Structural Analysis: Solve static linear elasticity problems

A new programmatic workflow lets you set up, solve, and analyze static linear elasticity problems using a familiar domain-specific language. When setting up a static linear elasticity problem, you can:

- Create a special model container for a static structural analysis. See createpde.
- Assign structural properties of the material, such as Young's modulus, Poisson's ratio, and mass density. See structuralProperties.
- Specify a body load for a structural model. See structuralBodyLoad.
- Specify pressure, surface traction, and translational stiffness for a particular boundary. See structuralBoundaryLoad.
- Specify enforced displacement and boundary constraints for a particular boundary.
 See structural BC.

The solve function solves a static structural analysis model and returns displacement, stress, strain, and von Mises stress at nodal locations of the mesh. You can analyze the resulting solution further by using one of these functions:

- interpolateDisplacement interpolates displacements to arbitrary spatial locations.
- interpolateStress and interpolateStrain interpolate stress and strain to arbitrary spatial locations.
- interpolateVonMisesStress interpolates von Mises stress to arbitrary spatial locations.
- evaluateReaction evaluates reaction forces on a specified boundary.
- evaluatePrincipalStress and evaluatePrincipalStrain evaluate principal stress and strain at mesh nodes.

The pdeplot and pdeplot3D functions let you visualize the solution by plotting the resulting displacements, stresses, and strains.

For more details about the new workflow, see "Structural Mechanics".

Planar STL Geometry: Import and mesh planar STL geometries

importGeometry can import a planar STL geometry and convert it to a 2-D geometry by mapping it to the X-Y plane. To mesh the resulting 2-D geometry, use generateMesh.

Meshing: Improved mesh generation

The mesh generator, generateMesh, now:

- · Uses new mesh generation algorithm for 2-D geometries.
- Lets you specify mesh growth rate for both 2-D and 3-D meshes. To specify mesh growth rate, use the Hgrad argument of generateMesh.

Compatibility Considerations

Resulting meshes can differ from meshes generated in previous releases. For example, meshes generated with the default size controls can have fewer elements than before.

Also, generateMesh creates quadratic meshes for 2-D problems by default. In previous releases, the default mesh for 2-D geometries is a linear mesh. For both 2-D and 3-D geometries, you can specify whether you want to use linear or quadratic mesh by using the GeometricOrder argument of generateMesh.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
Function handle for specifying nonconstant boundary conditions and coefficients of the form @f(problem, region, state)	Still runs	<pre>@f(region, state)</pre>	Use the two-argument form, @f(region, state), to define a function handle for applyBoundaryCondition or specifyCoefficients.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
pdetool	Still runs	pdeModeler	The function name pdetool has been changed to pdeModeler. Also, if you start using the PDE Modeler app and then reopen the app, you overwrite any existing information in the app.
Opening the PDE Modeler app by calling pdeModeler or pdetool or by using the Apps tab	Does not overwrite existing informatio n in the app anymore	To overwrite the existing information in the PDE Modeler app, select File > New .	In previous releases, starting the PDE Modeler app and then reopening the app by calling pdetool or by using the Apps tab overwrites any existing information in the app. Now, reopening the PDE Modeler app brings focus to the app window.
Jiggle, JiggleIter, and MesherVersion arguments of generateMesh	Ignored	No replacement	generateMesh produces good quality meshes without jiggling the nodes.

R2017a

Version: 2.4

New Features

Bug Fixes

Thermal Analysis: Solve conduction-dominant heat transfer problems with convection and radiation occurring at boundaries

A new programmatic workflow lets you set up, solve, and analyze conduction-dominant heat transfer problems using natural steps and familiar domain-specific language. When setting up a heat transfer problem, you can:

- Create a special model container for a steady-state or transient thermal model. See createpde.
- Assign thermal properties of the material, such as thermal conductivity, specific heat, and mass density. See thermalProperties.
- Specify internal heat sources of the geometry. See internalHeatSource.
- Set temperatures on boundaries, specify insulated boundaries, heat fluxes through boundaries, convection coefficients, radiation emissivity coefficients, and ambient temperature. See thermalBC.
- Set initial temperature or initial guess for temperature. See thermalIC.

The solve function solves steady-state and transient thermal models and returns temperatures and temperature gradients at nodal locations of the thermal model mesh. You can analyze the resulting solution further by using one of these functions:

- interpolateTemperature interpolates resulting temperatures to arbitrary spatial locations.
- evaluateTemperatureGradient evaluates temperature gradient for a transient thermal solution at arbitrary spatial locations.
- evaluateHeatFlux evaluates heat flux of a thermal solution at nodal or arbitrary spatial locations.
- evaluateHeatRate evaluates integrated heat flow rate normal to specified boundary.

The pdeplot and pdeplot3D functions let you visualize a thermal model solution by plotting the resulting temperatures, and temperature gradients, and mesh.

There is a new featured example showing heat transfer in a transient 3-D model, Heat Conduction in a Spherical Multidomain Geometry with Nonuniform Heat Flux.

For more details about the new workflow, see Heat Transfer.

3-D Multidomain Geometry: Create geometries consisting of stacked or nested cuboids, spheres, or cylinders

The multicuboid, multicylinder, and multisphere functions create 3-D geometries formed by several cubic, cylindrical, and spherical cells, respectively. With these functions, you can create stacked or nested geometries. You also can create geometries where some cells are empty, for example, hollow cylinders, cubes, or spheres.

All cells in a geometry must be of the same type: either cuboids, or cylinders, or spheres. These functions do not combine cells of different types in one geometry.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
pdemdlcv	Errors	No replacement	Remove all instances of pdemdlcv.
Function handle for specifying nonconstant boundary conditions and coefficients of the form@f(problem, region, state).	Still runs	<pre>@f(region,state)</pre>	Use the two-argument form, @f(region, state), to define a function handle for applyBoundaryCondition or specifyCoefficients.

R2016b

Version: 2.3

New Features

Bug Fixes

Flux of PDE Solution: Evaluate tensor product of c-coefficient and gradient of PDE solution for 2-D and 3-D problems

The evaluateCGradient function computes the tensor product of c-coefficient and gradients of the PDE solution, $\mathbf{c} \otimes \nabla_{\mathbf{u}}$, at nodal or arbitrary locations in 2-D or 3-D geometry.

Boundary Conditions: Set an individual boundary condition for each equation in a PDE system, query boundary condition assignments

The applyBoundaryCondition function can set an individual boundary condition for each equation in a system of PDEs in one function call. For example, in a system of two PDEs, one applyBoundaryConditions call can set the Dirichlet boundary condition for the first equation, and the Neumann boundary condition for the second equation.

The function uses clear precedence rules to decide which condition to use for every geometric region.

The findBoundaryConditions function returns the currently used boundary condition assignment for a geometric region.

Compatibility Considerations

The new syntax requires explicit specification of the boundary condition type as 'dirichlet', 'neumann', or 'mixed'. For example, in previous releases you used the following syntaxes to apply the Dirichlet boundary condition on edge 1 and Neumann boundary condition on face 2.

```
applyBoundaryCondition(model,'Edge',1,'u',0);
applyBoundaryCondition(model,'Face',2,'g',0,'q',0);
```

Update them to specify the boundary condition types.

```
applyBoundaryCondition(model,'dirichlet','Edge',1,'u',0);
applyBoundaryCondition(model,'neumann','Face',2,'g',0,'q',0);
```

Previously, to set the Dirichlet boundary condition for one equation in a PDE system and the Neumann boundary condition for another, you used two function calls to applyBoundaryCondition.

```
applyBoundaryCondition(model,'edge',4,'u',0,'EquationIndex',1);
applyBoundaryCondition(model,'edge',4,'g',[0,-1]);
```

Now, set both boundary conditions in one function call by specifying the boundary condition type as 'mixed'.

Nodal Initial Conditions: Set nodal initial conditions using the result of a previous simulation

The setInitialConditions function sets initial conditions at the mesh nodes by using the solution from a previous analysis on the same geometry and mesh.

Geometric Initial Conditions: Set initial conditions on vertices, edges, faces, and cells

The setInitialConditions function sets initial conditions on faces, edges, and vertices for both 2-D and 3-D geometries, and on cells for 3-D geometry. You can set initial conditions on particular vertices, edges, faces, and cells or set global initial conditions on all vertices, edges, faces, or cells in the geometry.

Mesh and Solution Plots: Set transparency, display node and element labels

The FaceAlpha argument of pdegplot, pdemesh, pdeplot, and pdeplot3D lets you set the plot transparency.

The ElementLabels argument of pdemesh, pdeplot, and pdeplot3D lets you display element labels.

The NodeLabels argument of pdemesh and pdeplot lets you display node labels.

The VertexLabels and CellLabels arguments of pdegplot let you display vertex and cell labels.

Compatibility Considerations

The argument SubdomainLabels is no longer recommended. Use FaceLabels for 2-D geometries instead.

3-D Geometry Import from STL Files: Improved quality of the resulting geometry

When importing an STL geometry for a 3-D problem, importGeometry can recognize and reconstruct more geometric vertices, edges, and faces of the original CAD geometry in some instances. In these cases, the resulting geometry is a closer match to the original CAD geometry.

Compatibility Considerations

Detailed geometries can now contain more faces and edges than in previous releases. As a result, in rare instances, the new faces and edges can cause renumbering of the existing ones. If your code imports an STL geometry, visually check the geometry to ensure that you are assigning boundary and initial conditions to the intended regions.

Functionality	What Happens When You Use It?	Use This Instead	Compatibility Considerations
pdemdlcv	Warns	No replacement	Remove all instances of pdemdlcv.
pde	Errors	createpde	Use createpde to create a PDEModel that holds the PDE analysis data. The pde class was a value class. The replacement PDEModel class is a handle class.

R2016a

Version: 2.2

New Features

Bug Fixes

PDE Solvers: Use solvepde and solvepdeeig functions to solve PDEs and PDE eigenvalue problems

New solver functions for PDEModel:

- solvepde replaces assempde, pdenonlin, hyperbolic, and parabolic.
- solvepdeeig replaces pdeeig.

To use the new solvers, include PDE coefficients in your model using specifyCoefficients. Include initial conditions in your model using setInitialConditions.

The new solvers return results as one of the three new objects:

- · StationaryResults Returned by solvepde for a stationary PDE model.
- TimeDependentResults Returned by solvepde for a time-dependent PDE model.
- EigenResults Returned by solvepdeeig.

StationaryResults and TimeDependentResults objects contain solution gradients at the nodes.

PDE Coefficients: Specify equation coefficients as a property of PDEModel

The specifyCoefficients function specifies equation coefficients as a property of PDEModel.

Initial Conditions: Set initial conditions or initial guess as a property of PDEModel

The setInitialConditions function specifies initial conditions as a property of PDEModel.

Quadratic Elements for 2-D Mesh: Generate 2-D mesh using quadratic triangular elements

Create a quadratic mesh for 2-D problems using generateMesh with GeometricOrder set to 'quadratic'.

Gradient of PDE Solution: Evaluate solution gradient at arbitrary 2-D or 3-D points

The evaluateGradient function enables you to interpolate the gradient of a StationaryResults or TimeDependentResults object at arbitrary points in the geometry.

Finite Element Matrices: Use assembleFEMatrices to assemble finite element matrices

The assembleFEMatrices function assembles finite element matrices for independent factoring and solution using linear algebra methods. It replaces assempde, assema, and assemb for matrix assembly.

PDE Results for Plotting and Postprocessing: New result objects depend on the type of PDE

The createPDEResults function returns results as one of the three new objects, depending on the type of the PDE problem.

- A StationaryResults object for a stationary PDE model. StationaryResults contains the solution of PDE and its gradients at the nodal locations.
- A TimeDependentResults object for a time-dependent PDE model.
 TimeDependentResults contains the solution of PDE and its gradients at the nodal locations.
- A EigenResults object for an eigenvalue problem.

Compatibility Considerations

createPDEResults no longer creates an object of type PDEResults.

The syntax of createPDEResults has changed to accommodate creating the new result types for time-dependent and eigenvalue problems.

- To create the TimeDependentResults object for a time-dependent problem, use the syntax createPDEResults (pdem, u, utimes, 'time-dependent'), where utimes is a vector of solution times.
- To create the EigenResults object for an eigenvalue problem, use the syntax createPDEResults (pdem, eigenvectors, eigenvalues, 'eigen').

EigenResults has different property names than PDEResults. Update any eigenvalue scripts that use PDEResults property names.

R2015b

Version: 2.1

New Features

Bug Fixes

3-D geometry creation from a finite element mesh using the geometryFromMesh function

The geometryFromMesh function creates 3-D geometry from a finite element mesh, or from a triangulated surface mesh. For details, see the function reference page or Create and View 3-D Geometry.

Data structure to represent solutions using the createPDEResults function

The createPDEResults function converts a PDE solution into a PDEResults object. The PDEResults object allows you to interpolate the solution using interpolateSolution. For details, see the reference pages.

	What Happens When You Use This Functionality?		Compatibility Considerations
pdesmech	Still runs	PDE app	Use the PDE app instead of pdesmech

R2015a

Version: 2.0

New Features

Bug Fixes

3-D finite element analysis

You can now solve partial differential equations with 3-D geometry. To do so, there is a new workflow that combines the geometry, mesh, and boundary conditions into a PDEModel object. You can also use this workflow for 2-D geometry. For details, see Solve Problems Using PDEModel Objects.

Equation coefficients and boundary conditions for 3-D problems

To specify problem coefficients or boundary conditions in 3-D geometry, you can use strings with a syntax similar to that of a 2-D problem. There is a new way of writing functions for coefficients in 3-D geometries. For details, see PDE Coefficients and Boundary Conditions.

Compatibility Considerations

To accommodate both 2-D and 3-D geometry, the format of boundary condition objects changed from that introduced in R2014b. The new object is BoundaryCondition Properties, and calling pdeBoundaryConditions now warns that it will be removed in a future release. If you saved a pdeBoundaryConditions object in an R2014b-format MAT file, then loading that file in R2015a can produce an error. Additionally, the syntax for specifying nonconstant boundary conditions has changed. Functions written in the previous syntax continue to work for now.

R2014b Syntax	R2015a Syntax
function bcMatrix =	function bcMatrix =
myfun(problem, region, state)	myfun(region,state)

For details, see Changes to Boundary Conditions Object From R2014b.

Elliptic, parabolic, hyperbolic, nonlinear, eigenvalue solvers for 3-D problems

The main toolbox solvers now support problems with 3-D geometry. For a listing of functions that do or do not support 3-D geometry, see Functions That Support 3-D Geometry. Solvers take a model argument instead of the previous b, p, e, t arguments. For details, see the function reference pages.

3-D geometry import from STL files

Import the geometry for a 3-D problem in the STL file format using the importGeometry function. For details, see Create and View 3-D Geometry.

3-D unstructured meshing using tetrahedra

Create finite element meshes using the generateMesh function. For 3-D geometry, the meshes consist of tetrahedra. See Mesh Data for [p,e,t] Triples: 3-D.

Plot function to inspect 3-D solutions

The pdeplot3D function plots solutions on the boundaries of 3-D geometry. For details, see Plot 3-D Solutions.

Featured examples with 3-D geometry

There are two new featured examples related to linear elasticity that have 3-D geometry:

- · Deflection Analysis of a Bracket
- · Vibration of a Square Plate

There is also a new example of plotting slices through a 3-D solution: Contour Slices Through a 3-D Solution.

To run the examples at the MATLAB® command line:

```
echodemo StrainedBracketExample
echodemo Eigenvaluesofa3DPlateExample
echodemo ContourSlices3DExample
```

pdebound and pdegeom reference pages removed

The pdebound and pdegeom reference pages have been replaced by the Boundary Conditions and 2-D Geometry documentation categories.

R2014b

Version: 1.5

New Features

Functions for modular definition of boundary conditions

To specify PDE boundary conditions in a modular fashion, per edge or set of edges, use a pdeBoundaryConditions specification. For details, see Steps to Specify a Boundary Conditions Object.

pdeInterpolant object for solution interpolation

Interpolate a PDE solution to a set of points using evaluate on an interpolant. Create the interpolant using pdeInterpolant.

R2014a

Version: 1.4

New Features

Damping option for hyperbolic solver

You can include damping in the hyperbolic solver in matrix form. There is a new example of dynamics of a damped cantilever beam that shows how to use this feature.

R2013b

Version: 1.3

New Features

Display option in hyperbolic and parabolic solvers

You can disable the display of internal ODE solution details that the hyperbolic and parabolic solvers report. To disable the display, set the Stats name-value pair to 'off'.

Eigenvalue example

There is a new example of eigenvalues of a circular membrane. View the example here. To run the example at the MATLAB command line:

echodemo eigsExample

R2013a

Version: 1.2

New Features

Performance and robustness enhancements in meshing algorithm

The meshing (geometry triangulation) functions in initmesh and adaptmesh provide an enhancement option for increased meshing speed and robustness. Choose the enhanced algorithm by setting the MesherVersion name-value pair to 'R2013a'. The default MesherVersion value of 'preR2013a' gives the same mesh as previous toolbox versions.

The enhancement is available inpdetool from the Mesh > Parameters > Mesher version menu.

New example

There is a new example of heat distribution in a radioactive rod. View the example here: "Heat Distribution in a Circular Cylindrical Rod". To run the example at the MATLAB command line:

echodemo radioactiveRod

R2012b

Version: 1.1

New Features

Compatibility Considerations

Coefficients of parabolic and hyperbolic PDEs that can be functions of the solution and its gradient

You can now solve parabolic and hyperbolic equations whose coefficients depend on the solution u or on the gradient of u. Use the parabolic or hyperbolic commands, or solve the equations using pdetool. For details, see the function reference pages.

Graphics export from pdetool

You can save the current pdetool figure in a variety of image formats. Save the figure using the **File > Export Image** menu. See File Menu.

pdegplot labels edges and subdomains

pdegplot now optionally labels:

- The edges in the geometry
- The subdomains in the geometry

To obtain these labels, set the edgeLabels or subdomainLabels name-value pairs to 'on'. For details, see the pdegplot reference page.

New examples

There is a new example of uniform pressure load on a thin plate. View the example here. To run the example at the MATLAB command line:

```
echodemo clampedSquarePlateExample
```

There is a new example of nonlinear heat transfer in a thin plate. View the example here. To run the example at the MATLAB command line:

```
echodemo heatTransferThinPlateExample
```

There is a new example of a system of coupled PDEs. View the example here. To run the example at the MATLAB command line:

```
echodemo deflectionPiezoelectricActuator
```

pdesmech shear strain calculation change

The pdesmech function now calculates shear strain according to the engineering shear strain definition. This has always been the documented behavior. However, the previous calculation was performed according to the tensor shear strain calculation, which gives half the value of the engineering shear strain.

Compatibility Considerations

pdesmech now returns shear strain values exactly twice as large as before.
