes exist in the compilation and the dependency analyzer cannot resolve overloaded methods at compile time. Dependency analysis also processes `include/exclude` files on each pass.

Tip To improve compile time performance and lessen application size, prune the path with the `mcc` command's `-N` and `-p` flags. You can also specify **Files required for your application** in the compiler app.

Function Dependency

The dependency analyzer searches for executable content such as:

- MATLAB files
- P-files

Note If the MATLAB file corresponding to the p-file is not available, the dependency analysis will not be able to determine the p-file's dependencies.

- Java classes and `.jar` files
- `.fig` files
- MEX-files

Data File Dependency

In addition to executable content listed above, MATLAB Compiler can detect and automatically include files that your MATLAB functions access by calling any of these functions: `audioinfo`, `audioread`, `csvread`, `daqread`, `dlmread`, `fileread`, `fopen`,

imfinfo, importdata, imread, load, matfile, mmfileinfo, open, readtable, type, VideoReader, xlsfinfo, xlsread, xmlread, and xslt.

If you are using the compiler app, these data files are automatically added to the **Files required for your application to run** area of the app.

MEX-Files, DLLs, or Shared Libraries

When you compile MATLAB functions containing MEX-files, ensure that the dependency analyzer can find them. Doing so allows you to avoid many common compilation problems. In particular, note that:

- Since the dependency analyzer cannot examine MEX-files, DLLs, or shared libraries to determine their dependencies, explicitly include all executable files these files require. To do so, use either the `mcc -a` option or the **Files required for your application to run** field in the compiler app.
- If you have any doubts that the dependency analyzer can find a MATLAB function called by a MEX-file, DLL, or shared library, then manually include that function. To do so, use either the `mcc -a` option or the **Files required for your application to run** field in the compiler app.
- Not all functions are compatible with the compiler. Check the file `mccExcludedFiles.log` after your build completes. This file lists all functions called from your application that you cannot deploy.

Deployable Archive

Each application or shared library you produce using the compiler has an embedded deployable archive. The archive contains all the MATLAB based content (MATLAB files, MEX-files, and so on). All MATLAB files in the deployable archive are encrypted using the Advanced Encryption Standard (AES) cryptosystem.

If you choose to extract the deployable archive as a separate file, the files remain encrypted. For more information on how to extract the deployable archive refer to the references in the following table.

Information on Deployable Archive Embedding/Extraction and Component Cache

Product	Refer to
MATLAB Compiler SDK C/C++ integration	“MATLAB Runtime Component Cache and Deployable Archive Embedding” (MATLAB Compiler SDK)
MATLAB Compiler SDK .NET integration	“MATLAB Runtime Component Cache and Deployable Archive Embedding” (MATLAB Compiler SDK)
MATLAB Compiler SDK Java integration	“Deployable Archive Embedding and Extraction” (MATLAB Compiler SDK)
MATLAB Compiler Excel integration	“MATLAB Runtime Component Cache and Deployable Archive Embedding”

Generated Component (EXE, DLL, SO, etc)

Additional Details

Multiple deployable archives, such as those generated with COM components, .NET assemblies, or Excel add-ins, can coexist in the same user application. You cannot, however, mix and match the MATLAB files they contain. You cannot combine encrypted and compressed MATLAB files from multiple deployable archives into another deployable archive and distribute them.

All the MATLAB files from a given deployable archive associate with a unique cryptographic key. MATLAB files with different keys, placed in the same deployable archive, do not execute. If you want to generate another application with a different mix of MATLAB files, recompile these MATLAB files into a new deployable archive.

The compiler deletes the deployable archive and generated binary following a failed compilation, but only if these files did not exist before compilation initiates. Run `help mcc -K` for more information.

Caution Release Engineers and Software Configuration Managers: Do not use build procedures or processes that strip shared libraries on deployable archives. If you do, you can possibly strip the deployable archive from the binary, resulting in run-time errors for the driver application.

Write Deployable MATLAB Code

In this section...

“Compiled Applications Do Not Process MATLAB Files at Run Time” on page 5-10

“Do Not Rely on Changing Directory or Path to Control the Execution of MATLAB Files” on page 5-11

“Use isdeployed Functions To Execute Deployment-Specific Code Paths” on page 5-11

“Gradually Refactor Applications That Depend on Noncompilable Functions” on page 5-11

“Do Not Create or Use Nonconstant Static State Variables” on page 5-12

“Get Proper Licenses for Toolbox Functionality You Want to Deploy” on page 5-13

Compiled Applications Do Not Process MATLAB Files at Run Time

The compiler secures your code against unauthorized changes. Deployable MATLAB files are suspended or frozen at the time. This does not mean that you cannot deploy a flexible application—it means that *you must design your application with flexibility in mind*. If you want the end user to be able to choose between two different methods, for example, both methods must be available in the deployable archive.

The MATLAB Runtime only works on MATLAB code that was encrypted when the deployable archive was built. Any function or process that dynamically generates new MATLAB code will not work against the MATLAB Runtime.

Some MATLAB toolboxes, such as the Neural Network Toolbox™ product, generate MATLAB code dynamically. Because the MATLAB Runtime only executes encrypted MATLAB files, and the Neural Network Toolbox generates unencrypted MATLAB files, some functions in the Neural Network Toolbox cannot be deployed.

Similarly, functions that need to examine the contents of a MATLAB function file cannot be deployed. `HELP`, for example, is dynamic and not available in deployed mode. You can use `LOADLIBRARY` in deployed mode if you provide it with a MATLAB function prototype.

Instead of compiling the function that generates the MATLAB code and attempting to deploy it, perform the following tasks:

- 1 Run the code once in MATLAB to obtain your generated function.
- 2 Compile the MATLAB code, including the generated function.

Tip Another alternative to using `EVAL` or `FEVAL` is using anonymous function handles.

If you require the ability to create MATLAB code for dynamic run-time processing, your end users must have an installed copy of MATLAB.

Do Not Rely on Changing Directory or Path to Control the Execution of MATLAB Files

In general, good programming practices advise against redirecting a program search path dynamically within the code. Many developers are prone to this behavior since it mimics the actions they usually perform on the command line. However, this can lead to problems when deploying code.

For example, in a deployed application, the MATLAB and Java paths are fixed and cannot change. Therefore, any attempts to change these paths (using the `cd` command or the `addpath` command) fails

If you find you cannot avoid placing `addpath` calls in your MATLAB code, use `ismcc` and `isdeployed`. See “Use `isdeployed` Functions To Execute Deployment-Specific Code Paths” on page 5-11 for details.

Use `isdeployed` Functions To Execute Deployment-Specific Code Paths

The `isdeployed` function allows you to specify which portion of your MATLAB code is deployable, and which is not. Such specification minimizes your compilation errors and helps create more efficient, maintainable code.

For example, you find it unavoidable to use `addpath` when writing your `startup.m`. Using `ismcc` and `isdeployed`, you specify when and what is compiled and executed.

Gradually Refactor Applications That Depend on Noncompilable Functions

Over time, refactor, streamline, and modularize MATLAB code containing non-compilable or non-deployable functions that use `isdeployed`. Your eventual goal is

“graceful degradation” of non-deployable code. In other words, the code must present the end user with as few obstacles to deployment as possible until it is practically eliminated.

Partition your code into design-time and run-time code sections:

- Design-time code is code that is currently evolving. Almost all code goes through a phase of perpetual rewriting, debugging, and optimization. In some toolboxes, such as the Neural Network Toolbox product, the code goes through a period of self-training as it reacts to various data permutations and patterns. Such code is almost never designed to be deployed.
- Run-time code, on the other hand, has solidified or become stable—it is in a finished state and is ready to be deployed by the end user.

Consider creating a separate directory for code that is not meant to be deployed or for code that calls undeployable code.

Do Not Create or Use Nonconstant Static State Variables

Avoid using the following:

- Global variables in MATLAB code
- Static variables in MEX-files
- Static variables in Java code

The state of these variables is persistent and shared with everything in the process.

When deploying applications, using persistent variables can cause problems because the MATLAB Runtime process runs in a single thread. You cannot load more than one of these non-constant, static variables into the same process. In addition, these static variables do not work well in multithreaded applications.

When programming against compiled MATLAB code, you should be aware that an instance of the MATLAB Runtime is created for each instance of a new class. If the same class is instantiated again using a different variable name, it is attached to the MATLAB Runtime created by the previous instance of the same class. In short, if an assembly contains n unique classes, there will be maximum of n instances of MATLAB Runtime created, each corresponding to one or more instances of one of the classes.

If you must use static variables, bind them to instances. For example, defining instance variables in a Java class is preferable to defining the variable as `static`.

Get Proper Licenses for Toolbox Functionality You Want to Deploy

You must have a valid MathWorks license for toolboxes you use to create deployable MATLAB code.

Calling Shared Libraries in Deployed Applications

The `loadlibrary` function in MATLAB allows you to load shared library into MATLAB.

Loading libraries using header files is not supported in compiled applications. Therefore, to create an application that uses the `loadlibrary` function with a header file, follow these steps:

- 1 Create a prototype MATLAB file. Suppose that you call `loadlibrary` with the following syntax.

```
loadlibrary(library, header)
```

Run the following command in MATLAB only once to create the prototype file:

```
loadlibrary(library, header, 'mfilename', 'mylibrarymfile');
```

This creates `mylibrarymfile.m` in the current folder. If you are on Windows, another file named `library_thunk_pcwin64.dll` is also created in the current folder.

- 2 Change the call to `loadlibrary` in your MATLAB to the following:

```
loadlibrary(library, @mylibrarymfile)
```

- 3 Compile and deploy the application.
 - If you are integrating the library into a deployed application, specify the library's `.dll` along with `library_thunk_pcwin64.dll`, if created, using the `-a` option of `mcc` command. If you are using Application Compiler or Library Compiler apps, add the `.dll` files to the **Files required for your application to run** section of the app.
 - If you are providing the library as an external file that is not integrated with the deployed application, place the library `.dll` file in the same folder as the compiled application. If you are on Windows, you must integrate `library_thunk_pcwin64.dll` into your compiled application.

The benefit of this approach is that you can replace the library with an updated version without recompiling the deployed application. Replacing the library with a different version works only if the function signatures of the function in the library are not altered. This is because `mylibrarymfile.m` and `library_thunk_pcwin64.dll` are tied to the function signatures of the functions in the library.

Note You cannot use `loadlibrary` inside MATLAB to load a shared library built with MATLAB. For more information on `loadlibrary`, see “Limitations to Shared Library Support” (MATLAB).

Note Operating systems have a `loadlibrary` function, which loads specified Windows operating system module into the address space of the calling process.

MATLAB Data Files in Compiled Applications

In this section...
“Explicitly Including MATLAB Data files Using the <code>%#function</code> Pragma” on page 5-16
“Load and Save Functions” on page 5-16

Explicitly Including MATLAB Data files Using the `%#function` Pragma

The compiler excludes MATLAB data files (MAT-files) from dependency analysis by default. See “Dependency Analysis” on page 5-4.

If you want the compiler to explicitly inspect data within a MAT file, you need to specify the `%#function` pragma when writing your MATLAB code.

For example, if you are creating a solution with Neural Network Toolbox, you need to use the `%#function` pragma within your code to include a dependency on the `gmdistribution` class, for instance.

Load and Save Functions

If your deployed application uses MATLAB data files (MAT-files), it is helpful to code `LOAD` and `SAVE` functions to manipulate the data and store it for later processing.

- Use `isdeployed` to determine if your code is running in or out of the MATLAB workspace.
- Specify the data file by either using `WHICH` (to locate its full path name) define it relative to the location of `ctfroot`.
- All MAT-files are unchanged after `mcc` runs. These files are not encrypted when written to the deployable archive.

For more information about deployable archives, see “Deployable Archive” on page 5-7.

See the `ctfroot` reference page for more information about `ctfroot`.

Use the following example as a template for manipulating your MATLAB data inside, and outside, of MATLAB.

Using Load/Save Functions to Process MATLAB Data for Deployed Applications

The following example specifies three MATLAB data files:

- user_data.mat
- userdata\extra_data.mat
- ..\externdata\extern_data.mat

- 1 Navigate to `matlab_root\extern\examples\compiler\Data_Handling`.
- 2 Compile `ex_loadsave.m` with the following `mcc` command:

```
mcc -mv ex_loadsave.m -a 'user_data.mat' -a
    '\userdata\extra_data.mat' -a
    '..\externdata\extern_data.mat'
```

ex_loadsave.m

```
function ex_loadsave
% This example shows how to work with the
% "load/save" functions on data files in
% deployed mode. There are three source data files
% in this example.
%   user_data.mat
%   userdata\extra_data.mat
%   ..\externdata\extern_data.mat
%
% Compile this example with the mcc command:
%   mcc -m ex_loadsave.m -a 'user_data.mat' -a
%     '\userdata\extra_data.mat'
%     -a '..\externdata\extern_data.mat'
% All the folders under the current main MATLAB file directory will
% be included as
% relative path to ctroot; All other folders will have the
% folder
% structure included in the deployable archive file from root of the
% disk drive.
%
% If a data file is outside of the main MATLAB file path,
% the absolute path will be
% included in deployable archive and extracted under ctroot. For example:
%   Data file
%     "c:\$matlabroot\examples\externdata\extern_data.mat"
%   will be added into deployable archive and extracted to
%   "$ctroot\$matlabroot\examples\externdata\extern_data.mat".
%
% All mat/data files are unchanged after mcc runs. There is
% no encryption on these user included data files. They are
% included in the deployable archive.
%
% The target data file is:
```

```

% .\output\saved_data.mat
% When writing the file to local disk, do not save any files
% under ctroot since it may be refreshed and deleted
% when the application isnext started.

%==== load data file =====
if isdeployed
    % In deployed mode, all file under CTFroot in the path are loaded
    % by full path name or relative to $ctfroot.
    % LOADFILENAME1=which(fullfile(ctfroot,mfilename,'user_data.mat'));
    % LOADFILENAME2=which(fullfile(ctfroot,'userdata','extra_data.mat'));
    LOADFILENAME1=which(fullfile('user_data.mat'));
    LOADFILENAME2=which(fullfile('extra_data.mat'));
    % For external data file, full path will be added into deployable archive;
    % you don't need specify the full path to find the file.
    LOADFILENAME3=which(fullfile('extern_data.mat'));
else
    %running the code in MATLAB
    LOADFILENAME1=fullfile(matlabroot,'extern','examples','compiler',
        'Data_Handling','user_data.mat');
    LOADFILENAME2=fullfile(matlabroot,'extern','examples','compiler',
        'Data_Handling','userdata','extra_data.mat');
    LOADFILENAME3=fullfile(matlabroot,'extern','examples','compiler',
        'externdata','extern_data.mat');
end

% Load the data file from current working directory
disp(['Load A from : ',LOADFILENAME1]);
load(LOADFILENAME1,'data1');
disp('A= ');
disp(data1);

% Load the data file from sub directory
disp(['Load B from : ',LOADFILENAME2]);
load(LOADFILENAME2,'data2');
disp('B= ');
disp(data2);

% Load extern data outside of current working directory
disp(['Load extern data from : ',LOADFILENAME3]);
load(LOADFILENAME3);
disp('ext_data= ');
disp(ext_data);

%==== multiple the data matrix by 2 =====
result = data1*data2;
disp('A * B = ');
disp(result);

%==== save the new data to a new file =====
SAVEPATH=strcat(pwd,filesep,'output');
if ( ~isdir(SAVEPATH))
    mkdir(SAVEPATH);
end
SAVEFILENAME=strcat(SAVEPATH,filesep,'saved_data.mat');

```

```
disp(['Save the A * B result to : ',SAVEFILENAME]);  
save(SAVEFILENAME, 'result');
```

Standalone Application Creation

- “Input and Output Files” on page 6-2
- “Dependency Analysis Function and User Interaction with the Compilation Path” on page 6-4

Input and Output Files

In this section...

“Standalone Executable” on page 6-2

“Macintosh 64 (Maci64)” on page 6-2

Standalone Executable

In this example, MATLAB Compiler takes the MATLAB files `foo.m` and `bar.m` as input and generates a standalone called `foo`.

```
mcc -m foo.m bar.m
```

File	Description
<code>foo</code>	The main file of the application. This file reads and executes the content stored in the embedded deployable archive. On Windows, this file is <code>foo.exe</code> .
<code>run_component.sh</code>	<code>mcc</code> generates <code>run_<component>.sh</code> file on Linux and Mac OS X systems for standalone applications. It temporarily sets up the environment variables needed at runtime and executes the application. On Windows, <code>mcc</code> doesn't generate this run script file, because the environment variables have already been set up by the installer. In this case, you just run your standalone <code>.exe</code> file.

Macintosh 64 (Maci64)

For 64-bit Macintosh, a Macintosh application bundle is created.

File	Description
<code>foo.app</code>	The bundle created for executable <code>foo</code> . Execution of the bundle occurs through <code>foo.app/Contents/MacOS/foo</code> .
<code>foo</code>	Application

File	Description
run_component.sh	The generated shell script which executes the application through the bundle.

Dependency Analysis Function and User Interaction with the Compilation Path

addpath and rmpath in MATLAB

MATLAB Compiler uses the MATLAB search path to analyze dependencies. See `addpath`, `rmpath`, `savepath` for information on working with the search path.

Note `mcc` does not use the MATLAB startup folder and will not find any path information saved there.

Passing `-I <directory>` on the Command Line

You can use the `-I` option to add a folder to the beginning of the list of paths to use for the current compilation. This feature is useful when you are compiling files that are in folders currently not on the MATLAB path.

Passing `-N` and `-p <directory>` on the Command Line

There are two MATLAB Compiler options that provide more detailed manipulation of the path. This feature acts like a “filter” applied to the MATLAB path for a given compilation. The first option is `-N`. Passing `-N` on the `mcc` command line effectively clears the path of all folders except the following core folders (this list is subject to change over time):

- `matlabroot\toolbox\matlab`
- `matlabroot\toolbox\local`
- `matlabroot\toolbox\compiler\deploy`
- `matlabroot\toolbox\compiler`

It also retains all subfolders of the above list that appear on the MATLAB path at compile time. Including `-N` on the command line allows you to replace folders from the original path, while retaining the relative ordering of the included folders. All subfolders of the included folders that appear on the original path are also included. In addition, the `-N` option retains all folders that the user has included on the path that are not under `matlabroot\toolbox`.

Use the `-p` option to add a folder to the compilation path in an order-sensitive context, i.e., the same order in which they are found on your MATLAB path. The syntax is

```
p <directory>
```

where `<directory>` is the folder to be included. If `<directory>` is not an absolute path, it is assumed to be under the current working folder. The rules for how these folders are included are

- If a folder is included with `-p` that is on the original MATLAB path, the folder and all its subfolders that appear on the original path are added to the compilation path in an order-sensitive context.
- If a folder is included with `-p` that is not on the original MATLAB path, that folder is not included in the compilation. (You can use `-I` to add it.)
- If a path is added with the `-I` option while this feature is active (`-N` has been passed) and it is already on the MATLAB path, it is added in the order-sensitive context as if it were included with `-p`. Otherwise, the folder is added to the head of the path, as it normally would be with `-I`.

Note The `-p` option requires the `-N` option on the `mcc` command line.

Deployment Process

This chapter tells you how to deploy compiled MATLAB code to developers and to end users.

- “Deploying to Developers” on page 7-2
- “Deploying to End Users” on page 7-3
- “About the MATLAB Runtime” on page 7-10
- “Install and Configure the MATLAB Runtime” on page 7-12
- “Deploy Standalone Application on Network Drive (Windows Only)” on page 7-20
- “MATLAB Compiler Deployment Messages” on page 7-22

Deploying to Developers

Standalone Applications

To distribute a standalone application created with MATLAB Compiler to a development machine, create a package that includes the following files.

Software Module	Description
MATLAB Runtime installer (Windows)	The MATLAB Runtime installer is a self-extracting executable that installs the necessary components to run your application. This file is included with MATLAB Compiler. Run <code>mcrinstaller</code> function to obtain name of executable.
MATLAB Runtime installer (Linux)	The MATLAB Runtime installer is a self-extracting executable that installs the necessary components to run your application on UNIX® machines (other than Mac). This file is included with MATLAB Compiler. Run <code>mcrinstaller</code> function to obtain name of binary.
MATLAB Runtime installer (Mac)	Run <code>mcrinstaller</code> function to obtain name of binary.
<code>application_name.exe</code> (Windows)	Application created by MATLAB Compiler. Maci64 must include the bundle directory hierarchy.
<code>application_name</code> (UNIX)	
<code>application_name.app</code> (Maci64)	

Deploying to End Users

In this section...

“Steps by the Developer to Deploy to End Users” on page 7-3

“What Software Does the End User Need?” on page 7-5

“Using Relative Paths with Project Files” on page 7-7

“Porting Generated Code to a Different Platform” on page 7-8

“Extracting a Deployable Archive Without Executing the Contents” on page 7-8

Steps by the Developer to Deploy to End Users

For an end user to run an application or use a library that contains compiled MATLAB code, there are two sets of tasks. Some tasks are for the developer who developed the application or library, and some tasks are for the end user.

- 1 Create a package that contains the software needed at run time. See “Standalone Applications” on page 7-2 for more details.

Note The package for end users must include the `.ctf` file, which includes all the files in your preferences folder. Be aware of the following with regards to preferences:

- MATLAB preferences set at compile time are inherited by the compiled application. Therefore, include no files in your preferences folder that you do not want exposed to end users.
- Preferences set by a compiled application do not affect the MATLAB preferences, and preferences set in MATLAB do not affect a compiled application until that application is recompiled. MATLAB does not save your preferences folder until you exit MATLAB. Therefore, if you change your MATLAB preferences, stop and restart MATLAB before attempting to recompile using your new preferences.

The preferences folder is as follows:

- `$HOME/.matlab/current_release` on UNIX

- `systemroot\profiles\user\applicationdata\mathworks\matlab\current_release` on Windows

The folder will be stored in the deployable archive in a folder with a generated name, such as:

`mwapplication_mcr\myapplication_7CBEDC3E1DB3D462C18914C13CBFA649.`

- 2 Write instructions for the end user.
- 3 Distribute the package to your end user, along with the instructions.

Steps by the End User

- 1 Open the package containing the software needed at run time.
- 2 Run `MCRInstaller` *once* on the target machine, that is, the machine where you want to run the application or library. The `MCRInstaller` opens a command window and begins preparation for the installation. See “Install and Configure the MATLAB Runtime” on page 7-12.
- 3 If you are deploying a Java application to end users, they must set the class path on the target machine.

Note for Windows Applications You must have administrative privileges to install the MATLAB Runtime on a target machine since it modifies both the system registry and the system path.

Running the `MCRInstaller` after the MATLAB Runtime has been set up on the target machine requires only user-level privileges.

Using the MATLAB Runtime Installer

- 1 When the MATLAB Runtime installer wizard appears, click **Next** to begin the installation. Click **Next** to continue.
- 2 In the Select Installation Folder dialog box, specify where you want to install the MATLAB Runtime and whether you want to install it for just yourself or others. Click **Next** to continue.

Note The **Install MATLAB Runtime for yourself, or for anyone who uses this computer** option is not implemented for this release. The current default is **Everyone**.

3 Confirm your selections by clicking **Next**.

The installation begins. The process takes some time due to the quantity of files that are installed.

The installer automatically:

- Copies the necessary files to the target folder you specified.
 - Registers the components as needed.
 - Updates the system path to point to the MATLAB Runtime binary folder, which is `<target_directory>\<version>\runtime\win64`.
- 4 When the installation completes, click **Close** on the Installation Completed dialog box to exit.

What Software Does the End User Need?

The software required by end users depends on which of the following kinds of software is to be run by the user:

- “Standalone Compiled Application That Accesses Shared Library” on page 7-5
- “.NET Application” on page 7-6
- “COM Application” on page 7-6
- “Java Application” on page 7-7
- “Microsoft Excel Add-In” on page 7-7

Standalone Compiled Application That Accesses Shared Library

To distribute a shared library created with MATLAB Compiler to end users, create a package that includes the following files.

Component	Description
MATLAB Runtime installer(Windows)	Self-extracting MATLAB Runtime library utility; platform-dependent file that must correspond to the end user's platform.
matrixdriver.exe (Windows) matrixdriver (UNIX)	Application

Component	Description
<code>libmatrix</code>	Shared library; extension varies by platform. Extensions are: <ul style="list-style-type: none"> • Windows — <code>.dll</code> • Linux, Linux x86-64 — <code>.so</code> • Mac OS X — <code>.dylib</code>

.NET Application

To distribute a .NET application that uses assemblies created with MATLAB Compiler SDK, create a package that includes the following files.

Software Module	Description
<code>assemblyName.xml</code>	Documentation files
<code>assemblyName.pdb</code> (if Debug option is selected)	Program Database File, which contains debugging information
<code>assemblyName.dll</code>	Compiled assembly file
MATLAB Runtime installer	MATLAB Runtime installer (if not already installed on the target machine). Run <code>mcrinstaller</code> function to obtain name of executable.
<code>application.exe</code>	Application

COM Application

To distribute a COM application that uses components created with MATLAB Compiler SDK for .NET assemblies or MATLAB Compiler for Excel add-ins, create a package that includes the following files.

Software Module	Description
<code>componentname.ctf</code>	Deployable archive. This is a platform-dependent file that must correspond to the end user's platform.
<code>componentname_version.dll</code>	Component that contains compiled MATLAB code
<code>_install.bat</code>	Script run by the self-extracting executable

Software Module	Description
MATLAB Runtime installer	Self-extracting MATLAB Runtime library utility; platform-dependent file that must correspond to the end user's platform. The MATLAB Runtime installer installs MATLAB Runtime, which users of your component need to install on the target machine once per release. Run <code>mcrinstaller</code> function to obtain name of executable.
<code>application.exe</code>	Application

Java Application

To distribute a Java application created with MATLAB Compiler SDK, create a `packageName.jar` file. To deploy the application on computers without MATLAB, you must include the MATLAB Runtime when creating your Java package.

Microsoft Excel Add-In

To distribute an Excel add-in created with MATLAB Compiler, create a package that includes the following files.

Software Module	Description
<code>addinName_version.dll</code>	Add-in that contains compiled MATLAB code
<code>_install.bat</code>	Script run by the self-extracting executable
MATLAB Runtime installer	Self-extracting MATLAB Runtime library utility; platform-dependent file that must correspond to the end user's platform. Run <code>mcrinstaller</code> function to obtain name of executable.
<code>*.xla</code>	Any Excel add-in files found in <code>projectdirectory\distrib</code>

Using Relative Paths with Project Files

Project files now support the use of relative paths as of R2007b of MATLAB Compiler, enabling you to share a single project file for convenient deployment over the network. Simply share your project folder and use relative paths to define your project location to your distributed computers.

Porting Generated Code to a Different Platform

You can distribute an application generated by MATLAB Compiler to any target machine that has the same operating system as the machine on which the application was compiled. For example, if you want to deploy an application to a Windows machine, you must use the Windows version of MATLAB Compiler to build the application on a Windows machine.

Note Since binary formats are different on each platform, the artifacts generated by MATLAB Compiler cannot be moved from platform to platform as is.

To deploy an application to a machine with an operating system different from the machine used to develop the application, you must rebuild the application on the desired targeted platform. For example, if you want to deploy a previous application developed on a Windows machine to a Linux machine, you must use MATLAB Compiler on a Linux machine and completely rebuild the application. You must have a valid MATLAB Compiler license on both platforms to do this.

Extracting a Deployable Archive Without Executing the Contents

Deployable archives contain content (MATLAB files and MEX-files) that need to be extracted from the archive before they can be executed. In order to extract the archive you must override the default deployable archive embedding option. To do this, ensure that you run the compiler with the `-C` option.

The deployable archive automatically expands the first time you run a MATLAB Compiler generated artifact.

To expand an archive without running the application, you can use the `extractCTF` (.exe on Windows) standalone utility provided in the `matlabroot\toolbox\compiler\arch` folder, where `arch` is your system architecture, Windows = `win64`, Linux = `glnx86`, `x86-64` = `glnxa64`, and Mac OS X = `mac`. This utility takes the deployable archive as input and expands it into the folder in which it resides. For example, this command expands `hello.ctf` into the folder where it resides:

```
extractCTF hello.ctf
```

The archive expands into a folder called `hello_mcr`. In general, the name of the folder containing the expanded archive is `<componentname>_mcr`, where `componentname` is the name of the deployable archive without the extension.

Note To run `extractCTF` from any folder, you must add `matlabroot\toolbox\compiler\arch` to your `PATH` environment variable. Run `extractCTF.exe` from a system prompt. If you run it from MATLAB, be sure to use the bang (!) operator.

About the MATLAB Runtime

In this section...
“How is the MATLAB Runtime Different from MATLAB?” on page 7-10
“Performance Considerations and the MATLAB Runtime” on page 7-11

The MATLAB Runtime is a standalone set of shared libraries, MATLAB code, and other files that enables the execution of MATLAB files on computers without an installed version of MATLAB. Applications that use artifacts built with MATLAB Compiler SDK require access to an appropriate version of the MATLAB Runtime to run.

End-users of compiled artifacts without access to MATLAB must install the MATLAB Runtime on their computers or know the location of a network-installed MATLAB Runtime. The installers generated by the compiler apps may include the MATLAB Runtime installer. If you compiled your artifact using `mcc`, you should direct your end-users to download the MATLAB Runtime installer from the website <http://www.mathworks.com/products/compiler/mcr>.

See “Install and Configure the MATLAB Runtime” on page 7-12 for more information.

How is the MATLAB Runtime Different from MATLAB?

The MATLAB Runtime differs from MATLAB in several important ways:

- In the MATLAB Runtime, MATLAB files are encrypted and immutable.
- MATLAB has a desktop graphical interface. The MATLAB Runtime has all the MATLAB functionality without the graphical interface.
- The MATLAB Runtime is version-specific. You must run your applications with the version of the MATLAB Runtime associated with the version of MATLAB Compiler SDK with which it was created. For example, if you compiled an application using version 6.3 (R2016b) of MATLAB Compiler, users who do not have MATLAB installed must have version 9.1 of the MATLAB Runtime installed. Use `mcrversion` to return the version number of the MATLAB Runtime.
- The MATLAB paths in a MATLAB Runtime instance are fixed and cannot be changed. To change them, you must first customize them within MATLAB.

Performance Considerations and the MATLAB Runtime

MATLAB Compiler SDK was designed to work with a large range of applications that use the MATLAB programming language. Because of this, run-time libraries are large.

Since the MATLAB Runtime technology provides full support for the MATLAB language, including the Java programming language, starting a compiled application takes approximately the same amount of time as starting MATLAB. The amount of resources consumed by the MATLAB Runtime is necessary in order to retain the power and functionality of a full version of MATLAB.

Calls into the MATLAB Runtime are serialized so calls into the MATLAB Runtime are threadsafe. This can impact performance.

Install and Configure the MATLAB Runtime

In this section...

“Download the MATLAB Runtime Installer from the Web” on page 7-12

“Install the MATLAB Runtime Interactively” on page 7-12

“Install the MATLAB Runtime Non-Interactively” on page 7-14

“Install the MATLAB Runtime without Administrator Rights” on page 7-16

“Multiple MATLAB Runtime Versions on Single Machine” on page 7-16

“MATLAB and MATLAB Runtime on Same Machine” on page 7-17

“Uninstall MATLAB Runtime” on page 7-18

Download the MATLAB Runtime Installer from the Web

Download the MATLAB® Runtime from the website at <http://www.mathworks.com/products/compiler/mcr>.

Install the MATLAB Runtime Interactively

To install the MATLAB Runtime:

- 1 Unzip/Extract the archive containing the MATLAB Runtime installer.

Platform	Steps
Windows	<p>Double-click the self-extracting MATLAB Runtime installer that you downloaded from the web.</p> <p>For example, an R2017b runtime will have the name <code>MCR_R2017b_win64_installer.exe</code>. Double clicking the installer extracts the necessary files and automatically starts the installer.</p>

Platform	Steps
Linux	<p>Unzip the MATLAB Runtime installer at the terminal using the <code>unzip</code> command.</p> <p>For example, if you are unzipping the R2017b MATLAB Runtime installer, at the Terminal, type:</p> <pre>unzip MCR_R2017b_glnxa64_installer.zip</pre>
macOS	<p>Unzip the MATLAB Runtime installer at the terminal using the <code>unzip</code> command.</p> <p>For example, if you are unzipping the R2017b MATLAB Runtime installer, at the Terminal, type:</p> <pre>unzip MCR_R2017b_maci64_installer.dmg.zip</pre>

Note The release part of the installer filename (`_R2017b_`) will change from one release to the next.

2 Start the MATLAB Runtime installer.

Platform	Steps
Windows	<p>Installer automatically starts after completing the previous step.</p>
Linux	<p>At the Terminal, type:</p> <pre>sudo ./install</pre> <p>Note On Debian® based Linux distributions, you will need to type:</p> <pre>gksudo ./install</pre>
macOS	<p>At the Terminal, type:</p> <pre>./install</pre> <p>Note You may need to enter an administrator username and password after you run <code>./install</code>.</p>

- 3 When the MATLAB Runtime installer starts, it displays a dialog box. Read the information and then click **Next** to proceed with the installation.
- 4 Specify the folder in which you want to install the MATLAB Runtime in the **Folder Selection** dialog box.

Note On Windows systems, you can have multiple versions of the MATLAB Runtime on your computer but only one installation for any particular version. If you already have an existing installation, the MATLAB Runtime installer does not display the **Folder Selection** dialog box because you can only overwrite the existing installation in the same folder.

- 5 Confirm your choices and click **Next**.

The MATLAB Runtime installer starts copying files into the installation folder.

- 6 On Linux and macOS platforms, after copying files to your disk, the MATLAB Runtime installer displays the **Product Configuration Notes** dialog box. This dialog box contains information necessary for setting your path environment variables. Copy the path information from this dialog box and then click **Next**.
- 7 Click **Finish** to exit the installer.

Install the MATLAB Runtime Non-Interactively

To install the MATLAB Runtime without having to interact with the installer dialog boxes, use one of the MATLAB Runtime installer's non-interactive modes:

- **silent**—the installer runs as a background task and does not display any dialog boxes
- **automated**—the installer displays the dialog boxes but does not wait for user interaction

When run in silent or automated mode, the MATLAB Runtime installer uses default values for installation options. You can override these defaults by using MATLAB Runtime installer command-line options or an installer control file.

Note When running in silent or automated mode, the installer overwrites the default installation location.

Running the Installer in Silent Mode

To install the MATLAB Runtime in silent mode:

- 1 Extract the contents of the MATLAB Runtime installer file to a temporary folder, called `$temp` in this documentation.

Note On Windows systems, **manually** extract the contents of the installer file.

- 2 Run the MATLAB Runtime installer, specifying the `-mode` option and `-agreeToLicense yes` on the command line.

Note On most platforms, the installer is located at the root of the folder into which the archive was extracted. On Windows 64, the installer is located in the `archives bin` folder.

Platform	Command
Windows	<code>setup -mode silent -agreeToLicense yes</code>
Linux	<code>./install -mode silent -agreeToLicense yes</code>
macOS	<code>./install -mode silent -agreeToLicense yes</code>

Note If you do not include the `-agreeToLicense yes` the installer will not install the MATLAB Runtime.

- 3 View a log of the installation.

On Windows systems, the MATLAB Runtime installer creates a log file, named `mathworks_username.log`, where `username` is your Windows log-in name, in the location defined by your `TEMP` environment variable.

On Linux and macOS systems, the MATLAB Runtime installer displays the log information at the command prompt, unless you redirect it to a file.

Customizing a Non-Interactive Installation

When run in one of the non-interactive modes, the installer will use the default values unless told to do otherwise. Like the MATLAB installer, the MATLAB Runtime installer accepts a number of command line options that modify the default installation properties.

Option	Description
-destinationFolder	Specifies where the MATLAB Runtime will be installed.
-outputFile	Specifies where the installation log file is written.
-automatedModeTimeout	Specifies how long, in milliseconds, that the dialog boxes are displayed when run in automatic mode.
-inputFile	Specifies an installer control file with the values for all of the above options.

Note The MATLAB Runtime installer archive includes an example installer control file called `installer_input.txt`. This file contains all of the options available for a full MATLAB installation. Only the options listed in this section are valid for the MATLAB Runtime installer.

Install the MATLAB Runtime without Administrator Rights

To install the MATLAB Runtime as a user without administrator rights on Windows:

- 1 Use the MATLAB Runtime installer to install it on a Windows machine where you have administrator rights.
- 2 Copy the folder where the MATLAB Runtime was installed to the machine without administrator rights. You can compress the folder into zip file and distribute to multiple users.
- 3 On the machine without administrator rights, add the `mcr_root\runtime\arch` directory onto the user's path environment variable.

Note You don't need administrator rights for adding directories to a user's path environment variable.

Multiple MATLAB Runtime Versions on Single Machine

MCRInstaller supports the installation of multiple versions of the MATLAB Runtime on a target machine. This allows applications compiled with different versions of the MATLAB Runtime to execute side by side on the same machine.

If you do not want multiple MATLAB Runtime versions on the target machine, you can remove the unwanted ones. On Windows, run **Add or Remove Programs** from the Control Panel to remove any of the previous versions. On UNIX, you manually delete the unwanted MATLAB Runtime. You can remove unwanted versions before or after installation of a more recent version of the MATLAB Runtime, as versions can be installed or removed in any order.

MATLAB and MATLAB Runtime on Same Machine

You do not need to install MATLAB Runtime on your machine if your machine has MATLAB installed. The version of MATLAB should be the same as the version of MATLAB that was used to create the compiled MATLAB code. Also, to act as the MATLAB Runtime replacement, the MATLAB installation must include MATLAB Compiler.

You can, however, install the MATLAB Runtime for debugging purposes.

Modifying the Path

If you install MATLAB Runtime on a machine that already has MATLAB on it, you must adjust the library path according to your needs.

- **Windows**

To run deployed MATLAB code against MATLAB Runtime install, `mcr_root\ver\runtime\win64` must appear on your system path before `matlabroot\runtime\win64`.

If `mcr_root\ver\runtime\arch` appears first on the compiled application path, the application uses the files in the MATLAB Runtime install area.

If `matlabroot\runtime\arch` appears first on the compiled application path, the application uses the files in the MATLAB installation area.

- **UNIX**

To run deployed MATLAB code against MATLAB Runtime on Linux, Linux x86-64, or the `<mcr_root>/runtime/<arch>` folder must appear on your `LD_LIBRARY_PATH` before `matlabroot/runtime/<arch>`.

- **macOS**

To run deployed MATLAB code on macOS, the `<mcr_root>/runtime` folder must appear on your `DYLD_LIBRARY_PATH` before `matlabroot/runtime/<arch>`.

To run MATLAB on macOS or Intel® Mac, `matlabroot/runtime/<arch>` must appear on your `DYLD_LIBRARY_PATH` before the `<mcr_root>/bin` folder.

Uninstall MATLAB Runtime

The method you use to uninstall MATLAB Runtime from your computer varies depending on the type of computer.

Windows

- 1 Start the uninstaller.

From the Windows Start menu, search for the **Add or Remove Programs** control panel, and double-click MATLAB Runtime in the list.

You can also start the MATLAB Runtime uninstaller from the `mcr_root\uninstall\bin\arch` folder, where `mcr_root` is your MATLAB Runtime installation folder and `arch` is an architecture-specific folder, such as `win64`.

- 2 Select the MATLAB Runtime from the list of products in the Uninstall Products dialog box.
- 3 Click **Next**.
- 4 Click **Finish**.

Linux

- 1 Exit the application.
- 2 Enter this command at the Linux prompt:

```
rm -rf mcr_root
```

where `mcr_root` represents the name of your top-level MATLAB installation folder.

macOS

- 1 Exit the application.
- 2 Navigate to your MATLAB Runtime installation folder. For example, the installation folder might be named `MATLAB_Compiler_Runtime.app` in your Applications folder.

- 3** Drag your MATLAB Runtime installation folder to the trash, and then select **Empty Trash** from the Finder menu.

Deploy Standalone Application on Network Drive (Windows Only)

You can deploy a compiled standalone application to a network drive so that it can be accessed by all network users without having them install the MATLAB Runtime on their individual machines.

Note There is no need to perform these steps on a Linux system.

There is no requirement for `vc redistrib` on Linux, and the component registration is in support of MATLAB Compiler for Excel add-ins and COM components, which both run on Windows only.

Distributing to a Linux network file system is exactly the same as distributing to a local file system. You only need to set up the `LD_LIBRARY_PATH` or use scripts on page B-10 which points to the MATLAB Runtime installation.

- 1 On any Windows machine, run `mcrinstaller` function to obtain name of the MATLAB Runtime installer executable.
- 2 Copy the entire MATLAB Runtime folder onto a network drive.
- 3 Copy the compiled application into a separate folder in the network drive and add the path `<mcr_root>\<ver>\runtime\<arch>` to all client machines. All network users can then execute the application.
- 4 Run `vc redistrib_x86.exe` on for 32-bit clients; run `vc redistrib_x64.exe` for 64-bit clients.
- 5 If you are using for Excel add-ins, register `mwcomutil.dll` and `mwcommgr.dll` on every client machine.

If you are using .NET assemblies to create COM objects, register `mwcomutil.dll` on every client machine.

To register the DLLs, at the DOS prompt enter

```
mwregsvr <fully_qualified_pathname\dllname.dll>
```

These DLLs are located in `<mcr_root>\<ver>\runtime\<arch>`.

Note These libraries are automatically registered on the machine on which the installer was run.

MATLAB Compiler Deployment Messages

To enable display of MATLAB Compiler deployment messages, see the *MATLAB Desktop Tools and Environment* documentation.

Work with the MATLAB Runtime

- “MATLAB Runtime Startup Options” on page 8-2
- “Using the MATLAB Runtime User Data Interface” on page 8-4
- “Display the MATLAB Runtime Initialization Messages” on page 8-6

MATLAB Runtime Startup Options

Set MATLAB Runtime Options

Set MATLAB Runtime options, such as `-nojvm`, `-nodisplay`, or `-logfile` by performing either of the following tasks.

- Using the **Additional Runtime Settings** area of the compiler apps.
- Using the `mcc` command, specify the `-R` switch.

Use a Compiler App

In the **Additional Runtime Settings** area of the compiler apps, you can set the following options.

Note Not all options are available for all compilation targets.

Set MATLAB Runtime Startup Options Using the Compiler Apps

MATLAB Runtime Startup Option	This option...	Set the options by...
<code>-nojvm</code>	Disables the Java Virtual Machine (JVM™), which is enabled by default. This can help improve the MATLAB Runtime performance.	Select the No JVM checkbox.
<code>-nodisplay</code>	On Linux, launches the MATLAB Runtime without display functionality.	In the Settings box, enter <code>-R -nodisplay</code> .
<code>-logfile</code>	Writes information about the MATLAB Runtime startup to a logfile.	Select the Create log file checkbox. Enter the path to the logfile, including the logfile name, in the Log File box.

Set MATLAB Runtime Startup Options Using the `mcc` Command Line

When you use the command line, specify the `-R` switch to invoke the MATLAB Runtime startup options you want to use.

Following are examples of using `mcc -R` to invoke `-nojvm`, `-nodisplay`, and `-logfile` when building a C standalone (designated by the `-m` switch).

Set `-nojvm`

```
mcc -m -R -nojvm -v foo.m
```

Set `-nodisplay` (Linux Only)

```
mcc -m -R -nodisplay -v foo.m
```

Set `-logfile`

```
mcc -e -R '-logfile,bar.txt' -v foo.m
```

Set `-nojvm`, `-nodisplay`, and `-logfile` With One Command

```
mcc -m -R '-logfile,bar.txt,-nojvm,-nodisplay' -v foo.m
```

Using the MATLAB Runtime User Data Interface

The MATLAB Runtime User Data Interface lets you easily access MATLAB Runtime data. It allows keys and values to be passed between a MATLAB Runtime instance, the MATLAB code running on the MATLAB Runtime, and the host application that created the instance. Through calls to the MATLAB Runtime User Data Interface API, you access MATLAB Runtime data by creating a per-instance associative array of `mxArrays`, consisting of a mapping from string keys to `mxArray` values. Reasons for doing this include, but are not limited to the following:

- You need to supply run-time profile information to a client running an application created with the Parallel Computing Toolbox. You supply and change profile information on a per-execution basis. For example, two instances of the same application may run simultaneously with different profiles. See “Use Parallel Computing Toolbox in Deployed Applications” (MATLAB Compiler SDK) for more information.
- You want to set up a global workspace, a global variable or variables that MATLAB and your client can access.
- You want to store the state of any variable or group of variables.

The API consists of:

- Two MATLAB functions callable from within deployed application MATLAB code
- Four external C functions callable from within deployed application wrapper code

MATLAB Functions

Use the MATLAB functions `getmcruserdata` and `setmcruserdata` from deployed MATLAB applications. They are loaded by default only in applications created with the MATLAB Compiler or MATLAB Compiler SDK products.

Tip `getmcruserdata` and `setmcruserdata` will produce an `Unknown function error` when called in MATLAB if the `MCLMCR` module cannot be located. This can be avoided by calling `isdeployed` before calling `getmcruserdata` and `setmcruserdata`. For more information about the `isdeployed` function, see the `isdeployed` reference page.

Set and Retrieve MATLAB Runtime Data for Shared Libraries

There are many possible scenarios for working with MATLAB Runtime data. The most general scenario involves setting the MATLAB Runtime with specific data for later retrieval, as follows:

- 1 In your code, include the MATLAB Runtime header file and the library header generated by MATLAB Compiler SDK.
- 2 Properly initialize your application using `mclInitializeApplication`.
- 3 After creating your input data, write or “set” it to the MATLAB Runtime with `mxSetData`.
- 4 After calling functions or performing other processing, retrieve the new MATLAB Runtime data with `mxGetData`.
- 5 Free up storage memory in work areas by disposing of unneeded arrays with `mxDestroyArray`.
- 6 Shut down your application properly with `mclTerminateApplication`.

Display the MATLAB Runtime Initialization Messages

You can display a console message for end users that informs them when MATLAB Runtime initialization starts and completes.

To create these messages, use the `-R` option of the `mcc` command.

You have the following options:

- Use the default start-up message only (Initializing MATLAB runtime version `x.xx`)
- Customize the start-up or completion message with text of your choice. The default start-up message will also display prior to displaying your customized start-up message.

Some examples of different ways to invoke this option follow:

This command:	Displays:
<code>mcc -R -startmsg</code>	Default start-up message Initializing MATLAB Runtime version <code>x.xx</code>
<code>mcc -R -startmsg, 'user customized message'</code>	Default start-up message Initializing MATLAB Runtime version <code>x.xx</code> and <i>user customized message for start-up</i>
<code>mcc -R -completemsg, 'user customized message'</code>	Default start-up message Initializing MATLAB Runtime version <code>x.xx</code> and <i>user customized message for completion</i>
<code>mcc -R -startmsg, 'user customized message' -R -completemsg, 'user customized message'</code>	Default start-up message Initializing MATLAB Runtime version <code>x.xx</code> and <i>user customized message for both start-up and completion by specifying -R before each option</i>
<code>mcc -R -startmsg, 'user customized message', -completemsg, 'user customized message'</code>	Default start-up message Initializing MATLAB Runtime version <code>x.xx</code> and <i>user customized message for both start-up and completion by specifying -R only once</i>

Best Practices

Keep the following in mind when using `mcc -R`:

- When calling `mcc` in the MATLAB command window, place the comma inside the single quote.

```
mcc -m hello.m -R '-startmsg,"Message_Without_Space"'
```

- If your initialization message has a space in it, call `mcc` from the system command window or use `!mcc` from MATLAB.

Distributing Code to an End User

Distribute MATLAB Code Using the MATLAB Runtime

On target computers without MATLAB, install the MATLAB Runtime, if it is not already present on the deployment machine.

MATLAB Runtime

The MATLAB Runtime is an execution engine made up of the same shared libraries MATLAB uses to enable execution of MATLAB files on systems without an installed version of MATLAB.

The MATLAB Runtime is available for downloading from the web to simplify the distribution of your applications created using the MATLAB Compiler or the MATLAB Compiler SDK. Download the MATLAB Runtime from the MATLAB Runtime product page.

The MATLAB Runtime installer does the following:

- 1 Install the MATLAB Runtime.
- 2 Install the component assembly in the folder from which the installer is run.
- 3 Copy the `MWArray` assembly to the Global Assembly Cache (GAC), as part of installing the MATLAB Runtime.

MATLAB Runtime Prerequisites

- 1 The MATLAB Runtime installer requires administrator privileges to run.
- 2 The version of the MATLAB Runtime that runs your application on the target computer must be compatible with the version of MATLAB Compiler or MATLAB Compiler SDK that built the deployed code.
- 3 Do not install the MATLAB Runtime in MATLAB installation directories.
- 4 The MATLAB Runtime installer requires approximately 2 GB of disk space.

Add the MATLAB Runtime Installer to the Installer

This example shows how to include the MATLAB Runtime in the generated installer, using one of the compiler apps. The generated installer contains all files needed to run the standalone application or shared library built with MATLAB Compiler or MATLAB Compiler SDK and properly lays them out on a target system.

- 1 On the **Packaging Options** section of the compiler interface, select one or both of the following options:
 - **Runtime downloaded from web** — This option builds an installer that invokes the MATLAB Runtime installer from the MathWorks website.
 - **Runtime included in package** — The option includes the MATLAB Runtime installer into the generated installer.
- 2 Click **Package**.
- 3 Distribute the installer as needed.

Install the MATLAB Runtime

This example shows how to install the MATLAB Runtime on a system.

If you are given an installer containing the compiled artifacts, then the MATLAB Runtime is installed along with the application or shared library. If you are given just the raw binary files, download the MATLAB Runtime installer from the web and run the installer.

Note If you are running on a platform other than Windows, modify the path on the target machine. Setting the paths enables your application to find the MATLAB Runtime. For more information on setting the path, see “MATLAB Runtime Path Settings for Run-Time Deployment” (MATLAB Compiler SDK).

Windows paths are set automatically. On Linux and Mac, you can use the run script to set paths. See Appendix B for detailed information on performing all deployment tasks specifically with UNIX variants such as Linux and Mac.

Compiler Commands

This chapter describes `mcc`, which is the command that invokes the compiler.

- “Command Overview” on page 10-2
- “Include Files for Compilation Using `%#function`” on page 10-5
- “Compiler Tips” on page 10-7

Command Overview

In this section...

“Compiler Options” on page 10-2

“Combining Options” on page 10-2

“Conflicting Options on the Command Line” on page 10-3

“Using File Extensions” on page 10-3

“Interfacing MATLAB Code to C/C++ Code” on page 10-4

Compiler Options

`mcc` is the MATLAB command that invokes the compiler. You can issue the `mcc` command either from the MATLAB command prompt or the system prompt.

You may specify one or more option flags to `mcc`. Most option flags have a one-letter name. You can list options separately on the command line, for example,

```
mcc -m -v myfun
```

Macros are MathWorks supplied options that simplify the more common compilation tasks. Instead of manually grouping several options together to perform a particular type of compilation, you can use a simple macro option. You can always use individual options to customize the compilation process to satisfy your particular needs. For more information on macros, see “Simplify Compilation Using Macros” (MATLAB Compiler SDK).

Combining Options

You can group options that do not take arguments by preceding the list of option flags with a single dash (-), for example:

```
mcc -mv myfun
```

Options that take arguments cannot be combined unless you place the option with its arguments last in the list. For example, these formats are valid:

```
mcc -v -W main -T link:exe myfun           % Options listed separately  
mcc -vW main -T link:exe myfun           % Options combined
```

This format is *not* valid:

```
mcc -Wv main -T link:exe myfun
```

In cases where you have more than one option that takes arguments, you can only include one of those options in a combined list and that option must be last. You can place multiple combined lists on the `mcc` command line.

If you include any C or C++ file names on the `mcc` command line, the files are passed directly to `mbuild`, along with any MATLAB Compiler SDK generated C or C++ files.

Conflicting Options on the Command Line

If you use conflicting options, the compiler resolves them from left to right, with the rightmost option taking precedence. For example, using the equivalencies in “Macros” (MATLAB Compiler SDK),

```
mcc -m -W none test.m
```

is equivalent to:

```
mcc -W main -T link:exe -W none test.m
```

In this example, there are two conflicting `-W` options. After working from left to right, the compiler determines that the rightmost option takes precedence, namely, `-W none`, and the product does not generate a wrapper.

Caution Macros and regular options may both affect the same settings and may therefore override each other depending on their order in the command line.

Using File Extensions

The valid, recommended file extension for a file submitted to the compiler is `.m`. Always include the `.m` extension, when compiling with `mcc`.

Note `.p` files have precedence over `.m` files, therefore if both `.p` files and `.m` files reside in a folder, and a file name is specified without an extension, the `.p` file will be selected.

Interfacing MATLAB Code to C/C++ Code

To designate code to be compiled with C or C++, rewrite the C or C++ function as a MEX-file and call it from your application.

You can control whether the MEX-file or a MATLAB stub gets called by using the `isdeployed` function.

Code Proper Return Types From C and C++ Methods

To avoid potential problems, ensure all C methods you write (and reference from within MATLAB code) return a `bool` return type indicating the status. C++ methods should return nothing (`void`).

Include Files for Compilation Using `##function`

In this section...

“Using `feval`” on page 10-5

“Using `##function`” on page 10-5

Using `feval`

In standalone mode, the pragma `##function <function_name-list>` informs the compiler that the specified function(s) should be included in the compilation, whether or not the dependency analysis detects it. Without this pragma, the dependency analysis will not be able to locate and compile all MATLAB files used in your application. This pragma adds the top-level function as well as all the local functions in the file to the compilation.

You cannot use the `##function` pragma to refer to functions that are not available in MATLAB code.

Using `##function`

A good coding technique involves using `##function` in your code wherever you use `feval` statements. This example shows how to use this technique to help the compiler find the appropriate files during compile time, eliminating the need to include all the files on the command line.

```
function ret = mywindow(data,filterName)
%MYWINDOW Applies the window specified on the data.
%
% Get the length of the data.
N= length(data);

% List all the possible windows.
% Note the list of functions in the following function pragma is
% on a single line of code.
##function bartlett, barthannwin, blackman, blackmanharris,
bohmanwin, chebwin, flattopwin, gausswin, hamming, hann, kaiser,
nuttallwin, parzenwin, rectwin, tukeywin, triang
```

```
window = feval(filterName,N);  
% Apply the window to the data.  
ret = data.*window;
```

“Using the VER Function in a Compiled MATLAB Application” on page 10-11

Calling a Function from the Command Line

You can make a MATLAB function into a standalone that is directly callable from the system command line. All the arguments passed to the MATLAB function from the system command line are strings. Two techniques to work with these functions are:

- Modify the original MATLAB function to test each argument and convert the strings to numbers.
- Write a wrapper MATLAB function that does this test and then calls the original MATLAB function.

For example:

```
function x=foo(a, b)
    if (ischar(a)), a = str2num(a), end;
    if (ischar(b)), b = str2num(b), end;

% The rest of your MATLAB code here...
```

You only do this if your function expects numeric input. If your function expects strings, there is nothing to do because that's the default from the command line.

Using MAT-Files in Deployed Applications

To use a MAT-file in a deployed application, use the `-a` option to include the file in the deployable archive.

Compiling a GUI That Contains an ActiveX Control

When you save a GUI that contains ActiveX® components, GUIDE creates a file in the current folder for each such component. The file name consists of the name of the GUI followed by an underscore (`_`) and `activexn`, where `n` is a sequence number. For example, if the GUI is named `ActiveXcontrol` then the file name would be `ActiveXcontrol_activex1`. The file name does not have an extension.

If you use the `mcc` command to compile a GUIDE-created GUI that contains an ActiveX component, you must use the `-a` option to add the ActiveX control files that GUIDE saved in the current folder to the deployable archive. Your command should be similar to

```
mcc -m mygui -a mygui_activex1
```

where `mygui_activex1` is the name of the file. If you have more than one such file, use a separate `-a` option for each file.

Deploying Applications That Call the Java Native Libraries

If your application interacts with Java, you need to specify the search path for native method libraries by editing `librarypath.txt` and deploying it.

- 1 Copy `librarypath.txt` from `matlabroot/toolbox/local/librarypath.txt`.
- 2 Place `librarypath.txt` in `<mcr_root>/<ver>/toolbox/local`.

`<mcr_root>` refers to the complete path where the MATLAB Runtime library archive files are installed on your machine.

- 3 Edit `librarypath.txt` by adding the folder that contains the native library that your application's Java code needs to load.

Locating .fig Files in Deployed Applications

MATLAB Compiler and MATLAB Compiler SDK locate .fig files automatically when there is a MATLAB file with the same name as the .fig file in the same folder. If the .fig file does not follow this rule, it must be added with the `-a` option.

Terminating Figures by Force In an Application

The purpose of `mclWaitForFiguresToDie` is to block execution of a calling program as long as figures created in the deployed application are displayed.

`mclWaitForFiguresToDie` takes no arguments. Your application can call `mclWaitForFiguresToDie` any time during execution. Typically you use `mclWaitForFiguresToDie` when:

- There are one or more figures you want to remain open.
- The function that displays the graphics requires user input before continuing.

When `mclWaitForFiguresToDie` is called, execution of the calling program is blocked if any figures created by the calling object remain open.

Both .NET assemblies and Java packages use `mclWaitForFiguresToDie` through the use of wrapper methods. See “Block Console Display When Creating Figures” (MATLAB Compiler SDK) and “Execution of Applications that Create Figures” (MATLAB Compiler SDK) for more details and code fragment examples.

Caution Use caution when calling the `mclWaitForFiguresToDie` function. Calling this function from an interactive program like Excel can hang the application. This function should be called *only* from console-based programs.

Passing Arguments to and from a Standalone Application

To pass input arguments to a MATLAB Compiler generated standalone application, you pass them just as you would to any console-based application. For example, to pass a file called `helpfile` to the compiled function called `filename`, use

```
filename helpfile
```

To pass numbers or letters (e.g., 1, 2, and 3), use

```
filename 1 2 3
```

Do not separate the arguments with commas.

To pass matrices as input, use

```
filename "[1 2 3]" "[4 5 6]"
```

You have to use the double quotes around the input arguments if there is a space in it. The calling syntax is similar to the `dos` command. For more information, see the MATLAB `dos` command.

The things you should keep in mind for your MATLAB file before you compile are:

- The input arguments you pass to your application from a system prompt are considered as string input. If, in your MATLAB code before compilation, you are expecting the data in different format, say double, you will need to convert the string input to the required format. For example, you can use `str2num` to convert the string input to numerical data. You can determine at run time whether or not to do this by using the `isdeployed` function. If your MATLAB file expects numeric inputs in MATLAB, the code can check whether it is being run as a standalone application. For example:

```
function myfun (n1, n2)
if (isdeployed)
    n1 = str2num(n1);
    n2 = str2num(n2);
end
```

- You cannot return back values from your standalone application to the user. The only way to return values from compiled code is to either display it on the screen or store it in a file. To display your data on the screen, you either need to unsuppress (do not use semicolons) the commands whose results yield data you want to return to the screen or, use the `disp` command to display the value. You can then redirect these outputs to other applications using output redirection (`>` operator) or pipes (only on UNIX systems).

Passing Arguments to a Double-Clickable Application

On Windows, if you want to run the standalone application by double-clicking it, you can create a batch file that calls this standalone application with the specified input arguments. Here is an example of the batch file:

```
rem main.bat file that calls sub.exe with input parameters
sub "[1 2 3]" "[4 5 6]"
@echo off
pause
```

The last two lines of code keep your output on the screen until you press a key. If you save this file as `main.bat`, you can run your code with the specified arguments by double-clicking the `main.bat` icon.

Using Graphical Applications in Shared Library Targets

When deploying a GUI as a shared library to a C/C++ application, use `mclWaitForFiguresToDie` to display the GUI until it is explicitly terminated.

Using the VER Function in a Compiled MATLAB Application

When you use the `VER` function in a compiled MATLAB application, it will perform with the same functionality as if you had called it from MATLAB. However, be aware that when using `VER` in a compiled MATLAB application, only version information for toolboxes which the compiled application uses will be displayed.

Standalone Applications

This chapter describes how to use MATLAB Compiler to code and build standalone applications. You can distribute standalone applications to users who do not have MATLAB software on their systems.

- “Introduction” on page 11-2
- “Deploying Standalone Applications” on page 11-3

Introduction

Suppose you want to create an application that calculates the rank of a large magic square. One way to create this application is to code the whole application in C or C++; however, this would require writing your own magic square, rank, and singular value routines. An easier way to create this application is to write it as one or more MATLAB files, taking advantage of the power of MATLAB and its tools.

You can create MATLAB applications that take advantage of the mathematical functions of MATLAB, yet do not require that end users own MATLAB. Standalone applications are a convenient way to package the power of MATLAB and to distribute a customized application to your users.

The source code for standalone applications consists either entirely of MATLAB files or some combination of MATLAB files and MEX-files.

MATLAB Compiler takes your MATLAB files and generates a standalone executable that allows your MATLAB application to be invoked from outside of interactive MATLAB.

You can call MEX-files from MATLAB Compiler generated standalone applications. The MEX-files will then be loaded and called by the standalone code.

Deploying Standalone Applications

In this section...

“Compiling the Application” on page 11-3

“Testing the Application” on page 11-3

“Deploying the Application” on page 11-4

“Running the Application” on page 11-6

Compiling the Application

This example takes a MATLAB file, `magicsquare.m`, and creates a standalone application, `magicsquare`.

- 1 Copy the file `magicsquare.m` from

```
matlabroot\extern\examples\compiler
```

to your work folder.

- 2 To compile the MATLAB code, use

```
mcc -mv magicsquare.m
```

The `-m` option tells MATLAB Compiler (`mcc`) to generate a standalone application. The `-v` option (verbose) displays the compilation steps throughout the process and helps identify other useful information such as which third-party compiler is used and what environment variables are referenced.

This command creates the standalone application called `magicsquare` and additional files. The Windows platform appends the `.exe` extension to the name. See the table in “Standalone Executable” on page 6-2 for the complete list of files created.

Testing the Application

These steps test your standalone application on your development machine.

Note Testing your application on your development machine is an important step to help ensure that your application is compilable. To verify that your application compiled

properly, you must test all functionality that is available with the application. If you receive an error message similar to Undefined function or Attempt to execute script *script_name* as a function, it is likely that the application will not run properly on deployment machines. Most likely, your deployable archive is missing some necessary functions. Use `-a` to add the missing functions to the archive and recompile your code.

- 1 Update your path as described in “MATLAB Runtime Path Settings for Run-Time Deployment” on page 14-2
- 2 Run the standalone application from the system prompt (shell prompt on UNIX or DOS prompt on Windows) by typing the application name.

```
magicsquare.exe 4 (On Windows)
magicsquare 4 (On UNIX)
magicsquare.app/Contents/MacOS/magicsquare (On Maci64)
```

The results are:

```
ans =
    16     2     3    13
     5    11    10     8
     9     7     6    12
     4    14    15     1
```

Deploying the Application

You can distribute a MATLAB Compiler generated standalone application to any target machine that has the same operating system as the machine on which the application was compiled.

For example, if you want to deploy an application to a Windows machine, you must use MATLAB Compiler to build the application on a Windows machine. If you want to deploy the same application to a UNIX machine, you must use MATLAB Compiler on the same UNIX platform and completely rebuild the application. To deploy an application to multiple platforms requires MATLAB and MATLAB Compiler licenses on all the desired platforms.

Windows

Gather and package the following files and distribute them to the deployment machine.

Component	Description
MATLAB Runtime installer	Self-extracting MATLAB Runtime library utility; platform-dependent file that must correspond to the end user's platform. Run the <code>mcrinstaller</code> command to obtain name of executable.
magicsquare	Application; <code>magicsquare.exe</code> for Windows

UNIX

Distribute and package your standalone application on UNIX by packaging the following files and distributing them to the deployment machine.

Component	Description
MATLAB Runtime installer	MATLAB Runtime library archive; platform-dependent file that must correspond to the end user's platform. Run the <code>mcrinstaller</code> command to obtain name of the binary.
magicsquare	Application

Maci64

Distribute and package your standalone application on 64-bit Macintosh by copying, tarring, or zipping as described in the following table.

Component	Description
MATLAB Runtime installer	MATLAB Runtime library archive; platform-dependent file that must correspond to the end user's platform. Run the <code>mcrinstaller</code> command to obtain name of the binary.
magicsquare	Application

Component	Description
magicsquare.app	<p>Application bundle</p> <p>Assuming <code>foo</code> is a folder within your current folder:</p> <ul style="list-style-type: none"> • Distribute by copying: <pre>cp -R myapp.app foo</pre> • Distribute by tarring: <pre>tar -cvf myapp.tar myapp.app cd foo tar -xvf ../ myapp.tar</pre> • Distribute by zipping: <pre>zip -ry myapp myapp.app cd foo unzip ../myapp.zip</pre>

Running the Application

These steps describe the process that end users must follow to install and run the application on their machines.

Preparing Your Machines

Install the MATLAB Runtime by running the `mcrinstaller` command to obtain name of the executable or binary. For more information on running the MATLAB Runtime installer utility and modifying your system paths, see “MATLAB Runtime” on page 9-2.

Executing the Application

Run the `magicsquare` standalone application from the system prompt and provide a number representing the size of the desired magic square, for example, 4.

```
magicsquare 4
```

The results are displayed as:

```
ans =
    16     2     3    13
     5    11    10     8
```

9	7	6	12
4	14	15	1

Note Input arguments you pass to and from a system prompt are treated as string input and you need to consider that in your application. For more information, see “Passing Arguments to and from a Standalone Application” on page 10-9.

Note Before executing your MATLAB Compiler generated executable, set the `LD_PRELOAD` environment variable to `\lib\libgcc_s.so.1`.

Executing the Application on 64-Bit Macintosh (Maci64)

For 64-bit Macintosh, you run the application through the bundle:

```
magicsquare.app/Contents/MacOS/magicsquare
```

Troubleshooting

- “Common Issues” on page 12-2
- “Compilation Failures” on page 12-3
- “Testing Failures” on page 12-7
- “Investigate Deployed Application Failures” on page 12-10
- “Troubleshoot mbuild” on page 12-12
- “MATLAB Compiler” on page 12-14
- “Deployed Applications” on page 12-17
- “Error and Warning Messages” on page 12-21

Common Issues

Some of the most common issues encountered when using MATLAB Compiler generated standalone executables:

- **Compilation fails with an error message.** This can indicate a failure during any one of the internal steps involved in producing the final output.
- **Compilation succeeds but the application does not execute because required DLLs are not found.** All shared libraries required for your standalone executable or shared library are contained in the MATLAB Runtime. Installing the MATLAB Runtime is required for any of the deployment targets.
- **Compilation succeeds, and the resultant file starts to execute but then produces errors and/or generates a crash dump.**
- **The compiled program executes on the machine where it was compiled but not on other machines.**
- **The compiled program executes on some machines and not others.**

Compilation Failures

You typically compile your MATLAB code on a development machine, test the resulting executable on that machine, and deploy the executable and MATLAB Runtime to a test or customer machine without MATLAB. The compilation process performs dependency analysis on your MATLAB code, creates an encrypted archive of your code and required toolbox code, generates wrapper code, and compiles the wrapper code into an executable. If your application fails to build an executable, the following questions may help you isolate the problem.

Are error messages produced at compile time?

See error messages in “MATLAB Compiler” on page 12-14.

Did you compile with the verbose flag?

Compilation can fail in MATLAB because of errors encountered by the system compiler when the generated wrapper code is compiled into an executable. Additional errors and warnings are printed when you use the verbose flag as such:

```
mcc -mv myApplication.m
```

In this example, `-m` tells MATLAB Compiler to create a standalone application and `-v` tells MATLAB Compiler and other processors to display messages about the process.

Are you compiling within or outside of MATLAB?

`mcc` can be invoked from the operating system command line or from the MATLAB prompt. When you run `mcc` inside the MATLAB environment, MATLAB will modify environment variables in its environment as necessary so `mcc` will run. Issues with `PATH`, `LD_LIBRARY_PATH`, or other environment variables seen at the operating system command line are often not seen at the MATLAB prompt. The environment that MATLAB uses for `mcc` can be listed at the MATLAB prompt. For example:

```
>>!set
```

lists the environment on Windows platforms.

```
>>!printenv
```

lists the environment on UNIX platforms. Using this path allows you to use `mcc` from the operating system command line.

Does a simple read/write application such as “Hello World” compile successfully?

Sometimes applications won't compile because of MEX-file issues, other toolboxes, or other dependencies. Compiling a `helloworld` application can determine if MATLAB Compiler is correctly set up to produce any executable. For example, try compiling:

```
function helloworld
    disp('hello world')
```

with:

```
>>mcc -mv helloworld.m
```

Have you tried to compile any of the examples in MATLAB Compiler help?

The source code for all examples is provided with MATLAB Compiler and is located in `matlabroot\extern\examples\compiler`, where `matlabroot` is the root folder of your MATLAB installation.

Did the MATLAB code compile successfully before this failure?

The three most common reasons for MATLAB code to stop compiling are:

- A change in the selection of the system compiler — It is possible to inadvertently change the system compiler for versions of MATLAB that store preferences in a common folder. For example, MATLAB 7.0.1 (R14SP1) and MATLAB 7.0.4 (R14SP2) store their preferences in the same folder. Changing the system compiler in R14SP1 will also change the system compiler in R14SP2.
- An upgrade to MATLAB that didn't include an upgrade to MATLAB Compiler — The versions of MATLAB Compiler and MATLAB must be the same in order to work together. It is possible to see conflicts in installations where the MATLAB installation is local and the MATLAB Compiler installation is on a network or vice versa.

Are you receiving errors when trying to compile a standalone executable?

If you are not receiving error messages to help you debug your standalone application, write an application to display the warnings or error messages to the console.

Are you receiving errors when trying to compile a shared library?

Errors at compile time can indicate issues with either `mcc` or `mbuild`. For troubleshooting `mcc` issues, see the previous section on compile time issues. It is

recommended that your driver application be compiled and linked using `mbuild`. `mbuild` can be executed with the `-v` switch to provide additional information on the compilation process. If you receive errors at this stage, ensure that you are using the correct header files and/or libraries produced by `mcc`, in your C or C++ driver. For example:

```
mcc -B csharedlib:hellolib hello.m
```

produces `hellolib.h`, which is required to be included in your C/C++ driver, and `hellolib.lib` or `hellolib.so`, which is required on the `mbuild` command line.

Is your MATLAB object failing to load?

If your MATLAB object fails to load, it is typically a result of the MATLAB Runtime not finding required class definitions.

When working with MATLAB objects, remember to include the following statement in your MAT file:

```
 %#function class_constructor
```

Using the `%#function` pragma in this manner forces dependency analyzer to load needed class definitions, enabling the MATLAB Runtime on page 9-2 to successfully load the object.

If you are compiling a driver application, are you using mbuild?

MathWorks recommends and supports using `mbuild` to compile your driver application. `mbuild` is designed and tested to correctly build driver applications. It will ensure that all MATLAB header files are found by the C/C++ compiler, and that all necessary libraries are specified and found by the linker.

Are you trying to compile your driver application using Microsoft Visual Studio or another IDE?

If you are using an IDE, in addition to linking to the generated export library, you need to include an additional dependency to `mclmcr rt.lib`. This library is provided for all supported third-party compilers in `matlabroot\extern\lib\vendor-name`.

Are you importing the correct versions of import libraries?

If you have multiple versions of MATLAB installed on your machine, it is possible that an older or incompatible version of the library is referenced. Ensure that the only

MATLAB library that you are linking to is `mclmcr rt.lib` and that it is referenced from the appropriate vendor folder. Do not reference libraries as `libmx` or `libut`. In addition, verify that your library path references the version of MATLAB that your shared library was built with.

Do you get the `MATLAB:I18n:InconsistentLocale` Warning?

The warning message

```
MATLAB:I18n:InconsistentLocale - The system locale setting,  
system_locale_name, is different from the user locale  
setting, user_locale_name
```

indicates a mismatch between locale setting on Microsoft Windows systems. This may affect your ability to display certain characters. For information about changing the locale settings, see your operating system Help.

Testing Failures

After you have successfully compiled your application, the next step is to test it on a development machine and deploy it on a target machine. Typically the target machine does not have a MATLAB installation and requires that the MATLAB Runtime be installed. A distribution includes all of the files that are required by your application to run, which include the executable, deployable archive and the MATLAB Runtime.

See “Deploying to Developers” on page 7-2 and “Deploying to End Users” on page 7-3 for information on distribution contents for specific application types and platforms.

Test the application on the development machine by running the application against the MATLAB Runtime shipped with MATLAB Compiler. This will verify that library dependencies are correct, that the deployable archive can be extracted and that all MATLAB code, MEX—files and support files required by the application have been included in the archive. If you encounter errors testing your application, the questions in the column to the right may help you isolate the problem.

Are you able to execute the application from MATLAB?

On the development machine, you can test your application's execution by issuing `!
application-name` at the MATLAB prompt. If your application executes within MATLAB but not from outside, this can indicate an issue with the system `PATH` variable.

Does the application begin execution and result in MATLAB or other errors?

Ensure that you included all necessary files when compiling your application (see the `readme.txt` file generated with your compilation for more details).

Functions that are called from your main MATLAB file are automatically included by MATLAB Compiler; however, functions that are not explicitly called, for example through `EVAL`, need to be included at compilation using the `-a` switch of the `mcc` command. Also, any support files like `.mat`, `.txt`, or `.html` files need to be added to the archive with the `-a` switch. There is a limitation on the functionality of MATLAB and associated toolboxes that can be compiled. Check the documentation to see that the functions used in your application's MATLAB files are valid. Check the file `mccExcludedFiles.log` on the development machine. This file lists all functions called from your application that cannot be compiled.

Does the application emit a warning like "MATLAB file may be corrupt"?

See the listing for this error message in “MATLAB Compiler” on page 12-14 for possible solutions.

Do you have multiple MATLAB versions installed?

Executables generated by MATLAB Compiler are designed to run in an environment where multiple versions of MATLAB are installed. Some older versions of MATLAB may not be fully compatible with this architecture.

On Windows, ensure that the `matlabroot\runtime\win64` of the version of MATLAB in which you are compiling appears ahead of `matlabroot\runtime\win64` of other versions of MATLAB installed on the `PATH` environment variable on your machine.

Similarly, on UNIX, ensure that the dynamic library paths (`LD_LIBRARY_PATH` on Linux) match. Do this by comparing the outputs of `!printenv` at the MATLAB prompt and `printenv` at the shell prompt. Using this path allows you to use `mcc` from the operating system command line.

If you are testing a standalone executable or shared library and driver application, did you install the MATLAB Runtime?

All shared libraries required for your standalone executable or shared library are contained in the MATLAB Runtime. Installing the MATLAB Runtime is required for any of the deployment targets.

Do you receive an error message about a missing DLL?

Error messages indicating missing DLLs such as `mclmcrrt7x.dll` or `mclmcrrt7x.so` are generally caused by incorrect installation of the MATLAB Runtime. It is also possible that the MATLAB Runtime is installed correctly, but that the `PATH`, `LD_LIBRARY_PATH`, or `DYLD_LIBRARY_PATH` variables are set incorrectly. For information on installing the MATLAB Runtime on a deployment machine, see “Install and Configure the MATLAB Runtime” on page 7-12.

Caution Do not solve these problems by moving libraries or other files within the MATLAB Runtime folder structure. The system is designed to accommodate different MATLAB Runtime versions operating on the same machine. The folder structure is an important part of this feature.

Does your system's graphics card support the graphics application?

In situations where the existing hardware graphics card does not support the graphics application, you should use software OpenGL. OpenGL libraries are visible for an application by appending `matlab/sys/opengl/lib/arch` to the `LD_LIBRARY_PATH`. For example:

```
setenv LD_LIBRARY_PATH $LD_LIBRARY_PATH:matlab/sys/opengl/lib/arch
```

For issues with MATLAB graphics in Linux, set the environment variable `LD_LIBRARY_PATH` to:

```
setenv LD_LIBRARY_PATH $MATLAB/sys/opengl/lib/glnxa64:$LD_LIBRARY_PATH
```

Is OpenGL properly installed on your system?

When searching for OpenGL libraries, the MATLAB Runtime first looks on the system library path. If OpenGL is not found there, it will use the `LD_LIBRARY_PATH` environment variable to locate the libraries. If you are getting failures due to the OpenGL libraries not being found, you can append the location of the OpenGL libraries to the `LD_LIBRARY_PATH` environment variable. For example:

```
setenv LD_LIBRARY_PATH $LD_LIBRARY_PATH:matlab/sys/opengl/lib/arch
```

Investigate Deployed Application Failures

After the application is working on the test machine, failures can be isolated in end-user deployment. The end users of your application need to install the MATLAB Runtime on their machines. The MATLAB Runtime includes a set of shared libraries that provides support for all features of MATLAB. If your application fails during end-user deployment, the following questions in the column to the right may help you isolate the problem.

Note There are a number of reasons why your application might not deploy to end users, after running successfully in a test environment. For a detailed list of guidelines for writing MATLAB code that can be consumed by end users, see “Write Deployable MATLAB Code” on page 5-10

Is the MATLAB Runtime installed?

All shared libraries required for your standalone executable or shared library are contained in the MATLAB Runtime. Installing the MATLAB Runtime is required for any of the deployment targets. See “Install and Configure the MATLAB Runtime” on page 7-12 for complete information.

If running on UNIX or Mac, did you update the dynamic library path after installing the MATLAB Runtime?

For information on installing the MATLAB Runtime on a deployment machine, see “Install and Configure the MATLAB Runtime” on page 7-12.

Do you receive an error message about a missing DLL?

Error messages indicating missing DLLs such as `mclmcr7x.dll` or `mclmcr7x.so` are generally caused by incorrect installation of the MATLAB Runtime. It is also possible that the MATLAB Runtime is installed correctly, but that the `PATH`, `LD_LIBRARY_PATH`, or `DYLD_LIBRARY_PATH` variables are set incorrectly. For information on installing the MATLAB Runtime on a deployment machine, see “Install and Configure the MATLAB Runtime” on page 7-12.

Caution Do not solve these problems by moving libraries or other files within the MATLAB Runtime folder structure. The system is designed to accommodate different

MATLAB Runtime versions operating on the same machine. The folder structure is an important part of this feature.

Do you have write access to the directory the application is installed in?

The first operation attempted by a compiled application is extraction of the deployable archive. If the archive is not extracted, the application cannot access the compiled MATLAB code and the application fails. If the application has write access to the installation folder, a subfolder named *application-name_mcr* is created the first time the application is run. After this subfolder is created, the application no longer needs write access for subsequent executions.

Are you executing a newer version of your application?

When deploying a newer version of an executable, both the executable needs to be redeployed, since it also contains the embedded deployable archive. The deployable archive is keyed to a specific compilation session. Every time an application is recompiled, a new, matched deployable archive is created. As above, write access is required to expand the new deployable archive. Deleting the existing *application-name_mcr* folder and running the new executable will verify that the application can expand the new deployable archive.

Troubleshoot mbuild

This section identifies some of the more common problems that might occur when configuring `mbuild` to create standalone applications.

Options File Not Writable. When you run `mbuild -setup`, `mbuild` makes a copy of the appropriate options file and writes some information to it. If the options file is not writable, you are asked if you want to overwrite the existing options file. If you choose to do so, the existing options file is copied to a new location and a new options file is created.

Directory or File Not Writeable. If a destination folder or file is not writable, ensure that the permissions are properly set. In certain cases, make sure that the file is not in use.

mbuild Generates Errors. If you run `mbuild filename` and get errors, it may be because you are not using the proper options file. Run `mbuild -setup` to ensure proper compiler and linker settings.

Compiler and/or Linker Not Found. On Windows, if you get errors such as unrecognized command or file not found, make sure the command-line tools are installed and the path and other environment variables are set correctly in the options file. For Microsoft Visual Studio®, for example, make sure to run `vcvars32.bat` (MSVC 6.x and earlier) or `vsvars32.bat` (MSVC 8.x and later).

mbuild Not a Recognized Command. If `mbuild` is not recognized, verify that `matlabroot\bin` is in your path. On UNIX, it may be necessary to rehash.

mbuild Works from the Shell But Not from MATLAB (UNIX). If the command

```
gcc -m hello
```

works from the UNIX command prompt but not from the MATLAB prompt, you may have a problem with your `.cshrc` file. When MATLAB launches a new C shell to perform compilations, it executes the `.cshrc` script. If this script causes unexpected changes to the `PATH` environment variable, an error may occur. You can test this before starting MATLAB by performing the following:

```
setenv SHELL /bin/sh
```

If this works correctly, then you should check your `.cshrc` file for problems setting the `PATH` environment variable.

Cannot Locate Your Compiler (Windows). If `mbuild` has difficulty locating your installed compilers, it is useful to know how it finds compilers. `mbuild` automatically detects your installed compilers by first searching for locations specified in the following environment variables:

- **Cannot Locate Your Compiler (Windows).** `MSVCDIR` for Microsoft Visual C++[®], Version 6.0 or 8.0

Next, `mbuild` searches the Windows registry for compiler entries.

Internal Error when Using `mbuild -setup` (Windows). Some antivirus software packages may conflict with the `mbuild-setup` process. If you get an error message during `mbuild -setup` of the following form

```
mex.bat: internal error in sub get_compiler_info(): don't  
recognize <string>
```

then you need to disable your antivirus software temporarily and rerun `mbuild-setup`. After you have successfully run the `setup` option, you can re-enable your antivirus software.

Verification of `mbuild` Fails. If none of the previous solutions addresses your difficulty with `mbuild`, contact Technical Support at MathWorks at http://www.mathworks.com/contact_TS.html.

MATLAB Compiler

Typically, problems that occur when building standalone applications involve `mbuild`. However, it is possible that you may run into some difficulty with MATLAB Compiler. A good source for additional troubleshooting information for the product is the MATLAB Compiler Product Support page at the MathWorks website.

libmwapack: load error: stgsy2_. This error occurs when a customer has both the R13 and the R14 version of MATLAB or MATLAB Runtime/MGL specified in the folder path and the R14 version fails to load because of a `lapack` incompatibility.

Licensing Problem. If you do not have a valid license for MATLAB Compiler, you will get an error message similar to the following when you try to access MATLAB Compiler:

```
Error: Could not check out a Compiler License:  
No such feature exists.
```

If you have a licensing problem, contact MathWorks. A list of contacts at MathWorks is provided at the beginning of this document.

loadlibrary usage (MATLAB loadlibrary command). The following are common error messages encountered when attempting to compile the MATLAB `loadlibrary` function or run an application that uses the MATLAB `loadlibrary` function with MATLAB Compiler:

- Output argument 'notfound' was not assigned during call to 'loadlibrary'.

```
Warning: Function call testloadlibcompile  
invokes inexact match  
d:\work\testLoadLibCompile_mcr\  
testLoadLibCompile\testLoadLibCompile.m.
```

```
??? Error using ==> loadlibrary  
Call to Perl failed. Possible error processing header file.  
Output of Perl command:  
Error using ==> perl  
All input arguments must be valid strings.
```

```
Error in ==> testLoadLibCompile at 4
```

- MATLAB:loadlibrary:cannotgeneratemfile
There was an error running the loader mfile.
Use the mfilename option

```

to produce a file that you can debug and fix.
Please report this
error to the MathWorks so we can improve this
function.
??? Error using ==> feval
Undefined function or variable 'GHlinkTest_proto'.

Error in ==> loadtest at 6

```

For information about how to properly invoke the MATLAB `loadlibrary` function with MATLAB Compiler, see “Calling Shared Libraries in Deployed Applications” on page 5-14 in the Deploying MATLAB Code section in your product user's guide.

MATLAB Compiler Does Not Generate the Application. If you experience other problems with MATLAB Compiler, contact Technical Support at MathWorks at http://www.mathworks.com/contact_TS.html.

"MATLAB file may be corrupt" Message Appears. If you receive the message

```

This MATLAB file does not have proper version information and
may be corrupt. Please delete the extraction directory and
rerun the application.

```

when you run your standalone application that was generated by MATLAB Compiler, you should check the following:

- **"MATLAB file may be corrupt" Message Appears.** Do you have a `startup.m` file that calls `addpath`? If so, this will cause run-time errors. As a workaround, use `isdeployed` to have the `addpath` command execute only from MATLAB. For example, use a construct such as:

```

if ~isdeployed
    addpath(path);
end

```

- **"MATLAB file may be corrupt" Message Appears.** Verify that the `.ctf` archive file self extracted and that you have write permission to the folder.
- **"MATLAB file may be corrupt" Message Appears.** Verify that none of the files in the `<application name>_mcr` folder have been modified or removed. Modifying this folder is not supported, and if you have modified it, you should delete it and redeploy or restart the application.

- **"MATLAB file may be corrupt" Message Appears.** If none of the above possible causes apply, then the error is likely caused by a corruption. Delete the `<application name>_mcr` folder and run the application.

Missing Functions in Callbacks. If your application includes a call to a function in a callback string or in a string passed as an argument to the `feval` function or an ODE solver, and this is the only place in your MATLAB file this function is called, MATLAB Compiler will not compile the function. MATLAB Compiler does not look in these text strings for the names of functions to compile. See “Fixing Callback Problems: Missing Functions” on page 13-3 for more information.

"MCRInstance not available" Message Appears. If you receive the message `MCRInstance not available` when you try to run a standalone application that was generated with MATLAB Compiler, it can be that the MATLAB Runtime is not located properly on your path or the deployable archive is not in the proper folder (if you extracted it from your binary). The UNIX verification process is the same, except you use the appropriate UNIX path information.

To verify that the MATLAB Runtime is properly located on your path, from a development Windows machine, confirm that `matlabroot\runtime\win64`, where `matlabroot` is your root MATLAB folder, appears on your system path ahead of any other MATLAB installations.

From a Windows target machine, verify that `<mcr_root>\<ver>\runtime\win64`, where `<mcr_root>` is your root MATLAB Runtime folder, appears on your system path. To verify that the deployable archive that MATLAB Compiler generated in the build process resides in the same folder as your program's file, look at the folder containing the program's file and make sure the corresponding `.ctf` file is also there.

No Info.plist file in application bundle or no... On 64-bit Macintosh, indicates the application is not being executed through the bundle.

Deployed Applications

Failed to decrypt file. The MATLAB file "<ctf_root>\toolbox\compiler\deploy\matlabrc.m" cannot be executed. The application is trying to use a deployable archive that does not belong to it. Applications and deployable archives are tied together at compilation time by a unique cryptographic key, which is recorded in both the application and the deployable archive. The keys must match at run time. If they don't match, you will get this error. To work around this, delete the *_mcr folder corresponding to the deployable archive and then rerun the application. If the same failure occurs, you will likely need to recompile the application using MATLAB Compiler and copy both the application binary and the deployable archive into the installation folder.

This application has requested the run time to terminate in an unusual way. This indicates a segmentation fault or other fatal error. There are too many possible causes for this message to list them all. To try to resolve this problem, run the application in the debugger and try to get a stack trace or locate the line on which the error occurs. Fix the offending code, or, if the error occurs in a MathWorks library or generated code, contact MathWorks technical support.

Checking access to X display <IP-address>:0.0 . . . If no response hit ^C and fix host or access control to host. Otherwise, checkout any error messages that follow and fix . . . Successful. . . . This message can be ignored.

??? Error: File: /home/username/<MATLAB file_name>Line: 1651 Column: 8 Arguments to IMPORT must either end with ".*" or else specify a fully qualified class name: "<class_name>" fails this test. The import statement is referencing a Java class (<class_name>) that MATLAB Compiler (if the error occurs at compile time) or the MATLAB Runtime (if the error occurs at run time) cannot find. To work around this, ensure that the JAR file that contains the Java class is stored in a folder that is on the Java class path. (See *matlabroot/toolbox/local/classpath.txt* for the class path.) If the error occurs at run time, the classpath is stored in *matlabroot/toolbox/local/classpath.txt* when running on the development machine. It is stored in <mcr_root>/toolbox/local/classpath.txt when running on a target machine.

Warning: Unable to find Java library: matlabroot\sys\java\jre\win64\jre<version>\bin\client\jvm.dll Warning: Disabling Java support. This warning indicates that a compiled application can not find the Java virtual machine, and therefore, the compiled application cannot run any Java code. This will affect your ability to display graphics. To resolve this, ensure that *jvm.dll* is in the

`matlabroot\sys\java\jre\win64\jre<version>\bin\client` folder and that this folder is on your system path.

Undefined function or variable 'matlabrc'. When MATLAB or the MATLAB Runtime starts, they attempt to execute the MATLAB file `matlabrc.m`. This message means that this file cannot be found. To work around this, try each of these suggestions in this order:

- **Undefined function or variable 'matlabrc'.** Ensure that your application runs in MATLAB (uncompiled) without this error.
- **Undefined function or variable 'matlabrc'.** Ensure that MATLAB starts up without this error.
- **Undefined function or variable 'matlabrc'.** Verify that the generated deployable archive contains a file called `matlabrc.m`.
- **Undefined function or variable 'matlabrc'.** Verify that the generated code (in the `*_mcc_component_data.c*` file) adds the deployable archive folder containing `matlabrc.m` to the MATLAB Runtime path.
- **Undefined function or variable 'matlabrc'.** Delete the `*_mcr` folder and rerun the application.
- **Undefined function or variable 'matlabrc'.** Recompile the application.

This MATLAB file does not have proper version information and may be corrupt. Please delete the extraction directory and rerun the application. The MATLAB file <MATLAB file> cannot be executed.

MATLAB:err_parse_cannot_run_m_file. This message is an indication that the MATLAB Runtime has found nonencrypted MATLAB files on its path and has attempted to execute them. This error is often caused by the use of `addpath`, either explicitly in your application, or implicitly in a `startup.m` file. If you use `addpath` in a compiled application, you must ensure that the added folders contain only data files. (They cannot contain MATLAB files, or you'll get this error.) To work around this, protect your calls to `addpath` with the `isdeployed` function.

This application has failed to start because mclmcr7x.dll was not found. Reinstalling the application may fix this problem. `mclmcr7x.dll` contains the public interface to the MATLAB Runtime. This library must be present on all machines that run applications generated by MATLAB Compiler. Typically, this means that either the MATLAB Runtime is not installed on this machine, or that the `PATH` does not contain the folder where this DLL is located. To work around this, install the MATLAB Runtime

or modify the path appropriately. The path must contain `<mcr_root>\<version>\runtime\<arch>`, for example: `c:\mcr\v73\runtime\win64`.

Linker cannot find library and fails to create standalone application (win64). If you try building your standalone application without `mbuild`, you must link to the following dynamic library:

```
mclmcr rt.lib
```

This library is found in one of the following locations, depending on your architecture:

```
matlabroot\extern\lib\arch
matlabroot\extern\lib\win64\arch
```

where `arch` is `microsoft` or `watcom`.

Error: library mclmcr rt84.dll not found. This error can occur for the following reasons:

- **Error: library mclmcr rt84.dll not found.** The machine on which you are trying to run the application an different, incompatible version of the MATLAB Runtime installed on it than the one the application was originally built with.
- **Error: library mclmcr rt84.dll not found.** You are not running a version of MATLAB Compiler compatible with the MATLAB Runtime version the application was built with.

To solve this problem, on the deployment machine, install the version of MATLAB you used to build the application.

Invalid .NET Framework. \n **Either the specified framework was not found or is not currently supported.** This error occurs when the .NET Framework version your application is specifying (represented by `n`) is not supported by the current version of MATLAB Compiler. See the MATLAB Compiler SDK Release Notes for a list of supported .NET Framework versions.

MATLAB:I18n:InconsistentLocale. The warning message

```
MATLAB:I18n:InconsistentLocale - The system locale setting,
system_locale_name, is different from the user locale
setting, user_locale_name
```

indicates a mismatch between locale setting on Microsoft Windows systems. This may affect your ability to display certain characters. For information about changing the locale settings, see your operating system Help.

System.AccessViolationException: Attempted to read or write protected memory. The message:

```
System.ArgumentException: Generate Queries
    threw General Exception:
System.AccessViolationException: Attempted to
    read or write protected memory.
This is often an indication that other memory is corrupt.
```

indicates a library initialization error caused by a Microsoft Visual Studio project linked against a `MCLMCRRT7XX.DLL` placed outside `matlabroot`.

Error and Warning Messages

In this section...

“About Error and Warning Messages” on page 12-21

“Compile-Time Errors” on page 12-21

“Warning Messages” on page 12-25

“Dependency Analysis Errors” on page 12-27

About Error and Warning Messages

This appendix lists and describes error messages and warnings generated by the compiler. Compile-time messages are generated during the compile or link phase. It is useful to note that most of these compile-time error messages should not occur if the MATLAB software can successfully execute the corresponding MATLAB file.

Use this reference to:

- Confirm that an error has been reported
- Determine possible causes for an error
- Determine possible ways to correct an error

When using MATLAB Compiler SDK, if you receive an internal error message, record the specific message and report it to Technical Support at http://www.mathworks.com/contact_TS.html.

Compile-Time Errors

Error: An error occurred while shelling out to mex/mbuild (error code = errorno). Unable to build (specify the -v option for more information)

The compiler reports this error if `mbuild` or `mex` generates an error.

Error: An error occurred writing to file "filename": reason

The file can not be written. The reason is provided by the operating system. For example, you may not have sufficient disk space available to write the file.

Error: Cannot write file "filename" because MCC has already created a file with that name, or a file with that name was specified as a command line argument

The compiler has been instructed to generate two files with the same name. For example:

```
mcc -W lib:liba liba -t      % Incorrect
```

Error: Could not check out a Compiler license

No additional MATLAB Compiler SDK licenses are available for your workgroup.

Error: File: "filename" not found

A specified file can not be found on the path. Verify that the file exists and that the path includes the file's location. You can use the `-I` option to add a folder to the search path.

Error: File: "filename" is a script MATLAB file and cannot be compiled with the current Compiler

The compiler cannot compile script MATLAB files.

Error: File: filename Line: # Column: # A variable cannot be made storageclass1 after being used as a storageclass2

You cannot change a variable's storage class (global/local/persistent). Even though MATLAB allows this type of change in scope, the compiler does not.

Error: Found illegal whitespace character in command line option: "string". The strings on the left and right side of the space should be separate arguments to MCC

For example:

```
mcc('-m', '-v', 'hello')% Correct
mcc('-m -v', 'hello')    % Incorrect
```

Error: Improper usage of option -optionname. Type "mcc -?" for usage information

You have incorrectly used a MATLAB Compiler SDK option. For more information about MATLAB Compiler SDK options, see “mcc Command Arguments Listed Alphabetically” on page A-4, or type `mcc -?` at the command prompt.

Error: libraryname library not found

MATLAB has been installed incorrectly.

Error: mclFreeStackTrace

The compiler reports this error when `startup.m` file executes functions that alter MATLAB search path, for example, `cd` or `addpath`. Hence, `startup.m` file cannot execute appropriately in deployed environment.

Insert the `isdeployed` function before the path altering functions in the `startup.m` file and recompile the application after modifying `startup.m`.

Error: No source files were specified (-? for help)

You must provide the compiler with the name of the source file(s) to compile.

Error: "optionname" is not a valid -option argument

You must use an argument that corresponds to the option. For example:

```
mcc -W main ...    % Correct
mcc -W mex  ...    % Incorrect
```

Error: Out of memory

Typically, this message occurs because the compiler requests a larger segment of memory from the operating system than is currently available. Adding additional memory to your system can alleviate this problem.

Error: Previous warning treated as error

When you use the `-w error` option, this error appears immediately after a warning message.

Error: The argument after the -option option must contain a colon

The format for this argument requires a colon. For more information, see `mcc`, or type `mcc -?` at the command prompt.

Error: The environment variable MATLAB must be set to the MATLAB root directory

On UNIX, the `MATLAB` and `LM_LICENSE_FILE` variables must be set. The `mcc` shell script does this automatically when it is called the first time.

Error: The license manager failed to initialize (error code is errornumber)

You do not have a valid license or no additional licenses are available.

Error: The option -option is invalid in modename mode (specify -? for help)

The specified option is not available.

Error: The specified file "filename" cannot be read

There is a problem with your specified file. For example, the file is not readable because there is no read permission.

Error: The -optionname option requires an argument (e.g. "proper_example_usage")

You have incorrectly used a compiler option. For more information about compiler options, see `mcc`, or type `mcc -?` at the command prompt.

Error: -x is no longer supported

The compiler no longer generates MEX-files because there is no longer any performance advantage to doing so. The MATLAB JIT Accelerator makes compilation for speed obsolete.

Error: Unable to open file "filename":<string>

There is a problem with your specified file. For example, there is no write permission to the output folder, or the disk is full.

Error: Unable to set license linger interval (error code is errornumber)

A license manager failure has occurred. Contact Technical Support with the full text of the error message.

Error: Unknown warning enable/disable string: warningstring

`-w enable:`, `-w disable:`, and `-w error:` require you to use one of the warning string identifiers listed in “Warning Messages” on page 12-25.

Error: Unrecognized option: -option

The option is not a valid option. See `mcc`, for a complete list of valid options for MATLAB Compiler SDK, or type `mcc -?` at the command prompt.

Warning Messages

This section lists the warning messages that MATLAB Compiler SDK can generate. Using the `-w` option for `mcc`, you can control which messages are displayed. Each warning message contains a description and the warning message identifier string (in parentheses) that you can enable or disable with the `-w` option. For example, to produce an error message if you are using a trial MATLAB Compiler SDK license to create your standalone application, you can use:

```
mcc -w error:trial_license -mvg hello
```

To enable all warnings except those generated by the `save` command, use:

```
mcc -w enable -w disable:trial_license ...
```

To display a list of all the warning message identifier strings, use:

```
mcc -w list
```

For additional information about the `-w` option, see `mcc`.

Warning: File: filename Line: # Column: # The #function pragma expects a list of function names

Identifier: `pragma_function_missing_names`

This pragma informs the compiler that the specified function(s) provided in the list of function names will be called through an `feval` call. This will automatically compile the selected functions.

Warning: MATLAB file "filename" was specified on the command line with full path of "pathname", but was found on the search path in directory "directoryname" first

Identifier: `specified_file_mismatch`

The compiler detected an inconsistency between the location of the MATLAB file as given on the command line and in the search path. The compiler uses the location in the search path. This warning occurs when you specify a full path name on the `mcc` command line and a file with the same base name (*filename*) is found earlier on the search path. This warning is issued in the following example if the file `afile.m` exists in both `dir1` and `dir2`,

```
mcc -m -I /dir1 /dir2/afile.m
```

Warning: The file filename was repeated on MATLAB Compiler SDK command line**Identifier:** `repeated_file`

This warning occurs when the same file name appears more than once on the compiler command line. For example,

```
mcc -m sample.m sample.m
```

Warning: The name of a shared library should begin with the letters "lib". "libraryname" doesn't**Identifier:** `missing_lib_sentinel`

This warning is generated if the name of the specified library does not begin with the letters “lib”. For example,

```
mcc -t -W lib:liba -T link:lib a0 a1
```

will not generate a warning while

```
mcc -t -W lib:a -T link:lib a0 a1
```

will generate a warning.

This warning is specific to UNIX and does not occur on the Windows operating system.

Warning: All warnings are disabled**Identifier:** `all_warnings`

This warning displays all warnings generated by the compiler. This warning is disabled.

Warning: A line has num1 characters, violating the maximum page width (num2)**Identifier:** `max_page_width_violation`

This warning is generated if there are lines that exceed the maximum page width, num2. This warning is disabled.

Warning: The option -optionname is ignored in modename mode (specify -? for help)**Identifier:** `switch_ignored`

This warning is generated if an option is specified on the `mcc` command line that is not meaningful in the specified mode. This warning is enabled.

Warning: Unrecognized Compiler pragma “pragma”

Identifier: `unrecognized_pragma`

This warning is generated if you use an unrecognized pragma. This warning is enabled.

Warning: "functionname1" is a MEX- or P-file being referenced from "functionname2"

Identifier: `mex_or_p_file`

This warning is generated if `functionname2` calls `functionname1`, which is a MEX- or P-file. This warning is enabled.

Trial Compiler license. The generated application will expire 30 days from today, on date

Identifier: `trial_license`

This warning displays the date that the deployed application will expire. This warning is enabled.

Dependency Analysis Errors

- “MATLAB Runtime/Dispatcher Errors” on page 12-27
- “XML Parser Errors” on page 12-27

MATLAB Runtime/Dispatcher Errors

These errors originate directly from the MATLAB Runtime/Dispatcher. If one of these error occurs, report it to Technical Support at MathWorks at http://www.mathworks.com/contact_TS.html.

XML Parser Errors

These errors appear as

```
depfun Error: XML error: <message>
```

Where `<message>` is a message returned by the XML parser. If this error occurs, report it to Technical Support at MathWorks at http://www.mathworks.com/contact_TS.html.

Compiling MATLAB and Toolboxes

MATLAB Compiler supports the full MATLAB language and almost all toolboxes based on MATLAB. However, some limited MATLAB and toolbox functionality is not licensed for compilation.

- Most of the prebuilt graphical user interfaces included in MATLAB and its companion toolboxes will not compile.
- Functionality that cannot be called directly from the command line will not compile.
- Some toolboxes, such as Symbolic Math Toolbox™, will not compile.

Compiled applications can only run on operating systems that run MATLAB. Also, since the MATLAB Runtime is approximately the same size as MATLAB, applications built with MATLAB Compiler need specific storage memory and RAM to operate. For the most up-to-date information about system requirements, go to the MathWorks Web site.

To see a full list of MATLAB Compiler limitations, visit http://www.mathworks.com/products/compiler/compiler_support.html.

Note See “MATLAB Functions That Cannot Be Compiled” on page 13-10 for a list of functions that cannot be compiled.

Fixing Callback Problems: Missing Functions

When MATLAB Compiler creates a standalone application, it compiles the MATLAB file(s) you specify on the command line and, in addition, it compiles any other MATLAB files that your MATLAB file(s) calls. MATLAB Compiler uses a dependency analysis, which determines all the functions on which the supplied MATLAB files, MEX-files, and P-files depend.

Note If the MATLAB file associated with a p-file is unavailable, the dependency analysis will not be able to discover the p-file’s dependencies.

The dependency analysis may not locate a function if the only place the function is called in your MATLAB file is a call to the function either:

- In a callback string
- In a character array passed as an argument to the `feval` function or an ODE solver

Tip Dependent functions can also be hidden from the dependency analyzer in `.mat` files that get loaded by compiled applications. Use the `mcc -a` argument or the `%#function` pragma to identify `.mat` file classes or functions that should be supported by the `load` command.

MATLAB Compiler does not look in these character arrays for the names of functions to compile.

Symptom

Your application runs, but an interactive user interface element, such as a push button, does not work. The compiled application issues this error message:

```
An error occurred in the callback: change_colormap
The error message caught was      : Reference to unknown function
                                change_colormap from FEVAL in stand-alone mode.
```

Workaround

There are several ways to eliminate this error:

- Using the `%#function` pragma and specifying callbacks as character arrays
- Specifying callbacks with function handles
- Using the `-a` option

Specifying Callbacks as Character Arrays

Create a list of all the functions that are specified only in callback character arrays and pass these functions using separate `%#function` pragma statements. This overrides the product's dependency analysis and instructs it to explicitly include the functions listed in the `%#function` pragmas.

For example, the call to the `change_colormap` function in the sample application, `my_test` , illustrates this problem. To make sure MATLAB Compiler processes the `change_colormap` MATLAB file, list the function name in the `%#function` pragma.

```
function my_test()
% Graphics library callback test application

%#function change_colormap

peaks;

p_btn = uicontrol(gcf,...
    'Style', 'pushbutton',...
    'Position',[10 10 133 25 ],...
    'String', 'Make Black & White',...
    'CallBack','change_colormap');
```

Specifying Callbacks with Function Handles

To specify the callbacks with function handles, use the same code as in the example above and replace the last line with

```
'CallBack',@change_colormap);
```

For more information on specifying the value of a callback, see the MATLAB Programming Fundamentals documentation.

Using the `-a` Option

Instead of using the `%#function` pragma, you can specify the name of the missing MATLAB file on the MATLAB Compiler command line using the `-a` option.

Finding Missing Functions in a MATLAB File

To find functions in your application that may need to be listed in a `%#function` pragma, search your MATLAB file source code for text specified as callback character arrays or as arguments to the `feval`, `fminbnd`, `fminsearch`, `funm`, and `fzero` functions or any ODE solvers.

To find text used as a callback character array, search for the characters “Callback” or “fcn” in your MATLAB file. This will find all the `Callback` properties defined by Handle Graphics® objects, such as `uicontrol` and `uimenu`. In addition, this will find the properties of figures and axes that end in `Fcn`, such as `CloseRequestFcn`, that also support callbacks.

Suppressing Warnings on the UNIX System

Several warnings may appear when you run a standalone application on the UNIX system. This section describes how to suppress these warnings.

To suppress the `libjvm.so` warning, make sure you set the dynamic library path properly for your platform. See “MATLAB Runtime Path Settings for Run-Time Deployment” on page 14-2.

You can also use the MATLAB Compiler option `-R -nojvm` to set your application's `nojvm` run-time option, if the application is capable of running without Java.

Cannot Use Graphics with the `-nojvm` Option

If your program uses graphics and you compile with the `-nojvm` option, you will get a run-time error.

Cannot Create the Output File

If you receive the error

```
Can't create the output file filename
```

there are several possible causes to consider:

- Lack of write permission for the folder where MATLAB Compiler is attempting to write the file (most likely the current working folder).
- Lack of free disk space in the folder where MATLAB Compiler is attempting to write the file (most likely the current working folder).
- If you are creating a standalone application and have been testing it, it is possible that a process is running and is blocking MATLAB Compiler from overwriting it with a new version.

No MATLAB File Help for Compiled Functions

If you create a MATLAB file with self-documenting online help by entering text on one or more contiguous comment lines beginning with the second line of the file and then compile it, the results of the command

```
help filename
```

will be unintelligible.

Note Due to performance reasons, MATLAB file comments are stripped out before MATLAB Runtime encryption.

No MATLAB Runtime Versioning on Mac OS X

The feature that allows you to install multiple versions of the MATLAB Runtime on the same machine is currently not supported on Mac OS X. When you receive a new version of MATLAB, you must recompile and redeploy all of your applications and components. Also, when you install a new MATLAB Runtime onto a target machine, you must delete the old version of the MATLAB Runtime and install the new one. You can only have one version of the MATLAB Runtime on the target machine.

Older Neural Networks Not Deployable with MATLAB Compiler

Loading networks saved from older Neural Network Toolbox versions requires some initialization routines that are not deployable. Therefore, these networks cannot be deployed without first being updated.

For example, deploying with Neural Network Toolbox Version 5.0.1 (2006b) and MATLAB Compiler Version 4.5 (R2006b) yields the following errors at run time:

```

??? Error using ==> network.subsasgn
"layers{1}.initFcn" cannot be set to non-existing
function "initwb".
Error in ==> updatenet at 40
Error in ==> network.loadobj at 10

??? Undefined function or method 'sim' for input
arguments of type 'struct'.
Error in ==> mynetworkapp at 30

```

Restrictions on Calling PRINTDLG with Multiple Arguments in Compiled Mode

In compiled mode, only one argument can be present in a call to the MATLAB `printdlg` function (for example, `printdlg(gcf)`).

You will not receive an error when making a call to `printdlg` with multiple arguments. However, when an application containing the multiple-argument call is compiled, the compile will fail with the following error message:

```

Error using ==> printdlg at 11
PRINTDLG requires exactly one argument

```

Compiling a Function with WHICH Does Not Search Current Working Directory

Using `which`, as in this example:

```

function pathtest
which myFile.mat
open('myFile.mat')

```

does not cause the current working folder to be searched in deployed applications. In addition, it may cause unpredictable behavior of the `open` function.

Use one of the following solutions as alternatives to using `which`:

- Use the `pwd` function to explicitly point to the file in the current folder, as follows:

```
open([pwd 'myFile.mat'])
```

- Rather than using the general `open` function, use `load` or other specialized functions for your particular file type, as `load` explicitly checks for the file in the current folder. For example:

```
load myFile.mat
```

- Include your file in the **Files required for your application to run** area of the compiler app or the `-a` flag using `mcc`.

Restrictions on Using C++ SETDATA to Dynamically Resize an MArray

You cannot use the C++ `SETDATA` function to dynamically resize `MArrays`.

For instance, if you are working with the following array:

```
[1 2 3 4]
```

you cannot use `SETDATA` to increase the size of the array to a length of five elements.

Licensing Terms and Restrictions on Compiled Applications

Applications you build with a trial MATLAB Compiler license are valid for thirty (30) days only.

Applications you build with a purchased license of MATLAB Compiler have no expiration date.

MATLAB Functions That Cannot Be Compiled

Note Due to the number of active and ever-changing list of MathWorks products and functions, this is not a complete list of functions that can not be compiled. If you have a question as to whether a specific MathWorks product's function is able to be compiled or not, the definitive source is that product's documentation. For an updated list of such functions, see Support for MATLAB and Toolboxes.

Functions that cannot be compiled fall into the following categories:

- Functions that print or report MATLAB code from a function, for example, the MATLAB `help` function or debug functions, will not work.
- Simulink functions, in general, will not work.
- Functions that require a command line, for example, the MATLAB `lookfor` function, will not work.
- `clc`, `home`, and `savepath` will not do anything in deployed mode.
- Tools that allow run-time manipulation of figures

Returned values from standalone applications will be 0 for successful completion or a nonzero value otherwise.

In addition, there are functions and programs that have been identified as nondeployable due to licensing restrictions.

`mccExcludedFiles.log` lists all the functions and files excluded by `mcc` if they can not be compiled. It is created after each attempted build if there are functions or files that cannot be compiled.

MATLAB Runtime Path Settings for Run-Time Deployment

In this section...
“General Path Guidelines” on page 14-2
“Path for Java Applications on All Platforms” on page 14-2
“Windows Path for Run-Time Deployment” on page 14-2
“Linux Paths for Run-Time Deployment” on page 14-3
“OS X Paths for Run-Time Deployment” on page 14-3

General Path Guidelines

Regardless of platform, be aware of the following guidelines with regards to placing specific folders on the path:

- Always avoid including `arch` on the path. Failure to do so may inhibit ability to run multiple MATLAB Runtime instances.
- Ideally, set the environment in a separate shell script to avoid run-time errors caused by path-related issues.

Path for Java Applications on All Platforms

When your users run applications that contain compiled MATLAB code, you must instruct them to set the path so that the system can find the MATLAB Runtime.

Note When you deploy a Java application to end users, they must set the class path on the target machine.

The system needs to find `.jar` files containing the MATLAB libraries. To tell the system how to locate the `.jar` files it needs, specify a `classpath` either in the `javac` command or in your system environment variables.

Windows Path for Run-Time Deployment

The following folder should be added to the system path:

```
mcr_root\version\runtime\win64
```

mcr_root refers to the complete path where the MATLAB Runtime library archive files are installed on the machine where the application is to be run.

mcr_root is version specific; you must determine the path after you install the MATLAB Runtime.

Note If you are running the MATLAB Runtime installer on a shared folder, be aware that other users of the share may need to alter their system configuration.

Linux Paths for Run-Time Deployment

Use these `setenv` commands to set your MATLAB Runtime paths.

```
setenv LD_LIBRARY_PATH
  mcr_root/version/runtime/glnxa64:
  mcr_root/version/bin/glnxa64:
  mcr_root/version/sys/os/glnxa64:
  mcr_root/version/sys/opengl/lib/glnxa64
```

OS X Paths for Run-Time Deployment

Use these `setenv` commands to set your MATLAB Runtime paths.

```
setenv DYLD_LIBRARY_PATH
  mcr_root/version/runtime/maci64:
  mcr_root/version/bin/maci64:
  mcr_root/version/sys/os/maci64
```

MATLAB Compiler Licensing

Using MATLAB Compiler Licenses for Development

You can run MATLAB Compiler from the MATLAB command prompt (MATLAB mode) or the DOS/UNIX prompt (standalone mode).

MATLAB Compiler uses a lingering license. This has different behavior in MATLAB mode and standalone mode.

Running MATLAB Compiler in MATLAB Mode

When you run MATLAB Compiler from “inside” of the MATLAB environment, that is, you run `mcc` from the MATLAB command prompt, you hold the MATLAB Compiler license as long as MATLAB remains open. To give up the MATLAB Compiler license, exit MATLAB.

Running MATLAB Compiler in Standalone Mode

If you run MATLAB Compiler from a DOS or UNIX prompt, you are running from “outside” of MATLAB. In this case, MATLAB Compiler

- Does not require MATLAB to be running on the system where MATLAB Compiler is running
- Gives the user a dedicated 30-minute time allotment during which the user has complete ownership over a license to MATLAB Compiler

Each time a user requests MATLAB Compiler, the user begins a 30-minute time period as the sole owner of the MATLAB Compiler license. Anytime during the 30-minute segment, if the same user requests MATLAB Compiler, the user gets a new 30-minute allotment. When the 30-minute interval has elapsed, if a different user requests MATLAB Compiler, the new user gets the next 30-minute interval.

When a user requests MATLAB Compiler and a license is not available, the user receives the message

```
Error: Could not check out a Compiler License.
```

This message is given when no licenses are available. As long as licenses are available, the user gets the license and no message is displayed. The best way to guarantee that all

MATLAB Compiler users have constant access to MATLAB Compiler is to have an adequate supply of licenses for your users.

Deployment Product Terms

A

Add-in — A Microsoft Excel add-in is an executable piece of code that can be actively integrated into a Microsoft Excel application. Add-ins are front-ends for COM components, usually written in some form of Microsoft Visual Basic®.

Application program interface (API) — A set of classes, methods, and interfaces that is used to develop software applications. Typically an API is used to provide access to specific functionality. See *MWArray*.

Application — An end user-system into which a deployed functions or solution is ultimately integrated. Typically, the end goal for the deployment customer is integration of a deployed MATLAB function into a larger enterprise environment application. The deployment products prepare the MATLAB function for integration by wrapping MATLAB code with enterprise-compatible source code, such as C, C++, C# (.NET), F#, and Java code.

Assembly — An executable bundle of code, especially in .NET.

B

Binary — See *Executable*.

Boxed Types — Data types used to wrap opaque C structures.

Build — See *Compile*.

C

Class — A user-defined type used in C++, C#, and Java, among other object-oriented languages, that is a prototype for an object in an object-oriented language. It is analogous to a derived type in a procedural language. A class is a set of objects which share a common structure and behavior. Classes relate in a class hierarchy. One class is a specialization (a subclass) of another (one of its *superclasses*) or comprises other classes. Some classes use other classes in a client-server relationship. Abstract classes have no members, and concrete classes have one or more members. Differs from a MATLAB class

Compile — In MATLAB Compiler and MATLAB Compiler SDK, to compile MATLAB code involves generating a binary that wraps around MATLAB code, enabling it to execute in various computing environments. For example, when MATLAB code is

compiled into a Java package, a Java wrapper provides Java code that enables the MATLAB code to execute in a Java environment.

COM component — In MATLAB Compiler, the executable back-end code behind a Microsoft Excel add-in. In MATLAB Compiler SDK, an executable component, to be integrated with Microsoft COM applications.

Console application — Any application that is executed from a system command prompt window.

D

Data Marshaling — Data conversion, usually from one type to another. Unless a MATLAB deployment customer is using type-safe interfaces, data marshaling—as from mathematical data types to MathWorks data types such as represented by the `MWArray` API—must be performed manually, often at great cost.

Deploy — The act of integrating MATLAB code into a larger-scale computing environment, usually to an enterprise application, and often to end users.

Deployable archive — The deployable archive is embedded by default in each binary generated by MATLAB Compiler or MATLAB Compiler SDK. It houses the deployable package. All MATLAB-based content in the deployable archive uses the Advanced Encryption Standard (AES) cryptosystem. See “Additional Details” on page 5-9.

DLL — Dynamic link library. Microsoft's implementation of the shared library concept for Windows. Using DLLs is much preferred over the previous technology of static (or non-dynamic) libraries, which had to be manually linked and updated.

E

Empties — Arrays of zero (0) dimensions.

Executable — An executable bundle of code, made up of binary bits (zeros and ones) and sometimes called a *binary*.

F

Fields — For this definition in the context of MATLAB Data Structures, see *Structs*.

Fields and Properties — In the context of .NET, *Fields* are specialized classes used to hold data. *Properties* allow users to access class variables as if they were accessing member fields directly, while actually implementing that access through a class method.

I

Integration — Combining deployed MATLAB code's functionality with functionality that currently exists in an enterprise application. For example, a customer creates a mathematical model to forecast trends in certain commodities markets. In order to use this model in a larger-scale financial application (one written with the Microsoft .NET Framework, for instance) the deployed financial model must be integrated with existing C# applications, run in the .NET enterprise environment.

Instance — For the definition of this term in context of MATLAB Production Server software, see *MATLAB Production Server Server Instance*.

J

JAR — Java archive. In computing software, a JAR file (or Java ARchive) aggregates many files into one. Software developers use JARs to distribute Java applications or libraries, in the form of classes and associated metadata and resources (text, images, etc.). Computer users can create or extract JAR files using the `jar` command that comes with a Java Development Kit (JDK).

Java-MATLAB Interface — Known as the *JMI Interface*, this is the Java interface built into MATLAB software.

JDK — The Java Development Kit is a free Oracle® product which provides the environment required for programming in Java.

JMI Interface — see *Java-MATLAB Interface*.

JRE — Java Run-Time Environment is the part of the Java Development Kit (JDK) required to run Java programs. It comprises the Java Virtual Machine, the Java platform core classes, and supporting files. It does not include the compiler, debugger, or other tools present in the JDK™. The JRE™ is the smallest set of executables and files that constitute the standard Java platform.

M

Magic Square — A square array of integers arranged so that their sum is the same when added vertically, horizontally, or diagonally.

MATLAB Runtime — An execution engine made up of the same shared libraries. MATLAB uses these libraries to enable the execution of MATLAB files on systems without an installed version of MATLAB.

MATLAB Runtime singleton — See *Shared MATLAB Runtime instance*.

MATLAB Runtime workers — A MATLAB Runtime session. Using MATLAB Production Server software, you have the option of specifying more than one MATLAB Runtime session, using the `--num-workers` options in the server configurations file.

MATLAB Production Server Client — In the MATLAB Production Server software, clients are applications written in a language supported by MATLAB Production Server that call deployed functions hosted on a server.

MATLAB Production Server Configuration — An instance of the MATLAB Production Server containing at least one server and one client. Each configuration of the software usually contains a unique set of values in the server configuration file, `main_config` (MATLAB Production Server).

MATLAB Production Server Server Instance — A logical server configuration created using the `mps-new` command in MATLAB Production Server software.

MATLAB Production Server Software — Product for server/client deployment of MATLAB programs within your production systems, enabling you to incorporate numerical analytics in enterprise applications. When you use this software, web, database, and enterprise applications connect to MATLAB programs running on MATLAB Production Server via a lightweight client library, isolating the MATLAB programs from your production system. MATLAB Production Server software consists of one or more servers and clients.

Marshaling — See *Data Marshaling*.

mbuild — MATLAB Compiler SDK command that compiles and links C and C++ source files into standalone applications or shared libraries. For more information, see the `mbuild` function reference page.

mcc — The MATLAB command that invokes the compiler. It is the command-line equivalent of using the compiler apps.

Method Attribute — In the context of .NET, a mechanism used to specify declarative information to a .NET class. For example, in the context of client programming with MATLAB Production Server software, you specify method attributes to define MATLAB structures for input and output processing.

mxArray interface — The MATLAB data type containing all MATLAB representations of standard mathematical data types.

MWArray interface — A proxy to `mxArray`. An application program interface (API) for exchanging data between your application and MATLAB. Using `MWArray`, you marshal data from traditional mathematical types to a form that can be processed and understood by MATLAB data type `mxArray`. There are different implementations of the `MWArray` proxy for each application programming language.

P

Package — The act of bundling the deployed MATLAB code, along with the MATLAB Runtime and other files, into an installer that can be distributed to others. The compiler apps place the installer in the `for_redistribution` subfolder. In addition to the installer, the compiler apps generate a number of loose artifacts that can be used for testing or building a custom installer.

PID File — See *Process Identification File (PID File)*.

Pool — A pool of threads, in the context of server management using MATLAB Production Server software. Servers created with the software do not allocate a unique thread to each client connection. Rather, when data is available on a connection, the required processing is scheduled on a pool, or group, of available threads. The server configuration file option `--num-threads` sets the size of that pool (the number of available request-processing threads) in the master server process.

Process Identification File (PID File) — A file that documents informational and error messages relating to a running server instance of MATLAB Production Server software.

Program — A bundle of code that is executed to achieve a purpose. Programs usually are written to automate repetitive operations through computer processing. Enterprise system applications usually consist of hundreds or even thousands of smaller programs.

Properties — For this definition in the context of .NET, see *Fields and Properties*.

Proxy — A software design pattern typically using a class, which functions as an interface to something else. For example, `MWArray` is a proxy for programmers who need to access the underlying type `mxArray`.

S

Server Instance — See MATLAB Production Server Server Instance.

Shared Library — Groups of files that reside in one space on disk or memory for fast loading into Windows applications. Dynamic-link libraries (DLLs) are Microsoft's implementation of the shared library concept for Microsoft Windows.

Shared MATLAB Runtime instance — When using MATLAB Compiler SDK, you can create a shared MATLAB Runtime instance, also known as a singleton. When you invoke MATLAB Compiler with the `-S` option through the compiler (using either `mcc` or a compiler app), a single MATLAB Runtime instance is created for each COM component or Java package in an application. You reuse this instance by sharing it among all subsequent class instances. Such sharing results in more efficient memory usage and eliminates the MATLAB Runtime startup cost in each subsequent class instantiation. All class instances share a single MATLAB workspace and share global variables in the deployed MATLAB files. MATLAB Compiler SDK creates singletons by default for .NET assemblies. MATLAB Compiler creates singletons by default for the COM components used by the Excel add-ins.

State — The present condition of MATLAB, or the MATLAB Runtime. MATLAB functions often carry state in the form of variable values. The MATLAB workspace itself also maintains information about global variables and path settings. When deploying functions that carry state, you must often take additional steps to ensure state retention when deploying applications that use such functions.

Structs — MATLAB Structures. Structs are MATLAB arrays with elements that you access using textual field designators. Fields are data containers that store data of a specific MATLAB type.

System Compiler — A key part of Interactive Development Environments (IDEs) such as Microsoft Visual Studio.

T

Thread — A portion of a program that can run independently of and concurrently with other portions of the program. See *pool* for additional information on managing the number of processing threads available to a server instance.

Type-safe interface — An API that minimizes explicit type conversions by hiding the `MWArray` type from the calling application.

W

Web Application Archive (WAR) — In computing, a Web Application Archive is a JAR file used to distribute a collection of `JavaServer` pages, servlets, Java classes, XML files, tag libraries, and static web pages that together constitute a web application.

Webfigure — A MathWorks representation of a MATLAB figure, rendered on the web. Using the WebFigures feature, you display MATLAB figures on a website for graphical manipulation by end users. This enables them to use their graphical applications from anywhere on the web, without the need to download MATLAB or other tools that can consume costly resources.

Windows Communication Foundation (WCF) — The Windows Communication Foundation™ is an application programming interface in the .NET Framework for building connected, service-oriented, web-centric applications. WCF is designed in accordance with service oriented architecture principles to support distributed computing where services are consumed by client applications.

Functions — Alphabetical List

%#function

Pragma to help MATLAB Compiler locate functions called through `feval`, `eval`, Handle Graphics callback, or objects loaded from MAT-files

Syntax

```
%#function function1 [function2 ... functionN]
```

```
%#function object_constructor
```

Description

The `%#function` pragma informs MATLAB Compiler that the specified function(s) will be called through an `feval`, `eval`, Handle Graphics callback, or objects loaded from MAT-files.

Use the `%#function` pragma in standalone applications to inform MATLAB Compiler that the specified function(s) should be included in the compilation, whether or not MATLAB Compiler's dependency analysis detects the function(s). It is also possible to include objects by specifying the object constructor.

Without this pragma, the product's dependency analysis will not be able to locate and compile all MATLAB files used in your application. This pragma adds the top-level function as well as all the local functions in the file to the compilation.

Examples

Example 1

```
function foo
    %#function bar

    feval('bar');
```

```
end %function foo
```

By implementing this example, MATLAB Compiler is notified that function `bar` will be included in the compilation and is called through `feval`.

Example 2

```
function foo
    ##function bar foobar

    feval('bar');
    feval('foobar');

end %function foo
```

In this example, multiple functions (`bar` and `foobar`) are included in the compilation and are called through `feval`.

Example 3

```
function foo
    ##function ClassificationSVM

    load('svm-classifier.mat');
    num_dimensions = size(svm_model.PredictorNames, 2);

end %function foo
```

In this example, an object from the class `ClassificationSVM` is loaded from a MAT-file. For more information, see “MATLAB Data Files in Compiled Applications”.

Introduced before R2006a

applicationCompiler

Build and package functions into standalone applications

Syntax

```
applicationCompiler  
applicationCompiler project_name  
applicationCompiler -build project_name  
applicationCompiler -package project_name
```

Description

`applicationCompiler` opens the MATLAB standalone compiler for the creation of a new compiler project. For more information on the Application Compiler app, see [Application Compiler](#).

`applicationCompiler project_name` opens the MATLAB standalone compiler app with the project preloaded.

`applicationCompiler -build project_name` runs the MATLAB standalone compiler to build the specified project. The installer is not generated.

`applicationCompiler -package project_name` runs the MATLAB standalone compiler to build and package the specified project. The installer is generated.

Examples

Create a New Standalone Application Project

Open the application compiler to create a new project.

```
applicationCompiler
```

Package a Standalone Application using an Existing Project

Open the application compiler to build a new application using an existing project.

```
applicationCompiler -package my_magic
```

Input Arguments

project_name — name of the project to be compiled

character array or string

Specify the name of a previously saved MATLAB Compiler project. The project must be on the current path.

See Also

`deploytool` | `mcc`

Introduced in R2013b

ctfroot

Location of files related to deployed application

Syntax

```
root = ctfroot
```

Description

`root = ctfroot` returns the name of the folder where the deployable archive for the application is expanded.

Use this function to access any file that the user would have included in their project (excluding the ones in the packaging folder).

Examples

Determine location of deployable archive

```
appRoot = ctfroot;
```

Output Arguments

root — Path to expanded deployable archive
character vector

Path to expanded deployable archive returned as a character vector in the form:
application_name_mcr..

Introduced in R2006a

deploytool

Compile and package functions for external deployment

Syntax

```
deploytool
deploytool project_name
deploytool -build project_name
deploytool -package project_name
```

Description

`deploytool` opens a list of the compiler apps.

`deploytool project_name` opens the appropriate compiler app with the project preloaded.

`deploytool -build project_name` runs the appropriate compiler app to build the specified project. The installer is not generated.

`deploytool -package project_name` runs the appropriate compiler app to build and package the specified project. The installer is generated.

Examples

Create a New Compiler Project

Open the compiler to create a new project.

```
deploytool
```

Package an Application using an Existing Project

Open the compiler to build a new application using an existing project.

```
deploytool -package my_magic
```

Input Arguments

project_name — name of the project to be compiled

character array or string

Name of the project to be compiled, specified as a character array or string. The project must be on the current path.

Introduced in R2006b

getmcruserdata

Retrieve MATLAB array value associated with a given key

Syntax

```
function_value = getmcruserdata(key)
```

Description

The `function_value = getmcruserdata(key)` command is part of the MATLAB Runtime User Data interface API. It returns an empty matrix if no such key exists.

Examples

```
function_value =  
    getmcruserdata('ParallelProfile');
```

See Also

setmcruserdata

Introduced in R2008b

isdeployed

Determine whether code is running in deployed or MATLAB mode

Syntax

```
x = isdeployed
```

Description

`x = isdeployed` returns true (1) when the function is running in deployed mode and false (0) if it is running in a MATLAB session.

If you include this function in an application and compile the application with MATLAB Compiler, the function will return true when the application is run in deployed mode. If you run the application containing this function in a MATLAB session, the function will return false.

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

Usage notes and limitations:

- Returns true and false as appropriate for MEX and SIM targets
- Returns false for other targets

Introduced before R2006a

ismcc

Test if code is running during compilation process (using `mcc`)

Syntax

```
x = ismcc
```

Description

`x = ismcc` returns true when the function is being executed by `mcc` dependency checker and false otherwise.

When this function is executed by the compilation process started by `mcc`, it will return true. This function will return false when executed within MATLAB as well as in deployed mode. To test for deployed mode execution, use `isdeployed`. This function should be used to guard code in `matlabrc`, or `hgrc` (or any function called within them, for example `startup.m` in the example on this page), from being executed by MATLAB Compiler (`mcc`) or any of the MATLAB Compiler SDK targets.

In a typical example, a user has `ADDPATH` calls in their MATLAB code. These can be guarded from executing using `ismcc` during the compilation process and `isdeployed` for the deployed application as shown in the example on this page.

Examples

```
`% startup.m
    if ~(ismcc || isdeployed)
        addpath(fullfile(matlabroot, 'work'));
    end
```

Extended Capabilities

C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

Usage notes and limitations:

- Returns true and false as appropriate for MEX and SIM targets.
- Returns false for other targets.

See Also

`isdeployed` | `mcc`

Introduced in R2008b

libraryCompiler

Build and package functions for use in external applications

Syntax

```
libraryCompiler  
libraryCompiler project_name  
libraryCompiler -build project_name  
libraryCompiler -package project_name
```

Description

`libraryCompiler` opens the Library Compiler app for the creation of a new compiler project

`libraryCompiler project_name` opens the Library Compiler app with the project preloaded.

`libraryCompiler -build project_name` runs the Library Compiler app to build the specified project. The installer is not generated.

`libraryCompiler -package project_name` runs the Library Compiler app to build and package the specified project. The installer is generated.

Examples

Create a New Project

Open the Library Compiler app to create a new project.

```
libraryCompiler
```

Package a Function using an Existing Project

Open the Library Compiler app using an existing project.

```
libraryCompiler -package my_magic
```

Input Arguments

project_name — name of the project to be compiled

character array or string

Specify the name of a previously saved project. The project must be on the current path.

Introduced in R2013b

mcc

Compile MATLAB functions for deployment

Syntax

```
mcc options mfilename1,...,mfilenameN
```

```
mcc -m options mfilename
```

```
mcc -e options mfilename
```

```
mcc -W 'excel:addin_name,class_name,version' -T link:lib options  
mfilename1,...,mfilenameN
```

```
mcc -H -W hadoop:archiveName,CONFIG:configFile
```

Description

`mcc options mfilename1,...,mfilenameN` compiles the functions as specified by the options.

The options used depend on the intended results of the compilation. For information on compiling:

- C/C++ shared libraries, .NET assemblies, Java packages, or Python® packages see `mcc` for MATLAB Compiler SDK
- MATLAB Production Server deployable archives or Excel add-ins for MATLAB Production Server see `mcc` for MATLAB Compiler SDK

`mcc -m options mfilename` compiles the function into a standalone application.

This is equivalent to `-W main -T link:exe`.

`mcc -e options mfilename` compiles the function into a standalone application that does not open an MS-DOS® command window.

This syntax is equivalent to `-W WinMain -T link:exe`.

`mcc -W 'excel:addin_name,className,version' -T link:lib options mfilename1,...,mfilenameN` creates a Microsoft Excel add-in from the specified files.

- *addin_name* — Specifies the name of the addin and its namespace, which is a period-separated list, such as `companyname.groupname.component`.
- *className* — Specifies the name of the class to be created. If you do not specify the class name, `mcc` uses the *addin_name* as the default. If specified, *className*, needs to be different from *mfilename*.
- *version* — Specifies the version of the add-in specified as *major.minor*.
 - *major* — Specifies the major version number. If you do not specify a version number, `mcc` uses the latest version.
 - *minor* — Specifies the minor version number. If you do not specify a version number, `mcc` uses the latest version.

Note Excel add-ins can be created only in MATLAB running on Windows.

Note Remove the single quotes around `'excel:addin_name,className,version'` when executing the `mcc` command from a DOS prompt.

`mcc -H -W hadoop:archiveName,CONFIG:configFile` generates a deployable archive that can be run as a job by Hadoop.

- *archiveName* — Specifies the name of the generated archive.
- *configFile* — Specifies the path to the configuration file for creating a deployable archive. For more information, see “Configuration File for Creating Deployable Archive Using the `mcc` Command”.

Tip You can issue the `mcc` command either at the MATLAB command prompt or the DOS or UNIX command line.

Examples

Compile a standalone application

```
mcc -m magic.m
```

Compile a standalone Windows application

Compile a standalone application that does not open a command prompt on Windows.

```
mcc -e magic.m
```

Compile an Excel add-in

```
mcc -W 'excel:myAddin,myClass,1.0' -T link:lib magic.m
```

Input Arguments

mfilename — File to be compiled

filename

File to be compiled, specified as a character vector or string scalar.

mfilename1, ..., mfilenameN — Files to be compiled

list of filenames

One or more files to be compiled, specified as a comma-separated list of filenames.

options — Options for customizing the output

-a | -b | -B | -C | -d | -f | -g | -G | -I | -K | -m | -M | -N | -o | -p | -R | -S | -T | -u | -U | -v | -w | -W | -Y

Options for customizing the output, specified as a list of character vectors or string scalars.

- **-a**

Add files to the deployable archive using `-a path` to specify the files to be added. Multiple `-a` options are permitted.

If a file name is specified with `-a`, the compiler looks for these files on the MATLAB path, so specifying the full path name is optional. These files are not passed to `mbuild`, so you can include files such as data files.

If a folder name is specified with the `-a` option, the entire contents of that folder are added recursively to the deployable archive. For example,

```
mcc -m hello.m -a ./testdir
```

specifies that all files in `testdir`, as well as all files in its subfolders, are added to the deployable archive. The folder subtree in `testdir` is preserved in the deployable archive.

If the filename includes a wildcard pattern, only the files in the folder that match the pattern are added to the deployable archive and subfolders of the given path are not processed recursively. For example,

```
mcc -m hello.m -a ./testdir/*
```

specifies that all files in `./testdir` are added to the deployable archive and subfolders under `./testdir` are not processed recursively.

```
mcc -m hello.m -a ./testdir/*.m
```

specifies that all files with the extension `.m` under `./testdir` are added to the deployable archive and subfolders of `./testdir` are not processed recursively.

Note `*` is the only supported wildcard.

When you add files to the archive using `-a` that do not appear on the MATLAB path at the time of compilation, a path entry is added to the application's run-time path so that they appear on the path when the deployed code executes.

When you use the `-a` option to specify a full path to a resource, the basic path is preserved, with some modifications, but relative to a subdirectory of the runtime cache directory, not to the user's local folder. The cache directory is created from the deployable archive the first time the application is executed. You can use the `isdeployed` function to determine whether the application is being run in deployed mode, and adjust the path accordingly. The `-a` option also creates a `.auth` file for authorization purposes.

Caution If you use the `-a` flag to include a file that is not on the MATLAB path, the folder containing the file is added to the MATLAB dependency analysis path. As a result, other files from that folder might be included in the compiled application.

Note If you use the `-a` flag to include custom Java classes, standalone applications work without any need to change the `classpath` as long as the Java class is not a member of a package. The same applies for JAR files. However, if the class being added is a member of a package, the MATLAB code needs to make an appropriate call to `javaaddpath` to update the `classpath` with the parent folder of the package.

- **-b**

Generate a Visual Basic file (`.bas`) containing the Microsoft Excel Formula Function interface to the COM object generated by MATLAB Compiler. When imported into the workbook Visual Basic code, this code allows the MATLAB function to be seen as a cell formula function.

- **-B**

Replace the file on the `mcc` command line with the contents of the specified file. Use

```
-B filename[:<a1>,<a2>,...,<an>]
```

The bundle `filename` should contain only `mcc` command-line options and corresponding arguments and/or other file names. The file might contain other `-B` options. A bundle can include replacement parameters for compiler options that accept names and version numbers. See “Using Bundles to Build MATLAB Code” (MATLAB Compiler SDK).

- **-C**

Do not embed the deployable archive in binaries.

- **-d**

Place output in a specified folder. Use

```
-d outFolder
```

to direct the generated files to `outFolder`.

- **-f**

Override the default options file with the specified options file. Use

`-f filename`

to specify `filename` as the options file when calling `mbuild`. This option lets you use different ANSI compilers for different invocations of the compiler. This option is a direct pass-through to `mbuild`.

- **-g, -G**

Include debugging symbol information for the C/C++ code generated by MATLAB Compiler SDK. It also causes `mbuild` to pass appropriate debugging flags to the system C/C++ compiler. The debug option lets you backtrace up to the point where you can identify if the failure occurred in the initialization of MATLAB Runtime, the function call, or the termination routine. This option does not let you debug your MATLAB files with a C/C++ debugger.

- **-I**

Add a new folder path to the list of included folders. Each `-I` option adds a folder to the beginning of the list of paths to search. For example,

```
-I <directory1> -I <directory2>
```

sets up the search path so that `directory1` is searched first for MATLAB files, followed by `directory2`. This option is important for standalone compilation where the MATLAB path is not available.

If used in conjunction with the `-N` option, the `-I` option adds the folder to the compilation path in the same position where it appeared in the MATLAB path rather than at the head of the path.

- **-K**

Direct `mcc` to not delete output files if the compilation ends prematurely due to error.

The default behavior of `mcc` is to dispose of any partial output if the command fails to execute successfully.

- **-m**

Direct `mcc` to generate a standalone application.

- **-M**

Define compile-time options. Use

```
-M string
```

to pass `string` directly to `mbuild`. This option provides a useful mechanism for defining compile-time options, for example, `-M "-Dmacro=value"`.

Note Multiple `-M` options do not accumulate; only the rightmost `-M` option is used.

- **-N**

Passing `-N` clears the path of all folders except the following core folders (this list is subject to change over time):

- `matlabroot\toolbox\matlab`
- `matlabroot\toolbox\local`
- `matlabroot\toolbox\compiler`
- `matlabroot\toolbox\shared\bigdata`

Passing `-N` also retains all subfolders in this list that appear on the MATLAB path at compile time. Including `-N` on the command line lets you replace folders from the original path, while retaining the relative ordering of the included folders. All subfolders of the included folders that appear on the original path are also included. In addition, the `-N` option retains all folders that you included on the path that are not under `matlabroot\toolbox`.

When using the `-N` option, use the `-I` option to force inclusion of a folder, which is placed at the head of the compilation path. Use the `-p` option to conditionally include folders and their subfolders; if they are present in the MATLAB path, they appear in the compilation path in the same order.

- **-o**

Specify the name of the final executable (standalone applications only). Use

```
-o outputfile
```

to name the final executable output of MATLAB Compiler. A suitable platform-dependent extension is added to the specified name (for example, `.exe` for Windows standalone applications).

- **-p**

Use in conjunction with the option `-N` to add specific folders and subfolders under `matlabroot\toolbox` to the compilation MATLAB path. The files are added in the same order in which they appear in the MATLAB path. Use the syntax

`-N -p directory`

where `directory` is the folder to be included. If `directory` is not an absolute path, it is assumed to be under the current working folder.

- If a folder is included with `-p` that is on the original MATLAB path, the folder and all its subfolders that appear on the original path are added to the compilation path in the same order.
- If a folder is included with `-p` that is not on the original MATLAB path, that folder is ignored. (You can use `-I` to force its inclusion.)
- **-R**

Provide MATLAB Runtime options. This option is relevant only when building standalone applications using MATLAB Compiler. The syntax is as follows:

`-R option`

Option	Description	Target
<code>-logfile, filename</code>	Specify a log file name.	MATLAB Compiler
<code>-nodisplay</code>	Suppress the MATLAB <code>nodisplay</code> runtime warning.	MATLAB Compiler
<code>-nojvm</code>	Do not use the Java Virtual Machine (JVM).	MATLAB Compiler
<code>-startmsg</code>	Customizable user message displayed at initialization time.	MATLAB Compiler Standalone Applications
<code>-completemsg</code>	Customizable user message displayed when initialization is complete.	MATLAB Compiler Standalone Applications

Caution When running on Mac OS X, if you use `-nodisplay` as one of the options included in `mclInitializeApplication`, then the call to `mclInitializeApplication` must occur before calling `mclRunMain`.

Note If you specify the `-R` option for libraries created from MATLAB Compiler SDK, `mcc` still compiles without errors and generates the results. But the `-R` option doesn't apply to these libraries and does not do anything.

- **-S**

The standard behavior for the MATLAB Runtime is that every instance of a class gets its own MATLAB Runtime context. The context includes a global MATLAB workspace for variables, such as the path and a base workspace for each function in the class. If multiple instances of a class are created, each instance gets an independent context. This ensures that changes made to the global or base workspace in one instance of the class does not affect other instances of the same class.

In a singleton MATLAB Runtime, all instances of a class share the context. If multiple instances of a class are created, they use the context created by the first instance which saves startup time and some resources. However, any changes made to the global workspace or the base workspace by one instance impacts all class instances. For example, if `instance1` creates a global variable `A` in a singleton MATLAB Runtime, then `instance2` can use variable `A`.

Singleton MATLAB Runtime is only supported by the following products on these specific targets:

Target supported by Singleton MATLAB Runtime	Create a Singleton MATLAB Runtime by....
Excel add-in	Default behavior for target is singleton MATLAB Runtime. You do not need to perform other steps.
.NET assembly	Default behavior for target is singleton MATLAB Runtime. You do not need to perform other steps.
COM component	<ul style="list-style-type: none"> • Using the Library Compiler app, click Settings and add <code>-S</code> to the Additional parameters passed to MCC field. • Using <code>mcc</code>, pass the <code>-S</code> flag.
Java package	

- **-T**

Specify the output target phase and type.

Use the syntax `-T target` to define the output type.

Target	Description
<code>compile:exe</code>	Generate a C/C++ wrapper file, and compile C/C++ files to an object form suitable for linking into a standalone application.
<code>compile:lib</code>	Generate a C/C++ wrapper file, and compile C/C++ files to an object form suitable for linking into a shared library or DLL.
<code>link:exe</code>	Same as <code>compile:exe</code> and also link object files into a standalone application.
<code>link:lib</code>	Same as <code>compile:lib</code> and also link object files into a shared library or DLL.

- **-u**

Register COM component for the current user only on the development machine. The argument applies only to the generic COM component and Microsoft Excel add-in targets.

- **-U**

Build deployable archive (.ctf file) for MATLAB Production Server.

- **-v**

Display the compilation steps, including:

- MATLAB Compiler version number
- The source file names as they are processed
- The names of the generated output files as they are created
- The invocation of `mbuild`

The `-v` option passes the `-v` option to `mbuild` and displays information about `mbuild`.

- **-w**

Display warning messages. Use the syntax

```
-w option [:<msg>]
```

to control the display of warnings.

Syntax	Description
<code>-w list</code>	List all of the possible warnings that <code>mcc</code> can generate.
<code>-w enable</code>	Enable all warnings.
<code>-w disable[:<string>]</code>	Disable specific warnings associated with <code><string></code> . See “Warning Messages” on page 12-25 for a list of the <code><string></code> values. Omit the optional <code><string></code> to apply the <code>disable</code> action to all warnings.
<code>-w enable[:<string>]</code>	Enable specific warnings associated with <code><string></code> . See “Warning Messages” on page 12-25 for a list of the <code><string></code> values. Omit the optional <code><string></code> to apply the <code>enable</code> action to all warnings.
<code>-w error[:<string>]</code>	Treat specific warnings associated with <code><string></code> as an error. Omit the optional <code><string></code> to apply the <code>error</code> action to all warnings.
<code>-w off[:<string>]</code> <code>[<filename>]</code>	Turn off warnings for specific error messages defined by <code><string></code> . You can also narrow the scope by specifying warnings be turned off when generated by specific <code><filename></code> s.
<code>-w on[:<string>]</code> <code>[<filename>]</code>	Turn warnings on for specific error messages defined by <code><string></code> . You can also narrow scope by specifying warnings be turned on when generated by specific <code><filename></code> s.

You can also turn warnings on or off in your MATLAB code.

For example, to turn off warnings for deployed applications (specified using `isdeployed`) in `startup.m`, you write:

```
if isdeployed
    warning off
end
```

To turn on warnings for deployed applications, you write:

```
if isdeployed
    warning on
end
```

- **-W**

Control the generation of function wrappers. Use the syntax

```
-W type
```

to control the generation of function wrappers for a collection of MATLAB files generated by the compiler. You provide a list of functions, and the compiler generates the wrapper functions and any appropriate global variable definitions.

- **-Y** Use

```
-Y license.lic
```

to override the default license file with the specified argument.

Note The `-Y` flag works only with the command-line mode.

```
>>!mcc -m foo.m -Y license.lic
```

Introduced before R2006a

mcrinstaller

Display version and location information for MATLAB Runtime installer corresponding to current platform

Syntax

```
[INSTALLER_PATH, MAJOR, MINOR, PLATFORM, LIST] = mcrinstaller;
```

Description

Displays information about available MATLAB Runtime installers using the format: `[INSTALLER_PATH, MAJOR, MINOR, PLATFORM, LIST] = mcrinstaller;` where:

- *INSTALLER_PATH* is the full path to the installer for the current platform.
- *MAJOR* is the major version number of the installer.
- *MINOR* is the minor version number of the installer.
- *PLATFORM* is the name of the current platform (returned by `COMPUTER(arch)`).
- *LIST* is a cell array of character vectors containing the full paths to MATLAB Runtime installers for other platforms. This list is non-empty only in a multi-platform MATLAB installation.

Note You must distribute the MATLAB Runtime library to your end users to enable them to run applications developed with MATLAB Compiler or MATLAB Compiler SDK.

See “Install and Configure the MATLAB Runtime” (MATLAB Compiler SDK) for more information about the MATLAB Runtime installer.

Examples

Find MATLAB Runtime Installer Locations

Display locations of MATLAB Runtime installers for platform. This example shows output for a win64 system.

```
mcrinstaller
```

```
The WIN64 MATLAB Runtime Installer, version 9.0.1, is:
```

```
C:\Program Files\MATLAB\R2016a\toolbox\compiler\deploy\win64\MCRInstaller.exe
```

```
MATLAB Runtime installers for other platforms are located in:
```

```
C:\Program Files\MATLAB\R2016a\toolbox\compiler\deploy\<ARCH>
```

```
<ARCH> is the value of COMPUTER('arch') on the target machine.
```

```
Full list of available MATLAB Runtime installers:
```

```
C:\Program Files\MATLAB\R2016a\toolbox\compiler\deploy\win64\MCRInstaller.exe
```

```
For more information, read your local MATLAB Runtime Installer Help.
```

```
Or see the online documentation at MathWorks' web site. (Page  
may load slowly.)
```

```
ans =
```

```
C:\Program Files\MATLAB\R2016a\toolbox\compiler\deploy\win64\MCRInstaller.exe
```

Introduced in R2009a

mcrversion

Determine version of installed MATLAB Runtime

Syntax

```
[major, minor] = mcrversion;
```

Description

The MATLAB Runtime version number consists of two digits, separated by a decimal point. This function returns each digit as a separate output variable: `[major, minor] = mcrversion;` Major and minor are returned as integers.

If the version number ever increases to three or more digits, call `mcrversion` with more outputs, as follows:

```
[major, minor, point] = mcrversion;
```

At this time, all outputs past “minor” are returned as zeros.

Typing only `mcrversion` will return the major version number only.

Examples

```
mcrversion
ans =
     7
```

Introduced in R2008a

setmcruserdata

Associate MATLAB data value with a key

Syntax

```
function setmcruserdata(key, value)
```

Description

The *function* `setmcruserdata(key, value)` command is part of the MATLAB Runtime User Data interface API.

Examples

In C++:

```
mxAArray *key = mxCreateString("ParallelProfile");
mxAArray *value = mxCreateString("\\usr\\userdir\\config.settings");
if (!setmcruserdata(key, value))
{
    fprintf(stderr,
            "Could not set MCR user data: \n %s ",
            mclGetLastErrorMessage());
    return -1;
}
```

In C:

```
mxAArray *key = mxCreateString("ParallelProfile");
mxAArray *value = mxCreateString("\\usr\\userdir\\config.settings");
if (!mclfSetmcruserdata(key, value))
{
    fprintf(stderr,
            "Could not set MCR user data: \n %s ",
            mclGetLastErrorMessage());
}
```

```
    return -1;  
}
```

MATLAB Compiler Quick Reference

Common Uses of MATLAB Compiler

In this section...
“Create a Standalone Application” on page A-2
“Create a Library” on page A-2

Create a Standalone Application

Example 1

To create a standalone application from `mymfile.m`, use

```
mcc -m mymfile
```

Example 2

To create a standalone application from `mymfile.m`, look for `mymfile.m` in the folder `/files/source`, and put the resulting C files and in `/files/target`, use

```
mcc -m -I /files/source -d /files/target mymfile
```

Example 3

To create a standalone application `mymfile1` from `mymfile1.m` and `mymfile2.m` using a single `mcc` call, use

```
mcc -m mymfile1 mymfile2
```

Create a Library

Example 1

To create a C shared library from `foo.m`, use

```
mcc -l foo.m
```

Example 2

To create a C shared library called `library_one` from `foo1.m` and `foo2.m`, use

```
mcc -W lib:library_one -T link:lib foo1 foo2
```

Note You can add the `-g` option to any of these for debugging purposes.

mcc Command Arguments Listed Alphabetically

Option	Description	Comment
-a <i>path</i>	Add <i>path</i> to the deployable archive.	If a folder name is specified, all files in the folder are added. If a wildcard is used all files matching the wildcard are added.
-b	Generate Excel compatible formula function.	Requires MATLAB Compiler for Excel add-ins
-B filename[:arg[,arg]]	Replace -B filename on the mcc command line with the contents of filename.	The file should contain only mcc command-line options. These are MathWorks included options files: <ul style="list-style-type: none"> • -Bcsharedlib:foo (C shared library) • -B cpplib:foo (C++ library)
-c	Generate C wrapper code.	Equivalent to -T codegen
-C	Direct mcc to not embed the deployable archive in generated binaries.	
-d directory	Place output in specified folder.	
-e	Suppresses appearance of the MS-DOS Command Window when generating a standalone application.	Use -e in place of the -m option. Available for Windows only. Use with -R option to generate error logging. Equivalent to -W WinMain -T link:exe The standalone app compiler suppresses the MS-DOS command window by default. To unsuppress it, unselect Do not require Windows Command Shell (console) for execution in the app's Additional Runtime Settings area.

Option	Description	Comment
-f filename	Use the specified options file, filename, when calling mbuild.	mbuild -setup is recommended.
-g	Generate debugging information.	None
-G	Same as -g	None
-I directory	Add folder to search path for MATLAB files.	
-K	Directs mcc to not delete output files if the compilation ends prematurely, due to error.	mcc's default behavior is to dispose of any partial output if the command fails to execute successfully.
-l	Macro to create a function library.	Equivalent to -W lib -T link:lib
-m	Macro to generate a standalone application.	Equivalent to -W main -T link:exe
-M string	Pass string to mbuild.	Use to define compile-time options.
-N	Clear the path of all but a minimal, required set of folders.	None
-o outputfile	Specify name of final output file.	Adds appropriate extension
-p directory	Add directory to compilation path in an order-sensitive context.	Requires -N option
-R option	Specify run-time options for MATLAB Runtime.	option = -nojvm, -nodisplay, -logfile filename, -startmsg, and -completemsg filename
-S	Create Singleton MATLAB Runtime.	Default for generic COM components. Valid for Microsoft Excel and Java packages.

Option	Description	Comment
-u	Registers COM component for current user only on development machine	Valid only for generic COM components and Microsoft Excel add-ins
-T	Specify the output target phase and type.	Default is codegen.
-v	Verbose; display compilation steps.	
-w <i>option</i>	Display warning messages.	<i>option</i> = list, level, or level:string where level = disable, enable, error, off:string, or on:string
-W <i>type</i>	Control the generation of function wrappers.	<i>type</i> = main cpplib:<string> lib:<string> none com:compname, clname, version
-Y licensefile	Use licensefile when checking out a MATLAB Compiler license.	The -Y flag works only with the command-line mode. >>!mcc -m foo.m -Y license.lic
-?	Display help message.	

mcc Command Line Arguments Grouped by Task

COM Components

Option	Description	Comment
-u	Registers COM component for current user only on development machine	Valid only for generic COM components and Microsoft Excel add-ins (requiring MATLAB Compiler)

Deployable Archive

Option	Description	Comment
-a <i>filename</i>	Add <i>filename</i> to the deployable archive.	None
-C	Directs <code>mcc</code> to not embed the deployable archive in C/C++ and main/Winmain shared libraries and standalone binaries by default.	None

Debugging

Option	Description	Comment
-g	Generate debugging information.	None
-G	Same as -g	None
-K	Directs <code>mcc</code> to not delete output files if the compilation ends prematurely, due to error.	<code>mcc</code> 's default behavior is to dispose of any partial output if the command fails to execute successfully.
-v	Verbose; display compilation steps.	None
-W <i>type</i>	Control the generation of function wrappers.	<code>type = main</code> <code>cpplib:<string></code> <code>lib:<string> none</code> <code>com:compname, clname, version</code>
-?	Display help message.	None

Dependency Function Processing

Option	Description	Comment
-a <i>filename</i>	Add <i>filename</i> to the deployable archive.	None

Licenses

Option	Description	Comment
-Y <i>licensefile</i>	Use <i>licensefile</i> when checking out a MATLAB Compiler license.	The -Y flag works only with the command-line mode. <code>>>!mcc -m foo.m -Y license.lic</code>

MATLAB Compiler for Excel Add-Ins

Option	Description	Comment
-b	Generate Excel compatible formula function.	Requires MATLAB Compiler
-u	Registers COM component for current user only on development machine	Valid only for generic COM components and Microsoft Excel add-ins (requiring MATLAB Compiler)

MATLAB Path

Option	Description	Comment
-I directory	Add folder to search path for MATLAB files.	MATLAB path is automatically included when running from MATLAB, but not when running from a DOS/UNIX shell.
-N	Clear the path of all but a minimal, required set of folders.	None
-p directory	Add <code>directory</code> to compilation path in an order-sensitive context.	Requires <code>-N</code> option

mbuild

Option	Description	Comment
-f filename	Use the specified options file, <code>filename</code> , when calling <code>mbuild</code> .	<code>mbuild -setup</code> is recommended.
-M string	Pass <code>string</code> to <code>mbuild</code> .	Use to define compile-time options.

MATLAB Runtime

Option	Description	Comment
-R <i>option</i>	Specify run-time options for MATLAB Runtime.	<i>option</i> = -nojvm -nodisplay-logfile <i>filename</i> -startmsg -completemsg <i>filename</i>
-S	Create Singleton MATLAB Runtime.	Default for generic COM components. Valid for Microsoft Excel and Java packages.

Override Default Inputs

Option	Description	Comment
-B filename[:arg[,arg]]	Replace -B filename on the mcc command line with the contents of filename (bundle).	The file should contain only mcc command-line options. These are MathWorks included options files: <ul style="list-style-type: none"> • -B csharedlib:foo — C shared library • -B cpplib:foo — C++ library

Override Default Outputs

Option	Description	Comment
-d <i>directory</i>	Place output in specified folder.	None
-o <i>outputfile</i>	Specify name of final output file.	Adds appropriate extension
-e	Suppresses appearance of the MS-DOS Command Window when generating a standalone application.	Use <code>-e</code> in place of the <code>-m</code> option. Available for Windows only. Use with <code>-R</code> option to generate error logging. Equivalent to <code>-W WinMain -T link:exe</code> The standalone app compiler suppresses the MS-DOS command window by default. To unsuppress it, unselect Do not require Windows Command Shell (console) for execution in the app's Additional Runtime Settings area.

Wrappers and Libraries

Option	Description	Comment
-c	Generate C wrapper code.	Equivalent to <code>-T codegen</code>
-l	Macro to create a function library.	Equivalent to <code>-W lib -T link:lib</code>
-m	Macro to generate a standalone application.	Equivalent to <code>-W main -T link:exe</code>
-W <i>type</i>	Control the generation of function wrappers.	<code>type = main</code> <code>cpplib:<string></code> <code>lib:<string> none</code> <code>com:compname, clname, ve</code> <code>rsion</code>

Accepted File Types

The valid and invalid file types are as follows:

Target Application	Valid File Types	Invalid File Types
Standalone Application	MATLAB Mex files, MATLAB scripts, and MATLAB functions. These files must have a single entry point.	MATLAB class files, PCode, Java functions, COM or .NET components, and data files
Library Compiler	MATLAB Mex files and MATLAB functions. These files must have a single entry point.	MATLAB scripts, MATLAB class files, PCode, Java functions, COM or .NET components, and data files
MATLAB Production Server	MATLAB Mex files and MATLAB functions. These files must have a single entry point.	MATLAB scripts, MATLAB class files, PCode, Java functions, COM or .NET components, and data files

Using MATLAB Compiler on Mac or Linux

Write Applications for Mac OS X

In this section...

“Objective-C/C++ Applications for Apple’s Cocoa API” on page B-2

“Where’s the Example Code?” on page B-2

“Preparing Your Apple Xcode Development Environment” on page B-2

“Build and Run the Sierpinski Application” on page B-3

“Running the Sierpinski Application” on page B-4

Objective-C/C++ Applications for Apple’s Cocoa API

Apple Xcode, implemented in the Objective-C language, is used to develop applications using the Cocoa framework, the native object-oriented API for the Mac OS X operating system.

This article details how to deploy a graphical MATLAB application with Objective C and Cocoa, and then deploy it using MATLAB Compiler.

Where’s the Example Code?

You can find example Apple Xcode, header, and project files in *matlabroot/extern/examples/compiler/xcode*.

Preparing Your Apple Xcode Development Environment

To run this example, you should have prior experience with the Apple Xcode development environment and the Cocoa framework.

The example in this article is ready to build and run on page B-3. However, before you build and run your own applications, you must do the following (as has been done in our example code on page B-2):

- 1 Build the shared library with MATLAB Compiler using either the Library Compiler or `mcc`.
- 2 Compile application code against the library’s header file and link the application against the component library and `libmwmc1mcrtrt`. See “Problems Setting

MATLAB Runtime Paths” on page B-10 and “Problems Setting MATLAB Runtime Paths” on page B-10 for information about and MATLAB Runtime paths and `libmwmclmcrtrt`.

3 In your Apple Xcode project:

- Specify `mcc` in the project target (Build Component Library in the example code on page B-2).
- Specify target settings in `HEADER_SEARCH_PATHS`.
 - Specify directories containing the library header.
 - Specify the path `matlabroot/extern/include`.
 - Define `MWINSTALL_ROOT`, which establishes the install route using a relative path.
- Set `LIBRARY_SEARCH_PATHS` to any directories containing the shared library, as well as to the path `matlabroot/runtime/maci64`.

Build and Run the Sierpinski Application

In this example, you deploy the graphical Sierpinski function (`sierpinski.m`, located at `matlabroot/extern/examples/compiler`).

```
function [x, y] = sierpinski(iterations, draw)
% SIERPINSKI Calculate (optionally draw) the points
% in Sierpinski's triangle

% Copyright 2004 The MathWorks, Inc.

% Three points defining a nice wide triangle
points = [0.5 0.9 ; 0.1 0.1 ; 0.9 0.1];

% Select an initial point
current = rand(1, 2);

% Create a figure window
if (draw == true)
    f = figure;
    hold on;
end

% Pre-allocate space for the results, to improve performance
```

```
x = zeros(1,iterations);
y = zeros(1,iterations);

% Iterate
for i = 1:iterations

    % Select point at random
    index = floor(rand * 3) + 1;

    % Calculate midpoint between current point and random point
    current(1) = (current(1) + points(index, 1)) / 2;
    current(2) = (current(2) + points(index, 2)) / 2;

    % Plot that point
    if draw, line(current(1),current(2));, end
    x(i) = current(1);
    y(i) = current(2);

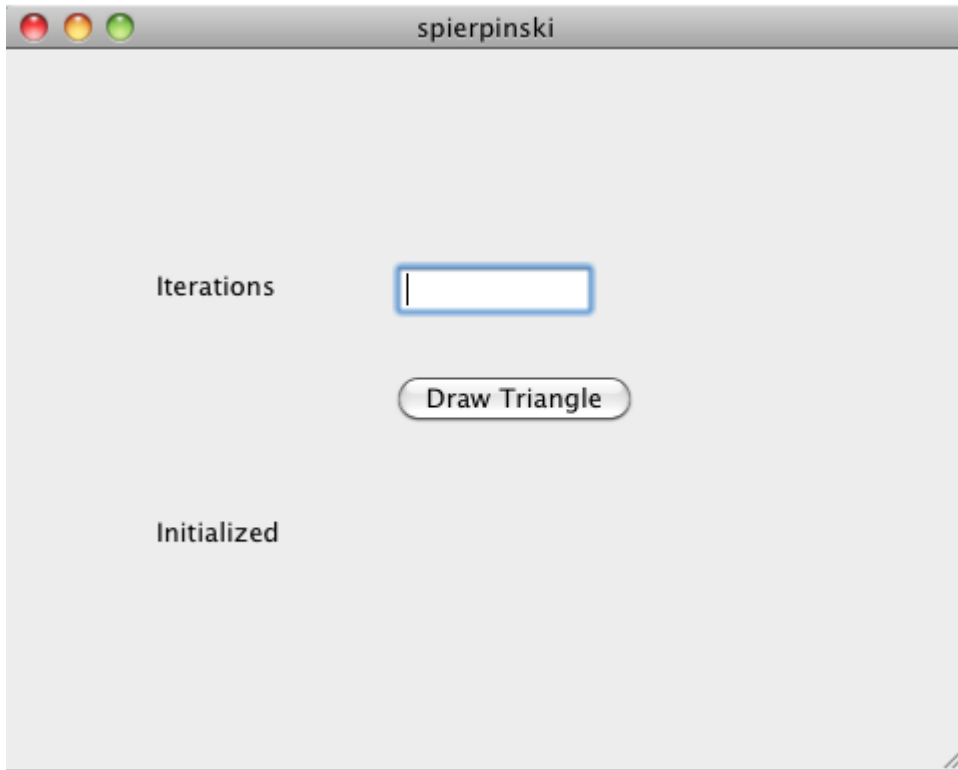

end

if (draw)
    drawnow;
end
```

- 1 Using the Mac Finder, locate the Apple Xcode project (*matlabroot/extern/examples/compiler/xcode*). Copy files to a working directory to run this example, if needed.
- 2 Open *sierpinski.xcodeproj*. The development environment starts.
- 3 In the **Groups and Files** pane, select **Targets**.
- 4 Click **Build and Run**. The make file runs that launches MATLAB Compiler (*mcc*).

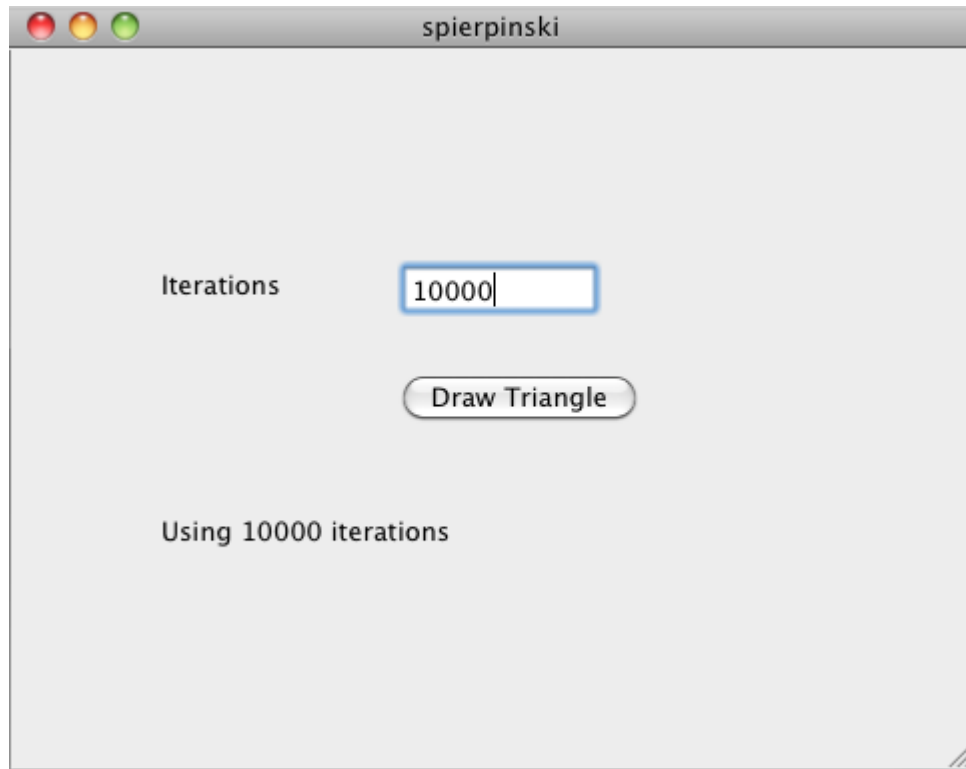

Running the Sierpinski Application

Run the **Sierpinski** application from the build output directory. The following GUI appears:

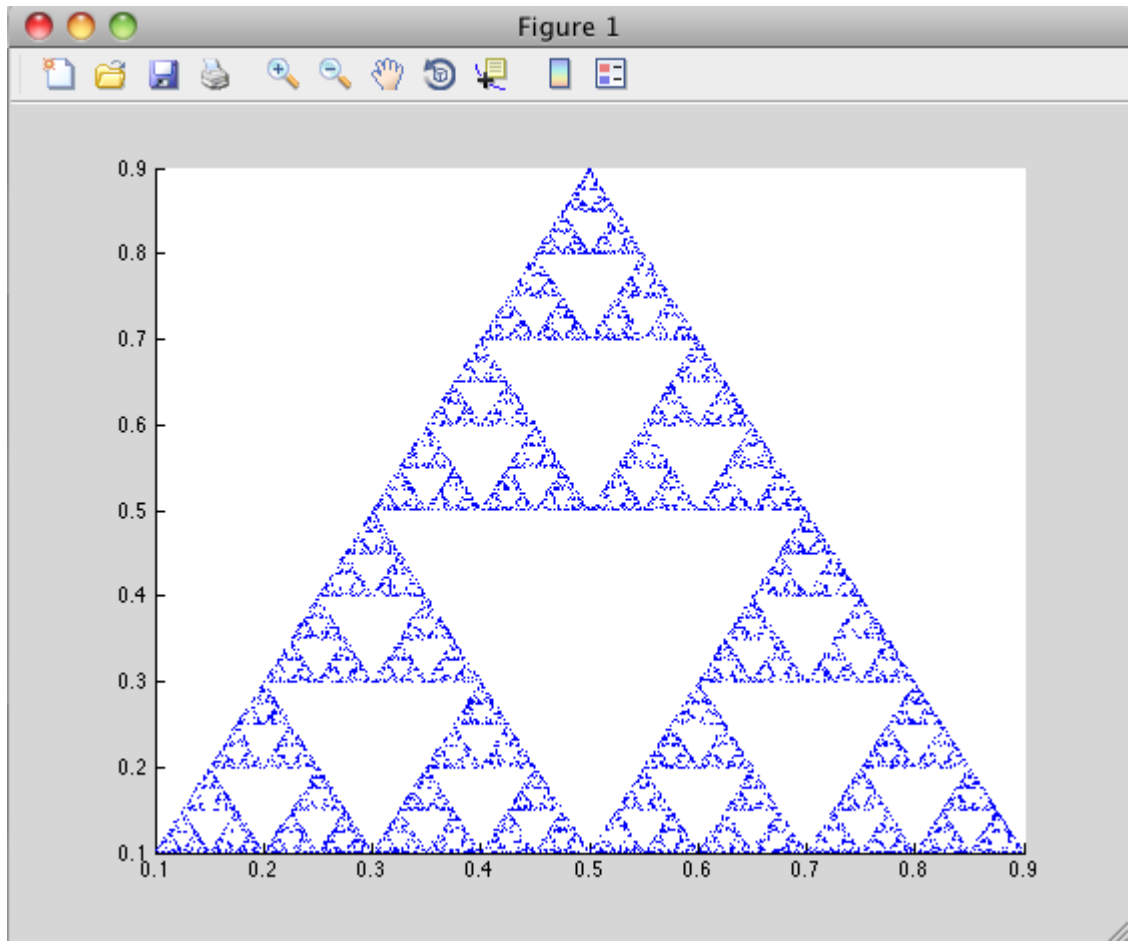

MATLAB Sierpinski Function Implemented in the Mac Cocoa Environment

- 1 In the **Iterations** field, enter an integer such as 10000:

- 2 Click **Draw Triangle**. The following figure appears:

Build Your Application on Mac or Linux

In this section...
“Compiling Your Application with the Compiler Apps” on page B-8
“Compiling Your Application with the Command Line” on page B-8

Compiling Your Application with the Compiler Apps

When running a graphical interface from your Mac or Linux desktop, use “Create Standalone Application from MATLAB” on page 1-6 as a template for building a standalone application with the Application Compiler. Use “Compile C/C++ Shared Libraries with Library Compiler App” (MATLAB Compiler SDK) for creating a shared library with the Library Compiler.

Compiling Your Application with the Command Line

For compiling your application at the command line, there are separate Macintosh and non-Macintosh instructions for Mac or Linux platforms.

On Non-Mac i64 Platforms

Use the section “Input and Output Files” on page 6-2 for lists of files produced and supplied to `mcc` when building a C shared library, or a C++ shared library.

On Maci64

Use the section “Input and Output Files” on page 6-2 for lists of files produced and supplied to `mcc` when building a “Macintosh 64 (Maci64)” on page 6-2 application.

Test Your Application on Mac or Linux

On Windows, deployed applications automatically modify the system `PATH` variable.

On Mac OS X or Linux, deployed applications do not modify the system `PATH` variable. You must perform this step manually.

Problems Setting MATLAB Runtime Paths

In this section...
“Running SETENV on Mac Failed” on page B-10
“Mac Application Fails with “Library not loaded” or “Image not found”” on page B-10

When you build applications, associated shell scripts (`run_application.sh`) are automatically generated in the same folder as your binary. By running these scripts, you can conveniently set the path to your MATLAB Runtime location.

Running SETENV on Mac Failed

If the `setenv` command fails with a message similar to `setenv: command not found` or `setenv: not found`, you are not using a C Shell command interpreter (such as `csh` or `tcsh`).

Set the environment variables using the `export` command using the format `export my_variable=my_value`.

For example, to set `DYLD_LIBRARY_PATH`, run the following command:

```
export DYLD_LIBRARY_PATH = mcr_root/v711/runtime/maci64:mcr_root/ ...
```

Mac Application Fails with “Library not loaded” or “Image not found”

If you set your environment variables, you may still receive the following message when you run your application:

```
imac-joe-user:~ joeuser$ /Users/joeuser/Documents/MATLAB/Dip/Dip ; exit;
dyld: Library not loaded: @loader_path/libmwmclmcrtr.7.11.dylib
Referenced from: /Users/joeuser/Documents/MATLAB/Dip/Dip
Reason: image not found
Trace/BPT trap
logout
```

You may have set your environment variables initially, but they were not set up as persistent variables. Do the following:

- 1 In your home directory, open a file such as `.bashrc` or `.profile` file in your log-in shell.

- 2 In either of these types of log-in shell files, add commands to set your environment variables so that they persist. For example, to set `DYLD_LIBRARY_PATH` in this manner, you enter the following in your file:

```
# Setting PATH for MCR

DYLD_LIBRARY_PATH=/Users/joeuser/Desktop/mcr/v711/runtime/maci64:
/Users/joeuser/Desktop/mcr/v711/sys/os/maci64:/Users/joeuser/Desktop/
mcr//v711/bin/maci64
export DYLD_LIBRARY_PATH

?
```

Note The `DYLD_LIBRARY_PATH=` statement is one statement that must be entered as a single line. The statement is shown on different lines, in this example, for readability only.

Apps

Application Compiler

Package MATLAB programs for deployment as standalone applications

Description

The **Application Compiler** app packages MATLAB programs into applications that can run outside of MATLAB.

Open the Application Compiler App

- MATLAB Toolstrip: On the **Apps** tab, under **Application Deployment**, click the app icon.
- MATLAB command prompt: Enter `applicationCompiler`.

Examples

- “Create Standalone Application from MATLAB” on page 1-6

Parameters

main file — name of the function to package
character vector

Name of the function to package as a character vector. The selected function is the entry point for the compiled application.

packaging options — method for installing the MATLAB Runtime with the compiled application

MATLAB Runtime downloaded from web (default) | MATLAB Runtime included in package

Method for installing the MATLAB Runtime as a radio button. Including MATLAB Runtime in the package significantly increases the size of the package.

files required for your application to run — files that must be included with application

list of files

Files that must be included with application as a list of files.

files installed with your application — optional files installed with application

list of files

Optional files installed with application as a list of files.

Settings

Additional parameters passed to MCC — flags controlling the behavior of the compiler

character vector

Flags controlling the behavior of the compiler as a character vector.

testing files — folder where files for testing are stored

character vector

Folder where files for testing are stored as a character vector.

end user files — folder where files for building a custom installer are stored

character vector

Folder where files for building a custom installer are stored are stored as a character vector.

packaged installers — folder where generated installers are stored

character vector

Folder where generated installers are stored as a character vector.

Application Information

application name — name of the installed application

character vector

Name of the installed application as a character vector.

For example, if the name is `foo`, the installed executable would be `foo.exe`, the start menu entry would be **foo**. The folder created for the application would be *InstallRoot/*`foo`.

The default value is the name of the first function listed in the **Main File(s)** field of the app.

version — version of the generated application

character vector

Version of the generated application as a character vector.

splash screen — image displayed on installer

image

Image displayed on installer as an image.

author name — name of the application author

character vector

Name of the application author as a character vector.

e-mail — e-mail address used to contact application support

character vector

E-mail address used to contact application support as a character vector.

summary — brief description of application

character vector

Brief description of application as a character vector.

description — detailed description of application

character vector

Detailed description of application as a character vector.

Additional Installer Options

default installation folder — folder where application is installed

character vector

Folder where the application is installed as a character vector.

installation notes — notes about additional requirements for using application character vector

Notes about additional requirements for using application as a character vector.

Programmatic Use

`applicationCompiler`

Introduced in R2013b

Hadoop Compiler

Package MATLAB programs for deployment to Hadoop clusters as MapReduce programs

Description

The **Hadoop Compiler** app packages MATLAB map and reduce functions into a deployable archive. You can incorporate the archive into a Hadoop mapreduce job by passing it as a payload argument to job submitted to a Hadoop cluster.

Open the Hadoop Compiler App

- MATLAB Toolstrip: On the **Apps** tab, under **Application Deployment**, click the app icon.
- MATLAB command prompt: Enter `hadoopCompiler`.

Examples

- “Example Using the Hadoop Compiler App Workflow”

Parameters

map function — mapper file

character vector

Function for the mapper, specified as a character vector.

reduce function — reducer file

character vector

Function for the reducer, specified as a character vector.

datastore file — file containing a datastore representing the data to be processed

character vector

A file containing a datastore representing the data to be processed, specified as a character vector.

In most cases, you will start off by working on a small sample dataset residing on a local machine that is representative of the actual dataset on the cluster. This sample dataset has the same structure and variables as the actual dataset on the cluster. By creating a datastore object to the dataset residing on your local machine you are taking a snapshot of that structure. By having access to this datastore object, a Hadoop job executing on the cluster will know how to access and process the actual dataset residing on HDFS™.

output types — format of output

keyvalue (default) | tabulartext

Format of output from Hadoop mapreduce job, specified as a keyvalue or tabular text.

additional configuration file content — additional parameters configuring how Hadoop executes the job

character vector

Additional parameters to configure how Hadoop executes the job, specified as a character vector. For more information, see “Configuration File for Creating Deployable Archive Using the mcc Command”.

files required for your MapReduce job payload to run — files that must be included with generated artifacts

list of files

Files that must be included with generated artifacts, specified as a list of files.

Settings

Additional parameters passed to MCC — flags controlling the behavior of the compiler

character vector

Flags controlling the behavior of the compiler, specified as a character vector.

testing files — folder where files for testing are stored

character vector

Folder where files for testing are stored, specified as a character vector.

packaged files — folder where generated artifacts are stored
character vector

Folder where generated artifacts are stored, specified as a character vector.

Programmatic Use

`hadoopCompiler`
