- *para*(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (τ) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- *para*(3) — Set *para*(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, upert

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify *xpert*. To extract the *xpert* structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing *xpert.signals.values*.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A, B, C, D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`dlinmod` compute a linear state-space model for a discrete-time system by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Discrete-Time System Linearization

The function `dlinmod` can linearize discrete, multirate, and hybrid continuous and discrete systems at any given sampling time. Use the same calling syntax for `dlinmod` as for `linmod`, but insert the sample time at which to perform the linearization as the second argument. For example,

```
[Ad,Bd,Cd,Dd] = dlinmod('sys', Ts, x, u);
```

produces a discrete state-space model at the sampling time T_s and the operating point given by the state vector x and input vector u . To obtain a continuous model approximation of a discrete system, set T_s to 0.

For systems composed of linear, multirate, discrete, and continuous blocks, `dlinmod` produces linear models having identical frequency and time responses (for constant inputs) at the converted sampling time T_s , provided that

- T_s is an integer multiple of all the sampling times in the system.
- The system is stable.

For systems that do not meet the first condition, in general the linearization is a time-varying system, which cannot be represented with the $[A,B,C,D]$ state-space model that `dlinmod` returns.

Computing the eigenvalues of the linearized matrix A_d provides an indication of the stability of the system. The system is stable if $T_s > 0$ and the eigenvalues are within the unit circle, as determined by this statement:

```
all(abs(eig(Ad))) < 1
```

Likewise, the system is stable if $T_s = 0$ and the eigenvalues are in the left half plane, as determined by this statement:

```
all(real(eig(Ad))) < 0
```

When the system is unstable and the sample time is not an integer multiple of the other sampling times, `dlinmod` produces A_d and B_d matrices, which can be complex. The eigenvalues of the A_d matrix in this case still, however, provide a good indication of stability.

You can use `dlinmod` to convert the sample times of a system to other values or to convert a linear discrete system to a continuous system or vice versa.

You can find the frequency response of a continuous or discrete system by using the `bode` command.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

Introduced in R2007a

close_system

Close Simulink system window or block dialog box

Syntax

```
close_system
close_system('sys')
close_system('sys', saveflag)
close_system('sys', 'newname')
close_system('sys', 'newname', 'ErrorIfShadowed', true)
```

Description

`close_system` with no arguments closes the current system or subsystem window. If the current system is the top-level system and it has been modified, `close_system` returns an error. The current system is defined in the description of the `gcs` command.

`close_system('sys')` closes the specified system, subsystem, or block window.

`close_system('sys')` unloads a model after specifying

- `load_system('sys')`.

'*sys*' can be a character vector (which can be a system, a subsystem, or a full block pathname), a cell array of character vectors, a numeric handle, or an array of numeric handles. This command displays an error if '*sys*' is a MATLAB keyword, 'simulink', or more than 63 characters long.

`close_system('sys', saveflag)`, if *saveflag* is 1, saves the specified top-level system to a file with its current name, then closes the specified top-level system window and removes it from memory. If *saveflag* is 0, the system is closed without saving. A single *saveflag* can be supplied, in which case it is applied to all block diagrams.

Alternatively, separate *saveflags* can be supplied for each block diagram, as a numeric array.

`close_system('sys', 'newname')` saves the specified top-level system to a file with the specified new name, then closes the system.

Additional arguments can be supplied when saving a block diagram. These are exactly the same as for `save_system`:

- `ErrorIfShadowed`: true or false (default: false)
- `BreakAllLinks`: true or false (default: false)
- `SaveAsVersion`: MATLAB version name (default: current)
- `OverwriteIfChangedOnDisk`: true or false (default: false)
- `SaveModelWorkspace`: true or false (default: false)

If you try to specify additional options when you are doing something other than saving a block diagram, they are ignored. You see a warning if you try to save when closing something other than a block diagram (e.g., a subsystem or a Block Properties dialog).

Examples

This command closes the current system.

```
close_system
```

This command closes the `vdp` system, unless it has been modified, in which case it returns an error.

```
close_system('vdp')
```

This command saves the engine system with its current name, then closes it.

```
close_system('engine', 1)
```

This command saves the `mymdl12` system under the new name `testsys`, then closes it.

```
close_system('mymdl12', 'testsys')
```

This command tries to save the `vdp` system to a file with the name `'max'`, but returns an error because `'max'` is the name of an existing MATLAB function.

```
close_system('vdp','max','ErrorIfShadowed', true)
```

All three of the following commands save and close mymodel (saved with the same name), and replace links to library blocks with copies of the library blocks in the saved file:

```
close_system('mymodel',1,'BreakAllLinks',true)
close_system('mymodel','mymodel','BreakAllLinks',true)
close_system('mymodel',[],'BreakAllLinks',true)
```

This command closes the dialog box of the Unit Delay block in the Combustion subsystem of the engine system.

```
close_system('engine/Combustion/Unit Delay')
```

Note The `close_system` command cannot be used in a block or menu callback to close the root-level model. Attempting to close the root-level model in a block or menu callback results in an error and discontinues the callback's execution.

Introduced before R2006a

closeDialog

Close configuration parameters dialog

Syntax

```
closeDialog(configObj)
```

Arguments

configObj

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`closeDialog` closes an open configuration parameters dialog box. If *configObj* is a configuration set, the function closes the dialog box that displays the configuration set. If *configObj* is a configuration reference, the function closes the dialog box that displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already closed, the function does nothing.

Examples

The following example closes a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);  
closeDialog(myConfigObj);
```

close

Close Simulink Project

Syntax

```
close(proj)
```

Description

`close(proj)` closes the project `proj`.

Examples

Open and Close a Simulink Project

Open a specified project and get a project object to manipulate the project at the command line. For example,

```
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Close the project.

```
close(proj)
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Functions

`simulinkproject`

Introduced in R2013a

coder.allowpcode

Package: coder

Control code generation from protected MATLAB files

Syntax

```
coder.allowpcode('plain')
```

Description

`coder.allowpcode('plain')` allows you to generate protected MATLAB code (P-code) that you can then compile into optimized MEX functions or embeddable C/C++ code. This function does not obfuscate the generated MEX functions or embeddable C/C++ code.

With this capability, you can distribute algorithms as protected P-files that provide code generation optimizations, providing intellectual property protection for your source MATLAB code.

Call this function in the top-level function before control-flow statements, such as `if`, `while`, `switch`, and function calls.

MATLAB functions can call P-code. When the `.m` and `.p` versions of a file exist in the same folder, the P-file takes precedence.

`coder.allowpcode` is ignored outside of code generation.

Examples

Generate optimized embeddable code from protected MATLAB code:

- 1 Write an function `p_abs` that returns the absolute value of its input:

```
function out = p_abs(in)    %#codegen
% The directive %#codegen indicates that the function
```

```
% is intended for code generation
coder.allowpcode('plain');
out = abs(in);
```

- 2 Generate protected P-code. At the MATLAB prompt, enter:

```
pcode p_abs
```

The P-file, `p_abs.p`, appears in the current folder.

- 3 Generate a MEX function for `p_abs.p`, using the `-args` option to specify the size, class, and complexity of the input parameter (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -args { int32(0) }
```

`codegen` generates a MEX function in the current folder.

- 4 Generate embeddable C code for `p_abs.p` (requires a MATLAB Coder license). At the MATLAB prompt, enter:

```
codegen p_abs -config:lib -args { int32(0) };
```

`codegen` generates C library code in the `codegen\lib\p_abs` folder.

`codegen` | `pcode`

Introduced in R2011a

coder.ceval

Call external C/C++ function

Syntax

```
coder.ceval(cfun_name)
coder.ceval(cfun_name,cfun_arguments)
coder.ceval('-global',cfun_name)
coder.ceval('-global',cfun_name,cfun_arguments)
cfun_return = coder.ceval(____)
```

Description

`coder.ceval(cfun_name)` executes the external C/C++ function specified by `cfun_name`. Define `cfun_name` in an external C/C++ source file or library.

`coder.ceval(cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments`. `cfun_arguments` is a comma-separated list of input arguments in the order that `cfun_name` requires.

By default, `coder.ceval` passes arguments by value to the C/C++ function whenever C/C++ supports passing arguments by value. To make `coder.ceval` pass arguments by reference, use the constructs `coder.ref`, `coder.rref`, and `coder.wref`. If C/C++ does not support passing arguments by value, for example, if the argument is an array, `coder.ceval` passes arguments by reference. If you do not use `coder.ref`, `coder.rref` or `coder.wref`, a copy of the argument can appear in the generated code to enforce MATLAB semantics for arrays.

`coder.ceval('-global',cfun_name)` executes `cfun_name` and indicates that `cfun_name` uses one or more MATLAB global variables. The code generator can then produce code that is consistent with this global variable usage.

`coder.ceval('-global',cfun_name,cfun_arguments)` executes `cfun_name` with arguments `cfun_arguments` and indicates that `cfun_name` uses one or more MATLAB global variables.

`cfun_return = coder.ceval(____)` executes `cfun_name` and returns a single scalar value, `cfun_return`, corresponding to the value that the C/C++ function returns in the return statement. To be consistent with C/C++, `coder.ceval` can return only a scalar value. It cannot return an array. Use this option with any of the input argument combinations in the previous syntaxes.

Examples

Call External C Function

Call a C function `foo(u)` from a MATLAB function from which you intend to generate C code.

Create a C header file `foo.h` for a function `foo` that takes two input parameters of type `double` and returns a value of type `double`.

```
#ifndef MATLAB_MEX_FILE
#include <tmwtypes.h>
#else
#include "rtwtypes.h"
#endif

double foo(double in1, double in2);
```

Write the C function `foo.c`.

```
#include <stdio.h>
#include <stdlib.h>
#include "foo.h"

double foo(double in1, double in2)
{
    return in1 + in2;
}
```

Write a function `callfoo` that calls `foo` by using `coder.ceval`.

```
function y = callfoo %#codegen
y = 0.0;
if coder.target('MATLAB')
    % Executing in MATLAB, call MATLAB equivalent of
```

```
% C function foo
y = 10 + 20;
else
% Executing in generated code, call C function foo
y = coder.ceval('foo', 10, 20);
end
end
```

Generate C library code for function `callfoo`. Pass `foo.c` and `foo.h` as parameters to include this custom C function in the generated code. `codegen` generates C code in the `codegen\lib\callfoo` subfolder.

```
codegen -config:lib callfoo foo.c foo.h

double callfoo(void)
{
/* Executing in generated code, call C function foo */
return foo(10.0, 20.0);
}
```

In this case, you have not specified the type of the input arguments, that is, the type of the constants 10 and 20. Therefore, the arguments are implicitly of double-precision, floating-point type by default because the default type for constants in MATLAB is `double`.

Call C Library Function

Call a C library function from MATLAB code.

Write a MATLAB function `absval`.

```
function y = absval(u) %#codegen
y = abs(u);
```

Generate the C library for `absval.m` by using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib absval -args {0.0}
```

`codegen` creates the library `absval.lib` and header file `absval.h` in the folder `/codegen/lib/absval`. It generates the functions `absval_initialize` and `absval_terminate` in the same folder.

Write a MATLAB function to call the generated C library functions by using `coder.ceval`.

```
function y = callabsval %#codegen
y = -2.75;
% Check the target. Do not use coder.ceval if callabsval is
% executing in MATLAB
if coder.target('MATLAB')
    % Executing in MATLAB, call function absval
    y = absval(y);
else
    % Executing in the generated code.
    % Call the initialize function before calling the
    % C function for the first time
    coder.ceval('absval_initialize');

    % Call the generated C library function absval
    y = coder.ceval('absval',y);

    % Call the terminate function after
    % calling the C function for the last time
    coder.ceval('absval_terminate');
end
```

Convert the code in `callabsval.m` to a MEX function so you can call the C library function `absval` directly from MATLAB.

```
codegen -config:mex callabsval codegen/lib/absval/absval.lib...
        codegen/lib/absval/absval.h
```

Call the C library by running the MEX function from MATLAB:

```
callabsval_mex
```

Call C Function That Uses Global Variable

Use the `'-global'` flag when you call a C function that modifies a global variable.

Write a MATLAB function `useGlobal` that calls a C function `addGlobal`. Use the `'-global'` flag to indicate to the code generator that the C function uses a global variable.

```
function y = useGlobal()
global g;
```

```
t = g;
% compare execution with/without '-global' flag
coder.ceval('-global', 'addGlobal');
y = t;
end
```

Create a C header file `addGlobal.h` for the function `addGlobal`.

```
void addGlobal(void);
```

Write the C function `addGlobal` in the file `addGlobal.c`. This function includes the header file `useGlobal_data.h` that the code generator creates when you generate code for the function `useGlobal`. This header file contains the global variable declaration for `g`.

```
#include "addGlobal.h"
#include "useGlobal_data.h"
void addGlobal(void) {
    g++;
}
```

Generate the MEX function for `useGlobal`. To define the input to the code generator, declare the global variable in the workspace.

```
global g;
g = 1;
codegen useGlobal -report addGlobal.h addGlobal.c
y = useGlobal_mex();
```

With the `'-global'` flag, the MEX function produces the result `y = 1`. The `'-global'` flag indicates to the code generator that the C function possibly modifies the global variable. For `useGlobal`, the code generator produces this code:

```
real_T useGlobal(const emlrtStack *sp)
{
    real_T y;
    (void)sp;
    y = g;
    addGlobal();
    return y;
}
```

Without the `'-global'` flag, the MEX function produces $y = 2$. Because there is no indication that the C function modifies `g`, the code generator assumes that `y` and `g` are identical. This C code is generated:

```
real_T useGlobal(const emlrtStack *sp)
{
    (void)sp;
    addGlobal();
    return g;
}
```

Input Arguments

cfun_name — C/C++ function name

character vector | string scalar

Name of external C/C++ function to call.

Example: `coder.ceval('foo')`

Data Types: `char` | `string`

cfun_arguments — C/C++ function arguments

scalar variable | array | element of an array | structure | structure field | object property

Comma-separated list of input arguments in the order that `cfun_name` requires.

Example: `coder.ceval('foo', 10, 20);`

Example: `coder.ceval('myFunction', coder.ref(x));`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `struct`

Complex Number Support: Yes

Limitations

- You cannot use `coder.ceval` on functions that you declare extrinsic with `coder.extrinsic`.

- When the LCC compiler creates a library, it adds a leading underscore to the library function names. If the compiler for the library was LCC and your code generation compiler is not LCC, you must add the leading underscore to the function name, for example, `coder.ceval('_mylibfun')`. If the compiler for a library was not LCC, you cannot use LCC to generate code from MATLAB code that calls functions from that library. Those library function names do not have the leading underscore that the LCC compiler requires.
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- For code generation, before calling `coder.ceval`, you must specify the type, size, and complexity data type of return values and output arguments.
- Use `coder.ceval` only in MATLAB for code generation. `coder.ceval` generates an error in uncompiled MATLAB code. To determine if a MATLAB function is executing in MATLAB, use `coder.target`. If the function is executing in MATLAB, call the MATLAB version of the C/C++ function.

Introduced in R2011a

coder.cinclude

Include header file in generated code

Syntax

```
coder.cinclude(headerfile)
coder.cinclude(headerfile, 'InAllSourceFiles', allfiles)
```

Description

`coder.cinclude(headerfile)` includes a header file in generated C/C++ source code.

MATLAB Coder generates the include statement in the C/C++ source files that are generated from the MATLAB code that contains the `coder.cinclude` call.

In a Simulink model, when a `coder.cinclude` call appears in a MATLAB Function block, the code generator puts the include statement in the model header file.

`coder.cinclude(headerfile, 'InAllSourceFiles', allfiles)` uses the `allfiles` option to determine whether to include the header file in almost all C/C++ source files.

If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all C/C++ source files, except for some utility files. This behavior is the `coder.cinclude` behavior from R2016a and earlier releases. The presence of the include statement in these additional files can increase compile time and make the generated code less readable. Use this option only if your code depends on the legacy behavior. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude(headerfile)`.

In a MATLAB Function block, `coder.cinclude(headerfile, 'InAllSourceFiles', allfiles)` is the same as `coder.cinclude(headerfile)`.

Examples

Include Header File in C/C++ Code Generated by Using the MATLAB Coder codegen Command

Generate code from a MATLAB function that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Write a MATLAB function, `myfunc`, that includes `myMult2.h` and calls `myMult2` for code generation only.

```
function y = myfunc
%#codegen
y = 21;
if ~coder.target('MATLAB')
    % Running in generated code
    coder.cinclude('myMult2.h');
    y = coder.ceval('myMult2', y);
else
    % Running in MATLAB
    y = y * 2;
end
end
```

Create a code configuration object for a static library. Specify the locations of `myMult2.h` and `myMult2.c`

```
cfg = coder.config('lib');
cfg.CustomInclude = fullfile(pwd, 'mycfiles');
cfg.CustomSource = fullfile(pwd, 'mycfiles', 'myMult2.c');
```

Generate the code.

```
codegen -config cfg myfunc -report
```

The file `myfunc.c` contains this statement:

```
#include "myMult2.h"
```

The include statement does not appear in any other file.

Include Header File in C/C++ Code Generated from a MATLAB Function Block in a Simulink Model

Generate code from a MATLAB Function block that calls an external C function. Use `coder.cinclude` to include the required header file in the generated C code.

In a writable folder, create a subfolder `mycfiles`.

Write a C function `myMult2.c` that doubles its input. Save it in `mycfiles`.

```
#include "myMult2.h"
double myMult2(double u)
{
    return 2 * u;
}
```

Write the header file `myMult2.h`. Save it in `mycfiles`.

```
#if !defined(MYMULT2)
#define MYMULT2
extern double myMult2(double);
#endif
```

Create a Simulink model that contains a MATLAB Function block connected to an Outport block.

In the MATLAB Function block, add the function `myfunc` that includes `myMult2.h` and calls `myMult2`.

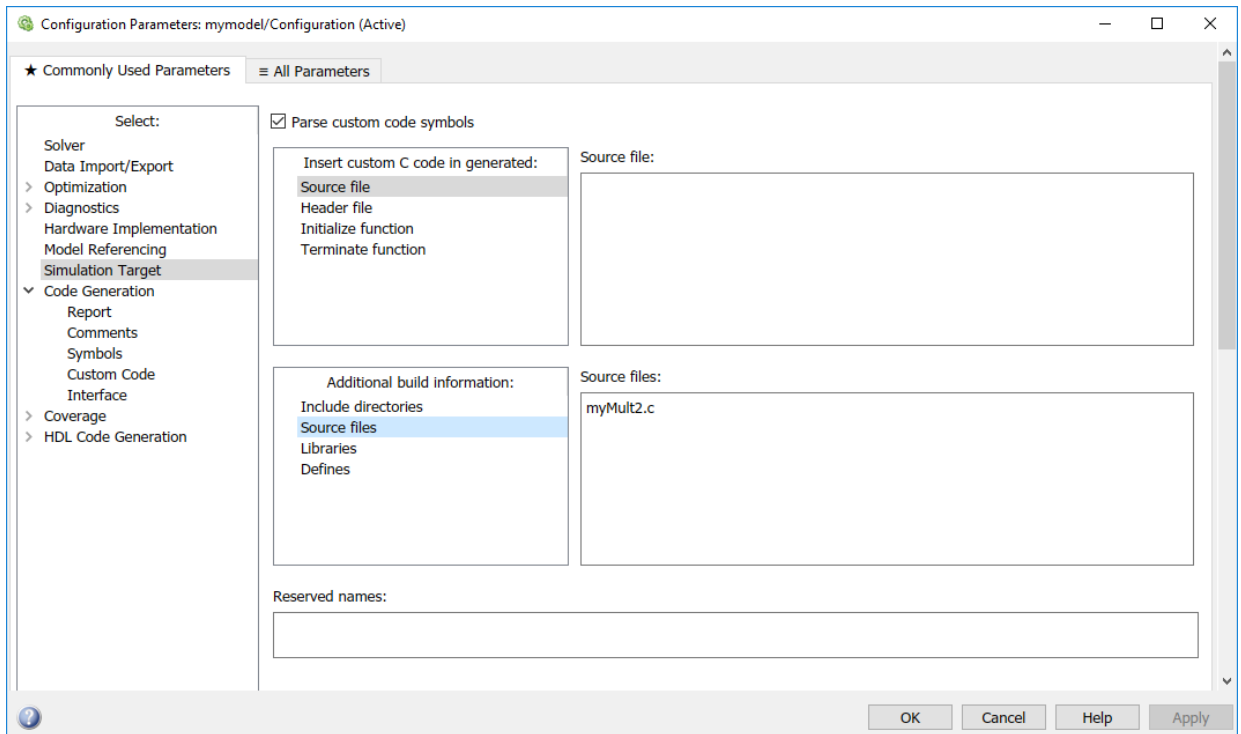

```
function y = myfunc
%#codegen
y = 21;
coder.cinclude('myMult2.h');
y = coder.ceval('myMult2', y);
end
```

Open the Configuration Parameters dialog box.

On the **Solver** pane, select a fixed-step solver.

Specify the locations of `myMult2.h` and `myMult2.c` for simulation and code generation.

- On the **Simulation Target** pane, under **Additional build information**, for **Include directories**, enter `mycfiles`.
- For **Source files**, enter `myMult2.c`.

- On the **Code Generation > Custom Code** pane, select the **Use the same custom code settings as Simulation Target** check box.

Save the model as mymodel1.

Build the model.

The file mymodel1.h contains this statement:

```
#include "myMult2.h"
```

Input Arguments

headerfile — Name of header file

character vector | string scalar

Name of a header file specified as a character vector or string scalar. `headerfile` must be a compile-time constant.

Enclose a system header file name in angle brackets `< >`. The generated `#include` statement for a system header file has the format `#include <sysheader>`. A system header file must be in a standard location or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude ('<sysheader.h>')`

For a header file that is not a system header file, omit the angle brackets. The generated `#include` statement for a header file that is not a system header file has the format `#include "myHeader"`. The header file must be in the current folder or on the include path. Specify the include path by using code generation custom code parameters.

Example: `coder.cinclude ('myheader.h')`

Data Types: `char`

allfiles — All source files option

`true` | `false`

Option to include header file in all generated C/C++ source files. If `allfiles` is `true`, MATLAB Coder generates the include statement in almost all of the C/C++ source files, except for some utility files. If `allfiles` is `false`, the behavior is the same as the behavior of `coder.cinclude (headerfile)`.

In a MATLAB Function block, the code generator ignores the all source files option.

Data Types: `logical`

Limitations

- Do not call `coder.cinclude` inside run-time conditional constructs such as `if` statements, `switch` statements, `while`-loops, and `for`-loops. You can call `coder.cinclude` inside compile-time conditional statements, such as `coder.target`. For example:

```
...  
if ~coder.target ('MATLAB')  
    coder.cinclude ('foo.h');
```

```
    coder.ceval('foo');  
end  
...
```

Tips

- Before a `coder.ceval` call, call `coder.cinclude` to include the header file required by the external function that `coder.ceval` calls.
- Extraneous include statements in generated C/C++ code can increase compile time and reduce code readability. To avoid extraneous include statements in code generated by MATLAB Coder, follow these best practices:
 - Place a `coder.cinclude` call as close as possible to the `coder.ceval` call that requires the header file.
 - Do not set `allfiles` to `true`.

For the MATLAB Function block, the code generator generates the include statement in the model header file.

- In R2016a and earlier releases, for any `coder.cinclude` call, MATLAB Coder included the header file in almost all generated C/C++ source files, except for some utility files. If you have code that depends on this legacy behavior, you can preserve the legacy behavior by using this syntax:

```
coder.cinclude(headerfile, 'InAllSourceFiles', true)
```

“Model Configuration Parameters: Code Generation Custom Code” (Simulink Coder)

Introduced in R2013a

coder.const

Fold expressions into constants in generated code

Syntax

```
out = coder.const(expression)
[out1,...,outN] = coder.const(handle, arg1,..., argN)
```

Description

`out = coder.const(expression)` evaluates `expression` and replaces `out` with the result of the evaluation in generated code.

`[out1,...,outN] = coder.const(handle, arg1,..., argN)` evaluates the multi-output function having handle `handle`. It then replaces `out1,...,outN` with the results of the evaluation in the generated code.

Examples

Specify Constants in Generated Code

This example shows how to specify constants in generated code using `coder.const`.

Write a function `AddShift` that takes an input `Shift` and adds it to the elements of a vector. The vector consists of the square of the first 10 natural numbers. `AddShift` generates this vector.

```
function y = AddShift(Shift) %#codegen
y = (1:10).^2+Shift;
```

Generate code for `AddShift` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator produces code for creating the vector. It adds `Shift` to each element of the vector during vector creation. The definition of `AddShift` in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
    int k;
    for (k = 0; k < 10; k++) {
        y[k] = (double)((1 + k) * (1 + k)) + Shift;
    }
}
```

Replace the statement

```
y = (1:10).^2+Shift;
```

with

```
y = coder.const((1:10).^2)+Shift;
```

Generate code for `AddShift` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport AddShift -args 0
```

The code generator creates the vector containing the squares of the first 10 natural numbers. In the generated code, it adds `Shift` to each element of this vector. The definition of `AddShift` in generated code looks as follows:

```
void AddShift(double Shift, double y[10])
{
    int i0;
    static const signed char iv0[10] = { 1, 4, 9, 16, 25, 36,
                                         49, 64, 81, 100 };

    for (i0 = 0; i0 < 10; i0++) {
        y[i0] = (double)iv0[i0] + Shift;
    }
}
```

Create Lookup Table in Generated Code

This example shows how to fold a user-written function into a constant in generated code.

Write a function `getsine` that takes an input `index` and returns the element referred to by `index` from a lookup table of sines. The function `getsine` creates the lookup table using another function `gettable`.

```
function y = getsine(index) %#codegen
    assert(isa(index, 'int32'));
    persistent tbl;
    if isempty(tbl)
        tbl = gettable(1024);
    end
    y = tbl(index);

function y = gettable(n)
    y = zeros(1,n);
    for i = 1:n
        y(i) = sin((i-1)/(2*pi*n));
    end
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

```
codegen -config:lib -launchreport getsine -args int32(0)
```

The generated code contains instructions for creating the lookup table.

Replace the statement:

```
tbl = gettable(1024);
```

with:

```
tbl = coder.const(gettable(1024));
```

Generate code for `getsine` using an argument of type `int32`. Open the Code Generation Report.

The generated code contains the lookup table itself. `coder.const` forces the expression `gettable(1024)` to be evaluated during code generation. The generated code does not

contain instructions for the evaluation. The generated code contains the result of the evaluation itself.

Specify Constants in Generated Code Using Multi-Output Function

This example shows how to specify constants in generated code using a multi-output function in a `coder.const` statement.

Write a function `MultiplyConst` that takes an input `factor` and multiplies every element of two vectors `vec1` and `vec2` with `factor`. The function generates `vec1` and `vec2` using another function `EvalConsts`.

```
function [y1,y2] = MultiplyConst(factor) %#codegen
    [vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
    y1=vec1.*factor;
    y2=vec2.*factor;

function [f1,f2]=EvalConsts(z,n)
    f1=z.^(2*n)/factorial(2*n);
    f2=z.^(2*n+1)/factorial(2*n+1);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator produces code for creating the vectors.

Replace the statement

```
[vec1,vec2]=EvalConsts(pi.*(1./2.^(1:10)),2);
```

with

```
[vec1,vec2]=coder.const(@EvalConsts,pi.*(1./2.^(1:10)),2);
```

Generate code for `MultiplyConst` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport MultiplyConst -args 0
```

The code generator does not generate code for creating the vectors. Instead, it calculates the vectors and specifies the calculated vectors in generated code.

Read Constants by Processing XML File

This example shows how to call an extrinsic function using `coder.const`.

Write an XML file `MyParams.xml` containing the following statements:

```
<params>
  <param name="hello" value="17"/>
  <param name="world" value="42"/>
</params>
```

Save `MyParams.xml` in the current folder.

Write a MATLAB function `xml2struct` that reads an XML file. The function identifies the XML tag `param` inside another tag `params`.

After identifying `param`, the function assigns the value of its attribute `name` to the field name of a structure `s`. The function also assigns the value of attribute `value` to the value of the field.

```
function s = xml2struct(file)

s = struct();
doc = xmlread(file);
els = doc.getElementsByTagName('params');
for i = 0:els.getLength-1
    it = els.item(i);
    ps = it.getElementsByTagName('param');
    for j = 0:ps.getLength-1
        param = ps.item(j);
        paramName = char(param.getAttribute('name'));
        paramValue = char(param.getAttribute('value'));
        paramValue = evalin('base', paramValue);
        s.(paramName) = paramValue;
    end
end
```

Save `xml2struct` in the current folder.

Write a MATLAB function `MyFunc` that reads the XML file `MyParams.xml` into a structure `s` using the function `xml2struct`. Declare `xml2struct` as extrinsic using `coder.extrinsic` and call it in a `coder.const` statement.

```
function y = MyFunc(u) %#codegen
    assert(isa(u, 'double'));
    coder.extrinsic('xml2struct');
    s = coder.const(xml2struct('MyParams.xml'));
    y = s.hello + s.world + u;
```

Generate code for `MyFunc` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:dll -launchreport MyFunc -args 0
```

The code generator executes the call to `xml2struct` during code generation. It replaces the structure fields `s.hello` and `s.world` with the values 17 and 42 in generated code.

Input Arguments

expression — MATLAB expression or user-written function

expression with constants | single-output function with constant arguments

MATLAB expression or user-defined single-output function.

The expression must have compile-time constants only. The function must take constant arguments only. For instance, the following code leads to a code generation error, because `x` is not a compile-time constant.

```
function y=func(x)
    y=coder.const(log10(x));
```

To fix the error, assign `x` to a constant in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args coder.Constant(10)
```

Example: `2*pi`, `factorial(10)`

handle — Function handle

function handle

Handle to built-in or user-written function.

Example: @log, @sin

Data Types: `function_handle`

arg1, . . . , argN — Arguments to the function with handle handle

function arguments that are constants

Arguments to the function with handle `handle`.

The arguments must be compile-time constants. For instance, the following code leads to a code generation error, because `x` and `y` are not compile-time constants.

```
function y=func(x,y)
    y=coder.const(@nchoosek,x,y);
```

To fix the error, assign `x` and `y` to constants in the MATLAB code. Alternatively, during code generation, you can use `coder.Constant` to define input type as follows:

```
codegen -config:lib func -args {coder.Constant(10),coder.Constant(2)}
```

Output Arguments

out — Value of expression

value of the evaluated expression

Value of `expression`. In the generated code, MATLAB Coder replaces occurrences of `out` with the value of `expression`.

out1, . . . , outN — Outputs of the function with handle handle

values of the outputs of the function with handle `handle`

Outputs of the function with handle `handle`. MATLAB Coder evaluates the function and replaces occurrences of `out1, . . . , outN` with constants in the generated code.

Tips

- The code generator constant-folds expressions automatically when possible. Typically, automatic constant-folding occurs for expressions with scalars only. Use `coder.const` when the code generator does not constant-fold expressions on its own.

See Also

Introduced in R2013b

coder.cstructname

Package: coder

Name structure in generated code

Syntax

```
coder.cstructname(var, 'structName')  
coder.cstructname(var, 'structName', 'extern')  
coder.cstructname(var, 'structName', 'extern', Name, Value)
```

Description

`coder.cstructname(var, 'structName')` specifies the name of the structure type that represents `var` in the generated C/C++ code. `var` is a structure or cell array variable. `structName` is the name for the structure type in the generated code. Call `coder.cstructname` before the first use of the variable. If `var` is a cell array element, call `coder.cstructname` after the first assignment to the element.

`coder.cstructname(var, 'structName', 'extern')` declares an externally defined structure. It does not generate the definition of the structure type. Provide the definition in a custom include file.

`coder.cstructname(var, 'structName', 'extern', Name, Value)` uses additional options specified by one or more `Name, Value` pair arguments.

Limitations

- You cannot use `coder.cstructname` with global variables.
- If `var` is a cell array, the field names of externally defined structures must be `f1`, `f2`, and so on.
- If `var` is a cell array element, call `coder.cstructname` after the first assignment to the element. For example:

```

...
x = cell(2,2);
x{1} = struct('a', 3);
coder.cstructname(x{1}, 'mytype');
...

```

Tips

- The code generator represents a heterogeneous cell array as a structure in the generated C/C++ code. To specify the name of the generated structure type, use `coder.cstructname`. Using `coder.cstructname` with a cell array variable makes the cell array heterogeneous.
- To use `coder.cstructname` on arrays, use single indexing. For example, you cannot use `coder.cstructname(x(1,2))`. Instead, use single indexing, for example `coder.cstructname(x(n))`.
- If you use `coder.cstructname` on an array, it sets the name of the base type of the array, not the name of the array. Therefore, you cannot use `coder.cstructname` on the base element and then on the array. For example, the following code does not work. The second `coder.cstructname` attempts to set the name of the base type to `myStructArrayName`, which conflicts with the previous `coder.cstructname`, `myStructName`.

```

% Define scalar structure with field a
myStruct = struct('a', 0);
coder.cstructname(myStruct, 'myStructName');
% Define array of structure with field a
myStructArray = repmat(myStruct, k, n);
coder.cstructname(myStructArray, 'myStructArrayName');

```

- If you are using custom structure types, specify the name of the header file that includes the external definition of the structure. Use the `HeaderFile` input argument.
- If you have an Embedded Coder license and use Code Replacement Libraries (CRLs), the CRLs provide the ability to align data objects passed into a replacement function to a specified boundary. To take advantage of target-specific function implementations that require data to be aligned, use the `Alignment` input argument.
- You can also use `coder.cstructname` to assign a name to a substructure, which is a structure that appears as a field of another structure. For more information, see “Assign a Name to a SubStructure” on page 2-85.

Input Arguments

structName

The name of the structure type in the generated code.

var

Structure or cell array variable.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Alignment

The run-time memory alignment of structures of this type in bytes. If you have an Embedded Coder license and use Code Replacement Libraries (CRLs), the CRLs provide the ability to align data objects passed into a replacement function to a specified boundary. This capability allows you to take advantage of target-specific function implementations that require data to be aligned. By default, the structure is not aligned on a specific boundary. Hence it is not matched by CRL functions that require alignment.

Alignment must be either -1 or a power of 2 that is not greater than 128.

Default: -1

HeaderFile

Name of the header file that contains the external definition of the structure, for example, 'mystruct.h'.

By default, the generated code contains `#include` statements for custom header files after the standard header files. If a standard header file refers to the custom structure type, then the compilation fails. By specifying the `HeaderFile` option, MATLAB Coder includes that header file exactly at the point where it is required.

Must be a non-empty character vector or string scalar.

Examples

Apply `coder.cstructname` to Top-Level Inputs

Generate code for a MATLAB function that takes structure inputs.

- 1 Write a MATLAB function, `topfun`, that assigns the name `MyStruct` to its input parameter.

```
function y = topfun(x)    %#codegen
% Assign the name 'MyStruct' to the input variable in
% the generated code
    coder.cstructname(x, 'MyStruct');
    y = x;
end
```

- 2 Declare a structure `s` in MATLAB. `s` is the structure definition for the input variable `x`.

```
s = struct('a',42,'b',4711);
```

- 3 Generate a MEX function for `topfun`, using the `-args` option to specify that the input parameter is a structure.

```
codegen topfun.m -args { s }
```

`codegen` generates a MEX function in the default folder `codegen\mex\topfun`. In this folder, the structure definition is in `topfun_types.h`.

```
typedef struct
{
    double a;
    double b;
} MyStruct;
```

Assign a Name to a Structure and Pass It to a Function

Assign the name `MyStruct` to the structure `var`. Pass the structure to a C function `use_struct`.

- 1 Create a C header file, `use_struct.h`, for a `use_struct` function that takes a parameter of type `MyStruct`. Define a structure of type `MyStruct` in the header file.

```
#ifndef MATLAB_MEX_FILE
#include <tmwtypes.h>
#else
#include "rtwtypes.h"
#endif

typedef struct MyStruct
{
    double s1;
    double s2;
} MyStruct;

void use_struct(struct MyStruct *my_struct);
```

2 Write the C function `use_struct.c`.

```
#include <stdio.h>
#include <stdlib.h>

#include "use_struct.h"

void use_struct(struct MyStruct *my_struct)
{
    double x = my_struct->s1;
    double y = my_struct->s2;
}
```

3 Write a `m_use_struct` compliant with MATLAB that declares a structure. Have the function assign the name `MyStruct` to the structure. Then, have the function call the C function `use_struct` using `coder.ceval`.

```
function m_use_struct %#codegen
% The directive %#codegen indicates that the function
% is intended for code generation
% Declare a MATLAB structure
var.s1 = 1;
var.s2 = 2;

% Assign the name MyStruct to the structure variable.
% extern indicates this is an externally defined
% structure.
coder.cstructname(var, 'MyStruct', 'extern');

% Call the C function use_struct. The type of var
% matches the signature of use_struct.
% Use coder.rref to pass the variable var by
```

```
% reference as a read-only input to the external C
% function use_struct
coder.ceval('use_struct', coder.rref(var));
```

- 4 Generate C library code for function `m_use_struct`, passing `use_struct.h` to include the structure definition.

```
codegen -config:lib m_use_struct use_struct.c use_struct.h
```

codegen generates C code in the default folder `codegen\lib\m_use_struct`. The generated header file `m_use_struct_types.h` in this folder does not contain a definition of the structure `MyStruct` because `MyStruct` is an external type.

Assign a Name to a SubStructure

Use `coder.cstructname` to assign a name to a substructure.

- 1 Define a MATLAB structure, `top`, that has another structure, `lower`, as a field.

```
% Define structure top with field lower,
% which is a structure with fields a and b
top.lower = struct('a',1,'b',1);
top.c = 1;
```

- 2 Define a function, `MyFunc`, which takes an argument, `TopVar`, as input. Mark the function for code generation using `codegen`.

```
function out = MyFunc(TopVar) %codegen
```

- 3 Inside `MyFunc`, include the following lines

```
coder.cstructname(TopVar, 'topType');
coder.cstructname(TopVar.lower, 'lowerType');
```

- 4 So that `TopVar` has the same type as `top`, generate C code for `MyFunc` with an argument having the same type as `top`.

```
codegen -config:lib MyFunc -args coder.typeof(top)
```

In the generated C code, the field variable `TopVar.lower` is assigned the type name `lowerType`. For instance, the structure declaration of the variable `TopVar.lower` appears in the C code as:

```
typedef struct
{
```

```
    /* Definitions of a and b appear here */  
} lowerType;
```

and the structure declaration of the variable `TopVar` appears as:

```
typedef struct  
{  
    lowerType lower;  
    /* Definition of c appears here */  
} topType;
```

Assign a Name to a Structure That Is an Element of a Cell Array

Write a function `struct_in_cell` that has a cell array `x{1}` that contains a structure. The `coder.cstructname` call follows the assignment to `x{1}`.

```
function z = struct_in_cell()  
x = cell(2,2);  
x{1} = struct('a', 3);  
coder.cstructname(x{1}, 'mytype');  
z = x{1};  
end
```

Generate a static library for `struct_in_cell`.

```
codegen -config:lib struct_in_cell -report
```

The type for `a` has the name `mytype`.

```
typedef struct {  
    double a;  
} mytype;
```

See Also

Topics

“Code Generation for Cell Arrays”

Introduced in R2011a

coder.extrinsic

Package: coder

Declare extrinsic function or functions

Syntax

```
coder.extrinsic('function_name');  
  
coder.extrinsic('function_name_1', ... , 'function_name_n');  
  
coder.extrinsic('-sync:on', 'function_name');  
  
coder.extrinsic('-sync:on', 'function_name_1', ... ,  
'function_name_n');  
  
coder.extrinsic('-sync:off', 'function_name');  
  
coder.extrinsic('-sync:off', 'function_name_1', ... ,  
'function_name_n');
```

Arguments

function_name
function_name_1, ... , function_name_n

Declares *function_name* or *function_name_1* through *function_name_n* as extrinsic functions.

-sync:on

function_name or *function_name_1* through *function_name_n*.

Enables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions, *function_name* or *function_name_1* through *function_name_n*. If only a few extrinsic calls modify global data, turn off synchronization before and after all extrinsic function calls by setting the global synchronization mode to `At MEX-function entry and exit`. Use the *-sync:on*

option to turn on synchronization for only the extrinsic calls that *do* modify global data.

`-sync:off`

Disables synchronization of global data between MATLAB and MEX functions before and after calls to the extrinsic functions, `function_name` or `function_name_1` through `function_name_n`. If most extrinsic calls modify global data, but a few do not, you can use the `-sync:off` option to turn off synchronization for the extrinsic calls that *do not* modify global data.

Description

`coder.extrinsic` declares extrinsic functions. During simulation, the code generator produces code for the call to an extrinsic function, but does not produce the function's internal code. Therefore, simulation can run only on platforms where MATLAB software is installed. During standalone code generation, MATLAB attempts to determine whether the extrinsic function affects the output of the function in which it is called — for example by returning `mxArrays` to an output variable. Provided that there is no change to the output, MATLAB proceeds with code generation, but excludes the extrinsic function from the generated code. Otherwise, compilation errors occur.

You cannot use `coder.ceval` on functions that you declare extrinsic by using `coder.extrinsic`.

`coder.extrinsic` is ignored outside of code generation.

Limitations

- Extrinsic function calls have some overhead that can affect performance. Input data that is passed in an extrinsic function call must be provided to MATLAB, which requires making a copy of the data. If the function has any output data, this data must be transferred back into the MEX function environment, which also requires a copy.

Tips

- The code generator detects calls to many common visualization functions, such as `plot`, `disp`, and `figure`. The software treats these functions like extrinsic functions, but you do not have to declare them extrinsic using the `coder.extrinsic` function.
- Use the `coder.screener` function to detect which functions you must declare extrinsic. This function opens the code generations readiness tool that detects code generation issues in your MATLAB code.

Examples

The following code declares the MATLAB function `patch` as extrinsic in the MATLAB local function `create_plot`.

```
function c = pythagoras(a,b,color) %#codegen
% Calculates the hypotenuse of a right triangle
% and displays the triangle as a patch object.

c = sqrt(a^2 + b^2);

create_plot(a, b, color);

function create_plot(a, b, color)

%Declare patch as extrinsic
coder.extrinsic('patch');

x = [0;a;a];
y = [0;0;b];
patch(x, y, color);
axis('equal');
```

By declaring `patch` as extrinsic, you instruct the code generator not to compile or produce code for `patch`. Instead, the code generator dispatches `patch` to MATLAB for execution.

Introduced in R2011a

coder.ignoreConst

Prevent use of constant value of expression for function specializations

Syntax

```
coder.ignoreConst(expression)
```

Description

`coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations on page 2-93.

`coder.ignoreConst(expression)` returns the value of `expression`.

Examples

Prevent Function Specializations Based on Constant Input Values

Use `coder.ignoreConst` to prevent function specializations for a function that is called with constant values.

Write the function `call_myfcn`, which calls `myfcn`.

```
function [x, y] = call_myfcn(n)
    %#codegen
    x = myfcn(n, 'mode1');
    y = myfcn(n, 'mode2');
end
```

```
function y = myfcn(n,mode)
    coder.inline('never');
    if strcmp(mode,'mode1')
        y = n;
    else
        y = -n;
    end
end
```

```
end  
end
```

Generate standalone C code. For example, generate a static library. Enable the code generation report.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you see two function specializations for `call_myfcn`.

The code generator creates `call_myfcn>myfcn>1` for mode with a value of 'mode1'. It creates `call_myfcn>myfcn>2` for mode with a value of 'mode2'.

In the generated C code, you see the specializations `my_fcn` and `b_my_fcn`.

```
static double b_myfcn(double n)  
{  
    return -n;  
}  
  
static double myfcn(double n)  
{  
    return n;  
}
```

To prevent the function specializations, instruct the code generator to ignore that values of the mode argument are constant.

```
function [x, y] = call_myfcn(n)  
    %#codegen  
    x = myfcn(n, coder.ignoreConst('mode1'));  
    y = myfcn(n, coder.ignoreConst('mode2'));  
end  
  
function y = myfcn(n,mode)  
    coder.inline('never');  
    if strcmp(mode, 'mode1')  
        y = n;
```

```

else
    y = -n;
end
end

```

Generate the C code.

```
codegen -config:lib call_myfcn -args {1} -report
```

In the code generation report, you do not see multiple function specializations.

In the generated C code, you see one function for `my_fcn`.

Input Arguments

expression — Expression whose value is to be treated as a nonconstant
MATLAB expression

Definitions

Function Specialization

Version of a function in which an input type, size, complexity, or value is customized for a particular invocation of the function.

Function specialization produces efficient C code at the expense of code duplication. The code generation report shows all MATLAB function specializations that the code generator creates. However, the specializations might not appear in the generated C/C++ code due to later transformations or optimizations.

Tips

- For some recursive function calls, you can use `coder.ignoreConst` to force run-time recursion. See “Force Code Generator to Use Run-Time Recursion”.
- `coder.ignoreConst(expression)` prevents the code generator from using the constant value of `expression` to create function specializations. It does not prevent other uses of the constant value during code generation.

`coder.inline`

Topics

“Force Code Generator to Use Run-Time Recursion”

“Compile-Time Recursion Limit Reached”

Introduced in R2017a

coder.inline

Package: coder

Control inlining in generated code

Syntax

```
coder.inline('always')
coder.inline('never')
coder.inline('default')
```

Description

`coder.inline('always')` forces inlining on page 2-96 of the current function in the generated code. Place the `coder.inline` directive inside the function to which it applies. The code generator does not inline entry-point functions, inline functions into `parfor` loops, or inline functions called from `parfor` loops.

`coder.inline('never')` prevents inlining of the current function in the generated code. Prevent inlining when you want to simplify the mapping between the MATLAB source code and the generated code.

`coder.inline('default')` uses internal heuristics to determine whether to inline the current function. Usually, the heuristics produce highly optimized code. Use `coder.inline` only when you need to fine-tune these optimizations.

Examples

- “Prevent Function Inlining” on page 2-95
- “Use `coder.inline` in Control Flow Statements” on page 2-96

Prevent Function Inlining

In this example, function `f00` is not inlined in the generated code:

```
function y = foo(x)
    coder.inline('never');
    y = x;
end
```

Use `coder.inline` in Control Flow Statements

You can use `coder.inline` in control flow code. If the software detects contradictory `coder.inline` directives, the generated code uses the default inlining heuristic and issues a warning.

Suppose that you want to generate code for a division function used by a system with limited memory. To optimize memory use in the generated code, the `inline_division` function manually controls inlining based on whether it performs scalar division or vector division:

```
function y = inline_division(dividend, divisor)

% For scalar division, inlining produces smaller code
% than the function call itself.
if isscalar(dividend) && isscalar(divisor)
    coder.inline('always');
else
% Vector division produces a for-loop.
% Prohibit inlining to reduce code size.
    coder.inline('never');
end

if any(divisor == 0)
    error('Cannot divide by 0');
end

y = dividend / divisor;
```

Definitions

Inlining

Technique that replaces a function call with the contents (body) of that function. Inlining eliminates the overhead of a function call, but can produce larger C/C++ code. Inlining can create opportunities for further optimization of the generated C/C++ code.

Introduced in R2011a

coder.load

Load compile-time constants from MAT-file or ASCII file into caller workspace

Syntax

```
S = coder.load(filename)
S = coder.load(filename,var1,...,varN)
S = coder.load(filename,'-regexp',expr1,...,exprN)
S = coder.load(filename,'-ascii')
S = coder.load(filename,'-mat')
S = coder.load(filename,'-mat',var1,...,varN)
S = coder.load(filename,'-mat','-regexp', expr1,...,exprN)
```

Description

`S = coder.load(filename)` loads compile-time constants from `filename`.

- If `filename` is a MAT-file, then `coder.load` loads variables from the MAT-file into a structure array.
- If `filename` is an ASCII file, then `coder.load` loads data into a double-precision array.

`S = coder.load(filename,var1,...,varN)` loads only the specified variables from the MAT-file `filename`.

`S = coder.load(filename,'-regexp',expr1,...,exprN)` loads only the variables that match the specified regular expressions.

`S = coder.load(filename,'-ascii')` treats `filename` as an ASCII file, regardless of the file extension.

`S = coder.load(filename,'-mat')` treats `filename` as a MAT-file, regardless of the file extension.

`S = coder.load(filename,'-mat',var1,...,varN)` treats `filename` as a MAT-file and loads only the specified variables from the file.

`S = coder.load(filename, '-mat', '-regexp', expr1, ..., exprN)` treats `filename` as a MAT-file and loads only the variables that match the specified regular expressions.

Examples

Load compile-time constants from MAT-file

Generate code for a function `edgeDetect1` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect1` uses `coder.load` to load the edge detection kernel from a MAT-file at compile time.

Save the Sobel edge-detection kernel in a MAT-file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];
```

```
save sobel.mat k
```

Write the function `edgeDetect1`.

```
function edgeImage = edgeDetect1(originalImage, threshold) %#codegen
assert(all(size(originalImage) <= [1024 1024]));
assert(isa(originalImage, 'double'));
assert(isa(threshold, 'double'));

S = coder.load('sobel.mat', 'k');
H = conv2(double(originalImage), S.k, 'same');
V = conv2(double(originalImage), S.k', 'same');
E = sqrt(H.*H + V.*V);
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect1`.

```
codegen -report -config cfg edgeDetect1
```

`codegen` generates C code in the `codegen\lib\edgeDetect1` folder.

Load compile-time constants from ASCII file

Generate code for a function `edgeDetect2` which given a normalized image, returns an image where the edges are detected with respect to the threshold value. `edgeDetect2` uses `coder.load` to load the edge detection kernel from an ASCII file at compile time.

Save the Sobel edge-detection kernel in an ASCII file.

```
k = [1 2 1; 0 0 0; -1 -2 -1];  
save sobel.dat k -ascii
```

Write the function `edgeDetect2`.

```
function edgeImage = edgeDetect2(originalImage, threshold) %#codegen  
assert(all(size(originalImage) <= [1024 1024]));  
assert(isa(originalImage, 'double'));  
assert(isa(threshold, 'double'));  
  
k = coder.load('sobel.dat');  
H = conv2(double(originalImage), k, 'same');  
V = conv2(double(originalImage), k', 'same');  
E = sqrt(H.*H + V.*V);  
edgeImage = uint8((E > threshold) * 255);
```

Create a code generation configuration object for a static library.

```
cfg = coder.config('lib');
```

Generate a static library for `edgeDetect2`.

```
codegen -report -config cfg edgeDetect2
```

`codegen` generates C code in the `codegen\lib\edgeDetect2` folder.

Input Arguments

filename — Name of file

character vector | string scalar

Name of file. `filename` must be a compile-time constant.

`filename` can include a file extension and a full or partial path. If `filename` has no extension, `load` looks for a file named `filename.mat`. If `filename` has an extension other than `.mat`, `load` treats the file as ASCII data.

ASCII files must contain a rectangular table of numbers, with an equal number of elements in each row. The file delimiter (the character between elements in each row) can be a blank, comma, semicolon, or tab character. The file can contain MATLAB comments (lines that begin with a percent sign, `%`).

Example: `'myFile.mat'`

`var1, ..., varN` — Names of variables to load

character vector | string scalar

Names of variables, specified as one or more character vectors or string scalars. Each variable name must be a compile-time constant. Use the `*` wildcard to match patterns.

Example: `coder.load('myFile.mat', 'A*')` loads all variables in the file whose names start with `A`.

`expr1, ..., exprN` — Regular expressions indicating which variables to load

character vector | string scalar

Regular expressions indicating which variables to load specified as one or more character vectors or string scalars. Each regular expression must be a compile-time constant.

Example: `coder.load('myFile.mat', '-regexp', '^A')` loads only variables whose names begin with `A`.

Output Arguments

`s` — Loaded variables or data

structure array | m-by-n array

If `filename` is a MAT-file, `S` is a structure array.

If `filename` is an ASCII file, `S` is an m-by-n array of type `double`. `m` is the number of lines in the file and `n` is the number of values on a line.

Limitations

- `coder.load` does not support loading objects.
- Arguments to `coder.load` must be compile-time constants.
- The output `S` must be the name of a structure or array without any subscripting. For example, `S(i) = coder.load('myFile.mat')` is not allowed.
- You cannot use `save` to save workspace data to a file inside a function intended for code generation. The code generator does not support the `save` function. Furthermore, you cannot use `coder.extrinsic` with `save`. Prior to generating code, you can use `save` to save workspace data to a file.

Tips

- `coder.load` loads data at compile time, not at run time. If you are generating MEX code or code for Simulink simulation, you can use the MATLAB function `load` to load run-time values.
- If the MAT-file contains unsupported constructs, use `coder.load(filename, var1, ..., varN)` to load only the supported constructs.
- If you generate code in a MATLAB Coder project, the code generator practices incremental code generation for the `coder.load` function. When the MAT-file or ASCII file used by `coder.load` changes, the software rebuilds the code.

`matfile` | `regexp` | `save`

Topics

“Regular Expressions” (MATLAB)

Introduced in R2013a

coder.nullcopy

Package: coder

Declare uninitialized variables

Syntax

```
X = coder.nullcopy(A)
```

Description

`X = coder.nullcopy(A)` copies type, size, and complexity of `A` to `X`, but does not copy element values. Preallocates memory for `X` without incurring the overhead of initializing memory.

`coder.nullcopy` does not support MATLAB classes as inputs.

Use With Caution

Use this function with caution. See “How to Eliminate Redundant Copies by Defining Uninitialized Variables”.

Examples

The following example shows how to declare variable `X` as a 1-by-5 vector of real doubles without performing an unnecessary initialization:

```
function X = foo

N = 5;
X = coder.nullcopy(zeros(1,N)) ;
for i = 1:N
    if mod(i,2) == 0
        X(i) = i;
```

```
    else
        X(i) = 0;
    end
end
```

Using `coder.nullcopy` with `zeros` lets you specify the size of vector X without initializing each element to zero.

“Eliminate Redundant Copies of Variables in Generated Code”

Introduced in R2011a

coder.opaque

Declare variable in generated code

Syntax

```
y = coder.opaque(type)
y = coder.opaque(type,value)
y = coder.opaque( ____, 'Size',Size)
y = coder.opaque( ____, 'HeaderFile',HeaderFile)
```

Description

`y = coder.opaque(type)` declares a variable `y` with the specified type and no initial value in the generated code.

- `y` can be a variable or a structure field.
- MATLAB code cannot set or access `y`, but external C functions can accept `y` as an argument.
- `y` can be an:
 - Argument to `coder.rref`, `coder.wref`, or `coder.ref`
 - Input or output argument to `coder.ceval`
 - Input or output argument to a user-written MATLAB function
 - Input to a subset of MATLAB toolbox functions supported for code generation
- Assignment from `y` declares another variable with the same type in the generated code. For example:

```
y = coder.opaque('int');
z = y;
```

declares a variable `z` of type `int` in the generated code.

- You can assign `y` from another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

- You can compare `y` to another variable declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types.

`y = coder.opaque(type,value)` specifies the type and initial value of `y`.

`y = coder.opaque(____, 'Size',Size)` specifies the size, in bytes, of `y`. You can specify the size with any of the previous syntaxes.

`y = coder.opaque(____, 'HeaderFile',HeaderFile)` specifies the header file that contains the type definition. The code generator produces the `#include` statement for the header file where the statement is required in the generated code. You can specify the header file with any of the previous syntaxes.

Examples

Declare Variable Specifying Initial Value

Generate code for a function `valtest` which returns 1 if the call to `myfun` is successful. This function uses `coder.opaque` to declare a variable `x1` with type `int` and initial value 0. The assignment `x2 = x1` declares `x2` to be a variable with the type and initial value of `x1`.

Write a function `valtest`.

```
function y = valtest
%codegen
%declare x1 to be an integer with initial value '0'
x1 = coder.opaque('int','0');
%Declare x2 to have same type and initial value as x1
x2 = x1;
x2 = coder.ceval('myfun');
%test the result of call to 'myfun' by comparing to value of x1
if x2 == x1
    y = 0;
else
    y = 1;
```

```
end
end
```

Declare Variable Specifying Initial Value and Header File

Generate code for a MATLAB function `filetest` which returns its own source code using `fopen/fread/fclose`. This function uses `coder.opaque` to declare the variable that stores the file pointer used by `fopen/fread/fclose`. The call to `coder.opaque` declares the variable `f` with type `FILE *`, initial value `NULL`, and header file `<stdio.h>`.

Write a MATLAB function `filetest`.

```
function buffer = filetest
%#codegen

% Declare 'f' as an opaque type 'FILE *' with initial value 'NULL'
%Specify the header file that contains the type definition of 'FILE *';

f = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
% Open file in binary mode
f = coder.ceval('fopen', cstring('filetest.m'), cstring('rb'));

% Read from file until end of file is reached and put
% contents into buffer
n = int32(1);
i = int32(1);
buffer = char(zeros(1,8192));
while n > 0
    % By default, MATLAB converts constant values
    % to doubles in generated code
    % so explicit type conversion to int32 is inserted.
    n = coder.ceval('fread', coder.ref(buffer(i)), int32(1), ...
        int32(numel(buffer)), f);
    i = i + n;
end
coder.ceval('fclose', f);

buffer = strip_cr(buffer);

% Put a C termination character '\0' at the end of MATLAB character vector
function y = cstring(x)
    y = [x char(0)];

% Remove all character 13 (CR) but keep character 10 (LF)
function buffer = strip_cr(buffer)
j = 1;
for i = 1:numel(buffer)
    if buffer(i) ~= char(13)
        buffer(j) = buffer(i);
        j = j + 1;
    end
end
```

```
    end
end
buffer(i) = 0;
```

Compare Variables Declared Using `coder.opaque`

Compare variables declared using `coder.opaque` to test for successfully opening a file.

Use `coder.opaque` to declare a variable `null` with type `FILE *` and initial value `NULL`.

```
null = coder.opaque('FILE *', 'NULL', 'HeaderFile', '<stdio.h>');
```

Use assignment to declare another variable `ftmp` with the same type and value as `null`.

```
ftmp = null;
ftmp = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

Compare the variables.

```
if ftmp == null
    %error condition
end
```

Cast to and from Types of Variables Declared Using `coder.opaque`

This example shows how to cast to and from types of variables that are declared using `coder.opaque`. The function `castopaque` calls the C run-time function `strncmp` to compare at most `n` characters of the strings `s1` and `s2`. `n` is the number of characters in the shorter of the strings. To generate the correct C type for the `strncmp` input `nsizet`, the function casts `n` to the C type `size_t` and assigns the result to `nsizet`. The function uses `coder.opaque` to declare `nsizet`. Before using the output `retval` from `strncmp`, the function casts `retval` to the MATLAB type `int32` and stores the results in `y`.

Write this MATLAB function:

```
function y = castopaque(s1,s2)

% <0 - the first character that does not match has a lower value in s1 than in s2
%  0 - the contents of both strings are equal
% >0 - the first character that does not match has a greater value in s1 than in s2
%
%#codegen
```

```

coder.cinclude('<string.h>');
n = min(numel(s1), numel(s2));

% Convert the number of characters to compare to a size_t
nsizet = cast(n, 'like', coder.opaque('size_t', '0'));

% The return value is an int
retval = coder.opaque('int');
retval = coder.ceval('strncmp', cstr(s1), cstr(s2), nsizet);

% Convert the opaque return value to a MATLAB value
y = cast(retval, 'int32');

%-----
function sc = cstr(s)
% NULL terminate a MATLAB character vector for C
sc = [s, char(0)];

```

Generate the MEX function.

```
codegen castopaque -args {blanks(3), blanks(3)} -report
```

Call the MEX function with inputs 'abc' and 'abc'.

```
castopaque_mex('abc', 'abc')
```

```
ans =
```

```
0
```

The output is 0 because the strings are equal.

Call the MEX function with inputs 'abc' and 'abd'.

```
castopaque_mex('abc', 'abd')
```

```
ans =
```

```
-1
```

The output is -1 because the third character d in the second string is greater than the third character c in the first string.

Call the MEX function with inputs 'abd' and 'abc'.

```
castopaque_mex('abd','abc')  
  
ans =  
  
     1
```

The output is 1 because the third character `d` in the first string is greater than the third character `c` in the second string.

In the MATLAB workspace, you can see that the type of `y` is `int32`.

Declare Variable Specifying Initial Value and Size

Declare `y` to be a 4-byte integer with initial value 0.

```
y = coder.opaque('int','0','Size',4);
```

Input Arguments

type — Type of variable

character vector | string scalar

Type of variable in generated code. `type` must be a compile-time constant. The type must be a:

- Built-in C data type or a type defined in a header file
- C type that supports copy by assignment
- Legal prefix in a C declaration

Example: `'FILE *'`

value — Initial value of variable

character vector | string scalar

Initial value of variable in generated code. `value` must be a compile-time constant. Specify a C expression not dependent on MATLAB variables or functions.

If you do not provide the initial value in `value`, initialize the value of the variable before using it. To initialize a variable declared using `coder.opaque`:

- Assign a value from another variable with the same type declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`.
- Assign a value from an external C function.
- Pass the address of the variable to an external function using `coder.wref`.

Specify a value that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results.

Example: `'NULL'`

size — Size of variable

integer

Number of bytes for the variable in the generated code, specified as an integer. If you do not specify the size, the size of the variable is 8 bytes.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

HeaderFile — Name of header file

character vector | string scalar

Name of header file that contains the definition of `type`. `HeaderFile` must be a compile-time constant.

For a system header file, use angle brackets.

Example: `'<stdio.h>'` generates `#include <stdio.h>`

For an application header file, use double quotes.

Example: `"foo.h"` generates `#include "foo.h"`

If you omit the angle brackets or double quotes, the code generator produces double quotes.

Example: `'foo.h'` generates `#include "foo.h"`

Specify the include path in the build configuration parameters.

Example: `cfg.CustomInclude = 'c:\myincludes'`

Tips

- Specify a value that has the type that `type` specifies. Otherwise, the generated code can produce unexpected results. For example, the following `coder.opaque` declaration can produce unexpected results.

```
y = coder.opaque('int', '0.2')
```

- `coder.opaque` declares the type of a variable. It does not instantiate the variable. You can instantiate a variable by using it later in the MATLAB code. In the following example, assignment of `fp1` from `coder.ceval` instantiates `fp1`.

```
% Declare fp1 of type FILE *
fp1 = coder.opaque('FILE *');
%Create the variable fp1
fp1 = coder.ceval('fopen', ['testfile.txt', char(0)], ['r', char(0)]);
```

- In the MATLAB environment, `coder.opaque` returns the value specified in `value`. If `value` is not provided, it returns an empty character vector.
- You can compare variables declared using either `coder.opaque` or assignment from a variable declared using `coder.opaque`. The variables must have identical types. The following example demonstrates how to compare these variables. “Compare Variables Declared Using `coder.opaque`” on page 2-108
- To avoid multiple inclusions of the same header file in generated code, enclose the header file in the conditional preprocessor statements `#ifndef` and `#endif`. For example:

```
#ifndef MyHeader_h
#define MyHeader_h
<body of header file>
#endif
```

- You can use the MATLAB `cast` function to cast a variable to or from a variable that is declared using `coder.opaque`. Use `cast` with `coder.opaque` only for numeric types.

To cast a variable declared by `coder.opaque` to a MATLAB type, you can use the `B = cast(A, type)` syntax. For example:

```
x = coder.opaque('size_t', '0');
x1 = cast(x, 'int32');
```

You can also use the `B = cast(A, 'like', p)` syntax. For example:

```
x = coder.opaque('size_t','0');  
x1 = cast(x, 'like', int32(0));
```

To cast a MATLAB variable to the type of a variable declared by `coder.opaque`, you must use the `B = cast(A, 'like', p)` syntax. For example:

```
x = int32(12);  
x1 = coder.opaque('size_t', '0');  
x2 = cast(x, 'like', x1);
```

Use `cast` with `coder.opaque` to generate the correct data types for:

- Inputs to C/C++ functions that you call using `coder.ceval`.
- Variables that you assign to outputs from C/C++ functions that you call using `coder.ceval`.

Without this casting, it is possible to receive compiler warnings during code generation.

See Also

`coder.ceval` | `coder.ref` | `coder.rref` | `coder.wref`

Introduced in R2011a

coder.ref

Pass argument by reference

Syntax

```
coder.ref(arg)
```

Description

`coder.ref(arg)` passes `arg` by reference to an external C/C++ function that you call by using `coder.ceval`. Use `coder.ref` inside a `coder.ceval` call only. The C/C++ function can read from or write to the variable passed by reference. Use a separate `coder.ref` construct for each argument that you pass by reference to the function.

Examples

Pass Scalar Variable by Reference

Pass a variable by reference to a C function that adds 1 to the variable.

Suppose that you have a C function `addone`.

```
void addone(double* p) {  
    *p = *p + 1;  
}
```

The C function prototype defines the input as a pointer because it is passed by reference.

Pass a variable by reference to `addone`.

```
...  
u = 42;
```

```

coder.ceval('addone', coder.ref(u));
...

```

Pass Multiple Arguments by Reference

```

...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.ref(u), coder.ref(v));
...

```

Pass Class Property by Reference

```

...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.ref(x.prop));
...

```

Pass a Structure by Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `incr_struct`.

```

void incr_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = my_struct->f1 + 1;
    my_struct->f2 = my_struct->f2 + 1;
}

```

Suppose that a C header file, `MyStruct.h`, defines a structure type named `MyStruct`.

```

...
typedef struct MyStruct
{
    double f1;
    double f2;
} MyStruct;

```

```
void incr_struct(struct MyStruct *my_struct);  
  
...
```

In your MATLAB function, pass a structure by reference to `incr_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in a C header file `MyStruct.h`, use `coder.cstructname`.

```
...  
s = struct('f1', 1, 'f2', 2);  
coder.cstructname(s, 'MyStruct', 'extern', 'HeaderFile', 'MyStruct.h');  
coder.ceval('incr_struct', coder.ref(s));  
...
```

Pass Structure Field by Reference

```
...  
s = struct('s1', struct('a', [0 1]));  
coder.ceval('foo', coder.ref(s.s1.a));  
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object
property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` |
`uint32` | `uint64` | `logical` | `char` | `struct`
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
 - Class or System object

- Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.ref` results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

See Also

`coder.ceval` | `coder.cstructname` | `coder.opaque` | `coder.rref` | `coder.wref`

Introduced in R2011a

coder.rref

Pass argument by reference as read-only input

Syntax

```
coder.rref(arg)
```

Description

`coder.rref(arg)` passes `arg` by reference to an external C/C++ function that you call by using `coder.ceval`. Use `coder.rref` inside a `coder.ceval` call only. The code generator assumes that the variable that you pass in `coder.rref` is read-only. To avoid unpredictable results, the C/C++ function must not write to this variable.

Use a separate `coder.rref` construct for each argument that you pass by reference to the function.

Examples

Pass Scalar Variable as a Read-Only Reference

Pass a variable as a read-only reference to a C function that returns the value of the variable plus one.

Consider the C function `addone`:

```
double addone(const double* p) {  
    return *p + 1;  
}
```

The C function prototype defines the input as a pointer because it is passed by reference.

Pass a variable by reference to `addone`.

```

...
u = 42;
y = 0;
y = coder.ceval('addone', coder.rref(u));
...

```

Pass Multiple Arguments as a Read-Only Reference

```

...
u = 1;
v = 2;
y = coder.ceval('my_fcn', coder.rref(u), coder.rref(v));
...

```

Pass Class Property as a Read-Only Reference

```

...
x = myClass;
x.prop = 1;
y = coder.ceval('foo', coder.rref(x.prop));
...

```

Pass Structure as a Read-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `use_struct`.

```

double use_struct(struct MyStruct *my_struct)
{
    return my_struct->f1 + my_struct->f2;
}

```

Suppose that a C header file, `MyStruct.h`, defines a structure type named `MyStruct`.

```

...
typedef struct MyStruct
{
    double f1;
    double f2;
}

```

```
} MyStruct;

double use_struct(struct MyStruct *my_struct);

...
```

In your MATLAB function, pass a structure as a read-only reference to `use_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in a C header file `MyStruct.h`, use `coder.cstructname`.

```
...
s = struct('f1', 1, 'f2', 2);
coder.cstructname(s, 'MyStruct', 'extern', 'HeaderFile', 'MyStruct.h');
y = 0;
y = coder.ceval('use_struct', coder.rref(s));
...
```

Pass Structure Field as a Read-Only Reference

```
...
s = struct('s1', struct('a', [0 1]));
y = coder.ceval('foo', coder.rref(s.s1.a));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | struct
Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
 - Class or System object
 - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.rref` results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Introduced in R2011a

coder.screener

Determine if function is suitable for code generation

Syntax

```
coder.screener(fcn)
coder.screener(fcn_1, ..., fcn_n )
```

Description

`coder.screener(fcn)` analyzes the entry-point MATLAB function, `fcn`. It identifies unsupported functions and language features as code generation compliance issues. It displays the code generation compliance issues in a report. If `fcn` calls other functions directly or indirectly that are not MathWorks® functions, `coder.screener` analyzes these functions. It does not analyze MathWorks functions. It is possible that `coder.screener` does not detect all code generation issues. Under certain circumstances, it is possible that `coder.screener` reports false errors.

`coder.screener(fcn_1, ..., fcn_n)` analyzes entry-point functions (`fcn_1, ..., fcn_n`).

Input Arguments

fcn

Name of entry-point MATLAB function that you want to analyze. Specify as a character vector or a string scalar.

fcn_1, ..., fcn_n

Comma-separated list of names of entry-point MATLAB functions that you want to analyze. Specify as character vectors or string scalars.

Examples

Identify Unsupported Functions

The `coder.screener` function identifies calls to functions that are not supported for code generation. It checks both the entry-point function, `foo1`, and the function `foo2` that `foo1` calls.

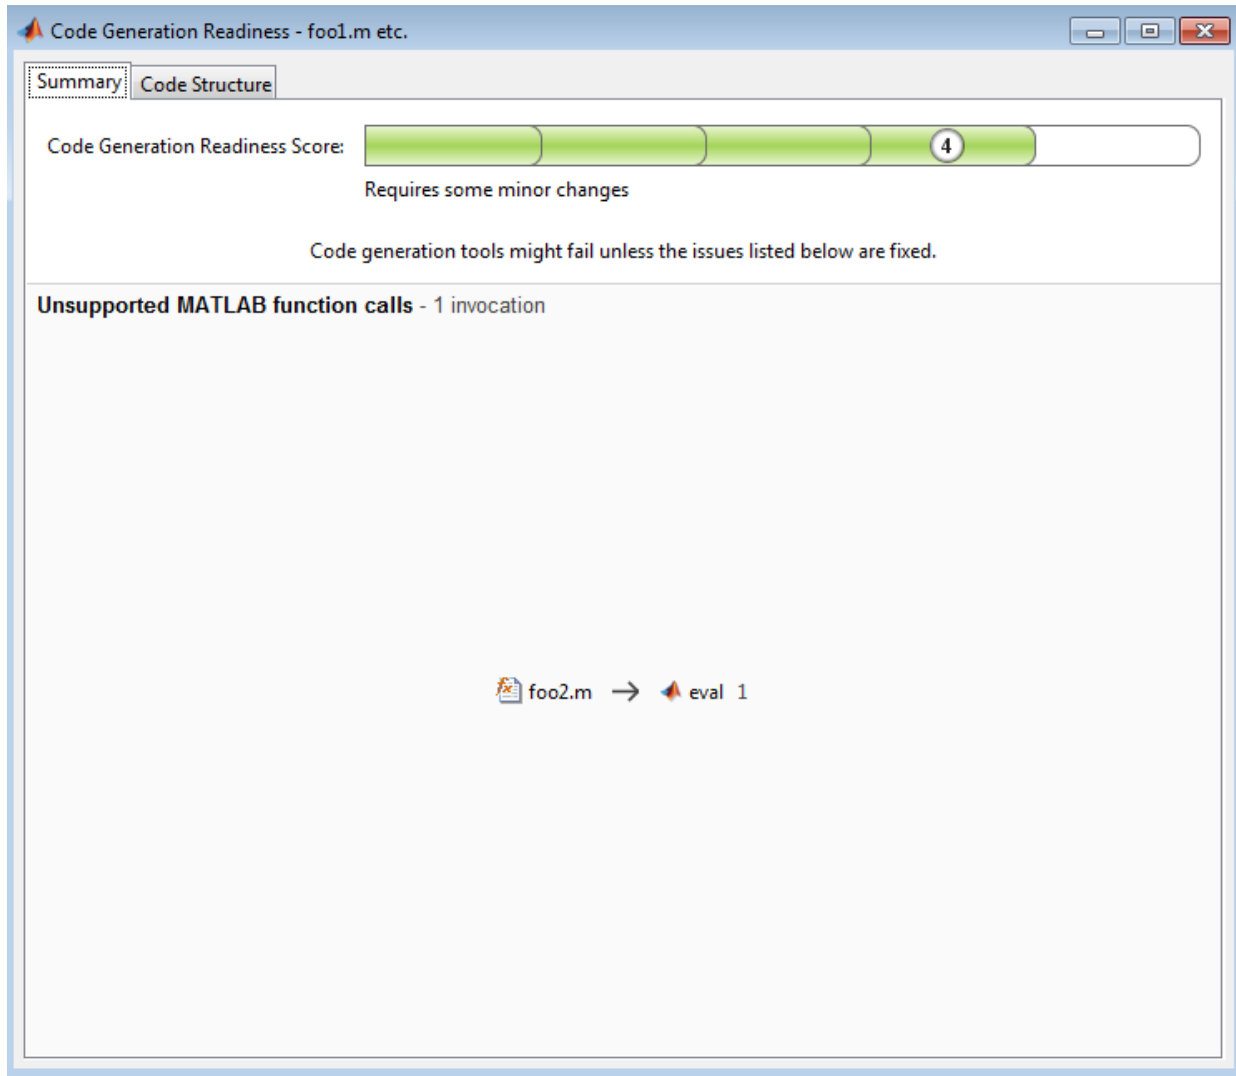

Analyze the MATLAB function `foo1` that calls `foo2`. Put `foo1` and `foo2` in separate files.

```
function out = foo1(in)
    out = foo2(in);
    disp(out);
end
```

```
function out = foo2(in)
    out = eval(in);
end
```

```
coder.screener('foo1')
```

The code generation readiness report displays a summary of the unsupported MATLAB function calls. The function `foo2` calls one unsupported MATLAB function.

In the report, click the **Code Structure** tab and select the **Show MATLAB functions** check box.

This tab displays a pie chart showing the relative size of each file and how suitable each file is for code generation. In this case, the report:

- Colors `foo1.m` green to indicate that it is suitable for code generation.
- Colors `foo2.m` yellow to indicate that it requires significant changes.
- Assigns `foo1.m` a code generation readiness score of 4 and `foo2.m` a score of 3. The score is based on a scale of 1–5. 1 indicates that significant changes are required; 5 indicates that the code generation readiness tool does not detect issues.
- Displays a call tree.

The report **Summary** tab indicates that `foo2.m` contains one call to the `eval` function, which code generation does not support. To generate a MEX function for `foo2.m`, modify the code to make the call to `eval` extrinsic.

```
function out = foo2(in)
    coder.extrinsic('eval');
```

```
    out = eval(in);  
end
```

Rerun the code generation readiness tool.

```
coder.screener('foo1')
```

The report no longer flags that code generation does not support the `eval` function. When you generate a MEX function for `foo1`, the code generator dispatches `eval` to MATLAB for execution. For standalone code generation, the code generator does not generate code for `eval`.

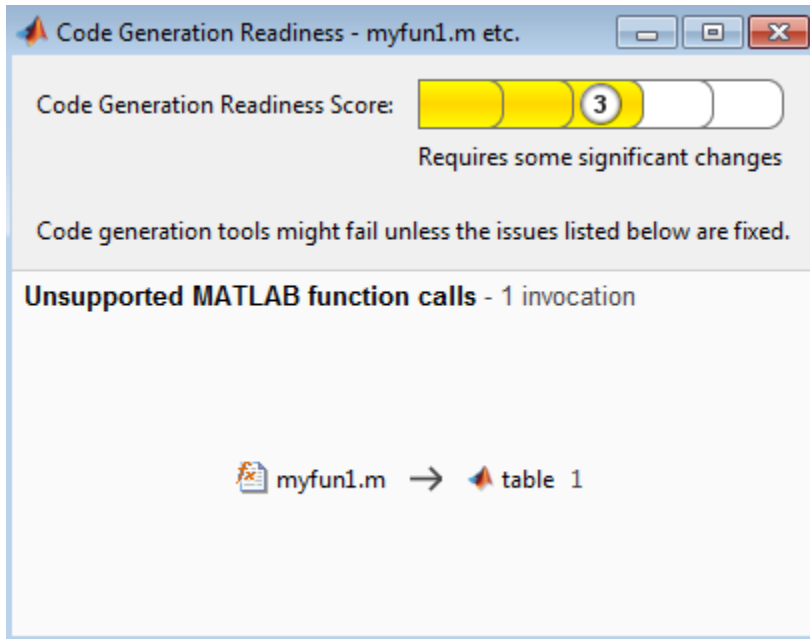

Identify Unsupported Data Types

The `coder.screener` function identifies MATLAB data types that code generation does not support.

Analyze the MATLAB function `myfun` that contains a MATLAB table.

```
function outTable = myfun1(A)  
outTable = table(A);  
end  
  
coder.screener('myfun1');
```

The code generation readiness report indicates that table data types are not supported for code generation.

The report assigns `myfun1` a code readiness score of 3. Before generating code, you must fix the reported issues.

Tips

- Before using `coder.screener`, fix issues that the Code Analyzer identifies.
- Before generating code, use `coder.screener` to check that a function is suitable for code generation. Fix all the issues that it detects.

Alternatives

- “Run the Code Generation Readiness Tool From the Current Folder Browser”

“Code Generation Readiness Tool”

Introduced in R2012b

coder.target

Determine if code generation target is specified target

Syntax

```
tf = coder.target(target)
```

Description

`tf = coder.target(target)` returns true (1) if the code generation target is target. Otherwise, it returns false (0).

If you generate code for MATLAB classes, MATLAB computes class initial values at class loading time before code generation. If you use `coder.target` in MATLAB class property initialization, `coder.target('MATLAB')` returns true.

Examples

Use `coder.target` to parameterize a MATLAB function

Parameterize a MATLAB function so that it works in MATLAB or generated code. When the function runs in MATLAB, it calls the MATLAB function `myabsval`. The generated code, however, calls a C library function `myabsval`.

Write a MATLAB function `myabsval`.

```
function y = myabsval(u)    %#codegen  
y = abs(u);
```

Generate the C library for `myabsval.m`, using the `-args` option to specify the size, type, and complexity of the input parameter.

```
codegen -config:lib myabsval -args {0.0}
```

codegen creates the library `myabsval.lib` and header file `myabsval.h` in the folder `/codegen/lib/myabsval`. It also generates the functions `myabsval_initialize` and `myabsval_terminate` in the same folder.

Write a MATLAB function to call the generated C library function using `coder.ceval`.

```
function y = callmyabsval %#codegen
y = -2.75;
% Check the target. Do not use coder.ceval if callmyabsval is
% executing in MATLAB
if coder.target('MATLAB')
    % Executing in MATLAB, call function myabsval
    y = myabsval(y);
else
    % Executing in the generated code.
    % Call the initialize function before calling the
    % C function for the first time
    coder.ceval('myabsval_initialize');

    % Call the generated C library function myabsval
    y = coder.ceval('myabsval',y);

    % Call the terminate function after
    % calling the C function for the last time
    coder.ceval('myabsval_terminate');
end
```

Convert `callmyabsval.m` to the MEX function `callmyabsval_mex`.

```
codegen -config:mex callmyabsval codegen/lib/myabsval/myabsval.lib...
        codegen/lib/myabsval/myabsval.h
```

Run the MATLAB function `callmyabsval`.

```
callmyabsval

ans =

    2.7500
```

Run the MEX function `callmyabsval_mex` which calls the library function `myabsval`.

```
callmyabsval_mex
```

```
ans =  
  
    2.7500
```

Input Arguments

target — code generation target

'MATLAB' | 'MEX' | 'Sfun' | 'Rtw' | 'HDL' | 'Custom'

Code generation target, specified as a character vector or a string scalar. Specify one of these targets.

'MATLAB'	Running in MATLAB (not generating code)
'MEX'	Generating a MEX function
'Sfun'	Simulating a Simulink model
'Rtw'	Generating a LIB, DLL, or EXE target
'HDL'	Generating an HDL target
'Custom'	Generating a custom target

Example: `tf = coder.target('MATLAB')`

Example: `tf = coder.target("MATLAB")`

`coder.ceval`

Introduced in R2011a

coder.unroll

Unroll `for`-loop by making a copy of the loop body for each loop iteration

Syntax

```
coder.unroll()  
coder.unroll(flag)  
for i = coder.unroll(range)  
for i = coder.unroll(range, flag)
```

Description

`coder.unroll()` unrolls a `for`-loop. The `coder.unroll` call must be on a line by itself immediately preceding the `for`-loop that it unrolls.

Instead of producing a `for`-loop in the generated code, loop unrolling produces a copy of the `for`-loop body for each loop iteration. In each iteration, the loop index becomes constant. To unroll a loop, the code generator must be able to determine the bounds of the `for`-loop.

For small, tight loops, unrolling can improve performance. However, for large loops, unrolling can increase code generation time significantly and generate inefficient code.

`coder.unroll` is ignored outside of code generation.

`coder.unroll(flag)` unrolls a `for`-loop if `flag` is `true`. `flag` is evaluated at code generation time. The `coder.unroll` call must be on a line by itself immediately preceding the `for`-loop that it unrolls.

`for i = coder.unroll(range)` is a legacy syntax that generates the same code as `coder.unroll()`.

`for i = coder.unroll(range, flag)` is a legacy syntax that generates the same code as `coder.unroll(flag)`.

Examples

Unroll a `for`-loop

To produce copies of a `for`-loop body in the generated code, use `coder.unroll`.

In one file, write the entry-point function `call_getrand` and a local function `getrand`. `getrand` unrolls a `for`-loop that assigns random numbers to an `n`-by-1 array. `call_getrand` calls `getrand` with the value 3.

```
function z = call_getrand
    %#codegen
    z = getrand(3);
end

function y = getrand(n)
    coder.inline('never');
    y = zeros(n, 1);
    coder.unroll();
    for i = 1:n
        y(i) = rand();
    end
end
```

Generate a static library.

```
codegen -config:lib call_getrand -report
```

In the generated code, the code generator produces a copy of the `for`-loop body for each of the three loop iterations.

```
static void getrand(double y[3])
{
    y[0] = b_rand();
    y[1] = b_rand();
    y[2] = b_rand();
}
```

Control `for`-loop Unrolling with Flag

Control loop unrolling by using `coder.unroll` with the `flag` argument.

In one file, write the entry-point function `call_getrand_unrollflag` and a local function `getrand_unrollflag`. When the number of loop iterations is less than 10, `getrand_unrollflag` unrolls the for-loop. `call_getrand` calls `getrand` with the value 50.

```
function z = call_getrand_unrollflag
    %#codegen
    z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
    coder.inline('never');
    unrollflag = n < 10;
    y = zeros(n, 1);
    coder.unroll(unrollflag)
    for i = 1:n
        y(i) = rand();
    end
end
```

Generate a static library.

```
codegen -config:lib call_getrand_unrollflag -report
```

The number of iterations is not less than 10. Therefore, the code generator does not unroll the for-loop. It produces a for-loop in the generated code.

```
static void getrand_unrollflag(double y[50])
{
    int i;
    for (i = 0; i < 50; i++) {
        y[i] = b_rand();
    }
}
```

Use Legacy Syntax to Unroll for-Loop

```
function z = call_getrand
    %#codegen
    z = getrand(3);
end

function y = getrand(n)
```

```
coder.inline('never');
y = zeros(n, 1);
for i = coder.unroll(1:n)
    y(i) = rand();
end
end
```

Use Legacy Syntax to Control for-Loop Unrolling

```
function z = call_getrand_unrollflag
    %#codegen
    z = getrand_unrollflag(50);
end

function y = getrand_unrollflag(n)
    coder.inline('never');
    unrollflag = n < 10;
    y = zeros(n, 1);
    for i = coder.unroll(1:n, unrollflag)
        y(i) = rand();
    end
end
```

Input Arguments

flag — Indicates whether to unroll the for-loop

true (default) | false

When `flag` is true, the code generator unrolls the for-loop. When `flag` is false, the code generator produces a for-loop in the generated code. `flag` is evaluated at code generation time.

Tips

Sometimes, the code generator unrolls a for-loop even though you do not use `coder.unroll`. For example, if a for-loop indexes into a heterogeneous cell array or into `varargin` or `varargout`, the code generator unrolls the loop. By unrolling the loop, the code generator can determine the value of the index for each loop iteration. The code generator uses heuristics to determine when to unroll a for-loop. If the heuristics fail to

identify that unrolling is warranted, or if the number of loop iterations exceeds a limit, code generation fails. In these cases, you can force loop unrolling by using `coder.unroll`. See “Nonconstant Index into varargin or vararginout in a for-Loop”.

Introduced in R2011a

coder.updateBuildInfo

Update build information object `RTW.BuildInfo`

Syntax

```
coder.updateBuildInfo('addCompileFlags', options)
coder.updateBuildInfo('addLinkFlags', options)
coder.updateBuildInfo('addDefines', options)
coder.updateBuildInfo( ____, group)
```

```
coder.updateBuildInfo('addLinkObjects', filename, path)
coder.updateBuildInfo('addLinkObjects', filename, path, priority,
precompiled)
coder.updateBuildInfo('addLinkObjects', filename, path, priority,
precompiled, linkonly)
coder.updateBuildInfo( ____, group)
```

```
coder.updateBuildInfo('addNonBuildFiles', filename)
coder.updateBuildInfo('addSourceFiles', filename)
coder.updateBuildInfo('addIncludeFiles', filename)
coder.updateBuildInfo( ____, path)
coder.updateBuildInfo( ____, path, group)
```

```
coder.updateBuildInfo('addSourcePaths', path)
coder.updateBuildInfo('addIncludePaths', path)
coder.updateBuildInfo( ____, group)
```

Description

`coder.updateBuildInfo('addCompileFlags', options)` adds compiler options to the build information object.

`coder.updateBuildInfo('addLinkFlags', options)` adds link options to the build information object.

`coder.updateBuildInfo('addDefines', options)` adds preprocessor macro definitions to the build information object.

`coder.updateBuildInfo(____, group)` assigns a group name to options for later reference.

`coder.updateBuildInfo('addLinkObjects', filename, path)` adds a link object from a file to the build information object.

`coder.updateBuildInfo('addLinkObjects', filename, path, priority, precompiled)` specifies if the link object is precompiled.

`coder.updateBuildInfo('addLinkObjects', filename, path, priority, precompiled, linkonly)` specifies if the object is to be built before being linked or used for linking alone. If the object is to be built, it specifies if the object is precompiled.

`coder.updateBuildInfo(____, group)` assigns a group name to the link object for later reference.

`coder.updateBuildInfo('addNonBuildFiles', filename)` adds a nonbuild-related file to the build information object.

`coder.updateBuildInfo('addSourceFiles', filename)` adds a source file to the build information object.

`coder.updateBuildInfo('addIncludeFiles', filename)` adds an include file to the build information object.

`coder.updateBuildInfo(____, path)` adds the file from specified path.

`coder.updateBuildInfo(____, path, group)` assigns a group name to the file for later reference.

`coder.updateBuildInfo('addSourcePaths', path)` adds a source file path to the build information object.

`coder.updateBuildInfo('addIncludePaths', path)` adds an include file path to the build information object.

`coder.updateBuildInfo(____, group)` assigns a group name to the path for later reference.

Examples

Add Multiple Compiler Options

Add the compiler options `-Zi` and `-Wall` during code generation for function, `func`.

Anywhere in the MATLAB code for `func`, add the following line:

```
coder.updateBuildInfo('addCompileFlags','-Zi -Wall');
```

Generate code for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -config:lib -launchreport func
```

Add Source File Name

Add a source file to the project build information while generating code for a function, `calc_factorial`.

- 1 Write a header file `fact.h` that declares a C function `factorial`.

```
double factorial(double x);
```

`fact.h` will be included as a header file in generated code. This inclusion ensures that the function is declared before it is called.

Save the file in the current folder.

- 2 Write a C file `fact.c` that contains the definition of `factorial`. `factorial` calculates the factorial of its input.

```
#include "fact.h"
```

```
double factorial(double x)
{
    int i;
    double fact = 1.0;
    if (x == 0 || x == 1) {
        return 1.0;
    } else {
        for (i = 1; i <= x; i++) {
```

```

        fact *= (double)i;
    }
    return fact;
}
}

```

fact.c is used as a source file during code generation.

Save the file in the current folder.

- 3 Write a MATLAB function `calc_factorial` that uses `coder.ceval` to call the external C function `factorial`.

Use `coder.updateBuildInfo` with option `'addSourceFiles'` to add the source file `fact.c` to the build information. Use `coder.cinclude` to include the header file `fact.h` in the generated code.

```

function y = calc_factorial(x) %#codegen

    coder.cinclude('fact.h');
    coder.updateBuildInfo('addSourceFiles', 'fact.c');

    y = 0;
    y = coder.ceval('factorial', x);

```

- 4 Generate code for `calc_factorial` using the `codegen` command.

```

codegen -config:dll -launchreport calc_factorial -args 0

```

Add Link Object

Add a link object `LinkObj.lib` to the build information while generating code for a function `func`. For this example, you must have a link object `LinkObj.lib` saved in a local folder, for example, `c:\Link_Objects`.

Anywhere in the MATLAB code for `func`, add the following lines:

```

libPriority = '';
libPreCompiled = true;
libLinkOnly = true;
libName = 'LinkObj.lib';
libPath = 'c:\Link_Objects';

```

```
coder.updateBuildInfo('addLinkObjects', libName, libPath, ...  
    libPriority, libPreCompiled, libLinkOnly);
```

Generate a MEX function for `func` using the `codegen` command. Open the Code Generation Report.

```
codegen -launchreport func
```

Add Include Paths

Add an include path to the build information while generating code for a function, `adder`. Include a header file, `adder.h`, existing on the path.

When header files do not reside in the current folder, to include them, use this method:

- 1 Write a header file `mysum.h` that contains the declaration for a C function `mysum`.

```
double mysum(double, double);
```

Save it in a local folder, for example `c:\coder\myheaders`.

- 2 Write a C file `mysum.c` that contains the definition of the function `mysum`.

```
#include "mysum.h"  
  
double mysum(double x, double y)  
{  
    return(x+y);  
}
```

Save it in the current folder.

- 3 Write a MATLAB function `adder` that adds the path `c:\coder\myheaders` to the build information.

Use `coder.cinclude` to include the header file `mysum.h` in the generated code.

```
function y = adder(x1, x2) %#codegen  
    coder.updateBuildInfo('addIncludePaths', 'c:\coder\myheaders');  
    coder.updateBuildInfo('addSourceFiles', 'mysum.c');  
    %Include the source file containing C function definition  
    coder.cinclude('mysum.h');
```

```

y = 0;
if coder.target('MATLAB')
    % This line ensures that the function works in MATLAB
    y = x1 + x2;
else
    y = coder.ceval('mysum', x1, x2);
end
end
end

```

- 4 Generate code for adder using the codegen command.

```
codegen -config:lib -launchreport adder -args {0,0}
```

Input Arguments

options — Build options

character vector | string scalar

Build options, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, options specifies the relevant build options to be added to the project's build information.

Leading Argument	Values in options
'addCompileFlags'	Compiler options
'addLinkFlags'	Link options
'addDefines'	Preprocessor macro definitions

The function adds the options to the end of an option vector.

Example: `coder.updateBuildInfo('addCompileFlags','-Zi -Wall')`

group — Group name

character vector | string scalar

Name of user-defined group, specified as a character vector or string scalar. The value must be a compile-time constant.

The group option assigns a group name to the parameters in the second argument.

Leading Argument	Second Argument	Parameters Named by group
'addCompileFlags'	options	Compiler options
'addLinkFlags'	options	Link options
'addLinkObjects'	filename	Name of file containing linkable objects
'addNonBuildFiles'	filename	Name of nonbuild-related file
'addSourceFiles'	filename	Name of source file
'addSourcePaths'	path	Name of source file path

You can use `group` to:

- Document the use of specific parameters.
- Retrieve or apply multiple parameters together as one group.

filename — File name

character vector | string scalar

File name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `filename` specifies the relevant file to be added to the project's build information.

Leading Argument	File Specified by <code>filename</code>
'addLinkObjects'	File containing linkable objects
'addNonBuildFiles'	Nonbuild-related file
'addSourceFiles'	Source file

The function adds the file name to the end of a file name vector.

path — Full path name

character vector | string scalar

Full path name, specified as a character vector or string scalar. The value must be a compile-time constant.

Depending on the leading argument, `path` specifies the relevant path name to be added to the project's build information.

Leading Argument	Path Specified by <code>path</code>
'addLinkObjects'	Path to linkable objects
'addNonBuildFiles'	Path to nonbuild-related files
'addSourceFiles', 'addSourcePaths'	Path to source files

The function adds the path to the end of a path name vector.

priority — Relative priority of link object

''

Priority of link objects.

This feature applies only when several link objects are added. Currently, only a single link object file can be added for every `coder.updateBuildInfo` statement. Therefore, this feature is not available for use.

To use the succeeding arguments, include '' as a placeholder argument.

precompiled — Variable indicating if link objects are precompiled

logical value

Variable indicating if the link objects are precompiled, specified as a logical value. The value must be a compile-time constant.

If the link object has been prebuilt for faster compiling and linking and exists in a specified location, specify `true`. Otherwise, the MATLAB Coder build process creates the link object in the build folder.

If `linkonly` is set to `true`, this argument is ignored.

Data Types: `logical`

linkonly — Variable indicating if objects must be used for linking only

logical value

Variable indicating if objects must be used for linking only, specified as a logical value. The value must be a compile-time constant.

If you want that the MATLAB Coder build process must not build or generate rules in the makefile for building the specified link object, specify `true`. Instead, when linking

the final executable, the process should just include the object. Otherwise, rules for building the link object are added to the makefile.

You can use this argument to incorporate link objects for which source files are not available.

If `linkonly` is set to `true`, the value of `precompiled` is ignored.

Data Types: `logical`

Introduced in R2013b

coder.varsize

Package: coder

Declare variable-size array

Syntax

```
coder.varsize('var1', 'var2', ...)
coder.varsize('var1', 'var2', ..., ubound)
coder.varsize('var1', 'var2', ..., ubound, dims)
coder.varsize('var1', 'var2', ..., [], dims)
```

Description

`coder.varsize('var1', 'var2', ...)` declares one or more variables as variable-size data, allowing subsequent assignments to extend their size. Each `'varn'` is the name of a variable or structure field enclosed in quotes. If the structure field belongs to an array of structures, use colon (`:`) as the index expression to make the field variable-size for all elements of the array. For example, the expression `coder.varsize('data(:).A')` declares that the field `A` inside each element of `data` is variable sized.

`coder.varsize('var1', 'var2', ..., ubound)` declares one or more variables as variable-size data with an explicit upper bound specified in `ubound`. The argument `ubound` must be a constant, integer-valued vector of upper bound sizes for every dimension of each `'varn'`. If you specify more than one `'varn'`, each variable must have the same number of dimensions.

`coder.varsize('var1', 'var2', ..., ubound, dims)` declares one or more variables as variable size with an explicit upper bound and a mix of fixed and varying dimensions specified in `dims`. The argument `dims` is a logical vector, or double vector containing only zeros and ones. Dimensions that correspond to zeros or `false` in `dims` have fixed size; dimensions that correspond to ones or `true` vary in size. If you specify more than one variable, each fixed dimension must have the same value across all `'varn'`.

`coder.varsize('var1', 'var2', ..., [], dims)` declares one or more variables as variable size with a mix of fixed and varying dimensions. The empty vector `[]` means that you do not specify an explicit upper bound.

When you do *not* specify *ubound*, the upper bound is computed for each `'varn'` in generated code.

When you do *not* specify *dims*, dimensions are assumed to be variable except the singleton ones. A singleton dimension is a dimension for which `size(A, dim) = 1`.

You must add the `coder.varsize` declaration before each `'varn'` is used (read). You can add the declaration before the first assignment to each `'varn'`. However, for a cell array element, the `coder.varsize` declaration must follow the first assignment to the element. For example:

```
...
x = cell(3, 3);
x{1} = [1 2];
coder.varsize('x{1}');
...
```

You cannot use `coder.varsize` outside the MATLAB code intended for code generation. For example, the following code does not declare the variable, `var`, as variable-size data:

```
coder.varsize('var',10);
codegen -config:lib MyFile -args var
```

Instead, include the `coder.varsize` statement inside `MyFile` to declare `var` as variable-size data.

Examples

Develop a Simple Stack That Varies in Size up to 32 Elements as You Push and Pop Data at Run Time.

Write primary function `test_stack` to issue commands for pushing data on and popping data from a stack.

```
function test_stack %#codegen
    % The directive %#codegen indicates that the function
```

```

% is intended for code generation
stack('init', 32);
for i = 1 : 20
    stack('push', i);
end
for i = 1 : 10
    value = stack('pop');
    % Display popped value
    value
end
end

```

Write local function `stack` to execute the push and pop commands.

```

function y = stack(command, varargin)
    persistent data;
    if isempty(data)
        data = ones(1,0);
    end
    y = 0;
    switch (command)
    case {'init'}
        coder.varsize('data', [1, varargin{1}], [0 1]);
        data = ones(1,0);
    case {'pop'}
        y = data(1);
        data = data(2:size(data, 2));
    case {'push'}
        data = [varargin{1}, data];
    otherwise
        assert(false, ['Wrong command: ', command]);
    end
end

```

The variable `data` is the stack. The statement `coder.varsize('data', [1, varargin{1}], [0 1])` declares that:

- `data` is a row vector
- Its first dimension has a fixed size
- Its second dimension can grow to an upper bound of 32

Generate a MEX function for `test_stack`:

```
codegen -config:mex test_stack
```

codegen generates a MEX function in the current folder.

Run `test_stack_mex` to get these results:

```
value =  
    20
```

```
value =  
    19
```

```
value =  
    18
```

```
value =  
    17
```

```
value =  
    16
```

```
value =  
    15
```

```
value =  
    14
```

```
value =  
    13
```

```
value =  
    12
```

```
value =  
    11
```

At run time, the number of items in the stack grows from zero to 20, and then shrinks to 10.

Declare a Variable-Size Structure Field.

Write a function `struct_example` that declares an array `data`, where each element is a structure that contains a variable-size field:

```

function y=struct_example() %#codegen

    d = struct('values', zeros(1,0), 'color', 0);
    data = repmat(d, [3 3]);
    coder.varsize('data(:).values');

    for i = 1:numel(data)
        data(i).color = rand-0.5;
        data(i).values = 1:i;
    end

    y = 0;
    for i = 1:numel(data)
        if data(i).color > 0
            y = y + sum(data(i).values);
        end;
    end
end

```

The statement `coder.varsize('data(:).values')` marks as variable-size the field values inside each element of the matrix `data`.

Generate a MEX function for `struct_example`:

```
codegen -config:mex struct_example
```

Run `struct_example`.

Each time you run `struct_example` you get a different answer because the function loads the array with random numbers.

Make a Cell Array Variable-Size

Write the function `make_varsz_cell` that defines a local cell array variable `c` whose elements have the same class, but different sizes. Use `coder.varsize` to indicate that `c` has variable-size.

```

function y = make_varsz_cell()
    c = {1 [2 3]};
    coder.varsize('c', [1 3], [0 1]);
    y = c;
end

```

Generate a C static library.

```
codegen -config:lib make_varsz_cell -report
```

In the report, view the MATLAB variables.

`c` is a 1x:3 homogeneous cell array whose elements are 1x:2 double.

Make the Elements of a Cell Array Variable-Size

Write the function `mycell` that defines a local cell array variable `c`. Use `coder.versize` to make the elements of `c` variable-size.

```
function y = mycell()
c = {1 2 3};
coder.versize('c{:}', [1 5], [0 1]);
y = c;
end
```

Generate a C static library.

```
codegen -config:lib mycell -report
```

In the report, view the MATLAB variables.

The elements of `c` are 1-by-:5 arrays of doubles.

Limitations

- If you use the cell function to create a cell array, you cannot use `coder.versize` with that cell array.
- If you use `coder.versize` with a cell array element, the `coder.versize` declaration must follow the first assignment to the element. For example:

```
...
x = cell(3, 3);
x{1} = [1 2];
coder.versize('x{1}');
...
```

- You cannot use `coder.varsize` with global variables.
- You cannot use `coder.varsize` with MATLAB class properties.
- You cannot use `coder.varsize` with string scalars.

Tips

- If you use input variables (or result of a computation using input variables) to specify the size of an array, it is declared as variable-size in the generated code. Do not use `coder.varsize` on the array again, unless you also want to specify an upper bound for its size.
- Using `coder.varsize` on an array without explicit upper bounds causes dynamic memory allocation of the array. This dynamic memory allocation can reduce the speed of generated code. To avoid dynamic memory allocation, use the syntax `coder.varsize('var1', 'var2', ..., ubound)` to specify an upper bound for the array size (if you know it in advance).
- A cell array can be variable size only if it is homogeneous. When you use `coder.varsize` with a cell array, the code generator tries to make the cell array homogeneous. It tries to find a class and size that apply to all elements of the cell array. For example, if the first element is double and the second element is 1x2 double, all elements can be represented as 1x2 double. If the code generator cannot find a common class and size, code generation fails. For example, suppose that the first element of a cell array is char and the second element is double. The code generator cannot find a class that can represent both elements.

Introduced in R2011a

coder.wref

Pass argument as write-only reference

Syntax

```
coder.wref(arg)
```

Description

`coder.wref(arg)` passes `arg` by reference to an external C/C++ function that you call by using `coder.ceval`. Use `coder.wref` inside a `coder.ceval` call only. The code generator assumes that the variable that you pass in `coder.wref` is write-only. The C/C++ function must write to this variable. If the variable is a vector or an array, the C/C++ function must write to every element of the variable. If the MATLAB code initializes `arg` before the `coder.ceval` call, the code generator might remove the initial values. To avoid unpredictable results, the C/C++ function must not read the variable before writing to it.

Use a separate `coder.wref` construct for each argument that you pass by reference to the function.

Examples

Pass Array by Reference as Write-Only

Pass a variable by reference to a C function that initializes an array.

Suppose that you have a C function `init_array`.

```
void init_array(double* array, int numel) {  
    for(int i = 0; i < numel; i++) {  
        array[i] = 42;  
    }  
}
```

The C function prototype defines `array` as a pointer because it is passed by reference.

Call the C function `init_array` to initialize all elements of `y` to 42.

```
...
Y = zeros(5, 10);
coder.ceval('init_array', coder.wref(Y), int32(numel(Y)));
...
```

Pass Multiple Arguments as a Write-Only Reference

```
...
U = zeros(5, 10);
V = zeros(5, 10);
coder.ceval('my_fcn', coder.wref(U), int32(numel(U)), coder.wref(V), int32(numel(V)));
...
```

Pass Class Property as a Write-Only Reference

```
...
x = myClass;
x.prop = 1;
coder.ceval('foo', coder.wref(x.prop));
...
```

Pass Structure as a Write-Only Reference

To indicate that the structure type is defined in a C header file, use `coder.cstructname`.

Suppose that you have the C function `init_struct`.

```
double init_struct(struct MyStruct *my_struct)
{
    my_struct->f1 = 1;
    my_struct->f2 = 2;
}
```

Suppose that a C header file, `MyStruct.h`, defines a structure type named `MyStruct`.

```
...
typedef struct MyStruct
```

```
{
    double f1;
    double f2;

} MyStruct;

double init_struct(struct MyStruct *my_struct);

...
```

In your MATLAB function, pass a structure as a write-only reference to `init_struct`. To indicate that the structure type for `s` has the name `MyStruct` that is defined in a C header file `MyStruct.h`, use `coder.cstructname`.

```
...
s = struct('f1', 1, 'f2', 2);
coder.cstructname(s, 'MyStruct', 'extern', 'HeaderFile', 'MyStruct.h');
coder.ceval('init_struct', coder.wref(s));
...
```

Pass Structure Field by Reference

```
...
s = struct('s1', struct('a', [0 1]));
coder.ceval('foo', coder.wref(s.s1.a));
...
```

Input Arguments

arg — Argument to pass by reference

scalar variable | array | element of an array | structure | structure field | object property

Argument to pass by reference to an external C/C++ function. The argument cannot be a class, a System object, a cell array, or an index into a cell array.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | struct

Complex Number Support: Yes

Limitations

- You cannot pass these data types by reference:
 - Class or System object
 - Cell array or index into a cell array
- If a property has a get method, a set method, or validators, or is a System object property with certain attributes, then you cannot pass the property by reference to an external function. See “Passing By Reference Not Supported for Some Properties”.

Tips

- When you pass a structure by reference to an external C/C++ function, use `coder.cstructname` to provide the name of a C structure type that is defined in a C header file.
- In MATLAB, `coder.wref` results in an error. To parameterize your MATLAB code so that it can run in MATLAB and in generated code, use `coder.target`.
- You can use `coder.opaque` to declare variables that you pass to and from an external C/C++ function.

Introduced in R2011a

createInputDataset

Generate dataset object for root-level Inport blocks in model

Syntax

```
[inports_dataset] = createInputDataset(model)
```

Description

`[inports_dataset] = createInputDataset(model)` generates a `Simulink.SimulationData.Dataset` object from the root-level Inport blocks in a model. Signals in the generated dataset have the properties of the root inports and the corresponding ground values at model start and stop times. You can create `timetable` or `timeseries` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

Examples

Generate and Populate Dataset for Root-Level Inport Blocks

Create a dataset with elements for the four root-level Inport blocks in a model. Use that dataset as a basis for creating a dataset to load signal data into the model.

Open the model. The `In1` block outputs a double, `In2` and `In3` each output a nonvirtual bus, and `In4` outputs an `int16`.

```
mdl = 'ex_dataset_for_inports';  
open_system(mdl)
```

Create a Dataset object for the root-level Inport blocks.

```
ds = createInputDataset mdl)
```

```
Simulink.SimulationData.Dataset '' with 4 elements
```

		Name	BlockPath
1	[1x1 timeseries]	In1	''
2	[1x1 struct]	In2	''
3	[1x1 struct]	In3	''
4	[1x1 timeseries]	In4	''

- Use braces { } to access, modify, or add elements using index.

Replace the placeholder value for the first signal in the Dataset with actual signal values that you want to load into the model.

```
ds{1} = ds{1}.delsample('Index',[1,2]);
ds{1} = ds{1}.addsample('time',[1 3 3 10]','data',[1 1 5 5]);
```

Examine the In2 signal.

```
ds{2}
```

```
ans =  
  
    struct with fields:  
  
        a: [1×1 timeseries]  
        b: [1×1 timeseries]
```

For In2, create data for bus elements a and b.

```
ds{2}.a = ds{2}.a.delsample('Index',[1,2]);  
ds{2}.a = addsample(ds{2}.a,'time',[1:10]','data',[1:10]');  
ds{2}.b = timeseries((1:10)',0.1:.1:1,'Name','sig2_b');
```

For In3, specify data for element a of the bus, and use ground values for element b.

```
ds{3}.a = timeseries((1:10)',0.1:.1:1,'Name','sig3_a');
```

Plot ds. For more information, see the `Simulink.SimulationData.Dataset.plot` documentation.

```
plot(ds)
```

Set the **Input** configuration parameter to ds.

```
set_param mdl, 'LoadExternalInput', 'on';  
set_param mdl, 'ExternalInput', 'ds';
```

Tip Alternatively, you can use the Root Inport Mapper tool to set the **Input** parameter. For details, see “Map Root Inport Signal Data”.

Run the simulation. The Inport blocks use the signal data specified in ds or ground values for elements that do not have specified signal data.

```
sim mdl)
```

Input Arguments

model — Model for which to generate dataset for root-level Inport blocks
character vector | model handle

Model for which to generate a dataset with an element for each root-level Inport block, specified as a character vector or model handle.

Output Arguments

inports_dataset — Dataset with an element for each root-level Inport block

a `Simulink.SimulationData.Dataset` object

Dataset with an element for each root-level Inport block, returned as a `Simulink.SimulationData.Dataset` object.

Introduced in R2017a

getHardwareImplementation

Class: `coder.BuildConfig`

Package: `coder`

Get handle of copy of hardware implementation object

Syntax

```
hw = bldcfg.getHardwareImplementation()
```

Description

`hw = bldcfg.getHardwareImplementation()` returns the handle of a copy of the hardware implementation object.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

hw

Handle of copy of hardware implementation object.

See Also

getStdLibInfo

Class: coder.BuildConfig

Package: coder

Get standard library information

Syntax

```
[linkLibPath,linkLibExt,execLibExt,libPrefix]=  
bldcfg.getStdLibInfo()
```

Description

[linkLibPath,linkLibExt,execLibExt,libPrefix]=
bldcfg.getStdLibInfo() returns character vectors representing the:

- Standard MATLAB architecture-specific library path
- Platform-specific library file extension for use at link time
- Platform-specific library file extension for use at run time
- Standard architecture-specific library name prefix

Input Arguments

bldcfg

coder.BuildConfig object.

Output Arguments

linkLibPath

Standard MATLAB architecture-specific library path specified as a character vector. The character vector can be empty.

linkLibExt

Platform-specific library file extension for use at link time, specified as a character vector. The value is one of `'.lib'`, `'.dylib'`, `'.so'`, `''`.

execLibExt

Platform-specific library file extension for use at run time, specified as a character vector. The value is one of `'.dll'`, `'.dylib'`, `'.so'`, `''`.

linkPrefix

Standard architecture-specific library name prefix, specified as a character vector. The character vector can be empty.

getTargetLang

Class: coder.BuildConfig

Package: coder

Get target code generation language

Syntax

```
lang = bldcfg.getTargetLang()
```

Description

`lang = bldcfg.getTargetLang()` returns a character vector containing the target code generation language.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

lang

A character vector containing the target code generation language. The value is 'C' or 'C++'.

getToolchainInfo

Class: `coder.BuildConfig`

Package: `coder`

Returns handle of copy of toolchain information object

Syntax

```
tc = bldcfg.getToolchainInfo()
```

Description

`tc = bldcfg.getToolchainInfo()` returns a handle of a copy of the toolchain information object.

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

tc

Handle of copy of toolchain information object.

See Also

isCodeGenTarget

Class: coder.BuildConfig

Package: coder

Determine if build configuration represents specified target

Syntax

```
tf = bldcfg.isCodeGenTarget(target)
```

Description

`tf = bldcfg.isCodeGenTarget(target)` returns true (1) if the code generation target of the current build configuration represents the code generation target specified by `target`. Otherwise, it returns false (0).

Input Arguments

bldcfg

coder.BuildConfig object.

target

Code generation target specified as a character vector or cell array of character vectors.

Specify	For code generation target
'rtw'	C/C++ dynamic Library, C/C++ static library, or C/C++ executable
'sfun'	S-function (Simulation)
'mex'	MEX-function

Specify `target` as a cell array of character vectors to test if the code generation target of the build configuration represents one of the targets specified in the cell array.

For example:

```
...  
mytarget = {'sfun','mex'};  
tf = bldcfg.isCodeGenTarget(mytarget);  
...
```

tests whether the build context represents an S-function target or a MEX-function target.

Output Arguments

tf

The value is true (1) if the code generation target of the build configuration represents the code generation target specified by `target`. Otherwise, the value is false (0).

See Also

`coder.target`

isMatlabHostTarget

Class: coder.BuildConfig

Package: coder

Determine if hardware implementation object target is MATLAB host computer

Syntax

```
tf = bldcfg.isMatlabHostTarget()
```

Description

`tf = bldcfg.isMatlabHostTarget()` returns true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, it returns false (0).

Input Arguments

bldcfg

`coder.BuildConfig` object.

Output Arguments

tf

Value is true (1) if the current hardware implementation object targets the MATLAB host computer. Otherwise, the value is false (0).

See Also

coder.ExternalDependency.getDescriptiveName

Class: coder.ExternalDependency

Package: coder

Return descriptive name for external dependency

Syntax

```
extname = coder.ExternalDependency.getDescriptiveName (bldcfg)
```

Description

`extname = coder.ExternalDependency.getDescriptiveName (bldcfg)` returns the name that you want to associate with an “external dependency” on page 2-171. The code generator uses the external dependency name for error messages.

Input Arguments

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-171

You can use this information when you want to return different names based on the build context.

Output Arguments

extname

External dependency name returned as a character vector.

Examples

Return external dependency name

Define a method that always returns the same name.

```
function myextname = getDescriptiveName(~)
    myextname = 'MyLibrary'
end
```

Return external library name based on the code generation target

Define a method that uses the build context to determine the name.

```
function myextname = getDescriptiveName(context)
    if context.isMatlabHostTarget()
        myextname = 'MyLibrary_MatlabHost';
    else
        myextname = 'MyLibrary_Local';
    end
end
```

Definitions

external dependency

External code interface represented by a class derived from a `coder.ExternalDependency` class. The external code can be a library, object files, or C/C++ source.

build context

Information used by the build process including:

- Target language
- Code generation target

- Target hardware
- Build toolchain

coder.ExternalDependency.isSupportedContext

Class: coder.ExternalDependency

Package: coder

Determine if build context supports external dependency

Syntax

```
tf = coder.ExternalDependency.isSupportedContext(bldcfg)
```

Description

`tf = coder.ExternalDependency.isSupportedContext(bldcfg)` returns true (1) if you can use the “external dependency” on page 2-174 in the current “build context” on page 2-174 . You must provide this method in the class definition for a class that derives from `coder.ExternalDependency`.

If you cannot use the “external dependency” on page 2-174 in the current “build context” on page 2-174, display an error message and stop code generation. The error message must describe why you cannot use the external dependency in this build context. If the method returns false (0), the code generator uses a default error message. The default error message uses the name returned by the `getDescriptiveName` method of the `coder.ExternalDependency` class.

Use `coder.BuildConfig` methods to determine if you can use the external dependency in the current build context.

Input Arguments

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-174.

Output Arguments

tf

Value is true (1) if the build context supports the external dependency.

Examples

Report error when build context does not support external library

This method returns true(1) if the code generation target is a MATLAB host target. Otherwise, the method reports an error and stops code generation.

Write `isSupportedContext` method.

```
function tf = isSupportedContext(ctx)
    if ctx.isMatlabHostTarget()
        tf = true;
    else
        error('adder library not available for this target');
    end
end
```

Definitions

external dependency

External code interface represented by a class derived from `coder.ExternalDependency` class. The external code can be a library, object file, or C/C++ source.

build context

Information used by the build process including:

- Target language

- Code generation target
- Target hardware
- Build toolchain

coder.ExternalDependency.updateBuildInfo

Class: coder.ExternalDependency

Package: coder

Update build information

Syntax

```
coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)
```

Description

`coder.ExternalDependency.updateBuildInfo(buildInfo, bldcfg)` updates the build information object whose handle is `buildInfo`. After code generation, the build information object has standard information. Use this method to provide additional information required to link to external code. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-177.

You must implement this method in a subclass of `coder.ExternalDependency`.

Input Arguments

buildInfo

Handle of build information object.

bldcfg

`coder.BuildConfig` object. Use `coder.BuildConfig` methods to get information about the “build context” on page 2-177.

Limitations

- The build information method `AddIncludeFiles` has no effect in a `coder.ExternalDependency.updateBuildInfo` method.

Definitions

build context

Information used by the build process including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

See Also

convertToSLDataset

Convert contents of MAT-file to Simulink.SimulationData.Dataset object

Syntax

```
success=convertToSLDataset(source,destination)
success=convertToSLDataset(source,destination,datasetname)
```

Description

`success=convertToSLDataset(source,destination)` converts the contents of a MAT-file (`source`) to a destination MAT-file (`destination`).

`success=convertToSLDataset(source,destination,datasetname)` names the dataset `datasetname`.

When converting structure signal data, the function names the signal using the value contained in the label field of the structure signal field, such as:
`mySignal.signal(1).label`.

This function ignores time expressions in `source`.

Examples

Save Signals to Dataset in file2.mat

Save signals from `file1.mat` to a dataset named `file1` in `file2.mat`.

```
success=convertToSLDataset('file1.mat','file2.mat')
```

Save Signals to Dataset Named myDataset in file2.mat

Save signals from file1.mat to a dataset named myDataset in file2.mat.

```
success=convertToSLDataset('file1.mat','file2.mat','myDataset')
```

Input Arguments

source — MAT-file

character vector

MAT-file that contains Simulink inputs.

destination — MAT-file

character vector

MAT-file to contain Simulink.SimulationData.Dataset converted from contents of source.

datasetname — Data set name

character vector

Data set name for new Simulink.SimulationData.Dataset object.

Output Arguments

success — Outcome of conversion

binary

Outcome of conversion, specified as binary:

- 1
Conversion is successful.
- 0
Conversion is not successful.

See Also

Introduced in R2016a

copy

Copy a configuration set

Syntax

```
copyCs = copy(cs)
```

Description

`copyCs = copy(cs)` returns a copy of a configuration set.

Examples

Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.

```
attachConfigSet ('vdp', develConfig);
```

Input Arguments

cs — Configuration set

`ConfigSet` object

Configuration set object to copy, specified as a `ConfigSet` object.

Output Arguments

copyCs — Copy of configuration set

`ConfigSet` object

A copy of the configuration set, specified as a `ConfigSet` object.

“Manage a Configuration Set”

Introduced before R2006a

createCategory

Create category of Simulink Project labels

Syntax

```
createCategory(proj, categoryName)
createCategory(proj, categoryName, dataType)
createCategory(proj, categoryName, dataType, single-valued)
```

Description

`createCategory(proj, categoryName)` creates a new category of labels `categoryName` in the project `proj`.

`createCategory(proj, categoryName, dataType)` specifies the class of data to store in labels of the new category.

`createCategory(proj, categoryName, dataType, single-valued)` specifies a single-valued category, where you can attach only one label from the category to a file. If you do not specify `single-valued`, then you can attach multiple labels from the category to a file.

Examples

Create a New Category of Labels for File Ownership

Create a new category of labels for file ownership, and attach a new label and label data to a file.

Open the `airframe` project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a new category of labels, called `Engineers`, to denote file ownership in a project. These labels have the `char` datatype for attaching character vector data.

```
createCategory(proj, 'Engineers', 'char');
```

Use `findCategory` to get the new category.

```
engineersCategory = findCategory(proj, 'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory, 'Tom');  
createLabel(engineersCategory, 'Dick')  
createLabel(engineersCategory, 'Harry')
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')  
addLabel(myfile, 'Engineers', 'Tom');
```

Get the label and add data.

```
label = findLabel(file, 'Engineers', 'Tom');  
label.Data = 'Maintenance responsibility';  
disp(label)
```

Label with properties:

```
File: [1x80 char]  
Data: 'Maintenance responsibility'  
DataType: 'char'  
Name: 'Tom'  
CategoryName: 'Engineers'
```

Create a New Category of Labels with Datatype Double

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj, 'Coverage', 'double')
```

```
category =
    Category with properties:
        Name: 'Coverage'
        DataType: 'double'
        LabelDefinitions: []
```

Find out what you can do with the new category.

```
category = findCategory(proj, 'Coverage');
methods(category)
```

Methods for class slproject.Category:

```
findLabel  removeLabel  createLabel
```

Create a Single-Valued Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = simulinkproject;
```

Create a category of labels for file ownership, and specify single-valued to restrict only one label in the category per file.

```
createCategory(proj, 'Engineers', 'char', 'single-valued');
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

categoryName — Name of category

character vector

Name of the category of labels to create, specified as a character vector.

dataType — Class of data to store in labels

character vector

The class of data to store in labels in the new category, specified as a character vector.

single-valued — Single-valued category

character vector

Single-valued category, specified as a character vector. Single-valued means you can attach only one label from the category to a file. If you do not specify single-valued, then you can attach multiple labels from the category to a file.

Tips

After you create a new category, you can create labels in the new category. See `createLabel`.

See Also

Functions

`createLabel` | `simulinkproject`

Introduced in R2013a

createLabel

Define Simulink Project label

Syntax

```
createLabel(category, newLabelName)
```

Description

`createLabel(category, newLabelName)` creates a new label, `newLabelName`, in a category. Use this syntax if you previously got a category by accessing a `Categories` property, e.g., using a command like `proj.Categories(1)`.

Use `addLabel` instead to create and attach a new label in an existing category using a single step.

Use `createCategory` first if you want to make a new category of labels.

Examples

Create a New Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
```

```
cat =
```

```
Category with properties:
```

```
        Name: 'Classification'  
        DataType: 'none'  
LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Define a new label in the category.

```
createLabel(cat, 'Future');
```

Create a New Category of Labels for File Ownership

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create creates a new category of labels called Engineers which can be used to denote file ownership in a project. These labels have the char datatype for attaching character vector data.

```
createCategory(proj, 'Engineers', 'char');
```

Use findCategory to get the new category.

```
engineersCategory = findCategory(proj, 'Engineers');
```

Create labels in the new category.

```
createLabel(engineersCategory, 'Tom');  
createLabel(engineersCategory, 'Dick');  
createLabel(engineersCategory, 'Harry');
```

Attach one of the new labels to a file in the project.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')  
addLabel(myfile, 'Engineers', 'Tom');
```

Get the label and add data.

```
label = findLabel(myfile, 'Engineers', 'Tom');  
label.Data = 'Maintenance responsibility';  
disp(label)
```

Label with properties:

```
File: [1x80 char]
Data: 'Maintenance responsibility'
DataType: 'char'
Name: 'Tom'
CategoryName: 'Engineers'
```

Input Arguments

category — Category

category object

Category for the new label, specified as a category object. Get the category by accessing a `Categories` property, e.g. with a command like `proj.Categories(1)`, or use `findCategory`. To create a new category, use `createCategory`.

newLabelName — The name of the new label to define

character vector

The name of the new label to define, specified as a character vector.

See Also

Functions

`addLabel` | `createCategory`

Introduced in R2013a

addStartupFile

Add startup file to project

Syntax

```
addStartupFile(proj, file)
```

Description

`addStartupFile(proj, file)` adds a startup file to the project `proj`. Startup files automatically run (.m and .p files), load (.mat files), or open (Simulink models) when you open the project.

Examples

Add a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')  
    new_system('new_model');  
    save_system('new_model', filepath)
```

Add the new model to the project.

```
projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file

character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

See Also

`simulinkproject`

Introduced in R2017b

addShutdownFile

Add shutdown file to project

Syntax

```
addShutdownFile(proj, file)
```

Description

`addShutdownFile(proj, file)` adds a shutdown file to the project `proj`. When you close the project, it runs the shutdown file automatically. Use the shutdown list to specify executable MATLAB code to run as the project shuts down.

Examples

Add a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file

character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'utilities/myscript.m'

See Also

`simulinkproject`

Introduced in R2017b

removeStartupFile

Remove startup file from project startup list

Syntax

```
removeStartupFile(proj, file)
```

Description

`removeStartupFile(proj, file)` removes the startup file from the startup list in the project `proj`.

Examples

Remove a Startup File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Create a new file.

```
filepath = fullfile(proj.RootFolder, 'new_model.slx')  
new_system('new_model');  
save_system('new_model', filepath)
```

Add the new model to the project.

```
projectFile = addFile(proj, filepath)
```

Automatically open the model when the project opens, by making it a startup file.

```
addStartupFile(proj, filepath);
```

Remove the startup file.

```
removeStartupFile(proj, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file

character vector

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

See Also

`simulinkproject`

Introduced in R2017b

removeShutdownFile

Remove shutdown file from project shutdown list

Syntax

```
removeShutdownFile(proj, file)
```

Description

`removeShutdownFile(proj, file)` removes the shutdown file from the shutdown list in the project `proj`.

Examples

Remove a Shutdown File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe  
proj = simulinkproject;
```

Specify executable MATLAB code to run as the project shuts down.

```
filepath = fullfile('utilities', 'rebuild_s_functions.m');
```

Automatically run the file when the project closes, by making it a shutdown file.

```
addShutdownFile(project, filepath);
```

Remove the shutdown file.

```
removeShutdownFile(project, filepath);
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file

character vector

Path of the MATLAB file to add relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'utilities/myscript.m'

See Also

`simulinkproject`

Introduced in R2017b

delete_block

Delete blocks from Simulink system

Syntax

```
delete_block(blockArg)
```

Description

`delete_block(blockArg)` deletes the specified blocks from a system. Open the system before you delete blocks.

Examples

Delete Block Using Full Path Name

Delete the block Mu from the vdp system.

```
open_system('vdp')  
delete_block('vdp/Mu')
```

Delete Block Using Block Handle

Delete the block Out2 from the vdp system using the block handle.

Open the vdp system.

```
open_system('vdp')
```

Interactively select the block Out1. Get the block's handle and assign it to the variable `Out1_handle`. Delete the block using the handle.

```
Out1_handle = get_param(gcb, 'Handle');  
delete_block(Out1_handle)
```

Delete Blocks Using Vector of Handles

Delete three blocks from the vdp system.

Open the vdp system. Add three blocks and assign their handles to variables.

```
open_system('vdp')  
Constant_handle = add_block('built-in/Constant', 'vdp/MyConstant');  
Gain_handle = add_block('built-in/Gain', 'vdp/MyGain');  
Outport_handle = add_block('built-in/Outport', 'vdp/MyOutport');
```

Delete the blocks you added using a vector of handles.

```
delete_block([Constant_handle Gain_handle Outport_handle])
```

Input Arguments

blockArg — Blocks to delete

full path name | handle | vector of handles | 1-D cell array of handles or block path names

Blocks to delete, specified as the full block path name, a handle, a vector of handles, or a 1-D cell array of handles or block path names.

Example: 'vdp/Mu'

Example: [handle1 handle2]

Example: {'vdp/Mu' 'vdp/Out1' 'vdp/Out2'}

See Also

`add_block`

Introduced before R2006a

delete_line

Delete line from Simulink model

Syntax

```
delete_line(sys,out,in)
delete_line(sys,point)
delete_line(lineHandle)
```

Description

`delete_line(sys,out,in)` deletes the line from the model or subsystem `sys` that connects the output port `out` to the input port `in`.

`delete_line(sys,point)` deletes the line that includes the point `point`.

`delete_line(lineHandle)` deletes the line using the line handle.

Examples

Remove Line Using Block Port Names

For the model `vdp`, remove the line connecting the Product block with the Gain block.

```
load_system('vdp');
delete_line('vdp','Product/1','Mu/1');
```

Remove Line Using Line Handle

For the model `vdp`, remove a line using the line handle. You can get the line handle using different techniques.

```
load_system('vdp');
h = get_param('vdp/Mu', 'LineHandles');
delete_line(h.Outputport(1));
```

Get a line handle when you create the line. Delete the line using that handle.

```
a = add_line('vdp', 'Mu/1', 'Sum/2');
delete_line(a)
```

Delete a Line Using a Point

You can use a point on the line to delete the whole line.

Find the port coordinates for the block Mu in the model vdp.

```
open_system('vdp');
mu = get_param('vdp/Mu', 'PortConnectivity');
mu.Position
```

```
ans =
    190    150
```

```
ans =
    225    150
```

The line that connects the Mu block to the Sum block starts at the output port, which is at (225,150). You can use any point to the right of that point along the same x -axis to delete the line.

```
delete_line('vdp', [230,150]);
```

Delete Segments of Branched Lines

Use `delete_line` with branched lines to remove the segment for any connection.

Open the model vdp.

```
open_system('vdp');
```

Delete the line from x1 to the Out1 block. This command deletes only the segment of the line that connects the branch to the specified block.

```
delete_line('vdp','x1/1','Out1/1')
```

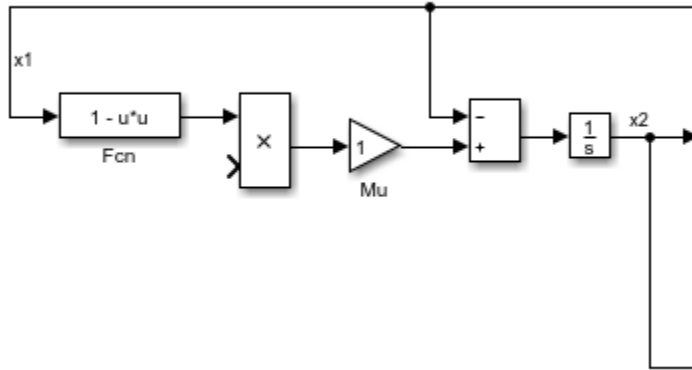

Delete the line segment from x2 to the Mux.

```
delete_line('vdp','x2/1','Mux/2')
```

Delete the line segment from x2 to the Product block.

```
delete_line('vdp','x2/1','Product/2')
```

Input Arguments

sys — Model or subsystem to delete line from
character vector

Model or subsystem to delete the line from, specified as a character vector.

Example: 'vdp', 'f14/Controller'

out — Block output port to delete line from
block/port name or number character vector | port handle

Block output port to delete line from, specified as either:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to delete the line from.

Use 'PortHandles' with `get_param` to get the handles.

Example: 'Mu/1', 'Subsystem/2'

in — Block input port to delete line from
block/port name or number character vector | port handle

Block input port to delete line from, specified as either:

- The block name, a slash, and the port name or number. The port name on:
 - An enabled subsystem is `Enable`.
 - A triggered subsystem is `Trigger`.
 - If `Action` and `Switch Case Action` subsystems is `Action`.
- The port handle that you want to delete the line from.

Use `'PortHandles'` with `get_param` to get handles.

Example: `'Mu/1'`, `'Subsystem/2'`

point — Point on the line you want to delete

1-by-2 matrix

Point that falls on the line you want to delete, specified as a 1-by-2 matrix.

Example: `[150 200]`

lineHandle — Handle of the line you want to delete

handle

Handle of the line you want to delete. You can get the line handle by using `get_param` with the `'LineHandles'` option or by assigning the line to a handle when you create it programmatically.

See Also

`add_line` | `get_param`

Introduced before R2006a

delete_param

Delete system parameter added via `add_param` command

Syntax

```
delete_param('sys', 'parameter1', 'parameter2', ...)
```

Description

This command deletes parameters that were added to the system using the `add_param` command. The command displays an error message if a specified parameter was not added with the `add_param` command.

Examples

The following example

```
add_param('vdp', 'DemoName', 'VanDerPolEquation', 'EquationOrder', '2')
delete_param('vdp', 'DemoName')
```

adds the parameters `DemoName` and `EquationOrder` to the `vdp` system, then deletes `DemoName` from the system.

See Also

`add_param`

Introduced before R2006a

dependencies.fileDependencyAnalysis

Find model file dependencies

Syntax

```
files = dependencies.fileDependencyAnalysis('modelname')  
[files, missing] = dependencies.fileDependencyAnalysis('modelname')  
[files, missing, depfile] = dependencies.fileDependencyAnalysis('modelname')  
[files, missing, depfile, manifestfile] =  
dependencies.fileDependencyAnalysis('modelname', 'manifestfile')
```

Description

`files = dependencies.fileDependencyAnalysis('modelname')` returns `files`, a cell array of character vectors containing the full paths of all existing files referenced by the model `modelname`.

`[files, missing] = dependencies.fileDependencyAnalysis('modelname')` returns `files`, all existing files referenced by the model `modelname`, and any referenced files that cannot be found in *missing*.

`[files, missing, depfile] = dependencies.fileDependencyAnalysis('modelname')` also returns `depfile`, the full path of the user dependencies (.smd) file, if it exists, that stores the names of any files you manually added or excluded.

`[files, missing, depfile, manifestfile] = dependencies.fileDependencyAnalysis('modelname', 'manifestfile')` also creates a manifest file with the name and path specified in `manifestfile`.

Input Arguments

modelName

Character vector specifying the name of the model to analyze for dependencies.

manifestfile

(Optional) Character vector to specify the name of the manifest file to create. You can specify a full path or just a file name (in which case the file is created in the current folder). The function adds the suffix `.smf` to the user-specified name.

Output Arguments

files

A cell array of character vectors containing the full-paths of all existing files referenced by the model `modelName`. If there is only one dependency, the return is a character vector. If there are no dependencies, the return is empty.

Default: []

missing

A cell array of character vectors containing the names of any files that are referenced by the model `modelName`, but cannot be found.

Default: []

depfile

Character vector containing the full path of a user dependencies (`.smd`) file, if it exists, that stores the names of any files you manually added or excluded. Simulink uses the `.smd` file to remember your changes the next time you generate a manifest. See “Edit Manifests”.

Default: []

manifestfile

Character vector containing the name and path of the new manifest file.

Default: []

Examples

The following code analyses the model *mymodel* for file dependencies:

```
files = dependencies.fileDependencyAnalysis('mymodel')
```

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Tip

If you try dependency analysis on an example model, it returns an empty list of required files because the standard MathWorks installation includes all the files required for the example models.

Alternatives

If your file is in a Simulink project, use `listRequiredFiles` instead.

You can interactively run dependency analysis in Simulink Project. See “Run Dependency Analysis”.

To create a report to identify where dependencies arise, find required toolboxes, and for more control over dependency analysis options, you can interactively generate a manifest and report. See “Analyze Model Dependencies”.

To programmatically check which *toolboxes* are required, see `dependencies.toolboxDependencyAnalysis`.

See Also

`dependencies.toolboxDependencyAnalysis` | `listRequiredFiles`

Topics

“What Are Model Dependencies?”

Introduced in R2012a

dependencies.toolboxDependencyAnalysis

Find toolbox dependencies

Syntax

```
names = dependencies.toolboxDependencyAnalysis(files_in)
[names, folders] = dependencies.toolboxDependencyAnalysis(files_in)
```

Description

`names = dependencies.toolboxDependencyAnalysis(files_in)` returns `names`, a cell array of toolbox names required by the files in `files_in`.

`[names, folders] = dependencies.toolboxDependencyAnalysis(files_in)` returns toolbox names and also a cell array of the toolbox folders.

Tip In a Simulink project, you can interactively run dependency analysis. You can find the required toolboxes for the whole project or for selected files. You can see which products a new team member requires to use the project, or find which file is introducing a product dependency. See “Find Required Toolboxes”.

Input Arguments

files_in

Cell array of character vectors containing `.m`, `.mdl`, or `.slx` files on the MATLAB path. Simulink model names (without file extension) are also allowed.

Default: `[]`

Output Arguments

names

Cell array of toolbox names required by the files in `files_in`.

folders

(Optional) Cell-array of the required toolbox folders.

Examples

The following code reports the detectable required toolboxes for the model `vdp`:

```
files_in={'vdp'};
names = dependencies.toolboxDependencyAnalysis(files_in)

names =

    'MATLAB'    'Simulink'    'Simulink Coder'
```

To find all detectable toolbox dependencies of your model *and* the files it depends on:

- 1 Call `fileDependencyAnalysis` on your model.

For example:

```
files = dependencies.fileDependencyAnalysis('mymodel')

files =

    'C:\Work\foo.m'
    'C:\Work\mymodel.mdl'
```

- 2 Call `toolboxDependencyAnalysis` on the files output of step 1.

For example:

```
tbxes = dependencies.toolboxDependencyAnalysis(files)

tbxes =

[1x24 char]    'MATLAB'    'Simulink Coder'    'Simulink'
```

To view long product names examine the `tbxes` cell array as follows:

```
tbxes{:}

ans =
Image Processing Toolbox

ans =
MATLAB

ans =
Simulink Coder

ans =
Simulink
```

Tips

The function `dependencies.toolboxDependencyAnalysis` looks for toolbox dependencies of the files in `files_in` but does *not* analyze any subsequent dependencies. See “Examples” on page 2-211.

For command-line dependency analysis, the analysis uses the default settings for analysis scope to determine required toolboxes. For example, if you have code generation products, then the check **Find files required for code generation** is on by default and Simulink Coder is always reported as required. See “Required Toolboxes” in the manifest documentation for more examples of how your installed products and analysis scope settings can affect reported toolbox requirements.

Alternatives

In a Simulink project, you can interactively run dependency analysis and find the required toolboxes for the whole project or for selected files. See “Find Required Toolboxes”.

For a model that is not in a project, you can interactively generate a manifest and report. You can create a report to identify where dependencies arise, and control dependency analysis options. See “Analyze Model Dependencies”.

To programmatically check which *files* are required, see `dependencies.fileDependencyAnalysis`.

See Also

`dependencies.fileDependencyAnalysis`

Topics

“Dependency Analysis”

“What Is Dependency Analysis?”

Introduced in R2012a

detachConfigSet

Dissociate configuration set or configuration reference from model

Syntax

```
detachConfigSet(model, configObjName)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObjName`

The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`detachConfigSet` detaches the configuration set or configuration reference (configuration object) specified by `configObjName` from `model`. If no such configuration object is attached to the model, an error occurs.

Examples

The following example detaches the configuration object named `DevConfig` from the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
detachConfigSet(gcs, 'DevConfig');
```

“Manage a Configuration Reference”

Introduced in R2006a

removeLabel(was detachLabelFromFile)

REMOVE — RENAMED TO REMOVELABEL — consolidate with existing removeLabel page. was: Detach label from Simulink Project file

Syntax

```
removeLabel(file,labelDefinition)
```

Description

`removeLabel(file,labelDefinition)` detaches the specified label `labelDefinition` from the file. Before you can detach the label, you need to get the label from the file.Label property or by using `findLabel`.

Examples

Detach a Label from a File

Remove a label from a particular project file.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj,'models/AnalogControl.mdl')
```

```
myfile =
```

```
ProjectFile with properties:
```

```
Path: [1x86 char]  
Labels: [1x1 slproject.Label]
```

Get the Labels property of the file.

```
myfile.Labels
```

```
ans =
```

```
Label with properties:
```

```
File: 'C:\work\airframe\models\AnalogControl.mdl'  
Data: []  
DataType: 'none'  
Name: 'Design'  
CategoryName: 'Classification'
```

Attach the label 'To Review' to the file.

```
addLabel(myfile, 'Review', 'To Review')
```

Get the label you want to remove. Index into the Labels property to get the second label attached to the file.

```
labeltoremove = myfile.Labels(2)
```

```
labeltoremove =
```

```
Label with properties:
```

```
File: [1x86 char]  
Data: []  
DataType: 'char'  
Name: 'To Review'  
CategoryName: 'Review'
```

Remove the label from the file.

```
removeLabel(myfile, labeltoremove)  
myfile.Labels
```

```
ans =
```

```
Label with properties:
```

```
File: [1x86 char]  
Data: []  
DataType: 'none'
```

```
Name: 'Design'  
CategoryName: 'Classification'
```

Input Arguments

file — File to detach label from

file object

File to detach the label from, specified as a file object. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

labelDefinition — Label to detach

label definition object

Name of the label to detach, specified as a label definition object returned by the `file.Label` property or `findLabel`.

See Also

Functions

`addLabel` | `createLabel` | `findFile` | `findLabel` | `simulinkproject`

disableimplicitsignalresolution

Convert model to use only explicit signal resolution

Syntax

```
retVal = disableimplicitsignalresolution('model')  
retVal = disableimplicitsignalresolution('model', displayOnly)
```

Description

`retVal = disableimplicitsignalresolution('model')` inputs a model, reports all signals and states that implicitly resolve to signal objects, and converts the model to resolve only signals and states that explicitly require it. The report and any changes are limited to the model itself; they do not include blocks that are library links.

Before executing this function, ensure that all relevant Simulink data objects are defined in the base workspace or a data dictionary to which the model is linked. The function ignores any data objects that are defined elsewhere.

The function scans `model`, returns a structure of handles to signals and states that resolve implicitly to signal objects, and performs the following operations on `model`:

- Search the model for all output ports and block states that resolve to Simulink signal objects.
- Modify these ports and blocks to enforce signal object resolution in the future.
- Set the model's `SignalResolutionControl` parameter to 'UseLocalSettings' (GUI: **Explicit Only**).

If `SignalResolutionControl` is already set to 'UseLocalSettings' or to 'None', the function takes no action and returns a warning.

- If any Stateflow output data resolves to a Simulink signal object:
 - Turn off hierarchical scoping of signal objects from within the Stateflow chart.
 - Explicitly label the output signal of the Stateflow chart.

- Enforce signal object resolution for this signal in the future.

Any changes made by `disableimplicitsignalresolution` permanently change the model. Be sure to back up the model before calling the function with `displayOnly` defaulted to or specified as `false`.

`retVal = disableimplicitsignalresolution('model', displayOnly)` is equivalent to `disableimplicitsignalresolution(model)` if `displayOnly` is `false`.

If `displayOnly` is `true`, the function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

Input Arguments

`displayOnly`

Boolean specifying whether to change the model (`false`) or just generate a report (`true`)

Default: `false`

`model`

Model name or handle

Output Arguments

`retVal`

A MATLAB structure containing:

Signals

Handles to ports with signal names that resolve to signal objects

States

Handles to blocks with states that resolve to signal objects

Introduced in R2007a

docblock

Get or set editor invoked by Simulink DocBlock

Syntax

```
docblock(setEditorType,command)
```

```
editCommand = docblock(getEditorType)
```

Description

`docblock(setEditorType,command)` uses the specified command to set the editor opened by double-clicking a DocBlock block.

By default, a DocBlock block opens Microsoft Word to edit HTML or RTF files. If Word is not available on your system, the block opens these file types using the text editor specified on the **Editor/Debugger Preferences** pane of the MATLAB Preferences dialog box. For text files, the default editor is the text editor specified in the MATLAB preferences.

`editCommand = docblock(getEditorType)` returns the current command to open the specified editor from a DocBlock block.

Input Arguments

setEditorType — File type whose editor command to set

'setEditorHTML' | 'setEditorDOC' | 'setEditorTXT'

File type whose editor command you want to set, specified as 'setEditorHTML', 'setEditorDOC', or 'setEditorTXT'.

command — Command to open file in editor

character vector | ''

Command to open the specified file type in an editor from the MATLAB command prompt, specified as a character vector. Use ' ' to reset to the default editor for that file type.

In the command, use the "%<FileName>" token to represent the full pathname to the document.

getEditorType — File type of the editor command to return

'getEditorHTML' | 'getEditorDOC' | 'getEditorTXT'

File type of the editor command to return, specified as 'getEditorHTML', 'getEditorDOC', or 'getEditorTXT'.

Output Arguments

editCommand — Command to open the editor

character vector

Command to open the editor, returned as a character vector.

Examples

Set DocBlock Text Editor

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system(''notepad "%<FileName>"'');')
```

Set and Get Current HTML Editor

You can use the docblock command to get the current editor.

Set your HTML editor for the DocBlock block to Mozilla Composer. The ampersand executes the command in the background.

```
docblock('setEditorHTML',...
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');')
```

Get the current HTML editor.

```
htmlEd = docblock('getEditorHTML')  
  
htmlEd =  
  
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');'
```

Reset Text Editor to Default

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT', 'system(''notepad "%<FileName>"');')
```

Get the current text editor.

```
txtEd = docblock('getEditorTXT')  
  
txtEd =  
  
    'system('notepad "%<FileName>");'
```

Reset the editor to the default editor.

```
docblock('setEditorTXT', '')
```

Introduced in R2007a

export

Export Simulink Project to zip

Syntax

```
export(proj, zipFileName)
export(proj, zipFileName, definitionType)
```

Description

`export(proj, zipFileName)` exports the project `proj` to a zip file specified by `zipFileName`. The zip archive preserves the project files, structure, labels, and shortcuts, and does not include any source control information. You can use the zip archive to send the project to customers, suppliers, or colleagues who do not have access to your source control repository. Recipients can create a new project from the zip archive by clicking **New** in the Simulink Project Tool, and then in the start page, clicking **Archive**.

`export(proj, zipFileName, definitionType)` exports the project using the specified `definitionType` for the project definition files, single or multiple. If you do not specify `definitionType`, the project's current setting is used. Use the `definitionType` `export` option if you want to change project definition file management from the type selected when the project was created. You can control project definition file management in the preferences.

Examples

Export a Project to a Zip File

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Export the project to a zip file.

```
export(proj, 'airframeproj.zip')
```

- “Archive Projects in Zip Files”

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

zipFileName — Zip file name or path

character vector

Zip file name or path, specified as a character vector ending in the file extension `.zip`. If `zipFileName` is a filename, Simulink exports the file to the current folder. You can also specify a fully qualified path name.

Example: `'project.zip'`

Data Types: `char`

definitionType — Definition file type

`slproject.DefinitionFiles.SingleFile` | `slproject.DefinitionFiles.MultiFile`

Definition file type, specified as `slproject.DefinitionFiles.SingleFile`, `slproject.DefinitionFiles.MultiFile`, or `slproject.DefinitionFiles.FixedPathMultiFile`. Use the `definitionType` export option if you want to change project definition file management from the type selected when the project was created. `MultiFile` is better for avoiding merging issues on shared projects. `SingleFile` is faster but is likely to cause merge issues when two users submit changes in the same project to a source control tool. If you need to work with long file paths, use `FixedPathMultiFile`.

Example: `export(proj, 'proj.zip', slproject.DefinitionFiles.SingleFile)`

Introduced in R2013a

findCategory

Get Simulink Project category of labels

Syntax

```
category = findCategory(proj, categoryName)
```

Description

`category = findCategory(proj, categoryName)` returns the project category specified by `categoryName`. You need to get a category before you can use `createLabel` or `removeLabel`.

Examples

Get a Category of Project Labels

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Use `findCategory` to get a category of labels by name.

```
category = findCategory(proj, 'Classification')
```

```
category =
```

```
Category with properties:
```

```
    Name: 'Classification'  
    DataType: 'none'  
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Alternatively, you can examine categories by index. Get the first category.

```
proj.Categories(1)

ans =

    Category with properties:
        Name: 'Classification'
        DataType: 'none'
        LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Find out what you can do with the category.

```
methods(category)

Methods for class slproject.Category:

createLabel      findLabel  removeLabel
```

Input Arguments

proj — Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

categoryName — Name of category

character vector

Name of the category to get, specified as a character vector.

Output Arguments

category — Category of labels

category object

Category of labels, returned as a category object that you can query or modify. If the specified category is not found, the function returns an empty array.

See Also

Functions

`createLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

findFile

Get Simulink Project file by name

Syntax

```
file = findFile(proj, fileName)
```

Description

`file = findFile(proj, fileName)` returns a specific project file by name. You need to get a file before you can query labels, or use `addLabel` or `removeLabel`.

Examples

Find a File By Name

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Use `findFile` to get a file by name. You need to know the path if it is inside subfolders under the project root.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')
```

```
myfile =
```

```
ProjectFile with properties:
```

```
    Path: [1x86 char]  
    Labels: [1x1 slproject.Label]  
    Revision: '2'  
    SourceControlStatus: Unmodified
```

Alternatively, you can examine files by index. Get the first file.

```
file = proj.Files(1);
```

Find out what you can do with the file.

```
methods(file)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel    removeLabel  findLabel
```

Input Arguments

proj — Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

fileName — Path of file

character vector

Path of the file to find, including any subfolders under the project root, specified as a character vector.

Output Arguments

file — Project file

file object

Project file, returned as a file object that you can query or modify.

See Also

Functions

`addLabel` | `findCategory` | `findLabel` | `removeLabel` | `simulinkproject`

Introduced in R2013a

findLabel

Get Simulink Project file label

Syntax

```
label = findLabel(file, categoryName, labelName)
label = findLabel(file, labelDefinition)
label = findLabel(category, labelName)
```

Description

`label = findLabel(file, categoryName, labelName)` returns the label and its attached data for the label `labelName` in the category `categoryName` that is attached to the specified file or files. Use this syntax when you know the label name and category.

`label = findLabel(file, labelDefinition)` returns the file label and its attached data for the label name and category specified by `labelDefinition`. Use this syntax if you previously got a `labelDefinition` by accessing a `Labels` property, e.g., using a command like `myfile.Labels(1)`.

`label = findLabel(category, labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Files with the Label Utility

Find all project files with a particular label.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get the list of project files.

```
files = proj.Files;
```

Loop through each file. If the file has the extension .m, attach the label Utility.

```
for fileIndex = 1:numel(files)
    file = files(fileIndex);
    [~, ~, fileExtension] = fileparts(file.Path);
    if strcmp(fileExtension, '.m')
        addLabel(file, 'Classification', 'Utility');
    end
end
```

Find all the files with the label Utility and add them to a list returned in utility_files_to_review.

```
utility_files_to_review = {};
for jj=1:numel(files)
    this_file = files(jj);

    label = findLabel(this_file, 'Classification', 'Utility');

    if ( ~isempty(label))
        % This is a file labeled 'Utility'. Add to the
        % list of utility files.
        utility_files_to_review = [utility_files_to_review; this_file];
    end
end
```

Find a Label by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.mdl');
```

Get a label by name.

```
label = findLabel(myfile, 'Classification', 'Design');
```

Alternatively, examine the `Labels` property of the file to get an array of `Label` objects, one for each label attached to the file.

```
labels = myfile.Labels
```

Index into the `Labels` property to get the label attached to the particular file.

```
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the `Labels` property, you can use it with `findLabel`.

```
label = findLabel(myfile,labeldefinition);
```

Find Labels by Name or Definition

Open the `airframe` project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Get a category.

```
category = proj.Categories(1)
```

```
category =
```

```
Category with properties:
```

```
    Name: 'Classification'  
    DataType: 'none'  
    LabelDefinitions: [1x8 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabel(category,'Design')
```

```
ld =
```

```
LabelDefinition with properties:
```

```
Name: 'Design'  
CategoryName: 'Classification'
```

Input Arguments

file — File to search labels of

file object

File to search the labels of, specified as a file object or an array of file objects. You can get the file object by examining the project's Files property (`proj.Files`), or use `findFile` to get a file by name. The file must be in the project.

categoryName — Name of category

character vector

Name of the parent category for the label, specified as a character vector.

labelName — Name of label

character vector

Name of the label to get, specified as a character vector.

labelDefinition — Name of label

label definition object

Name of the label to get, specified as a label definition object returned by the `file.Label` property.

category — Category of labels

category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

label — Label

label object

Label, returned as a label object.

See Also

Functions

`addLabel` | `createLabel` | `findFile` | `simulinkproject`

Introduced in R2013a

findLabelDefinition(renamed to findLabel)

Get Simulink Project label definition

Syntax

```
labelDefinition = findLabelDefinition(category, labelName)
```

Description

`labelDefinition = findLabelDefinition(category, labelName)` returns the label definition of the label in this category specified by `labelName`. Returns an empty array if the label is not found.

Examples

Find Labels by Name or Definition

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Get a category.

```
category = proj.Categories(1)
```

```
category =
```

```
Category with properties:
```

```
    Name: 'Review'  
    DataType: 'char'  
    LabelDefinitions: [1x4 slproject.LabelDefinition]
```

Get a label definition.

```
ld = findLabelDefinition(category, 'To Review')

ld =

    LabelDefinition with properties:

        Name: 'To Review'
        CategoryName: 'Review'
```

Alternatively, get a file and examine the `Labels` property to get an array of `Label` objects, one for each label attached to the file.

```
myfile = findFile(proj, 'models/AnalogControl.mdl');
labels = myfile.Labels
```

Index into the `Labels` property to get the second label attached to the particular file.

```
labeldefinition = myfile.Labels(1)
```

After you get the label definition from the `Labels` property, you can use it with `findLabel`.

```
label = findLabel(myfile, labeldefinition);
```

Alternatively, get a particular file by name, and then get one of its labels by name.

```
myfile = findFile(proj, 'models/AnalogControl.mdl');
label = findLabel(myfile, 'Review', 'To Review');
```

Input Arguments

labelName — Name of label

character vector

Name of the label to get, specified as a character vector.

category — Category of labels

category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

Output Arguments

labelDefinition — Label definition

label definition object

Label definition, returned as a label definition object. Query the label definition properties to find the label data type.

Functions

`addLabel` | `createLabel` | `findCategory` | `simulinkproject`

Introduced in R2013a

find_mdrefs

Find Model blocks and referenced models at all levels or at top level only

Syntax

```
[refMdls,mdlBlks] = find_mdrefs(system)
[refMdls,mdlBlks] = find_mdrefs(system,Name,Value)
[refMdls,mdlBlks] = find_mdrefs(system,allLevels)
```

Description

`[refMdls,mdlBlks] = find_mdrefs(system)` finds all referenced models and Model blocks contained by the subsystem or model reference hierarchy that `system` is the top level of.

`[refMdls,mdlBlks] = find_mdrefs(system,Name,Value)` finds referenced models and Model blocks with additional options specified by one or more `Name, Value` pair arguments.

`[refMdls,mdlBlks] = find_mdrefs(system,allLevels)` specifies the levels of the system to search.

Tip The `find_mdrefs` function provides two different ways to specify the levels of the system to search. Both techniques give the same results, but only the name and value technique allows you to control inclusion of protected and variant models in `refMdls`.

Examples

Find Referenced Models in Model Reference Hierarchy

Find referenced models and Model blocks for all models referenced by the specified model. Include all model reference variants.

```
load_system('sldemo_mdhref_variants_enum');
[myModels,myModelBlks] = find_mdhrefs('sldemo_mdhref_variants_enum',...
'AllLevels',true,'Variants','AllVariants')
```

```
myModels =
```

```
9x1 cell array
```

```
{'sldemo_mrv_linear_controller'      }
{'sldemo_mrv_nonlinear_controller'  }
{'sldemo_mrv_sig_filter1_production'}
{'sldemo_mrv_sig_filter1_prototype' }
{'sldemo_mrv_sig_filter2_production'}
{'sldemo_mrv_sig_filter2_prototype' }
{'sldemo_mrv_sig_filter3_production'}
{'sldemo_mrv_sig_filter3_prototype' }
{'sldemo_mdhref_variants_enum'      }
```

```
myModelBlks =
```

```
8x1 cell array
```

```
{'sldemo_mdhref_variants_enum/Controller/Linear'    }
{'sldemo_mdhref_variants_enum/Controller/Nonlinear'}
{'sldemo_mdhref_variants_enum/Filter1/Production'   }
{'sldemo_mdhref_variants_enum/Filter1/Prototype'   }
{'sldemo_mdhref_variants_enum/Filter2/Production'   }
{'sldemo_mdhref_variants_enum/Filter2/Prototype'   }
{'sldemo_mdhref_variants_enum/Filter3/Production'   }
{'sldemo_mdhref_variants_enum/Filter3/Prototype'   }
```

- “Set up Model Variants Using a Model Block”
- “Protected Model”

Input Arguments

system — System to search

character vector | handle

System to search, specified as a character vector or a handle.

- The character vector can be the path to a Model block, subsystem, or a model in a model reference hierarchy.
- The handle can be for a Model block, subsystem, or model in a model reference hierarchy.

allLevels — Levels to search

`true` (default) | `false`

Levels to search, specified as `true` or `false`.

- `true` — Search all Model blocks in the model reference hierarchy for which the system is the top model.
- `false` — Search only the top-level system.

Data Types: `logical`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `refModels = find_mdirefs(top_model, 'Variants', true)`

AllLevels — Levels to search

`true` (default) | `false`

Levels to search, specified as a `true` or `false`.

- `true` — Search all Model blocks in the model reference hierarchy for which the system is the top model.
- `false` — Search only the top-level system.

Data Types: `logical`

IncludeProtectedModels — Include protected models in search results

`false` (default) | `true`

Include protected models in search, specified as `true` or `false`. This setting does not affect the list of Model blocks returned.

Data Types: `logical`

Variants — Include variants in search

'ActivePlusCodeVariants' (default) | 'ActiveVariants' | 'AllVariants'

Include variants in search, specified as 'ActivePlusCodeVariants', 'ActiveVariants', or 'AllVariants'.

- 'ActivePlusCodeVariants' — Include all variants for Model Variants blocks for which you select the **Generate preprocessor conditionals** option.
- 'ActiveVariants' — Include the active variant for Model Variants blocks.
- 'AllVariants' — Include all variants for Model Variants blocks.

IncludeCommented — Include commented blocks in search

'off' (default) | 'on'

Include commented blocks in search, specified as 'off' or 'on'.

KeepModelsLoaded — Keep loaded models that function loads

false (default) | true

The `find_mdhrefs` function loads the models in the model reference hierarchy of the model that you specify. By default, the function closes those models, except for models that were already loaded before execution of the function. To keep all the models loaded that the function loads, set this argument to `true`.

Data Types: `logical`

Output Arguments

refMdlS — Names of referenced models

cell array of character vectors

Names of referenced models, returned as a cell array of character vectors. The last element is the system you specified in the `system` input argument or the parent model of that system.

mdlBlks — Names of Model blocks

cell array of character vectors

Names of Model blocks, returned as a cell array of character vectors.

Model | `find_system`

Topics

“Set up Model Variants Using a Model Block”

“Protected Model”

“Model Referencing”

Introduced before R2006a

find_system

Find systems, blocks, lines, ports, and annotations

Syntax

```
Objects = find_system
Objects = find_system(System)
Objects = find_system(Name, Value)
Objects = find_system(System, Name, Value)
```

Description

`Objects = find_system` returns loaded systems and their blocks, including subsystems.

`Objects = find_system(System)` returns the specified system and its blocks.

`Objects = find_system(Name, Value)` returns loaded systems and the objects in those systems that meet the criteria specified by one or more `Name, Value` pair arguments. You can use this syntax to specify search constraints and to search for specific parameter values. Specify the search constraints before the parameter and value pairs.

`Objects = find_system(System, Name, Value)` returns the objects in the specified system that meet the specified criteria.

Input Arguments

System — System to search

path name | cell array of path names | handle | vector of handles

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: 'MyModel/Subsystem1'

Example: `{'vdp', 'fuelsys'}`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

When you use the `find_system` function, `Name`, `Value` pair arguments can include search constraints and parameter name and value pairs. You can specify search constraints in any order, but they must precede the parameter name and value pairs.

See “Model Parameters” on page 6-2 and “Block-Specific Parameters” on page 6-128 for the lists of model and block parameters.

Example: `'SearchDepth', '0', 'LookUnderMasks', 'none', 'BlockType', 'Goto'` searches in loaded systems, excluding masked subsystems, for `Goto` blocks.

The table lists the possible search constraint pairs. Braces indicate default values.

Name	Value Type	Description
'BlockDialogParams'	character vector	Search block dialog box parameters for the specified value. This pair, like parameter and value pairs, must follow the other search constraint pairs.
'CaseSensitive'	{'on'} 'off'	If 'on', search considers case when matching.
'FindAll'	'on' {'off'}	If 'on', search includes lines, ports, and annotations within systems. <code>find_system</code> returns a vector of handles when this option is set to 'on', regardless of how you specify <code>System</code> .
'FirstResultOnly'	'on' {'off'}	Return only the first result found and stop the search.

Name	Value Type	Description
'FollowLinks'	'on' {'off'}	If 'on', search follows links into library blocks. If you do not specify a system to search, find_system includes loaded libraries in the results, whether you set 'FollowLinks' to 'on' or 'off'. You can use 'FollowLinks' with 'LookUnderMasks' to update library links in subsystems. See “Update Library Links in a Subsystem” on page 2-256.
'IncludeCommented'	'on' {'off'}	Specify whether to include commented blocks in the search.
'LoadFullyIfNeeded'	{'on'} 'off'	If 'on', attempts to load any partially loaded models. If 'off', disables model loading. Use this pair, for example, to prevent load warnings.
'LookUnderMasks'	{'graphical'}	Search includes masked subsystems that have no workspaces and no dialogs.
	'none'	Search skips masked subsystems.
	'functional'	Search includes masked subsystems that do not have dialogs.
	'all'	Search includes all masked subsystems.
	'on' 'off'	If 'on', search includes all masked subsystems. If 'off', search skips masked subsystem.
'RegExp'	'on' {'off'}	If 'on', search treats search expressions as regular expressions. To learn more about MATLAB regular expressions, see “Regular Expressions” (MATLAB).

Name	Value Type	Description
'SearchDepth'	positive integer character vector	Restricts the search depth to the specified level ('0' for loaded systems only, '1' for blocks and subsystems of the top-level system, '2' for the top-level system and its children, etc.). The default is all levels.
'Variants' This search constraint applies only to variant subsystems and model variants.	{'ActiveVariants'}	Search in only the active variant subsystems.
	'AllVariants'	Search in all variants.
	'ActivePlusCodeVariants'	Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.

Output Arguments

Objects — Matching objects

cell array of path names | vector of handles

Matching objects found, returned as:

- A cell array of path names if you specified `System` as a path name or cell array of path names, or if you did not specify a system
- A vector of handles if you specified `System` as a handle or vector of handles

Examples

Find Loaded Systems and Their Blocks

Return the names of all loaded systems and their blocks.

```
load_system('vdp')
find_system
```

```

ans =

    13x1 cell array

    {'vdp'
     {'vdp/Fcn'
     {'vdp/More Info'
     {'vdp/More Info/Model Info'
     {'vdp/Mu'
     {'vdp/Mux'
     {'vdp/Product'
     {'vdp/Scope'
     {'vdp/Sum'
     {'vdp/x1'
     {'vdp/x2'
     {'vdp/Out1'
     {'vdp/Out2'
  
```

Returns loaded systems and libraries, including vdp.

Find Specific System and Its Blocks

Return vdp system and its blocks.

```

load_system({'vdp', 'fuelsys'})
find_system('vdp')
  
```

```

ans =

    13x1 cell array

    {'vdp'
     {'vdp/Fcn'
     {'vdp/More Info'
     {'vdp/More Info/Model Info'
     {'vdp/Mu'
     {'vdp/Mux'
     {'vdp/Product'
     {'vdp/Scope'
     {'vdp/Sum'
  
```

```
{'vdp/x1'           }  
{'vdp/x2'           }  
{'vdp/Out1'        }  
{'vdp/Out2'        }
```

Return Names of Loaded Models

Return the names of only the loaded models, i.e., block diagrams. This command returns library names as well, because libraries are treated as models.

```
load_system('vdp');  
open_bd = find_system('type','block_diagram')  
  
open_bd =  
  
    1x1 cell array  
  
    {'vdp'}
```

Search Children of Subsystem

Return the names of all Goto blocks that are children of the Unlocked subsystem in the `sldemo_clutch` system.

```
load_system('sldemo_clutch');  
find_system('sldemo_clutch/Unlocked','SearchDepth',1,'BlockType','Goto')  
  
ans =  
  
    2x1 cell array  
  
    {'sldemo_clutch/Unlocked/Goto' }  
    {'sldemo_clutch/Unlocked/Goto1'}
```

Search Using Multiple Criteria

Search in the vdp system and return the names of all Gain blocks whose **Gain** value is set to 1.

```
load_system('vdp');  
find_system('vdp','BlockType','Gain','Gain','1')
```

```
ans =
```

```
1x1 cell array  
  
{'vdp/Mu'}
```

Return Lines and Annotations as Handles

Get the handles of all lines and annotations in the vdp system. With 'FindAll', the function returns handles regardless of how you specify the system to search.

```
load_system('vdp');  
L = find_system('vdp','FindAll','on','type','line')  
A = find_system('vdp','FindAll','on','type','annotation')
```

```
L =
```

```
33.0201  
32.0181

30.0575  
29.0746  
28.1221  
27.0188  
26.0209  
25.0227  
24.0176  
23.0206  
22.0188  
21.0189  
20.0187  
19.0199
```

```
18.0149
17.0195
```

```
A =
```

```
35.0153
34.0171
```

Search for Specific Block Parameter Value

Find any block dialog box parameters with a value of 0 in the vdp and fuelsys systems.

```
load_system({'vdp', 'fuelsys'})
find_system({'vdp', 'fuelsys'}, 'BlockDialogParams', '0')
```

```
ans =
```

```
'vdp/x2'
'vdp/Out1'
'vdp/Out2'
'fuelsys/Constant2'
'fuelsys/Constant4'
'fuelsys/Constant5'
'fuelsys/engine ...'
'fuelsys/engine ...'
'fuelsys/engine ...'
'fuelsys/engine ...'
.
.
.
```

Search Using Regular Expressions

Find all blocks in the top level of the currently loaded systems with a block dialog parameter value that starts with 3.

```
load_system({'fuelsys', 'vdp'});
find_system('SearchDepth', '1', 'regex', 'on', 'BlockDialogParams', '^3')
```

```
ans =

3x1 cell array

{'vdp/Scope'          }
{'vdp/Scope'          }
{'fuelsys/Nominal...'}

```

Regular Expression Search for Partial Match

When you search using regular expressions, you can specify a part of the character vector you want to match to return all objects that contain that character vector. Find all the inport and outport blocks in the `sldemo_clutch` model.

```
load_system('sldemo_clutch');
find_system('sldemo_clutch','regexp','on','blocktype','port')

```

```
ans =

39x1 cell array

```

Update Library Links in a Subsystem

In this example, `myModel` contains a single subsystem, which is a library link. After the model was last opened, a Gain block was added to the corresponding subsystem in the library.

Open the model. Use `find_system` with `'FollowLinks'` set to `'off'`. The command does not follow the library links into the subsystem and returns only the subsystem at the top level.

```
open_system('myModel')
find_system(bdroot, 'LookUnderMasks', 'on', 'FollowLinks', 'off')

ans =

    'myModel'
    'myModel/Subsystem'
```

Use `find_system` with `'FollowLinks'` set to `'on'`. `find_system` updates the library links and returns the block in the subsystem.

```
find_system(bdroot, 'LookUnderMasks', 'on', 'FollowLinks', 'on')
```

```
Updating Link: myModel/Subsystem/Gain
```

```
Updating Link: myModel/Subsystem/Gain
```

```
ans =
```

```
    'myModel'  
    'myModel/Subsystem'  
    'myModel/Subsystem/Gain'
```

Return Values as Handles

Provide the system to `find_system` as a handle. Search for block dialog box parameters with a value of 0. If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
load_system('vdp');  
sys = get_param('vdp', 'Handle');  
find_system(sys, 'BlockDialogParams', '0')
```

```
ans =
```

```
    10.0027  
    13.0029  
    14.0028  
    14.0028  
    15.0026  
    15.0026
```

fixdt

Create `Simulink.NumericType` object describing fixed-point or floating-point data type

Syntax

```
a = fixdt(Signed, WordLength)
a = fixdt(Signed, WordLength, FractionLength)
a = fixdt(Signed, WordLength, TotalSlope, Bias)
a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent,
Bias)
a = fixdt(DataTypeNameString)
a = fixdt(..., 'DataTypeOverride', 'Off')
[DataType, IsScaledDouble] = fixdt(DataTypeNameString)
[DataType, IsScaledDouble] = fixdt(DataTypeNameString,
'DataTypeOverride', 'Off')
```

Description

`a = fixdt(Signed, WordLength)` returns a `Simulink.NumericType` object describing a fixed-point data type with unspecified scaling. The scaling would typically be determined by another block parameter. `Signed` can be 0 (false) for unsigned or 1 (true) for signed.

`a = fixdt(Signed, WordLength, FractionLength)` returns a `Simulink.NumericType` object describing a fixed-point data type with binary point scaling. `FractionLength` can be greater than `WordLength`. For more information, see “Binary Point Interpretation” (Fixed-Point Designer).

`a = fixdt(Signed, WordLength, TotalSlope, Bias)` or `a = fixdt(Signed, WordLength, SlopeAdjustmentFactor, FixedExponent, Bias)` returns a `Simulink.NumericType` object describing a fixed-point data type with slope and bias scaling.

`a = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type

name. The data type name can be either the name of a built-in Simulink data type or the name of a fixed-point data type that conforms to the naming convention for fixed-point names established by the Fixed-Point Designer product. For more information, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).

`a = fixdt(..., 'DataTypeOverride', 'Off')` returns a `Simulink.NumericType` object with its `DataTypeOverride` parameter set to `Off`. The default value for this property is `Inherit`. You can specify the `DataTypeOverride` parameter after any combination of other input parameters.

`[DataType, IsScaledDouble] = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name and a flag that indicates whether the specified data type name was the name of a scaled double data type.

`[DataType, IsScaledDouble] = fixdt(DataTypeNameString, 'DataTypeOverride', 'Off')` returns:

- A `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name. The `DataTypeOverride` parameter of the `Simulink.NumericType` object is set to `Off`.
- A flag that indicates whether the specified data type name was the name of a scaled double data type.

Examples

Return a `Simulink.NumericType` object describing a fixed-point data type with unspecified scaling:

```
a = fixdt(1,16)
```

```
a =
```

```
Simulink.NumericType
  DataTypeMode: 'Fixed-point: unspecified scaling'
  Signedness: 'Signed'
  WordLength: 16
  IsAlias: false
  HeaderFile: ''
  Description: ''
```

Return a `Simulink.NumericType` object describing a fixed-point data type with binary point scaling :

```
a = fixdt(1,16,2)
```

```
a =
```

```
Simulink.NumericType
  DataTypeMode: 'Fixed-point: binary point scaling'
  Signedness: 'Signed'
  WordLength: 16
  FractionLength: 2
  IsAlias: false
  HeaderFile: ''
  Description: ''
```

Return a `Simulink.NumericType` object describing a fixed-point data type with slope and bias scaling:

```
a = fixdt(1, 16, 2^-2, 4)
```

```
a =
```

```
Simulink.NumericType
  DataTypeMode: 'Fixed-point: slope and bias scaling'
  Signedness: 'Signed'
  WordLength: 16
  Slope: 0.25
  Bias: 4
  IsAlias: false
  HeaderFile: ''
  Description: ''
```

Return a `Simulink.NumericType` object describing an integer, fixed-point, or floating-point data type specified by a data type name:

```
[DataType, IsScaledDouble] = fixdt('ufix8')
```

```
DataType =
```

```
Simulink.NumericType
  DataTypeMode: 'Fixed-point: binary point scaling'
  Signedness: 'Unsigned'
  WordLength: 8
```

```
FractionLength: 0
    IsAlias: false
    HeaderFile: ''
    Description: ''
IsScaledDouble =

    0
```

Return a `Simulink.NumericType` object with its `DataTypeOverride` property set to `Off`:

```
a = fixdt(0, 8, 2, 'DataTypeOverride', 'Off')

a =

Simulink.NumericType
    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Unsigned'
    WordLength: 8
    FractionLength: 2
    DataTypeOverride: Off
    IsAlias: false
    HeaderFile: ''
    Description: ''
```

fixpt_evenspace_cleanup

Modify breakpoints of lookup table to have even spacing

Syntax

```
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

Description

xdata_modified = fixpt_evenspace_cleanup(*xdata*,*xdt*,*xscale*) modifies breakpoints of a lookup table to have even spacing after quantization. By adjusting breakpoints to have even spacing after quantization, Simulink Coder generated code can exclude breakpoints from memory.

xdata is the breakpoint vector of a lookup table to make evenly spaced, such as 0:0.005:1. *xdt* is the data type of the breakpoints, such as `sfixed(16)`. *xscale* is the scaling of the breakpoints, such as 2^{-12} . Using these three inputs, fixpt_evenspace_cleanup returns the modified breakpoints in *xdata_modified*.

This function works only with nontunable data and considers data to have even spacing relative to the scaling slope. For example, the breakpoint vector [0 2 5], which has spacing value 2 and 3, appears to have uneven spacing. However, the difference between the maximum spacing 3 and the minimum spacing 2 equals 1. If the scaling slope is 1 or greater, a spacing variation of 1 represents a 1-bit change or less. In this case, the fixpt_evenspace_cleanup function considers a spacing variation of 1 bit or less to be even.

Modifications to breakpoints can change the numerical behavior of a lookup table. To check for changes, test the model using simulation, rapid prototyping, or other appropriate methods.

Examples

Modify breakpoints of a lookup table to have even spacing after quantization:

```
xdata = 0:0.005:1;  
xdt = sfix(16);  
xscale = 2^-12;  
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

fixpt_interp1

Implement 1-D lookup table

Syntax

```
y = fixpt_interp1(xdata, ydata, x, xdt, xscale, ydt, yscale, rndmeth)
```

Description

`y = fixpt_interp1(xdata, ydata, x, xdt, xscale, ydt, yscale, rndmeth)` implements a one-dimensional lookup table to find output y for input x . If x falls between two $xdata$ values (breakpoints), y is the result of interpolating between the corresponding $ydata$ values. If x is greater than the maximum value in $xdata$, y is the maximum $ydata$ value. If x is less than the minimum value in $xdata$, y is the minimum $ydata$ value.

If the input data type xdt or the output data type ydt is floating point, `fixpt_interp1` performs the interpolation using floating-point calculations. Otherwise, `fixpt_interp1` uses integer-only calculations. These calculations handle the input scaling $xscale$ and the output scaling $yscale$ and obey the rounding method $rndmeth$.

Input Arguments

xdata

Vector of breakpoints for the lookup table, such as `linspace(0, 8, 33)`.

ydata

Vector of table data that correspond to the breakpoints for the lookup table, such as `sin(xdata)`.

x

Vector of input values for the lookup table to process, such as `linspace(-1, 9, 201)`.

xdt

Data type of input x , such as `sfixed(8)`.

xscale

Scaling for input x , such as 2^{-3} .

ydt

Data type of output y , such as `sfixed(16)`.

yscale

Scaling for output y , such as 2^{-14} .

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Interpolate outputs for x using a 1-D lookup table that approximates the sine function:

```
xdata = linspace(0,8,33).';
ydata = sin(xdata);
% Define input x as a vector of 201 evenly
% spaced points between -1 and 9 (includes
% values both lower and higher than the range
% of breakpoints in xdata)
x = linspace(-1,9,201).';
% Interpolate output values for x
```

```
y = fixpt_interp1(xdata,ydata,x,sfix(8),2^-3,sfix(16),...  
  2^-14,'Floor')
```

fixpt_look1_func_approx

Optimize fixed-point approximation of nonlinear function by interpolating lookup table data points

Syntax

```
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax)  
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[])  
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax)  
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...  
xmin,xmax,xdt,xscale,ydtydt,yscale,rndmeth,errmax,nptsmax,spacing)
```

Description

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error and maximum number of points that you specify.

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[]) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error that you specify.

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum number of points that you specify.

```
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...)
```

xmin, xmax, xdt, xscale, ydtydt, yscale, rndmeth, errmax, nptsmax, spacing) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error, maximum number of points, and breakpoint spacing that you specify.

In each case, `fixpt_look1_func_approx` interpolates between lookup table data points to optimize the fixed-point approximation. The inputs *xmin* and *xmax* specify the range over which to approximate the breakpoints. The inputs *xdt*, *xscale*, *ydt*, *yscale*, and *rndmeth* follow conventions used by fixed-point Simulink blocks.

The inputs *errmax*, *nptsmax*, and *spacing* are optional. Of these inputs, you must specify at least *errmax* or *nptsmax*. If you omit one of those two inputs, you must use brackets, [], in place of the omitted input. `fixpt_look1_func_approx` ignores that requirement for the lookup table.

If you do not specify *spacing*, and more than one spacing satisfies *errmax* and *nptsmax*, `fixpt_look1_func_approx` chooses in this order: power-of-2 spacing, even spacing, uneven spacing. This behavior applies when you specify both *errmax* and *nptsmax*, but not when you specify just one of the two.

Input Arguments

func

Function of *x* for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of *x*.

xmax

Maximum value of *x*.

xdt

Data type of *x*.

xscale

Scaling for the x values.

ydt

Data type of y .

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

errmax

Maximum acceptable error between the ideal function and the approximation given by the lookup table.

nptsmax

Maximum number of points for the lookup table.

spacing

Spacing of breakpoints for the lookup table:

'even'	Even spacing
'pow2'	Even, power-of-2 spacing
'unrestricted' (default)	Uneven spacing

If you specify...	The breakpoints of the lookup table...
<i>errmax</i> and <i>nptsmax</i>	Meet both criteria, if possible. The <i>errmax</i> requirement has higher priority than <i>nptsmax</i> . If the breakpoints cannot meet both criteria with the specified spacing, <i>nptsmax</i> does not apply.
<i>errmax</i> only	Meet the error criteria, and <code>fixpt_look1_func_approx</code> returns the fewest number of points.
<i>nptsmax</i> only	Meet the points criteria, and <code>fixpt_look1_func_approx</code> returns the smallest worst-case error.

Output Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

errworst

Worst-case error, which is the maximum absolute error between the ideal function and the approximation given by the lookup table.

Examples

Approximate a fixed-point sine function using a lookup table:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
```

```
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Create the lookup table
[xdata,ydata,errworst] = fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
```

Topics

“Producing Lookup Table Data” (Fixed-Point Designer)

“Use Lookup Table Approximation Functions” (Fixed-Point Designer)

Introduced before R2006a

fixpt_look1_func_plot

Plot fixed-point approximation function for lookup table

Syntax

```
fixpt_look1_func_plot(xdata, ydata, 'func', ...  
xmin, xmax, xdt, xscale, ydt, yscale, rndmeth)  
errworst = fixpt_look1_func_plot(xdata, ydata, 'func', ...  
xmin, xmax, xdt, xscale, ydt, yscale, rndmeth)
```

Description

`fixpt_look1_func_plot(xdata, ydata, 'func', ...
xmin, xmax, xdt, xscale, ydt, yscale, rndmeth)` plots a lookup table approximation function and the error from the ideal function.

`errworst = fixpt_look1_func_plot(xdata, ydata, 'func', ...
xmin, xmax, xdt, xscale, ydt, yscale, rndmeth)` plots a lookup table approximation function and the error from the ideal function. The output `errworst` is the maximum absolute error.

You can use `fixpt_look1_func_approx` to generate `xdata` and `ydata`, the breakpoints and table data for the lookup table, respectively. `fixpt_look1_func_approx` applies the ideal function to the breakpoints in `xdata` to produce `ydata`. While this method is the easiest way to generate `ydata`, you can choose other values for `ydata` as input for `fixpt_look1_func_plot`. Choosing different values for `ydata` can, in some cases, produce a lookup table with a smaller maximum absolute error.

Input Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

func

Function of x for which to approximate breakpoints. Enclose this expression in single quotes, for example, 'sin(2*pi*x) '.

xmin

Minimum value of x .

xmax

Maximum value of x .

xdt

Data type of x .

xscale

Scaling for the x values.

ydt

Data type of y .

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'

Round to the nearest representable number in the direction of positive infinity.

'Floor' (default)

Round to the nearest representable number in the direction of negative infinity.

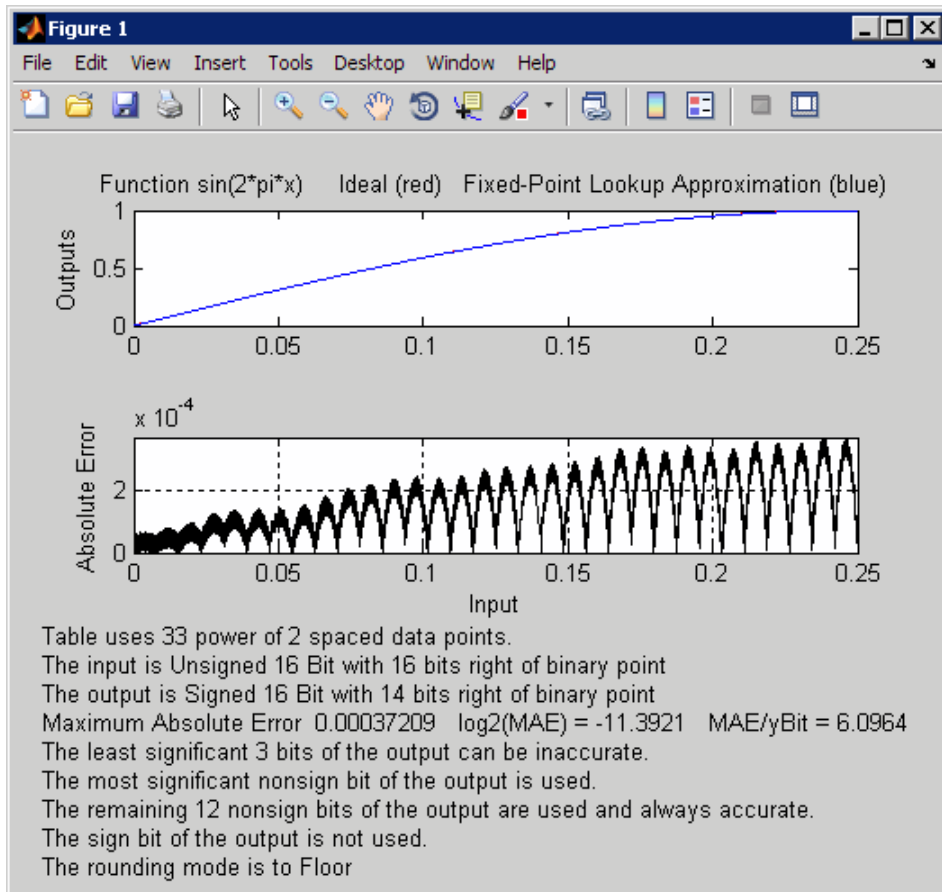

'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Plot a fixed-point approximation of the sine function using data points generated by `fixpt_look1_func_approx`:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Generate data points for the lookup table
[xdata,ydata,errworst]=fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
% Plot the sine function (ideal and fixed-point) & errors
fixpt_look1_func_plot(xdata,ydata,func,xmin,xmax,...
    xdt,xscale,ydt,yscale,rndmeth);
```

`fixpt_look1_func_plot` plots the fixed-point sine function, using generated data points, and plots the error between the ideal function and the fixed-point function. The maximum absolute error and the number of points required appear on the plot. The error drops to zero at a breakpoint, but increases between breakpoints due to curvature differences between the ideal function and the line drawn between breakpoints.

The lookup table requires 33 points to achieve a maximum absolute error of $2^{-11.3922}$.

Introduced before R2006a

fixpt_set_all

Set property for each fixed-point block in subsystem

Syntax

```
fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)
```

Description

`fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)` sets the property `fixptPropertyName` of every applicable block in the model or subsystem `SystemName` to the value `fixptPropertyValue`

Examples

Set each fixed-point block in a model `Filter_1` to round towards the floor and saturate upon overflow:

```
% Round towards the floor
fixpt_set_all('Filter_1', 'RndMeth', 'Floor')

% Saturate upon overflow
fixpt_set_all('Filter_1', 'DoSatur', 'on')
```

Introduced before R2006a

fixptbestexp

Exponent that gives best precision for fixed-point representation of value

Syntax

```
out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)
out = fixptbestexp(RealWorldValue, FixPtDataType)
```

Description

`out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)` returns the exponent that gives the best precision for the fixed-point representation of *RealWorldValue*. *TotalBits* specifies the number of bits for the fixed-point number. *IsSigned* specifies whether the fixed-point number is signed: 1 indicates the number is signed and 0 indicates the number is not signed.

`out = fixptbestexp(RealWorldValue, FixPtDataType)` returns the exponent that gives the best precision based on the data type *FixPtDataType*.

Examples

Get the exponent that gives the best precision for the real-world value $4/3$ using a signed, 16-bit number:

```
out = fixptbestexp(4/3,16,1)

out =
    -14
```

Alternatively, specify the fixed-point data type:

```
out = fixptbestexp(4/3,sfix(16))

out =
    -14
```

This shows that the maximum precision representation of $4/3$ is obtained by placing 14 bits to the right of the binary point:

```
01.01010101010101
```

You can specify the precision of this representation in fixed-point blocks by setting the scaling to 2^{-14} or `2^fixptbestexp(4/3,16,1)`.

See Also

`fixptbestprec`

Introduced before R2006a

fixptbestprec

Determine maximum precision available for fixed-point representation of value

Syntax

```
out = fixptbestprec(RealWorldValue, TotalBits, IsSigned)
out = fixptbestprec(RealWorldValue, FixPtDataType)
```

Description

`out = fixptbestprec(RealWorldValue, TotalBits, IsSigned)` determines the maximum precision for the fixed-point representation of the real-world value specified by `RealWorldValue`. You specify the number of bits for the fixed-point number with `TotalBits`, and you specify whether the fixed-point number is signed with `IsSigned`. If `IsSigned` is 1, the number is signed. If `IsSigned` is 0, the number is not signed. The maximum precision is returned to `out`.

`out = fixptbestprec(RealWorldValue, FixPtDataType)` determines the maximum precision based on the data type specified by `FixPtDataType`.

Examples

Example 1

The following command returns the maximum precision available for the real-world value $4/3$ using a signed, 8-bit number:

```
out = fixptbestprec(4/3, 8, 1)
out =
    0.015625
```

Alternatively, you can specify the fixed-point data type:

```
out = fixptbestprec(4/3,sfix(8))  
  
out =  
    0.015625
```

This value means that the maximum precision available for $4/3$ is obtained by placing six bits to the right of the binary point since 2^{-6} equals 0.015625:

```
01.010101
```

Example 2

You can use the maximum precision as the scaling in fixed-point blocks. This enables you to use `fixptbestprec` to perform a type of autoscaling if you would like to designate a known range of your simulation. For example, if your known range is -13 to 22, and you are using a safety margin of 30%:

```
knownMax = 22;  
knownMin = -13;  
localSafetyMargin = 30;  
slope = max( fixptbestprec( (1+localSafetyMargin/100)* ...  
    [knownMax,knownMin], sfix(16) ) );
```

The variable `slope` can then be used in the expression that you specify for the **Output data type** parameter in a block mask. Be sure to select the **Lock output data type setting against changes by the fixed-point tools** check box in the same block to prevent the Fixed-Point Tool from overriding the scaling. If you know the range, you can use this technique in place of relying on a model simulation to provide the range to the autoscaling tool, as described in `autofixexp` in the Fixed-Point Designer documentation.

`fixptbestexp`

Introduced before R2006a

float

Create `Simulink.NumericType` object describing floating-point data type

Syntax

```
a = float('single')
a = float('double')
```

Description

`a = float('single')` returns a `Simulink.NumericType` object that describes the data type of an IEEE single (32 total bits, 8 exponent bits).

`a = float('double')` returns a `Simulink.NumericType` object that describes the data type of an IEEE double (64 total bits, 11 exponent bits).

Note `float` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `float('single')` with `fixdt('single')` and `float('double')` with `fixdt('double')`.

Examples

Define an IEEE single data type.

```
>> a = float('single')
a =
    NumericType with properties:
        DataTypeMode: 'Single'
        IsAlias: 0
        DataScope: 'Auto'
        HeaderFile: ''
        Description: ''
```

Introduced before R2006a

frameedit

Edit print frames for Simulink and Stateflow block diagrams

Syntax

```
frameedit  
frameedit filename
```

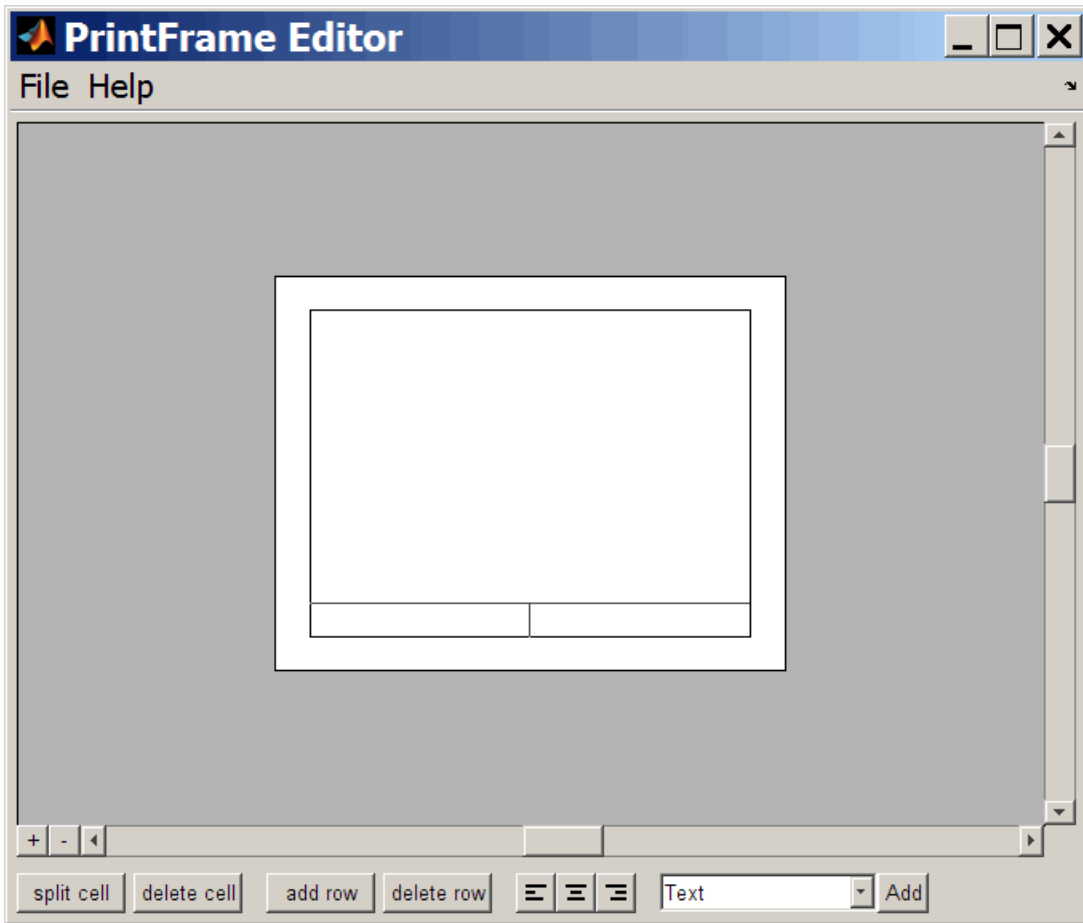

Description

`frameedit` starts the **PrintFrame Editor**, a graphical user interface you use to create borders for Simulink and Stateflow block diagrams. With no argument, `frameedit` opens the **PrintFrame Editor** window with a new file.

`frameedit filename` opens the **PrintFrame Editor** window with the specified `filename`, where `filename` is a figure file (`.fig`) previously created and saved using `frameedit`.

Tips

This illustrates the main features of the **PrintFrame Editor**.

Closing the PrintFrame Editor

To close the **PrintFrame Editor** window, click the close box in the upper right corner, or select **Close** from the **File** menu.

Printing Simulink Block Diagrams with Print Frames

Select **Print** from the Simulink **File** menu. Check the **Frame** box and supply the filename for the print frame you want to use. Click **OK** in the **Print** dialog box.

Getting Help for the PrintFrame Editor

For further instructions on using the PrintFrame Editor, select **PrintFrame Editor Help** from the **Help** menu in the PrintFrame Editor.

Introduced in R2008b

fxptdlg

Start Fixed-Point Tool

Syntax

```
fxptdlg('modelname')
```

Description

`fxptdlg('modelname')` starts the Fixed-Point Tool for the Simulink model specified by `modelname`. You can also access this tool by the following methods:

- From the Simulink **Analysis** menu, select **Data Type Design > Fixed-Point Tool**.
- From a subsystem context (right-click) menu, select **Fixed-Point Tool**.

In conjunction with Fixed-Point Designer software, the Fixed-Point Tool provides convenient access to:

- Model and subsystem parameters that control the signal logging, fixed-point instrumentation mode, and data type override. (see “Model Parameters” on page 6-2)
- Plotting capabilities that enable you to plot data that resides in the MATLAB workspace, namely, simulation results associated with Scope, To Workspace, and root-level Outport blocks, in addition to logged signal data (see “Signal Logging” in the *Simulink User's Guide*)
- An interactive automatic data typing feature that proposes fixed-point data types for appropriately configured objects in your model, and then allows you to selectively accept and apply the data type proposals

You can launch the Fixed-Point Tool for any system or subsystem, and the tool controls the object selected in its **System under design** pane. If Fixed-Point Designer software is installed, the Fixed-Point Tool displays the name, data type, design minimum and maximum values, minimum and maximum simulation values, and scaling of each model object that logs fixed-point data. Additionally, if a signal saturates or overflows, the tool displays the number of times saturation or overflow occurred.

Note The Fixed-Point Tool works only for models that simulate in Normal mode. The tool does not work when you simulate your model in Accelerator or Rapid Accelerator mode.

Overriding Fixed-Point Specifications

Most of the functionality in the Fixed-Point Tool is for use with the Fixed-Point Designer software. However, even if you do not have Fixed-Point Designer software, you can configure data type override settings to simulate a model that specifies fixed-point data types. In this mode, the Simulink software temporarily overrides fixed-point data types with floating-point data types when simulating the model.

Note If you use `fi` objects or embedded numeric data types in your model or workspace, you might introduce fixed-point data types into your model. You can set `fipref` to prevent the checkout of a Fixed-Point Designer license.

To simulate a model without using Fixed-Point Designer:

- 1 Enter the following at the command line.

```
set_param(gcs, 'DataTypeOverride', 'Double', ...
'DataTypeOverrideAppliesTo', 'AllNumericTypes', ...
'MinMaxOverflowLogging', 'ForceOff')
```

- 2 If you use `fi` objects or embedded numeric data types in your model, set the `fipref` `DataTypeOverride` property to `TrueDoubles` or `TrueSingles` (to be consistent with the model-wide data type override setting) and the `DataTypeOverrideAppliesTo` property to `All numeric types`.

For example, at the MATLAB command line, enter:

```
p = fipref('DataTypeOverride', 'TrueDoubles', ...
'DataTypeOverrideAppliesTo', 'AllNumericTypes');
```

“Propose Fraction Lengths Using Simulation Range Data” (Fixed-Point Designer) | Fixed-Point Tool

Introduced before R2006a

gcb

Get path name of current block

Syntax

```
b1 = gcb  
b1 = gcb(sys)
```

Description

`b1 = gcb` returns the full block path name of the current block in the current system. The current block is:

- The most recently clicked block
- The S-Function block currently executing its corresponding MATLAB function
- The block whose callback routine is being executed
- The block whose mask is being evaluated as part of the `MaskInitialization` parameter evaluation
- The last block loaded after opening a model

`b1 = gcb(sys)` returns the full block path name of the current block in the specified system. Load the system first.

Input Arguments

sys — System that contains the block

character vector

System that contains the block, specified as a character vector.

Example: `'vdp' 'sldemo_fuelsys/fuel_rate_control'`

Examples

Get Path Name of Most Recently Selected Block

Open a model.

```
vdp
```

In the model, select a block. For example, select the Gain block. Then, enter `gcb` at the command prompt.

```
gcb
```

```
ans =
```

```
vdp/Mu
```

Get Parameters of Current Block

Open a model.

```
vdp
```

Select the Gain block.

Use the value of `gcb` with `get_param` to get the value of the Gain parameter.

```
x = get_param(gcb, 'Gain')
```

```
x =
```

```
1
```

Get Current Block in Specified System

Load the model.

```
load_system('sldemo_fuelsys');
```

Get the current block in the `fuel_rate_control` subsystem.

```
b1 = gcb('sldemo_fuelsys/fuel_rate_control')  
  
b1 =  
  
sldemo_fuelsys/fuel_rate_control/validate_sample_time
```

gcbh | gcs | get_param

Topics

“Mask Callback Code”

Introduced before R2006a

gcbh

Get handle of current block

Syntax

```
gcbh
```

Description

`gcbh` returns the handle of the current block in the current system.

You can use this command to identify or address blocks that have no parent system. The command should be most useful to blockset authors.

Examples

This command returns the handle of the most recently selected block.

```
gcbh
```

```
ans =
```

```
    281.0001
```

See Also

`gcb` | `getSimulinkBlockHandle`

Introduced before R2006a

gcs

Get pathname of current system

Syntax

```
gcs
```

Description

`gcs` returns the full pathname of the current system.

The current system is one of these:

- During editing, the current system is the system or subsystem most recently clicked.
- During simulation of a system that contains S-Function blocks, the current system is the system or subsystem containing the S-Function block that is currently being evaluated.
- During callbacks, the current system is the system containing any block whose callback routine is being executed.
- During evaluation of `MaskInitialization`, the current system is the system containing the block whose mask is being evaluated.

The current system is always the current model or a subsystem of the current model. Use `bdroot` to get the current model.

Examples

This example returns the path of the system that contains the most recently selected block.

```
gcs
ans =
    clutch/Locked
```

See Also

`bdroot` | `gcb`

Introduced before R2006a

get_param

Get parameter names and values

Syntax

```
ParamValue = get_param(Object,Parameter)
```

Description

`ParamValue = get_param(Object,Parameter)` returns the name or value of the specified parameter for the specified model or block object. Open or load the Simulink model first.

Tip If you make multiple calls to `get_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.

For parameter names, see:

- “Model Parameters” on page 6-2
- “Block-Specific Parameters” on page 6-128
- “Common Block Properties” on page 6-109

Examples

Get a Block Parameter Value and a Model Parameter Value

Load the `vdp` model.

```
load_system('vdp');
```

Get the value for the `Expression` block parameter.

```
BlockParameterValue = get_param('vdp/Fcn', 'Expression')
```

```
BlockParameterValue =  
    1 - u*u
```

Get the value for the SolverType model parameter.

```
SolverType = get_param('vdp', 'SolverType')
```

```
SolverType =  
    Variable-step
```

Get Root Parameter Names and Values

Get a list of global parameter names by finding the difference between the Simulink root parameter names and the model parameter names.

```
RootParameterNames = fieldnames(get_param(0, 'ObjectParameters'));  
load_system('vdp')  
ModelParameterNames = fieldnames(get_param('vdp', 'ObjectParameters'));  
GlobalParameterNames = setdiff(RootParameterNames, ModelParameterNames)
```

```
GlobalParameterNames =  
    'AutoSaveOptions'  
    'CacheFolder'  
    'CallbackTracing'  
    'CharacterEncoding'  
    . . .  
    'CurrentSystem'
```

Get the value of a global parameter.

```
GlobalParameterValue = get_param(0, 'CurrentSystem')
```

```
GlobalParameterValue =  
    vdp
```

Get Model Parameter Names and Values

Get a list of model parameters for the vdp model .

```
load_system('vdp')
ModelParameterNames = get_param('vdp','ObjectParameters')

ModelParameterNames =
    Name: [1x1 struct]
    Tag: [1x1 struct]
    Description: [1x1 struct]
    Type: [1x1 struct]
    Parent: [1x1 struct]
    Handle: [1x1 struct]
    .
    .
    .
    Version: [1x1 struct]
```

Get the current value of the ModelVersion model parameter for the vdp model.

```
ModelParameterValue = get_param('vdp','ModelVersion')

ModelParameterValue =
    1.6
```

Get All Blocks and a Parameter Value

Get a list of block paths and names for the vdp model.

```
load_system('vdp')
BlockPaths = find_system('vdp','Type','Block')

BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

Get a list of block dialog parameters for the Fcn block.

```
BlockDialogParameters = get_param('vdp/Fcn','DialogParameters')
```

```
BlockDialogParameters =  
    Expr: [1x1 struct]  
    SampleTime: [1x1 struct]
```

Get the value for the Expr block parameter.

```
BlockParameterValue = get_param('vdp/Fcn', 'Expr')
```

```
BlockParameterValue =  
    1 - u*u
```

Get a Block Parameter Value Using a Block Handle

If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector, e.g., 'vdp/Fcn'.

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use `getSimulinkBlockHandle` to load the vdp model if necessary (by specifying `true`), and get a handle to the FCN block.

```
fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn', true);
```

Use the block handle with `get_param` and get the value for the Expr block parameter.

```
BlockParameterValue = get_param(fcnblockhandle, 'Expression')
```

```
BlockParameterValue =  
    1 - u*u
```

Display Block Types for all Blocks in a Model

Get a list of block paths and names for the vdp model.

```
load_system('vdp')  
BlockPaths = find_system('vdp', 'Type', 'Block')
```

```
BlockPaths =
    'vdp/Fcn'
    'vdp/More Info'
    'vdp/More Info/Model Info'
    'vdp/Mu'
    'vdp/Mux'
    'vdp/Product'
    'vdp/Scope'
    'vdp/Sum'
    'vdp/x1'
    'vdp/x2'
    'vdp/Out1'
    'vdp/Out2'
```

Get the value for the `BlockType` parameter for each of the blocks in the `vdp` model.

```
BlockTypes = get_param(BlockPaths, 'BlockType')
```

```
BlockTypes =
    'Fcn'
    'SubSystem'
    'SubSystem'
    'Gain'
    'Mux'
    'Product'
    'Scope'
    'Sum'
    'Integrator'
    'Integrator'
    'Outport'
    'Outport'
```

- “Associating User Data with Blocks”
- “Use MATLAB Commands to Change Workspace Data”

Input Arguments

Object — Name or handle of a model or block, or root

handle | character vector | cell array of character vectors | 0

Handle or name of a model or block, or root, specified as a numeric handle or a character vector, a cell array of character vectors for multiple blocks, or 0 for root. A numeric

handle must be a scalar. You can also get parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `get_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Specify 0 to get root parameter names, including global parameters and model parameters for the current Simulink session.

- Global parameters include Editor preferences and Simulink Coder parameters.
- Model parameters include configuration parameters, Simulink Coder parameters, and Simulink Code Inspector™ parameters.

Example: `'vdp/Fcn'`

Parameter — Parameter of model or block, or root
character vector

Parameter of model or block, or root, specified as a character vector or 0 for root. The table shows special cases.

Specified Parameter	Result
'ObjectParameters'	Returns a structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
'DialogParameters'	Returns a structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	Result
Parameter name, e.g., 'BlockType'. Specify any model or block parameter, or block dialog box parameter.	Returns the value of the specified model or block parameter. If you specified multiple blocks as a cell array, returns a cell array with the values of the specified parameter common to all blocks. All of the specified blocks in the cell array must contain the parameter, otherwise the function returns an error.

Example: 'ObjectParameters'

Data Types: char

Output Arguments

ParamValue — The name or value of the specified parameter for the specified model or block, or root

any data type, depending on the parameter

The name or value of the specified parameter for the specified model or block, or root. If you specify multiple objects, the output is a cell array of objects. The table shows special cases.

Specified Parameter	ParamValue Returned
'ObjectParameters'	A structure array with the parameter names of the specified object (model, block, or root) as separate fields in the structure.
'DialogParameters'	A structure array with the block dialog box parameter names as separate fields in the structure. If the block has a mask, the function instead returns the mask parameters.

Specified Parameter	ParamValue Returned
Parameter name, e.g., 'BlockType'	The value of the specified model or block parameter. If multiple blocks are specified as a cell array, returns a cell array with the values of the specified parameter common to all blocks.

If you get the root parameters by specifying `get_param(0, 'ObjectParameters')`, then the output `ParamValue` is a structure array with the root parameter names as separate fields in the structure. Each parameter field is a structure containing these fields:

- **Type** — Parameter type values are: 'boolean', 'string', 'int', 'real', 'point', 'rectangle', 'matrix', 'enum', 'ports', or 'list'
- **Enum** — Cell array of enumeration character vector values that applies only to 'enum' parameter types
- **Attributes** — Cell array of character vectors defining the attributes of the parameter. Values are: 'read-write', 'read-only', 'read-only-if-compiled', 'write-only', 'dont-eval', 'always-save', 'never-save', 'nondirty', or 'simulation'

getActiveConfigSet

Get model's active configuration set or configuration reference

Syntax

```
myConfigObj = getActiveConfigSet(model)
```

Arguments

model

The name of an open model, or `gcs` to specify the current model

Description

`getActiveConfigSet` returns the configuration set or configuration reference (configuration object) that is the active configuration object of model.

Examples

The following example returns the active configuration object of the current model. The code is the same whether the object is a configuration set or configuration reference.

```
myConfigObj = getActiveConfigSet(gcs);
```

Introduced before R2006a

getCallbackAnnotation

Get annotation executing callback

Syntax

```
ann = getCallbackAnnotation
```

Description

`ann = getCallbackAnnotation` gets the annotation from which a callback was invoked. Invoke a callback from an annotation click function. After you get the annotation, you can, for example, get text or parameters from the annotation to use someplace else in your model.

For information on click functions, see “Associate a Click Function with an Annotation”.

Examples

Click Annotation to Change Parameter Value

Invoke a callback by way of an annotation click function. This example shows how to change a parameter value on a block to the value shown on an annotation.

Open `vdp`. Add and position two annotations. Each annotation displays a different value.

```
open_system('vdp');  
an1 = Simulink.Annotation('vdp/1');  
an1.position = [100,300];  
an2 = Simulink.Annotation('vdp/3');  
an2.position = [150,300];
```

Assign a click function to each annotation. The click function uses `getAnnotationCallback` to get the annotation instance. Get the text from each annotation and use it to set the parameter on the Gain block (`Mu`).

```
an1.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'', ''Gain'  
an2.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'', ''Gain'
```

Click each annotation. When you click, the gain value on the Mu block changes to the number shown on the annotation.

Output Arguments

ann — Annotation

`Simulink.Annotation` instance

Annotation, returned as a `Simulink.Annotation` instance.

See Also

`Simulink.Annotation`

Topics

“Associate a Click Function with an Annotation”

Introduced before R2006a

getComponent

Get a configuration set component

Syntax

```
component = getComponent(cs, componentName)
```

Description

`component = getComponent(cs, componentName)` returns the specified component from a configuration set. With no component name specified, returns a list of the components contained in the configuration set.

Examples

Get a Component for a Configuration Set

Get the solver component for the active configuration set.

Get the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Get the solver component of the active configuration set.

```
hSolverConfig = getComponent(hCs, 'Solver');
```

Get List of Components for an Active Configuration Set

Get a list of the components contained in the active configuration set.

Get the active configuration set of the currently selected model.

```
hCs = getActiveConfigSet(gcs);
```

Get the list of components contained in the configuration set.

```
getComponent(hCs)
```

The code displays the names of the components at the MATLAB command line.

Input Arguments

cs — Configuration set object

`ConfigSet` object

Configuration set, specified as a `ConfigSet` object

componentName — Component name

character vector

Name of a component object, specified as a character vector. If a component name is not specified, the function displays a list of the components contained in the configuration set at the MATLAB command line.

Example: 'Solver'

Output Arguments

component — Component

`Simulink.ConfigComponent` object

A component in the configuration set, returned as an instance of a `Simulink.ConfigComponent` object

See Also

Topics

“About Configuration Sets”

“Manage a Configuration Set”

Introduced before R2006a

getConfigSet

Get one of model's configuration sets or configuration references

Syntax

```
myConfigObj = getConfigSet(model, configObjName)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObjName`

The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`getConfigSet` returns the configuration set or configuration reference (configuration object) that is attached to `model` and is named `configObjName`. If no such object exists, an error occurs.

Examples

The following example returns the configuration object that is named `DevConfig` and attached to the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
myConfigObj = getConfigSet(gcs, 'DevConfig');
```

Topics

“Manage a Configuration Set”

“Manage a Configuration Reference”

Introduced before R2006a

getConfigSets

Get names of all of model's configuration sets or configuration references

Syntax

```
myConfigObjNames = getConfigSets(model)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

Description

`getConfigSets` returns a cell array of character vectors specifying the names of all configuration sets and configuration references (configuration objects) attached to `model`.

Examples

The following example obtains the names of the configuration objects attached to the current model.

```
myConfigObjNames = getConfigSets(gcs)
```

getfullname

Get pathname of block or line

Syntax

```
path=getfullname(handle)
```

Description

`path=getfullname(handle)` returns the full pathname of the block or line specified by `handle`.

Examples

`getfullname(gcb)` returns the pathname of the block currently selected in the model editor's window.

The following code returns the pathname of the line currently selected in the model editor's window.

```
line = find_system(gcs, 'SearchDepth', 1, 'FindAll', 'on', ...  
    'Type', 'line', 'Selected', 'on');  
path = getfullname(line);
```

See Also

`find_system` | `gcb`

Introduced in R2007a

getInputString

Create comma-separated list of variables to map

Syntax

```
externalInputString = getInputString(inputmap, 'base')
```

```
externalInputString = getInputString(inputmap, filename)
```

```
externalInputString = getInputString(inputmap)
```

Description

`externalInputString = getInputString(inputmap, 'base')` creates an input character vector using the supplied mapping `inputmap` and the variables loaded in the base workspace ('base').

This function generates a comma-separated list of variables (input character vector) to be mapped. You can then use this list:

- As input to the `sim` command. Load the variables in the base workspace first.
- As input for the **Configuration Parameters > Data Import/Export > Input** parameter. Copy the contents of the input character vector into the text field.

This function is most useful if you have created a custom mapping.

`externalInputString = getInputString(inputmap, filename)` creates an input character vector using the supplied mapping `inputmap` and the variables defined in `filename`.

`externalInputString = getInputString(inputmap)` creates an input character vector using the signals from the most recently created mapping.

Examples

Create an input character vector from the base workspace

Create an input character vector from the base workspace and simulate a model.

Open the model

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);  
Brake     = timeseries(zeros(10,1));
```

Create a mapping (inputMap) for the model.

```
inputMap = getRootInportMap('model', ...  
    'slexAutotransRootInportsExample', ...  
    'signalName', {'Throttle', 'Brake'}, ...  
    'blockName', {'Throttle', 'Brake'});
```

Call `getInputString` with `inputMap` and 'base' as inputs.

```
externalInputString = getInputString(inputMap, 'base')  
  
externalInputString =
```

```
Throttle, Brake
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...  
externalInputString);
```

Create an external input character vector from variables in a MAT-file

Create an external input character vector from variables in a MAT-file named `input.mat`.

In a writable folder, create a MAT-file with input variables.

```
Throttle = timeseries(ones(10,1)*10);
Brake     = timeseries(zeros(10,1));
save('input.mat','Throttle','Brake');
```

Open the model.

```
slexAutotransRootInportsExample;
```

Create map object.

```
inputMap = getRootInportMap('model',...
'slexAutotransRootInportsExample',...
'signalName',{ 'Throttle','Brake'},...
'blockName',{ 'Throttle','Brake'});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap,'input.mat')

externalInputString =

Throttle,Brake
```

Load variables from the base workspace for the simulation.

```
load('input.mat');
```

Simulate the model.

```
sim('slexAutotransRootInportsExample','ExternalInput',...
externalInputString);
```

Create an external input character vector from only an input map

Create an input character vector from only an input map vector and simulate the model.

Open the model.

```
slexAutotransRootInportsExample;
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake     = timeseries(zeros(10,1));
```

Create a mapping vector for the model.

```
inputMap = getS1RootInportMap('model', 'slexAutotransRootInportsExample', ...  
    'MappingMode', 'BlockName', ...  
    'signalName', {'Throttle', 'Brake'}, ...  
    'signalValue', {Throttle, Brake});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap)
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...  
externalInputString);
```

Alternatively, if you want to input the list of variables through the Configuration Parameters dialog, copy the contents of `externalInputString` (`Throttle, Brake`) into the **Data Import/Export > Input** parameter. Apply the changes, and then simulate the model.

Input Arguments

inputmap — Map object

character vector

Map object, as returned from the `getRootInportMap` or `getS1RootInportMap` functions.

filename — Input variables

MAT-file name as character vector

Input variables, contained in a MAT-file. The file contains variables to map.

Example: `'data.mat'`

Data Types: `char`

Output Arguments

externalInputString — External input

comma-separated character vector

External input, returned as a comma-separated character vector. The character vector contains root inport information that you can specify to the `sim` command or the **Configuration Parameters > Data Import/Export > Input** parameter.

`getRootInportMap` | `getSlRootInportMap`

Topics

“Map Root Inport Signal Data”

Introduced in R2013a

getRootInportMap

Create custom object to map signals to root-level inports

Syntax

```
map = getRootInportMap('Empty');  
map = getRootInportMap(model, mdl, Name, Value);  
map = getRootInportMap(inputmap, map, Name, Value);
```

Description

`map = getRootInportMap('Empty');` creates an empty map object, *map*. Use this map object to set up an empty custom mapping object. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards.

`map = getRootInportMap(model, mdl, Name, Value);` creates a map object for *model*, *mdl*, with block names and signal names specified. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`map = getRootInportMap(inputmap, map, Name, Value);` overrides the mapping object with the specified property. You can override only the properties *model*, *blockName*, and *signalName*. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Use the `getRootInportMap` function when creating a custom mapping mode to map data to root-level inports. See the example file `BlockNameIgnorePrefixMap.m`, located in `matlabroot/help/toolbox/simulink/examples`, for an example of a custom mapping algorithm.

Input Arguments

Empty

Create an empty map object.

Default: none

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

model

Name of model to associate with the root inport map.

Default: None

blockName

Block names of root-level input ports. The tool assigns data to ports according to the name of the root-inport block. If the tool finds a data element whose name matches the name of a root-inport block, it maps the data to the corresponding port.

The value for this argument can be:

Block name of root-level input ports.

Cell array containing multiple block names of root-level input ports.

Default: None

signalName

Signal names to be mapped. The tool assigns data to ports according to the name of the signal on the port. If the tool finds a data element whose name matches the name of a signal at a port, it maps the data to the corresponding port.

The value for this argument can be:

Signal name to be mapped.

Cell array containing multiple signal names of signals to be mapped.

Default: None

inputmap

Name of mapping object to override.

Default: None

Output Arguments

map

Custom object that you can use to map data to root-level input port. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Examples

Empty Mapping Object

Create an empty custom mapping object.

```
map = getRootInportMap('Empty')
```

```
map =
```

```
1x0 InputMap array with properties:
```

```
Type  
DataSourceName  
Destination
```

Simple Mapping Object

Create a simple mapping object using a MATLAB time series object.

Create a time series object, `signalIn1`.

```

signalIn1 = timeseries((1:10)')

Common Properties:
    Name: 'unnamed'
    Time: [10x1 double]
    TimeInfo: [1x1 tsdata.timemetadata]
    Data: [10x1 double]
    DataInfo: [1x1 tsdata.datametadata]

```

Create a mapping object for the time series object for the model, `ex_minportsOnlyModel`.

```

modelFile = fullfile(matlabroot, 'help', 'toolbox', 'simulink', ...
    'examples', 'ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model', 'ex_minportsOnlyModel', ...
    'blockName', 'In1', 'signalname', 'signalIn1')

```

```
map =
```

```

InputMap with properties:
    Type: 'Inport'
    DataSourceName: 'signalIn1'
    Destination: [1x1 Simulink.iospecification.Destination]

```

Mapping Object with Vectors

Create a mapping object using vectors of block names and signal names for the model `ex_minportsOnlyModel`.

Create a mapping object of vectors.

```

modelFile = fullfile(matlabroot, 'help', 'toolbox', 'simulink', ...
    'examples', 'ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model', 'ex_minportsOnlyModel', ...
    'blockName', {'In1' 'In2'}, ...
    'signalname', {'signalIn1' 'signalIn2'})

```

```
map =
```

```
1x2 InputMap array with properties:
```

```
Type
DataSourceName
Destination
```

Overriding Maps

Create a mapping object that contains the signal *var2*, then override *var2* with *var1*.

Create a mapping object of vectors.

```
% Load the model and define variables
modelFile = fullfile(matlabroot, 'help', 'toolbox', 'simulink', ...
    'examples', 'ex_minportsOnlyModel');
load_system(modelFile);
modelValue = 'ex_minportsOnlyModel';
blockNameValue = 'In1';
signalNameValue = 'var2';
portType = 'Inport';

% Define var1 and override var2 with var1
signalNameToOverload = 'var1';
mapToOverload = getRootInportMap('model', modelValue, ...
    'blockName', blockNameValue, ...
    'signalName', signalNameToOverload)

mapToOverload =

    InputMap with properties:

        Type: 'Inport'
    DataSourceName: 'var1'
    Destination: [1x1 Simulink.iospecification.Destination]
```

- “Create Custom Mapping File Function”

Tips

- Load the model before running this function.
- If your custom mapping mode similar to an existing Simulink mapping mode, consider using the `getS1RootInportMap` function instead.

Topics

“Create Custom Mapping File Function”

Introduced in R2012b

getSimulinkBlockHandle

Get block handle from block path

Syntax

```
handle = getSimulinkBlockHandle(path)
handle = getSimulinkBlockHandle(path,true)
```

Description

`handle = getSimulinkBlockHandle(path)` returns the numeric handle of the block specified by `path`, if it exists in a loaded model or library. Returns `-1` if the block is not found. Library links are resolved where necessary.

Use the numeric handle returned by `getSimulinkBlockHandle` to manipulate the block in subsequent calls to `get_param` or `set_param`. This approach is more efficient than making multiple calls to these functions using the full block path. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block. The handle applies only to the current MATLAB session.

Use `getSimulinkBlockHandle` to check whether a block path is valid. This approach is more efficient than calling `get_param` inside a `try` statement.

`handle = getSimulinkBlockHandle(path,true)` attempts to load the model or library containing the specified block path, and then checks if the block exists. No error is returned if the model or library is not found. Any models or libraries loaded this way remain in memory even if the function does not find a block with the specified path.

Examples

Get the Handle of a Block

Get the handle of the `Pilot` block.

```
load_system('f14')
handle = getSimulinkBlockHandle('f14/Pilot')

handle =

    562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Load the Model and Get the Block Handle

Load the model `f14` if necessary (by specifying `true`), and get the handle of the `Pilot` block.

```
handle = getSimulinkBlockHandle('f14/Pilot',true)

handle =

    562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Check If a Model Contains a Specific Block

Check whether the model `f14` is loaded and contains a block named `Pilot`. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`.

```
valid_block_path = getSimulinkBlockHandle('f14/Pilot') > 0

valid_block_path =

    0
```

The model contains the block but the model is not loaded, so this command returns `0` because it cannot find the block.

Using `getSimulinkBlockHandle` to check whether a block path is valid is more efficient than calling `get_param` inside a `try` statement.

Input Arguments

path — Block path name

character vector | cell array of character vectors

Block path name, specified as a character vector or a cell array of character vectors.

Example: `'f14/Pilot'`

Data Types: `char`

Output Arguments

handle — Numeric handle of a block

double | array of doubles

Numeric handle of a block, returned as a double or an array of doubles. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`. If the `path` input is a cell array of character vectors, then the output is a numeric array of handles.

Data Types: `double`

See Also

`get_param` | `set_param`

Introduced in R2015a

getSlRootInportMap

Create custom object to map signals to root-level inports using Simulink mapping mode

Syntax

```
inputMap = getSlRootInportMap('model', modelname, 'MappingMode',
mappingmode, 'SignalName', signalname, 'SignalValue', signalvalue)
[inputMap, hasASignal] = getSlRootInportMap('model',
modelname, 'MappingMode', mappingmode, 'SignalName',
signalname, 'SignalValue', signalvalue)
```

```
inputMap = getSlRootInportMap('model',
modelname, 'MappingMode', 'Custom', 'CustomFunction',
customfunction, 'SignalName', signalname, 'SignalValue', signalvalue)
[inputMap, hasASignal] = getSlRootInportMap('model',
modelname, 'MappingMode', 'Custom', 'CustomFunction',
customfunction, 'SignalName', signalname, 'SignalValue', signalvalue)
```

Description

`inputMap = getSlRootInportMap('model', modelname, 'MappingMode', mappingmode, 'SignalName', signalname, 'SignalValue', signalvalue)` creates a root inport map using one of the Simulink mapping modes. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`[inputMap, hasASignal] = getSlRootInportMap('model', modelname, 'MappingMode', mappingmode, 'SignalName', signalname, 'SignalValue', signalvalue)` returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

```
inputMap = getSlRootInportMap('model',
modelname, 'MappingMode', 'Custom', 'CustomFunction',
```

`customfunction, 'SignalName', signalname, 'SignalValue', signalvalue)` creates a root inport map using a custom mapping mode specified in `customfunction`. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

```
[inputMap, hasASignal] = getSIRootInportMap('model',  
modelname, 'MappingMode', 'Custom', 'CustomFunction',  
customfunction, 'SignalName', signalname, 'SignalValue', signalvalue)
```

returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

To map signals to root-level inports using custom mapping modes, you can use `getSIRootInport` with the Root Inport Mapper dialog box custom mapping capability.

Examples

Create inport map using Simulink mapping mode

Create a vector of inport maps using a built-in mapping mode.

```
Throttle = timeseries(ones(10,1)*10);  
Brake    = timeseries(zeros(10,1));  
inputMap = getSIRootInportMap('model', 'slexAutotransRootInportsExample', ...  
    'MappingMode', 'BlockName', ...  
    'SignalName', {'Throttle' 'Brake'}, ...  
    'SignalValue', {Throttle Brake});
```

Create inport map using custom function

Create a vector of inport maps using a custom function

```
port1    = timeseries(ones(10,1)*10);  
port2    = timeseries(zeros(10,1));  
inputMap = getSIRootInportMap('model', 'slexAutotransRootInportsExample', ...  
    'MappingMode', 'Custom', ...  
    'CustomFunction', 'slexCustomMappingMyCustomMap', ...
```

```
'SignalName',{'port1' 'port2'},...
'SignalValue',{port1 port2});
```

Input Arguments

modelName — Model name

character vector

Specify the model to associate with the root inport map.

Data Types: char

mappingmode — Simulink mapping mode

character vector

Specify the mapping mode to use with model name and data source. Possible values are:

'Index'	Assign sequential index numbers, starting at 1, to the data in the MAT-file, and map this data to the corresponding inport.
'BlockName'	Assign data to ports according to the name of the root-inport block. If the block name of a data element matches the name of a root-inport block, map the data to the corresponding port.
'SignalName'	Assign data to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, map the data to the corresponding port.
'BlockPath'	Assign data to ports according to the block path of the root-inport block. If the block path of a data element matches the block path of a root-inport block, map the data to the corresponding port.
'Custom'	Apply mappings according to the definitions in a custom file.

Data Types: char

customfunction — Custom function file name

character vector

Specify name of file that implements a custom method to map signals to root-level ports. This function must be on the MATLAB path.

Data Types: char

signalname — signal name

scalar | cell array of character vectors

Specify the signal name(s) of the signal to associate with the root inport map.

Data Types: char | cell

signalvalue — signal value

scalar | cell arrays

Specify the values of the signals to map to the root inport map. For the list of supported data types for the values, see “Choose a Base Workspace and MAT-File Format”.

Output Arguments

inputMap — input map

scalar | vector

Mapping object that defines the mapping of input signals to root-level ports. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

hasASignal — signal presence indicator

scalar | vector

A vector of logical values with the same length as `inputMap`. If the value is true the `inputMap` has a signal associated with it. If the value is false the `inputMap` does not have a signal associated with it and will use a ground value as an input

Data Types: logical

Tips

- Load the model before running this function.
- If your custom mapping mode is not similar to an existing Simulink mapping mode, consider using the `getRootInportMap` function instead.

`getInputString` | `getRootInportMap`

Topics

“Map Root Inport Signal Data”

Introduced in R2013b

getVariable

Get value of variable from workspace

Syntax

```
variableValue = getVariable(workspaceHandle, variableName)
variableValue = workspaceHandle.getVariable(variableName)
```

Description

`variableValue = getVariable(workspaceHandle, variableName)` returns the value of the variable. If the variable does not exist in the workspace, an error occurs.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of a handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 2-337).

`variableValue = workspaceHandle.getVariable(variableName)` is an alternative syntax.

Input Arguments

workspaceHandle

Handle to the workspace containing the variable.

variableName

Name of the variable containing the value.

Output Arguments

variableValue

Value of the variable.

Examples

Get Value of Workspace Variable

Get the value of the workspace variable `K`, which is defined in model `mdl`.

```
wksp = get_param(mdl, 'ModelWorkspace')
value = getVariable(wksp, 'K')
```

```
value =
    5
```

Modify Property Value of Handle Object

Modify a property of the `Simulink.Parameter` object `K`, which is defined in model `mdl`. When you call `getVariable`, use the `copy` method because `Simulink.Parameter` is a handle class.

```
wksp = get_param(mdl, 'ModelWorkspace');
value = copy(getVariable(wksp, 'K'));
value.DataType = 'single';
assignin(wksp, 'K', value);
```

See Also

`get_param`

Introduced in R2012a

hasVariable

Determine if variable exists in workspace

Syntax

```
variableExists = hasVariable(workspaceHandle, variableName)  
variableExists = workspaceHandle.hasVariable(variableName)
```

Description

variableExists = hasVariable(*workspaceHandle*, *variableName*) returns 1 if the variable exists in the workspace, and 0 if not.

variableExists = *workspaceHandle*.hasVariable(*variableName*) is an alternative syntax.

Input Arguments

workspaceHandle

Handle to the workspace.

variableName

Name of the variable.

Output Arguments

variableExists

Boolean value that indicates whether the variable exists in the workspace (1 if true and 0 if false).

Examples

Determine Existence of Variable

Determine if the variable K exists in the workspace for model mdl.

```
wksp = get_param(mdl, 'ModelWorkspace')
exists = hasVariable(wksp, 'K')

exists =
    1
```

`get_param`

Introduced in R2012a

hdllib

Display blocks that are compatible with HDL code generation

Syntax

```
hdllib
hdllib('off')
hdllib('html')
hdllib('librarymodel')
```

Description

`hdllib` displays the blocks that are supported for HDL code generation, and for which you have a license, in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this Library Browser view.

If you close and reopen the Library Browser in the same MATLAB session, the Library Browser continues to show only the blocks supported for HDL code generation. To show all blocks, regardless of HDL code generation compatibility, at the command prompt, enter `hdllib('off')`.

`hdllib('off')` displays all the blocks for which you have a license in the Library Browser, regardless of HDL code generation compatibility.

`hdllib('html')` creates a library of blocks that are compatible with HDL code generation. It generates two additional HTML reports: a categorized list of blocks (`hdlblklist.html`) and a table of blocks and their HDL code generation parameters (`hdlsupported.html`).

To run `hdllib('html')`, you must have an HDL Coder license.

`hdllib('librarymodel')` displays blocks that are compatible with HDL code generation in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this library.

The default library name is `hdlSupported`. After you generate the library, you can save it to a folder of your choice.

To keep the library current, you must regenerate it each time that you install a new software release.

To run `hdlLib('librarymodel')`, you must have an HDL Coder license.

Examples

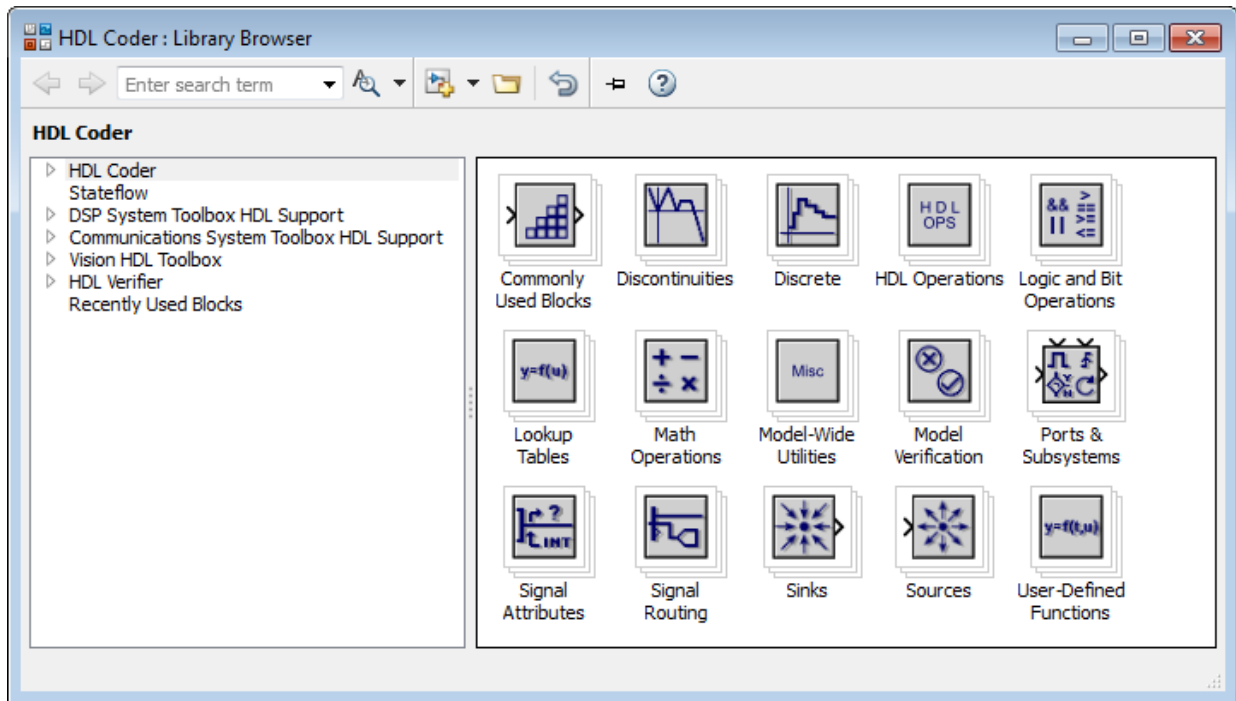

Display Supported Blocks in the Library Browser

To display blocks that are compatible with HDL code generation in the Library Browser:

```
hdlLib
```

```
### Generating view of HDL Coder compatible blocks in Library Browser.
```

```
### To restore the Library Browser to the default Simulink view, enter "hdlLib off".
```

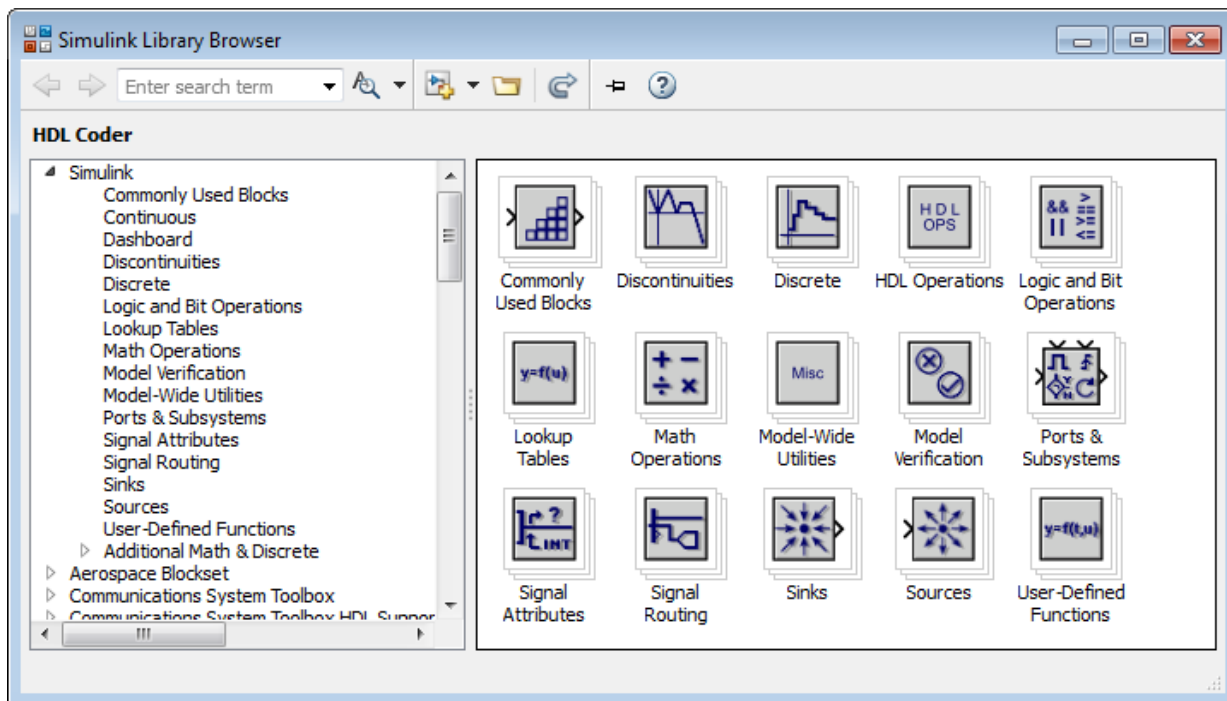

Display All Blocks in the Library Browser

To display all blocks in the Library Browser, regardless of HDL code generation compatibility:

```
hdlilib('off')
```

```
### Restoring Library Browser to default view; removing the HDL Coder compatibility fil
```

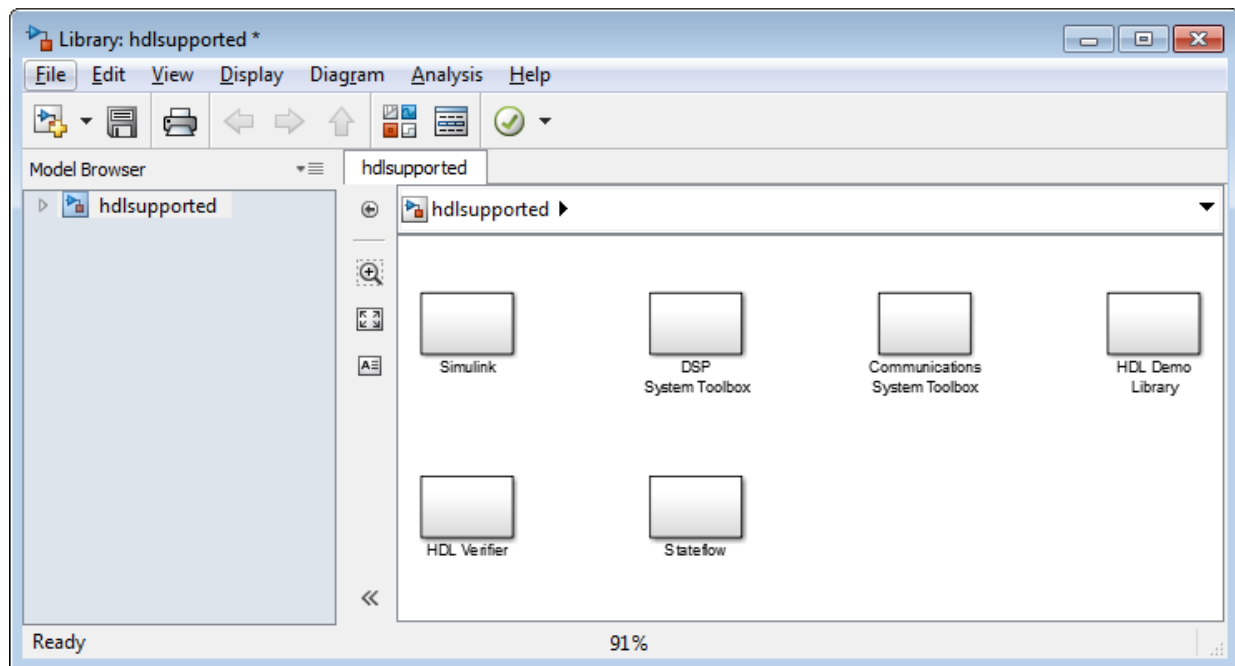

Create a Supported Blocks Library and HTML Reports

To create a library and HTML reports showing the blocks that are compatible with HDL code generation:

```
hdlLib('html')

### HDL supported block list hdlblklist.html
### HDL implementation list hdl-supported.html
```

The `hdl-supported` library opens. To view the reports, click the `hdlblklist.html` and `hdl-supported.html` links.

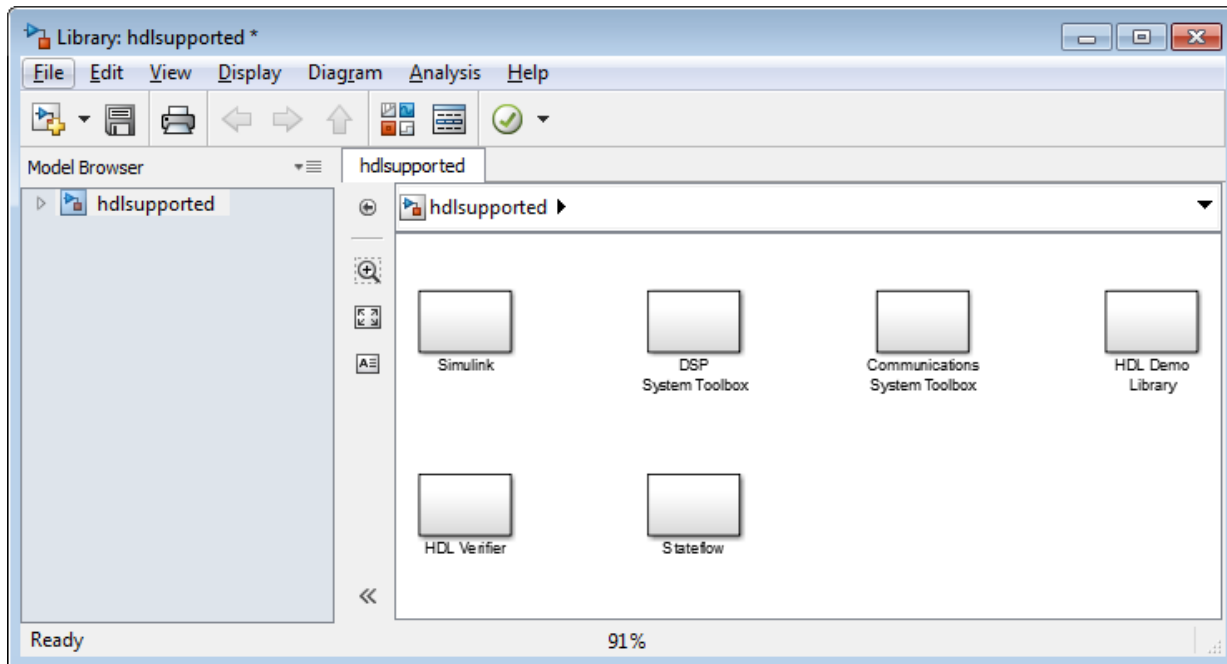

Create a Supported Blocks Library

To create a library that contains blocks that are compatible with HDL code generation:

```
hdlilib('librarymodel')
```

The `hdl_supported` block library opens.

- “Show Blocks Supported for HDL Code Generation” (HDL Coder)
- “View HDL-Specific Block Documentation” (HDL Coder)
- “Prepare Simulink Model For HDL Code Generation” (HDL Coder)

Introduced in R2006b

hilite_system

Highlight block, signal line, port, or annotation

Syntax

```
hilite_system(obj)  
hilite_system(obj, style)
```

Description

`hilite_system(obj)` highlights a block, line, port, or annotation in an open model using the default highlight style. Use `hilite_system` with a port to highlight the signal line attached to the port. Each use of `hilite_system` adds to the highlighting. Highlighting is not saved with the model.

`hilite_system(obj, style)` uses the specified highlighting style.

Input Arguments

obj — **Block, port, line, or annotation to highlight**

block path name | numeric handle | traceability tag

Block, port, line, or annotation to highlight, specified as:

- The full block path name
- A numeric handle for lines, ports, or annotations
- A traceability tag from the comments of Simulink Coder generated code.

Using a traceability tag requires a Simulink Coder license.

The format for a traceability tag is `<system>/block`, where `system` is either:

- Root

- A unique system number assigned by Simulink during code generation

Example: 'vdp/Mu', 'sldemo_fuelsys/fuel_rate_control/airflow_calc', '<Root>/Mu'

style — Highlighting style

'default' (default) | character vector

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-349.

- 'default' — Default color scheme: red outline, yellow fill.
- 'none' — Clears the highlight.

To clear all highlighting, in the Simulink Editor, select **Display > Remove Highlighting**.

- 'debug' — Uses default color scheme.
- 'different' — Applies red outline, white fill.
- 'error' — Uses default color scheme.
- 'fade' — Applies gray outline, white fill.
- 'find' — Applies dark blue outline, blue fill.
- 'lineTrace' — Applies red outline, blue fill.
- 'unique' — Dark blue outline, white fill.
- 'user1', 'user2', 'user3', 'user4', 'user5' — Applies custom highlight: black outline, white fill by default (i.e., no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- 'orangeWhite'
- 'blackWhite'
- 'redWhite'
- 'blueWhite'
- 'greenWhite'

Examples

Highlight Block Using Default Highlight Style

Open the model `slexAircraftExample`.

```
slexAircraftExample
```

Highlight the Controller block. When you use the default highlight style, the block appears highlighted with a red outline and yellow fill.

```
hilite_system('slexAircraftExample/Controller')
```

Highlight a Block Using a Highlight Style

Open the model `vdp`.

```
vdp
```

Highlight the Mu block using the style 'fade'.

```
hilite_system('vdp/Mu', 'fade')
```

Use Block Highlighting to Trace Generated Code

If you have a Simulink Coder license, you can trace generated code to the corresponding source block in a model.

Open the model `f14`.

```
f14
```

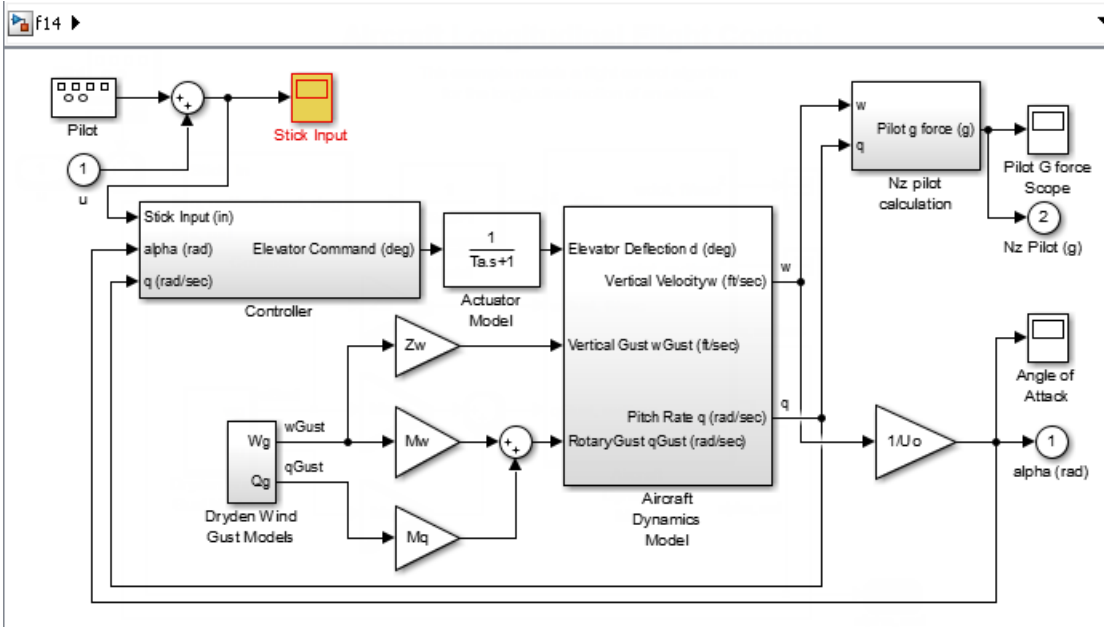

In the model configuration parameters, in the **Solver** pane, set **Type** to `Fixed-step`.

Generate code for the model using **Code > C/C++ Code > Build Model**.

In an editor or in the code generation report, open a generated source or header file. As you review lines of code, note traceability tags that correspond to code of interest.

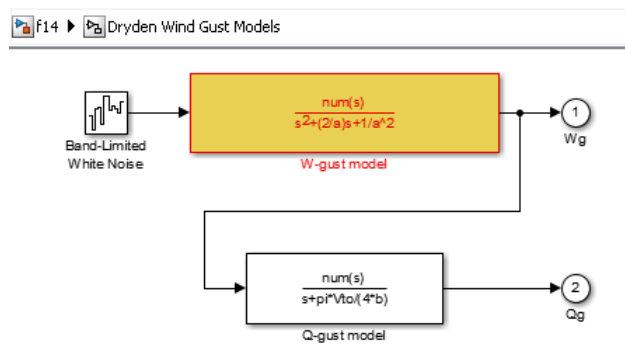

Highlight a block using a traceability tag.

```
hilite_system('<Root>/Stick Input')
```

Highlight a block in a subsystem.

```
hilite_system('<S3>/W-gust model')
```

Customize a Highlighting Style

You can customize a highlighting style by setting the `'HiliteAncestorsData'` parameter on the root-level model using `set_param` in this form:

```
set_param(0, 'HiliteAncestorsData', hiliteData)
```

Specify `hiliteData` as a structure array that has these fields:

- `'HiliteType'` — Highlighting style to customize, such as `'user1'`, `'debug'`, or `'error'`.
- `'ForegroundColor'` — Color for block fill.
- `'BackgroundColor'` — Color for block outline.

The supported values for `'ForegroundColor'` and `'BackgroundColor'` are:

- `'black'`
- `'white'`
- `'gray'`
- `'red'`
- `'orange'`
- `'yellow'`
- `'green'`
- `'darkGreen'`
- `'blue'`
- `'lightBlue'`
- `'cyan'`
- `'magenta'`

Define a highlight style for `'user1'`, and customize the style for `'debug'`.

```
set_param(0, 'HiliteAncestorsData', ...
          struct('HiliteType', 'user1', ...
                'ForegroundColor', 'darkGreen', ...
                'BackgroundColor', 'lightBlue'));
set_param(0, 'HiliteAncestorsData', ...
          struct('HiliteType', 'debug', ...
```

```
'ForegroundColor','red',...  
'BackgroundColor','black'));
```

Use the defined style to highlight a block.

```
f14  
hilite_system('f14/Controller/Alpha-sensor Low-pass Filter','user1')
```

[find_system](#) | [rtwtrace](#)

Introduced before R2006a

isLoaded

Determine if Simulink Project is loaded

Syntax

```
loaded = isLoaded(proj)
```

Description

`loaded = isLoaded(proj)` returns whether the project referenced by the project object `proj` is loaded.

Examples

Find Out if Project Is Loaded

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Find out if the project is still loaded.

```
loaded = isLoaded(proj)
```

```
loaded =
```

```
1
```

Input Arguments

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Output Arguments

loaded — Loaded status

1 | 0

Project loaded status, returned as true (1) if the project is loaded.

Data Types: `logical`

legacy_code

Use Legacy Code Tool

Syntax

```
legacy_code('help')
specs = legacy_code('initialize')
legacy_code('sfcn_cmex_generate', specs)
legacy_code('compile', specs, compilerOptions)
legacy_code('generate_for_sim', specs, modelname)
legacy_code('slblock_generate', specs, modelname)
legacy_code('sfcn_tlc_generate', specs)
legacy_code('sfcn_makecfg_generate', specs)
legacy_code('rtwmakecfg_generate', specs)
legacy_code('backward_compatibility')
```

Description

The `legacy_code` function creates a MATLAB structure for registering the specification for existing C or C++ code and the S-function being generated. In addition, the function can generate, compile and link, and create a masked block for the specified S-function. Other options include generating

- A TLC file for simulation in Accelerator mode or code generation
- An `rtwmakecfg.m` file that you can customize to specify dependent source and header files that reside in a different directory than that of the generated S-function

`legacy_code('help')` displays instructions for using Legacy Code Tool.

`specs = legacy_code('initialize')` initializes the Legacy Code Tool data structure, `specs`, which registers characteristics of existing C or C++ code and properties of the S-function that the Legacy Code Tool generates.

`legacy_code('sfcn_cmex_generate', specs)` generates an S-function source file as specified by the Legacy Code Tool data structure, `specs`.

`legacy_code('compile', specs, compilerOptions)` compiles and links the S-function generated by the Legacy Code Tool based on the data structure, `specs`, and compiler options that you might specify. The compiler options must be supported by the `mex` function.

`legacy_code('generate_for_sim', specs, modelname)` generates, compiles, and links the S-function in a single step. If the `Options.useTlcWithAccel` field of the Legacy Code Tool data structure is set to logical 1 (`true`), the function also generates a TLC file for accelerated simulations.

`legacy_code('slblock_generate', specs, modelname)` generates a masked S-Function block for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. The block appears in the Simulink model specified by `modelname`. If you omit `modelname`, the block appears in an empty model editor window.

`legacy_code('sfcn_tlc_generate', specs)` generates a TLC file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant if you want to:

- Force Accelerator mode in Simulink software to use the TLC inlining code of the generated S-function. See the description of the `ssSetOptions SimStruct` function and `SS_OPTION_USE_TLC_WITH_ACCELERATOR` S-function option for more information.
- Use Simulink Coder software to generate code from your Simulink model. For more information, see “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('sfcn_makecfg_generate', specs)` generates an `sFunction_makecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use `makecfg` to Customize Generated Makefiles for S-Functions” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('rtwmakecfg_generate', specs)` generates an `rtwmakecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant only if you use Simulink Coder software to generate code from your Simulink model. For more information, see “Use `rtwmakecfg.m` API to Customize

Generated Makefiles” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('backward_compatibility')` automatically updates syntax for using Legacy Code Tool to the supported syntax described in this reference page and in “Integrate C Functions Using Legacy Code Tool”.

Input Arguments

specs

A structure with the following fields:

Name the S-function

`SFunctionName` (Required) — A character vector specifying a name for the S-function to be generated by the Legacy Code Tool.

Define Legacy Code Tool Function Specifications

- `InitializeConditionsFcnSpec` — A nonempty character vector specifying a reentrant function that the S-function calls to initialize and reset states. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `OutputFcnSpec` — A nonempty character vector specifying the function that the S-function calls at each time step. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `StartFcnSpec` — A character vector specifying the function that the S-function calls when it begins execution. This function can access S-function parameter arguments only. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `TerminateFcnSpec` — A character vector specifying the function that the S-function calls when it terminates execution. This function can access S-function parameter arguments only. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.

Define Compilation Resources

- `HeaderFiles` — A cell array of character vectors specifying the file names of header files required for compilation.
- `SourceFiles` — A cell array of character vectors specifying source files required for compilation. You can specify the source files using absolute or relative path names.
- `HostLibFiles` — A cell array of character vectors specifying library files required for host compilation. You can specify the library files using absolute or relative path names.
- `TargetLibFiles` — A cell array of character vectors specifying library files required for target (that is, standalone) compilation. You can specify the library files using absolute or relative path names.
- `IncPaths` — A cell array of character vectors specifying directories containing header files. You can specify the directories using absolute or relative path names.
- `SrcPaths` — A cell array of character vectors specifying directories containing source files. You can specify the directories using absolute or relative path names.
- `LibPaths` — A cell array of character vectors specifying directories containing host and target library files. You can specify the directories using absolute or relative path names.

Specify a Sample Time

`SampleTime` — One of the following:

- `'inherited'` (default) — Sample time is inherited from the source block.
- `'parameterized'` — Sample time is represented as a tunable parameter. Generated code can access the parameter by calling MEX API functions, such as `mxGetPr` or `mxGetData`.
- `Fixed` — Sample time that you explicitly specify. For information on how to specify sample time, see “Specify Sample Time”.

If you specify this field, you must specify it last.

Define S-Function Options

`Options` — A structure that controls S-function options. The structure's fields include:

- `isMacro` — A logical value specifying whether the legacy code is a C macro. By default, the value is false (0).

- `isVolatile` — A logical value specifying the setting of the S-function `SS_OPTION_NONVOLATILE` option. By default, the value is `true` (1).
- `canBeCalledConditionally` — A logical value specifying the setting of the S-function `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option. By default, the value is `true` (1).
- `useTlcWithAccel` — A logical value specifying the setting of the S-function `SS_OPTION_USE_TLC_WITH_ACCELERATOR` option. By default, the value is `true` (1).
- `language` — A character vector specifying either `'C'` or `'C++'` as the target language of the S-function that Legacy Code Tool will produce. By default, the value is `'C'`.

Note The Legacy Code Tool can interface with C++ functions, but not C++ objects. For a work around, see “Legacy Code Tool Limitations” in the Simulink documentation.

- `singleCPPMexFile` — A logical value that, if `true`, specifies that generated code:
 - Requires you to generate and manage an inlined S-function as only one file (`.cpp`) instead of two (`.c` and `.tlc`).
 - Maintains model code style (level of parentheses usage and preservation of operand order in expressions and condition expressions in if statements) as specified by model configuration parameters.

By default, the value is `false`.

Limitations You cannot set the `singleCPPMexFile` field to `true` if

- `Options.language='C++'`
- You use one of the following Simulink objects with the `IsAlias` property set to `true`:
 - `Simulink.Bus`
 - `Simulink.AliasType`
 - `Simulink.NumericType`

- The Legacy Code Tool function specification includes a `void*` or `void**` to represent scalar work data for a state argument
 - `HeaderFiles` field of the Legacy Code Tool structure specifies multiple header files
-
- `supportsMultipleExecInstances`— A logical value specifying whether to include a call to the `ssSupportsMultipleExecInstances` function. By default, the value is `false (0)`.
 - `convertNDMatrixToRowMajor`— A logical value specifying the automatic conversion of a matrix between a column-major format and a row-major format. The column-major format is used by MATLAB, Simulink, and the generated code. The row-major format is used by C. By default, the value is `false (0)`. If you currently specify the previous version of the option, `convert2DMatrixToRowMajor`, the function automatically specifies the new `convertNDMatrixToRowMajor` option.

Note This option does not support a 2-D matrix of complex data.

- `supportCoverage`— A logical value specifying whether the generated S-function must be compatible with Model Coverage. By default, the value is `false (0)`.
- `supportCoverageAndDesignVerifier`— A logical value specifying whether the generated S-function must be compatible with Model Coverage and Simulink Design Verifier™. By default, the value is `false (0)`.
- `outputsConditionallyWritten`— A logical value specifying whether the legacy code conditionally writes the output ports. If `true`, the generated S-function specifies that the memory associated with each output port cannot be overwritten and is global (`SS_NOT_REUSABLE_AND_GLOBAL`). If `false`, the memory associated with each output port is reusable and is local (`SS_REUSABLE_AND_LOCAL`). By default, the value is `false (0)`. For more information, see `ssSetOutputPortOptimOpts`.

modelName

The name of a Simulink model into which Legacy Code Tool is to insert the masked S-function block generated when you specify `legacy_code` with the action character vector `'slblock_generate'`. If you omit this argument, the block appears in an empty model editor window.

Introduced in R2006b

libinfo

Get information about library blocks referenced by model

Syntax

```
libdata = libinfo('system')  
libdata = libinfo('system', constraint1, value1, ...)
```

Description

`libdata = libinfo('system')` returns information about library blocks referenced by `system` and all the systems underneath it.

`libdata = libinfo('system', constraint1, value1, ...)` restricts the search as indicated by the search constraint(s) `c1, v1, ...`

Input Arguments

system

The system to search recursively for library blocks.

constraint1, value1, ...

One or more pairs, each consisting of a search constraint followed by a constraint value. You can specify any of the search constraints that you can use with `find_system`.

Output Arguments

libdata

An array of structures that describes each library block referenced by `system`. Each structure has the following fields:

Block

Library

ReferenceBlock

LinkStatus

Path of the link to the library block

Name of the library containing the referenced block

Path of the library block

Value of the `LinkStatus` parameter for the link to the library block

See Also

`find_system`

Topics

“Custom Libraries and Linked Blocks”

Introduced before R2006a

linmod

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod('sys');
argout = linmod('sys', x, u);
argout = linmod('sys', x, u, para);
argout = linmod('sys', x, u, 'v5');
argout = linmod('sys', x, u, para, 'v5');
argout = linmod('sys', x, u, para, xpert, upert, 'v5');
```

Arguments

<i>sys</i>	Name of the Simulink system from which the linear model is extracted.
<i>x</i> and <i>u</i>	State (<i>x</i>) and the input (<i>u</i>) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify <i>x</i> . To extract the <i>x</i> structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

<i>Ts</i>	Sample time of the discrete-time linearized model
'v5'	An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling <code>linmodv5</code> .

para

A three-element vector of optional arguments:

- para(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- para(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (τ) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- para(3) — Set para(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert and upert

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify xpert. To extract the xpert structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing xpert.signals.values.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling linmodv5 or specifying the 'v5' input argument to linmod.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A, B, C, D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmod` compute a linear state-space model by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of t at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose i th row is the block name associated with the i th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

`dlinmod` | `linmod2` | `linmodv5`

Introduced in R2007a

linmod2

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod2('sys', x, u);  
argout = linmod2('sys', x, u, para);
```

Arguments

- | | |
|-------------|---|
| <i>sys</i> | Name of the Simulink system from which the linear model is extracted. |
| <i>x, u</i> | State (<i>x</i>) and the input (<i>u</i>) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify <i>x</i> . To extract the <i>x</i> structure from the model, use the following command:
<pre>x = Simulink.BlockDiagram.getInitialState('sys');</pre> <p>You can then change the operating point values within this structure by editing <code>x.signals.values</code>.</p> <p>If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.</p> |

para

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (τ) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A, B, C, D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmod2` computes a linear state-space model by perturbing the model inputs and model states, and uses an advanced algorithm to reduce truncation error.

`linmod2` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For more information, see “Linearizing Models”.

See Also

`dlinmod` | `linmod` | `linmodv5`

Introduced in R2007a

linmodv5

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmodv5('sys');  
argout = linmodv5('sys',x,u);  
argout = linmodv5('sys', x, u, para);  
argout = linmodv5('sys', x, u, para, xpert, upert);
```

Arguments

<i>sys</i>	Name of the Simulink system from which the linear model is extracted.
<i>x</i> , <i>u</i>	State (<i>x</i>) and the input (<i>u</i>) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify <i>x</i> . To extract the <i>x</i> structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

para

A three-element vector of optional arguments:

- *para*(1) — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- *para*(2) — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (τ) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- *para*(3) — Set *para*(3)=1 to remove extra states associated with blocks that have no path from input to output. The default value is 0.

xpert, upert

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify *xpert*. To extract the *xpert* structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing *xpert.signals.values*.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.

argout

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A, B, C, D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

Description

`linmodv5` computes a linear state space model using the full model perturbation algorithm created prior to MATLAB 5.3.

`linmodv5` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of t at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

`dlinmod` | `linmod` | `linmod2`

Introduced in R2011b

load_system

Invisibly load Simulink model

Syntax

```
load_system('sys')
```

Description

`load_system('sys')` loads `sys`, where `sys` is the name of a Simulink model, into memory without making its model window visible.

You cannot use `load_system` to load MATLAB file models last saved in Simulink Version 1.3 (for example: `load_system mymodel.m`). If you have a MATLAB file model, you must upgrade to Simulink model file format as follows:

- 1 Execute the model as a function:

```
mymodel
```

- 2 Save the model as a Simulink model file:

```
save_system mymodel
```

Examples

The command

```
load_system('vdp')
```

loads the `vdp` sample model into memory.

See Also

`close_system` | `open_system`

Introduced before R2006a

loadIntoMemory

Load logged data into memory

Syntax

```
logs = loadIntoMemory(logs)
```

Description

`logs = loadIntoMemory(logs)` loads the data in `logs` into memory. Data is logged to a repository and brought into memory on an as-needed basis. When you want to work with all elements of a large set of logged data, use `loadIntoMemory` to bring all of the elements into memory at once. Loading all the data at once, rather than element by element, is much faster.

Examples

Load Logged Data into Memory

This example shows how to load a set of logged data into memory all at once, rather than element by element.

```
% Simulate model to generate logged data  
sim('sldemo_fuelsys')
```

The simulation logs all of the instrumented signals in the model to the `Simulink.SimulationData.Dataset` object `sldemo_fuelsys_output`. At the end of simulation, the signal data remains in the repository until used in the MATLAB workspace. When you work with small sets of data or only postprocess a subset, leaving signals in the repository improves performance. But when you have a large set of data and need to postprocess all of the signals, you should bring them all into memory at once.

```
% Load all logged signals into memory  
loadIntoMemory(sldemo_fuelsys_output);
```

All of the data in `sldemo_fuelsys_output` is now available for efficient postprocessing.

Input Arguments

logs — Data to load into memory

`'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'`

Data to load into memory. The `loadIntoMemory` function can load `Simulink.SimulationData.Dataset` and `Simulink.SimulationOutput` data.

Example: `logsave`

Output Arguments

logs — Data

`'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'`

Data loaded into memory.

See Also

`Simulink.SimulationData.Dataset` | `Simulink.SimulationOutput`

Introduced in R2017b

model

Execute particular phase of simulation of model

Syntax

```
[sys,x0,str,ts] = model([],[],[],'sizes');  
[sys,x0,str,ts] = model([],[],[],'compile');  
outputs = model(t,x,u,'outputs');  
derivs = model(t,x,u,'derivs');  
dstates = model(t,x,u,'update');  
model([],[],[],'term');
```

Description

The `model` command executes a specific phase of the simulation of a Simulink model whose name is `model`. The command's last argument (`flag`) specifies the phase of the simulation to be executed. See “Simulation Phases in Dynamic Systems” for a description of the steps that Simulink software uses to simulate a model.

This command ignores the effects of state transitions and conditional execution. Therefore, it is not suitable for models which have such logic. Use this command for models which can be represented as simple dynamic systems. Such systems should meet these requirements.

- All states in the model must be built-in non-bus data types. For a discussion on built-in data types, see “About Data Types in Simulink”.
- If you are using vector format to specify the state, this command can access only non-complex states of `double` data type.
- There is minimal amount of state logic (Stateflow, conditionally executed subsystems etc.)
- The models are not mixed-domain models. That is, most blocks in the model are built-in Simulink blocks and do not include user-written S-functions or blocks from other Sim* products.

For models which do not comply with these requirements, using this command can cause Simulink to produce results which can only be interpreted by further analyzing and simplifying the model.

Note The state variable x can be represented in structure as well as vector formats. The variable follows the limitations of the format in which it is specified.

This command is also not intended to be used to run a model step-by-step, for example, to debug a model. Use the Simulink debugger if you need to examine intermediate results to debug a model.

Arguments

<code>sys</code>	<p>Vector of model size data:</p> <ul style="list-style-type: none"> • <code>sys(1)</code> = number of continuous states • <code>sys(2)</code> = number of discrete states • <code>sys(3)</code> = number of outputs • <code>sys(4)</code> = number of inputs • <code>sys(5)</code> = reserved • <code>sys(6)</code> = direct-feedthrough flag (1 = yes, 0 = no) • <code>sys(7)</code> = number of sample times (= number of rows in <code>ts</code>)
<code>x0</code>	Vector containing the initial conditions of the system's states
<code>str</code>	Vector of names of the blocks associated with the model's states. The state names and initial conditions appear in the same order in <code>str</code> and <code>x0</code> , respectively.
<code>ts</code>	An m -by-2 matrix containing the sample time (period, offset) information
<code>outputs</code>	Outputs of the model at time step t .
<code>derivs</code>	Derivatives of the continuous states of the model at time t .

dstates	<p>States of the model at time t returned as either a structure or an array. Simulink returns a structure when the model has states and x is either empty (<code>[]</code>) or in structure format. Otherwise, Simulink returns an array.</p> <ul style="list-style-type: none"> • If the return type is a vector or array, Simulink returns real double discrete states only. • If the return type is a structure, Simulink returns a structure that contains both continuous and discrete states of built-in types only. Non-built-in types are omitted.
t	Time step, specified as real double in scalar format.
x	State vector, specified as real double in structure or vector format.
u	Inputs, specified as real double in vector format.
flag	<p>Specification of the simulation phase to be executed:</p> <ul style="list-style-type: none"> • 'sizes' executes the size computation phase of the simulation. This phase determines the sizes of the model's inputs, outputs, state vector, etc. • 'compile' executes the compilation phase of the simulation. The compilation phase propagates signal and sample time attributes. • 'update' computes the next values of the model's discrete states. • 'outputs' computes the outputs of the model's blocks at time t. • 'derivs' computes the derivatives of the model's continuous states at time step t. • 'term' causes Simulink software to terminate simulation of the model.

Examples

The following command executes the compilation phase of the `vdp` model that comes with Simulink software.

```
vdp([], [], [], 'compile')
```

The following command terminates the simulation initiated in the previous example.

```
vdp([], [], [], 'term')
```

Note Simulink does not let you close a model while it is compiling or simulating. For all phases except the `'sizes'` phase, before closing the model, you must invoke the model command with the `'term'` argument.

`sim`

Introduced in R2007a

modeladvisor

Open Model Advisor

Syntax

```
modeladvisor(model)
```

Description

`modeladvisor(model)` opens the Model Advisor for the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

Examples

Open Model Advisor for model

Open the Model Advisor for `vdp` example model:

```
modeladvisor('vdp')
```

Open Model Advisor for subsystem

Open the Model Advisor for the Aircraft Dynamics Model subsystem of the `f14` example model:

```
modeladvisor('f14/Aircraft Dynamics Model')
```

Open Model Advisor for currently selected model

Open the Model Advisor on the currently selected model:

```
modeladvisor (bdroot)
```

Open Model Advisor for currently selected subsystem

Open the Model Advisor on the currently selected subsystem:

```
modeladvisor (gcs)
```

Input Arguments

model — Model or subsystem name

character vector

Model or subsystem name or handle, specified as a character vector.

Data Types: `char`

See Also

“Run Model Checks”

Introduced before R2006a

new_system

Create Simulink model or library in memory

Syntax

```
h = new_system

h = new_system(name)
h = new_system(name, 'FromTemplate', template)
h = new_system(name, 'FromFile', file)
h = new_system( ___, 'ErrorIfShadowed')

h = new_system(name, 'Model')
h = new_system(name, 'Model', subsystem)
h = new_system(name, 'Library')
h = new_system( ___, 'ErrorIfShadowed')
```

Description

`h = new_system` creates a model named `untitled` (and then `untitled1`, `untitled2`, and so on) based on your default model template and returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name)` creates a model based on your default model template and gives the new model the specified name. This function returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

If `name` is empty, the function creates a model named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name, 'FromTemplate', template)` creates the model based on the specified template.

`h = new_system(name, 'FromFile', file)` creates the model based on the specified model or template.

`h = new_system(____, 'ErrorIfShadowed')` creates the model or returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. It uses any of the input arguments in the previous syntaxes.

`h = new_system(name, 'Model')` creates an empty model based on the Simulink default model and returns the new model's numeric handle. The Simulink default model is also known as the root block diagram and has the numeric handle 0. If `name` is empty, the function creates a model or library named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name, 'Model', subsystem)` creates a model based on the subsystem `subsystem` in a currently loaded model.

`h = new_system(name, 'Library')` creates an empty library that has the specified name and returns a numeric handle.

`h = new_system(____, 'ErrorIfShadowed')` returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. This syntax uses any of the input arguments in the previous syntaxes.

Examples

Create a Model Based on Default Template

Create a model in memory called `untitled`.

```
h = new_system;
```

You can use `get_param` to get the name.

```
get_param(h, 'Name')
open_system(h)
open_system('untitled')
open_system(get_param(h, 'Name'))
```

```
ans =
```

```
untitled
```

Use the name, the handle, or `get_param` command as input to `open_system`. You can use any of these commands:

Create a Model Based on Named Template

Before you use this syntax, create a template. In the Simulink Editor, create the model you want to use as the template. Then select **File > Export Model to > Template**. For this example, name the template `mytemplate`.

By default, the template is on the MATLAB path, so if you change location, add the folder to the MATLAB path.

Create a model named `templateModel` based on the template `mytemplate`.

```
h = new_system('templateModel', 'FromTemplate', 'mytemplate');
```

```
Invoking template \\myuserdir\Documents\MATLAB\mytemplate.sltx
```

Create a Model Based on Another Model

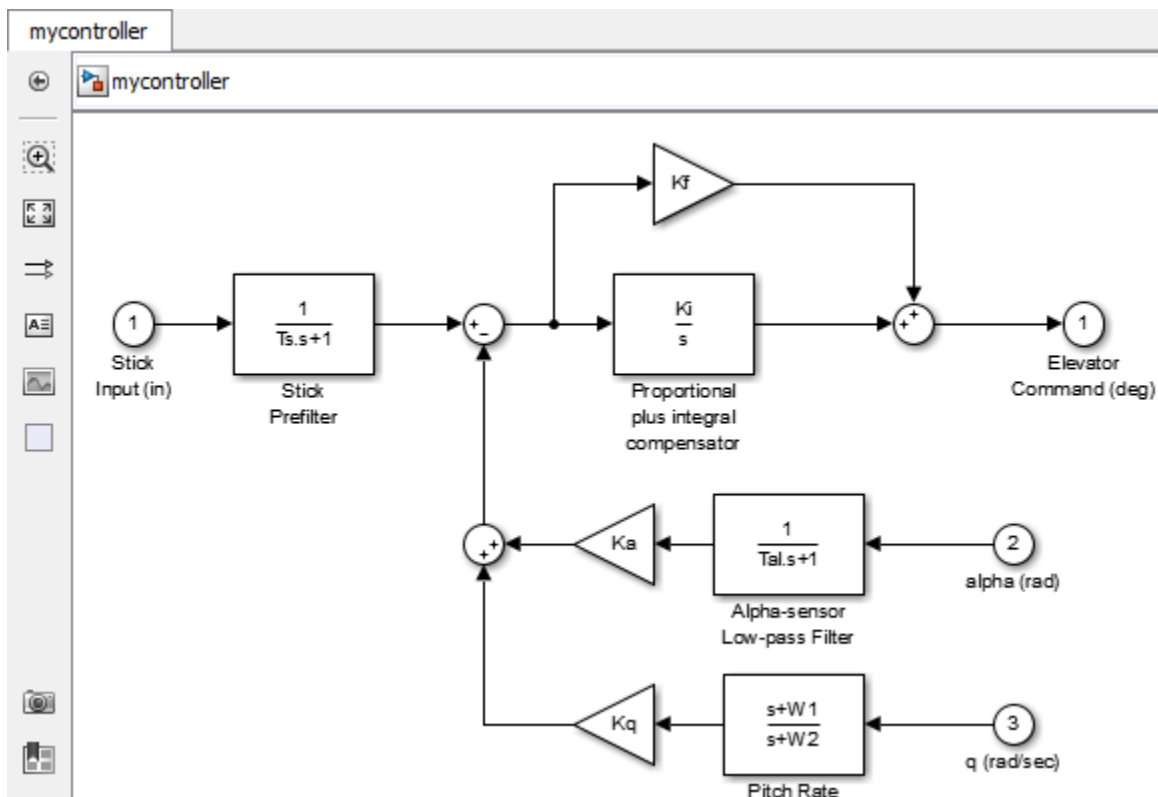

Create a model named `mynewmodel` based on `myoldmodel`, which is in the current folder.

```
h = new_system('mynewmodel', 'FromFile', 'myoldmodel.slx');
```

Create Model from Subsystem

Load the model f14. Create a model based on the Controller subsystem.

```
load_system('f14');
new_system('mycontroller', 'Model', 'f14/Controller');
open_system('mycontroller');
```

Create a Library

Create a library in memory and then open it.

```
new_system('mylib', 'Library')
open_system('mylib')
```

Ensure Model Name Is Unique

Create a variable with the name `myvar`.

```
myvar = 17
```

Try to create a model that uses the same name as the variable. When you use the `'ErrorIfShadowed'` option, the `new_system` function returns an error.

```
new_system('myvar2', 'Model', 'ErrorIfShadowed')
```

The model `'myvar2'` cannot be created because this name is shadowing another name on the path or in the workspace. Choose another name, or do not use the option `'ErrorIfShadowed'`.

Input Arguments

name — Name of new model or library

character vector

Name of new model or library, specified as a character vector that:

- Has 63 or fewer characters
- Is not a MATLAB keyword
- Is not `'simulink'`
- Is unique among model names, variables, and MATLAB files on the MATLAB path and in the workspace

Example: `'mymodel', 'mylibrary'`

subsys — Subsystem to base new model on

subsystem block path name

Subsystem to base the new model on, specified as the subsystem block path name in a currently open model.

Example: `'f14/Controller'`

template — Name of template to base new model on

character vector

Name of the template to base the new model on, specified as a character vector of the name of a template on the MATLAB path. Create a template in the Simulink Editor using **File > Export Model to > Template**.

Example: 'mytemplate', 'mytemplate.sltx'

file — Path name of model or template to base new model on

character vector

Path name of the model or template to base the new model on, specified as a character vector. You can use an .mdl, .slx, or .sltx file. Include the extension and use a full or relative path.

Example: 'Models/mymodel.slx', 'mytemplate.sltx', 'model.mdl'

`Simulink.defaultModelTemplate` | `open_system` | `save_system`

Introduced before R2006a

num2fixpt

Convert number to nearest value representable by specified fixed-point data type

Syntax

```
outValue = num2fixpt(OrigValue, FixPtDataType, FixPtScaling,  
                    RndMeth, DoSatur)
```

Description

`num2fixpt(OrigValue, FixPtDataType, FixPtScaling, RndMeth, DoSatur)` returns the result of converting `OrigValue` to the nearest value representable by the fixed-point data type `FixPtDataType`. Both `OrigValue` and `outValue` are of data type `double`. As illustrated in the example that follows, you can use `num2fixpt` to investigate quantization error that might result from converting a number to a fixed-point data type. The arguments of `num2fixpt` include:

<code>OrigValue</code>	Value to be converted to a fixed-point representation. Must be specified using a <code>double</code> data type.
<code>FixPtDataType</code>	The fixed-point data type used to convert <code>OrigValue</code> .
<code>FixPtScaling</code>	Scaling of the output in either <code>Slope</code> or <code>[Slope Bias]</code> format. If <code>FixPtDataType</code> does not specify a generalized fixed-point data type using the <code>sfix</code> or <code>ufix</code> command, <code>FixPtScaling</code> is ignored.
<code>RndMeth</code>	Rounding technique used if the fixed-point data type lacks the precision to represent <code>OrigValue</code> . If <code>FixPtDataType</code> specifies a floating-point data type using the <code>float</code> command, <code>RndMeth</code> is ignored. Valid values are <code>Zero</code> , <code>Nearest</code> , <code>Ceiling</code> , or <code>Floor</code> (the default).

`DoSatur` Indicates whether the output should be saturated to the minimum or maximum representable value upon underflow or overflow. If `FixPtDataType` specifies a floating-point data type using the `float` command, `DoSatur` is ignored. Valid values are `on` or `off` (the default).

Examples

Suppose you wish to investigate the quantization effect associated with representing the real-world value 9.875 as a signed, 8-bit fixed-point number. The command

```
num2fixpt(9.875, sfix(8), 2^-1)
```

```
ans =
```

```
9.500000000000000
```

reveals that a slope of 2^{-1} results in a quantization error of 0.375. The command

```
num2fixpt(9.875, sfix(8), 2^-2)
```

```
ans =
```

```
9.750000000000000
```

demonstrates that a slope of 2^{-2} reduces the quantization error to 0.125. But a slope of 2^{-3} , as used in the command

```
num2fixpt(9.875, sfix(8), 2^-3)
```

```
ans =
```

```
9.875000000000000
```

eliminates the quantization error entirely.

`fixptbestexp` | `fixptbestprec`

Introduced before R2006a

open_system

Open Simulink model, library, subsystem, or block dialog box

Syntax

```
open_system(obj)

open_system(sys, 'loadonly')

open_system(sbsys, 'window')
open_system(sbsys, 'tab')

open_system(blk, 'mask')
open_system(blk, 'force')
open_system(blk, 'parameter')
open_system(blk, 'OpenFcn')
```

Description

`open_system(obj)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder Browser, or the subsystem or block in the Simulink Editor.

A model or library opens in a new window. For a subsystem or block within a model, the behavior depends on the type of block and its properties.

- Any `OpenFcn` callback parameter is evaluated.
- If there is no `OpenFcn` callback, and a mask is defined, the mask parameter dialog box opens.
- Without an `OpenFcn` callback or a mask parameter, Simulink opens the object.
 - A referenced model opens in a new window.
 - A subsystem opens in a new tab in the same window.
 - For blocks, the parameters dialog box for the block opens.

To open a specific subsystem or block, you must load the model or library containing it. Otherwise Simulink returns an error.

You can override the default behavior by supplying a second input argument.

`open_system(sys, 'loadonly')` loads the specified model or library without opening the Simulink Editor. This is equivalent to using `load_system`.

`open_system(sbsys, 'window')` opens the subsystem `sbsys` in a new Simulink Editor window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(sbsys, 'tab')` opens the subsystem in a new Simulink Editor tab in the same window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk, 'mask')` opens the mask dialog box of the block or subsystem specified by `blk`. Load the model or library containing `blk` before opening it.

`open_system(blk, 'force')` looks under the mask of a masked block or subsystem. It opens the dialog box of the block under the mask or opens a masked subsystems in a new Simulink Editor tab. This is equivalent to the **Look Under Mask** menu item. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk, 'parameter')` opens the block parameter dialog box.

`open_system(blk, 'OpenFcn')` runs the block callback `OpenFcn`.

Examples

Open a Model

Open the `f14` model.

```
open_system('f14')
```

Load a Model Without Opening it

Load the f14 model.

```
open_system('f14','loadonly')
```

Open a Subsystem

Open the Controller subsystem of the f14 model.

```
load_system('f14')  
open_system('f14/Controller')
```

Open a Subsystem in New Tab in Existing Window

Open the f14 model and open the Controller subsystem in a new tab.

```
f14  
open_system('f14/Controller','tab')
```

Open a Subsystem in a Separate Window

Open a subsystem in its own Simulink Editor window.

```
open_system('f14')  
open_system('f14/Controller','window')
```

Open a Referenced Model

Open the model sldemo_mdhref_counter, which is referenced by the CounterA model block in sldemo_mdhref_basic.

```
open_system('sldemo_mdhref_basic')  
open_system('sldemo_mdhref_basic/CounterA')
```

The referenced model opens in its own Simulink Editor window.

Open Block Dialog Box

Open the block parameters dialog box for the first Gain block in the Controller subsystem.

```
load_system('f14')
open_system('f14/Controller/Gain')
```

Run Block Open Callback Function

Define an OpenFcn callback for a block and execute the block callback.

```
f14
set_param('f14/Pilot','OpenFcn','disp(''Hello World!'')')
open_system('f14/Pilot','OpenFcn')
```

The words `Hello World` appear on the MATLAB Command Prompt.

Open Masked Subsystem

Open the contents of the masked subsystem Vehicle in the model `sf_car`.

```
open_system('sf_car')
open_system('sf_car/Vehicle', 'force')
```

Open Multiple Systems with One Command

Create a cell array of two model names, `f14` and `vdp`. Open both models using `open_system` with the cell array name.

```
models = {'f14', 'vdp'}  
open_system(models)
```

Input Arguments

obj — Model, referenced model, library, subsystem, or block path

character vector

Model, referenced model, library, subsystem, or block path, specified as a character vector. If the model is not on the MATLAB path, specify the full path to the model file. Specify the block or subsystem using its full name, e.g., `f14/Controller/Gain`, on an opened or loaded model. On UNIX systems, the fully qualified path name of a model can start with a tilde (~), signifying your home directory.

Data Types: `char`

sys — Model or library path

character vector

The full name or path of a model or library, specified as a character vector.

Data Types: `char`

sbsys — Subsystem path

character vector

The full name or path of a subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

blk — Block or subsystem path

character vector

The full name or path of a block or subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

`close_system` | `load_system` | `new_system` | `save_system`

Introduced before R2006a

openDialog

Open configuration parameters dialog

Syntax

```
openDialog(configObj)
```

Arguments

configObj

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`openDialog` opens a configuration parameters dialog box. If *configObj* is a configuration set, the dialog box displays the configuration set. If *configObj* is a configuration reference, the dialog box displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already open, its window becomes selected.

Examples

The following example opens a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);  
openDialog(myConfigObj);
```

“Manage a Configuration Reference”

Introduced in R2006b

parsim

Simulate dynamic system in parallel or serial

Syntax

```
simOut = parsim(in)
simOut = parsim(in, 'ShowSimulationManager', 'on')
simOut = parsim(in, Name, Value, ...NameN, ValueN)
job = batch(@parsim, 1, {in}, 'Profile', 'ProfileName', 'Pool',
PoolSize)
```

Description

`simOut = parsim(in)` simulates a model using the inputs specified in the `SimulationInput` object, `in`. The `parsim` command uses an array of `SimulationInput` objects to run multiple simulations.

`simOut = parsim(in, 'ShowSimulationManager', 'on')` simulates a model in parallel using the inputs specified in the `SimulationInput` object and opens the Simulation Manager UI. For more information, see `Simulation Manager`.

`simOut = parsim(in, Name, Value, ...NameN, ValueN)` simulates a model in parallel using the inputs specified in the `SimulationInput` object and the options specified as the `Name, Value` pair.

`job = batch(@parsim, 1, {in}, 'Profile', 'ProfileName', 'Pool', PoolSize)` uses `parsim` with the `batch` command to run batch simulations.

The `parsim` command uses the Parallel Computing Toolbox™ license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created and in the absence of Parallel Computing Toolbox .

Examples

Simulate Model in Parallel with `parsim`

Simulate the model, `cstr`, in parallel by sweeping over a variable. An array of `SimulationInput` objects is used to perform the sweep.

Specify sweep values.

```
FeedTempSweep = 250:10:300;
```

Create an array of `SimulationInput` objects.

```
for i = length(FeedTempSweep):-1:1;
in(i) = Simulink.SimulationInput('cstr');
in(i) = in(i).setVariable('FeedTemp0', FeedTempSweep(i));
end
```

Simulate the model in parallel.

```
out = parsim(in, 'ShowProgress', 'on')
```

Input Arguments

`in` — `Simulink.SimulationInput` object used to simulate the model
object, array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for a simulation.

Example: `in = Simulink.SimulationInput('vdp')`

Name-Value Pair Arguments

Note All parameters passed to `parsim` command are unrelated to the parameters that are used with the `sim` command. Use the list of following input arguments to pass to the `parsim` command.

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` and `Value` must appear

inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'ShowProgress', 'on'`

ShowProgress — Shows the progress of the simulations

`'on'(default) | 'off'`

When `ShowProgress` is set to `'on'`, you can see the progress of the simulations in the command window. The progress is hidden when set to `'off'`.

Note When the progress is shown, a message 'Cleaning up parallel workers..' may be displayed before the completion of the last few simulations. This message does not depend on the completion of the simulations. Simulations "complete" when the outputs are fetched from the future.

SetupFcn — Function handle to run once per worker

function handle

You can specify a function handle to `'SetupFcn'` to run once per worker before the start of the simulations.

Example: `'SetupFcn', @() simulinkproject('OCRAex/OCRA_example.prj')`

Note When `buildRapidAcceleratorTarget` is used in the `SetupFcn` and the model has external inputs specified, either set `'LoadExternalInput'` to `'off'` or ensure that the specified external input is available on the workers to prevent compilation error.

CleanupFcn — Function handle to run once per worker after running simulations

function handle

You can specify a function handle to `'CleanupFcn'` to run once per worker after the simulations are completed.

AttachedFiles — Files to attach to pool

character vector or cell array of character vectors

Use `AttachedFiles` to attach files to pool, specified as a character vector or cell array of character vectors.

Example: `{ 'file1.m', 'file2.m' }`;

UseFastRestart — Uses fast restart

false (default) | true

When `UseFastRestart` is set to `true`, simulations run on the workers using fast restart.

Note When using `parsim`, use the `UseFastRestart` option and NOT the `FastRestart` option. See “Factors Affecting Fast Restart” for more information.

TransferBaseWorkspaceVariables — Transfers variables to the parallel workers

false (default) | true

When `TransferBaseWorkspaceVariables` is set to `true`, variables used in the model and defined in the base workspace are transferred to the parallel workers.

Note Use of `TransferBaseWorkspaceVariables` requires model compilation.

ShowSimulationManager — Starts the Simulation Manager App

'off' (default) | 'on'

When `ShowSimulationManager` is set to `'on'`, you can use the Simulation Manager App to monitor simulations.

Pool — Size of the parallel pool

numeric value

Pool determines the size of the parallel pool

Output Arguments

simOut — Simulation object containing logged simulation results

object

`Simulink.SimulationOutput` is an array of `Simulink.SimulationOutput` objects that contains all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

Introduced in R2017a

performanceadvisor

Open Performance Advisor

Syntax

```
performanceadvisor(model)
```

Description

`performanceadvisor(model)` opens the Performance Advisor on the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

Input Arguments

model

A character vector specifying the name or handle to the model or subsystem.

Examples

Open Performance Advisor

Open Performance Advisor on the `vdp` example model.

```
performanceadvisor('vdp')
```

Performance Advisor opens the `vdp` model and opens Performance Advisor on the model.

- “Improve Simulation Performance Using Performance Advisor”
- “Perform a Quick Scan Diagnosis”

- “Improve vdp Model Performance”

Alternatives

In the Simulink Editor, select **Analysis > Performance Tools > Performance Advisor**.

Introduced in R2013a

reload

Reload Simulink Project

Syntax

```
reload(proj)
```

Description

`reload(proj)` reloads the project. Use `reload` when you want to run the project startup shortcuts.

Examples

Reload Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

When you want to run the startup shortcuts again, reload the project.

```
reload(proj)
```

Input Arguments

proj — Project

project object

Project, specified as a project object already created with `simulinkproject` to manipulate a Simulink Project at the command line.

See Also

Functions

`isLoading` | `simulinkproject`

Introduced in R2013a

removeCategory

Remove Simulink Project category of labels

Syntax

```
removeCategory(proj, categoryName)
```

Description

`removeCategory(proj, categoryName)` removes a category of labels, `categoryName`, from the Simulink Project specified by `proj`.

Examples

Remove Category

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Create a new category of labels.

```
createCategory(proj, 'Engineers', 'char');
```

Remove the new category of labels.

```
removeCategory(proj, 'Engineers');
```

A message appears warning you that you cannot undo the operation. Click **Continue**. You can configure warnings in the Preferences in the Simulink Project Tool.

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

categoryName — Name of category

character vector

Name of the category to remove, which exists in the project, specified as a character vector.

See Also

Functions

`createCategory` | `findCategory` | `simulinkproject`

Introduced in R2013a

removeFile

Remove file from Simulink Project

Syntax

```
removeFile(proj, file)
```

Description

`removeFile(proj, file)` removes a file from the project `proj`.

Examples

Remove File from Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Remove a file.

```
removeFile(proj, 'models/AnalogControl.mdl')
```

Add the file back to the project.

```
addFile(proj, 'models/AnalogControl.mdl')
```

Input Arguments

proj — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file

character vector | file object

Path of the file to remove relative to the project root folder, including the file extension, specified as a character vector or a file object returned by `findFile`. The file must be in the project.

Example: `'models/myModelName.slx'`

See Also

Functions

`addFile` | `findFile` | `simulinkproject`

Introduced in R2013a

removeLabel

Remove label from Simulink Project

Syntax

```
removeLabel(category, labelName)
removeLabel(file, categoryName, labelName)
removeLabel(file, labelDefinition)
```

Description

`removeLabel(category, labelName)` removes the label from the specified category of labels in the currently loaded project.

`removeLabel(file, categoryName, labelName)` removes the specified label in the category `categoryName` from the file. Use this syntax to specify category and label by name.

`removeLabel(file, labelDefinition)` removes the specified label `labelDefinition` from the file. Before you can remove the label, you need to get the label from the file.Label property or by using `findLabel`.

Examples

Remove a Label

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;
proj = simulinkproject;
```

Examine the first existing category.

```
cat = proj.Categories(1)
```

```

cat =

    Category with properties:

        Name: 'Classification'
        DataType: 'none'
        LabelDefinitions: [1x8 slproject.LabelDefinition]

```

Define a new label in the category.

```
createLabel(cat, 'Future');
```

Remove the new label.

```
removeLabel(cat, 'Future');
```

Input Arguments

category — Category of labels

category object

Category of labels, specified as a category object. Get a category object from the `proj.Categories` property or by using `findCategory`.

labelName — Name of label

character vector

Name of the label to remove, specified as a character vector.

file — File to detach label from

file object

File to detach the label from, specified as a file object. You can get the file object by examining the project's `Files` property (`proj.Files`), or use `findFile` to find a file by name. The file must be within the root folder.

categoryName — Name of category that contains label

character vector

Name of the category that contains the label to remove, specified as a character vector.

labelDefinition — Label to detach

label definition object

Name of the label to detach, specified as a label definition object returned by the `file.Label` property or `findLabel`.

Functions

`addLabel` | `createLabel` | `findCategory` | `findLabel` | `simulinkproject`

Introduced in R2013a

replace_block

Replace blocks in Simulink model

Syntax

```
replBlks = replace_block(sys,current,new)
replBlks = replace_block(sys,Name,Value,new)
replBlks = replace_block( ____, 'noprompt')
```

Description

`replBlks = replace_block(sys,current,new)` replaces the blocks `current` in the model `sys` with blocks of type `new`. You can use a block from a Simulink library or from another model as the replacement block.

Load the model `sys` before using this function. The function prompts you to select the blocks you want to replace from a list of blocks that match the `current` argument.

Tip Save the model before using this command.

`replBlks = replace_block(sys,Name,Value,new)` replaces the blocks that match the block parameters specified by the `Name,Value` pair arguments. You can also use `find_system Name,Value` pairs to qualify the search for blocks to replace.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

With the `replace_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-109 and “Block-Specific Parameters” on page 6-128.

To specify additional information about the search for blocks to replace, you use `find_system` `Name, Value` pairs before the block parameters. For example, you can use `'CaseSensitive', 'off'` to make the search for blocks case insensitive or `'FollowLinks', 'on'` to follow links into library links. See `find_system` for that list of `Name, Value` pairs.

`replBlks = replace_block(____, 'noprompt')` replaces the blocks without prompting you to select them from a dialog box.

Examples

Replace Blocks in a Model

Replace blocks in the 'vdp' model.

Load the model 'vdp'.

```
load_system('vdp');
```

Replace Gain blocks with Integrator blocks.

```
RepNames = replace_block('vdp', 'Gain', 'Integrator');
```

A dialog box prompts you to select the blocks you want to replace.

With `vdp/Mu` selected in the dialog box, click **OK**.

Replace Scope blocks with To Workspace blocks.

```
RepNames = replace_block('vdp', 'Scope', 'simulink/Sinks/To Workspace');
```

A dialog box prompts you to select the blocks you want to replace.

With `vdp/Scope` selected in the dialog box, click **OK**.

Replace Blocks in a Subsystem Using Parameter Values

Replace blocks in the `Unlocked` subsystem of the `sldemo_clutch` model. Replace blocks whose `Gain` parameter is set to `bv`.

Load the model `sldemo_clutch`.

```
load_system('sldemo_clutch');
```

In the 'Unlocked' subsystem, replace blocks whose Gain value is `bv` with Integrator blocks.

```
replace_block('sldemo_clutch/Unlocked','Gain','bv','Integrator');
```

A dialog box prompts you to select the blocks to replace.

With `sldemo_clutch/Unlocked/VehicleDamping` selected in the dialog box, click **OK**.

Replace Blocks Without Dialog Box

Load the model `f14`.

```
load_system('f14')
```

Replace Gain blocks with Integrator blocks. The command returns the blocks it found to replace and replaces the blocks.

```
repl = replace_block('f14','Gain','Integrator','noprompt')
```

```
repl =
```

```
13x1 cell array

    {'f14/Aircraft...' }
    {'f14/Aircraft...' }
    {'f14/Aircraft...' }
    {'f14/Aircraft...' }
    {'f14/Controller/Gain' }
    {'f14/Controller/Gain2' }
    {'f14/Controller/Gain3' }
    {'f14/Gain' }
    {'f14/Gain1' }
    {'f14/Gain2' }
    {'f14/Gain5' }
    {'f14/Nz pilot...' }
```

```
{'f14/Nz pilot...' }
```

Use `find_system` Pairs with `replace_block`

Select a block that is a library link. Follow the library links and replace Gain blocks with Integrator blocks within them.

```
replace_block(gcb, 'FollowLinks', 'on', 'BlockType', 'Gain', 'Integrator', 'noprompt')
```

Input Arguments

sys — Model or subsystem whose blocks to replace

character vector

Name of model whose blocks to replace, specified as a character vector. If you specify a model, the command replaces all blocks that match in the model. If you specify a subsystem, the command replaces blocks in that subsystem and below.

Example: `'vdp', 'sldemo_fuelsys/fuel_rate_control'`

current — Type of block to replace

BlockType value | MaskType value

Type of block to replace, specified as a BlockType or MaskType value. To find out the block type, select the block and, at the command prompt, enter:

```
get_param(gcb, 'BlockType')
```

For masked blocks, to find out the mask type, select the block and enter:

```
get_param(gcb, 'MaskType')
```

new — Block to replace current blocks

BlockType value | MaskType value | library path | block path name from a model

Block to replace the current block, specified in one of these forms:

- BlockType value of the replacement block. Specifying this value uses a library block as the replacement block.

- `MaskType` value of the replacement block. Specifying this value uses a library block as the replacement block.
- Library path of the replacement block, for example, 'simulink/Sinks/ToWorkspace'. Hover over the block in the library to see the library path.
- Block path name of a block from a different model, for example, 'vdp/Mu'. Use this value to reuse an instance of a block from another model in your model.

Output Arguments

rep1Blks — Blocks returned by the current argument

cell array of character vectors

Blocks returned by the `current` argument, returned as a cell array of character vectors. The function returns the values regardless of whether you complete the replacement.

Introduced before R2006a

save_system

Save Simulink system

Syntax

```
save_system
save_system(sys)
save_system(sys, newsysname)
save_system(sys, newsysname.slx)
save_system(sys, newsysname, Name,Value)
save_system(sys, 'exported_file_name.xml', 'ExportToXML', true)
filename = save_system(sys)
```

Description

`save_system` saves the current top-level system. If the system has not previously been saved, `save_system` creates a new file in the current folder.

`save_system(sys)` saves the top-level system that you specify in `sys` to a file using the current system name. `sys` must be a system name with no file extension. The system must be loaded. `sys` can be a character vector, a cell array of character vectors, a numeric handle, or an array of numeric handles. If you specify any options they apply to all the systems that you save.

`save_system(sys, newsysname)` saves the top-level system that you specify to a file using the new system name `newsysname`. The system must be loaded. `newsysname` can be a system name, or a filename with file extension and optional path, or empty. If you do not specify a file extension (`.slx` or `.mdl`) then `save_system` uses the file format specified in your Simulink preferences.

`save_system(sys, newsysname.slx)` saves the top-level system `sys` to a new file `newsysname` in the SLX file format.

`save_system(sys, newsysname, Name,Value)` saves the system with additional options specified by one or more `Name,Value` pair arguments.

`save_system(sys, 'exported_file_name.xml', 'ExportToXML', true)` exports the system to a file in a simple XML format. Do not use `ExportToXML` with any other `save_system` options. The `ExportToXML` option warns and will be removed in a future release.

`filename = save_system(sys)` returns the fully-qualified file name of the file you saved.

`save_system` can save only entire systems. To save a subsystem, use the `Simulink.SubSystem.copyContentsToBlockDiagram` function to copy the subsystem contents to a new block diagram and then save it using `save_system`. See `Simulink.SubSystem.copyContentsToBlockDiagram`.

If you set the `UpdateHistory` property of the model to `UpdateHistoryWhenSave`, you see the following behavior:

- When you save interactively, you see a dialog prompting for a comment to include in the model history.
- When you save using `save_system`, you do not see a prompt for a comment. `save_system` reuses the previous comment, unless you set `'ModifiedComment'` before saving:

```
set_param(mymodel, 'ModifiedComment', mycomment)
```

Input Arguments

sys

Top-level system to save. `'sys'` must be a system name, not a file name, i.e., without a file extension.

The system must be open. `'sys'` can be a character vector, a cell array of character vectors, a numeric handle, or an array of numeric handles.

newsysname

New system name.

'*newsysname*' can be a system name, or a filename with file extension and optional path. If you do not specify a file extension (.slx or .mdl) then `save_system` uses the file format specified in your Simulink preferences.

'*newsysname*' can be empty (`[]`), in which case the current name is used. You must specify a *newsysname* argument before any name-value pair arguments even when you don't want to name a new sys, and in that case you leave it empty.

If '*sys*' refers to more than one block diagram, '*newsysname*' must be a cell array of new names.

This command displays an error if you enter any of the following as the new system name:

- A MATLAB keyword
- 'simulink'
- More than 63 characters

Name-Value Pair Arguments

Specify optional comma-separated pairs of *Name*, *Value* arguments. *Name* is the argument name and *Value* is the corresponding value. *Name* must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as *Name1*, *Value1*, ..., *NameN*, *ValueN*.

Example: `save_system(sys, newsysname, 'SaveModelWorkspace', true, 'BreakUserLinks', true, 'OverwriteIfChangedOnDisk', true)`

AllowPrompt —

false (default) | true

Logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to `true`. Also accepts `on` or `off`.

BreakAllLinks —

false (default) | true

Logical value that indicates whether the function replaces links to library blocks with copies of the library blocks in the saved file. The 'BreakAllLinks' option affects any linked block, including user-defined and Simulink library blocks. Also accepts `on` or `off`.

Note The 'BreakAllLinks' option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:

- Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
- Any broken links prevent the automatic library forwarding mechanism from upgrading the link.

If you have saved a model with broken links to builtin libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

BreakUserLinks —

`false` (default) | `true`

Logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file. Also accepts `on` or `off`.

BreakToolboxLinks — Break all toolbox links

`false` (default) | `true` | `'on'` | `'off'`

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in the saved file. The 'BreakToolboxLinks' option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

ErrorIfShadowed —

`false` (default) | `true`

Logical value that indicates whether the function generates an error if the new name already exists on the MATLAB path or workspace. Also accepts `on` or `off`.

ExportToXML —

`false` (default) | `true`

Logical value that indicates whether the function exports the specified block diagram to a file in a simple XML format. Specify the full name of the file, including an extension. The block diagram in memory does not change and no callbacks execute. Do not use this option with any other `save_system` options. Also accepts `on` or `off`. The `ExportToXML` option warns and will be removed in a future release.

ExportToVersion — MATLAB release name

`'R2012A'` | `'R2014A_MDL'` | `'R2016B_SLX'` | ...

MATLAB release name, which specifies a previous Simulink version. `save_system` exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

To export to Release 2012a and later, you can specify model file format as `SLX` or `MDL`. If you do not specify a format, you export your default model file format.

You can also use `Simulink.exportToVersion`.

`SaveAsVersion` is a legacy option for this argument that is also supported.

These version names are not case sensitive:

If you use the Export to Previous Version dialog box instead of `save_system`, then the **Save as type** list supports 7 years of previous releases.

OverwriteIfChangedOnDisk —

`false` (default) | `true`

Logical value that indicates whether to overwrite the file on disk (`true`) even if it has been externally modified since the system was loaded. To save the model regardless of whether the file has been changed on disk, supply the `OverwriteIfChangedOnDisk` option with value `true`.

If the file has changed on disk since the model was loaded, `save_system` displays an error to prevent the changes on disk from being overwritten, unless you use the `OverwriteIfChangedOnDisk` option set to `true`. Also accepts `on` or `off`.

You can control whether `save_system` displays an error if the file has changed on disk. Select **Saving the model** under **Change Notification** in the **Model File** pane of the Simulink Preferences dialog box. This preference is on by default.

SaveDirtyReferencedModels —

`false` (default) | `true`

Logical value that indicates whether to save referenced models that contain unsaved changes. Also accepts `on` or `off`.

- If you specify `'true'`, then any unsaved referenced models are saved as well as your top model.
- If you have not specified `SaveDirtyReferencedModels`, or if you specify `'false'`, and there are unsaved referenced models, then you see an error, and no models are saved.

SaveModelWorkspace —

`false` (default) | `true`

Logical value that indicates whether the function saves the contents of the model workspace. The model workspace `DataSource` must be a MAT-file. If the data source is not a MAT-file, `save_system` does not save the workspace. See “Specify Source for Data in Model Workspace”. Also accepts `on` or `off`.

Output Arguments

filename

`save_system` returns the full name of the file that you saved, as a character vector. If you saved multiple files, the return value is a cell array of character vectors.

Examples

The following examples assume prerequisites such as: you have loaded a model and the folder where you want to save is writeable.

Save the current system.

```
save_system
```

Save the vdp system with the name vdp.

```
save_system('vdp')
```

Save the vdp system to a file with the name 'myvdp'. If you do not specify a file extension in the second argument (.slx or .mdl), then `save_system` uses the file format specified in your Simulink preferences.

```
save_system('vdp', 'myvdp')
```

Save the vdp system to another folder.

```
save_system('vdp', 'C:\TMP\vdp.slx')
```

Save an existing model `mymodel` to a different file and specifying the SLX file format:

```
save_system('mymodel', 'newsysname.slx')
```

Save the vdp system to a file with the name 'myvdp' and replace links to library blocks with copies of the library blocks in the saved file.

```
save_system('vdp','myvdp','BreakAllLinks', true)
```

Save the current model (with its current name), and break any library links in it:

```
save_system('mymodel', 'mymodel', 'BreakAllLinks', true)
```

or

```
save_system('mymodel', [], 'BreakAllLinks', true)
```

Save the current model with a new name, but display an error (instead of saving) if something with this name already exists on the MATLAB path:

```
save_system('mymodel', 'mynewmodel', 'ErrorIfShadowed', true)
```

Prevent saving the vdp system with a new name if something with this name already exists on the MATLAB path. In this case `save_system` displays an error (instead of saving) because 'max' is the name of a MATLAB function.

```
save_system('vdp', 'max', 'ErrorIfShadowed', true)
```

Export the vdp system to Simulink Version R2008a with the name 'myvdp'. It does not replace links to library blocks with copies of the library blocks.

```
save_system('vdp', 'myvdp', 'ExportToVersion', 'R2008a')
```

Save the current model with a new name, save the model workspace, break any library links, and overwrite if the file has changed on disk:

```
save_system('mymodel', 'mynewmodel', 'SaveModelWorkspace',  
true, 'BreakAllLinks', true, 'OverwriteIfChangedOnDisk', true)
```

Return the full path name of the file that you saved, as a character vector. If you saved multiple files, the return value is a cell array of character vectors.

```
filename = save_system('mymodel')
```

Return the full path name of a system saved to a new file.

```
filename = save_system('mymodel', 'newmodelname')
```

Topics

“Save a Model”

Introduced before R2006a

set_param

Set system and block parameter values

Syntax

```
set_param(Object, ParameterName, Value, ... ParameterNameN, ValueN)
```

Description

`set_param(Object, ParameterName, Value, ... ParameterNameN, ValueN)` sets the parameter to the specified value on the specified model or block object.

When you set multiple parameters on the same model or block, use a single `set_param` command with multiple pairs of `ParameterName, Value` arguments, rather than multiple `set_param` commands. This technique is efficient because using a single call requires evaluating parameters only once. If any parameter names or values are invalid, then the function doesn't set any parameters.

Tips:

- If you make multiple calls to `set_param` for the same block, then specifying the block using a numeric handle is more efficient than using the full block path. Use `getSimulinkBlockHandle` to get a block handle.
- If you use `matlab -nodisplay` to start a session, you cannot use `set_param` to run your simulation. The `-nodisplay` mode does not support simulation using `set_param`. Use the `sim` command instead.
- After you set parameters in the MATLAB workspace, to see the changes in a model, update the diagram.

```
set_param(model, 'SimulationCommand', 'Update')
```

For parameter names, see:

- “Model Parameters” on page 6-2

- “Block-Specific Parameters” on page 6-128
- “Common Block Properties” on page 6-109

Examples

Set Model Configuration Parameters for a Model

Open `vdp` and set the `Solver` and `StopTime` parameters.

```
vdp
set_param('vdp','Solver','ode15s','StopTime','3000')
```

Set Model Configuration Parameters for Current Model

Open a model and set the `Solver` and `StopTime` parameters. Use `bdroot` to get the current top-level model.

```
vdp
set_param(bdroot,'Solver','ode15s','StopTime','3000')
```

Set a Gain Block Parameter Value

Open `vdp` and set a `Gain` parameter value in the `Mu` block.

```
vdp
set_param('vdp/Mu','Gain','10')
```

Set Position of Block

Open `vdp` and set the position of the `Fcn` block.

```
vdp
set_param('vdp/Fcn','Position',[50 100 110 120])
```

Set Position of Block Using a Handle

Set the position of the Fcn block in the vdp model.

Use `getSimulinkBlockHandle` to load the vdp model if necessary (by specifying `true`), and get a handle to the Fcn block. If you make multiple calls to `set_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
fcnblockhandle = getSimulinkBlockHandle('vdp/Fcn',true);
```

You can use the block handle in subsequent calls to `get_param` or `set_param`. If you examine the handle, you can see that it contains a double. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify a block.

Use the block handle with `set_param` to set the position.

```
set_param(fcnblockhandle,'Position',[50 100 110 120])
```

- “Associating User Data with Blocks”
- “Use MATLAB Commands to Change Workspace Data”
- “Control Simulations Programmatically”

Input Arguments

object — Name or handle of a model or block

character vector | handle

Handle or name of a model or block, specified as a numeric handle or a character vector. A numeric handle must be a scalar. You can also set parameters of lines and ports, but you must use numeric handles to specify them.

Tip If you make multiple calls to `set_param` for the same block, then specifying a block using a numeric handle is more efficient than using the full block path with `set_param`. Use `getSimulinkBlockHandle` to get a block handle. Do not try to use the number of a handle alone (e.g., `5.007`) because you usually need to specify many more digits than

MATLAB displays. Assign the handle to a variable and use that variable name to specify a block.

Example: `'vdp/Fcn'`

ParameterName — Model or block parameter name

character vector

Model or block parameter name, specified as the comma-separated pair consisting of the parameter name, specified as a character vector, and the value, specified in the format determined by the parameter type. Case is ignored for parameter names. Value are case sensitive. Values are often character vectors, but they can also be numeric, arrays, and other types. Many block parameter values are specified as character vectors, but two exceptions are these parameters: `Position`, specified as a vector, and `UserData`, which can be any data type.

Example: `'Solver', 'ode15s', 'StopTime', '3000'`

Example: `'SimulationCommand', 'start'`

Example: `'Position', [50 100 110 120]`

Data Types: `char`

setActiveConfigSet

Specify model's active configuration set or configuration reference

Syntax

```
setActiveConfigSet(model, configObjName)
```

Arguments

`model`

The name of an open model, or `gcs` to specify the current model

`configObjName`

The name of a configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

Description

`setActiveConfigSet` specifies the active configuration set or configuration reference (configuration object) of `model` to be the configuration object specified by `configObjName`. If no such configuration object is attached to the model, an error occurs. The previously active configuration object becomes inactive.

Examples

The following example makes `DevConfig` the active configuration object of the current model. The code is the same whether `DevConfig` is a configuration set or configuration reference.

```
setActiveConfigSet(gcs, 'DevConfig');
```

sfix

Create `Simulink.NumericType` object describing signed fixed-point data type

Syntax

```
a = sfix(WordLength)
```

Description

`sfix(WordLength)` returns a `Simulink.NumericType` object that describes a signed fixed-point number with the specified word length and unspecified scaling.

Note `sfix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfix(WordLength)` with `fixdt(1, WordLength)`.

Examples

Define a 16-bit signed fixed-point data type.

```
a = sfix(16)
```

```
a =
```

```
NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: unspecified scaling'  
        Signedness: 'Signed'  
        WordLength: 16  
            IsAlias: 0  
        DataScope: 'Auto'  
        HeaderFile: ''  
        Description: ''
```

Introduced before R2006a

sfrac

Create `Simulink.NumericType` object describing signed fractional data type

Syntax

```
a = sfrac(WordLength)
a = sfrac(WordLength, GuardBits)
```

Description

`sfrac(WordLength)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional data type with a word size given by `WordLength`.

`sfrac(WordLength, GuardBits)` returns a `Simulink.NumericType` object that describes the data type of a signed fractional number. The total word size is given by `WordLength` with `GuardBits` bits located to the left of the binary point.

The most significant (leftmost) bit is the sign bit. The default binary point for this data type is assumed to lie immediately to the right of the sign bit. If guard bits are specified, they lie to the left of the binary point and to right of the sign bit. For example, the structure for an 8-bit signed fractional data type with 4 guard bits is:

Note `sfrac` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sfrac(WordLength,GuardBits)` with `fixdt(1,WordLength,(WordLength-1-GuardBits))` and `sfrac(WordLength)` with `fixdt(1,WordLength,(WordLength-1))`.

Examples

Define an 8-bit signed fractional data type with 4 guard bits. Note that the range of this data type is $-2^4 = -16$ to $(1 - 2^{(1-8)}) \cdot 2^4 = 15.875$.

```
a = sfrac(8,4)
```

```
a =
```

```
NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: binary point scaling'  
    Signedness: 'Signed'  
    WordLength: 8  
    FractionLength: 3  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

signalbuilder

Create and access Signal Builder blocks

Syntax

```
[time, data] = signalbuilder(block)
[time, data, signames] = signalbuilder(block)
[time, data, signames, groupnames] = signalbuilder(block)
block = signalbuilder([], 'create', time, data, signames,
groupnames)
block = signalbuilder(path, 'create', time, data, signames,
groupnames)
block = signalbuilder(path, 'create', time, data, signames,
groupnames, vis)
block = signalbuilder(path, 'create', time, data, signames,
groupnames, vis, pos)
block = signalbuilder(path, 'create', time, data, signames,
groupnames, vis, pos, {openui openmodel})
block = signalbuilder(block, 'append', time, data, signames,
groupnames)
block = signalbuilder(block, 'appendgroup', time, data, signames,
groupnames)
signalbuilder(block, 'append', ds)
signalbuilder(block, 'appendgroup', ds)
signalbuilder(block, 'append', [ds ds2])
signalbuilder(block, 'appendgroup', [ds ds2])
signalbuilder(block, 'appendsignal', time, data, signames)
signalbuilder(block, 'showsignal', signal, group)
signalbuilder(block, 'hidesignal', signal, group)
[time, data] = signalbuilder(block, 'get', signal, group)
ds=signalbuilder(block, 'get', group)
[ds1 ds2] =signalbuilder(block, 'get', group)
signalbuilder(block, 'set', signal, group, time, data)
signalbuilder(block, 'set', groupid, ds)
signalbuilder(block, 'set', groupid, [ds1 ds2])
index = signalbuilder(block, 'activegroup')
```

```
[index, activeGroupLabel]= signalbuilder(block, 'activegroup')
signalbuilder(block, 'activegroup', index)
signalbuilder(block, 'annotategroup', onoff)
signalbuilder(block, 'print', [])
signalbuilder(block, 'print', config, printArgs)
figh = signalbuilder(block, 'print', config, 'figure')
```

Description

Use the `signalbuilder` command to interact programmatically with Signal Builder blocks.

- “Creating and Accessing Signal Builder Blocks” on page 2-441
- “Adding New Groups” on page 2-443
- “Working with Signals” on page 2-444
- “Using Get/Set Methods for Specific Signals and Groups” on page 2-445
- “Querying, Labelling, and Setting the Active Group” on page 2-446
- “Enabling Current Group Display” on page 2-446
- “Printing Signal Groups” on page 2-447

Note When you use the `signalbuilder` command to interact with a Signal Builder block, the **Undo last edit** and **Redo last edit** buttons on the block dialog box are grayed out. You cannot undo the results of using the `signalbuilder` command.

Creating and Accessing Signal Builder Blocks

`[time, data] = signalbuilder(block)` returns the time (x -coordinate) and amplitude (y -coordinate) data of the Signal Builder block, `block`.

The output arguments, `time` and `data`, take different formats depending on the block configuration:

Configuration	Time/Data Format
1 signal, 1 group	Row vector of break points.

Configuration	Time/Data Format
>1 signal, 1 group	Column cell vector where each element corresponds to a separate signal and contains a row vector of points.
1 signal, >1 group	Row cell vector where each element corresponds to a separate group and contains a row vector of points.
>1 signal, >1 group	Cell matrix where each element (i, j) corresponds to signal i and group j.

`[time, data, signames] = signalbuilder(block)` returns the signal names, `signames`, in a character vector or a cell array of character vectors.

`[time, data, signames, groupnames] = signalbuilder(block)` returns the group names, `groupnames`, in a character vector or a cell array of character vectors.

`block = signalbuilder([], 'create', time, data, signames, groupnames)` creates a Signal Builder block in a new Simulink model using the specified values. The preceding table describes the allowable formats of `time` and `data`. If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector in `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value. Signal names, `signames`, and group names, `groupnames`, can be omitted to use default values. The function returns the path to the new block, `block`. Always provide `time` and `data` when using the `create` command. These two parameters are always required.

`block = signalbuilder(path, 'create', time, data, signames, groupnames)` creates a new Signal Builder block at `path` using the specified values. If `path` is empty, the function creates a block in a new model, which has a default name. If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value. Signal names, `signames`, and group names, `groupnames`, can be omitted to use default values. The function returns the path to the new block, `block`. Always provide `time` and `data` when using the `create` command. These two parameters are always required.

`block = signalbuilder(path,'create', time, data, signames, groupnames, vis)` creates a new Signal Builder block and sets the visible signals in each group based on the values of the matrix `vis`. This matrix must be the same size as the cell array, `data`. Always provide `time` and `data` when using the `create` command. These two parameters are always required. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the `vis` parameter for all signals to 0, the first signal is still visible.

`block = signalbuilder(path,'create', time, data, signames, groupnames, vis, pos)` creates a new Signal Builder block and sets the block position to `pos`. Always provide `time` and `data` when using the `create` command. These two parameters are always required. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the `vis` parameter for all signals to 0, the first signal is still visible.

If you create signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data. It does so by holding the final value.

`block = signalbuilder(path,'create', time, data, signames, groupnames, vis, pos, {openui openmodel})` creates a new Signal Builder block and opens or invisibly loads the model and Signal Builder block window.

- Set `openui` to 1 to open the Signal Builder block window when you create the Signal Builder block. Set `openui` to 0 keep this window closed upon block creation.
- Set `openmodel` to 1 to open the model when you create the Signal Builder block. Set `openmodel` to 0 to invisibly load the model upon block creation.

Adding New Groups

`block = signalbuilder(block, 'append', time, data, signames, groupnames)` or `block = signalbuilder(block, 'appendgroup', time, data, signames, groupnames)` appends new groups to the Signal Builder block, `block`. The `time` and `data` arguments must have the same number of signals as the existing block.

`signalbuilder(block, 'append', ds)` or `signalbuilder(block, 'appendgroup', ds)` appends one data set.

`signalbuilder(block, 'append', [ds ds2])` or `signalbuilder(block, 'appendgroup', [ds ds2])` appends N data sets.

Data sets must have the same number of elements as the signals in a signal group. Data set format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
- Timeseries data and/or time must not be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

Note

- If you specify a value of ' ' or {} for *signames*, the function uses existing signal names for the new groups.
 - If you do not specify a value for *groupnames*, the function creates the new signal groups with the default group name pattern, `GROUP #n`.
-

Working with Signals

`signalbuilder(block, 'appendsignal', time, data, signames)` appends new signals to all signal groups in the Signal Builder block, *block*. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block; you cannot append signals to a subset of the groups. Correspondingly, provide *time* and *data* arguments for either one group (append the same information to all groups) or different *time* and *data* arguments for different groups. To use default signal names, omit the signal names argument, *signames*.

`signalbuilder(block, 'showsignal', signal, group)` makes *signals* that are hidden from the Signal Builder block visible. By default, signals in the current active group are visible when created. You control the visibility of a signal at creation with the *vis* parameter. *signal* can be a unique signal name, a signal scalar index, or an array of signal indices. *group* is the list of one or more signal groups that contains the affected signals. *group* can be a unique group name, a scalar index, or an array of indices.

`signalbuilder(block, 'hidesignal', signal, group)` makes signals, *signal*, hidden from the Signal Builder block. By default, all signals are visible when created. *signal* can be a unique signal name, a signal scalar index, or an array of signal indices.

group is the list of one or more signal groups that contains the affected signals. *group* can be a unique group name, a scalar index, or an array of indices.

Note For the `showsignal` and `hidesignal` methods, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all the signals and groups.

Using Get/Set Methods for Specific Signals and Groups

`[time, data] = signalbuilder(block, 'get', signal, group)` gets the time and data values for the specified signal(s) and group(s). The `signal` argument can be the name of a signal, a scalar index of a signal, or an array of signal indices. The `group` argument can be a group name, a scalar index, or an array of indices.

`ds=signalbuilder(block, 'get', group)` gets one data set for one requested signal Builder group.

`[ds1 ds2] =signalbuilder(block, 'get', group)` gets *N* data sets for *N* requested Signal Builder groups.

`signalbuilder(block, 'set', signal, group, time, data)` sets the time and data values for the specified signal(s) and group(s). Use empty values of *time* and *data* to remove groups and signals. To remove a signal group, you must also remove all the signals in that group in the same command.

`signalbuilder(block, 'set', groupid, ds)` sets one data set for the requested Signal Builder group. Specifying an empty data set deletes the groups specified in *groupid*.

`signalbuilder(block, 'set', groupid, [ds1 ds2])` sets *N* data sets for *N* requested groups.

Data sets must have the same number of elements as the signals in a signal group. Data set format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.
- Timeseries data and/or time must not be empty.
- Timeseries data must be of type double.

- Timeseries data must be 1-D (scalar value at each time).

Note For the `set` method, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all signals and groups.

When removing signals, you remove all signals from all groups. You cannot select a subset of groups from which to remove signals, unless you are also going to also remove that group.

Note The `signalbuilder` function does not allow you to alter and delete data in the same invocation. It also does not allow you to delete all the signals and groups from the application.

If you set signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data by holding the final value.

Querying, Labelling, and Setting the Active Group

`index = signalbuilder(block, 'activegroup')` gets the index of the active group.

`[index, activeGroupLabel]= signalbuilder(block, 'activegroup')` gets the label value of the active group.

`signalbuilder(block, 'activegroup', index)` sets the active group index to *index*.

Enabling Current Group Display

`signalbuilder(block, 'annotategroup', onoff)` controls the display of the current group name on the mask of the Signal Builder block.

<i>onoff</i> Value	Description
'on'	Default. Displays the current group name on the block mask.
'off'	Does not display the current group name on the block mask.

Printing Signal Groups

`signalbuilder(block, 'print', [])` prints the currently active signal group.

`signalbuilder(block, 'print', config, printArgs)` prints the currently active signal group or the signal group that `config` specifies. The argument `config` is a structure that allows you to customize the printed appearance of a signal group. The `config` structure may contain any of the following fields:

Field	Description	Example Value
<code>groupIndex</code>	Scalar specifying index of signal group to print	2
<code>timeRange</code>	Two-element vector specifying the time range to print (must not exceed the block's time range)	[3 6]
<code>visibleSignals</code>	Vector specifying index of signals to print	[1 2]
<code>yLimits</code>	Cell array specifying limits for each signal's <i>y</i> -axis	{[-1 1], [0 1]}
<code>extent</code>	Two-element vector of the form: [width, height] specifying the dimensions (in pixels) of the area in which to print the signals	[500 300]
<code>showTitle</code>	Logical value specifying whether to print a title; <code>true</code> (1) prints the title	false

Set up the structure with one or more of these fields before you print. For example, if you want to print just group 2 using a configuration structure, `configstruct`, set up the structure as follows. You do not need to specify any other fields.

```
configstruct.groupIndex=2
```

The optional argument `printArgs` allows you to configure print options (see `print` in the MATLAB Function Reference).

`figh = signalbuilder(block, 'print', config, 'figure')` prints the currently active signal group or the signal group that `config` specifies to a new hidden figure handle, `figh`.

Interpolating Missing Data Values

When specifying a periodic signal such as a Sine Wave, the `signalbuilder` function uses linear Lagrangian interpolation to compute data values for time steps that occur between time steps for which the `signalbuilder` function supplies data. When specifying periodic signals, specify them as a time vector that is defined as multiples of sample time, for example:

```
t = 0.2*[0:49]';
```

Examples

Example 1

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

Get signal builder data from this block.

```
[time, data, signames, groupnames] = signalbuilder('untitled/Signal Builder')
```

```
time =
```

```
    [1x2 double]  
    [1x2 double]
```

```
data =
```

```
    [1x2 double]  
    [1x2 double]
```

```
signames =
```

```
    'Signal 1'    'Signal 2'
```

```
groupnames =
```

```
    'Group 1'
```

The Signal Builder block contains two signals in one group. Alter the second signal in the group:

```
signalbuilder(block, 'set', 2, 1, [0 5], [2 0])
```

To make this same change using the signal name and group name:

```
signalbuilder(block, 'set', 'Signal 2', 'Group 1', [0 5], [2 0])
```

Delete the first signal from the group:

```
signalbuilder(block, 'set', 1, 1, [], [])
```

Append the group with a new signal:

```
signalbuilder(block, 'append', [0 2.5 5], [0 2 0], 'Signal 2', 'Group 2');
```

Append another group with a new signal using appendgroup:

```
signalbuilder(block, 'appendgroup', [0 2.5 5], [0 2 0], 'Signal 2', 'Group 3');
```

Example 2

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 2], {[0 1],[1 0]});
```

The Signal Builder block has two groups, each of which contains a signal. To delete the second group, also delete its signal:

```
signalbuilder(block, 'set', 1, 2, [], [])
```

Example 3

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 1], ...
    {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]});
```

The Signal Builder block has two groups, each of which contains three signals.

Example 4

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', {[0 10],[0 20]}, {[6 -6],...  
[2 5]});
```

The Signal Builder block has two groups. Each group contains one signal.

Append a new signal group to the existing block.

```
block = signalbuilder(block, 'append', [0 30], [10 -10]);
```

Append a new signal, sig3, to all groups.

```
signalbuilder(block, 'appendsignal', [0 30], [0 10], 'sig3');
```

Example 5

Create a Signal Builder block in a new model editor window:

```
time = [0 1];  
data = {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]};  
block = signalbuilder([], 'create', time, data);
```

The Signal Builder block has two groups. Each group contains three signals.

Delete the second group. To delete a signal group, also delete all the signals in the group.

```
signalbuilder(block, 'set', [1,2,3], 'Group 2', []);
```

Example 6

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

The Signal Builder block has one group that contains two signals.

Hide the signal, Signal 1.

```
signalbuilder(block, 'hidesignal', 'Signal 1', 'Group 1')
```

Signal 1 is no longer visible in the Signal Builder block.

Make Signal 1 visible again.

```
signalbuilder(block, 'showsignal', 'Signal 1', 'Group 1')
```

Example 7

Create a Signal Builder block in a new model editor window:

```
block = signalbuilder([], 'create', [0 5], {[2 2] [0 2]});
```

The Signal Builder block has two groups, each with one signal.

Create a structure, `configstruct`, to customize the Signal Builder block that you want to print.

```
configstruct.groupIndex = 2;  
configstruct.timeRange = [0 2];  
configstruct.visibleSignals = 1;  
configstruct.yLimits = {[0 1]};  
configstruct.extent = [500 300];  
configstruct.showTitle = true;
```

This sequence fills all the fields of the `configstruct` structure.

Print a view of the Signal Builder block to the default printer. The `configstruct` structure defines the view to print.

```
signalbuilder(block, 'print', configstruct)
```

Print with print options, for example `-dps`.

```
signalbuilder(block, 'print', configstruct, '-dps')
```

Print a view of the Signal Builder block as defined by the `configstruct` structure to a new hidden figure handle, `figH`.

```
figH = signalbuilder(block, 'print', configstruct, 'figure')  
figure(figH)
```

Example 8

Create two Signal Builder blocks in new model editor windows:

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});  
block1 = signalbuilder('untitled/Signal Builder1', 'create', [1 2], {[1 2];[0 10]});
```

Get a data set for group 1 of `block`.

```
ds=signalbuilder(block, 'get', 1);
```

Get a data set for group 1 of *block1*.

```
ds1=signalbuilder(block1, 'get', 1);
```

Set the data set for group 1 of *block* to *ds1*.

```
signalbuilder(block, 'set', 1, ds1);
```

Append the original data set for group 1 of *block* (*ds*) to *block*.

```
signalbuilder(block, 'append', ds);
```

To create a third group in *block*, append *ds1* to the end of the groups in *block*.

```
signalbuilder(block, 'appendgroup', ds1);
```

“Signal Groups”

Introduced in R2007a

signalEditor

Start Signal Editor

Syntax

```
signalEditor  
signalEditor(Name,Value)
```

Description

`signalEditor` starts Signal Editor without an associated model.

`signalEditor(Name,Value)` starts signal Editor using additional options specified by one or more name-value pair arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify the name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

- `Model` - Model name, specified as a character array, for which Signal Editor is to start. You can specify one model per call to the `signalEditor` function.

Note Load the model before starting Signal Editor for it.

- `DataSource` - Data set name, specified as a character array, to be edited. You can specify one data set file per call to the `signalEditor` function.

Note You can start multiple sessions of Signal Editor for the same model. However, you can associate a data set file with only one Signal Editor at a time. A data set file cannot have multiple Signal Editor sessions associated with it.

Examples

Start Signal Editor for a Model

Start the Signal Editor for the model, `slexAutotransRootInportsExample`.

Load the `slexAutotransRootInportsExample` model, then start Signal Editor for it.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model', 'slexAutotransRootInportsExample');
```

Start Signal Editor to Edit a Data Set File

Start Signal Editor to edit `myFile.mat`.

```
signalEditor('DataSource', 'myFile.mat');
```

Start Signal Editor and Data Set File for a Model

Load the `slexAutotransRootInportsExample` model, then start Signal Editor for the model, and edit `myFile.mat`.

```
open_system('slexAutotransRootInportsExample')
signalEditor('Model', 'slexAutotransRootInportsExample', 'DataSource', 'myFile.mat');
```

“Create and Edit Signal Data”

Introduced in R2017b

sim

Simulate dynamic system

Syntax

```
simOut = sim(model,Name,Value)
simOut = sim(model,ParameterStruct)
simOut = sim(model,ConfigSet)
simOut = sim(model)
simOut = sim(model,'ReturnWorkspaceOutputs','on')
simOut = sim(simIn)
simOut = sim(simIn,'ShowProgress',true)
```

Description

`simOut = sim(model,Name,Value)` simulates the specified model using parameter name-value pairs.

`simOut = sim(model,ParameterStruct)` simulates the specified model using the parameter values specified in the structure `ParameterStruct`.

`simOut = sim(model,ConfigSet)` simulates the specified model using the configuration settings specified in the model configuration set `ConfigSet`.

`simOut = sim(model)` simulates the specified model using existing model configuration parameters, and returns the result as either a `Simulink.SimulationOutput` object (single-output format) or as a time vector compatible with Simulink version R2009a or earlier.

To return simulation results using the single-output format (simulation object), select **Single simulation output** on the Data Import/Export pane of the Configuration Parameters dialog box. This selection overrides the `Dataset` format used for signal logging.

To return simulation results using the backward-compatible format (time vector), see “Backward-Compatible Syntax” on page 2-463.

`simOut = sim(model, 'ReturnWorkspaceOutputs', 'on')` simulates the specified model using existing model configuration parameters, and returns the result as a `Simulink.SimulationOutput` object (single-output format).

`simOut = sim(simIn)` simulates a model using the inputs specified in the `SimulationInput` object, `simIn`. The `sim` command is also used with an array of `SimulationInput` objects to run multiple simulations in a series.

`simOut = sim(simIn, 'ShowProgress', true)` simulates a model in a series using an array of `SimulationInput` objects and shows the progress of these simulations at the command line.

Examples

Simulate Model with `sim` Command-Line Options

Simulate the model, `vdp`, in Rapid Accelerator mode for an absolute tolerance of $1e-5$ and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters as name-value pairs to the `sim` command:

```
simOut = sim('vdp', 'SimulationMode', 'rapid', 'AbsTol', '1e-5', ...
            'StopTime', '30', ...
            'ZeroCross', 'on', ...
            'SaveTime', 'on', 'TimeSaveName', 'tout', ...
            'SaveState', 'on', 'StateSaveName', 'xoutNew', ...
            'SaveOutput', 'on', 'OutputSaveName', 'youtNew', ...
            'SignalLogging', 'on', 'SignalLoggingName', 'logout')

### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp

Simulink.SimulationOutput:
    tout: [86x1 double]
    xoutNew: [86x2 double]
    youtNew: [86x2 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
```

```
ErrorMessage: [0x0 char]
```

Simulate Model with `sim` Command-Line Options in Structure

Simulate the model, `vdp`, in Rapid Accelerator mode for an absolute tolerance of $1e-5$ and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters using a name-value pairs structure `paramNameValStruct` for the `sim` command:

```
paramNameValStruct.SimulationMode = 'rapid';
paramNameValStruct.AbsTol         = '1e-5';
paramNameValStruct.SaveState      = 'on';
paramNameValStruct.StateSaveName  = 'xoutNew';
paramNameValStruct.SaveOutput     = 'on';
paramNameValStruct.OutputSaveName = 'youtNew';
simOut = sim('vdp',paramNameValStruct)

### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp

Simulink.SimulationOutput:
    xoutNew: [65x2 double]
    youtNew: [65x2 double]

SimulationMetadata: [1x1 Simulink.SimulationMetadata]
ErrorMessage: [0x0 char]
```

Simulate Model with `sim` Command-Line Options in Configuration Set

Simulate the model, `vdp`, in Rapid Accelerator mode for an absolute tolerance of $1e-5$ and save the states in `xoutNew` and the output in `youtNew`.

Specify parameters as name-value pairs in configuration set `mdl_cs` for the `sim` command:

```
mdl = 'vdp';
load_system(mdl)
simMode = get_param(mdl, 'SimulationMode');
set_param(mdl, 'SimulationMode', 'rapid')
```

```
cs = getActiveConfigSet mdl;
mdl_cs = cs.copy;
set_param(mdl_cs, 'AbsTol', '1e-5', ...
          'SaveState', 'on', 'StateSaveName', 'xoutNew', ...
          'SaveOutput', 'on', 'OutputSaveName', 'youtNew')
simOut = sim(mdl, mdl_cs);
set_param(mdl, 'SimulationMode', simMode)

### Building the rapid accelerator target for model: vdp
### Successfully built the rapid accelerator target for model: vdp
```

Simulate Model with Default Parameter Settings

Simulate the model `vdp` using default model configuration parameters.

```
simOut = sim('vdp', 'ReturnWorkspaceOutputs', 'on')
```

Input Arguments

model — Model to simulate

character vector

Name of model to simulate, specified as a character vector.

Example: `simOut = sim('vdp')`

ParameterStruct — Structure containing parameter settings

structure

Structure with fields that are the names of the configuration parameters for the simulation. The corresponding values are the parameter values.

Example: `simOut = sim('vdp', paramNameValStruct)`

ConfigSet — Configuration set

object

The set of configuration parameters for a model.

Example: `simOut = sim('vdp', mdl_cs)`

simIn — SimulationInput object for a model

object

SimulationInput object created by specifying the model name. For more information, see `Simulink.SimulationInput`

Example: `simIn = Simulink.SimulationInput('CSTR')`

Use the `SimulationInput` object to specify Block Parameters, Model Parameters, Variables and External Inputs to a model to be simulated.

Example: `simIn.addBlockParameter('CSTR/Feed Temperature', 'Value', '300'); simIn.addModelParameter('StartTime', '1'); simIn.addVariable('FeedTemp0', 320)`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'Solver', 'ode15s', 'TimeOut', 30` specifies that the model is simulated using the `ode15s` solver with a maximum simulation time of 30 seconds.

The `sim` command accepts all simulation parameters as name-value pair arguments. See “Model Parameters” on page 6-2 for a list of all simulation parameters.

In addition, the `sim` command accepts the following parameters.

CaptureErrors — Save errors to SimulationMetadata object

`off` (default) | `on`

By default, if an error occurs during simulation, the `sim` command stops and reports the error in the MATLAB Command Window. If you specify `'CaptureErrors', 'on'`, the `sim` command does not stop, but instead saves any errors to the `ErrorDiagnostic` structure within the `SimulationMetadata` object. The error message is saved in the `ErrorMessage` property of the `SimulationOutput` object.

This option is useful when running multiple simulations in a loop, so that one simulation error will not stop a script or function from continuing.

If you specify an array of input objects, the `sim` commands runs with `CaptureErrors` enabled. If an error occurs, the error messages are included in the

`Simulink.SimulationMetadata` object for the simulation, as well as simulation data up to the point of the failure.

This option is not available for simulation in SIL and PIL modes.

Example: `'CaptureErrors', 'on'`

ConcurrencyResolvingToFileSuffix — Append suffix to model name

character vector

(Rapid Accelerator mode only) Appends this suffix character vector to the filename of a model (before the file extension) if:

- The model contains a To File block.
- You call the `sim` command from `parfor`.

Example: `'ConcurrencyResolvingToFileSuffix', 'model'`

Debug — Run simulation in debug mode

off (default) | on | cmds

Starts the simulation in debug mode (see “Debugger Graphical User Interface” for more information). The value of this option can be a cell array of commands to be sent to the debugger after it starts.

Example: `'Debug', 'on'`

LoggingFileName — Specify name of MAT-file to log data

out.mat (default) | character vector

Use when you enable the `LoggingToFile` name-value pair for logging to persistent storage. Specify the destination MAT-file for data logging.

Tip Do not use a file name from one locale in a different locale.

Example: `'LoggingFileName', 'out.mat'`

LoggingToFile — Log simulation data to MAT-file

off (default) | on

Store logged data that uses `Dataset` format to persistent storage (MAT-file).

Use this feature when logging large amounts of data that can cause memory issues. For details, see “Log Data to Persistent Storage”.

Tip To avoid running out of memory when accessing stored data, you can use a reference to access the object stored in the MAT-file. Use a `Simulink.SimulationData.DatasetRef` object to access stored data by reference. Using this object loads signal logging and states data into the model workspace incrementally (signal by signal). Accessing data for other kinds of logging loads all of the data at once.

Example: `'LoggingToFile','on'`

RapidAcceleratorParameterSets — Pass run-time parameters directly to Rapid Accelerator simulations

structure

(Rapid Accelerator mode only) Returns structure that contains run-time parameters for running Rapid Accelerator simulations in `parfor`.

Example: `'RapidAcceleratorParameterSets',parameterSet(idx)`

RapidAcceleratorUpToDateCheck — Perform up-to-date check before simulation

on (default) | off

(Rapid Accelerator mode only) Enables/disables up-to-date check. If you set this value to 'off', Simulink does not perform an up-to-date check. It skips the start/stop callbacks in blocks. If you call the `sim` command from `parfor`, set this value to 'off'.

When you set this option to 'off', changes that you make to block parameter values in the model (for example, by using block dialog boxes, by using the `set_param` function, or by changing the values of MATLAB variables) do not affect the simulation. Instead, use `RapidAcceleratorParameterSets` to pass new parameter values directly to the simulation.

Example: `'RapidAcceleratorUpToDateCheck','off'`

SrcWorkspace — Workspace in which to evaluate MATLAB expressions

base (default) | current | parent

Specifies the workspace in which to evaluate MATLAB expressions defined in the model. Setting `SrcWorkspace` has no effect on a referenced model that executes in Accelerator

mode. Setting `SrcWorkspace` to `current` within a `parfor` loop causes a transparency violation.

Example: `'SrcWorkspace', 'current'`

TimeOut — Maximum simulation run time

positive scalar

Specify the time, in seconds, to allow the simulation to run. If you run your model for a period longer than the value of `TimeOut`, the software issues a warning and stops the simulation. `TimeOut` refers to the time spent for a simulation.

Example: `'TimeOut', 60`

Trace — Enables simulation tracing facilities

`minstep` | `siminfo` | `compile`

Enables simulation tracing facilities (specify one or more as a comma-separated list):

- `'minstep'` specifies that simulation stops when the solution changes so abruptly that the variable-step solvers cannot take a step and satisfy the error tolerances.
- `'siminfo'` provides a short summary of the simulation parameters in effect at the start of simulation.
- `'compile'` displays the compilation phases of a block diagram model.

By default, Simulink issues a warning message and continues the simulation.

Example: `'Trace', 'minstep', 'Trace', 'siminfo', 'Trace', 'compile'`

Output Arguments

simOut — Simulation object containing logged simulation results

object

`Simulink.SimulationOutput` object that contains all of the logged simulation results.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the **Model Configuration Parameters** dialog box. You can log signals using blocks such as the `To Workspace` and `Scope` blocks. The **Signal & Scope Manager** can directly log signals.

Note The output of the `sim` command always returns to `SimOut`, the single simulation output object. The simulation output object in turn, is returned to the workspace.

Definitions

Backward-Compatible Syntax

Starting with R2009b, the `sim` command was enhanced to provide greater compatibility with parallel computing. The improved single-output format saves all simulation results to a single object, simplifying the management of output variables.

For backward compatibility with R2009a or earlier releases, use the backward-compatible syntax:

```
[T,X,Y] = sim('model',Timespan, Options, UT)
[T,X,Y1,...,Yn] = sim('model',Timespan, Options, UT)
```

If you specify only the `model` argument, Simulink automatically saves the time, state, and output to the specified output arguments.

If you do not specify any output arguments, Simulink determines what data to log based on the settings for the **Configuration Parameters > Data Import/Export** pane. Simulink stores the simulation output either in the current workspace or in the variable `ans`, based on the setting for **Save simulation output as a single object** parameter.

Argument	Description
<i>T</i>	The time vector returned.
<i>X</i>	The state returned in matrix or structure format. The state matrix contains continuous states followed by discrete states.
<i>Y</i>	The output returned in matrix or structure format. For block diagram models, this variable contains all root-level blocks.
<i>Y1,...,Yn</i>	The outputs, which can only be specified for diagram models. Here, <i>n</i> must be the number of root-level blocks. Each output will be returned in the <i>Y1,...,Yn</i> variables.
' <i>model</i> '	The name of the model to simulate.

Argument	Description
<i>Timespan</i>	The timespan can be <code>TFinal</code> , <code>[TStart TFinal]</code> , or <code>[TStart OutputTimes TFinal]</code> . Output times are time points returned in <i>T</i> , but in general, <i>T</i> includes additional time points.
<i>Options</i>	Optional simulation parameters created in a structure by the <code>simset</code> command using name-value pairs.
<i>UT</i>	Optional external inputs. For supported expressions, see “Load Data to Root-Level Input Ports”.

Simulink requires only the `model` argument. Simulink takes all defaults from the block diagram, including unspecified options. If you specify any optional arguments, your specified settings override the settings in the block diagram.

Specifying an input argument of `sim` as the empty matrix, `[]`, causes Simulink to use the default for that argument.

This command simulates the Van der Pol equations, using the `vdp` model. The command uses all default parameters.

```
[t,x,y] = sim('vdp')
```

This command simulates the Van der Pol equations, using the parameter values associated with the `vdp` model, but defines a value for the `Refine` parameter.

```
[t,x,y] = sim('vdp', [], simset('Refine',2));
```

This command simulates the Van der Pol equations for 1,000 seconds, saving the last 100 rows of the return variables. The simulation outputs values for `t` and `y` only, but saves the final state vector in a variable called `xFinal`.

```
[t,x,y] = sim('vdp', 1000, simset('MaxRows', 100,
    'OutputVariables', 'ty', 'FinalStateName', 'xFinal'));
```

Tips

- Parameters specified using the `sim` command override the values defined in the **Model Configuration Parameters** dialog box. The software restores the original configuration values at the end of simulation.

- In the case of a model with a model reference block, the parameter specifications are applied to the top model.
- When simulating a model with infinite stop time, to stop the simulation, you must press **Ctrl+C**.
- To specify the time span for a simulation, you must specify the `StartTime` and `StopTime` parameters.
- To log the model time, states, or outputs, use the **Data Import/Export** pane of the Model Configuration Parameters dialog box.
- To log signals, either use a block such as the To Workspace block or the Scope block, or use the Signal and Scope Manager to log results directly.
- To get a list of simulation parameters for the model `vdp`, in the MATLAB Command Window, enter:

```
configSet = getActiveConfigSet('vdp')  
configSetNames = get_param(configSet, 'ObjectParameters')
```

This command lists several object parameters, including simulation parameters such as `'StopTime'`, `'SaveTime'`, `'SaveState'`, `'SaveOutput'`, and `'SignalLogging'`.

Introduced before R2006a

simplot

Redirects to the Simulation Data Inspector

Note `simplot` will be removed in a future release. Use the Simulation Data Inspector instead.

Syntax

```
simplot
```

Description

`simplot` redirects to the Simulation Data Inspector and returns empty handles. This function is no longer supported and has been replaced by the Simulation Data Inspector. Use the **Simulation Data Inspector** button in the Simulink Editor to capture simulation output in the Simulation Data Inspector. Programmatically, use the function `Simulink.sdi.view` instead.

See Also

`Simulink.sdi.view`

Simulation Manager

Monitor multiple simulations in one window

Description

Simulation Manager allows you to monitor the status of multiple simulations. Using this app, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the errored simulations.
- Abort simulations.
- Select a simulation and view its specifications.
- View simulation results in the **Simulation Data Inspector**.

Open the Simulation Manager App

- `parsim` command – Set the argument `ShowSimulationManager` to `on` with Parallel Computing Toolbox. `Parsim` command uses a `SimulationInput` object to run simulations. For more information, see `Simulink.SimulationInput`.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

- `sim` command – Set the argument `ShowSimulationManager` to `on`.
- To reopen the Simulation Manager, use the command `openSimulationManager('modelName')`. This command lets you reopen the last running session.

Examples

Open Simulation Manager

Open the model `sldemo_suspn_3dof` and create a set of sweep values.

```
mdl = 'sldemo_suspn_3dof';  
open_system(mdl);  
Cf_sweep = Cf*(0.05:0.1:0.95);  
numSims = length(Cf_sweep);
```

Create an array of `Simulink.SimulationInput` objects to modify the block parameter **Road-Suspension Interaction** with the sweep values.

```
for i = numSims:-1:1  
    in(i) = Simulink.SimulationInput(mdl);  
    in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));  
end
```

Run multiple simulations and open the Simulation Manager to monitor them.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

In the absence of Parallel Computing Toolbox, the simulations run in serial.

Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:

The screenshot shows the Simulation Manager window with the 'List' view selected. The interface includes a toolbar with buttons for 'Stop Job', 'Open Selected', 'Grid', 'List', 'Simulation Details', and 'Show Results'. Below the toolbar, the current simulation is identified as 'sldemo_suspn_3dof'. A summary table shows 10 total simulations, with 6 active workers and 0 errors/aborted, active, or queued. A progress bar is 100% green. A detailed table lists 10 simulation runs, all completed with 100% progress, on the machine 'ah-cdeshpan'.

Run ID	Status	Progress	Elapsed Time	Machine
1	Completed	100%	00:00:03	ah-cdeshpan
2	Completed	100%	00:00:03	ah-cdeshpan
3	Completed	100%	00:00:03	ah-cdeshpan
4	Completed	100%	00:00:03	ah-cdeshpan
5	Completed	100%	00:00:03	ah-cdeshpan
6	Completed	100%	00:00:03	ah-cdeshpan
7	Completed	100%	00:00:02	ah-cdeshpan
8	Completed	100%	00:00:02	ah-cdeshpan
9	Completed	100%	00:00:02	ah-cdeshpan
10	Completed	100%	00:00:02	ah-cdeshpan

The progress bar on top right is color coded based on the status of the simulations.

You can view all the multiple simulations in a detailed list view. This view gives you an option to add or delete columns to the view. Use the button,  to choose which columns to display. You can also sort the columns based on your preference.

Topics

“Parallel Simulations Workflow”
“Run Multiple Simulations”

simulink

Open Simulink Start Page

Syntax

```
simulink
```

Description

`simulink` opens the Simulink Start Page. Choose a model or project template, or browse the examples. See “Create and Open Models”.

The behavior of the `simulink` function changed in R2016a. Formerly it opened the Simulink Library Browser and loaded the Simulink block library. If you wish to preserve that behavior, use `sLibraryBrowser` instead to open the Library Browser, or `load_system simulink` to load the Simulink block library.

If you want to start Simulink without opening the Library Browser or Start Page, use the faster `start_simulink` instead.

Introduced before R2006a

simulinkproject

Open Simulink Project and get project object

Syntax

```
simulinkproject
simulinkproject(projectPath)

proj = simulinkproject
proj = simulinkproject(projectPath)
```

Description

`simulinkproject` opens Simulink Project or brings focus to the tool if it is already open. After you open the tool, you can create new projects or access recent projects using the **Simulink Project** tab.

`simulinkproject(projectPath)` opens the Simulink project specified by any file or folder under the project root in `projectPath` and gives focus to Simulink Project.

`proj = simulinkproject` returns a project object `proj` you can use to manipulate the project at the command line. You need to get a project object before you can use any of the other project functions.

If you want to avoid giving focus to Simulink Project in your startup script, specify an output argument.

To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`.

`proj = simulinkproject(projectPath)` opens the Simulink project specified by `projectPath` and returns a project object.

Examples

Open Simulink Project Tool

Open the Simulink Project Tool.

```
simulinkproject
```

Open a Simulink Project

Specify either the `.prj` file path or the folder that contains your `.SimulinkProject` folder and `.prj` file. The project opens and brings focus to Simulink Project.

```
simulinkproject('C:/projects/project1/')
```

Open a Simulink Project and Get a Project Object

Open a specified project and get a project object to manipulate the project at the command line. To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`. If you use `uiopen(myproject.prj)` this calls `simulinkproject` with no output argument and gives focus to Simulink Project.

```
start_simulink  
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

Get Airframe Example Project

Open the Airframe project and create a project object to manipulate and explore the project at the command line.

```
sldemo_slproject_airframe  
proj = simulinkproject  
  
proj =
```

ProjectManager with properties:

```
        Name: 'Simulink Project Airframe Example'  
    Information: [1x1 slproject.Information]

    StartupFiles: [1x0 slproject.StartupFile]  
    ShutdownFiles: [1x0 slproject.ShutdownFile]  
    RootFolder: 'C:\slexamples\airframe11'
```

Find Project Commands

Find out what you can do with your project.

methods(proj)

Methods for class slproject.ProjectManager:

```
addFile  
addFolderIncludingChildFiles  
addPath  
addReference  
addShortcut  
addShutdownFile  
addStartupFile  
close  
createCategory  
export  
findCategory  
findFile  
isLoading  
listModifiedFiles  
listRequiredFiles  
refreshSourceControl  
reload  
removeCategory  
removeFile  
removePath
```

```
removeReference  
removeShortcut  
removeShutdownFile  
RemoveStartupFile
```

Examine Project Properties Programmatically

After you get a project object using the `simulinkproject` function, you can examine project properties.

Examine the project files.

```
files = proj.Files  
  
files =  
  
    1x31 ProjectFile array with properties:  
  
        Path  
        Labels  
        Revision  
        SourceControlStatus
```

Use indexing to access files in this list. The following command gets file number 14. Each file has properties describing its path, attached labels, and source control information.

```
proj.Files(15)  
  
ans =  
  
    ProjectFile with properties:  
  
        Path: 'C:\slexamples\airframe24\models\DigitalControl.slx'  
        Labels: [1x1 slproject.Label]  
        Revision: '2'  
        SourceControlStatus: Unmodified
```

Examine the labels of the file.

```
proj.Files(15).Labels  
  
ans =
```

```

Label with properties:

File: 'C:\slexamples\airframe24\models\DigitalControl.slx'
  DataType: 'none'
  Data: []
  Name: 'Design'
  CategoryName: 'Classification'

```

Get a particular file by name.

```

myfile = findFile(proj, 'models/AnalogControl.mdl')

myfile =

ProjectFile with properties:

Path: 'C:\slexamples\airframe24\models\AnalogControl.mdl'
  Labels: [1x1 slproject.Label]
  Revision: '2'
  SourceControlStatus: Unmodified

```

Find out what you can do with the file.

```

methods(myfile)

Methods for class slproject.ProjectFile:

addLabel      findLabel      removeLabel

```

Update the file dependencies.

```

update(proj.Dependencies)

```

The project runs a dependency analysis to update the known dependencies between project files.

For more information on working with project files, including modified files and dependencies, see “Automate Simulink Project Tasks Using Scripts”.

- “Automate Simulink Project Tasks Using Scripts”
- “Create a New Project From a Folder”
- “Open Recent Projects”
- “Retrieve a Working Copy of a Project from Source Control”

Input Arguments

projectPath — Full path to project file or folder
character vector

Full path to project .prj file, or the path to the project root folder, or any subfolder or file under your project root, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

Output Arguments

proj — Project
project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink project at the command line.

Properties of `proj` output argument.

Project Property	Description
Categories	Categories of project labels
Dependencies	Dependencies between project files in a MATLAB digraph object
Files	Paths and names of project files
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project
Name	Project name
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.

Project Property	Description
RootFolder	Full path to project root folder
Shortcuts	An array of the shortcuts in this project
ShutdownFiles	An array of the shutdown files in this project
StartupFiles	An array of the startup files in this project

Tips

Alternatively, you can use `slproject.loadProject` to load a project, and `slproject.getCurrentProjects` to get a project object. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` and `slproject.loadProject` for project automation scripts.

Simulink.architecture.add

Add tasks or triggers to selected architecture of model

Syntax

```
Simulink.architecture.add(Type, Object)
```

Description

`Simulink.architecture.add(Type, Object)` adds the new task or trigger `Object` of the specified `Type` to a model.

Examples

Add periodic trigger

Add a task, `MyTask1`, to the software node `MulticoreProcessor` of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample;  
Simulink.architecture.add('Task', 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1');
```

Input Arguments

Type — Object type

'PeriodicTrigger' | 'AperiodicTrigger' | 'Task'

Object type that identifies the kind of trigger or task to add, , specified as a 'PeriodicTrigger', 'AperiodicTrigger', or 'Task'.

- 'PeriodicTrigger'

Adds a periodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- 'AperiodicTrigger'

Adds an aperiodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- 'Task'

Adds a task to the architecture. Set the properties of the task with the `Simulink.architecture.set_param` function.

Object — Trigger or task object identifier

character vector

Trigger or task object identifier to add to architecture, specified as a character vector.

Example: 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1'

Data Types: char

See Also

Simulink.architecture.config

Create or convert configuration for concurrent execution

Syntax

```
Simulink.architecture.config(model, 'Convert')  
Simulink.architecture.config(model, 'Add')  
Simulink.architecture.config(model, 'OpenDialog')
```

Description

`Simulink.architecture.config(model, 'Convert')` converts the active configuration set in the specified model to one for concurrent execution.

`Simulink.architecture.config(model, 'Add')` adds and activates a new configuration set for concurrent execution.

`Simulink.architecture.config(model, 'OpenDialog')` opens the Concurrent Execution dialog box for a model configuration.

Examples

Convert existing configuration set

Convert existing configuration set for concurrent execution in the model `vdp`.

```
vdp;  
Simulink.architecture.config('vdp', 'Convert');
```

Add new configuration set

Add a new configuration set (copied from the existing configuration set) for concurrent execution in the model `vdp`.

```
vdp;  
Simulink.architecture.config('vdp', 'Add');
```

Open Concurrent Execution dialog box

Open the Concurrent Execution dialog box in the model `slexMulticoreExample`.

```
slexMulticoreExample;  
Simulink.architecture.config('slexMulticoreExample', 'OpenDialog');
```

Input Arguments

model — Model name

character vector

Model name whose configuration set you want to convert or add to, specified as a character vector.

Example:

Data Types: `char`

Introduced in R2014a

Simulink.architecture.delete

Delete triggers and tasks from selected architecture of model

Syntax

```
Simulink.architecture.delete(Object)
```

Description

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

Examples

Delete task Plant

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample  
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

Input Arguments

object — Object to delete, specified as a character vector

character vector

Object to be deleted. Possible objects are:

- Periodic trigger

Note You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

- Aperiodic trigger
- Task

Example: [bdroot '/MulticoreProcessor/Core2/Task3']

Data Types: char

Introduced in R2014a

Simulink.architecture.find_system

Find objects under architecture object

Syntax

```
object = Simulink.architecture.find_system(RootObject)
```

```
object = Simulink.architecture.find_system(RootObject, ParamName,  
ParamValue)
```

Description

`object = Simulink.architecture.find_system(RootObject)` looks for all objects under `RootObject`.

`object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)` returns the object in `RootObject` whose parameter `ParamName` has the value `ParamValue`. Parameter name and value character vectors are case-sensitive.

Examples

Look for all objects

To find all the objects in `slexMulticoreExample`:

```
slexMulticoreExample  
t = Simulink.architecture.find_system('slexMulticoreExample')  
  
t =  
  
    'slexMulticoreExample'  
    'slexMulticoreExample/MulticoreProcessor'  
    'slexMulticoreExample/MulticoreProcessor/Core1'  
    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
```

```
'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
'slexMulticoreExample/MulticoreProcessor/Core2'
'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Look for all tasks

To find all the tasks in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample','Type','Task')

t =

    'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
    'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
    'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

Input Arguments

RootObject — Object to search

character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example: 'slexMulticoreExample'

ParamName — Name of parameter to find

character vector | scalar | vector

Name of the parameter to find. Possible values are:

- 'Name'
- 'Type'
- 'ClockFrequency'
- 'Color'
- 'Period'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'

Example: 'EventName'

ParamValue — Parameter value to find

character vector | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: 'ERTDefaultEvent'

Introduced in R2014a

Simulink.architecture.get_param

Get configuration parameters of architecture objects

Syntax

```
ParamValue = Simulink.architecture.get_param(Object, ParamName)
```

Description

`ParamValue = Simulink.architecture.get_param(Object, ParamName)` returns the value of the specified parameter for the object, `Object`. `ParamName` is case-sensitive.

Examples

Get period

Get the period of task `Task3` of trigger `Core2` of software node `MulticoreProcessor` of the selected architecture for the model `slexMulticoreExample`.

```
slexMulticoreExample;  
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3', 'Period')
```

```
p =
```

```
0.2
```

Input Arguments

Object — Object whose parameter value to return

character vector

Object whose parameter value to return, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Parameter whose value to return

character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:

- 'ArchitectureName'
- 'Type'

For a software node:

- 'Name'
- 'Type'

For a hardware node

- 'Name'
- 'ClockFrequency'
- 'Color'
- 'Type'

For a periodic trigger:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

For an aperiodic trigger:

- 'Name'
- 'Color'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'
- 'Type'

For a task:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

Syntax

```
Simulink.architecture.importAndSelect(model, Architecture)
```

```
Simulink.architecture.importAndSelect(model,  
CustomArchitectureDescriptionFile)
```

Description

`Simulink.architecture.importAndSelect(model, Architecture)` **imports and selects** the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

```
Simulink.architecture.importAndSelect(model,  
CustomArchitectureDescriptionFile) imports and selects the architecture from an  
XML-based architecture description file.
```

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

Examples

Import and select a different architecture

Import and select the sample architecture to the model `slexMulticoreExample`.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')
```

Import and select a custom architecture

Import and select the custom architecture defined in the XML file `custom_arch.xml`. This example requires you to create a `custom_arch.xml` file first.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')
```

Input Arguments

model — Model

character vector

Model to import architecture to, specified as a character vector.

Data Types: `char`

Architecture — Target architecture name

character vector

Target architecture name to import into the concurrent execution environment for the model. Possible target names are:

Property	Description
'Multicore'	Single CPU with multiple cores
'Sample Architecture'	Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution.
'Simulink Real-Time'	Simulink Real-Time™ target
'Xilinx Zynq ZC702 evaluation kit'	Xilinx® Zynq® ZC702 evaluation kit target
'Xilinx Zynq ZC706 evaluation kit'	Xilinx Zynq ZC706 evaluation kit target

Property	Description
'Xilinx Zynq Zedboard'	Xilinx Zynq ZedBoard™ target

Data Types: char

CustomArchitectureDescriptionFile — Custom target architecture file

XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: `custom_arch.xml`

Introduced in R2014a

Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

Syntax

```
Simulink.architecture.profile(model)  
Simulink.architecture.profile(model,numSamples)
```

Description

`Simulink.architecture.profile(model)` generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

`Simulink.architecture.profile(model,numSamples)` specifies the number of samples to generate a profile report.

Examples

Generate profile report

Generate profile report for the model `slexMulticoreExample`.

```
slexMulticoreExample;  
Simulink.architecture.profile('slexMulticoreExample');
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder and opens it.

Generate profile report for 120 time steps

Generate profile report for the model `slexMulticoreExample` with data for 120 time steps.

```
slexMulticoreExample;  
Simulink.architecture.profile('slexMulticoreExample',120);
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder.

Input Arguments

model — Model to profile

character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: `char`

numSamples — Number of time steps

100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

Introduced in R2014a

Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

Syntax

```
Simulink.architecture.register(CustomArchFile)
```

Description

`Simulink.architecture.register(CustomArchFile)` adds an XML-format custom target architecture file `CustomArchFile` to the concurrent execution target architecture selector. To access this selector, click the **Select** button on the Concurrent Execution pane of the Concurrent Execution dialog box.

Examples

Add custom target architecture

Add custom target architecture defined in the XML file `custom_arch.xml` to the concurrent execution target architecture selector. This example requires you to create a `custom_arch.xml` first.

```
slexMulticoreExample  
Simulink.architecture.register('custom_arch.xml')
```

Input Arguments

CustomArchFile — Custom target architecture file

XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.

See Also

`Simulink.architecture.find_system` |
`Simulink.architecture.importAndSelect` | `Simulink.architecture.profile`
| `Simulink.architecture.set_param`

Introduced in R2014a

Simulink.architecture.set_param

Set architecture object properties

Syntax

```
Simulink.architecture.set_param(Object, ParamName, ParamValue)
```

Description

`Simulink.architecture.set_param(Object, ParamName, ParamValue)` sets the specified parameter of `Object` to the specified value. Parameter name and value character vectors are case sensitive.

Examples

Set software node name

Set the software node name from `MulticoreProcessor` to `MyCPUNewName`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'], 'Name', 'MyCPUNewName');
```

Change Periodic

Set `Core2` trigger period to `.01`.

```
slexMulticoreExample  
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'],'Period','.01')
```

Input Arguments

Object — Object whose parameter value to set

character vector

Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

ParamName — Name of the parameter to set

character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- 'Name' — Name of the software node.

For hardware node:

- 'Name' — Name of the hardware node.
- 'ClockFrequency' — Frequency of the hardware node clock.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- 'Name' — Name of the trigger.
- 'Period' — Period of the trigger.

- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- 'Name' — Name of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).
- 'EventHandlerType' — Trigger source for the interrupt-driven task. Possible values:
 - 'Event (Windows)'
 - 'Posix Signal (Linux/VxWorks 6.x)'
- 'SignalNumber' — Signal number for the trigger. You can set this value only if `EventHandlerType` is set to `Event (Windows)`.
- 'EventName' — Event name for the trigger. You can set this value only if `EventHandlerType` is set to `Posix Signal (Linux/VxWorks 6.x)`.

For task:

- 'Name' — Name of the task.
- 'Period' — Period of the task.
- 'Color' — Color of the task icon, specified as an RGB triplet (vector).

Data Types: `char`

ParamValue — Value to set the parameter to

character vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: `'MyCPUNewName'`

Simulink.Block.getSampleTimes

Return sample time information for a block

Syntax

```
ts = Simulink.Block.getSampleTimes(block)
```

Input Arguments

block

Full name or handle of a Simulink block

Output Arguments

ts

The command returns *ts* which is a 1×*n* array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here *n* is the number of sample times associated with the block. The format of the returns is:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- *value* — A two-element array of doubles that contains the sample time period and offset
- *Description* — A character vector that describes the sample time type
- *ColorRGBValue* — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

- `Annotation` — A character vector that represents the annotation of a specific sample time (e.g., 'D1')
- `OwnerBlock` — For asynchronous and variable sample times, a character vector containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector.
- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

Description

`ts = Simulink.Block.getSampleTimes(block)` performs an update diagram and then returns the sample times of the block connected to the input argument `mdl/signal`. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

See Also

`Simulink.BlockDiagram.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

Syntax

```
[destBlocks,busToVectorBlocks,ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model)  
[destBlocks,busToVectorBlocks,ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model,includeLibs)  
[destBlocks,busToVectorBlocks,ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly)  
[destBlocks,busToVectorBlocks,ignoredBlocks] =  
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,  
strictOnly)
```

Description

[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model) searches a model, excluding any library blocks, for bus signals used implicitly as vectors, and returns the results of the search.

[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs) searches a model, and if includeLibs is true, includes in the search library blocks for bus signals used implicitly as vectors.

[destBlocks,busToVectorBlocks,ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly) searches a model, and if reportOnly is set to false, then the function inserts a Bus to Vector block into each bus that is used as a vector in any block that it searches. The insertion replaces the implicit use of a bus as a vector with an explicit conversion of the bus to a vector. The source and destination blocks of the signal do not change.

If Simulink.BlockDiagram.addBusToVector adds Bus to Vector blocks to the model or any library, the function changes the saved copy of the diagram.

If `Simulink.BlockDiagram.addBusToVector` changes a library block, the change affects every instance of that block in every model that uses the library.

`[destBlocks,busToVectorBlocks,ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model,includeLibs,reportOnly,strictOnly)` searches a model, and if `strictOnly` is true, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permut Dimensions

Examples

Insert Bus to Vector Block to Handle Bus Used as Vector

The `ex_bus_to_mux_ng` model simulates correctly, but the input to the Gain block is a bus, while the output is a vector. Therefore, the Gain block uses a bus signal as a vector.

Open the model.

```
open_system(fullfile(matlabroot,'examples','simulink',...  
'ex_bus_to_mux_ng'))
```

Insert a Bus to Vector block to convert the bus input signal for the Gain block to a vector signal because the Gain block can accept only non-bus signals.

```
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_mux_ng',true,false)

### Processing block diagram 'ex_bus_to_mux_ng'
### Number of blocks left that are connected to a bus being used as a vector: 1
### Successfully inserted Bus to Vector Blocks in model. Preparing to save model and/or libraries
### To eliminate modeling errors in the future, please enable strict bus modeling by setting the 'Bus signal
### Done processing block diagram 'ex_bus_to_mux_ng'

blocks =

    struct with fields:

        BlockPath: 'ex_bus_to_mux_ng/Gain'
        InputPort: 1
        LibPath: ''

busToVectors =

    cell

    'ex_bus_to_mux_ng/Bus to Vector'
```

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The results of simulation are the same for both models. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.

Input Arguments

model — Model name or handle
character vector

Model name or handle, specified as a character vector.

includeLibs — Search library blocks
`false` (default) | `true`

Search library blocks, specified as `false` or `true`.

- `false` — Search only the blocks in the model.
- `true` — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: `logical`

reportOnly — Report results without changing model
`true` (default) | `false`

Choice to report results without changing the model, specified as `false` or `true`.

- `false` — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- `true` — Report search results, but do not change the model.

Specify as the third argument (you must also specify the `model` and `includeLibs` arguments).

Data Types: `logical`

`strictOnly` — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals

`false` (default) | `true`

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as `false` or `true`. If `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permut Dimensions

Specify as the fourth argument (you must also specify the `model` and `includeLibs` arguments).

Data Types: `logical`

Output Arguments

`destBlocks` — Blocks connected to buses but that treat buses as vectors

array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

- `LibPath` — If the block is a library block instance, and `includeLibs` is `true`, the field value is the path to the source library block. Otherwise, `LibPath` is empty (`[]`).

busToVectorBlocks — Bus to Vector blocks added by function

cell array

Bus to Vector blocks added by the function, specified as a cell array. If `reportOnly` is set to `false`, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, `busToVectorBlocks` is empty (`[]`).

ignoredBlocks — Cases where function cannot insert Bus to Vector block

array of structures

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

Tips

- Before you execute this function:
 - 1 Ensure that the model compiles without error.
 - 2 Save the model.
- Back up the model and any libraries before calling the function with `reportOnly` set to `false`.
- To preview the effects of the change on blocks in all models, call `Simulink.BlockDiagram.addBusToVector` with `includeLibs` set to `true` and `reportOnly` set to `true`. Then, examine the information returned in the `destBlocks` output argument.

Bus to Vector

Introduced in R2007a

Simulink.BlockDiagram.buildRapidAcceleratorTarget

Build Rapid Accelerator target for model and return run-time parameter set

Syntax

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget (mdl)
```

Description

`rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget (mdl)` builds a Rapid Accelerator target for model, `mdl`, and returns run-time parameter set, `rtp`.

Input Arguments

`mdl`

Name or handle of a Simulink model

Output Arguments

`rtp`

Run-time parameter set that contains two elements:

Element	Description				
<code>modelChecksum</code>	1x4 vector that encodes the structure of the model.				
<code>parameters</code>	A structure of the tunable parameters in the model. This structure contains the following fields.				
	<table border="1"> <thead> <tr> <th>Field</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> </tr> </tbody> </table>	Field	Description		
Field	Description				

Element	Description		
	dataTypeName	The data type name, for example, double.	
	dataTypeId	Internal data type identifier for use by Simulink Coder.	
	complex	Complex type or real type specification. Value is 0 if real, 1 if complex.	
	dtTransIdx	Internal data type identifier for use by Simulink Coder.	
	values	All values associated with this entry in the <code>parameters</code> substructure.	
	map	Mapping structure information that correlates the values to the model tunable parameters. This structure contains the following fields.	
		Field	Description
		Identifier	Tunable parameter name.
		ValueIndices	Start and end indices into the values field, [<code>startIdx</code> , <code>endIdx</code>].
	Dimensions	Dimension of this tunable parameter (matrices are generally stored in column-major format).	

Examples

Build Rapid Accelerator Target for Model

In the MATLAB Command Window, type:

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('f14')

### Building the rapid accelerator target for model: f14
### Successfully built the rapid accelerator target for model: f14

rtp =
```

```
modelChecksum: [2.6812e+09 2.7198e+09 589261472 4.0180e+09]  
parameters: [1x1 struct]
```

Introduced in R2012b

Simulink.BlockDiagram.copyContentsToSubsystem

Copy contents of block diagram to empty subsystem

Syntax

```
Simulink.BlockDiagram.copyContentsToSubsystem(bdiag, subsys)
```

Description

`Simulink.BlockDiagram.copyContentsToSubsystem(bdiag, subsys)` copies the contents of the block diagram *bdiag* to the subsystem *subsys*. The block diagram and subsystem must have already been loaded. The subsystem cannot be part of the block diagram.

The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets. You can use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

This function cannot be used if the destination subsystem contains any blocks or signals. Other types of information can exist in the destination subsystem and are not affected by the function. Use `Simulink.SubSystem.deleteContents` if necessary to empty the subsystem before using `Simulink.BlockDiagram.copyContentsToSubsystem`.

Input Arguments

bdiag

Block diagram name or handle

subsys

Subsystem name or handle

Examples

Copy the contents of `vdp` to an empty subsystem named `vdp_subsystem` that is in the model named `new_model_with_vdp`:

```
open_system('vdp');
new_system('new_model_with_vdp')
open_system('new_model_with_vdp');
add_block('built-in/Subsystem', 'new_model_with_vdp/vdp_subsystem')
Simulink.BlockDiagram.copyContentsToSubsystem...
('vdp', 'new_model_with_vdp/vdp_subsystem')
```

“Create a Subsystem”

Introduced in R2007a

Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

Syntax

```
Simulink.BlockDiagram.createSubsystem(blocks)  
Simulink.BlockDiagram.createSubsystem()
```

Description

`Simulink.BlockDiagram.createSubsystem(blocks)` creates a new subsystem and moves the specified blocks into the subsystem. All of the specified blocks must originally reside at the top level of the model or in the same existing subsystem within the model.

If any of the blocks have unconnected input ports, the command creates input port blocks for each unconnected input port in the subsystem and connects the input port block to the unconnected input port. The command similarly creates and connects output port blocks for unconnected output ports on the specified blocks. If any of the specified blocks is an input port, the command creates an input port block in the parent system and connects it to the corresponding input port of the newly created subsystem. The command similarly creates and connects output port blocks for each of the specified blocks that is an output port block.

`Simulink.BlockDiagram.createSubsystem()` creates a new subsystem in the currently selected model and moves the currently selected blocks in the current model to the new subsystem.

Input Arguments

blocks

An array of block handles

Default: []

Examples

This function converts the contents of a model or subsystem into a subsystem.

```
function convert2subsys(sys)
    blocks = find_system(sys, 'SearchDepth', 1);
    bh = [];
    for i = 2:length(blocks)
        bh = [bh get_param(blocks{i}, 'handle')];
    end
    Simulink.BlockDiagram.createSubsystem(bh);
end
```

For example, suppose you create this model and save it as `initial_model.slx`.

Execute this code to convert the model to create a subsystem:

```
convert2subsys('initial_model');
```

Simulink.BlockDiagram.deleteContents

Delete contents of block diagram

Syntax

```
Simulink.BlockDiagram.deleteContents(bdiag)
```

Description

`Simulink.BlockDiagram.deleteContents(bdiag)` deletes the contents of the block diagram *bdiag*. The function affects only blocks, lines, and annotations. The block diagram must have already been loaded.

Input Arguments

bdiag

Block diagram name or handle

Examples

Delete the graphical content of an open block diagram named `f14`, including all subsystems:

```
Simulink.BlockDiagram.deleteContents('f14');
```

“Create a Subsystem”

Introduced in R2007a

Simulink.BlockDiagram.expandSubsystem

Expand subsystem contents to containing model level

Syntax

```
Simulink.BlockDiagram.expandSubsystem(block)
```

Description

`Simulink.BlockDiagram.expandSubsystem(block)` expands the contents of the subsystem for the specified Subsystem block. Subsystem expansion involves moving the contents of a virtual subsystem into the system that contains that subsystem.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see “Subsystems That You Can Expand”.

Input Arguments

block

A character vector that specifies one of the following:

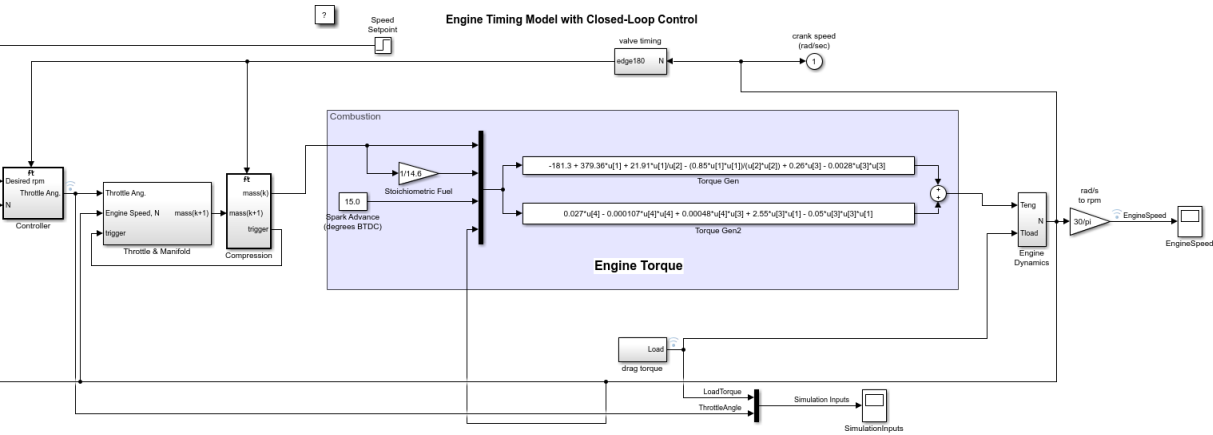

- The path to a subsystem block in a loaded model.
- The block handle of a subsystem block in a loaded model.
- `gcb` (the currently selected block)

Examples

The following function expands the Combustion subsystem.

```
open_system('sldemo_enginewc')  
Simulink.BlockDiagram.expandSubsystem('sldemo_enginewc/Combustion')
```

The blocks and signals that were in the Combustion subsystem become part of the top-level model that contained the Combustion subsystem, replacing that Subsystem block.

Introduced in R2014a

Simulink.BlockDiagram.getChecksum

Return checksum of model

Syntax

```
[checksum, details] = Simulink.BlockDiagram.getChecksum('model')
```

Description

```
[checksum, details] = Simulink.BlockDiagram.getChecksum('model')
```

returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see `slAccelDemoWhyRebuild`.

Note `Simulink.BlockDiagram.getChecksum` compiles the specified model, if the model is not already in a compiled state.

This command accepts the argument *model*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- *checksum* — Array of four 32-bit integers that represents the model's 128-bit checksum.
- *details* — Structure of the form

```
ContentsChecksum: [1x1 struct]  
InterfaceChecksum: [1x1 struct]  
ContentsChecksumItems: [nx1 struct]  
InterfaceChecksumItems: [mx1 struct]
```

- *ContentsChecksum* — Structure of the following form that represents a checksum that provides information about all blocks in the model.

Value: [4x1 uint32]
MarkedUnique: [bool]

- Value — Array of four 32-bit integers that represents the model's 128-bit checksum.
- MarkedUnique — True if any blocks in the model have a property that prevents code reuse.
- InterfaceChecksum — Structure of the following form that represents a checksum that provides information about the model.

Value: [4x1 uint32]
MarkedUnique: [bool]

- Value — Array of four 32-bit integers that represents the model's 128-bit checksum.
- MarkedUnique — Always true. Present for consistency with ContentsChecksum structure.
- ContentsChecksumItems and InterfaceChecksumItems — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for ContentsChecksum and InterfaceChecksum, respectively:

Handle: [char array]
Identifier: [char array]
Value: [type]

- Handle — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.
- Identifier — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.
- Value — Value of the item Simulink software added to the checksum. If the item is a parameter, Value is the value returned by

`get_param(handle, identifier)`

`Simulink.BlockDiagram.getChecksum` returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:

- Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
- Code generation— in all other cases

To compile the model before calling `Simulink.BlockDiagram.getChecksum`, use this command:

```
modelName([], [], [], 'compile')
```

Note The checksum that `Simulink.BlockDiagram.getChecksum` returns can vary from the checksum returned if you first compile the model at the command line (using the `model` command) before running `Simulink.BlockDiagram.getChecksum`.

Tip

The structural checksum reflects changes to the model that can affect the simulation results, including:

- Changing the solver type, for example from Variable-step to Fixed-step
- Adding or deleting blocks or connections between blocks
- Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
- Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
- Changing the number of states or the initial states in the model
- Selecting a different function in the Trigonometric Function block
- Changing signs used in a Sum block
- Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

- Changing the position of a block
- Changing the position of a line
- Resizing a block
- Adding, removing, or changing a model annotation

See Also

`Simulink.SubSystem.getChecksum` | `Simulink.getFileChecksum`

Introduced in R2006b

Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

Syntax

```
x0 = Simulink.BlockDiagram.getInitialState('model')
```

Description

`x0 = Simulink.BlockDiagram.getInitialState('model')` returns the initial state data of the block diagram specified by the input argument *model*. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the `LoadInitialState` model argument or the **Data Import/Export > Initial state** configuration parameter.

To specify the format for the initial state data, use the `SaveFormat` model argument. The default format is 'Dataset'. Other formats 'Array', 'Structure', and 'StructureWithTime'. Alternatively, you can set the initial state format using the **Data Import/Export > Format** configuration parameter.

- If format is 'Dataset', then the `Simulink.BlockDiagram.getInitialState` function returns a `Simulink.SimulationData.Dataset` object.
- For other format settings, the function returns a structure of the form:

```
time: 0  
signals: [1xn struct]
```

where *n* is the number of states contained in the model, including any models referenced by Model blocks. The `signals` field is a structure of the form:

```
values: [1xm double]  
dimensions: [1x1 double]  
label: [char array]  
blockName: [char array]
```

```
inReferencedModel: [bool]  
sampleTime: [1x2 double]
```

- `values` — Numeric array of length `m`, where `m` is the number of states in the signal
- `dimensions` — Length of the values vector
- `label` — Indication of whether the state is continuous (CSTATE) or discrete. If the state is discrete:

The name of the discrete state is shown for S-function blocks.

The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

DSTATE is used in all other cases.

- `blockName` — Full path to block associated with this state
- `inReferencedModel` — Indication of whether the state originates in a model referenced by a Model block (1) or in the top model (0)
- `sampleTime` — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

Introduced in R2006b

Simulink.BlockDiagram.getSampleTimes

Return all sample times associated with model

Syntax

```
ts = Simulink.BlockDiagram.getSampleTimes('model')
```

Description

`ts = Simulink.BlockDiagram.getSampleTimes('model')` performs an update diagram and then returns the sample times associated with the block diagram `model`. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

Input Arguments

model

Name or handle of a Simulink model

Output Arguments

ts

The command returns a `1xn` array of `Simulink.SampleTime` objects associated with the model passed to `Simulink.BlockDiagram.getSampleTimes`. Here `n` is the number of sample times associated with the block diagram. The format of the returns is as follows:

```
1xn Simulink.SampleTime  
Package: Simulink
```

```
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- `value` — A two-element array of doubles that contains the sample time period and offset.
- `Description` — A character vector that describes the sample time type.
- `ColorRGBValue` — A 1x3 array of doubles that contains the red, green, and blue (RGB) values of the sample time color.
- `Annotation` — A character vector that represents the annotation of a specific sample time (e.g., 'D1').
- `OwnerBlock` — For asynchronous and variable sample times, a character vector containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector.
- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

See Also

`Simulink.Block.getSampleTimes`

Introduced in R2009a

Simulink.BlockDiagram.loadActiveConfigSet

Package: Simulink.BlockDiagram

Load, associate, and activate configuration set with model

Syntax

```
Simulink.BlockDiagram.loadActiveConfigSet(model, filename)
```

Description

`Simulink.BlockDiagram.loadActiveConfigSet(model, filename)` loads a configuration set, associates it with a model, and makes it the active configuration set. `model` is the name or handle of a model. `filename` is the name of the file (.m or .mat) that creates or contains a configuration set object to load. If you do not provide a file extension, it defaults to .m. If the file name is the same as a model name on the MATLAB path, the software cannot determine which file contains the configuration set object and displays an error message.

Examples

Save the configuration set from the `sldemo_counters` model to `my_config_set.m`.

```
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

Load the configuration set from `my_config_set.m`, associate it with the `vdp` model, and make it the active configuration set.

```
% Open the vdp model
vdp
% Load the configuration set from my_config_set.m, making it the active
% configuration set for vdp.
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'my_config_set.m')
```

Tips

- If you load a configuration set with the same name as the active configuration set, the software overwrites the active configuration set.
- If you load a configuration set with the same name as an inactive configuration set associated with the model, the software detaches the inactive configuration from the model.
- If you load a configuration set object that contains an invalid custom target, the software sets the “**System target file**” (**Simulink Coder**) parameter to `ert.tlc`.

Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

Syntax

```
[isPropagated, convertedModels] =  
Simulink.BlockDiagram.propagateConfigSet(model)  
[isPropagated, convertedModels] =  
Simulink.BlockDiagram.propagateConfigSet(model, 'include',  
refModels)  
[isPropagated, convertedModels] =  
Simulink.BlockDiagram.propagateConfigSet(model, 'exclude',  
refModels)  
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

Description

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

`handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the **Configuration Reference Propagation to Referenced Models** dialog box.

Examples

Propagate a Configuration Reference to All Referenced Models

```
[isPropagated,convertedModels] = ...  
Simulink.BlockDiagram.propagateConfigSet('sldemo_mdref_depgraph')
```

Propagate a Configuration Reference to Listed Referenced Models

```
[isPropagated,convertedModels] = ...  
Simulink.BlockDiagram.propagateConfigSet(...  
'sldemo_mdref_depgraph','include',...  
{'sldemo_mdref_heater','sldemo_mdref_house'})
```

Propagate a Configuration Reference to Referenced Models with Exclusions

```
[isPropagated,convertedModels] = ...  
Simulink.BlockDiagram.propagateConfigSet(...  
'sldemo_mdref_depgraph','exclude',...  
{'sldemo_mdref_heater','sldemo_mdref_house'})
```

Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```
Simulink.BlockDiagram.propagateConfigSet(...  
'sldemo_mdref_depgraph','gui')
```

- “Share a Configuration Across Referenced Models”
- “Manage a Configuration Reference”

Input Arguments

model — Top model

character vector

Top model with configuration reference to propagate, specified as a character vector.

Example: 'mdl'

refModels — Referenced models

cell array of character vectors

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors.

Example: {'mdl1','mdl2','mdl3'}

Output Arguments

isPropagated — Success of propagation

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

convertedModels — Converted models

cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

handle — Handle to dialog box

handle

Handle to the **Configuration Reference Propagation to Referenced Models** dialog box. Returned when you specify the 'gui' argument to the function.

“Manage a Configuration Reference”

Introduced in R2012b

Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

Syntax

```
[isRestored, restoredModels] =  
Simulink.BlockDiagram.restoreConfigSet(model)
```

Description

```
[isRestored, restoredModels] =  
Simulink.BlockDiagram.restoreConfigSet(model) restores the model  
configuration for all converted models after propagating a configuration reference from a  
top model to the referenced models. Execute the function from a writable folder.
```

Examples

Restore the Model Configuration for Converted Models

```
[isRestored, restoredModels] = ...  
Simulink.BlockDiagram.restoreConfigSet('sldemo_mdlref_depgraph');
```

- “Share a Configuration Across Referenced Models”
- “Manage a Configuration Reference”

Input Arguments

model — Top model

character vector

Name of top model, specified as a character vector.

Example: 'mdl'

Output Arguments

isRestored — Success of restoration

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

restoredModels — Restored models

cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

Simulink.BlockDiagram.saveActiveConfigSet

Package: Simulink.BlockDiagram

Save active configuration set of model

Syntax

```
Simulink.BlockDiagram.saveActiveConfigSet(model, filename)
```

Description

`Simulink.BlockDiagram.saveActiveConfigSet(model, filename)` saves the active configuration set of a model to a `.m` or `.mat` file. `model` is the name or handle of the model. `filename` is the name of the file to save the model configuration set. If you specify a `.m` extension, the file contains a function that creates a configuration set object. If you specify a `.mat` extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a `.m` extension. Do not specify `filename` to be the same as a model name; otherwise the software cannot determine which file contains the configuration set object when loading the file.

Examples

Save the configuration set from the `sldemo_counters` model to `my_config_set.m`.

```
% Open the sldemo_counters model
sldemo_counters
% Save the active configuration set to my_config_set.m
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_counters', 'my_config_set.m')
```

Simulink.Bus.cellToObject

Convert cell array containing bus information to bus objects

Syntax

```
Simulink.Bus.cellToObject (busCells)
```

Description

`Simulink.Bus.cellToObject (busCells)` creates a set of bus objects in the MATLAB base workspace from a cell array of bus information.

Examples

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

```
busCell = { ...  
    { ...  
        'myBusObj', ...  
        'MyHeader.h', ...  
        'My description', ...  
        'Exported', ...  
        '-1', ...  
        {'a',1,'double', [0.2 0],'real','Frame'}; ...  
        {'b',1,'double', [0.2 0],'real','Sample'}}, ...  
    }, ...  
};
```

Generate a bus object in the base workspace from the cell array.

```
Simulink.Bus.cellToObject (busCell)
```

- “When to Use Bus Objects”
- “Create Bus Objects Programmatically”
- “Create Bus Objects with the Bus Editor”
- “Save and Import Bus Objects”

Input Arguments

busCells — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains bus object information, using these data fields:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The `elements` field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
- Minimum
- Maximum
- Units
- Description

Tips

The inverse function is `Simulink.Bus.objectToCell`.

Introduced before R2006a

Simulink.Bus.createMATLABStruct

Create MATLAB structures using same hierarchy and attributes as bus signals

Syntax

```
structFromBus = Simulink.Bus.createMATLABStruct (busSource)
structFromBus = Simulink.Bus.createMATLABStruct (busSource,
partialValues)
structFromBus = Simulink.Bus.createMATLABStruct (busSource,
partialValues,dims)

structsForBuses = Simulink.Bus.createMATLABStruct (portHandles)
structsForBuses = Simulink.Bus.createMATLABStruct (portHandles,
partialStructures)
structsForBuses = Simulink.Bus.createMATLABStruct (busObjectNames)
```

Description

`structFromBus = Simulink.Bus.createMATLABStruct (busSource)` creates a MATLAB structure that has the same hierarchy and attributes (such as type and dimension) as the bus specified in `busSource`. The resulting structure uses the ground values of the bus signal.

`structFromBus = Simulink.Bus.createMATLABStruct (busSource, partialValues)` creates a structure that uses specified values of `partialValues` instead of the corresponding ground values of the bus signal.

`structFromBus = Simulink.Bus.createMATLABStruct (busSource, partialValues,dims)` creates a structure that has the specified dimensions. To create a structure for an array of buses, use `dims`.

`structsForBuses = Simulink.Bus.createMATLABStruct (portHandles)` creates a cell array of structures for bus signal ports, specified with port handles. The resulting cell array of structures uses ground values. Use this syntax to create initialization structures for multiple bus ports. This syntax improves performance compared to using separate `Simulink.Bus.createMATLABStruct` calls to create the structures.

`structsForBuses = Simulink.Bus.createMATLABStruct(portHandles, partialStructures)` creates a cell array of structures that uses the specified values of `partialStructures` instead of the ground values.

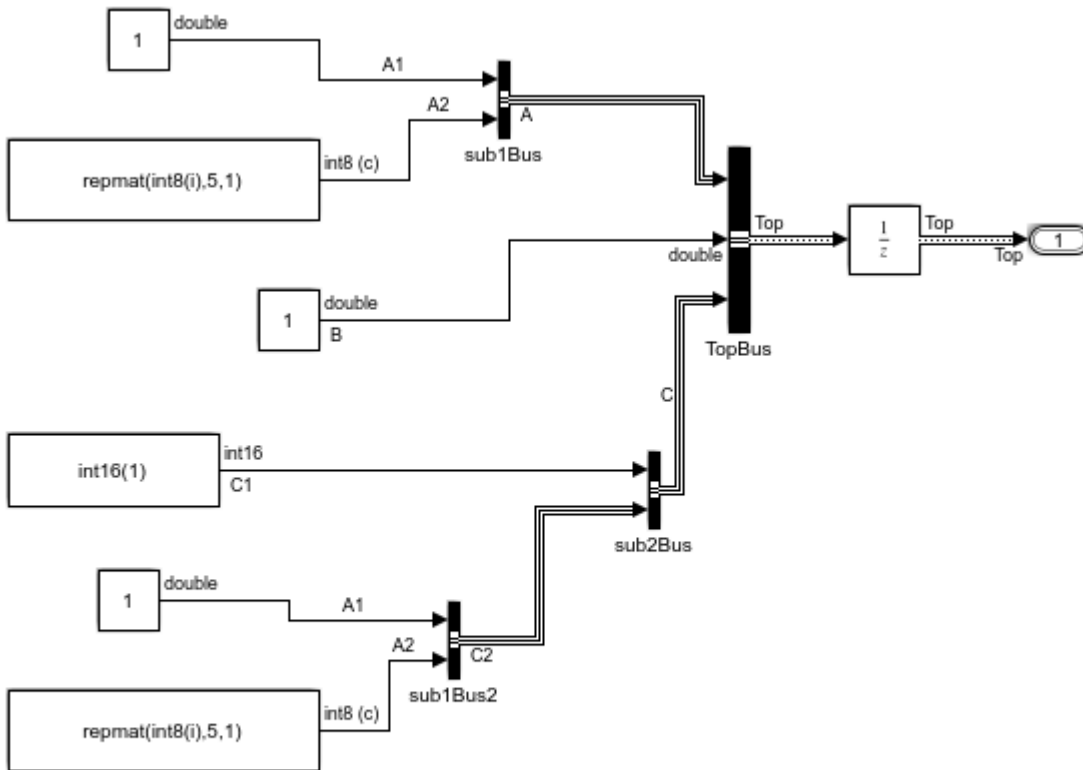

`structsForBuses = Simulink.Bus.createMATLABStruct(busObjectNames)` creates a cell array of structures based on the specified bus objects.

Examples

MATLAB Structure from Bus Object

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot, 'examples', 'simulink', 'busic_example');  
open_system(model);  
sim('busic_example')
```

Copyright 2004-2010 The MathWorks, Inc.

Create a MATLAB® structure using the bus object `Top`, which the `basic_example` model loads.

```
mStruct = Simulink.Bus.createMATLABStruct('Top')
```

```
mStruct =
```

```
struct with fields:
```

```
A: [1x1 struct]
B: 0
```

```
C: [1x1 struct]
```

Set a value for the field of the `mStruct` structure that corresponds to bus element A1 of bus A.

```
mStruct.A.A1 = 3;  
mStruct.A
```

```
ans =
```

```
struct with fields:
```

```
A1: 3  
A2: [5x1 int8]
```

Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

You can use `mStruct` as the initial condition structure for the Unit Delay block.

Initialize Signal Elements That Use a Data Type Other than double

Create a MATLAB® structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the partial structure, match the data types of the fields with the data types of the corresponding elements.

Open a Simulink® model.

```
model = fullfile(matlabroot, 'examples', 'simulink', 'busic_example');  
open_system(model);  
sim('busic_example')
```

Copyright 2004-2010 The MathWorks, Inc.

The C1 signal element that the Constant5 block produces uses the data type `int16`.

Find the port handle for the Bus Creator block port that produces the `Top` bus signal.

```
ph = get_param('busic_example/TopBus','PortHandles');
```

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the `TopBus` block. To set the value of the `C.C1` field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (`int16`).

```
PartialstructForK = struct('B',3,'C',struct('C1',int16(5)));
```

Create a full structure by using the port handle (ph) for the TopBus block. Override the ground values for the C.C1 and B elements.

```
outPort = ph.Outport;  
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);
```

The field C.C1 in the output structure continues to use the data type int16.

MATLAB Structure with Specified Dimensions

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot, 'examples', 'simulink', 'busic_example');  
open_system(model);  
sim('busic_example')
```

Copyright 2004-2010 The MathWorks, Inc.

Create a partial structure, which is a MATLAB® structure that specifies values for a subset of bus elements for the bus signal created by the TopBus block.

```
PartialStructForK = struct('A',struct('A1',4),'B',3)
```

```
PartialStructForK =
  struct with fields:
    A: [1x1 struct]
```

```
B: 3
```

Create a MATLAB structure using the bus object `Top` (which the `basic_example` model loads), a partial structure, and dimensions for the resulting structure.

```
structFromBus = Simulink.Bus.createMATLABStruct...  
    ('Top',PartialStructForK,[2 3])
```

```
structFromBus =
```

```
2x3 struct array with fields:
```

```
A  
B  
C
```

Close the system.

```
close_system('basic_example')
```

Cell Array of MATLAB Structures

Open a Simulink model and simulate it.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...  
    'examples','ex_two_outports_create_struct')))  
sim('ex_two_outports_create_struct')
```

Find the port handles for the Bus Creator blocks Bus1 and Bus2.

```
ph_1 = get_param...
    ('ex_two_outports_create_struct/Bus Creator', 'PortHandles')
ph_2 = get_param...
    ('ex_two_outports_create_struct/Bus Creator1', 'PortHandles')
```

Create a MATLAB structure using an array of port handles.

```
mStruct = Simulink.Bus.createMATLABStruct...
    ([ph_1.Outport ph_2.Outport])
```

```
mStruct =
    [1x1 struct]
    [1x1 struct]
```

Close the system.

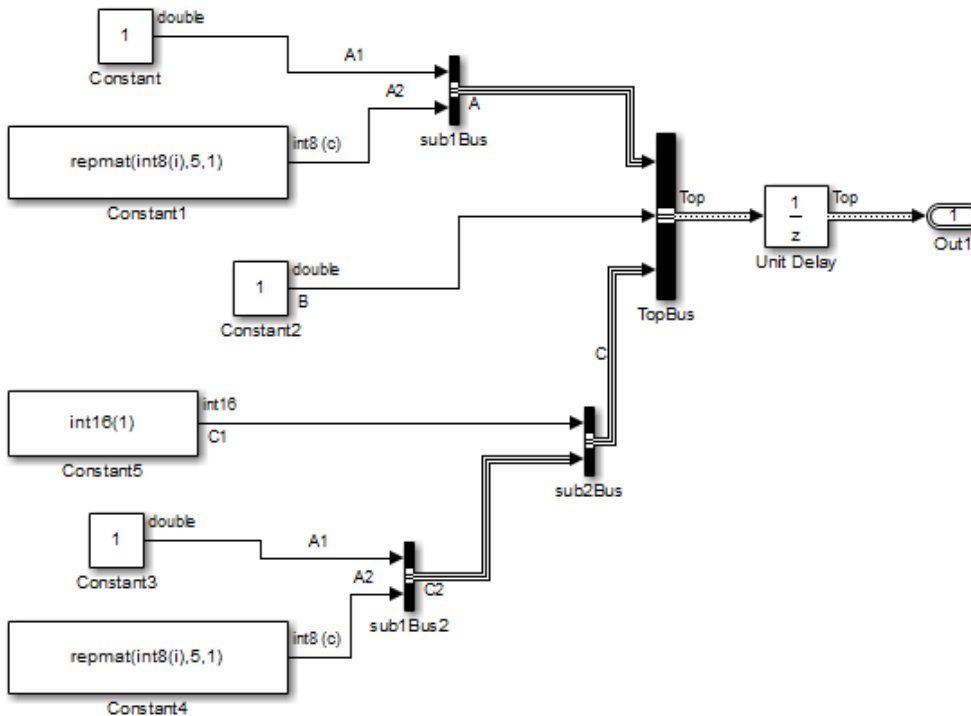

```
close_system('ex_two_outports_create_struct')
```

MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of bus elements of the bus signal that connects to the port.

Open a Simulink model.

```
run([docroot '/toolbox/simulink/ug/examples/signals/basic_example.mdl']);
sim('basic_example')
```

Find the port handle for the Bus Creator block port that produces the `Top` bus signal. The `Outport` handle is the handle that you need.

```
ph = get_param('basic_example/TopBus', 'PortHandles')
```

```
ph =
```

```

    Inport: [143.0013 144.0013 145.0013]
    Outport: 34.0013
    Enable: []
    Trigger: []
    State: []
    LConn: []
    RConn: []
    Ifaction: []

```

Create a partial structure, which is a MATLAB structure that specifies values for a subset of bus elements for the bus signal created by the TopBus block.

```
PartialstructForK = struct('A',struct('A1',4),'B',3)
```

```
PartialstructForK =
```

```

    A: [1x1 struct]
    B: 3

```

Bus elements represented by structure fields `Top.B` and `Top.A` are at the same nesting level in the bus. You can use this partial structure to override the ground values for the B and A bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (`ph`) for the TopBus block. Override the ground values for the A.A1 and B bus elements.

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK)
```

```
mStruct =
```

```

    A: [1x1 struct]
    B: 3
    C: [1x1 struct]

```

Input Arguments

busSource — Source representing a bus signal

a `Simulink.Bus` object | port handle

Source representing a bus signal to use for creating a MATLAB structure, specified as the name of a bus object or port handle.

- If you use the `dims` argument, then for `busSource`, use a bus object.
- For an array of buses signal, you cannot use a port handle.
- If you use a bus object name, then the bus object must be in the MATLAB base workspace. The data type for the bus object name is `char`.
- If you use a port handle, then the model must compile successfully before you use the `createMATLABStruct` method. The data type for the port handle is a `double`.

Example:

```
structFromBus = Simulink.Bus.createMATLABStruct('myBusObject');  
structForPortHandle = Simulink.Bus.createMATLABStruct(port_handle_1);
```

partialValues — Values for a subset of leaf nodes of the resulting structure

partial structure | []

Values for a subset of leaf nodes of the resulting structure, specified as a partial structure or empty array. Each field that you specify in a partial structure must match the data attributes of the corresponding bus element exactly. For details, see “Create Partial Structures for Initialization”.

Use an empty matrix `[]` when you use the `dims` argument and want to use ground values for all of the nodes in the resulting structure.

Data Types: `struct`

dims — Dimensions of the resulting structure

vector

Dimensions of the resulting structure, specified as a vector.

Each dimension element must be an integer that is greater than or equal to 1. If you specify `partialValues`, then each dimension element in `dims` must be greater than or equal to its corresponding dimension element in the partial structure.

To use ground values, use an empty matrix (`[]`) for `partialValues`.

Data Types: `double`

portHandles — Handles of bus signal ports

array

Handles of bus signal ports, specified as an array. If you use the `partialStructures` argument, then the number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: `double`**partialStructures** — Partial structures

cell array

Partial structures specified as a cell array. The number of port handles that you specify in `portHandles` must be the same as the number of partial structures.

Data Types: `cell`**busObjectNames** — Bus object names

cell array

Bus object names, specified as a cell array.

Data Types: `cell`

Output Arguments

structFromBus — Bus signal hierarchy and attributes

MATLAB structure

Bus signal hierarchy and attributes, returned as a MATLAB structure.

The dimensions of `structFromBus` depend on the input arguments:

- If you specify only `busSource`, then the dimension is 1.
- If you also specify `partialValues`, then the dimensions match the dimensions of `partialValues`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

structsForBuses — Structures having the same hierarchy and attributes as bus signals

cell array

Structures having the same hierarchy and attributes as bus signals, returned as a cell array of structures of data with same hierarchy and attributes as a bus signals that you specify with an array of port handles. The cell array of structures uses ground values of the bus signals.

The dimensions of `StructsForBuses` depend on the input arguments:

- If you specify only `portHandles`, then the dimension is 1.
- If you also specify `partialStructures`, then the dimensions match the dimensions of `partialStructures`.

Tips

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in compile before using the function multiple times. For example, to put the `vdp` model in compile, use this command:

```
[sys,x0,str,ts] = vdp([],[],[],'compile')
```

After you create the MATLAB structure, terminate the compile. For example:

```
vdp([],[],[],'term')
```

- You can use the Bus Editor to invoke the `Simulink.Bus.createMATLABStruct` function. Use one of these approaches:
 - Select the **File > Create a MATLAB structure** menu item.
 - Select the bus object for which you want to create a full MATLAB structure. Then, in the toolbar, click the **Create a MATLAB structure** button (.

You can then edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.

- You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model. For details, see the “Referenced Model: Setting Initial Value for Bus Output” section of the Detailed Workflow for Managing Data with Model Reference example.

“Specify Initial Conditions for Bus Signals” | “Composite Signals” | Bus to Vector | Bus Assignment | Bus Creator | Simulink.Bus | Simulink.Bus.cellToObject | Simulink.Bus.createObject | Simulink.Bus.objectToCell | Simulink.Bus.save | Simulink.BusElement | Simulink.SimulationData.createStructOfTimeseries |

Introduced in R2010a

Simulink.Bus.createObject

Create bus objects from blocks or MATLAB structures

Syntax

```
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject( ____,file)
busInfo = Simulink.Bus.createObject( ____,format)
```

Description

`busInfo = Simulink.Bus.createObject(model,blocks)` creates bus objects (instances of `Simulink.Bus` class in the MATLAB base workspace) for specified blocks, and returns information about the objects that it created.

`busInfo = Simulink.Bus.createObject(struct)` creates bus objects in the MATLAB workspace from a MATLAB structure of `timeseries` objects or a numeric MATLAB structure.

`busInfo = Simulink.Bus.createObject(____,file)` saves the bus objects in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The `elements` field is an array containing this data for each element:

- Element name

- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode
- Minimum
- Maximum
- Units
- Description

`busInfo = Simulink.Bus.createObject(____, format)` saves the bus objects in a file that contains either a cell array of bus information, or the bus objects themselves.

Examples

Use Bus Creator Blocks to Create a Bus Object

Create a bus object from the Bus Creator block called Bus Creator2.

```
open_system('busdemo')
bus2Info = Simulink.Bus.createObject...
('busdemo','busdemo/Bus Creator2')
close_system('busdemo')
```

Create a bus object from two Bus Creator blocks, using block handles to specify the blocks. Assign the block handles to variables and use the variables in a vector to specify the blocks used for creating the bus object.

Open the model.

```
clear;
open_system('busdemo')
```

In the Simulink Editor, select the Bus Creator2 block. In MATLAB, assign the block handle to a variable.

```
bc2 = gcbh;
```

In the Simulink Editor, select the Bus Creator block. In MATLAB, assign the block handle to a variable.

```
bc1 = gcbh;
```

Use the block handle variables in a vector to create a bus object.

```
bus3Info = Simulink.Bus.createObject...  
( 'busdemo', [bc2 bc1], 'busdemo_busobject' )  
close_system('busdemo')
```

Create Bus Objects from Cell Array of Bus Information

Create a cell array of cell arrays of bus information, and use that cell array to generate a bus object in the base workspace.

Create a cell array of bus information.

```
busCell = { ...  
    { ...  
        'myBusObj', ...  
        'MyHeader.h', ...  
        'My description', ...  
        'Exported', ...  
        '-1', ...  
        {{ 'a', 1, 'double', [0.2 0], 'real', 'Frame' }; ...  
          { 'b', 1, 'double', [0.2 0], 'real', 'Sample' }}, ...  
        }, ...  
    };
```

Generate a bus object in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell)
```

Input Arguments

model — Model name or handle

character vector

Model name or handle, specified as a character vector.

blocks — Blocks to create bus objects for

character vector | cell array of block pathnames | vector of block names

Blocks to create bus object for, specified as a character vector, cell array of block pathnames, or vector of block names.

- For just one block, specify the full path name of the block.
- For multiple blocks, specify either a cell array of block pathnames or a vector of block names.
- If you specify a Bus Creator block that is at the highest level of a bus hierarchy, the function creates bus objects for all buses in the hierarchy.

struct — Structure used to create bus objectsstructure of MATLAB `timeseries` objects | numeric structure

Structure used to create bus objects, specified as a structure of MATLAB `timeseries` objects or a numeric structure.

file — File to save bus objects in

character vector

File to save bus objects in, specified as a character vector. The file name must be unique. If you omit this argument, the function saves the created bus objects in a cell array, not in a file.

format — Format for storing bus objects in file

'cell' (default) | 'object'

Format for storing bus objects in file, specified as either 'cell' or 'object'. The cell format is more compact, but the cell format is easier to read.

Output Arguments

busInfo — Bus information for specified blocks

structure array

Bus information for specified blocks, returned as a structure array. Each element of the structure array corresponds to one block and contains these fields:

- `block` – Handle of the block
- `busName` – Name of the bus object associated with the block

Tips

If you specify a model name, the model must compile successfully before you use the `Simulink.Bus.createObject` command.

Simulink.Bus.objectToCell

Use bus objects to create cell array containing bus information

Syntax

```
busCells = Simulink.Bus.objectToCell(busNames)
```

Description

`busCells = Simulink.Bus.objectToCell(busNames)` inputs a cell array of names of bus objects that are in the MATLAB base workspace. The function returns a cell array of cell arrays in which each subordinate cell array contains the bus information defined by one of the bus objects. The order of the elements in the output cell array corresponds to the order of the names in the input cell array.

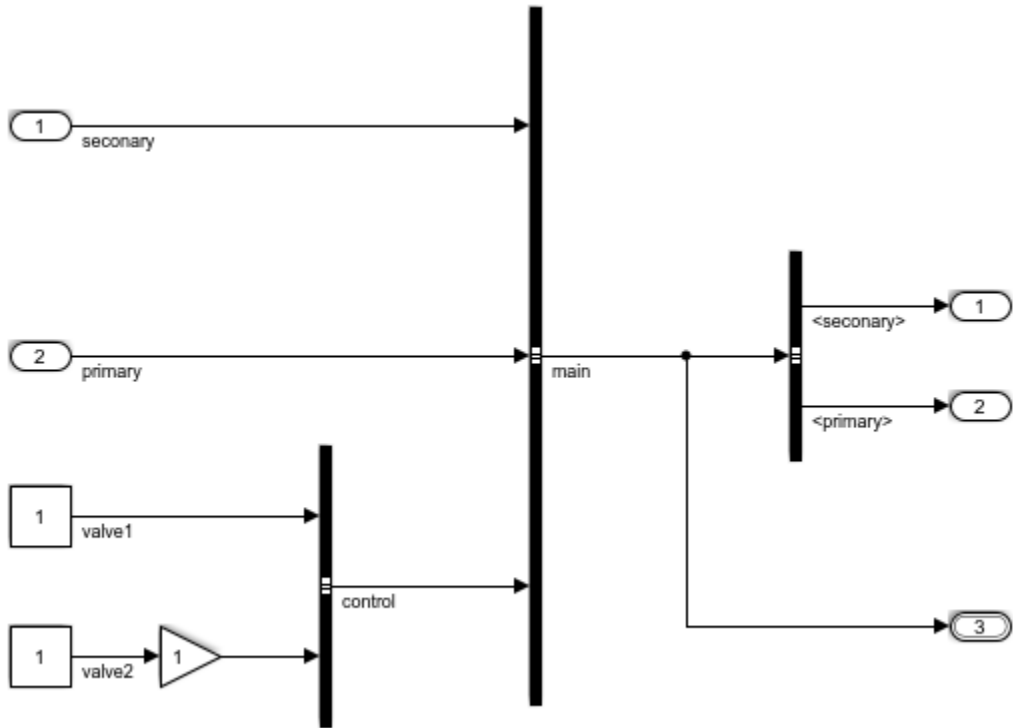

Examples

Create Cell Array Containing Bus Object Information

Use the `Simulink.Bus.objectToCell` function to create a cell array of information about bus objects in the base workspace.

Open a model that has two bus objects defined, CONTROL and MAIN.

```
open_system(fullfile(matlabroot, 'examples', 'simulink', ...  
    'ex_bus_object_tutorial_using_objects'))
```

Create cell array of information about the CONTROL bus object.

```
busCells = Simulink.Bus.objectToCell({'CONTROL'});
busCells{1}
```

ans =

1x6 cell array

```
{'CONTROL'} {0x0 char} {0x0 char} {'Auto'} {'-1'} {2x1 cell}
```

- “Create Bus Objects Programmatically”
- “When to Use Bus Objects”
- “Create Bus Objects with the Bus Editor”

- “Modify Bus Objects”
- “Save and Import Bus Objects”

Input Arguments

busNames — Bus objects in base workspace for which to create cell arrays of bus object information

cell array of names of bus objects, specified as character vectors

Bus objects in the base workspace for which to create cell arrays of bus object information, specified as a cell array of names of bus objects. Specify the bus object names as character vectors. If `busNames` is empty, the function converts all bus objects in the base workspace.

Output Arguments

busCells — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains bus object information, using these data fields:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The `elements` field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time

- Complexity
- Dimensions mode
- Minimum
- Maximum
- Units
- Description

Tips

The inverse function is `Simulink.Bus.cellToObject`.

Introduced in R2007a

Simulink.Bus.save

Save bus objects in MATLAB file

Syntax

```
Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)
```

Description

`Simulink.Bus.save(fileName)` saves all bus objects (instances of `Simulink.Bus` class) that are in the MATLAB base workspace in a MATLAB file that contains a cell array of cell arrays. Each subordinate cell array represents a bus object and contains this data:

- Bus name
- Header file
- Description
- Data scope
- Alignment
- Elements

The `elements` field is an array containing this data for each element:

- Element name
- Dimensions
- Data type
- Sample time
- Complexity
- Dimensions mode

- Minimum
- Maximum
- Units
- Description

`Simulink.Bus.save(fileName, format)` saves the bus objects in a MATLAB file that contains either a cell array of bus information or the bus objects themselves.

`Simulink.Bus.save(fileName, format, busNames)` saves only those bus objects whose names appear in `busNames`.

Examples

Save a Bus Object

Use the `Simulink.Bus.save` function to save a bus object.

Define a cell array of bus object information.

```
busCell = { ...
    { ...
        'myBusObj', ...
        'MyHeader.h', ...
        'My description', ...
        'Exported', ...
        '-1', ...
        {'a',1,'double',[0.2 0],'real','Frame'}; ...
        {'b',1,'double',[0.2 0],'real','Sample'}}; ...
    }, ...
};
```

Create `myBusObj` bus object from the cell array.

```
Simulink.Bus.cellToObject(busCell);
```

Save the bus object in the `BusCellFile1` file, in cell format.

```
fileName = 'BusCellFile1';
Simulink.Bus.save(fileName);
```

Save the bus object in bus format.

```
Simulink.Bus.save('BusObjFile','object');
```

Save myBusObj in cell format in BusCellFile2.m.

```
Simulink.Bus.save('BusCellFile2','cell',{'myBusObj'});
```

- “When to Use Bus Objects”
- “Create Bus Objects Programmatically”
- “Create Bus Objects with the Bus Editor”
- “Save and Import Bus Objects”

Input Arguments

fileName — File in which to store bus objects

character vector

File in which to store bus objects, specified as a character vector.

format — Format for storing bus objects in file

'cell' (default) | 'object'

Format for storing bus objects in file, specified as either 'cell' or 'object'. The cell format is more compact, but the object format is easier to read.

busNames — Bus objects to save

cell array of bus objects

Bus objects to save, specified as a cell array of bus objects. Only the specified bus objects in the base workspace are saved.

Tips

Executing a MATLAB file created by `Simulink.Bus.save` in cell array format calls `Simulink.Bus.cellToObject` to recreate the bus objects and returns the new bus objects in the cell array. To suppress the creation of bus objects, specify the optional argument 'false' when you execute the MATLAB file.

Simulink.createFromTemplate

Create model or project from template

Syntax

```
Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename,Name,Value)
```

Description

`Simulink.createFromTemplate(templatename)` creates a model or a project from the template file specified by `templatename`.

`h = Simulink.createFromTemplate(templatename)` creates a model or a project from the template file and returns `h`, either a numeric model handle or a `simulinkproject` object.

`h = Simulink.createFromTemplate(templatename,Name,Value)` specifies additional options as one or more `Name, Value` pair arguments.

Examples

Create a Model From a Template

```
Simulink.createFromTemplate('simple_simulation.sltx')
```

Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a `simulinkproject` object) for manipulating it programmatically.

```
proj = Simulink.createFromTemplate('code_generation_example.sltx', 'Name', 'myProject', 'E
```

- “Create and Open Models”
- “Create a Template from a Model”
- “Using Templates to Create Standard Project Settings”

Input Arguments

templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example:

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example:

Folder — Project root folder

character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: `char`

Name — New model or project name

character vector

New model or project name, specified as a character vector.

Data Types: `char`

Output Arguments

h — Handle

numeric handle | `simulinkproject`

Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

Syntax

```
Simulink.data.assigninGlobal(modelName, varName, varValue)
```

Description

`Simulink.data.assigninGlobal(modelName, varName, varValue)` assigns the value `varValue` to the variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `assigninGlobal` creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, `assigninGlobal` searches for `varName` in the entire dictionary hierarchy. If `assigninGlobal` does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

Examples

Modify Variable in Model With or Without Data Dictionary

Create a variable `myNewVariable` with value `237` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.assigninGlobal('vdp', 'myNewVariable', 237)
```

Create a variable `myNewEntry` with value `true` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary

sldemo_fuelsys_dd_controller.sldd. The entry myNewEntry appears in the Design Data section of the dictionary.

```
Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',...
    'myNewEntry',true)
```

Confirm the addition of myNewEntry to the data dictionary sldemo_fuelsys_dd_controller.sldd by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
    'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

- “Store Data in Dictionary Programmatically”

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

varName — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

varValue — Value to assign to variable or data dictionary entry

MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: `Simulink.Parameter`

Tips

- `assignInGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.cleanupWorkerCache
```

Description

`Simulink.data.dictionary.cleanupWorkerCache` restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a `spmd` block, after you finish parallel simulation using `parfor` blocks, to restore default settings that were altered by the `Simulink.data.dictionary.setupWorkerCache` function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function `Simulink.data.dictionary.setupWorkerCache` grants each worker a unique dictionary cache to allow independent access to the data, and the function `Simulink.data.dictionary.cleanupWorkerCache` restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj,'Design Data');
    entryObj = getEntry(sectObj,'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj,temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
```

```
        discardChanges(dictObj);
        close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end
```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Introduced in R2015a

Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

Syntax

```
Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll( ____, unsavedAction)
```

Description

`Simulink.data.dictionary.closeAll` attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as `Simulink.data.Dictionary`, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the `close` method of a `Simulink.data.Dictionary` object. To find dictionaries that are open, use `Simulink.data.dictionary.getOpenDictionaryPaths`. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a Simulink Project.

`Simulink.data.dictionary.closeAll(dictFileName)` closes all connections to the dictionary named `dictFileName`. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify `dictFileName` as a full file path such as `'C:\temp\myDict.sldd'`.

`Simulink.data.dictionary.closeAll(____, unsavedAction)` closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.

Examples

Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

```
Simulink.data.dictionary.closeAll('-discard')
```

Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.slidd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

You now have two connections to this dictionary: The `Simulink.data.Dictionary` object and the Model Explorer.

Make a change to the dictionary by adding an entry.

```
dDataSectObj = getSection(dictObj, 'Design Data');  
addEntry(dDataSectObj, 'myEntry', 5.2);
```

The `Simulink.data.dictionary.Section` object `dDataSectObj` is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

```
Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.slidd', '-discard')
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer. The `Simulink.data.Dictionary` object `dictObj` is disconnected from the

dictionary. You cannot interact with the dictionary by using the `Simulink.data.dictionary.Section` object `dDataSectObj`.

Clear the objects that referred to the dictionary.

```
clear dictObj dDataSectObj
```

- “Store Data in Dictionary Programmatically”

Input Arguments

dictFileName — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

unsavedAction — Action for unsaved changes

`'-discard'` | `'-save'`

Action for unsaved changes, specified as `'-discard'` (to discard changes) or `'-save'` (to save changes).

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
 - `Simulink.data.Dictionary`

- `Simulink.data.dictionary.Section`
- `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2016a

Simulink.data.dictionary.create

Create new data dictionary and create `Simulink.data.Dictionary` object

Syntax

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)` creates a data dictionary file in your current working folder or in a file path you can specify in `dictionaryFile`. The function returns a `Simulink.data.Dictionary` object representing the new data dictionary.

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
myDictionaryObj =
```

```
data dictionary with properties:
```

```
    DataSourcees: {0x1 cell}
HasUnsavedChanges: 0
    NumberOfEntries: 0
```

- “Store Data in Dictionary Programmatically”

Input Arguments

dictionaryFile — Name of new data dictionary

character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, `Simulink.data.dictionary.create` creates the new data dictionary file in your working MATLAB folder. `Simulink.data.dictionary.create` also supports file paths specified relative to your working folder.

Example: `'myDictionary.slidd'`

Example: `'C:\Users\jsmith\myDictionary.slidd'`

Example: `'..\myOtherDictionary.slidd'`

Data Types: `char`

Output Arguments

dictionaryObj — Newly created data dictionary

`Simulink.data.Dictionary` object

Newly created data dictionary, returned as a `Simulink.data.Dictionary` object.

Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See “Migrate Single Model to Use Dictionary” for more information.

See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.open`

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

Syntax

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths  
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(  
dictFileName)
```

Description

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths` returns the file names and paths of all data dictionaries that are open. For example, a data dictionary is open if you create objects, such as `Simulink.data.Dictionary`, that refer to the dictionary. If you open two or more dictionaries that have the same file name but different file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are open, use this function to identify open dictionaries so that you can close them. For example, when you run parallel simulations as described in “Sweep Variant Control Using Parallel Simulation”, this function helps you identify open dictionaries before executing the command `Simulink.data.dictionary.cleanupWorkerCache`.

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)` returns the file paths of data dictionaries that have the file name `dictFileName`. If you open two or more dictionaries that have the same file name but different file paths, you can use this syntax to return all of the file paths.

Examples

Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as

`Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

```
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

Identify all of the dictionaries that are open.

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```
hide(dictObj)
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```
close(dictObj)
clear dictObj
```

- “Store Data in Dictionary Programmatically”

Input Arguments

dictFileName — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: char

Output Arguments

openDDs — File names and paths of open data dictionaries

cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
 - `Simulink.data.Dictionary`
 - `Simulink.data.dictionary.Section`
 - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

“Store Data in Dictionary Programmatically”

Introduced in R2016a

Simulink.data.dictionary.open

Open data dictionary for editing

Syntax

```
dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)
```

Description

`dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)` opens the specified data dictionary and returns a `Simulink.data.Dictionary` object representing an existing data dictionary identified by its file name and, optionally, file path with `dictionaryFile`.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

Examples

Open Existing Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSourcees: {'myRefDictionary_ex_API.sldd'}  
    HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

- “Store Data in Dictionary Programmatically”

Input Arguments

dictionaryFile — Target data dictionary

character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, `Simulink.data.dictionary.open` searches the MATLAB path for the specified file. `Simulink.data.dictionary.open` also supports paths specified relative to the MATLAB working folder.

Example: `'myDictionary_ex_API.sldd'`

Example: `'C:\Users\jsmith\myDictionary_ex_API.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: `char`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.setupWorkerCache

Enable parallel simulation with data dictionary

Syntax

```
Simulink.data.dictionary.setupWorkerCache
```

Description

`Simulink.data.dictionary.setupWorkerCache` prepares the workers in a parallel pool for simulating a model that is linked to a data dictionary. Use this function in a `spmd` block, prior to starting a `parfor` block, to provide the workers in a parallel pool a way to safely interact with a single data dictionary.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. `Simulink.data.dictionary.setupWorkerCache` temporarily provides each worker in the pool with its own data dictionary cache, allowing the workers to use the data in the dictionary without permanently changing it.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

Examples

Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the

programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.slidd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
    Simulink.data.dictionary.setupWorkerCache
end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
    % Create objects to interact with dictionary data
    % You must create these objects for every iteration of the parfor-loop
    dictObj = Simulink.data.dictionary.open(dd);
    sectObj = getSection(dictObj, 'Design Data');
    entryObj = getEntry(sectObj, 'MODE');
    % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

    % Modify the value of MODE
    temp = getValue(entryObj);
    temp.Value = CtrlValues(index);
    setValue(entryObj, temp);

    % Simulate and store simulation output in the nondistributed array
    simOut{index} = sim(model);

    % Each worker must discard all changes to the data dictionary and
    % close the dictionary when finished with an iteration of the parfor-loop
    discardChanges(dictObj);
    close(dictObj);
end
```

```
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
    bdclose(model)
    Simulink.data.dictionary.cleanupWorkerCache
end
```

Note If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

Simulink.data.evalinGlobal

Evaluate MATLAB expression in context of Simulink model

Syntax

```
returnValue = Simulink.data.evalinGlobal(modelName,expression)
```

Description

`returnValue = Simulink.data.evalinGlobal(modelName,expression)` evaluates the MATLAB expression `expression` in the context of the Simulink model `modelName` and returns the values returned by `expression`. `evalinGlobal` evaluates `expression` in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Evaluate MATLAB Expression in Model With or Without Data Dictionary

Evaluate the MATLAB expression `myNewVariable = 237;` in the context of the model `vdp`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.evalinGlobal('vdp','myNewVariable = 237;')
```

Evaluate the MATLAB expression `myNewEntry = true;` in the context of the model `sldemo_fuelsys_dd_controller`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. `myNewEntry` appears as an entry in the Design Data section of the dictionary.

```
Simulink.data.evalinGlobal('sldemo_fuelsys_dd_controller',...  
'myNewEntry = true;')
```

Confirm the creation of the entry `myNewEntry` in the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...  
'sldemo_fuelsys_dd_controller.sldd');  
show(myDictionaryObj)
```

- “Store Data in Dictionary Programmatically”

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Output Arguments

returnValue — Value returned by specified expression

valid entry or variable value

Value returned by the specified MATLAB expression.

Tips

- `evalinGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to manipulate model variables before and after linking a model to a data dictionary.

See Also

`Simulink.data.assigninGlobal` | `Simulink.data.existsInGlobal` | `evalin`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.existsInGlobal

Check existence of variable in context of Simulink model

Syntax

```
varExists = Simulink.data.existsInGlobal(modelName,varName)
```

Description

`varExists = Simulink.data.existsInGlobal(modelName,varName)` returns an indication of the existence of a variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `Simulink.data.existsInGlobal` searches the Design Data section of the data dictionary that is linked to the target model or the MATLAB base workspace if the target model is not linked to any data dictionary.

Examples

Determine Existence of Variable in Model With or Without Data Dictionary

Determine the existence of a variable `PressVect` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary.

```
Simulink.data.existsInGlobal('vdp','PressVect')
```

```
ans =
```

```
0
```

Because `vdp.slx` is not linked to any data dictionary, `existsInGlobal` searches only in the MATLAB base workspace for `PressVect`.

Determine the existence of a variable `PressVect` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`.

```
Simulink.data.existsInGlobal('sldemo_fuelsys_dd_controller','PressVect')  
  
ans =  
  
    1
```

Because `sldemo_fuelsys_dd_controller.slx` is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`, `existsInGlobal` searches for `PressVect` only in the Design Data section of the dictionary.

- “Store Data in Dictionary Programmatically”

Input Arguments

modelName — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

varName — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

Output Arguments

varExists — Indication of existence of target variable or data dictionary entry

1 | 0

Indication of existence of target variable or data dictionary entry, returned as 1 to indicate existence or 0 to indicate absence.

Tips

- `existsInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to find model variables before and after linking a model to a data dictionary.

Alternatives

You can use Model Explorer to search a data dictionary or any workspace for entries or variables.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.getEnumTypeInfo

Get information about enumerated data type

Syntax

```
information = Simulink.data.getEnumTypeInfo(enumTypeName,  
infoRequest)
```

Description

```
information = Simulink.data.getEnumTypeInfo(enumTypeName,  
infoRequest) returns information about an enumerated data type enumTypeName.
```

Use this function only to return information about an enumerated data type. To customize an enumerated data type, for example, by specifying a default enumeration member or by controlling the scope of the type definition in generated code, see “Customize Simulink Enumeration”.

Examples

Return Default Value of Enumerated Data Type

Get the default enumeration member of an enumerated data type `LEDcolor`. Suppose `LEDcolor` defines two enumeration members, `GREEN` and `RED`, and uses `GREEN` as the default member.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DefaultValue')  
  
ans =  
  
    GREEN
```

Get Scope of Enumerated Data Type Definition in Generated Code

For an enumerated data type `LEDcolor`, find out if generated code exports or imports the definition of the type to or from a header file.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DataScope')  
Simulink.data.getEnumTypeInfo('LEDcolor','HeaderFile')
```

```
ans =
```

```
Auto
```

```
ans =
```

```
''
```

Because `DataScope` is `'Auto'` and `HeaderFile` is empty, generated code defines the enumerated data type `LEDcolor` in the header file `model_types.h` where `model` is the name of the model used to generate code.

- “Customize Simulink Enumeration”

Input Arguments

enumTypeName — Name of target enumerated data type

character vector

Name of the target enumerated data type, specified as a character vector.

Example: `'myFirstEnumType'`

Data Types: `char`

infoRequest — Information to return

valid character vector

Information to return, specified as one of the character vector options in the table.

Specified value	Information returned	Example return value
'DefaultValue'	The default enumeration member, returned as an instance of the enumerated data type.	enumMember1
'Description'	The custom description of this data type, returned as a character vector. Returns an empty character vector if a description was not specified for the type.	'My first enum type.'
'HeaderFile'	The name of the custom header file that defines the data type in generated code, returned as a character vector. Returns an empty character vector if a header file was not specified for the type.	'myEnumType.h'
'DataScope'	Indication whether generated code imports or exports the definition of the data type. A return value of 'Auto' indicates generated code defines the type in the header file <i>model_types.h</i> or imports the definition from the header file identified by <i>HeaderFile</i> . A return value of 'Exported' or 'Imported' indicates generated code exports or imports the definition to or from the header file identified by <i>HeaderFile</i> .	'Exported'
'StorageType'	The integer data type used by generated code to store the numeric values of the enumeration members, returned as a character vector. Returns 'int' if you did not specify a storage type for the enumerated type, in which case generated code uses the native integer type of the hardware target.	'int32'
'AddClassNameToEnumNames'	Indication whether generated code prefixes the names of enumeration members with the name of the data type. Returned as true or false.	true

`Simulink.defineIntEnumType`

Topics

“Customize Simulink Enumeration”

“Simulink Enumerations”

Introduced in R2014b

Simulink.defineIntEnumType

Define enumerated data type

Syntax

```
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues)  
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues,  
'Description', ClassDesc)  
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues,  
'DefaultValue', DefValue)  
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues,  
'DataScope', ScopeSelection)  
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues,  
'HeaderFile', FileName)  
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues,  
'AddClassNameToEnumNames', Flag)  
Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues,  
'StorageType', DataType)
```

Description

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues)` defines an enumeration named *ClassName* with enumeration values specified with *CellofEnums* and underlying numeric values specified by *IntValues*.

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues, 'Description', ClassDesc)` defines the enumeration with a description (character vector).

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues, 'DefaultValue', DefValue)` defines a default value for the enumeration, which is one of the character vectors you specify for *CellofEnums*.

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues, 'DataScope', ScopeSelection)` specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues, 'HeaderFile', FileName)` specifies the name of a header file containing the enumeration class definition for use in code generated from a model.

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues, 'AddClassNameToEnumNames', Flag)` specifies whether the code generator applies the class name as a prefix to the enumeration values that you specify for *CellofEnums*. For *Flag*, specify `true` or `false`. For example, if you specify `true`, the code generator would use `BasicColors.Red` instead of `Red` to represent an enumerated value.

`Simulink.defineIntEnumType(ClassName, CellofEnums, IntValues, 'StorageType', DataType)` specifies the data type used to store the enumerations' underlying integer values in code generated from a model.

Input Arguments

ClassName

The name of the enumerated data type.

CellofEnums

A cell array of character vectors that defines the enumerations for the data type.

IntValues

An array of numeric values that correspond to enumerations of the data type.

'Description', ClassDesc

Specifies a character vector that describes the enumeration data type.

'DefaultValue', DefValue

Specifies the default enumeration value.

'HeaderFile', FileName

Specifies a character vector naming the header file that is to contain the data type definition.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `FileName` as `'<myTypes.h>'`.

'DataScope', 'Auto' | 'Exported' | 'Imported'

Specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

Value	Action
Auto (default)	<p>If no value is specified for <code>Headerfile</code>, export the type definition to <code>model_types.h</code>, where <code>model</code> is the model name.</p> <p>If a value is specified for <code>Headerfile</code>, import the data type definition from the specified header file.</p>
Exported	<p>Export the data type definition to a header file.</p> <p>If no value is specified for <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <code>type</code> is the data type name.</p>
Imported	<p>Import the data type definition from a header file.</p> <p>If no value is specified for <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <code>type</code> is the data type name.</p>

'AddClassNameToEnumNames', Flag

A logical flag that specifies whether code generator applies the class name as a prefix to the enumerations.

'StorageType', DataType

Specifies a character vector that identifies the data type used to store the enumerations' underlying integer values in generated code. The following data types are supported: `'int8'`, `'int16'`, `'int32'`, `'uint8'`, or `'uint16'`.

Examples

Assume an external data dictionary includes the following enumeration:

```
BasicColors.Red(0), BasicColors.Yellow(1), BasicColors.Blue(2)
```

Import the enumeration class definition into the MATLAB workspace while specifying `int16` as the underlying integer data type for generated code:

```
Simulink.defineIntEnumType('BasicColors', ...  
    {'Red', 'Yellow', 'Blue'}, ...  
    [0;1;2], ...  
    'Description', 'Basic colors', ...  
    'DefaultValue', 'Blue', ...  
    'HeaderFile', 'mybasiccolors.h', ...  
    'DataScope', 'Exported', ...  
    'AddClassNameToEnumNames', true, ...  
    'StorageType', 'int16');
```

Introduced in R2010b

Simulink.defaultModelTemplate

Set or get default model template

Syntax

```
Simulink.defaultModelTemplate(templatename)  
templatepath = Simulink.defaultModelTemplate
```

Description

`Simulink.defaultModelTemplate(templatename)` sets the template file specified by `templatename` as the default model template to use for new models. This setting is persistent between Simulink sessions.

`templatepath = Simulink.defaultModelTemplate` gets the full path to the current default model template.

Examples

Set the default model template

```
Simulink.defaultModelTemplate('simple_simulation.sltx')
```

Get the default model template

```
mydefaulttemplate = Simulink.defaultModelTemplate
```

Clear and restore the default model template

Use `set_param` to set a root block diagram parameter. This clears the default template so that new models will inherit this property of the root block diagram, and warns.

```
set_param(0, 'StopTime', '99');
```

Restore the default template.

```
Simulink.defaultModelTemplate('$restore');
```

- “Create and Open Models”
- “Create a Template from a Model”
- “Using Templates to Create Standard Project Settings”

Input Arguments

templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and *.sltx extension.

Example: \\Home\username\Documents\MATLAB\template.sltx

Data Types: char

Output Arguments

templatepath — Template path

character vector

Template path, specified as a character vector, showing the full path to the current default model template.

Simulink.exportToTemplate

Create template from model or project

Syntax

```
templatefile = Simulink.exportToTemplate(obj,templatename)
templatefile = Simulink.exportToTemplate(obj,templatename,
Name,Value)
```

Description

`templatefile = Simulink.exportToTemplate(obj,templatename)` creates a template file (*templatename.sltx*) from a model or project specified by `obj`.

If you have project templates created in R2014a or earlier (.zip files), use `Simulink.exportToTemplate` to upgrade them to .sltx files, then you can use them in the start page.

`templatefile = Simulink.exportToTemplate(obj,templatename, Name,Value)` specifies additional template options as one or more Name, Value pair arguments.

Examples

Create a Template From a Model

Open the `vdp` model and create a template from it.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate')
```

Create a Template From a Model and Specify Description

Open the vdp model and create a template from it, specifying a description.

```
vdp  
myvdptemplate = Simulink.exportToTemplate (bdroot, 'vdptemplate', 'Description', 'Use this
```

- “Create and Open Models”
- “Create a Template from a Model”
- “Using Templates to Create Standard Project Settings”

Input Arguments

obj — Model, library, or project

character vector | numeric handle | slproject.ProjectManager

Model, library, or project, specified by name or numeric handle, or a slproject.ProjectManager object returned by the simulinkproject function.

Data Types: double | char

templatename — Template file name

character vector

Template file name, specified as a character vector that can optionally include the fully-qualified path to a template file and *.sltx extension.

Data Types: char

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: Title, 'My Project Template'

Group — Group of template

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'Simscape'

Data Types: char

Author — Author of template

character vector

Author of template, specified as a character vector.

Data Types: char

Description — Description of template

character vector

Description of template, specified as a character vector.

Data Types: char

ThumbnailFile — Thumbnail image file name

character vector

Thumbnail image file name, specified as a character vector.

Data Types: char

Title — Title of model or project template

character vector

Title of template, specified as a character vector. On the Start Page, the templates titles are shown on the tiles. The title can be different from the file name, and you can use any characters in the title. The default value is the name of the model or project.

Example: 'My Project Template'

Data Types: char

Output Arguments

templatefile — Template file

character vector

Template file, returned as *templatename.sltx* file.

Simulink.exportToVersion

Export model or library for use in previous version of Simulink

Syntax

```
exported_file = Simulink.exportToVersion(modelname,target_filename,
version)
exported_file = Simulink.exportToVersion(modelname,target_filename,
version,Name,Value)
```

Description

`exported_file = Simulink.exportToVersion(modelname,target_filename,version)` exports the model or library `modelname` to a file named `target_filename` in a format that the specified previous Simulink version can load.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

The `save_system` `ExportToVersion` option is a legacy option for this functionality that is also supported.

`exported_file = Simulink.exportToVersion(modelname,target_filename,version,Name,Value)` specifies additional options as one or more `Name, Value` pair arguments.

Examples

Export a Model to a Previous Version

Get the current top-level system and export it.

```
Simulink.exportToVersion(bdroot, 'mymodel.slx', 'R2014b');
```

Export a Model to a Previous Version and Break Links

Get the current top-level system and export it, replacing links to library blocks with copies of the library blocks in the saved file.

```
Simulink.exportToVersion(bdroot, 'mymodel.slx', 'R2014b', 'BreakUserLinks', true);
```

- “Save a Model”

Input Arguments

modelName — Model to export

character vector

Model to export, specified as a character vector, without any file extension. The model must be loaded and unmodified. The target file must not be the same as the model file.

Data Types: char

target_filename — Exported file name

character vector

Exported file name, specified as a character vector. The target file must not be the same as the model file.

Example: 'mymodel.slx'

Data Types: char

version — MATLAB release name

'R2012A' | 'R2014A_MDL' | 'R2016B_SLX' | ...

MATLAB release name, specified as a character vector, which specifies a previous Simulink version. `Simulink.exportToVersion` exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version. These version names are not case sensitive.

To export to Release 2012a and later, you can specify model file format as SLX or MDL using the suffix `_MDL` or `_SLX`. If you do not specify a format, you export your default model file format.

If you use the Export to Previous Version dialog box instead of `Simulink.exportToVersion`, then the **Save as type** list supports 7 years of previous releases.

Example: 'R2015B'

Data Types: char

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example:

AllowPrompt — Allow prompt or message dialog box

false (default) | true | 'on' | 'off'

Allow prompt or message dialog box, specified by a logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to `true`, or `on`.

BreakUserLinks — Break user-defined links

false (default) | true | 'on' | 'off'

Break user-defined links, specified by a logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file.

BreakToolboxLinks — Break all toolbox links

false (default) | true | 'on' | 'off'

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in

the saved file. The 'BreakToolboxLinks' option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

Note The 'BreakToolboxLinks' option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:

- Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
- Any broken links prevent the automatic library forwarding mechanism from upgrading the link.

If you have saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

Output Arguments

exported_file — Exported file

character vector

Exported file, returned in the format that the specified previous Simulink version can load.

`save_system`

Topics

“Save a Model”

Introduced in R2016a

Simulink.findTemplates

Find model or project templates with specified properties

Syntax

```
filename = Simulink.findTemplates(templatename)
filename = Simulink.findTemplates(templatename,Name,Value)
[filename,info] = Simulink.findTemplates(templatename)
```

Description

`filename = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates that include `templatename`.

`filename = Simulink.findTemplates(templatename,Name,Value)` also specifies additional template properties as one or more `Name, Value` pair arguments.

`[filename,info] = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates.

Examples

Find a Particular Template

Get the full path to the default model template.

```
filename = Simulink.findTemplates('factory_default_model');
```

Find All Templates With Specified Folders or Authors

Get all templates inside folders called `work`.

```
filename = Simulink.findTemplates('work/')
```

Get all templates for which the `Author` property includes the character vector `Smith`.

```
filename = Simulink.findTemplates('*', 'Author', 'Smith')
```

Find All DSP Templates and Get TemplateInfo Objects

Get the paths to all DSP model templates, and `sltemplate.TemplateInfo` objects for each of them.

```
[filename,info] = Simulink.findTemplates('dsp*', 'Type', 'Model');
```

- “Create and Open Models”
- “Create a Template from a Model”
- “Using Templates to Create Standard Project Settings”

Input Arguments

templatename — Template name

character vector

Template name, specified as a character vector containing a portion of a file name, which can contain the wildcard asterisk character “*”.

Example:

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

You can specify regular expressions for any of the `Value` character vectors, e.g., including the wildcard asterisk character “*”.

Example: 'Author', '*son'

Type — Model, library, or project

'Model' | 'Library' | 'Project'

Model, library, or project template type, specified as a character vector for model, library, or project.

Example: 'Simscape'

Data Types: char

Title — Title of template

character vector

Title of template, specified as a character vector.

Example: 'Simscape'

Data Types: char

Group — Group of template

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'Simscape'

Data Types: char

Author — Author of template

character vector

Author of template, specified as a character vector.

Data Types: char

Description — Description of template

character vector

Description of template, specified as a character vector.

Data Types: char

Output Arguments

filename — Template name

character vector | cell array of character vectors

Template names of matching templates, returned as character vectors.

info — Template information

template info objects | array of template info objects

Template information of matching templates, returned as `sltemplate.TemplateInfo` objects.

Simulink.findVars

Analyze relationship between variables and blocks in models

Syntax

```
[variables] = Simulink.findVars(context)
[variables] = Simulink.findVars(context,variablefilter)
[variables] = Simulink.findVars(____,Name,Value)
```

Description

`[variables] = Simulink.findVars(context)` finds and returns variables that are used in the blocks and models specified by `context`, including subsystems and referenced models. The function returns an empty vector if `context` does not use any variables.

`[variables] = Simulink.findVars(context,variablefilter)` finds only the variables or enumerated types that are specified by `variablefilter`. For example, use this syntax to determine where a variable is used in a model.

`[variables] = Simulink.findVars(____,Name,Value)` finds variables with additional options specified by one or more `Name, Value` pair arguments. For example, you can search for unused variables. You can also search for enumerated data types that are used in `context`, in addition to variables.

Examples

Variables in Use in a Model

Find variables used by `MyModel`.

```
variables = Simulink.findVars('MyModel');
```

Specific Variable in Use in a Model

Find all uses of the base workspace variable `k` by `MyModel`. Use the cached results to avoid compiling `MyModel`.

```
variables = Simulink.findVars('MyModel', 'Name', 'k',  
'SearchMethod', 'cached', 'SourceType', 'base workspace');
```

Regular Expression Matching

Find all uses of a variable whose name matches the regular expression `^trans`.

```
variables = Simulink.findVars('MyModel', 'Regexp', 'on',  
'Name', '^trans');
```

Variables Common to Two Models

Given two models, find the variables used by the first model, the second, and both

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
commonVars = intersect(model1Vars, model2Vars);
```

Variables Not Used in a Model

Find the variables that are defined in the model workspace of `MyModel` but that are not used by the model.

```
unusedVars = Simulink.findVars('MyModel', 'FindUsedVars', 'off',  
'SourceType', 'model workspace');
```

Specific Variable Not Used in a Model

Determine if the base workspace variable `k` is not used by `MyModel`.

```
varObj = Simulink.VariableUsage('k', 'base workspace');
unusedVar = Simulink.findVars('MyModel', varObj,
    'FindUsedVars', 'off');
```

Variables Used by a Block

Find the variables that are used by the block `Gain1` in `MyModel`.

```
variables = Simulink.findVars('MyModel',
    'Users', 'MyModel/Gain1');
```

Variables Used in a Model Reference Hierarchy

Find the variables that are used in a model reference hierarchy. Begin the search with the model `MyNestedModel`, and search the entire hierarchy below `MyNestedModel`.

```
variables = Simulink.findVars('MyNestedModel', 'SearchReferencedModels', 'on');
```

Variables and Enumerated Types Used in a Model

Find variables and enumerated types that are used in `MyModel`.

```
varsAndEnumTypes = Simulink.findVars('MyModel', 'IncludeEnumTypes', 'on');
```

- “Search Using Model Explorer”

Input Arguments

context — Models and blocks to search

character vector | cell array of character vectors

Models and blocks to search, specified as a character vector or a cell array of character vectors. You can specify `context` in one of the following ways:

- The name of a model. For example, (`'vdp'`) specifies the model `vdp.slx`.
- The name or path of a block or masked block. For example, (`'vdp/Gain1'`) specifies a block named `Gain1` at the root level of the model `vdp.slx`.

- A cell array of model or block names.

Data Types: `char` | `cell`

variablefilter — Specific variables to find

array of `Simulink.VariableUsage` objects

Specific variables to find, specified as an array of `Simulink.VariableUsage` objects. Each `Simulink.VariableUsage` object identifies a variable to find.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'FindUsedVars', 'off'`

FindUsedVars — Find variables that are used or not used

`'on'` (default) | `'off'`

Flag to find variables that are explicitly used or not used, specified as the comma-separated pair consisting of `'FindUsedVars'` and `'on'` or `'off'`. If you specify `FindUsedVars` as `'off'`, the function finds variables that are not used in context but that are defined in the workspace specified by `SourceType`.

Example: `'FindUsedVars', 'off'`

IncludeEnumTypes — Find enumerated types that are used

`'off'` (default) | `'on'`

Flag to find enumerated data types that are used, specified as the comma-separated pair consisting of `'IncludeEnumTypes'` and `'on'` or `'off'`. The function finds enumerated types that are used explicitly in context as well as types that define variables that are used in context.

If you specify `SourceType` as `'base workspace'`, `'model workspace'`, or `'mask workspace'`, the function does not report enumerated types because those sources cannot define enumerated types.

You cannot find unused enumerated types by specifying `FindUsedVars` as `'off'`.

Example: `'IncludeEnumTypes', 'on'`

RegExp — Enable regular expression matching

`'off'` (default) | `'on'`

Flag to enable regular expression matching for input arguments, specified as the comma-separated pair consisting of `'RegExp'` and `'on'`. You can match only input arguments that have character vector values.

Example: `'RegExp', 'on'`

SearchMethod — Compile status

`'compiled'` (default) | `'cached'`

Compile status, specified as the comma-separated pair consisting of `'SearchMethod'` and one of these values:

- `'compiled'` — Return up-to-date results by compiling every model in the search context before search.
- `'cached'` — Return quicker results by using results cached during the previous compile.

Example: `'SearchMethod', 'compiled'`

SearchReferencedModels — Enable search in referenced models

`'off'` (default) | `'on'`

Flag to enable search in referenced models, specified as the comma-separated pair consisting of `'SearchReferencedModels'` and `'on'`.

Example: `'SearchReferencedModels', 'on'`

Name — Name of a variable or enumerated type to search for character vector

Name of a variable or enumerated data type to search for, specified as the comma-separated pair consisting of `'Name'` and a character vector.

Example: `'Name', 'trans'`

Data Types: `char`

SourceType — Workspace or source defining the variables or enumerated types

character vector

Workspace or source defining the variables, specified as the comma-separated pair of 'SourceType' and one of these options:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

The function filters results for variables that are defined in the specified source.

Example: 'SourceType', 'base workspace'

If you search for enumerated data types by specifying 'IncludeEnumTypes' as 'on', 'SourceType' represents the way an enumerated type is defined. You can specify one of these options:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

The function filters results for enumerated types that are defined in the specified source.

Example: 'SourceType', 'MATLAB file'

If you do not specify SourceType, the function does not filter results by source.

Users — Name of block to search for variables

character vector

Name of specific block to search for variables, specified as the comma-separated pair consisting of 'Users' and a character vector.

To search a set of specific blocks, enable regular expression matching by specifying RegExp as 'on' and use regular expressions in the character vector. For example, you can specify 'Users', 'MyModel/Gain*' to search all blocks in MyModel whose names begin with Gain.

Example: 'Users', 'MyModel/Gain1'

Example: 'Users', 'MyModel/mySubsystem/Gain2'

Example: 'Users', 'MyModel/Gain*'

Limitations

`Simulink.findVars` does not work with these constructs:

- MATLAB code in scripts and initialization and callback functions
- Libraries and blocks in libraries
- Variables in MATLAB Function blocks, except for input arguments

However, `Simulink.findVars` can find enumerated types anywhere they are used in MATLAB Function blocks.

- Calls directly to MATLAB from the Stateflow action language
- S-functions that use data type variables registered using `ssRegisterDataType`

To make the variables searchable, use `ssRegisterTypeFromNamedObject` instead.

- Variables referenced by machine-parented data in Stateflow

`Simulink.findVars` discovers variable usage in inactive subsystem variants only if you select **Analyze all choices during update diagram and generate preprocessor conditionals** in the Variant Subsystem block dialog box. If you do not select this check box, the function does not discover variable usage in inactive variants.

Simulink.getFileChecksum

Checksum of file

Syntax

```
checksum = Simulink.getFileChecksum(filename)
```

Description

`checksum = Simulink.getFileChecksum(filename)` returns the checksum of the specified file, using the MD5 checksum algorithm. Use the checksum to see if the file has changed compared to a previous checksum. You can use checksums as part of an audit trail.

Use `Simulink.getFileChecksum` to get a checksum for any file. If the file contents do not change from one checksum to the next, the checksum from `Simulink.getFileChecksum` stays the same. Otherwise, the checksum is different with each change to the file contents.

For functional information on a model, use `Simulink.BlockDiagram.getChecksum` instead. `Simulink.BlockDiagram.getChecksum` looks at the functional aspect of the model. If the functional aspect doesn't change, then `Simulink.BlockDiagram.getChecksum` returns the same checksum.

For example, if you moved a block, the file contents are different (measured by `Simulink.getFileChecksum`) but the function of the model is unchanged (measured by `Simulink.BlockDiagram.getChecksum`).

Examples

Get Checksum of a File

Use `fullfile` to specify a full path to a file and get the checksum.

```
filechecksum = Simulink.getFileChecksum(fullfile(matlabroot, 'toolbox', ...  
'matlab', 'demos', 'gatlin.mat'));
```

Input Arguments

filename — File name to get checksum for
file of any type

File name to get checksum for, with file extension and optional full path. Use `fullfile` to specify a full path to a file, or use the form 'C:\Work\filename.mat'.

Example: 'lengthofline.m'

Data Types: char

Output Arguments

checksum — Checksum value
character vector

Checksum value in a 32-character vector.

See Also

`Simulink.BlockDiagram.getChecksum` | `Simulink.SubSystem.getChecksum`

Introduced in R2014b

Simulink.getSuppressedDiagnostics

Return `Simulink.SuppressedDiagnostic` objects associated with a block, subsystem, or model

Syntax

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)
```

Description

`suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)` returns an array of `Simulink.SuppressedDiagnostic` objects that are associated with the specified source.

Examples

Get All `Simulink.SuppressedDiagnostic` Objects on a Specific Block

Using the model from “Suppress Diagnostic Messages Programmatically”, get all suppressed diagnostics associated with a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...  
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Get the `Simulink.SuppressedDiagnostic` objects associated with the block.

```
suppressed_diagnostic = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo/one')  
suppressed_diagnostic =  
    SuppressedDiagnostic with properties:
```

```
Source: 'Suppressor_CLI_Demo/one'  
Id: 'SimulinkFixedPoint:util:fxpParameterPrecis...'  
LastModifiedBy: ''  
Comments: ''  
LastModified: '2016-Jul-04 14:12:24'
```

- “Suppress Diagnostic Messages Programmatically”

Input Arguments

source — System, block, or model object throwing warning

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

Output Arguments

suppressed_diagnostics — Suppressed diagnostics

array

Suppressed diagnostics, returned as an array of `Simulink.SuppressedDiagnostic` objects.

See Also

`Simulink.SuppressedDiagnostic` | `Simulink.SuppressedDiagnostic.restore`
| `Simulink.getSuppressedDiagnostics` | `Simulink.restoreDiagnostic` |
`Simulink.suppressDiagnostic`

Topics

“Suppress Diagnostic Messages Programmatically”

Introduced in R2016b

Simulink.importExternalCTypes

Generate Simulink representations of custom data types defined by C or C++ code

Syntax

```
importInfo = Simulink.importExternalCTypes(headerFiles)
importInfo = Simulink.importExternalCTypes(modelName)
importInfo = Simulink.importExternalCTypes( ____, Name, Value)
```

Description

`importInfo = Simulink.importExternalCTypes(headerFiles)` parses the C or C++ header files (.h or .hpp) identified by `headerFiles` for `typedef`, `struct`, and `enum` type definitions, and generates Simulink representations of the types. The output, `importInfo`, identifies the successfully and unsuccessfully imported types.

You can use the Simulink representations to:

- Reuse your existing algorithmic C code and, through simulation, test its interaction with your Simulink control algorithm. For an example that shows how to use the Legacy Code Tool, see “Integrate C Function Whose Arguments Are Pointers to Structures”.
- Generate code (Simulink Coder) that reuses the types and data that your existing code defines. You can then integrate and compile the generated and existing code into a single application. For an example, see “Exchange Structured and Enumerated Data Between Generated and External Code” (Embedded Coder).
- Create and organize data (signals, parameters, and states) in a model by using standard data types that your organization defines in C code.
 - To create structures of signals in Simulink, use nonvirtual buses. See “Getting Started with Buses”.
 - To create structures of parameters, use MATLAB structures and `Simulink.Parameter` objects. See “Organize Related Block Parameter Definitions in Structures”.

- To create enumerated data, see “Use Enumerated Data in Simulink Models”.
- To match a primitive `typedef` statement, use a `Simulink.AliasType` object to set parameter and signal data types in a model.

By default, the function:

- Imports an enumerated type by generating a script file that derives an enumeration class from `Simulink.IntEnumType`, as described in “Define Simulink Enumerations”. If necessary, you can then edit the class definition to customize it (for example, by implementing the `addClassNameToEnumNames` method).
- Imports a structure type by generating a `Simulink.Bus` object in the base workspace.
- Imports a primitive `typedef` statement by generating a `Simulink.AliasType` object in the base workspace.
- Interprets generic C data types, such as `int` or `short`, according to the word lengths of your host computer. For example, for most modern machines, `int` has a 32-bit word length, so the function represents an `int` structure field as a bus element that uses the Simulink data type `int32`.

To override this default behavior, identify your target hardware board by using the `HardwareImplementation` pair argument.

For additional information about default behavior, see “Tips” on page 2-662.

`importInfo = Simulink.importExternalCTypes(modelName)` generates Simulink representations of custom C data types by analyzing a model that you identify with `modelName`. When you use the **Simulation Target** configuration parameters in a model to identify header files for inclusion during simulation, use this syntax to import types for the purpose of simulating the model on your host computer. The function interprets generic C data types according to the word lengths of your host computer.

When you use this syntax, do not use pair arguments, such as `HardwareImplementation`, that can conflict with the configuration parameters of the target model. When you use such pair arguments with this syntax, the function generates a warning.

`importInfo = Simulink.importExternalCTypes(____, Name, Value)` specifies additional options using one or more name-value pair arguments. You can use this syntax to:

- Specify the names of types to import by using the `Names` pair argument.
- Control the way that Simulink stores the imported types, for example, by generating the types in a Simulink data dictionary. Use the `MATFile` and `DataDictionary` pair arguments.
- Control the way that the function interprets generic C data types. Use the `HardwareImplementation` pair argument.
- Maintain synchrony between the C-code definitions and the Simulink representations by attempting to import the updated C-code definitions again. You can choose whether to overwrite the existing Simulink representations. Use the `Overwrite` and `Verbose` pair arguments.

Examples

Import Simple Structure and Enumerated Types

This example shows how to generate Simulink representations of a C structure type (`struct`) and an enumerated (`enum`) data type from a header file.

In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
    PWR_LOSS = 0,           /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h');
```

The function creates a `Simulink.Bus` object, `params_T`, in the base workspace. To inspect the properties of the object, open the Bus Editor.

```
buseditor
```

Each bus element uses a name and a data type (double) that match the corresponding structure field in `ex_cc_simpleTypes.h`.

In your current folder, inspect the generated file, `fault_T.m`, which defines the enumerated type `fault_T` as an enumeration class.

You can use the bus object and the enumeration class to set signal and parameter data types in Simulink models.

Import Structure Type Whose Fields Use Custom Data Types

This example shows how to generate a Simulink representation of a structure type whose fields use custom data types (typedef).

Create the file `ex_integer_aliases.h` in your current folder.

```
typedef int sint_32;
typedef unsigned short uint_16;
```

Create the file `ex_cc_struct_alias.h` in your current folder.

```
#include "ex_integer_aliases.h"

typedef struct {
    sint_32 accum;
    uint_16 index;
} my_ints_T;
```

Import the structure type into Simulink as a `Simulink.Bus` object in the base workspace. Import the typedef statements as `Simulink.AliasType` objects.

```
Simulink.importExternalCTypes('ex_cc_struct_alias.h');
```

Inspect the data types of the bus elements in the bus object. For example, inspect the `DataType` property of the first bus element, which corresponds to the structure field `accum`.

```

my_ints_T.Elements(1)

ans =

  BusElement with properties:

      Name: 'accum'
  Complexity: 'real'
  Dimensions: 1
      DataType: 'sint_32'
          Min: []
          Max: []
  DimensionsMode: 'Fixed'
      SampleTime: -1
          Unit: ''
  Description: ''

```

The `Simulink.importExternalCTypes` function uses the generated `Simulink.AliasType` objects to set the data types of the bus elements.

Inspect the `Simulink.AliasType` objects in the base workspace. For example, the object named `sint_32` corresponds to one of the `typedef` statements in `ex_integer_aliases.h`.

```

sint_32

sint_32 =

  AliasType with properties:

  Description: ''
  DataScope: 'Imported'
  HeaderFile: 'ex_integer_aliases.h'
  BaseType: 'int32'

```

For most host computers (which the function targets by default), the word length of `int` is 32 bits and the word length of `unsigned short` is 16 bits. The function maps `int` and `unsigned short` to the Simulink types `int32` and `uint16`.

If you have Embedded Coder, the code that you generate from the model can use `sint_32` and `uint_16` instead of the standard data type names, `int32_T` and `uint16_T`.

Store Imported Types in Data Dictionary

This example shows how to store the imported data types in a Simulink data dictionary. A data dictionary stores data specifications (such as for signals and block parameter values), data types, and other design data for one or more Simulink models.

In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
    PWR_LOSS = 0,           /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    double coeff;
    double init;
} params_T;
```

Create a subfolder called `myDictionaries`.

```
mkdir('myDictionaries')
```

Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`. Permanently store the type definitions by creating a new data dictionary, `ex_cc_myTypes.sldd`, in the new subfolder.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h',...
    'DataDictionary','ex_cc_myTypes.sldd',...
    'OutputDir','myDictionaries');
```

To inspect the contents of the dictionary, set your current folder to `myDictionaries` and double-click the dictionary file.

To use the Simulink representations in the dictionary, you must link a model or models to the dictionary. See “Migrate Models to Use Simulink Data Dictionary”.

Import Only Specified Types

This example shows how to generate Simulink representations only for enumerated and structure data types that you identify by name.

In your current folder, create the file `ex_cc_manySimpleTypes.h`. The file defines three structure types: `params_T`, `signals_T`, and `states_T`.

```
typedef struct {
    double coeff;
    double init;
} params_T;

typedef struct {
    double flow_rate;
    double steam_press;
} signals_T;

typedef struct {
    double accum;
    double error;
} states_T;
```

Generate Simulink representations only for `params_T` and `signals_T`.

```
Simulink.importExternalCTypes('ex_cc_manySimpleTypes.h', ...
    'Names', {'params_T', 'signals_T'});
```

The `Simulink.Bus` objects, `params_T` and `signals_T`, appear in the base workspace.

Import Types for 16-Bit Hardware

By default, `Simulink.importExternalCTypes` represents an enumerated data type by creating an enumeration class that derives from the built-in class `Simulink.IntEnumType`. When you simulate or generate code from a model that uses the generated class, configuration parameters that you select for the model (for example,

on the **Hardware Implementation** pane) determine the specific integer length that `Simulink.IntEnumType` and the enumeration class employ.

By default, the function interprets generic, primitive C data types, such as `short` and `int`, according to the word lengths of your host computer. For example, to represent an `int` structure field, the function typically applies the 32-bit data type `int32` to the corresponding bus element. When you want to simulate and generate code for hardware other than your host computer, use the `HardwareImplementation` pair argument to identify the target hardware and, by extension, the word lengths of the hardware.

This example shows how to import data types from code that you intend to use on 16-bit hardware. For this board, `int` has a 16-bit length, and each item of enumerated data (`enum`) consumes 16 bits.

In your current folder, create the file `ex_cc_intTypes.h`.

```
typedef enum {
    PWR_LOSS = 0,           /* Default value */
    OVERSPD,
    PRESS_LOW,
} fault_T;

typedef struct {
    int coeff;
    int init;
} params_T;
```

The code defines an enumerated data type and a structure type whose fields use the generic C data type `int`.

To generate an accurate Simulink representation of the structure type, first open an existing model or create a new model. For this example, create a new model named `ex_hdwImpl_16bit`.

In the new model, set **Configuration Parameters > Hardware Implementation > Device vendor** to `Atmel`. Set **Device type** to `AVR`.

Alternatively, at the command prompt, use these commands to create and configure the model:

```
new_system('ex_hdwImpl_16bit','Model');
set_param('ex_hdwImpl_16bit','ProdHWDeviceType','Atmel->AVR')
```

Generate Simulink representations of the types. To specify the word lengths of the target 16-bit hardware, extract the model configuration parameters (which include the **Hardware Implementation** settings) as a `Simulink.ConfigSet` object.

```
configSet = getActiveConfigSet('ex_hdwImpl_16bit');
Simulink.importExternalCTypes('ex_cc_intTypes.h','HardwareImplementation',configSet);
```

The `Simulink.Bus` object `params_T` appears in the base workspace. The bus elements, such as `coeff`, use the Simulink data type `int16`.

```
params_T.Elements(1)

ans =

    BusElement with properties:

        Name: 'coeff'
    Complexity: 'real'
    Dimensions: 1
        DataType: 'int16'
            Min: []
            Max: []
    DimensionsMode: 'Fixed'
        SampleTime: -1
            Unit: ''
        Description: ''
```

In your current folder, the file `fault_T.m` defines the enumeration class `fault_T`. The class derives from `Simulink.IntEnumType`, so you must use model configuration parameters to identify the target hardware and, by extension, the correct native integer length.

```
type('fault_T.m')

classdef fault_T < Simulink.IntEnumType
    % MATLAB enumeration class definition generated from template

    enumeration
        PWR_LOSS(0),
        OVERSPD(1),
        PRESS_LOW(2)
```

```
end

methods (Static)

function defaultValue = getDefaultValue()
    % GETDEFAULTVALUE Returns the default enumerated value.
    % If this method is not defined, the first enumeration is used.
    defaultValue = fault_T.PWR_LOSS;
end

function dScope = getDataScope()
    % GETDATASCOPE Specifies whether the data type definition should be imported
    % or exported to, a header file during code generation.
    dScope = 'Imported';
end

function desc = getDescription()
    % GETDESCRIPTION Returns a description of the enumeration.
    desc = '';
end

function headerFile = getHeaderFile()
    % GETHEADERFILE Specifies the name of a header file.
    headerFile = 'ex_cc_intTypes.h';
end

function flag = addClassNameToEnumNames()
    % ADDCLASSNAMETOENUMNAMES Indicate whether code generator applies the class
    % name to the enumeration.
    flag = false;
end

end

end
```

Import Structure Type Whose Fields Use 16-Bit Fixed-Point Data Types

Create the file `ex_cc_fixpt_struct.h` in your current folder.

```
typedef struct {
```

```

int coeff; /* Word length 16,
           binary fraction length 7 */

int init; /* Word length 16,
           binary fraction length 3 */

} params_T;

```

The file defines a structure type whose fields use fixed-point data types. For example, the structure stores the field `coeff` in a signed, 16-bit integer data type. A binary fraction length of 7 relates the stored integer value to the real-world value.

Suppose that this code operates on 16-bit hardware (such that the generic C data type `int` has a 16-bit word length). To generate a Simulink representation of the type, first create a `coder.HardwareImplementation` object that identifies the hardware.

```

hdw = coder.HardwareImplementation;
hdw.ProdHWDeviceType = 'Atmel->AVR';

```

Generate a Simulink representation of the structure type.

```

Simulink.importExternalCTypes('ex_cc_fixpt_struct.h', ...
    'HardwareImplementation', hdw);

```

The `Simulink.Bus` object, `params_T`, appears in the base workspace. Each bus element, such as `coeff`, uses the data type `int16`.

```
params_T.Elements(1)
```

```
ans =
```

```
BusElement with properties:
```

```

    Name: 'coeff'
Complexity: 'real'
Dimensions: 1
    DataType: 'int16'
        Min: []
        Max: []
DimensionsMode: 'Fixed'
    SampleTime: -1
        Unit: ''
    Description: ''

```

`Simulink.importExternalCTypes` cannot infer the fixed-point scaling (binary fraction length) from the C code. You must manually specify the data types of the bus elements. To specify the data types at the command prompt, use the `fixdt` function.

```
params_T.Elements(1).DataType = 'fixdt(1,16,7)';  
params_T.Elements(2).DataType = 'fixdt(1,16,3)';
```

To specify the data types interactively (by using the Data Type Assistant), use the Bus Editor.

```
buseditor
```

Manually Synchronize Simulink Representations with C-Code Definitions

This example shows how to maintain the Simulink representations of C data types whose definitions you modify during the life of a modeling project.

Import Custom C Types

Create the file `ex_cc_myTypes_rec.h` in your current folder. The file defines a custom structure type.

```
typedef struct {  
    double flow;  
    double pres;  
    double tqe;  
} sigStructType;
```

Generate a `Simulink.Bus` object that represents the type.

```
Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

Modify Type Definition in C Code

In `ex_cc_myTypes_rec.h`, add a field named `spd` to `sigStructType`.

In the same file, create a new structure type, `stateStructType`.

```
typedef struct {  
    double flow;
```

```

        double pres;
        double tqe;
        double spd;
    } sigStructType;

typedef struct {
    double err;
    double read;
    double write;
} stateStructType;

```

Attempt to Import Types Again

Attempt to generate bus objects that represent the types.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

The function generates warnings at the command prompt. Instead of relying on the warnings, you can inspect the output, `importInfo`, to determine whether the function failed to import any types.

```
importInfo.failedToImport.Bus
```

```
ans =

    1×1 cell array

    {'sigStructType'}
```

The function did not import `sigStructType`. The corresponding bus object in the base workspace still has only three bus elements. To determine the reason that the function did not import `sigStructType`, inspect the `report` field of `importInfo`.

Import `sigStructType` again. This time, overwrite the existing bus object.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h', ...
    'Names', importInfo.failedToImport.Bus, 'Overwrite', 'on');
```

When you overwrite existing Simulink representations, any customizations that you made to the Simulink representations (such as the application of fixed-point data types to bus elements) are overwritten.

- “Data Types Supported by Simulink”
- “Data Types for Bus Signals”
- “Use Enumerated Data in Simulink Models”
- “Control Data Type Names in Generated Code” (Embedded Coder)
- “Control Signal Data Types”
- “Exchange Data Between External C/C++ Code and Simulink Model or Generated Code” (Simulink Coder)

Input Arguments

headerFiles — Names and paths of header files to parse

character vector | cell array of character vectors | string scalar | string array

Names and paths of header files to parse, specified as a character vector, cell array of character vectors, string, or string array. Include the `.h` or `.hpp` file extension.

If you use a hierarchy of included (`#include`) header files to define your types, when you specify `HeaderFiles`, you need to identify only the entry-point files. The function parses the included files as well as the identified entry-point files. If the included files are not in the same folder as the corresponding entry-point file, use the `IncludeDirs` pair argument to identify the additional folders.

Example: `'myHeader.h'`

Example: `{ 'thisHeader.hpp', 'thatHeader.hpp' }`

Data Types: `char` | `cell` | `string`

modelName — Name of loaded Simulink model for which to import types

character vector | string scalar

Name of a loaded Simulink model for which to import types, specified as a character vector or string scalar. A model is loaded if, for example, you open the model or use the `load_system` function. When you use this argument, the function:

- Searches the model configuration parameters for custom header files and parses those header files for data types to import. Only the configuration parameters on the **Simulation Target** pane affect this search.

For example, if in the model you set **Configuration Parameters > Simulation Target > Insert custom C code in generated > Header file** to `#include "myTypes.h"`, the function parses `myTypes.h` for types to import.

- Interprets generic C data types such as `int` or `short` according to the word lengths of your host computer. Do not use the `HardwareImplementation` pair argument to override this interpretation.

Example: `'myModel'`

Data Types: `char | string`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example:

```
Simulink.importExternalCTypes('myHdr.h', 'DataDictionary', 'myDictionary.sldd')
```

MATFile — Name and path of MAT-file to create for storing generated objects

`''` (empty) (default) | character vector | string scalar

Name and, optionally, path of the MAT-file to create for storing generated `Simulink.Bus` and `Simulink.AliasType` objects, specified as a character vector or string. If you do not use `MATFile`, by default, the function generates the objects in the base workspace.

The function does not generate enumeration definitions in MAT-files.

If you import some `struct` types and primitive `typedef` statements by using `MATFile` and later import some of the same types again by using `MATFile`, the function entirely replaces the old MAT-file with a new one. The function discards any changes that you made to the contents of the old MAT-file.

You cannot use the `MATFile` and `DataDictionary` pair arguments simultaneously.

Example: `'myMat.mat'`

Example: `'myMat'`

Example: `fullfile('subfolder','myMat')`

Data Types: `char` | `string`

DataDictionary — Name and path of Simulink data dictionary to use or create for storing types

`'` (default) | character vector | string scalar

Name and, optionally, path of the Simulink data dictionary to use or create for storing generated enumerations and objects, specified as a character vector or string. When you use this pair argument, the function imports enumerated types as `Simulink.data.dictionary.EnumTypeDefinition` objects, and stores those objects (as well as `Simulink.Bus` objects and `Simulink.AliasType` objects) in the target dictionary.

For information about data dictionaries, see “What Is a Data Dictionary?”.

You can optionally specify a `.sldd` extension.

You cannot use the `DataDictionary` and `MATFile` pair arguments simultaneously.

Example: `'myDict.slidd'`

Example: `'myDict'`

Example: `fullfile('subfolder','myDict.slidd')`

Data Types: `char` | `string`

Names — Names of types to import

`'` (default) | character vector | cell array of character vectors | string scalar | string array

Names of types to import, specified as a character vector, cell array of character vectors, string, or string array. By default, if you do not use `Names`, the function attempts to import all of the custom types that the identified header files define.

To match multiple type names with a single character vector, use an asterisk (*).

Example: `'myEnumType'`

Example: `{ 'myEnumType', 'myStructType' }`

Example: `'my*Type'`

Data Types: `char` | `cell` | `string`

Defines — Compiler options to define macros that influence type definitions

`'` (default) | character vector | string scalar

Compiler options to define macros that influence C type definitions, specified as a character vector, or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `Defines` to specify macro definitions that you otherwise define through compiler options such as `-D`.

Example: `'SIGSTRUCT=1'`

Example: `'SIGSTRUCT=1 ENUM=1'`

Data Types: `char` | `string`

UnDefines — Compiler options to delete macros that influence type definitions

`'` (default) | character vector | string scalar

Compiler options to delete macros that influence C type definitions, specified as a character vector or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `UnDefines` to specify macro deletions that you otherwise define through compiler options such as `-U`.

Example: `'SIGSTRUCT'`

Example: `'SIGSTRUCT ENUM'`

Data Types: `char` | `string`

IncludeDirs — Folders that contain subordinate, included header files

`'` (default) | character vector | cell array of character vectors | string scalar | string array

Folders that contain subordinate, included (`#include`) header files, specified as a character vector, cell array of character vectors, string, or string array. Use this pair

argument to enable the function to locate and parse additional header files on which the primary header files (which you specify with the `headerFiles` argument) depend.

If you use the `modelName` syntax instead of the `headerFiles` syntax, in the target model, you can use the **Simulation Target** configuration parameters to specify include paths. In that case, you do not need to use the `IncludeDirs` pair argument.

Example: `'myHeaders'`

Example: `fullfile('myProject','myHeaders')`

Example:

```
{fullfile('myProject','myHeaders'),fullfile('myProject','myOtherHeaders')}
```

Data Types: `char` | `cell` | `string`

OutputDir — Folder for storing generated files

`'` (default) | character vector | string scalar

Folder for storing generated files, specified as a character vector or string. The function places generated files, such as `classdef` script files and data dictionary files, in this folder.

The folder that you specify must exist before you use the function.

Example: `'myDictionaries'`

Example: `fullfile('myProject','myDictionaries')`

Data Types: `char` | `string`

HardwareImplementation — Word lengths for interpreting generic, primitive C data types

`'` (default) | `Simulink.ConfigSet` object | `coder.HardwareImplementation` object

Word lengths for interpreting generic, primitive C data types, specified as a `Simulink.ConfigSet` or `coder.HardwareImplementation` object.

- To use a `Simulink.ConfigSet` object, you can extract a configuration set from a model by using functions such as `getConfigSet` and `getActiveConfigSet`. This technique enables you to use the Configuration Parameters dialog box to identify your target hardware (through the **Hardware Implementation** configuration parameters).

- To use a `coder.HardwareImplementation` object (which you create and configure programmatically), specify properties of the object, such as `ProdHWDeviceType`, to identify your target hardware. The object then sets other properties, such as `ProdBitPerInt`, that reflect the native integer size of the hardware.

The function inspects the object to determine which Simulink integer data types to employ when interpreting generic C data types such as `int`. For example, if you create a `coder.HardwareImplementation` object to identify 16-bit hardware and then use the function to import a structure type whose fields use the C data type `int`, the function generates a bus object whose bus elements use the Simulink data type `int16`. The function uses the production hardware settings, not the test hardware settings.

For more information about hardware implementation settings for Simulink models, see “Configure Run-Time Environment Options” (Simulink Coder).

Overwrite — Specification to overwrite existing Simulink representations

`'off'` (default) | `'on'`

Specification to overwrite existing Simulink representations, specified as `'on'` or `'off'`. If an imported type already has a representation in Simulink:

- If you specify `'off'` or if you do not specify `Overwrite`, the function does not import the type. In the output argument, `importInfo`, the `failedToImport` field identifies the type.
- If you specify `'on'`, the function overwrites the existing Simulink representation.

If you use the function to import some types into the base workspace or a data dictionary and later customize the generated Simulink representations, when you use the function again and set `Overwrite` to `'on'`, the function does not preserve your customizations. These customizations can include:

- In an enumeration class definition, implementing extra methods or modifying the generated methods such as `getDataScope` (see “Customize Simulink Enumeration”).
- Modifying the properties of a generated `Simulink.Bus` or `Simulink.AliasType` object (for example, manually setting the data types of bus elements to a fixed-point data type).

Verbose — Specification to generate messages for successful import operations

`'off'` (default) | `'on'`

Specification to generate messages for successful import operations, specified as 'on' or 'off'.

- If you specify 'off' or if you do not specify `Verbose`, the function imports types silently. Messages do not appear in the Command Window unless the function cannot import a type.
- If you specify 'on', the function generates a message in the Command Window for each operation during the import process.

Output Arguments

importInfo — Information about types that were imported and not imported

structure

Information about types that were imported and not imported, returned as a structure with these fields.

report — Descriptions of types that were imported and not imported

character vector

Descriptions of types that were imported and not imported, returned as a character vector. Inspect the value of this field to determine the reason that the function could not import a type.

failedToImport — Types that were not imported

structure

Types that were not imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
Bus	Cell array of character vectors	Names of structure (struct) types that were not imported.
Enum	Cell array of character vectors	Names of enumerated types (enum) that were not imported.

Field Name	Field Value	Purpose
AliasType	Cell array of character vectors	Names of primitive typedef statements that were not imported.

importedTypes — Types that were successfully imported
structure

Types that were successfully imported, returned as a structure with these fields.

Field Name	Field Value	Purpose
Bus	Cell array of character vectors	Names of structure (struct) types that were imported. The generated Simulink.Bus objects use these names.
Enum	Cell array of character vectors	Names of enumerated types (enum) that were imported. The generated enumeration classes or Simulink.data.dictionary.EnumTypeDefinition objects use these names.
AliasType	Cell array of character vectors	Names of primitive typedef statements that were imported. The generated Simulink.AliasType objects use these names.

Limitations

- The function does not support:
 - C data types that do not correspond to a type that Simulink supports. For example, Simulink does not recognize an equivalent for long double. For

information about data types that Simulink supports, see “Data Types Supported by Simulink”.

- Pointer types, such as a structure that defines a field whose value is a pointer or a `typedef` statement whose base type is a pointer type.
- Structures that define a field whose value has more than one dimension.

If a field value is a 1-D array, the function creates a bus element that represents a vector, not a matrix.

- Unions.
- If a structure field represents fixed-point data, or if a `typedef` statement maps to a fixed-point base type, the function sets the data type of the corresponding bus element or `Simulink.AliasType` object to the relevant Simulink integer type (such as `int16`). The importer cannot determine the fixed-point scaling by parsing the C code. After using the function, you must manually specify the data type of the bus element or the base type of the `Simulink.AliasType` object by using the `fixdt` function.

Tips

By default:

- For an imported enumeration, because the Simulink enumeration class derives from `Simulink.IntEnumType`, when you simulate or generate code from a model, the enumeration uses the integer size that is native to your target hardware. You specify the characteristics of your target hardware by using model configuration parameters such as **Production device vendor and type** and **Native word size in production hardware**.
- For an imported structure type:
 - The function imports a structure field as numerically complex only if the field uses one of the corresponding Simulink Coder structure types as the data type. For example, if a structure field in your external code uses the data type `cint8_T`, the function imports the field as a bus element (`Simulink.BusElement` object) whose data type is `int8` and whose `Complexity` property is set to `'complex'`.
 - For nested structures, the function generates a bus object for each unique structure type.
- For an imported structure type or enumeration, if your external code uses a `typedef` statement to name the type, the name of the generated bus object or Simulink

enumeration class matches the `typedef` name. If your code does not use a `typedef` statement, the name of the object or class is `struct_type` or `enum_type` where `type` is the tag name of the type. If you do not specify a tag name or apply a `typedef` name, Simulink generates an arbitrary name for the object or class.

- The function configures the generated Simulink representations as imported for the purposes of simulation and code generation. For example, for bus objects, the function sets the `DataScope` property to 'Imported' and the `HeaderFile` property to the name of your external header file. To simulate or generate code from a model that uses one of these Simulink representations, you must make your header file available to the model.

When you specify files for `Simulink.importExternalCTypes` to use or generate, for example, by using the `DataDictionary` pair argument:

- If the existing files to use are in your current folder or on the MATLAB path, you do not need to specify a file path. You can specify the file name by itself.
- To control the folder location of generated files, you can specify paths as well as file names. You can also use the `OutputDir` pair argument.

Introduced in R2017a

Simulink.ModelDataLogs.convertToDataset

Convert logging data from `Simulink.ModelDataLogs` format to `Simulink.SimulationData.Dataset` format

Syntax

```
convertedDataset =  
sourceModelDataLogsObject.convertToDataset(convertedDatasetName)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

```
convertedDataset =  
sourceModelDataLogsObject.convertToDataset(convertedDatasetName)  
converts the sourceModelDataLogsObject to a  
Simulink.SimulationData.Dataset object. The name of the converted object is based  
on convertedDatasetName.
```

The resulting `Simulink.SimulationData.Dataset` object is a flat list. This list has one element for each `Simulink.Timeseries` or `Simulink.TsArray` object in the `Simulink.ModelDataLogs` object.

Limitations

Source of <code>Simulink.ModelDataLogs</code> Logged Data	Conversion Limitation
Referenced model	<p>Loads all ancestors of the referenced model not previously loaded. If any ancestor model does not appear on the MATLAB path, the conversion fails.</p> <p>If the model has changed, or the model ancestors have changed, after Simulink logged the data, the conversion can fail. For example, adding, deleting, or renaming a block after logging can cause conversion failure.</p>
Variant model or subsystem	The current active variant must be the same one that was active when Simulink logged the data. Otherwise, the conversion fails.
Frame signal	The conversion fails.
Mux block	The conversion produces a different <code>Simulink.SimulationData.Dataset</code> object as the dataset than Simulink creates when you simulate the model using the Dataset format for the logged data.
Stateflow chart	Not supported.

Input Arguments

`sourceModelDataLogsObject`

A `Simulink.ModelDataLogs` object that you want to convert to a `Simulink.SimulationData.Dataset` object.

convertedDatasetName

Name of the dataset that the conversion process creates.

Output Arguments

convertedDataset

The `Simulink.SimulationDataset` object that the `Simulink.ModelDataLogs.convertToDataset` function creates.

For details about the converted dataset, see `Simulink.SimulationData.Dataset`.

Example

In releases before R2016a, you could log signals using `ModelDataLogs` format. If you have a MAT-file with signal logging data that uses the `ModelDataLogs` format, here is how you can convert that data to `Dataset` format. This example assumes that the model that generated the logging data had the **Configuration Parameters > Data Import/Export > Signal logging** name set to `logout`.

- 1 Load the MAT-file.
- 2 Convert `logout` to a dataset called `myModel_dataset`. (The elements information will be different for your data.)

```
dataset = logout.convertToDataset('myModel_Dataset')
```

```
dataset =  
  Simulink.SimulationData.Dataset  
  Package: Simulink.SimulationData  
  
Characteristics:  
    Name: 'myModel_Dataset'  
  Total Elements: 2  
  
Elements:  
  1: 'x1'  
  2: 'x2'
```

- Use `get` or `getElement` to access elements by index or name.
- Use `addElement` or `setElement` to add or modify elements.

Simulink.restoreDiagnostic

Restore diagnostic warnings to a specific block, subsystem, or model

Syntax

```
Simulink.restoreDiagnostic(source)
Simulink.restoreDiagnostic(source, message_id)
Simulink.restoreDiagnostic(diagnostic)
Simulink.restoreDiagnostic(system, 'FindAll', 'on')
```

Description

`Simulink.restoreDiagnostic(source)` restores all suppressed diagnostics associated with the blocks specified by `source`.

`Simulink.restoreDiagnostic(source, message_id)` restores all instances of `message_id` on the blocks specified by `source`.

`Simulink.restoreDiagnostic(diagnostic)` restores the suppressed diagnostics associated with MSLDiagnostic object `diagnostic`.

`Simulink.restoreDiagnostic(system, 'FindAll', 'on')` restores all suppressed diagnostics associated with the system specified by `system`.

Examples

Restore All Diagnostics for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on a specified block.

Create a cell array of message identifiers. Use the `Simulink.suppressDiagnostic` function to suppress these multiple diagnostics from the Constant block, one.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', ...
        'SimulinkFixedPoint:util:fxpParameterUnderflow'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Remove all suppressions and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one');
```

Restore a Diagnostic for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore a suppressed diagnostic on a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Remove the suppression and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one', ...
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Restore All Diagnostics for a Specified System

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the specified subsystem.

To restore all diagnostics from a system, use `'FindAll'`, `'on'` to search within the system hierarchy. Specify the system or system handle within which to search.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/Convert', ...
    'FindAll', 'On');
```

- “Suppress Diagnostic Messages Programmatically”

Input Arguments

source — Block or model object throwing diagnostic

block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

message_id — message identifier of diagnostic

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of warnings and errors thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

system — Name of subsystem

character vector

The subsystem name, or handle, specified as a character vector.

Data Types: `char`

diagnostic — Diagnostic object

`MSLDiagnostic` object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

Introduced in R2016b

getBlockSimState

Class: Simulink.SimState.ModelSimState

Package: Simulink.SimState

Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Syntax

```
blockSimState = getBlockSimState(x, 'blockpath')
```

Description

blockSimState = getBlockSimState(*x*, '*blockpath*') returns the SimState of the block specified as *blockpath*. *blockpath* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

Input Arguments

x

The *x* argument is a Simulink.SimState.ModelSimState object.

blockpath

The path to the block for which you are requesting the SimState values.

Output Arguments

blockSimState

The SimState of the block specified.

Examples

```
chartState = getBlockSimState(x, 'mymodel/chart')
```

See Also

`Simulink.SimState.ModelState.setBlockSimState`

setBlockSimState

Class: Simulink.SimState.ModelSimState

Package: Simulink.SimState

Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

Syntax

```
setBlockSimState(x, 'blockpath', blockSimState)
```

Description

`setBlockSimState(x, 'blockpath', blockSimState)` sets the SimState of the block specified as `blockpath`. `blockpath` must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the `Simulink.SimState.ModelSimState` class.

Input Arguments

x

The argument `x` is a `Simulink.SimState.ModelSimState` object.

blockpath

The path to the block for which you are setting the SimState values

blockSimState

The SimState of the block specified.

Examples

```
newObj = setBlockSimState(obj, 'mymodel/chart', newChartState);
```

See Also

`Simulink.SimState.ModelState.getBlockSimState`

Simulink.saveVars

Save workspace variables and their values in MATLAB code format

Syntax

Note `Simulink.saveVars` is not recommended. Use `matlab.io.saveVariablesToScript` instead.

```
Simulink.saveVars(filename)
Simulink.saveVars(filename, VarNames)
Simulink.saveVars(filename, '-regexp', RegExps)
Simulink.saveVars(filename, Specifications, UpdateOption)
Simulink.saveVars(filename, Specifications, Configuration)
Simulink.saveVars(filename, Specifications, MatlabVer)
[r1, r2] = Simulink.saveVars(filename, Specifications)
```

Description

`Simulink.saveVars(filename)` saves all variables in the current workspace for which MATLAB code can be generated to a MATLAB file named `filename.m`. If MATLAB code cannot be generated for a variable, the variable is saved into a companion MAT-file named `filename.mat`, and a warning is generated. If either file already exists, it is overwritten. The `filename` cannot match the name of any variable in the current workspace, and can optionally include the suffix `.m`. Using `Simulink.saveVars` has no effect on the contents of any workspace.

Executing the MATLAB file restores the variables saved in the file to the current workspace. If a companion MAT-file exists, code in the MATLAB file loads the MAT-file, restoring its variables also. When both a MATLAB file and a MAT-file exist, do not load the MATLAB file unless the MAT file is available, or an error will occur. Do not load a MAT-file directly, or incomplete data restoration will result. No warning occurs if loading a file overwrites any existing variables.

You can edit a MATLAB file that `Simulink.saveVars` creates. You can insert comments between or within the MATLAB code sections for saved variables. However, if you later use `Simulink.saveVars` to update or append to the file, only comments between MATLAB code sections will be preserved. Internal comments should therefore be used only in files that you do not expect to change any further.

You must not edit the header section in the MATLAB file, which comprises the first five comment lines. Simulink does not check that a manually edited MATLAB file is syntactically correct. MathWorks recommends not editing any MATLAB code in the file. You cannot edit a MAT-file and should never attempt to do so.

`Simulink.saveVars(filename, VarNames)` saves only the variables specified in *VarNames*, which is a comma-separated list of variable names. You can use the wildcard character `*` to save all variables that match a pattern. The `*` matches one or more characters, including non-alphanumeric characters.

`Simulink.saveVars(filename, '-regexp', RegExps)` saves only variables whose names match one of the regular expressions in *RegExps*, which is a comma-separated list of expressions. See “Regular Expressions” (MATLAB) for more information. A call to the function can specify both *VarNames* and `-regexprs RegExps`, in that order and comma-separated.

`Simulink.saveVars(filename, Specifications, UpdateOption)` saves the variables described by *Specifications* (which represents the variable specifications in any of the above syntaxes) as directed by *UpdateOption*, which can be any one of the following:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the *Specifications*. If either file already exists, it is overwritten. This is the default behavior.
- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by changing only variables that match the *Specifications* and already exist in any files. The order of the variables in files is preserved. Comments within MATLAB code sections are not preserved.
- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by:
 - Updating variables that match the *Specifications* and already exist in the file or files, preserving the existing order in the file or files. Comments within MATLAB code sections are not preserved.

- Appending variables that match the *Specifications* and do not exist in the file or files by appending the variables to the file or files. These new sections initially have no comments.

`Simulink.saveVars(filename, Specifications, Configuration)` saves the variables described by *Specifications* (which represents the variable specifications in any of the above syntaxes) according to the specified *Configuration*. The *Configuration* can contain any or all of the following options, in any order, separated by commas if more than one appears:

- `'-maxnumel'` *MaxNum* — Limits the number of elements saved for an array to *MaxNum*, which must be an integer between 1 and 10000. For a character array, the upper limit is set to twice the value that you specify with *MaxNum*. If an array is larger than *MaxNum*, the whole array appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 1000
- `'-maxlevels'` *MaxLevels* limits the number of levels of hierarchy saved for a structure or cell array to *MaxLevels*, which must be an integer between 1 and 200. If a structure or cell array is deeper than *MaxLevels*, the whole entity appears in the MAT-file rather than the MATLAB file, generating a warning. Default: 20
- `'-textwidth'` *TextWidth* sets the text wrap width in the MATLAB file to *TextWidth*, which must be an integer between 32 and 256. Default: 76
- `'-2dslice'` — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) char, logic, or numeric array data. `Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:
 - The two integers must be positive.
 - The two integers must be less than or equal to the number of dimensions of the n-D array.
 - The second integer must be greater than the first.

`Simulink.saveVars(filename, Specifications, MatlabVer)` acts as described by *Specifications* (which represents the specifications after *filename* in any of the above syntaxes) saving any MAT-file that it creates in the format required by the MATLAB version specified by *MatlabVer*. Possible values:

- `'-v7.3'` — 7.3 or later

- '-v7.0' — 7.0 or later
- '-v6' — Version 6 or later
- '-v4' — Any MATLAB version

`[r1, r2] = Simulink.saveVars(filename, Specifications)` acts as described by *Specifications* (which represents the specifications after *filename* in any of the above syntaxes) and reports what variables it has saved:

- *r1* — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MATLAB file.
- *r2* — A cell array of character vectors. The character vectors name all variables (if any) that were saved to a MAT-file.

Input Arguments

filename

The name of the file or names of the files that the function creates or updates. The *filename* cannot match the name of any variable in the current workspace. The *filename* can have the suffix `.m`, but the function ignores it.

VarNames

A variable or sequence of comma-separated variables. The function saves only the specified variables to the output file. You can use the wildcard character `*` to save all variables that match a pattern. The `*` matches one or more characters, including non-alphanumeric characters.

'-regexp', RegExps

After the keyword, a regular expression or sequence of comma-separated regular expressions. The function saves to the output file only those variables whose names match one of the expressions. See “Regular Expressions” (MATLAB) for more information. A call to the function can specify both *VarNames* and `-regexprs RegExps`, in that order and comma-separated.

UpdateOption

Any of three keywords that control the action of the function. The possible values are:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed) as directed by the *Specifications*.
- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by changing only variables that match the *Specifications* and already exist in the file or files. The order of the variables in the file or files is preserved.
- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by *filename* by:
 - Updating variables that match the *Specifications* and already exist in the file or files, preserving the existing order in the file or files.
 - Appending variables that match the *Specifications* and do not exist in the file or files by appending the variables that match the *Specifications* to the file or files.

Default: `'-create'`

Configuration

Any or all of the following options, in any order, separated by commas if more than one appears:

- `'-maxnumel'` *MaxNum* — Limits the number of elements saved for an array to *MaxNum*, which must be an integer between 0 and 10000. If an array is larger than that, the whole array appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 1000
- `'-maxlevels'` *MaxLevels* — Limits the number of levels saved for a structure or cell array to *MaxLevels*, which must be an integer between 0 and 200. If a structure or cell array is deeper than that, the whole entity appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 20
- `'-textwidth'` *TextWidth* — Sets the text wrap width in the MATLAB script file to *TextWidth*, which must be an integer between 32 and 256. Default: 76
- `'-2dslice'` — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) arrays of char, logic, or numeric data. Using the `'-2dslice'` option produces more readable generated code that is consistent with how MATLAB displays n-D array data.

`Simulink.saveVars` uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the `-2dslice` option. If you specify two integer arguments:

- The two integers must be positive.
- The two integers must be less than or equal to the number of dimensions of the n-D array.
- The second integer must be greater than the first.

Note You can use the MATLAB Preferences to change the defaults for the `-maxnumel`, `-maxlevels`, `'-2dslice'`, and `-textwidth` configuration options. In the **Workspace** pane, use the options in the **Saving variables as MATLAB script files** group.

MatlabVer

Specifies the MATLAB version whose syntax will be used by any MAT-file saved by the function.

- `'-v7.3'` — 7.3 or later
- `'-v7.0'` — 7.0 or later
- `'-v6'` — Version 6 or later
- `'-v4'` — Any MATLAB version

Default: `'-v7.3'`

Output Arguments

r1

A list of the names of all variables (if any) that were saved to a MATLAB file.

r2

A list of the names of all variables (if any) that were saved to a MAT-file.

Examples

Define some base workspace variables, then save them all to a new MATLAB file named `MyVars.m` using the default values for all input arguments except the `filename`.

```
a = 1;
b = 2.5;
c = 'A string';
d = {a, b, c};
Simulink.saveVars('MyVars');
```

Define additional base workspace variables, then append them to the existing file `MyVars.m` without changing the values previously saved in the file:

```
K = Simulink.Parameter;
MyType = fixdt(1,16,3);
Simulink.saveVars('MyVars', '-append', 'K', 'MyType');
```

Update the variables `V1` and `V2` with their values in a MATLAB file, or for any whose value cannot be converted to MATLAB code, in a MAT-file. The file must already exist. Any array with more than 10 elements will be saved to a MAT-file that can be loaded on any version of MATLAB. The return argument `r1` lists the names of any variables saved to a MATLAB file; `r2` lists any saved to a MAT-file.

```
[r1, r2] = Simulink.saveVars('MyFile', 'V1', 'V2', '-update',
'-maxnumel', 10, '-v4');
```

Specify a 2-D slice for the output of the `my3Dtable` 3-D array. Specify that the 2-D slice expands along the first and third dimensions:

```
my3DTable = zeros(3, 4, 2, 'single');
Simulink.saveVars('mfile.m', 'my3DTable', '-2dslice', 1, 3);
```

The generated MATLAB code is:

```
my3DTable = zeros(3, 4, 2, 'single');
my3DTable(:,1,:) = single( ...
    [1 13;
     5 17;
     9 21]);
my3DTable(:,2,:) = single( ...
    [2 14;
     6 18;
    10 22]);
my3DTable(:,3,:) = single( ...
    [3 15;
     7 19;
    11 23]);
my3DTable(:,4,:) = single( ...
```

```
[4 16;  
 8 20;  
12 24]);
```

Limitations

The `Simulink.saveVars` function:

- Does not preserve shared references.
- Ignores dynamic properties of objects.
- Saves the following to the MAT-file although they could appear in the MATLAB file:
 - `Simulink.ConfigSet` objects with custom target components.
(Use the `Simulink.ConfigSet` method `saveAs` instead.)
 - `Simulink.Timeseries` and `Simulink.ModelDataLogs` objects.

If you save many variables, the generated MATLAB file can contain many lines of code and take a long time to execute. To avoid the long execution time, consider these alternatives:

- Permanently store variables in a data dictionary instead of using `Simulink.saveVars`. A data dictionary also provides more tools for managing variables. See “Determine Where to Store Variables and Objects for Simulink Models”.
- Save variables in a MAT-file by using the `save` function.

Tips

- If you do not need to save variables in an easily-understood form, see the `save` function.
- If you need to save only bus objects, use the `Simulink.Bus.save` function.
- If you need to save only a configuration set, use the `Simulink.ConfigSet.saveAs` method.

`Simulink.Bus.save` | `Simulink.Bus.save` | `Simulink.ConfigSet` |
`matlab.io.saveVariablesToScript` | `save`

Introduced in R2010a

Simulink.sdi.addToRun

Add data to existing run

Syntax

```
signalIDs = Simulink.sdi.addToRun(runID, 'base', varName)
signalIDs = Simulink.sdi.addToRun(runID, 'model', modelNameOrHandle)
signalIDs = Simulink.sdi.addToRun(runID, 'vars', var)
signalIDs = Simulink.sdi.addToRun(runID, 'namevalue', dataName,
dataValue)
```

Description

`signalIDs = Simulink.sdi.addToRun(runID, 'base', varName)` adds data, `varName`, from the base workspace to an existing run, specified by `runID`.

`signalIDs = Simulink.sdi.addToRun(runID, 'model', modelNameOrHandle)` adds model simulation data, specified on the **Data Import/Export** pane of the Configuration Parameters dialog box, to an existing run, specified by `runID`. Open the model before you use this syntax.

`signalIDs = Simulink.sdi.addToRun(runID, 'vars', var)` adds data stored as variables, `var`, from the calling workspace to an existing run, specified by `runID`.

`signalIDs = Simulink.sdi.addToRun(runID, 'namevalue', dataName, dataValue)` adds simulation data `dataValue`, to an existing run, specified by `runID`, and lets you specify a name, `dataName`, for the data in the run.

Examples

Add Simulation Data from Base Workspace

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
```

```
        'StructureWithTime', 'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('My Run')

% Add simulation output from the base workspace
Simulink.sdi.addToRun(runID, 'base', {'simOut'});

% See the results in Simulation Data Inspector
Simulink.sdi.view;
```

Add Simulation Data As Specified in a Model

```
% Open the model
sldemo_absbrake;
```

Click **Run** to simulate the model.

```
% Create a Data Inspector run
runID = Simulink.sdi.createRun('My Run');
Simulink.sdi.addToRun(runID, 'model', 'sldemo_absbrake');

% See the results in Simulation Data Inspector
Simulink.sdi.view;
```

Add Simulation Data by Passing Variables Directly to `simulink.sdi.addToRun`

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
            'StructureWithTime', 'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('My Run');
Simulink.sdi.addToRun(runID, 'vars', simOut);

% See the results in Simulation Data Inspector
Simulink.sdi.view;
```

Add Simulation Data and Name the Data

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime', ...
            'ReturnWorkspaceOutputs','on');

% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('My Run');
% Name simulation output passed to Simulink.sdi.addToRun
Simulink.sdi.addToRun(runID,'namevalue',{'MyData'},{simOut});

% See the results in Simulation Data Inspector
Simulink.sdi.view;
```

- “Inspect and Compare Data Programmatically”

Input Arguments

runID — Unique run identifier

integer

Unique number identifying a run in the Simulation Data Inspector, specified as an integer.

varName — Base workspace data

cell array

The names of variables in the base workspace, specified as a cell array of character vectors.

Example: {'simOut'}

modelNameOrHandle — Model name

character vector

The model name, or a model handle, specified as a character vector.

Example: 'sldemo_absbrake'

var — Variable data

variable

Data stored as variables. These variables are assumed to be in the calling workspace.

Example: `simOut`

dataName — Signal data name

cell array

Name of the data in the run, specified as a cell array.

Example: `{ 'MyData' }`

dataValue — Signal data values

cell array

Values of the signal data, specified as a cell array.

Example: `{ simOut }`

Output Arguments

signalIDs — Unique signal identifier

array

Unique signal identifier, returned as an array of integers where each element is a unique ID for a signal added to the run.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.cleanupWorkerResources

Clean up worker repositories

Syntax

```
Simulink.sdi.cleanupWorkerResources
```

Description

`Simulink.sdi.cleanupWorkerResources` removes redundant data from each Parallel Computing Toolbox worker file used by the Simulation Data Inspector. Call this function while worker pools are running. The Simulation Data Inspector automatically cleans up repository files when you close the worker pool.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport(1)

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

```
parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
    modelWorkspace.assignin('Ts', Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans =
```

```
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
datasetRef(1)
```

```
ans =
```

```
DatasetRef with properties:
```

```
    Name: 'Run 6: slexAircraftExample'
      Run: [1x1 Simulink.sdi.Run]
 numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

`Simulink.sdi.WorkerRun` | `Simulink.sdi.isPCTSupportEnabled`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.clear

Clear all data from the Simulation Data Inspector

Syntax

```
Simulink.sdi.clear
```

Description

`Simulink.sdi.clear` clears all run data from the Simulation Data Inspector.

Examples

Remove All Runs from the Simulation Data Inspector

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime');
```

```
% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('First Run','base',{'simOut'});
```

```
Simulink.sdi.clear;
```

```
% The number of runs is now zero
runCount = Simulink.sdi.getRunCount()
```

- “Inspect and Compare Data Programmatically”

See Also

`Simulink.sdi.clearPreferences` | `Simulink.sdi.close`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.clearPreferences

Clear Simulation Data Inspector preference changes

Syntax

```
Simulink.sdi.clearPreferences
```

Description

`Simulink.sdi.clearPreferences` reverts all Simulation Data Inspector preferences to their default values.

Examples

Restore All Simulation Data Inspector Preferences to Default Values

You can restore default values to all Simulation Data Inspector preferences programmatically with `Simulink.sdi.clearPreferences`.

```
Simulink.sdi.clearPreferences
```

Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')
```

```
% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =

    'sldemo_fuelsys Run 11'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =

    'Run <run_index>: <model_name>'
```

Introduced in R2017a

Simulink.sdi.close

Package: Simulink.sdi

Close the Simulation Data Inspector

Syntax

```
Simulink.sdi.close  
Simulink.sdi.close('filename')
```

Description

`Simulink.sdi.close` closes the Simulation Data Inspector.

`Simulink.sdi.close('filename')` closes the Simulation Data Inspector and saves the data in the file, `filename`.

Examples

Close the Simulation Data Inspector from the Command Line

You can close the Simulation Data Inspector from the MATLAB command line when you have finished inspecting and analyzing your data.

```
Simulink.sdi.close
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

- “Inspect and Compare Data Programmatically”
- “Save and Share Simulation Data Inspector Data and Views”

Introduced in R2013b

Simulink.sdi.compareRuns

Package: Simulink.sdi

Compare the data in two simulation runs

Syntax

```
diffResult = Simulink.sdi.compareRuns(runID1, runID2)
diffResult = Simulink.sdi.compareRuns(runID1, runID2,
alignmentMethods)
```

Description

`diffResult = Simulink.sdi.compareRuns(runID1, runID2)` compares the data in the runs corresponding to `runID1` and `runID2`, returning the result in the `Simulink.sdi.DiffRunResult` object, `diffResult`.

`diffResult = Simulink.sdi.compareRuns(runID1, runID2, alignmentMethods)` compares the simulation runs corresponding to `runID1` and `runID2` using the specified alignment criteria and returns the comparison result in the `Simulink.sdi.DiffRunResult` object, `diffResult`. For more information about how the Simulation Data Inspector aligns signals for comparison, see “How the Simulation Data Inspector Compares Data”.

Examples

Compare Simulation Data Inspector Runs Programmatically

This example shows how to compare runs of simulation data and access the comparison results with the Simulation Data Inspector API.

Generate Runs of Simulation Data

Simulate the model to create runs of simulation data to analyze with the Simulation Data Inspector API.

```
% Open model
load_system('ex_sldemo_absbrake')

% Set the desired slipratio to 0.24 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.24')
sim('ex_sldemo_absbrake');

% Change the desired slip ratio to 0.25 and simulate
set_param('ex_sldemo_absbrake/Desired relative slip','Value','0.25')
sim('ex_sldemo_absbrake');
```

Compare Runs

Get the run IDs for the runs you just created with the `Simulink.sdi.getAllRunIDs` function.

```
% Get run IDs for last two runs
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
runResult = Simulink.sdi.compareRuns(runID1, runID2);
```

Create a Plot of a Comparison Result

Use the `Simulink.sdi.DiffRunResult` object you created in the previous step with `Simulink.sdi.compareRuns` to access the data for the `Ww` signal result to plot it in a figure.

```
% Plot the |Ww| signal difference
signalResult_Ww = runResult.getResultByIndex(1);
figure(1)
plot(signalResult_Ww.Diff)
```

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

```
% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'alpha')
```

```
% Simulate system
sim('slexAircraftExample')

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2)

% Simulate again
sim('slexAircraftExample')

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1, runID2);

% Get signal result
sigResult1 = diffRun1.getResultByIndex(1);

% Check whether signals matched
sigResult1.match

ans =

    logical

     0

% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sig1 = Simulink.sdi.getSignal(sigID1);

% Change absolute tolerance to 0.2
sig1.absTol = 0.2;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1, runID2);
sigResult2 = diffRun2.getResultByIndex(1);
```

```

% Check the result
sigResult2.match

ans =

    logical

     1

```

Compare Runs with Alignment Criteria

This example shows how to compare runs using your desired criteria for aligning signals between runs.

Generate Runs to Compare

This example simulates the `slexAircraftExample` model with two different values of `Ts` to generate two simulation runs for comparison.

```

% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
            'Dataset', 'ReturnWorkspaceOutputs', 'on');

% Create a run from the simulation output
runID1 = Simulink.sdi.createRun('My Run', 'namevalue', {'simOut'}, ...
                               {simOut});

% Get workspace and change workspace variable Ts
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2);

% Simulate again
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', 'SaveFormat', ...
            'Dataset', 'ReturnWorkspaceOutputs', 'on');

% Create another run and get signal IDs
runID2 = Simulink.sdi.createRun('New Run', 'namevalue', {'simOut'}, ...
                               {simOut});

```

Define Alignment Criteria for the Comparison

Before running the comparison, define how you want the Simulation Data Inspector to align the signals between the runs. This example aligns signals by their name, then by their block path, and then by their Simulink identifier.

```
% Define the alignment criteria for the comparison to align signals by
% name, then by block path, then by SID
alignMethods = [Simulink.sdi.AlignType.SignalName
                Simulink.sdi.AlignType.BlockPath
                Simulink.sdi.AlignType.SID];
```

Compare the Runs with the Specified Alignment Criteria

Compare the simulation data in your two runs, with the alignment criteria you specified.

```
% Compare the runs
diffResults = Simulink.sdi.compareRuns(runID1 ,runID2, alignMethods);
```

Check the Comparison Results for the Aligned Signals

You can use the `getResultByIndex` method to access the aligned signals and the results of the comparison for each signal in the runs you compared.

```
% Check the number of comparisons in the result
numComparisons = diffResults.count;

% Iterate through each element and display results in command window
for k = 1:numComparisons

    resultAtIdx = diffResults.getResultByIndex(k);

    % Get signal IDs for each comparison result
    sigID1 = resultAtIdx.signalID1;
    sigID2 = resultAtIdx.signalID2;

    sig1 = Simulink.sdi.getSignal(sigID1);
    sig2 = Simulink.sdi.getSignal(sigID2);

    % Display whether signals match
    displayStr = 'Signals with IDs %s and %s %s \n';
    if resultAtIdx.match
        fprintf(displayStr, sig1.Name, sig2.Name, 'match');
    else
        fprintf(displayStr, sig1.Name, sig2.Name, 'do not match');
```

end

end

```

Signals with IDs Actuator Model and Actuator Model do not match
Signals with IDs Integrate qdot and Integrate qdot do not match
Signals with IDs Integrate and Integrate do not match
Signals with IDs Alpha-sensor Low-pass Filter and Alpha-sensor Low-pass Filter do not match
Signals with IDs Pitch Rate Lead Filter and Pitch Rate Lead Filter do not match
Signals with IDs Proportional plus integral compensator and Proportional plus integral
Signals with IDs Stick Prefilter and Stick Prefilter do not match
Signals with IDs Q-gust model and Q-gust model do not match
Signals with IDs W-gust model[1] and W-gust model[1] do not match
Signals with IDs W-gust model[2] and W-gust model[2] do not match
Signals with IDs alpha, rad and alpha, rad do not match

```

- “Inspect and Compare Data Programmatically”
- “Compare Simulation Data”
- “How the Simulation Data Inspector Compares Data”

Input Arguments

runID1 — Baseline run identifier

integer

Numerical identification for the **Baseline** run in the comparison.

runID2 — Compare to run identifier

integer

Numerical identification for the **Compare to** run in the comparison.

alignmentMethods — Signal alignment methods

array

Array specifying alignment algorithms to use to pair signals with the runs for comparison. The Simulation Data Inspector aligns signals first by the first element in the array, then by the second element in the array, and so on.

Value	Aligns By
Simulink.sdi.AlignType.BlockPath	Path to the signal's source block

Value	Aligns By
<code>Simulink.sdi.AlignType.SID</code>	Simulink identifier “Locate Diagram Components Using Simulink Identifiers”
<code>Simulink.sdi.AlignType.SignalName</code>	Signal name
<code>Simulink.sdi.AlignType.DataSource</code>	Path of the variable in the MATLAB workspace

Example: `[Simulink.sdi.AlignType.SignalName, Simulink.sdi.AlignType.SID]` specifies signal alignment by name and then by SID.

Output Arguments

diffResult — Comparison results

'Simulink.sdi.diffRunResult'

`Simulink.sdi.DiffRunResult` object that provides access to comparison results.

Simulink.sdi.compareSignals

Compare data from two signals

Syntax

```
diff = Simulink.sdi.compareSignals(signalID1,signalID2)
```

Description

`diff = Simulink.sdi.compareSignals(signalID1,signalID2)` compares two signals and returns the result in a `Simulink.sdi.DiffSignalsResult` object.

Examples

Compare Two Signals

Call `Simulink.sdi.createRun` to get signal IDs for a simulation run in the Simulation Data Inspector. The function `Simulink.sdi.compareSignals` returns a `Simulink.sdi.DiffSignalResult` object containing the result of the comparison.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on',...
            'SaveFormat','StructureWithTime',...
            'ReturnWorkspaceOutputs','on');

% Create a Simulation Data Inspector run and get signal IDs
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','namevalue',{'MyData'},{simOut});

sig1 = signalIDs(1);
sig2 = signalIDs(2);

% Compare two signals, which returns results in
% instance of a Simulink.sdi.DiffSignalResult object
diff = Simulink.sdi.compareSignals(sig1,sig2);
```

```
% Find if the signal data match
match = diff.match;

% Get the tolerance used in Simulink.sdi.compareSignals
tolerance = diff.tol;
```

Compare Signals From Two Different Runs

```
% Load the model 'slexAircraftExample'
load_system('slexAircraftExample');

% Configure model "slexAircraftExample" for logging
set_param('slexAircraftExample','SolverType','Fixed-Step','SaveOutput','on',...
          'SaveFormat','StructureWithTime','ReturnWorkspaceOutputs',...
          'on');

% CD to temporary directory and build
cd(tempdir);
rtwbuild('slexAircraftExample');

% Run the executable
if ispc
    system('slexAircraftExample');
elseif unix
    system('./slexAircraftExample');
end

% Create a Data Inspector run using slexAircraftExample.mat created in the current
% directory
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','file','slexAircraftExample.mat');

% Get first signal id to compare
sig1 = signalIDs(1);

% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on',...
            'SaveFormat','StructureWithTime',...
            'ReturnWorkspaceOutputs','on');

% Create a Data Inspector run and get signal IDs
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','namevalue',...

```

```

                                {'MyData'}, {simOut});

% Get second signal id to compare
sig2 = signalIDs(1);

% compare two signals
result = Simulink.sdi.compareSignals(sig1, sig2);
if result.match
    disp('****The signals match****');
else
    disp('****The signals did not match****');
end

% Plot results in a figure
plot(result.tol, 'Color', 'r');
hold on;
plot(result.diff, 'Color', 'g');
legend('Tolerance', 'Difference');

```

- “Inspect and Compare Data Programmatically”

Input Arguments

signalID1 — Unique signal identifier

integer

Signal ID, a unique number identifying the first signal for comparison.

signalID2 — Unique signal identifier

integer

Signal ID, a unique number identifying the second signal for comparison.

Output Arguments

diff — Comparison difference data

object

Simulink.sdi.DiffSignalResult object containing the results of the comparison.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.copyRun

Create a copy of a run

Syntax

```
runIDcopy = Simulink.sdi.copyRun(runID)
[runIDcopy,runIndex] = Simulink.sdi.copyRun(runID)
[runIDcopy,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)
```

Description

`runIDcopy = Simulink.sdi.copyRun(runID)` copies the run associated with `runID` and returns a run ID, `runIDcopy`, associated with the new run. The new run contains all of the simulation output data and metadata from the original run.

`[runIDcopy,runIndex] = Simulink.sdi.copyRun(runID)` copies the run associated with `runID` and returns the run ID, `runIDcopy`, and the `runIndex` for the new run.

`[runIDcopy,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)` copies the run associated with `runID` and returns the run ID, run index, and array of new signal IDs, `signalIDs`, for signals in the new run.

Examples

Copy Simulink.sdi.Run Object Representing a Run In the Simulation Data Inspector

```
% Configure model 'slexAircraftExample' for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on',...
            'SaveFormat','StructureWithTime',...
            'ReturnWorkspaceOutputs','on');

% Create a Simulation Data Inspector run
```

```
runID = Simulink.sdi.createRun('First Run', 'base', {'simOut'});  
  
[newRunID, runIndex, signalIDs] = Simulink.sdi.copyRun(runID);  
  
% See the results in Simulation Data Inspector  
Simulink.sdi.view;
```

- “Inspect and Compare Data Programmatically”

Input Arguments

runID — Unique run identifier

integer

Run ID, a unique number identifying a run in the Simulation Data Inspector, specified as an integer.

Output Arguments

runIDcopy — Unique run identifier

integer

The unique number identifying the copied run, returned as an integer.

runIndex — Simulation run index

integer

Number representing the new index to the list of runs currently in the Simulation Data Inspector, returned as an integer.

signalIDs — Unique signal identifiers

array

Vector of numbers, where each element is a unique ID for a signal in this run. The signal IDs are different in the new run.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.copyRunViewSettings

Copy signal line style and color specifications from one run to another run

Syntax

```
alignedSignals = Simulink.sdi.copyRunViewSettings(sourceRun,  
destinationRun,moveCheckboxes)
```

Description

`alignedSignals = Simulink.sdi.copyRunViewSettings(sourceRun, destinationRun,moveCheckboxes)` copies the signal line style and color from one run to another run. The function returns an array of signal identifiers that align between runs where the settings were copied.

Examples

Copy Signal Line Style and Color

```
% Configure model 'slexAircraftExample' for logging and simulate  
simOut = sim('slexAircraftExample','SaveOutput','on',...  
            'SaveFormat','StructureWithTime',...  
            'ReturnWorkspaceOutputs','on');  
  
% Create the first Simulation Data Inspector run  
runID_1 = Simulink.sdi.createRun('First Run','base',{'simOut'});  
  
% Simulate the model again  
simOut = sim('slexAircraftExample','SaveOutput','on',...  
            'SaveFormat','StructureWithTime',...  
            'ReturnWorkspaceOutputs','on');  
  
% Create second run in the Simulation Data Inspector  
runID_2 = Simulink.sdi.createRun('Second Run','base',{'simOut'});
```

```
% Copy the signal settings from first run to the second run  
alignedSignals = Simulink.sdi.copyRunViewSettings(runID_1,runID_2,true);
```

- “Inspect and Compare Data Programmatically”

Input Arguments

sourceRun — Source run identifier

integer or object

A run ID, specified as an integer, or a `Simulink.sdi.Run` object, specified as an object, for the source run.

destinationRun — Destination run identifier

integer or object

A run ID, specified as an integer, or a `Simulink.sdi.Run` object, specified as an object, for the destination run.

moveCheckboxes — Move plotted signals

`false` (default) | `true`

Indicate to move the check boxes in the **Runs** pane, which plot signals, from the source run to the destination run, specified as `true` or `false`.

Output Arguments

alignedSignals — Aligned signals between runs

integer array

Signals that match between runs where the settings were copied, returned as an array of signal identifiers. See “Signal Alignment in the Simulation Data Inspector” for more information on signal alignment.

See Also

`Simulink.sdi.copyRun`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2016a

Simulink.sdi.createRun

Create a run in the Simulation Data Inspector

Syntax

```
runID = Simulink.sdi.createRun
runID = Simulink.sdi.createRun(var)
runID = Simulink.sdi.createRun(runName)
runID = Simulink.sdi.createRun(runName, 'base', varName)
runID = Simulink.sdi.createRun(runName, 'model', modelNameOrHandle)
runID = Simulink.sdi.createRun(runName, 'vars', var)
runID = Simulink.sdi.createRun(runName, 'namevalue', dataName,
dataValue)
runID = Simulink.sdi.createRun(runName, 'file', fileName)

[runID, runIndex] = Simulink.sdi.createRun( ___ )
[runID, runIndex, signalIDs] = Simulink.sdi.createRun( ___ )
```

Description

`runID = Simulink.sdi.createRun` creates an empty unnamed run in the Simulation Data Inspector and returns the corresponding run ID.

`runID = Simulink.sdi.createRun(var)` creates a run in the Simulation Data Inspector with data `var` from the base workspace.

`runID = Simulink.sdi.createRun(runName)` creates an empty run named `runName` in the Simulation Data Inspector and returns the corresponding run ID.

`runID = Simulink.sdi.createRun(runName, 'base', varName)` creates a run in the Simulation Data Inspector with data, `varName`, from the base workspace.

`runID = Simulink.sdi.createRun(runName, 'model', modelNameOrHandle)` creates a run in the Simulation Data Inspector with model simulation output data, as specified on the **Data Import/Export** pane of the Configuration Parameters dialog box.

`modelNameOrHandle` is a character vector specifying the model name of a model handle. Open the model before you use this syntax.

`runID = Simulink.sdi.createRun(runName, 'vars', var)` creates a run in the Simulation Data Inspector with data stored in variables, `var`. These variables must be in the calling workspace.

`runID = Simulink.sdi.createRun(runName, 'namevalue', dataName, dataValue)` creates a run in the Simulation Data Inspector from simulation data `dataValue`. `dataName` specifies a name for the data.

`runID = Simulink.sdi.createRun(runName, 'file', fileName)` creates a run in the Simulation Data Inspector with data from a MAT-file, `fileName`.

`[runID, runIndex] = Simulink.sdi.createRun(____)` creates a run in the Simulation Data Inspector and returns the run ID and the run index. Use this option with any of the input argument combinations in the previous syntaxes.

`[runID, runIndex, signalIDs] = Simulink.sdi.createRun(____)` creates a run in the Simulation Data Inspector and returns the run ID, the run index, and the signal IDs. Use this option with any of the input argument combinations in the previous syntaxes.

Examples

Create Empty Run With No Name

```
runID = Simulink.sdi.createRun;
```

Create Run Directly From Simulation Output

```
% Configure the model sllexAircraftExample for logging and simulate
simOut = sim('sllexAircraftExample', 'SaveOutput', 'on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run from the simulation
% output data in the base workspace
```

```

Simulink.sdi.createRun(simOut);

% Open the Simulation Data Inspector tool to view the data
Simulink.sdi.view;

```

Create Run From Simulation Output In the Base Workspace

```

% Configure the model slexAircraftExample for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run from the simulation
% output data in the base workspace
Simulink.sdi.createRun('My Run', 'base', {'simOut'});

% Open the Simulation Data Inspector tool to view the data
Simulink.sdi.view;

```

Create Run Using Simulation Output From a Model

The model must be open to use this function signature.

```

% Open the model sldemo_absbrake
sldemo_absbrake;

```

Click **Run** to simulate the model. The model is already configured for signal logging.

```

% Create a Simulation Data Inspector run named 'My Run' using
% simulation output data from the model
Simulink.sdi.createRun('My Run', 'model', 'sldemo_absbrake');

% Open the Simulation Data Inspector tool to view the data
Simulink.sdi.view;

```

Create Run Using Passed Variables

```

% Configure the model slexAircraftExample for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', ...

```

```
        'SaveFormat', 'StructureWithTime', ...
        'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run named 'My Run' using
% simulation output data from the model
Simulink.sdi.createRun('My Run', 'vars', simOut);

% Open the Simulation Data Inspector tool to view the data
Simulink.sdi.view;
```

Create Run and Include Name of Simulation Data

```
% Configure the model slexAircraftExample for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run named 'My Run' using
% simulation output data from the model
Simulink.sdi.createRun('My Run', 'namevalue', {'MyData'}, {simOut});

% Open the Simulation Data Inspector tool to view the data
Simulink.sdi.view;
```

Create Run Using MAT-File Data

This example includes data from a code generation build and requires Simulink Coder.

```
% Load the model slexAircraftExample
load_system('slexAircraftExample');

% Configure the model for logging and simulate
set_param('slexAircraftExample', 'SolverType', 'Fixed-Step', ...
        'SaveOutput', 'on', ...
        'SaveFormat', 'StructureWithTime', ...
        'ReturnWorkspaceOutputs', 'on');

% Build the model to a temporary directory
cd(tempdir);
rtwbuild('slexAircraftExample');
```

```

% Run the executable
if ispc
    system('slexAircraftExample');
elseif unix
    system('./slexAircraftExample');
end

% A MAT-file is generated in the current directory

% Create a Simulation Data Inspector run using the data in the MAT-file
Simulink.sdi.createRun('My Run', 'file', 'slexAircraftExample.mat');

% Open the Simulation Data Inspector tool to view the data
Simulink.sdi.view;

```

A run named, My Run, appears in the Simulation Data Inspector.

- “Inspect and Compare Data Programmatically”

Input Arguments

runName — Run name

character vector

Name of the run as it appears in the Simulation Data Inspector, specified as a character vector.

varName — Base workspace data

cell array

The names of variables in the base workspace, specified as a cell array of character vectors.

Example: {'simOut'}

modelNameOrHandle — Model name

character vector

The model name, or a model handle, specified as a character vector.

Example: 'sldemo_absbrake'

var — Variable data

variable

Data stored as variables. These variables are assumed to be in the calling workspace.

Example: `simOut`

dataName — Signal data name

cell array

Name of the data in the run, specified as a cell array.

Example: `{ 'MyData' }`

dataValue — Signal data values

cell array

Values of the signal data, specified as a cell array.

Example: `{ simOut }`

fileName — Simulation data file name

character vector

The file name and path of a MAT-file containing simulation data, specified as a character vector.

Example: `'slexAircraftExample.mat'`

Output Arguments

runID — Unique run identifier

integer

Unique number identifying a run in the Simulation Data Inspector, returned as an integer.

runIndex — Simulation run index

integer

Number representing an index to the list of runs currently in the Simulation Data Inspector, returned as an integer.

signalIDs — Unique signal identifiers

array

Vector of numbers, where each element is a unique ID for a signal in a run.

Tips

- Before calling `Simulink.sdi.createRun` with either 'base' or 'model' as an input argument, you must configure the model for logging and simulate the model.
- When you create and add a run, the Simulation Data Inspector maintains a list of these runs. The first run in the list is given a `runIndex` of 1. If you delete a run from the Simulation Data Inspector, the subsequent runs move up the list and each `runIndex` changes. However, the run IDs remain the same.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.createRunOrAddToStreamedRun

Create a single run for all simulation outputs

Syntax

```
runID = Simulink.sdi.createRunOrAddToStreamedRun mdl, runName,  
varNames, varValues)
```

Description

`runID = Simulink.sdi.createRunOrAddToStreamedRun(mdl, runName, varNames, varValues)` creates a new run with the data identified by `varNames` and `varValues` if no run exists for the model identified by `mdl`. The function adds the data identified by `varNames` and `varValues` to an existing run if a run associated with `mdl` already exists.

Examples

Generate and Add Data to Run

```
%load system  
load_system('slexAircraftExample')  
  
%mark signal for logging  
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', ...  
    4, 'on')  
  
%simulate model  
sim('slexAircraftExample')  
  
%create cells for names and data  
names = cell({'tout', 'xout', 'yout'});  
data = cell({tout, xout, yout});
```

```
%add data to run
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample', ...
    'Run 1', names, data);
```

Input Arguments

mdl — Name of the model the simulation data is from

character vector

Name of the model the simulation data is from, specified as a character vector.

Example: 'sldemo_absbrake'

runName — Run name

character vector

Name for the new or augmented run.

varNames — Names for data

cell array

Cell array containing the names of all signals and variables.

varValues — Run data

cell array

Cell array containing all of the data for signals and variables.

Output Arguments

runID — Unique numerical identifier for the created or augmented run

integer

Numerical identifier for created or augmented run.

Introduced in R2017a

Simulink.sdi.deleteRun

Delete a run from the Simulation Data Inspector

Syntax

```
Simulink.sdi.deleteRun(runID)
```

Description

`Simulink.sdi.deleteRun(runID)` deletes a run associated with the run ID in the Simulation Data Inspector. Deleting the run removes all data included in the run. After deleting a run, the subsequent runs move up the list, and the run index for each run changes. However, the unique run IDs remain the same.

Examples

Remove Run from the Simulation Data Inspector

```
% Configure model 'slexAircraftExample' for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime');

% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('First Run','base',{'simOut'});

Simulink.sdi.deleteRun(runID);
```

- “Inspect and Compare Data Programmatically”

Input Arguments

runID — Unique run identifier
integer

A unique simulation run identifier, specified as an integer. The `Simulink.sdi.createRun` function creates a unique run ID. The run ID can also be accessed for a particular run using the `Simulink.sdi.getRunIDByIndex` function.

Simulink.sdi.deleteSignal

Delete a signal from the Simulation Data Inspector

Syntax

```
Simulink.sdi.deleteSignal(signalID)
```

Description

`Simulink.sdi.deleteSignal(signalID)` deletes a signal from the Simulation Data Inspector **Inspect** pane.

Examples

Delete Signal From Simulation Data Inspector

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on','SaveFormat',...
            'StructureWithTime');

% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('First Run','base',{'simOut'});

% Delete the first signal in this run
run = Simulink.sdi.getRun(runID);
signalID = run.getSignalIDByIndex(1);
Simulink.sdi.deleteSignal(signalID);
```

- “Inspect and Compare Data Programmatically”

Input Arguments

signalID — Unique signal identifier

integer

Unique number identifying a signal in a run, specified as an integer. To find the signal ID, you can use the method `Simulink.sdi.Run.getSignalIDByIndex`.

Introduced in R2016a

Simulink.sdi.enablePCTSupport

Control how the Simulation Data Inspector works with the Parallel Computing Toolbox

Syntax

```
Simulink.sdi.enablePCTSupport(enable)
```

Description

`Simulink.sdi.enablePCTSupport(enable)` enables or disables support for automatically importing data from Parallel Computing Toolbox workers into the Simulation Data Inspector, depending on the value of the logical input `enable`.

Examples

Enable Support for Parallel Computing Toolbox

Enable support for Parallel Computing Toolbox to automatically import the output from Parallel Computing Toolbox workers to the Simulation Data Inspector.

```
Simulink.sdi.enablePCTSupport(1)
```

Disable Support for Parallel Computing Toolbox

Disable support for Parallel Computing Toolbox to prevent the output from Parallel Computing Toolbox workers from automatically importing to the Simulation Data Inspector.

```
Simulink.sdi.enablePCTSupport(0)
```

Input Arguments

enable — Logical enable

logical

Logical enable for Parallel Computing Toolbox.

- `true` or `1` enables support for Parallel Computing Toolbox.
- `false` or `0` disables support for Parallel Computing Toolbox.

Data Types: `logical`

See Also

Introduced in R2017b

Simulink.sdi.exportRun

Create a Simulink.SimulationData.Dataset object of the data in the specified run

Syntax

```
ds = Simulink.sdi.exportRun(runID)
```

Description

`ds = Simulink.sdi.exportRun(runID)` creates a Simulink.SimulationData.Dataset object of the run in the Simulation Data Inspector identified by `runID`.

Examples

Generate and Export a Run in the Simulation Data Inspector

```
%load example system
load_system('sldemo_fuelsys')

%simulate system and create a run in the Simulation Data Inspector
simOut = sim('sldemo_fuelsys', 'SaveFormat', 'StructureWithTime');

runID = Simulink.sdi.createRun(simOut);

%export run to Simulink.SimulationData.Dataset object
ds = Simulink.sdi.exportRun(runID);
```

Input Arguments

runID — Numerical run identifier
integer

Number identifying a run in the Simulation Data Inspector.

Output Arguments

ds — **Simulink.SimulationData.Dataset** object

`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the data of the run corresponding to the `runID`.

See Also

`Simulink.sdi.createRun`

Introduced in R2017a

Simulink.sdi.getAllRunIDs

Get all run identifiers within the Simulation Data Inspector

Syntax

```
runIDs = Simulink.sdi.getAllRunIDs
```

Description

`runIDs = Simulink.sdi.getAllRunIDs` returns an n-by-1 matrix of all numerical run identifiers for runs in the **Inspect** pane of the Simulation Data Inspector.

Examples

Retrieve All Run IDs After Several Simulations

```
%load example system
load_system('slexAircraftExample')

%simulate system and save output
simOut = sim('slexAircraftExample', 'SaveFormat', 'StructureWithTime');
simOut1 = sim('slexAircraftExample', 'SaveFormat', 'StructureWithTime');

%create run from simulation output
Simulink.sdi.createRun(simOut);
Simulink.sdi.createRun(simOut1);

%get run IDs for runs in the Simulation Data Inspector
runIDs = Simulink.sdi.getAllRunIDs;
```

- “Inspect and Compare Data Programmatically”
- “Organize Your Simulation Data Inspector Workspace”

Output Arguments

runIDs — Matrix of all run IDs in the Simulation Data Inspector

n-by-1 matrix

An n-by-1 matrix containing all of the run IDs for runs of the specified group in the Simulation Data Inspector.

See Also

Simulink.sdi.getMarkersOn

Package: Simulink.sdi

Return logical indication of marker property

Syntax

```
res = Simulink.sdi.getMarkersOn
```

Description

`res = Simulink.sdi.getMarkersOn` returns the logical value `res` indicating whether data markers are displayed on plots in the Simulation Data Inspector.

Examples

Save Marker State

You can use the `Simulink.sdi.getMarkersOn` property to save or query part of a Simulation Data Inspector configuration.

```
markerState = Simulink.sdi.getMarkersOn
```

Output Arguments

res — Logical indication of marker state

true | false

Logical indication of whether markers are displayed on plots in the Simulation Data Inspector.

- `true` indicates that markers are displayed.

- `false` indicates that markers are not displayed.

Introduced in R2017b

Simulink.sdi.getRun

Get a `Simulink.sdi.Run` object containing simulation output data

Syntax

```
runObj = Simulink.sdi.getRun(runID)
```

Description

`runObj = Simulink.sdi.getRun(runID)` returns a handle to the `Simulink.sdi.Run` object for the run corresponding to `runID` in the Simulation Data Inspector.

Examples

Get Simulink.sdi.Run Object For Run in the Simulation Data Inspector

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');

% Create a Simulation Data Inspector run
[runID,runIndex,signalIDs] = Simulink.sdi.createRun('My Run', 'base', {'simOut'});

runObj = Simulink.sdi.getRun(runID);
```

- “Inspect and Compare Data Programmatically”

Input Arguments

runID — Unique run identifier
integer

Run ID, a unique number identifying a run in the Simulation Data Inspector, specified as an integer.

Output Arguments

runObj — Run object handle

object

Object containing the signal data and metadata, returned as a `Simulink.sdi.Run` object handle.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.createRun`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.getRunCount

Get the number of runs in the Simulation Data Inspector

Syntax

```
runCount = Simulink.sdi.getRunCount
```

Description

`runCount = Simulink.sdi.getRunCount` returns the number of runs that are in the Simulation Data Inspector.

Examples

Check Run Count After Simulation

Call `Simulink.sdi.getRunCount` to get the number of runs currently in the Simulation Data Inspector after a simulation.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime');

% Create a Simulation Data Inspector run
runID = Simulink.sdi.createRun('First Run','base',{'simOut'});

% Get run count in the Simulation Data Inspector
runCount = Simulink.sdi.getRunCount()

runCount =

     1
```

- “Inspect and Compare Data Programmatically”

Output Arguments

runCount — Number of runs

integer

Number of runs that exist in the Simulation Data Inspector, returned as an integer.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.createRun`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.getRunIDByIndex

Get the run ID corresponding to the specified run index

Syntax

```
runID = Simulink.sdi.getRunIDByIndex(runIndex)
```

Description

`runID = Simulink.sdi.getRunIDByIndex(runIndex)` returns the run ID for the run corresponding to the run index.

Examples

Get Run IDs For All Runs in the Simulation Data Inspector

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime', ...
            'ReturnWorkspaceOutputs','on');

% Create a Simulation Data Inspector run
[runID, runIndex, signalIDs] = Simulink.sdi.createRun('Run1','base',{'simOut'});

% Get the ID of the previously created run by index
runID2 = Simulink.sdi.getRunIDByIndex(runIndex);

% Both runID and runID2 reference the same run and should be equal
isequal(runID, runID2)
```

```
ans =
```

```
1
```

- “Inspect and Compare Data Programmatically”

Input Arguments

runIndex — Simulation run index

integer

Number representing an index to the list of runs currently in the Simulation Data Inspector, specified as an integer. The run index is an output of the `Simulink.sdi.createRun` function.

Output Arguments

runID — Unique run identifier

integer

Run ID, a unique number identifying a run in the Simulation Data Inspector, returned as an integer.

See Also

`Simulink.sdi.createRun` | `Simulink.sdi.getRunCount` |
`Simulink.sdi.isValidRunID`

Introduced in R2011b

Simulink.sdi.getRunNamingRule

Get the run naming rule for Simulation Data Inspector runs

Syntax

```
runNamingRule = Simulink.sdi.getRunNamingRule()
```

Description

`runNamingRule = Simulink.sdi.getRunNamingRule()` returns the run naming rule for Simulation Data Inspector runs.

Examples

Change and Restore the Simulation Run Naming Rule

```
% Load the model
sldemo_absbrake;

% Save the prior run naming rule and set a new rule
runNamingRule = Simulink.sdi.getRunNamingRule();
Simulink.sdi.setRunNamingRule('My special simulation');

% Record logged signals and send them to the Simulation Data Inspector
set_param('sldemo_absbrake', 'InspectSignalLogs', 1);

% Run the simulation
set_param('sldemo_absbrake', 'SimulationCommand', 'Start');

% Restore the previous run naming rule
Simulink.sdi.setRunNamingRule(runNamingRule);
```

```
% Open the Simulation Data Inspector to see the new run
Simulink.sdi.view;
```

Output Arguments

runNamingRule — Current Simulation Data Inspector run naming rule
character vector

Current Simulation Data Inspector run naming rule, returned as a character vector containing any of the run naming rule tokens <run_index>, <model_name>, <time_stamp>, <sim_mode>, or a custom run naming rule.

See Also

`Simulink.sdi.resetRunNamingRule` | `Simulink.sdi.setRunNamingRule`

Introduced in R2015a

Simulink.sdi.getSignal

Get a `Simulink.sdi.Signal` object for the specified signal in the Simulation Data Inspector

Syntax

```
signal = Simulink.sdi.getSignal(signalID)
```

Description

`signal = Simulink.sdi.getSignal(signalID)` returns the `Simulink.sdi.Signal` object for the signal corresponding to the signal ID. The `Simulink.sdi.Signal` object manages the signal's time series data and metadata.

Examples

Modify Signal Properties in Simulation Data Inspector

Get the `Simulink.sdi.Signal` object for a signal in the Simulation Data Inspector. With the signal object you can modify its comparison and visualization properties.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', ...
            'SaveFormat', 'StructureWithTime');

% Create a Simulation Data Inspector run
[runID,runIndex,signalIDs] = Simulink.sdi.createRun('My Run', 'base', {'simOut'});

signalObj = Simulink.sdi.getSignal(signalIDs(1));

% Specify the comparison and visualization signal properties
signalObj.absTol = .5;
signalObj.syncMethod = 'intersection';
signalObj.interpMethod = 'linear';
```

```
signalObj.lineColor = [1,0.4,0.6];  
signalObj.lineDashed = '-';  
signalObj.checked = true;  
  
% View the signals in Simulation Data Inspector GUI  
Simulink.sdi.view;
```

- “Inspect and Compare Data Programmatically”

Input Arguments

signalID — Unique signal identifier

integer

Signal ID, a unique number identifying a signal in the Simulation Data Inspector, specified as an integer.

Output Arguments

signal — Signal time series object

object

A signal properties object, returned as a `Simulink.sdi.Signal` handle object.

See Also

`Simulink.sdi.Run` | `Simulink.sdi.Signal` | `Simulink.sdi.createRun` | `Simulink.sdi.getRun`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.isPCTSupportEnabled

Determine status for Parallel Computing Toolbox support

Syntax

```
res = Simulink.sdi.isPCTSupportEnabled
```

Description

`res = Simulink.sdi.isPCTSupportEnabled` returns `res`, a logical indication of whether support for the Parallel Computing Toolbox is enabled.

Examples

Check Status of Parallel Computing Toolbox Support

Before running code that depends on whether the Parallel Computing Toolbox is supported, you can use `Simulink.sdi.isPCTSupportEnabled` to check the support status. The default behavior for the Simulation Data Inspector enables Parallel Computing Toolbox support.

```
Simulink.sdi.isPCTSupportEnabled
```

```
ans =
```

```
    logical
```

```
     1
```

Output Arguments

res — Logical indicator of Parallel Computing Toolbox support

logical

Logical indication of Parallel Computing Toolbox support.

- 1 indicates that support for the Parallel Computing Toolbox is enabled.
- 0 indicates that support for the Parallel Computing Toolbox is not enabled.

See Also

`Simulink.sdi.WorkerRun` | `Simulink.sdi.enablePCTSupport`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

Simulink.sdi.isValidRunID

Determine if run ID is valid

Syntax

```
isValid = Simulink.sdi.isValidRunID(runID)
```

Description

`isValid = Simulink.sdi.isValidRunID(runID)` returns true if the `runID` corresponds to a run currently in the Simulation Data Inspector. Otherwise, it returns false.

Examples

Verify Run IDs

Before comparing the simulation data of two runs, you can verify that the run IDs are valid.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput', 'on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');

% Create a Data Inspector run
run1ID = Simulink.sdi.createRun('First Run', 'base', {'simOut'});
run2ID = Simulink.sdi.createRun('Second Run', 'base', {'simOut'});

% Check if run IDs are valid in Simulation Data Inspector
run1ID_valid = Simulink.sdi.isValidRunID(run1ID);
run2ID_valid = Simulink.sdi.isValidRunID(run2ID);

if run1ID_valid & run2ID_valid
```

```
% Compare two runs
difference = Simulink.sdi.compareRuns(run1ID, run2ID);
end
```

- “Inspect and Compare Data Programmatically”

Input Arguments

runID — Unique run identifier

integer

Run ID, a unique number identifying a run in the Simulation Data Inspector, specified as an integer.

Output Arguments

isValid — Valid run indicator

logical

Indication of whether the run is a valid Simulation Data Inspector run, returned as a Boolean value: 1, if the run exists; 0, otherwise.

Simulink.sdi.load

Load a saved Simulation Data Inspector session or view

Syntax

```
isValidSDIMatFile = Simulink.sdi.load(fileName)
```

Description

`isValidSDIMatFile = Simulink.sdi.load(fileName)` loads the Simulation Data Inspector session or view from the MLDATX-file or MAT-file `fileName`.

Examples

Load Previous Simulation Data Inspector Session from a MAT-File

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample', 'SaveOutput','on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');

% Create a run in the Simulation Data Inspector
runID = Simulink.sdi.createRun('My Run', 'base', { 'simOut' });

% Save the current Simulation Data Inspector session
Simulink.sdi.save('my_runs.mat');

% Clear all data from the Simulation Data Inspector
Simulink.sdi.clear;

% Import saved MAT-file into the Simulation Data Inspector
Simulink.sdi.load('my_runs.mat');
```

```
% See the results in Simulation Data Inspector  
Simulink.sdi.view;
```

- “Inspect and Compare Data Programmatically”

Input Arguments

fileName — Session or view file name

character vector

File name, specified as a character vector, of the full or partial path of a Simulation Data Inspector session or view MLDATX-file.

Output Arguments

isValidSDIMatFile — Valid file indicator

logical

Indication of whether the MLDATX-file is a valid Simulation Data Inspector session or view file, returned as a Boolean value. Returns 1 if the file is valid and 0 if the file is not valid.

Alternatives

In the Simulation Data Inspector, click **Open** on the **Visualize** tab. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

Simulink.sdi.markSignalForStreaming

Turn streaming on or off for a signal

Syntax

```
Simulink.sdi.markSignalForStreaming(block,port_index,state)
Simulink.sdi.markSignalForStreaming(port_handle,state)
Simulink.sdi.markSignalForStreaming(line_handle,state)
```

Description

`Simulink.sdi.markSignalForStreaming(block,port_index,state)` turns streaming on or off for a signal by specifying the block, `block`, and port index, `port_index`.

`Simulink.sdi.markSignalForStreaming(port_handle,state)` turns streaming on or off for a signal by specifying the block output port, `port_handle`.

`Simulink.sdi.markSignalForStreaming(line_handle,state)` turns streaming on or off for a signal by specifying the signal line handle, `line_handle`.

Examples

Use Block Path to Mark Signal for Streaming

```
% Open the model
sldemo_absbrake;

% Turn on streaming for the Weight block signal output
% in sldemo_absbrake model
Simulink.sdi.markSignalForStreaming('sldemo_absbrake/Weight',1,'on');
```

Use Port Handle to Mark Signal for Streaming

Open a model, and select a block with a signal output to stream.

```
% Get the selected block port handles
phs = get_param(gcf, 'PortHandles')

% Turn streaming on for the block output
Simulink.sdi.markSignalForStreaming(phs.Outport(1), 'on');
```

Use Line Handle to Turn Signal Streaming Off

Open a model, and select a signal marked for streaming.

```
% Get the signal line handles for the model
slhs = get_param(gcf, 'Lines');

% Turn streaming off for the first signal in the structure
Simulink.sdi.markSignalForStreaming(slhs(1).Handle, 'off');
```

Save, Remove, and Restore Streamed Signals

You can save the set of streamed signals to a file and then restore them to your model at a later time using the `Simulink.HMI.InstrumentedSignals` class.

```
% Save signals that are currently streamed in a model
sigs = get_param(bdroot, 'InstrumentedSignals');
save my_instrumented_signals.mat sigs

% Remove all streamed signals from the model
set_param(bdroot, 'InstrumentedSignals', []);

% Restore streamed signals to the model
load my_instrumented_signals.mat
set_param(bdroot, 'InstrumentedSignals', sigs);
```

- “Iterate Model Design with the Simulation Data Inspector”
- “Inspect and Compare Data Programmatically”

Input Arguments

block — Source block path or handle

character vector | handle

Block path or handle that contains the signal source, specified as a character vector.

Example: 'sf_car/shift_logic'

port_index — Source block output port index

integer

Source block output index of the associated signal, specified as an integer.

Example: 1

state — Streaming state toggle

'on' | 'off'

Turn streaming for a signal on or off, specified as a logical value.

Example: 'on'

port_handle — Output port handle

handle

Source block output port of the associated signal, specified as a handle.

Example: pbs.Outport(1)

line_handle — Signal line handle

handle

Source block signal line, specified as a handle.

Example: sls(1).Handle

Simulink.sdi.report

Generate a Simulation Data Inspector report

Syntax

```
Simulink.sdi.report  
Simulink.sdi.report(Name,Value)
```

Description

`Simulink.sdi.report` creates a report of the default column set and plotted data in the **Inspect** pane in the Simulation Data Inspector.

`Simulink.sdi.report(Name,Value)` uses additional options specified by one or more `Name,Value` pair arguments to generate a report of the specified view and plotted data in the Simulation Data Inspector.

Examples

Create Report from Inspect Pane Plots

```
% Configure model "slexAircraftExample" for logging and simulate  
simOut = sim('slexAircraftExample','SaveOutput','on', ...  
            'SaveFormat','StructureWithTime', ...  
            'ReturnWorkspaceOutputs','on');  
  
% Create a Data Inspector run  
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','base',{'simOut'});  
  
% Select signals for plotting  
for i = 1:length(signalIDs)  
    signal = Simulink.sdi.getSignal(signalIDs(i));  
    signal.checked = true;  
end
```

```
% Create default report, which is the Runs pane view
Simulink.sdi.report;
```

Create Report from Compare Pane Plots

```
% Configure model "slexAircraftExample" for logging and simulate
set_param('slexAircraftExample/Pilot','WaveForm','square');
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime', ...
            'ReturnWorkspaceOutputs','on');

% Create a Simulation Data Inspector run, Simulink.sdi.Run, from
% simOut in the base workspace
runID1 = Simulink.sdi.createRun('First Run','namevalue',{'simOut'},{simOut});

% Simulate again
set_param('slexAircraftExample/Pilot','WaveForm','sawtooth');
simOut = sim('slexAircraftExample','SaveOutput','on', ...
            'SaveFormat','StructureWithTime', ...
            'ReturnWorkspaceOutputs','on');

% Create another Simulation Data Inspector run
runID2 = Simulink.sdi.createRun('Second Run','namevalue',{'simOut'},{simOut});

% Compare two runs
difference = Simulink.sdi.compareRuns(runID1,runID2);

% Specify columns to include in the report
metaDataOfInterest = [Simulink.sdi.SignalMetaData.Result, ...
                     Simulink.sdi.SignalMetaData.BlockPath1, ...
                     Simulink.sdi.SignalMetaData.RelTol];

% Report on the run comparison
Simulink.sdi.report('ReportToCreate','Compare Runs', ...
                  'ColumnsToReport',metaDataOfInterest, ...
                  'SignalsToReport','ReportAllSignals');
```

- “Inspect and Compare Data Programmatically”

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'ColumnsToReport', 'SignalName'`

ReportToCreate — Simulation Data Inspector pane and plots set

`'Inspect Signals'` (default) | `'Compare Runs'`

Simulation Data Inspector pane and plots to include in the report, specified as the comma-separated pair consisting of `'ReportToCreate'` and one of these values:

- `'Inspect Signals'` — Information in the **Inspect** pane.
- `'Compare Runs'` — Information in the **Compare** pane.

Example: `'ReportToCreate', 'Inspect Signals'`

ReportOutputFolder — File output location

`<current working folder>/slprj/sdi` (default) | character vector

Location of the generated report, specified as the comma-separated pair consisting of `'ReportOutputFolder'` and a character vector.

ReportOutputFile — Report file name

`'SDI_report.html'` (default) | character vector

Report file name, specified as the comma-separated pair consisting of `'ReportOutputFile'` and a character vector.

PreventOverwritingFile — Report overwrite prevention

`true` (default) | `false`

Report overwrite prevention, specified as the comma-separated pair consisting of `'PreventOverwritingFile'` and one of the Boolean `true` or `false` values. If the report file exists and the value is `true`, then the report generator increments the file name. If `false`, the report generator overwrites the report file, if it exists.

ColumnsToReport — Metadata column specifier

array

Signal and run metadata column specifier, specified as the comma-separated pair consisting of 'ColumnsToReport' and an array of column enumerations.

Array specifying values from the enumeration class, `Simulink.sdi.SignalMetaData`, which lists all signal metadata available in the Simulation Data Inspector. For example, to include the **Run** and **Synchronization Method** pane columns in a report, create an array `signal_metadata`.

```
signal_metadata = [Simulink.sdi.SignalMetaData.Run, Simulink.sdi.SignalMetaData.SyncMethod];
```

Specify the array as the value in the comma-separated pair.

```
Simulink.sdi.report('ColumnsToReport', signal_metadata);
```

Table columns available for the `Inspect Signals` report:

Column Value	Description
SignalName (default)	Signal name
Line (default)	Signal line style and color
SID	Signal ID
Units	Signal measurement units
SigDataType	Signal data type
SigSampleTime	Method used to sample the signal
Model	Name of the model that generated the signal
BlockName	Name of the source block for the signal
BlockPath	Path to the source block for the signal
Port	Index of the signal on the output port of its block
Dimensions	Dimensions of the matrix containing the signal
Channel	Index of signal within matrix
Run	Name of the simulation run containing the signal

Column Value	Description
AbsTol	User-specified, positive-valued absolute tolerance for the signal
RelTol	User-specified, positive-valued relative tolerance for the signal
OverrideGlobalTol	User-specified property that determines whether signal tolerances take priority over global tolerances
TimeTol	User-specified, positive-valued time tolerance for the signal
InterpMethod	User-specified interpolation method
SyncMethod	User-specified synchronization method used to coordinate signals for comparison
TimeSeriesRoot	Name of the variable associated with the signal for signals imported from the MATLAB workspace
TimeSource	Name of the array containing the time data for signals imported from the MATLAB workspace
DataSource	Name of the array containing the signal data for signals imported from the MATLAB workspace

Table columns available for the Compare Runs report:

Column Value	Description
Result (default)	Pass/fail result of the signal comparison between the Baseline and Compare To runs
Line1	Line style and color for the Baseline signal
Line2	Line style and color for the Compare To signal
AbsTol (default)	User-specified, positive-valued absolute tolerance for the Baseline signal
RelTol (default)	User-specified, positive-valued relative tolerance for the Baseline signal

Column Value	Description
MaxDifference	The maximum difference between the Baseline and Compare To signals
OverrideGlobalTol	User-specified property that specifies whether the Baseline signal tolerances take priority over global tolerances
TimeTol	User-specified, positive-valued time tolerance for the Baseline signal
SignalName1	Signal name from the Baseline run
SignalName2	Signal name from the Compare To run
Units1	Measurement units for the signal in the Baseline run
Units2	Measurement units for the signal in the Compare To run
SigDataType1	The data type for the signal in the Baseline run
SigDataType2	The data type for the signal in the Compare To run
SigSampleTime1	Method used to sample the signal in the Baseline run
SigSampleTime2	Method used to sample the signal in the Compare To run
Run1	Name of the Baseline run
Run2	Name of the Compare To run
AlignedBy (default)	Signal alignment method used to correlate Baseline and Compare To signals
Model1	Name of the model that generated the Baseline signals
Model2	Name of the model that generated the Compare To signals
BlockName1	Name of the source block for the Baseline signal

Column Value	Description
BlockName2	Name of the source block for the Compare To signal
BlockPath1	Path to the source block for the Baseline signal
BlockPath2	Path to the source block for the Compare To signal
Port1	Index of the Baseline signal on the output port of its block
Port2	Index of the Compare To signal on the output port of its block
Dimensions1	Dimensions of the matrix containing the Baseline signal
Dimensions2	Dimensions of the matrix containing the Compare To signal
Channel1	Index of the Baseline within its matrix
Channel2	Index of the Compare To within its matrix
InterpMethod	User-specified interpolation method for the Baseline signal
SyncMethod	User-specified synchronization method for the Baseline signal
TimeSeriesRoot1	Name of the variable associated with the Baseline signal for signals imported from the MATLAB workspace
TimeSeriesRoot2	Name of the variable associated with the Compare To signal for signals imported from the MATLAB workspace
TimeSource1	Name of the array containing the Baseline time data for signals imported from the MATLAB workspace
TimeSource2	Name of the array containing the Compare To time data for signals imported from the MATLAB workspace

Column Value	Description
DataSource1	Name of the array containing the Baseline signal data for signals imported from the MATLAB workspace
DataSource2	Name of the array containing the Compare To signal data for signals imported from the MATLAB workspace
LinkToPlot (default)	Link to a plot of each comparison result

ShortenBlockPath — Block path name length

true (default) | false

Block path name length, specified as the comma-separated pair consisting of 'ShortenBlockPath' and one of the Boolean true or false values. If the value is true and the block path name is too long, the Simulation Data Inspector shortens the name in the report. If the value is false, then the report displays the entire block path name.

LaunchReport — Launch report after creation

true (default) | false

Launch report after creation, specified as the comma-separated pair consisting of 'LaunchReport' and one of the Boolean true or false values. If the value is true after creation, the generated report opens.

SignalsToReport — Comparison signals set

'ReportOnlyMismatchedSignals' (default) | 'ReportAllSignals'

For the **Compare** pane report only. Comparison signals set, specified as the comma-separated pair consisting of 'SignalsToReport' and one of these values:

- 'ReportOnlyMismatchedSignals' — Include only the mismatched signals from the comparison between the **Baseline** and **Compare To** runs.
- 'ReportAllSignals' — Include all signals from the comparison between the **Baseline** and **Compare To** runs.

Alternatives

In the Simulation Data Inspector, click **Create Report**. For more information, see “Create a Simulation Data Inspector Report”.

`Simulink.sdi.compareRuns` | `Simulink.sdi.createRun`

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2011b

Simulink.sdi.resetRunNamingRule

Reset the Simulation Data Inspector run naming rule to the default

Syntax

```
Simulink.sdi.resetRunNamingRule
```

Description

`Simulink.sdi.resetRunNamingRule` resets the run naming rule to the default rule tokens for Simulation Data Inspector runs.

Examples

Reset the Run Naming Rule to Default

```
% Load the model
sldemo_absbrake;

% Change the run naming rule
Simulink.sdi.setRunNamingRule('My special simulation');

% Record logged signals and send them to the Simulation Data Inspector
set_param('sldemo_absbrake', 'InspectSignalLogs', 1);

% Run the simulation
set_param('sldemo_absbrake', 'SimulationCommand', 'Start');

% Reset the naming rule
Simulink.sdi.resetRunNamingRule;

% Run the simulation again
set_param('sldemo_absbrake', 'SimulationCommand', 'Start');
```

```
% Open the Simulation Data Inspector  
Simulink.sdi.view;
```

The first run in the **Inspect** pane of the Simulation Data Inspector uses the run naming rule `My special simulation`, and the second run uses the default run naming rule `Run <run_index>: <model_name>`, which appears as `Run 2: sldemo_absbrake`.

See Also

`Simulink.sdi.getRunNamingRule` | `Simulink.sdi.setRunNamingRule`

Introduced in R2015a

Simulink.sdi.save

Save current Simulation Data Inspector session

Syntax

```
Simulink.sdi.save(fileName)
```

Description

`Simulink.sdi.save(fileName)` saves all runs, signals, tolerances, and signal selections to a MAT-file `fileName`.

Examples

Save Simulation Data Inspector Runs

Save the Simulation Data Inspector simulation runs and specified tolerances to a MAT-file.

```
% Configure model "sldemo_fuelsys" for logging and simulate
simOut = sim('sldemo_fuelsys', 'SaveOutput','on', ...
            'SaveFormat', 'StructureWithTime', ...
            'ReturnWorkspaceOutputs', 'on');
% Create a run in the Simulation Data Inspector
runID = Simulink.sdi.createRun('My Run','base',{ 'simOut'});

% Save the current Simulation Data Inspector session
Simulink.sdi.save('my_runs.mat');
```

You can also load the information back in to the Simulation Data Inspector using the `Simulink.sdi.load` function.

- “Inspect and Compare Data Programmatically”

Input Arguments

fileName — Session file name

character vector

A character vector specifying the target file to save.

Alternatives

In the Simulation Data Inspector, click **Save** on the **Visualize** tab. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

Simulink.sdi.setMarkersOn

Package: Simulink.sdi

Control whether markers are shown

Syntax

```
Simulink.sdi.setMarkersOn(value)
```

Description

`Simulink.sdi.setMarkersOn(value)` sets the `show markers` parameter in the Simulation Data Inspector according to `value`.

Examples

Display Markers in the Simulation Data Inspector

```
Simulink.sdi.setMarkersOn(true);
```

Input Arguments

value — Logical input

'true' | 'false'

Logical indication of whether markers are shown on plots in the Simulation Data Inspector.

- `True` shows markers on plots in the Simulation Data Inspector.
- `False` does not show markers on plots in the Simulation Data Inspector.

Data Types: `logical`

Simulink.sdi.setRunNamingRule

Specify a run naming rule

Syntax

```
Simulink.sdi.setRunNamingRule(rule)
```

Description

`Simulink.sdi.setRunNamingRule(rule)` specifies a template for naming a run in the Simulation Data Inspector.

Examples

Specify Run Naming Rule

```
Simulink.sdi.setRunNamingRule(...  
    'Run <run_index> : <model_name> : <sim_mode>');
```

After recording a run, in the Signal Browser table of the Simulation Data Inspector, the run appears with a name similar to the following:

```
Run 1 : slexAircraftExample : normal
```

- “Inspect and Compare Data Programmatically”
- “Organize Your Simulation Data Inspector Workspace”

Input Arguments

rule — Run naming rule

```
<run_index> | <model_name> | <time_stamp> | <sim_mode>
```

A character vector using predefined tokens and regular characters to create a template for run names. The available tokens are

- `<run_index>` — Sequential number of each run
- `<model_name>` — Name of model
- `<time_stamp>` — Run creation time
- `<sim_mode>` — Simulation mode for recorded run

The tokens are contained within a character vector. For example:

```
Simulink.sdi.setRunNamingRule('Run <run_index> : <model_name>');
```

Alternatives

You can modify run naming rule using the Simulation Data Inspector UI. The run properties are located on the **New Run** tab of the Simulation Data Inspector preferences menu. For more information, see “Organize Your Simulation Data Inspector Workspace”.

Introduced in R2011b

Simulink.sdi.setRunOverwrite

Enable overwrite run mode for a Simulation Data Inspector run

Syntax

```
Simulink.sdi.setRunOverwrite(runID, overwrite)
```

Description

`Simulink.sdi.setRunOverwrite(runID, overwrite)` enables overwrite run mode for the run identified by `runID` in the Simulation Data Inspector.

Examples

Mark Run for Overwriting

This example shows how to enable overwrite run mode for a run in the Simulation Data Inspector.

Open the `sldemo_fuelsys` model.

On the Simulink Editor toolbar, click the **Simulation Data Inspector** button arrow and select **Send Logged Workspace Data to Data Inspector**.

Simulate the model.

Open the Simulation Data Inspector.

At the MATLAB Command Window, create a `runID` variable that uses the value of the **Run ID** for a run. You can find the **Run ID** for a run using the function `Simulink.sdi.getRunIDByIndex`.

```
runID = 1;
```

Set the overwrite condition to `true`.

```
Simulink.sdi.setRunOverwrite(runID,true);
```

In the Simulation Data Inspector, you can see the run is now marked to overwrite during the next simulation.

Simulate `sldemo_fuelsys`.

In the Simulation Data Inspector, the new simulation data replaces the previous run.

- “Inspect and Compare Data Programmatically”
- “Iterate Model Design with the Simulation Data Inspector”
- “Organize Your Simulation Data Inspector Workspace”

Input Arguments

runID — Unique run identifier

integer

Run ID, a unique number identifying a run in the Simulation Data Inspector, specified as an integer.

overwrite — Overwrite run setting

`true` | `false`

Overwrite run setting, specified as `true` or `false`. When set to `true`, the subsequent simulations overwrite the run identified by the `runID`.

Example: `Simulink.sdi.setRunOverwrite(1, true);`

Alternatives

You can set and disable run overwrite mode from the right-click context menu for the run in the Simulation Data Inspector UI. For more information see “Iterate Model Design with the Simulation Data Inspector”.

Introduced in R2011b

Simulink.sdi.setSubPlotLayout

Package: Simulink.sdi

Set subplot layout in the Simulation Data Inspector

Syntax

```
Simulink.sdi.setSubPlotLayout(r,c)
```

Description

`Simulink.sdi.setSubPlotLayout(r,c)` sets the grid layout of plots in the Simulation Data Inspector using the specified number of rows, `r`, and columns, `c`.

Examples

Change Subplot Layout

```
% Change subplot layout to 4 rows and 2 columns  
Simulink.sdi.setSubPlotLayout(4,2);
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
```

```

cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view

```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

- “Inspect and Compare Data Programmatically”
- “Create Plots Using the Simulation Data Inspector”

Input Arguments

r — Number of rows

integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

c — Number of columns

integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

Simulink.sdi.setTableGrouping

Package: Simulink.sdi

Change signal grouping hierarchy in Inspect pane

Syntax

```
Simulink.sdi.setTableGrouping
Simulink.sdi.setTableGrouping('group1')
Simulink.sdi.setTableGrouping('group1', 'group2')
Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')
```

Description

`Simulink.sdi.setTableGrouping` groups signals in the **Inspect** pane of the Simulation Data Inspector as a flat list.

`Simulink.sdi.setTableGrouping('group1')` groups signals in the **Inspect** pane by the parameter specified by `group1`.

`Simulink.sdi.setTableGrouping('group1', 'group2')` groups signals in the **Inspect** pane first by the parameter specified by `group1` and then by the parameter specified by `group2`.

`Simulink.sdi.setTableGrouping('group1', 'group2', 'group3')` groups signals in the **Inspect** pane first by the parameter specified by `group1`, then by the parameter specified by `group2`, and finally by the parameter specified by `group3`. If you have a Simscape license, you have three options for table grouping.

Examples

Group Data by Model and Then Data Hierarchy

You can group your data in the navigation pane to visualize subsystem and data hierarchy relationships among signals clearly.

```
Simulink.sdi.setTableGrouping('Subsystems','DataHierarchy');
```

- “Inspect and Compare Data Programmatically”
- “Organize Your Simulation Data Inspector Workspace”

Input Arguments

'group1' — Signal grouping parameter

character vector

Parameter used to group signals in the **Inspect** pane of the Simulation Data Inspector. You can specify two grouping parameters, or three if you have a Simscape license.

- `DataHierarchy` groups signals according to any data hierarchy in the model, for example grouping signals in a bus together.
- `SubSystems` groups signals according to the model's subsystem hierarchy.
- `PhysmodHierarchy` groups signals according to the Simscape block structure. This parameter is only available with a Simscape license.

Example: 'SubSystems'

Example: 'DataHierarchy'

Data Types: char

Topics

“Inspect and Compare Data Programmatically”

“Organize Your Simulation Data Inspector Workspace”

Introduced in R2016a

Simulink.sdi.view

Package: Simulink.sdi

Open the Simulation Data Inspector

Syntax

```
Simulink.sdi.view
```

Description

`Simulink.sdi.view` opens the Simulation Data Inspector. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use `Simulink.sdi.view` to see the results.

Examples

Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

```
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

- “Inspect and Compare Data Programmatically”
- “Populate the Simulation Data Inspector with Your Data”

Alternatives

You can open the Simulation Data Inspector from the Simulink Editor toolbar with the

Simulation Data Inspector button .

Introduced in R2011b

Simulink.SimulationData.createStructOfTimeseries

Create a structure with MATLAB timeseries object leaf nodes

Syntax

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (
tsArrayObject)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (
busObj, structOfTimeseries)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (
busObj, cellofTimeseries)
```

```
struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (
busObj, cellofTimeseries, dims)
```

Description

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (tsArrayObject)` creates a structure of MATLAB timeseries objects from a Simulink.TsArray object. Use this syntax for signal logging data for a model simulated in a release earlier than R2016a that used ModelDataLogs signal logging format.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (busObj, structOfTimeseries)` creates a structure that matches the attributes of the bus object busObj and sets the values of structure leaf nodes using a structure of MATLAB timeseries objects structOfTimeseries. Use this syntax when using a partial structure as the basis for creating a full structure to load into a model.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries (busObj, cellofTimeseries)` creates a structure that matches the attributes of the bus object busObj and sets the values of structure leaf nodes using a cell array of MATLAB timeseries objects cellofTimeseries.

`struct_of_ts = Simulink.SimulationData.createStructOfTimeseries(busObj, cellOfTimeseries, dims)` creates a structure with the dimensions `dims`. Use this syntax to create a structure to load into an array of buses.

Examples

Structure Based on `Simulink.TsArray`

Suppose you had signal logging data from simulating a model in a release earlier than R2016a, using the `ModelDataLogs` format. The logged output is `logout`.

View the logged data.

```
logout
```

```
logout =
```

```
Simulink.ModelDataLogs (log_modeldatalogs):
  Name           Elements  Simulink Class
  bus1           2        TsArray
```

Convert the logged data to a structure of MATLAB timeseries objects.

```
struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logout.bus1)

struct_of_ts =
```

```

const1_sig: [1x1 timeseries]
const2_sig: [1x1 timeseries]

```

Structure Based on Bus Object and a Partial Structure of Timeseries Data

Create a structure of MATLAB `timeseries` objects based on a `Simulink.Bus` object and a partial structure of MATLAB `timeseries` objects. Use this structure to load into another model. Open a model and simulate it, producing signal logging data.

Open a model and simulate it, producing signal logging data.

```

open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_log_structTimeSeries')))
sim('ex_log_structTimeSeries')

```

View the logged signal data.

```
ex_log_structTimeSeries_logargout
```

```
Simulink.SimulationData.Dataset 'ex_log_structTimeSeries_logargout' with 2 elements
```

	Name	BlockPath
1	[1x1 Signal]	bus1 ex_log_structTimeSeries/Bus Creator
2	[1x1 Signal]	bus2 ex_log_structTimeSeries/Bus Creator1

- Use braces { } to access, modify, or add elements using index.

Open the model to load the logged signal data into.

```
open_system(docpath(fullfile(docroot,'toolbox','simulink',...
'examples','ex_load_structTimeSeries_Bus')))
```

The `ex_load_structTimeSeries_Bus` model **Configuration Parameters > Data Import/Export > Input** parameter lists the `ex_load_structTimeSeries_inputBus` variable. However, you have not yet defined that variable in the MATLAB workspace. Use `Simulink.SimulationData.createStructOfTimeseries` to define that variable.

```
ex_load_structTimeSeries_inputBus = ...
Simulink.SimulationData.createStructOfTimeseries...
('bus', ex_log_structTimeSeries_logout.get(2).Values)

ex_load_structTimeSeries_inputBus =

    a: [1x1 timeseries]
    b: [1x1 timeseries]
```

Structure to Use with an Array of Buses

Create a structure of MATLAB `timeseries` objects to load into an array of buses. Specify the dimensions of the created structure and a cell array of MATLAB `timeseries` objects.

Open a model and simulate it, producing signal logging data.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
    'examples', 'ex_log_structTimeSeries')))
sim('ex_log_structTimeSeries')
```

The simulated `ex_log_structTimeSeries` model looks like this:

View the logged signal data.

```
ex_log_structTimeSeries_logargout
```

```
Simulink.SimulationData.Dataset 'ex_log_structTimeSeries_logargout' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	bus1	ex_log_structTimeSeries/Bus Creator
2	[1x1 Signal]	bus2	ex_log_structTimeSeries/Bus Creator1

- Use braces { } to access, modify, or add elements using index.

Open the model to load the logged signal data into.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
    'examples', 'ex_load_structTimeSeries_AoB')))
```

The `ex_load_structTimeSeries_AoB` model's **Configuration Parameters > Data Import/Export > Input** parameter lists the `ex_load_structTimeSeries_inputAoB` variable. However, you have not yet defined that variable in the MATLAB workspace. Use `Simulink.SimulationData.createStructOfTimeseries` to define that variable.

```
ex_load_structTimeSeries_inputAoB = ...
Simulink.SimulationData.createStructOfTimeseries...
('bus',{ex_log_structTimeSeries_logargout.get(1).Values.a,...
ex_log_structTimeSeries_logargout.get(1).Values.b,...
ex_log_structTimeSeries_logargout.get(2).Values.c,...
ex_log_structTimeSeries_logargout.get(2).Values.d},[2, 1])

ex_load_structTimeSeries_inputAoB =

2x1 struct array with fields:
    a
    b
```

Input Arguments

tsArrayObject — `Simulink.TsArray` object to convert

`Simulink.TsArray` object

`Simulink.TsArray` object to convert to a structure of MATLAB timeseries objects

In releases earlier than R2016a, when you log signals using the `ModelDataLogs` format, the logged data is a collection of `Simulink.TsArray` objects.

busObj — Bus object for creating a structure of MATLAB timeseries objects`Simulink.Bus` object

Bus object for creating a structure of MATLAB timeseries objects, specified as the name of a `Simulink.Bus` object.

Data Types: `char`

structOfTimeseries — Structure object for values to override ground values, specified as a structure of MATLAB timeseries objects.`structure of MATLAB timeseries objects`

Structure object for values to override ground values, specified as a structure of MATLAB timeseries objects. The structure must have the same hierarchy as the bus object. However, the names of the fields in the structure do not have to match the names of the corresponding bus object nodes.

Data Types: `struct`

cellOfTimeseries — Cell array objects for values to override ground values, specified as a cell array of MATLAB timeseries objects.`cell array of MATLAB timeseries objects`

Cell array object for values to override ground values, specified as a cell array of MATLAB timeseries objects. If you specify a cell array of MATLAB timeseries objects and you specify a `dims` argument, then the length of the cell array must be equal to the result of `Simulink.BusObject.getNumLeafBusElements` times the product of the specified dimensions.

Data Types: `cell`

dims — Dimensions of the structure that this function creates.`vector`

Dimensions of the structure that this function creates, specified as a vector. The length of the cell array is equal to the result of `Simulink.BusObject.getNumLeafBusElements` times the product of the specified dimensions.

If you specify a dimension in the form `[n]`, then Simulink interprets the dimension to be `1xn`.

Data Types: `double`

Output Arguments

struct_of_ts — Structure of MATLAB timeseries objects.

MATLAB structure

MATLAB timeseries objects, returned as a structure. The structure has the same hierarchy and attributes as the `Simulink.TsArray` object or `Simulink.Bus` object that you specify.

The dimensions of `structOfTimeseries` depend on the input arguments:

- If you specify `tsArrayObject`, then the dimension is 1.
- If you specify the `busObj` and a structure of MATLAB timeseries, then the dimension matches the dimensions of the specified structure.
- If you specify only the `busObj` and a cell array of MATLAB timeseries, then the dimension is 1.
- If you specify the `busObj` argument, a cell array of MATLAB timeseries, and the `dims` argument, then the dimensions match the dimensions of `dims`.

Introduced in R2013a

getAsDatastore

Class: Simulink.SimulationData.DatasetRef

Package: Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

Syntax

```
element =  
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)
```

Description

```
element =  
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)
```

returns a matlab.io.datastore.SimulationDatastore representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a Dataset element as a matlab.io.datastore.SimulationDatastore object if the element was placed into the MAT-file using either of these approaches:

- Log Dataset format data to persistent storage (MAT-file).
- Place the element into a Simulink.SimulationData.Dataset object and saved the Dataset object to a v7.3 MAT-file.

The SimulationDatastore representation for a Dataset element creates a SimulationDatastore object for the Values field of that element. The SimulationDatastore representation supports streaming of the data for the Values property of the element into other simulations or into MATLAB.

Note You cannot use create a `SimulationDatastore` for Dataset elements that contain these types of data:

- Array
-

You can use `SimulationDatastore` objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

Input Arguments

datasetref_element — Element of referenced dataset in MAT-file
index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector).

Output Arguments

element — Element accessed using `SimulationDatastore` object

`matlab.io.datastore.SimulationDatastore` object |
`Simulink.SimulationData.Signal`, `Simulink.SimulationData.State` or similar object, whose `Values` data uses a `matlab.io.datastore.SimulationDatastore` object

Element accessed using `SimulationDatastore` object, returned as either a `matlab.io.datastore.SimulationDatastore` object or a `Simulink.Signal`, `Simulink.State`, or similar object, whose `Values` data uses a `matlab.io.datastore.SimulationDatastore` object.

Examples

Use a SimulationDatastore to Reference a Signal's Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a DatasetRef for the signal logging Dataset data (logout) in the out.mat MAT-file.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
firstSig = sigLogRef.getAsDatastore(1)
```

```
firstSig =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData
```

```
Properties:
```

```
    Name: 'x1'
  PropagatedName: ''
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]
    PortType: 'outport'
    PortIndex: 1
    Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

Load the data into another model. This approach streams the values of the signal x1 for another simulation.

```
ds = Simulink.SimulationData.Dataset;
ds{1} = sigLogRef{1};
sim('other_model', 'ExternalInput', 'ds');
```

- “Load Big Data for Simulations”

Alternative

To streamline the use of indexing, you can use curly braces ({}) syntax to obtain a SimulationDatastore object for DatasetRef object signal values. The requirements and results are the same as using getAsDatastore. For example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
firstSig = sigLogRef{1}
```

```
ans =  
  
Simulink.SimulationData.Signal  
Package: Simulink.SimulationData  
  
Properties:  
    Name: 'x1'  
    PropagatedName: ''  
    BlockPath: [1x1 Simulink.SimulationData.BlockPath]  
    PortType: 'outport'  
    PortIndex: 1  
    Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

See Also

Topics

“Load Big Data for Simulations”

Introduced in R2017a

Simulink.SimulationData.DatasetRef.getDatasetVariableNames

List names of Dataset variables in MAT-file

Syntax

```
varNames =  
Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)
```

Description

```
varNames =  
Simulink.SimulationData.DatasetRef.getDatasetVariableNames(matFile)
```

lists the names of variables for Dataset data in a MAT-file.

Examples

List Variable Names in MAT-File

Suppose that you simulate a model using the default variable names for signal logging data and states data. You enable the **Configuration Parameters > Data Import/Export > Log Dataset data to file** and use the default MAT-file name of `out.mat`.

List the variable names in the MAT-file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
```

```
varNames =  
  
    'xout'    'logout'
```

- “Log Data to Persistent Storage”

- “Load Big Data for Simulations”

Tips

To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who`, or `whos` functions.

Input Arguments

matFile — MAT-file that contains `Dataset` variables
character vector

MAT-file that contains `Dataset` variables, specified as a character vector. The character vector specifies the path to the MAT-file.

Output Arguments

varNames — Names of `Dataset` variables in MAT-file
cell array

Names of `Dataset` variables in MAT-file, returned as a cell array.

Simulink.SimulationData.forEachTimeseries

Call function on each `timeseries` object

Syntax

```
dataResults = Simulink.SimulationData.forEachTimeseries(  
functionHandle,inputData)
```

Description

`dataResults = Simulink.SimulationData.forEachTimeseries(functionHandle,inputData)` runs the specified function handle on all MATLAB `timeseries` objects contained in `inputData`.

Examples

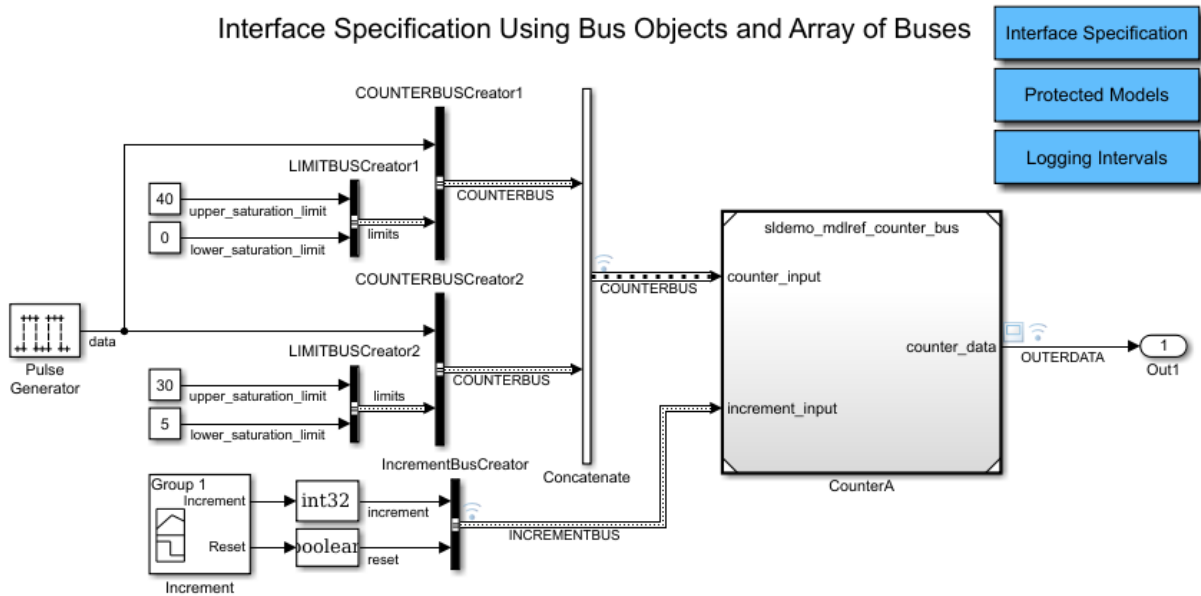

Find Minimum for Logged Bus Signal Data

This example shows how to use the `forEachTimeseries` function to run the `min` function on each `timeseries` object in the logged data for the `COUNTERBUS` signal.

Open the model and simulate it.

```
open_system('sldemo_mdref_bus')  
sim('sldemo_mdref_bus');
```

Interface Specification Using Bus Objects and Array of Buses

- Interface Specification
- Protected Models
- Logging Intervals

Access the signal logging data. For this model, that data is stored in the topOut variable.

topOut

Simulink.SimulationData.Dataset 'topOut' with 4 elements

	Name	BlockPath
1 [1x1 Signal]	COUNTERBUS	sldemo_mdref_bus/Concatenate
2 [1x1 Signal]	OUTERDATA	sldemo_mdref_bus/CounterA
3 [1x1 Signal]	INCREMENTBUS	sldemo_mdref_bus/IncrementBusCreator
4 [1x1 Signal]	INNERDATA	...erA\sldemo_mdref_counter_bus/COUNTER

- Use braces { } to access, modify, or add elements using index.

Find the values for the COUNTERBUS element.

```
counterbusData = topOut{1}.Values
```

```
counterbusData =
```

```
2x1 struct array with fields:
```

```
    data  
    limits
```

Run the `min` function on the counterbus data.

```
ret = Simulink.SimulationData.forEachTimeseries(@min,counterbusData)
```

```
ret =
```

```
2x1 struct array with fields:
```

```
    data  
    limits
```

Explore the returned data.

```
ret(1)
```

```
ans =
```

```
    data: 0  
    limits: [1x1 struct]
```

```
ret(2).limits
```

```
ans =
```

```
    upper_saturation_limit: 40  
    lower_saturation_limit: 0
```

Input Arguments

functionHandle — Function to run on MATLAB timeseries objects

function handle

Function to run on `timeseries` objects, specified as a function handle. For information about specifying function handles, see “Pass Function to Another Function” (MATLAB).

The function that you use with `forEachTimeseries`:

- Can be either a built-in function or a user-specified function

- Must return a scalar

If the function that you use with `forEachTimeseries` takes:

- One argument, specify the function handle and the input data. For example:

```
ret = Simulink.SimulationData.forEachTimeseries(@min,data);
```

- More than one argument, specify the function handle as `@(x)` and then specify the function, using `x` as the first argument. For remaining arguments, specify values. For example, this command runs the `resample` function on MATLAB timeseries objects in `data`, for the time vector `[2.5 3]`.

```
ret = Simulink.SimulationData.forEachTimeseries(@(x) ...  
    (resample(x,[2.5 3]),data);
```

inputData — Data to run specified function on

MATLAB `timeseries` object | array of `timeseries` | structure with `timeseries` at leaf nodes | array of structures with `timeseries` at leaf nodes

Data to run specified function on, specified as `timeseries` data.

Output Arguments

dataResults — Data resulting from running specified function

MATLAB `timeseries` object | array of `timeseries` | structure with `timeseries` at leaf nodes | array of structures with `timeseries` at leaf nodes

Data resulting from running specified function, returned using the format and hierarchy of the input data.

MATLAB `timeseries` “Function Handles”

Introduced in R2016b

Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

Syntax

```
Simulink.SimulationData.signalLoggingSelector(modelName)
```

Description

`Simulink.SimulationData.signalLoggingSelector(modelName)` opens the Signal Logging Selector dialog box for the model that you specify with `modelName`.

Input Arguments

modelName

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

Example

Open the Signal Logging Selector dialog box for the `sldemo_mdrefref_bus.mdl`.

```
Simulink.SimulationData.signalLoggingSelector('sldemo_mdrefref_bus')
```

setName

Class: Simulink.SimulationData.Unit

Package: Simulink.SimulationData

Specify name of logging data units

Syntax

```
unitObject = setName(unitObj,unitName)
```

Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

Input Arguments

unitObj — Logging data unit object to name

`Simulink.SimulationData.Unit` object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

unitName — Name of logging data unit

character vector

Name of logging data unit, specified as a character vector.

Output Arguments

name — Name of logging data units

character vector

Name of logging data units, returned as a character vector.

Examples

Name a Logging Data Unit Object

```
inchesUnit = Simulink.SimulationData.Unit('in');  
inchesUnit = setName(inchesUnit, 'inches')
```

```
inchesUnit =
```

```

Introduced in R2011a

Simulink.SimulationData.updateDatasetFormatLogging

Convert model and its referenced models to use `Dataset` format for signal logging

Syntax

```
Simulink.SimulationData.updateDatasetFormatLogging(top_model)
Simulink.SimulationData.updateDatasetFormatLogging(top_model,
variants)
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format. You do not need to use this command to update the signal logging format for a model that uses model referencing. Opening the model in R2016a or later uses `Dataset` format for all signal logging.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model)` converts the top-level model and all of its referenced models to use the `Dataset` format for signal logging instead of the `ModelDataLogs` format. You can convert signal logging data from

ModelDataLogs to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If a Model block has the **Generate preprocessor conditionals** option selected, the function converts all the variants; otherwise, the function converts only the active variant.

`Simulink.SimulationData.updateDatasetFormatLogging(top_model, variants)` specifies which variant models to convert to use the Dataset signal logging format. For details about the `variants` argument, see “Input Arguments” on page 2-814

Input Arguments

`top_model`

Character vector that specifies the name of the top-level model.

`variants`

Character vector that specifies which variant models to update:

- 'ActivePlusCodeVariants' — (Default) Search all variants if any generate preprocessor conditionals. Otherwise, search only the active variant.
- 'ActiveVariants' — Convert only the active variant.
- 'AllVariants' — Convert all variants.

Definitions

Dataset

The *Dataset* format causes Simulink to use a `Simulink.SimulationData.Dataset` object to store the logged signal data. The Dataset format use MATLAB timeseries objects to formatting the data.

ModelDataLogs

The *ModelDataLogs* format causes Simulink to use a `Simulink.ModelDataLogs` object to store the logged signal data. `Simulink.Timeseries` and `Simulink.TsArray` objects provide the format for the data.

Tips

- The conversion function sets the `SignalLoggingSaveFormat` parameter value to `Dataset` for all the updated models.
- If you want to save the format updates that the conversion function makes, then ensure that the top-level model, referenced models, and variant models are accessible and writable.
- If a model has no other unsaved changes, the conversion function saves the format updates to the model. If the model has unsaved changes, the function updates the format, but does not save those changes.
- If you use this function for a model that does not include any referenced models, the function converts the top-level model use the `Dataset` format.

Topics

“Migrate Scripts That Use Legacy ModelDataLogs API”

Introduced in R2011a

find

Class: Simulink.SimulationOutput

Package: Simulink

Access and display values of simulation results

Syntax

```
output = simOut.find('VarName')
```

Description

`output = simOut.find('VarName')` accepts one variable name. Specify *VarName* inside single quotes.

Input Arguments

VarName

Name of logged variable for which you seek values.

Default:

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable `youtNew` in `yout`.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  
            'SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
yout = simOut.find('youtNew')
```

Alternatives

A simpler alternative to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

```
simOut.xoutNew
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.get`.

See Also

`Simulink.SimulationOutput.get` | `Simulink.SimulationOutput.who`

get

Class: Simulink.SimulationOutput

Package: Simulink

Access and display values of simulation results

Syntax

```
output = simOut.get('VarName')
```

Description

`output = simOut.get('VarName')` accepts one variable name. Specify *VarName* inside single quotes.

Tip A simpler alternative to using the `get` function is to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Input Arguments

VarName

Name of logged variable for which you seek values.

Default:

Output Arguments

Value

Value of the logged variable name specified in input.

Examples

Simulate `vdp` and store the values of the variable `youtNew` in `yout`.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...
            'SaveState','on','StateSaveName','xoutNew',...
            'SaveOutput','on','OutputSaveName','youtNew');
yout = simOut.get('youtNew')
```

Alternatives

A simpler alternative to use dot notation. For example, to access data for the `xout` output variable, you can use this command:

```
simOut.xout
```

Another alternative is to use `Simulink.SimulationOutput.who` and then `Simulink.SimulationOutput.find`.

See Also

`Simulink.SimulationOutput.find` | `Simulink.SimulationOutput.who`

getSimulationMetadata

Class: Simulink.SimulationOutput

Package: Simulink

Return `SimulationMetadata` object for simulation

Syntax

```
mData = simout.getSimulationMetadata()
```

Description

`mData = simout.getSimulationMetadata()` retrieves metadata information in a `SimulationMetadata` object from the `simout` `SimulationOutput` object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

Output Arguments

mData — `SimulationMetadata` object stored in the `simout` `SimulationOutput` object
object

`SimulationMetadata` object stored in the `simout` `SimulationOutput` object, returned as an object.

Examples

Retrieve Metadata From vdp Simulation

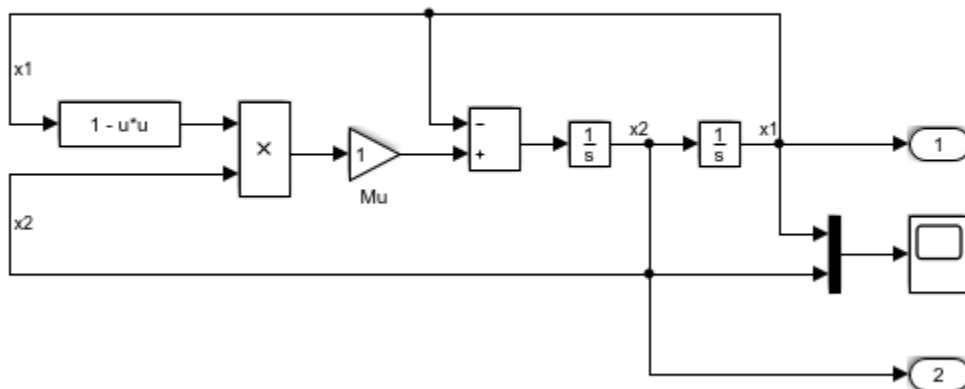

Simulate the vdp model and retrieve metadata information from the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout

```
open_system('vdp')
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

van der Pol Equation

Copyright 2004-2013 The MathWorks, Inc.

Retrieve metadata information about this simulation using `mData`.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

```
SimulationMetadata with properties:
```

```
    ModelInfo: [1x1 struct]  
    TimingInfo: [1x1 struct]  
    ExecutionInfo: [1x1 struct]  
    UserString: ''
```

```
UserData: []
```

Alternatives

A simpler alternative to use dot notation with the `SimulationMetadata` property. For example:

```
simOut.SimulationMetadata.ModelInfo
```

Another alternative is to display simulation metadata in the Variable Editor using one of these approaches:

- Select the **Show Simulation Metadata** check box (which displays the data in a tree structure).
- Double-click the **SimulationMetadata** row.
- View the `SimulationMetadata` object.

See Also

`Simulink.SimulationMetadata` | `Simulink.SimulationOutput.setUserData` | `Simulink.SimulationOutput.setUserString`

setUserData

Class: Simulink.SimulationOutput

Package: Simulink

Store custom data in `SimulationMetadata` object that `SimulationOutput` object contains

Syntax

```
simoutNew = simout.setUserData (CustomData)
```

Description

`simoutNew = simout.setUserData (CustomData)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomData` in its `SimulationMetadata` object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

CustomData — Data to store in a metadata object
data

Any custom data you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom data
object

A copy of the `simout` `SimulationOutput` object that contains `CustomData` in its `SimulationMetadata` object, returned as an object.

Examples

Store Data in SimulationMetadata Object of vdp Simulation

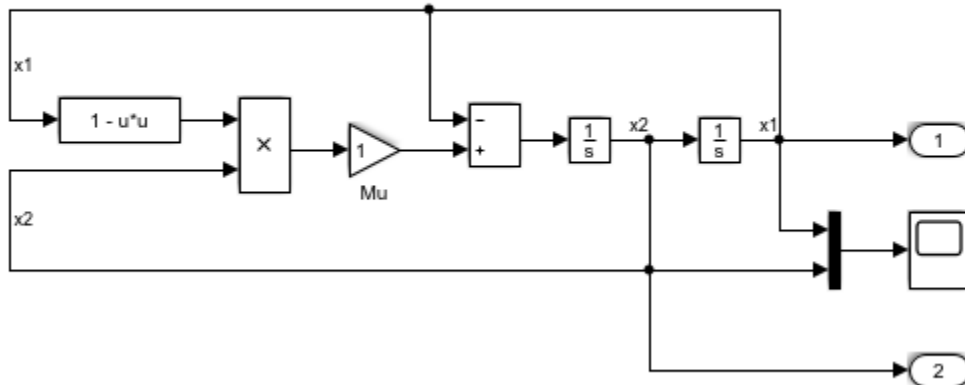

Simulate the `vdp` model. Store custom data in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

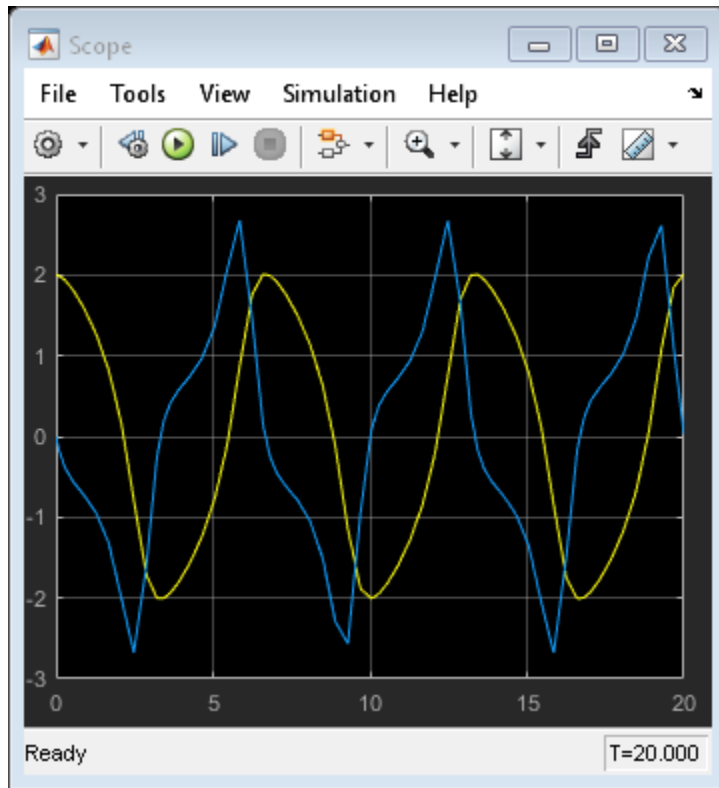

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation

Copyright 2004-2013 The MathWorks, Inc.

Store custom data about the simulation in the `SimulationMetadata` object that `simout` contains.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'))
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();  
disp(mData.UserData)  
  
    param1: 'value1'  
    param2: 'value2'
```

```
param3: 'value3'
```

[Simulink.SimulationOutput.setUserString](#)

setUserString

Class: Simulink.SimulationOutput

Package: Simulink

Store custom character vector in `SimulationMetadata` object that `SimulationOutput` object contains

Syntax

```
simoutNew = simout.setUserString(CustomString)
```

Description

`simoutNew = simout.setUserString(CustomString)` assigns a copy of the `simout` `SimulationOutput` object to `simoutNew`. The copy contains `CustomString` in its `SimulationMetadata` object.

Input Arguments

simout — Simulation object to get metadata from
object

Simulation object to get metadata from, specified as a `SimulationOutput` object.

CustomString — Character vector to store in a metadata object
character vector

Any custom character vector you want to store in the metadata object.

Output Arguments

simoutNew — Simulation object that stores metadata object with custom character vector
object

A copy of the `simout` `SimulationOutput` object that contains `CustomString` in its `SimulationMetadata` object, returned as an object.

Examples

Store a Character Vector in SimulationMetadata Object of vdp Simulation

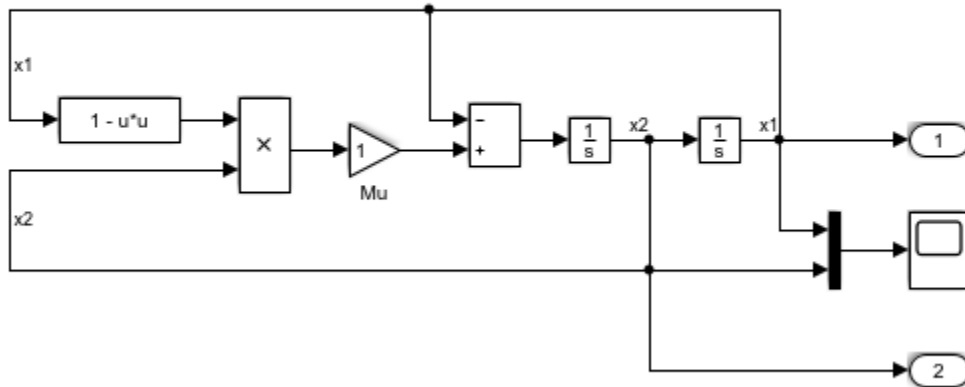

Simulate the `vdp` model. Store a custom character vector in the `SimulationMetadata` object that the `SimulationOutput` object contains.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

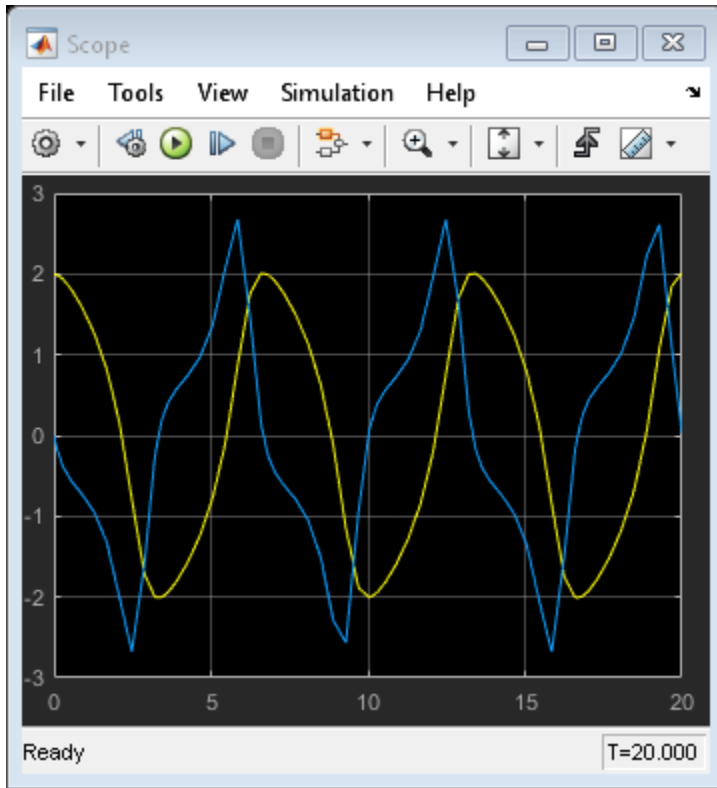

```
open_system('vdp')
simout=sim(bdroot,'ReturnWorkspaceOutputs','on');
```

van der Pol Equation

Copyright 2004-2013 The MathWorks, Inc.

Store a character vector to describe the simulation.

```
simout=simout.setUserString('First Simulation');
```

Use `SimulationOutput.getSimulationMetadata` to retrieve the information you stored.

```
mData=simout.getSimulationMetadata();  
disp(mData.UserString)
```

First Simulation

who

Class: Simulink.SimulationOutput

Package: Simulink

Access and display output variable names of simulation

Syntax

```
simOutVar = simOut.who
```

Description

simOutVar = simOut.who returns the names of all simulation output variables, including workspace variables.

Output Arguments

simOutVar

Character vector array of output variable names of simulation.

Examples

Simulate vdp and store the character vector values of the output variable names.

```
simOut = sim('vdp','SimulationMode','rapid','AbsTol','1e-5',...  
            'SaveState','on','StateSaveName','xoutNew',...  
            'SaveOutput','on','OutputSaveName','youtNew');  
simOutVar = simOut.who
```

Alternatives

A simpler alternative to use dot notation. For example, to access data for the `xoutNew` output variable, you can use this command:

```
simOut.xoutNew
```

See Also

```
Simulink.SimulationOutput.find | Simulink.SimulationOutput.get
```

Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

Syntax

```
Simulink.SubSystem.convertToModelReference(gcb, 'UseConversionAdvisor', true)
```

```
[success, mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys, mdlRefs)
```

```
[success, mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys, mdlRefs, Name, Value)
```

Description

`Simulink.SubSystem.convertToModelReference(gcb, 'UseConversionAdvisor', true)` opens the Model Reference Conversion Advisor for the currently selected subsystem block.

`[success, mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference(subsys, mdlRefs)` converts the specified subsystems to referenced models using the `mdlRefs` value.

For each subsystem that the function converts, it:

- Creates a model
- Copies the contents of the subsystem into the new model
- Updates any root-level Inport, Outport, Trigger, and Enable blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem
- Copies the contents of the model workspace of the original model to the new model

Before you use the function, load the model containing the subsystem.

`[success,mdlRefBlkHs] = Simulink.SubSystem.convertToModelReference (subsys,mdlRefs,Name,Value)` uses additional options specified by one or more `Name, Value` pair arguments.

Examples

Open the Model Reference Conversion Advisor

Open the f14 model.

```
open_system('f14');
```

In the f14 model, select the Controller subsystem output signal, click the **Simulation**

Data Inspector button arrow, and select **Log Selected Signals**.

In the Simulink Editor, select the Controller subsystem. Then open the Model Reference Conversion Advisor from the command line.

```
Simulink.SubSystem.convertToModelReference(gcb, 'UseConversionAdvisor', true);
```

Perform the conversion using the advisor.

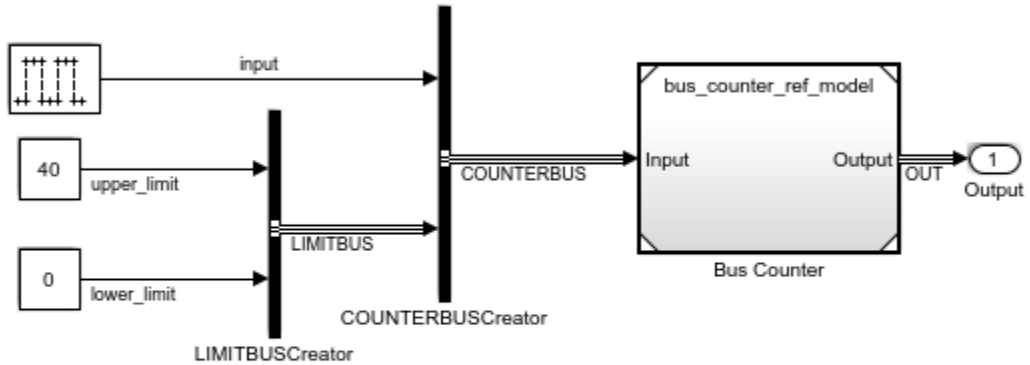

Convert Subsystem to Referenced Model

Convert the Bus Counter subsystem to a referenced model named `bus_counter_ref_model`.

```
open_system('sldemo_mdhref_conversion');
Simulink.SubSystem.convertToModelReference(...
    'sldemo_mdhref_conversion/Bus Counter', ...
    'bus_counter_ref_model', ...
    'AutoFix', true, ...
    'ReplaceSubsystem', true, ...
    'CheckSimulationResults', true);

### Successfully converted Subsystem to Model reference block
```

Conversion to Model Reference Example

Double click here to convert
'Bus Counter' Subsystem to
Referenced Model

Copyright 1990-2014 The MathWorks, Inc.

Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```
open_system('f14');
set_param(gcs, 'SaveOutput', 'on', 'SaveFormat', 'Dataset');
set_param(gcs, 'SignalResolutionControl', 'UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
{'f14/Controller', 'f14/Aircraft Dynamics Model'},...
{'controller_ref_model', 'aircraft_dynamics_ref_model'},...
'ReplaceSubsystem', true, ...
```

```
'AutoFix', true, ...
'CheckSimulationResults', true)
```

- sldemo_mdhref_conversion
- “Convert a Subsystem to a Referenced Model”
- “Model Referencing”

Input Arguments

subsys — Subsystems to convert

character vector | subsystem handle | cell array of character vectors | array of subsystem handles

Subsystems to convert, specified as a character vector, subsystem handle, or cell array of strings or array of subsystem handles.

For information about which subsystems you can convert, see “Limitations on Subsystems That You Can Convert”.

Note You cannot convert a parent subsystem a child of that subsystem at the same time.

Data Types: `double`

mdlRefs — Referenced model names

character vector | cell array of character vectors

Referenced model names, specified as a character vector or cell array of character vectors. Each model name must be 59 characters or less.

If you specify a cell array of subsystems to convert, specify a cell array of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

Example: `Simulink.SubSystem.convertToModelReference...
(engineSubsys, engineModelRef, 'ReplaceSubsystem', true)`

AutoFix — Fix all conversion issues that can be fixed automatically

`false` (default) | `true`

If you set `AutoFix` to `true`, the function fixes all conversion issues that it can fix.

For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

Note If you set 'Force' to `true`, then the function does not automatically fix conversion issues.

Data Types: `logical`

Force — Complete conversion even with errors

`false` (default) | `true`

If you set 'Force' to `true`, the function returns conversion errors as warnings and continues with the conversion without fixing the errors. This option allows you to use the function to do the initial steps of conversion and then complete the conversion process yourself.

If you set `Force` to `true`, then the function does not fix conversion issues, even if you set 'AutoFix' to `true`. However, the success output argument is `true`, regardless of whether any conversion errors occurred.

CheckSimulationResults — Compare simulation results before and after conversion

`false` (default) | `true`

Compare simulation results before and after conversion, specified as `true` or `false`.

Before performing the conversion, enable signal logging for the subsystem output signals of interest in the model.

For the `Simulink.SubSystem.convertToModelReference` command, set:

- 'CheckSimulationResults' to true
- 'AbsoluteTolerance'
- 'RelativeTolerance'
- 'SimulationModes' to the same as the simulation mode as in the original model

If the difference between simulation results exceeds the tolerance level, the function displays a message.

AbsoluteTolerance — Absolute signal tolerance for comparison

'1e-06' (default) | double

Absolute signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to true.

Data Types: double

RelativeTolerance — Relative signal tolerance for comparison

'1e-06' (default) | double

Relative signal tolerance for comparison, specified as a double. Use the option only if you set `CheckSimulationResults` to true.

Data Types: double

DataFileName — Name of file for storing conversion data

character vector

Name of file for storing conversion data, specified as a character vector. You can specify an absolute or relative path.

You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a `.m` file extension, the function serializes all variables to a MATLAB file.

By default, the function uses a file name consisting of the model name plus `_conversion_data.mat`.

ReplaceSubsystem — Replace content of each subsystem with Model blocks

false (default) | true

Replace subsystem blocks with Model blocks, specified as true or false. The Model block references the referenced model.

By default, the function displays the referenced models in separate Simulink Editor windows.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
- If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: `logical`

CreateWrapperSubsystem — Insert wrapper subsystem to preserve model layout

`false` (default) | `true`

Insert wrapper subsystem to preserve model layout, specified as `true` or `false`. When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of a model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: `logical`

SimulationModes — Simulation mode for Model blocks

`'Normal'` (default) | `'Accelerator'`

Simulation mode for Model blocks, specified as `'Normal'` or `'Accelerator'`. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

BuildTarget — Model reference targets to generate

`'Sim'` | `'RTW'`

Model reference targets to generate.

- 'Sim' — Model reference simulation target
- 'RTW' — Code generation target

Output Arguments

success — Conversion status

1 | 0

Conversion status. A value of 1 indicates a successful conversion.

If you set 'Force' to `true`, the function returns a value of 1 if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

mdlRefBlkHs — Handles of created Model blocks

handle of Model block | array of handles of Model blocks

Handles of created Model blocks, returned as a double or cell array.

Data Types: `double`

Tips

- You cannot convert a parent subsystem a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time, compared to converting each subsystem separately. The multiple-subsystem conversion process compiles the model one time.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
 - Specifying these 'Autofix', 'ReplaceSubsystem', 'CheckSimulationResults' name and value pairs, set to `true`.
 - In the model, setting a short simulation time.

- Simulink uses the data dictionary to save the bus objects that it creates as part of the conversion processing when both these conditions exist:
 - The top model uses a data dictionary.
 - All changes to the top model are saved.
- After you complete the conversion, update the model as necessary to meet your modeling requirements. For details, see “Integrate the Referenced Model into the Parent Model”.
- Converting a masked subsystem can require you to perform additional tasks to maintain the same general behavior that the masked subsystem provided.

If the subsystem that you convert contains a masked block, consider masking the Model block in your new referenced model (see “Block Masks”). Configure the referenced model to support the functionality of the masked subsystem.

Note A referenced model does not support the functionality that you can achieve with mask initialization code to create masked parameters.

For mask parameters, replace the mask parameters with model arguments (see “Parameterize Instances of a Reusable Referenced Model”):

- 1 In the model workspace of the referenced model, create a variable for each mask parameter.
- 2 In the Model Explorer, select the `Model Workspace` node. In the **Contents** pane, select the **Argument** check box to identify the variables as model arguments.
- 3 In the new Model block, on the **Arguments** tab, in the **Model arguments** table, specify the values for the model arguments.

For masked callbacks, icons, ports, and documentation:

- 1 In the backup copy, open the Mask Editor on the masked subsystem and copy the content you want into the masked Model block.
- 2 In the Mask Editor for the new Model block, paste the masked subsystem content.

“Convert a Subsystem to a Referenced Model”

“Model Referencing”

Introduced in R2006a

Simulink.SubSystem.copyContentsToBlockDiagram

Copy contents of subsystem to empty block diagram

Syntax

```
Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag)
```

Description

`Simulink.SubSystem.copyContentsToBlockDiagram(subsys, bdiag)` copies the contents of the subsystem *subsys* to the block diagram *bdiag*. The subsystem and block diagram must have already been loaded. The subsystem cannot be part of the block diagram. The function affects only blocks, lines, and annotations; it does not affect nongraphical information such as configuration sets.

This function cannot be used if the destination block diagram contains any blocks or signals. Other types of information can exist in the destination block diagram and are unaffected by the function. Use `Simulink.BlockDiagram.deleteContents` if necessary to empty the block diagram before using `Simulink.SubSystem.copyContentsToBlockDiagram`.

Tip To flatten a model hierarchy by expanding the contents of a subsystem to the system that contains that subsystem, do not use the `Simulink.SubSystem.copyContentsToBlockDiagram` function. Instead, expand the subsystem, as described in “Expand Subsystem Contents”.

Input Arguments

subsys

Subsystem name or handle

bdiag

Block diagram name or handle

Examples

Copy the graphical contents of `f14/Controller`, including all nested subsystems, to a new block diagram:

```
% open f14
open_system('f14');

% create a new model
newbd = new_system;
open_system(newbd);

% copy the subsystem
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', newbd);

% close f14 and the new model
close_system('f14', 0);
close_system(newbd, 0);
```

Simulink.SubSystem.deleteContents

Delete contents of subsystem

Syntax

```
Simulink.SubSystem.deleteContents(subsys)
```

Description

`Simulink.SubSystem.deleteContents(subsys)` deletes the contents of the subsystem *subsys*. The function affects only blocks, lines, and annotations. The subsystem must have already been loaded.

Note This function does not delete library blocks in a subsystem.

Input Arguments

subsys

Subsystem name or handle

Examples

Delete the graphical contents of `Controller`, including all nested subsystems:

```
Simulink.SubSystem.deleteContents('f14/Controller');
```

Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

Syntax

```
[checksum,details] = Simulink.SubSystem.getChecksum(subsys)
```

Description

`[checksum,details] = Simulink.SubSystem.getChecksum(subsys)` returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

Note `Simulink.SubSystem.getChecksum` compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command `model([], [], [], 'compile')` to place the model in a compiled state before using `Simulink.SubSystem.getChecksum`.

This command accepts the argument `subsys`, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

Examples

Run `getChecksum` on Model

Run the function `Simulink.SubSystem.getChecksum` on the model `rtwdemo_ssreuse`. In the MATLAB editor window, both output structures are

displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model `rtwdemo_ssreuse`.

```
rtwdemo_ssreuse
```

Select subsystem `SS1` and execute the follow line of code in the MATLAB editor to get the full name and path to the subsystem `SS1`:

```
path_ss1 = gcb
```

Run the function `getChecksum` on the subsystem with the following command:

```
[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)
```

The output structures `chksum1` and `chksum1_details` will store the output of the `getChecksum` function call.

```
chksum1 =
```

```
struct with fields:
    Value: [4x1 uint32]
    MarkedUnique: 0
```

```
chksum1_details =
```

```
struct with fields:
    ContentsChecksum: [1x1 struct]
    InterfaceChecksum: [1x1 struct]
    ContentsChecksumItems: [359x1 struct]
    InterfaceChecksumItems: [60x1 struct]
```

Input Arguments

subsys — Name or handle of nonvirtual subsystem

character vector

Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: `char`

Output Arguments

checksum — A structure that stores the value of the checksum and indicates whether **subsys** contains unique block or subsystem properties which prevent generated code reuse
structure

Checksum information, returned as a structure with the fields:

value — Array of four 32-bit integers that represents the subsystem's 128-bit checksum
`4x1 uint32`

MarkedUnique — True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false
`bool`

details — A structure that stores checksum data on model contents and the interface
structure

Checksum information, returned as a structure with the fields:

ContentsChecksum — A structure of the same form as **checksum**, representing a checksum that provides information about all blocks in the system
structure

InterfaceChecksum — A structure of the same form as **checksum**, representing a checksum that provides information about the subsystem's block parameters and connections
structure

ContentsChecksumItems — Structure array that Simulink uses to compute the checksum for **ContentsChecksum**
structure

Structure array returned with the following fields:

handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port
`char array`

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

char array

value — Value of the item Simulink added to the checksum. If the item is a parameter, value is the value returned by `get_param(handle, identifier)`

type

InterfaceChecksumItems — Structure array that Simulink uses to compute the checksum for `InterfaceChecksum`

structure

Structure array returned with the following fields:

Handle — Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port

char array

Identifier — Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

char array

value — Value of the item Simulink added to the checksum. If the item is a parameter, value is the value returned by `get_param(handle, identifier)`

type

Introduced in R2006b

Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

Syntax

```
Simulink.suppressDiagnostic(source, message_id)  
Simulink.suppressDiagnostic(diagnostic)
```

Description

`Simulink.suppressDiagnostic(source, message_id)` suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

`Simulink.suppressDiagnostic(diagnostic)` suppresses the diagnostics associated with `MSLDiagnostic` object `diagnostic`.

Examples

Suppress a Warning Thrown By a Block

Using the model from “Suppress Diagnostic Messages Programmatically”, use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...  
    'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

- “Suppress Diagnostic Messages Programmatically”

Input Arguments

source — Block or model object throwing the diagnostic
block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

message_id — message identifier of diagnostic

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: `char` | `cell`

diagnostic — Diagnostic object

`MSLDiagnostic` object

Diagnostic specified as an `MSLDiagnostic` object. Access the `MSLDiagnostic` object through the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object.

Data Types: `struct`

Topics

“Suppress Diagnostic Messages Programmatically”

sint

Create `Simulink.NumericType` object describing signed integer data type

Syntax

```
a = sint(WordLength)
```

Description

`sint(WordLength)` returns a `Simulink.NumericType` object that describes the data type of a signed integer with a word size given by *WordLength*.

Note `sint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `sint(WordLength)` with `fixdt(1,WordLength,0)`.

Examples

Define a 16-bit signed integer data type.

```
a = sint(16)
```

```
a =
```

```
    NumericType with properties:
```

```
        DataTypeMode: 'Fixed-point: binary point scaling'  
        Signedness: 'Signed'  
        WordLength: 16  
        FractionLength: 0  
        IsAlias: 0  
        DataScope: 'Auto'  
        HeaderFile: ''  
        Description: ''
```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `ufix` | `ufrac` | `uint`

Introduced before R2006a

slbuild

Build standalone executable or model reference target for model; except where noted, this function requires a Simulink Coder license

Syntax

```
slbuild(model,buildSpec,varArgIn)
```

Description

`slbuild(model,buildSpec,varArgIn)` builds a standalone Simulink Coder binary executable file from the `model`, using the current model configuration settings. If the `model` has not been loaded, `slbuild` loads it before initiating the build process. The `buildSpec` and `varArgIn` arguments are optional.

Do not use `rtwbuild`, `rtwrebuild`, or `slbuild` commands with parallel language features (Parallel Computing Toolbox) (for example, within a `parfor` or `spmd` loop). For information about parallel builds of referenced models, see “Reduce Build Time for Referenced Models” (Simulink Coder).

You cannot use `slbuild` to build subsystems.

Examples

Generate Code and Build Executable Image for Model

Generate C code for model `rtwdemo_rtwinintro`.

```
slbuild('rtwdemo_rtwinintro')  
% same operation as ...  
% slbuild('rtwdemo_rtwinintro','StandaloneRTWTarget')
```

For the GRT target, the coder generates the following code files and places them in folders `rtwdemo_rtwinintro_grt_rtw` and `slprj/grt/_sharedutils`.

Model Files	Shared Files	Interface Files	Other Files
rtwdemo_rtwinintro.c	rtwtypes.h	rtmodel.h	none
rtwdemo_rtwinintro.h	multiword_types.h		
rtwdemo_rtwinintro_private.h	builtin_typeid_types.h		
rtwdemo_rtwinintrotypes.h			

If the following model configuration parameters settings apply, the coder generates additional results.

Parameter Setting	Results
Code Generation > Generate code only pane is cleared	Executable image rtwdemo_rtwinintro.exe
Code Generation > Report > Create code generation report is selected	Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outports, interface parameters, and data stores

Force Top Model Build

Generate code and build an executable image for `rtwdemo_mdltreftop`, which refers to model `rtwdemo_mdltreftop`, regardless of model checksums and parameter settings.

```
sbuild('rtwdemo_mdltreftop', 'StandaloneRTWTarget', ...
    'ForceTopModelBuild', true)
```

Clean Top Model Build

Clean the model build area enough to trigger regeneration of the top model code at the next build.

```
slbuild('rtwdemo_rtwinintro','CleanTopModel')
```

Input Arguments

model — Specifies model for the build process

handle | character vector

Model for which to build a standalone executable or model reference target, specified as a handle or a character vector representing the model name.

Example: `gcs`

buildSpec — Specifies the code generation action for the build process

'StandaloneRTWTarget' (default) | 'ModelReferenceSimTarget' |
'ModelReferenceRTWTarget' | 'ModelReferenceRTWTargetOnly' |
'CleanTopModel'

The *buildSpec* directs the code generator to perform the selected build action for the *model* and the build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build only a model reference simulation target.

The *buildSpec* argument must be one of the following:

buildSpec	Build Action
'StandaloneRTWTarget'	Builds a standalone Simulink Coder binary executable file from the <i>model</i> , using the current model configuration settings. If the <i>model</i> has not been loaded, <code>slbuild</code> loads it before initiating the build process.
'ModelReferenceSimTarget'	Builds a model reference simulation target (does not require a Simulink Coder license)
'ModelReferenceRTWTarget'	Builds a model reference Simulink Coder target and the corresponding model reference simulation target
'ModelReferenceRTWTargetOnly'	Builds only a model reference Simulink Coder target

buildSpec	Build Action
'CleanTopModel'	Cleans the model build area enough to trigger regeneration of the top model code at the next build

Example: 'ModelReferenceSimTarget'

varArgIn — Name-value pair parameters that provide added arguments for the build process

name-value pairs

```
sbuild(myModel, 'StandaloneRTWTarget', 'ForceTopModelBuild', true)
```

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'UpdateThisModelReferenceTarget', 'Force'

UpdateThisModelReferenceTarget — Specifies a conditional rebuild option for the model reference build

'Force' | 'IfOutOfDateOrStructuralChange' | 'IfOutOfDate'

The 'UpdateThisModelReferenceTarget' option only applies when the *buildSpec* selection is 'ModelReferenceSimTarget', 'ModelReferenceRTWTarget', or 'ModelReferenceRTWTargetOnly'.

The 'UpdateThisModelReferenceTarget' value specifies a conditional rebuild option for the model reference target build when the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box is set to *Never*.

The 'UpdateThisModelReferenceTarget' value applies only to *model*, not to any models referenced by *model*.

The 'UpdateThisModelReferenceTarget' value must be one of the following:

UpdateThisModelReferenceTarget	Conditional Rebuild Action
'Force'	Unconditionally rebuilds the model. This option is equivalent to the Always rebuild option on the Model Referencing pane of the Configuration Parameters dialog box.
'IfOutOfDateOrStructuralChange'	Rebuilds the model if the build process detects any changes. This option is equivalent to the If any changes detected rebuild option on the Model Referencing pane of the Configuration Parameters dialog box.
'IfOutOfDate'	Rebuilds the model if the build process detects any changes in known dependencies of this model. This option is equivalent to the If any changes in known dependencies detected rebuild option on the Model Referencing pane of the Configuration Parameters dialog box.

Example: 'UpdateThisModelReferenceTarget', 'Force'

ForceTopModelBuild — Directs the code generator to generate code and build an executable image for the top model of the referenced model hierarchy, regardless of model checksums and parameter settings

false (default) | true

Use 'ForceTopModelBuild' value true to force the top model build.

Example: 'ForceTopModelBuild', true

Introduced before R2006a

slCharacterEncoding

Change MATLAB character set encoding

Syntax

```
currentCharacterEncoding = slCharacterEncoding()  
slCharacterEncoding(encoding)
```

Description

This command allows you to change the current MATLAB character set encoding to be compatible with the character encoding of a model that you want to open.

`currentCharacterEncoding = slCharacterEncoding()` returns the current MATLAB character set encoding.

`slCharacterEncoding(encoding)` changes the MATLAB character set encoding to the specified encoding. You should only specify these values:

- 'US-ASCII'
- 'Windows-1252'
- 'ISO-8859-1'
- 'Shift_JIS'
- 'UTF-8'

If you want to use a different character encoding, you need to start MATLAB with the appropriate locale settings for your operating system. Consult your operating system manual to change the locale setting. Simulink can support any character encoding that uses single-byte or double-byte characters.

If you open a model that uses a particular character set encoding in a MATLAB session that uses a different encoding, a warning appears. For example, suppose that you create a model in a MATLAB session configured for `Shift_JIS` and open it in a session configured for `US_ASCII`. The warning message shows the encoding of the current

session and the encoding used to create the model. If you encounter any problems with corrupted characters, for example when using MATLAB files associated with the model, then try using the `sICharacterEncoding` function to change the character encoding

- 1 Close all open models.
- 2 Use `sICharacterEncoding` to change the character encoding of the current MATLAB session to match the model character encoding.
- 3 Reopen the model.

Note You must close all open models or libraries before changing the MATLAB character set encoding except when changing from 'US-ASCII' to another encoding.

Topics

“Open a Model with Different Character Encoding”

“Save Models with Different Character Encodings”

Introduced before R2006a

sldebug

Start simulation in debug mode

Syntax

```
sldebug('sys')
```

Description

`sldebug('sys')` starts a simulation in debug mode. See “Debugger Command-Line Interface” for information about using the debugger.

Examples

The following command:

```
sldebug('vdp')
```

loads the Simulink example model `vdp` into memory and starts the simulation in debug mode. Alternatively, you can achieve the same result by using the `sim` command:

```
sim('vdp', 'debug', 'on')
```

See Also

`sim`

Introduced in R2006a

sldiagnostics

Display diagnostic information about Simulink system

Syntax

```
sldiagnostics('sys')  
[txtRpt, sRpt] = sldiagnostics('sys')  
[txtRpt, sRpt] = sldiagnostics('sys', options)  
[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')  
[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')
```

Description

`sldiagnostics('sys')` displays the following diagnostic information associated with the model or subsystem specified by `sys`:

- Number of each type of block
- Number of each type of Stateflow object
- Number of states, outputs, inputs, and sample times of the root model.
- Names of libraries referenced and instances of the referenced blocks
- Time and additional memory used for each compilation phase of the root model

If the model specified by `sys` is not loaded, then `sldiagnostics` loads the model before performing the analysis.

The command `sldiagnostics('sys', options)` displays only the diagnostic information associated with the specific operations listed as `options` character vectors. The table below summarizes the options available and their corresponding valid input and output.

With `sldiagnostics`, you can input the name of a model or the path to a subsystem. For some analysis options, `sldiagnostics` can analyze only a root model. If you provide an incompatible input for one of these analyses, then `sldiagnostics` issues a warning. Finally, if you input a Simulink Library, then `sldiagnostics` cannot perform options

that require a model compilation (**Update Diagram**). Instead, `sldiagnostics` issues a warning.

During the analysis, `sldiagnostics` will follow library links but will not follow or analyze Model References. See `find_mdrefs` for more information on finding all Model blocks and referenced models in a specified model.

Option	Valid Inputs	Output
<code>CountBlocks</code>	root model, library, or subsystem	Lists all unique blocks in the system and the number of occurrences of each. This includes blocks that are nested in masked subsystems or hidden blocks.
<code>CountSF</code>	root model, library, or subsystem	Lists all unique Stateflow objects in the system and the number of occurrences of each.
<code>Sizes</code>	root model	Lists the number of states, outputs, inputs, and sample times, as well as a flag indicating direct feedthrough, used in the root model.
<code>Libs</code>	root model, library, or subsystem	Lists all unique libraries referenced in the root model, as well as the names and numbers of the library blocks.
<code>CompileStats</code>	root model	Lists the time and additional memory used for each compilation phase of the root model. This information helps users troubleshoot model compilation speed and memory issues.
<code>RTWBuildStats</code>	root model	Lists the same information as the <code>CompileStats</code> diagnostic. When issued with the second output argument <code>sRpt</code> , it captures the same statistics included in <code>CompileStats</code> and also the Simulink Coder build statistics. You must explicitly specify this option, because it is not part of the default analysis.

Option	Valid Inputs	Output
All	not applicable	Performs all diagnostics.

Note Running the `CompileStats` diagnostic before simulating a model for the first time will show greater memory usage. However, subsequent runs of the `CompileStats` diagnostic on the model will require less memory usage.

`[txtRpt, sRpt] = sldiagnostics('sys')` returns the diagnostic information as a textual report `txtRpt` and a structure array `sRpt`, which contains the following fields that correspond to the diagnostic options:

- `blocks`
- `stateflow`
- `sizes`
- `links`
- `compilestats`

`[txtRpt, sRpt] = sldiagnostics('sys', options)` returns only the specified options. If your chosen options specify just one type of analysis, then `sRpt` contains the results of only that analysis.

`[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')` returns information on time and memory usage in `txtRpt` and `sRpt`.

`[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')` includes Simulink Coder build statistics in addition to the information reported for `CompileStats` in the `sRpt` output.

- `txtRpt` contains the formatted textual output of time spent in each of the phases in Simulink and Simulink Coder (if you specified `RTWBuildStats`), for example:

```
Compile Statistics For: rtwdemo_counter
  Cstat1: 0.00 seconds Model compilation pre-start
  Cstat2: 0.00 seconds Stateflow compile pre-start notification
  Cstat3: 0.10 seconds Post pre-comp-start engine event
  Cstat4: 10.00 seconds Stateflow compile start notification
  Cstat5: 0.00 seconds Model compilation startup completed
```

- `sRpt` is a MATLAB structure containing time and memory usage for each of the phases, for example:

```
sRpt =  
Model:      'myModel1'  
Statistics:  [1x134 struct]
```

The size of the `sRpt.Statistics` array indicates the number of compile and build phases executed during the operation. Examine the `Statistics` fields:

```
sRpt.Statistics(1) =  
Description:      'Phase1'  
CPUTime:         7.2490  
WallClockTime    4.0092  
ProcessMemUsage: 26.2148  
ProcessMemUsagePeak: 28.6680  
ProcessVMSize:   15.9531
```

`CPUTime` and `WallClockTime` show the elapsed time for the phase in seconds.

`ProcessMemUsage`, `ProcessMemUsagePeak` and `ProcessVMSize` show the memory consumption during execution of the phase in MB.

Examine these key metrics to understand the performance:

- `WallClockTime`—The real-time elapsed in each phase in seconds. Sum the `WallClockTime` in each phase to get the total time taken to perform the operation:

```
ElapsedTime = sum([statRpt.Statistics(:).WallClockTime]);
```

- `ProcessMemUsage`—The amount of memory consumed in each phase. Sum the `ProcessMemUsage` across all the phases to get the memory consumption during the entire operation:

```
TotalMemory = sum([statRpt.Statistics(:).ProcessMemUsage]);
```

- `ProcessMemUsagePeak`—The maximum amount of allocated memory in each phase. Get the maximum of this metric across all the phases to find the peak memory allocation during the operation:

```
PeakMemory = max([statRpt.Statistics(:).ProcessMemUsagePeak]);
```

Note Memory statistics are available only on the Microsoft Windows platform.

Examples

The following command counts and lists each type of block used in the `sldemo_bounce` model that comes with Simulink software.

```
sldiagnostics('sldemo_bounce', 'CountBlocks')
```

The following command counts and lists both the unique blocks and Stateflow objects used in the `sf_boiler` model that comes with Stateflow software; the textual report returned is captured as `myReport`.

```
myReport = sldiagnostics('sf_boiler', 'CountBlocks', 'CountSF')
```

The following commands open the `f14` model that comes with Simulink software, and counts the number of blocks used in the `Controller` subsystem.

```
sldiagnostics('f14/Controller', 'CountBlocks')
```

The following command runs the `Sizes` and `CompileStats` diagnostics on the `f14` model, capturing the results as both a textual report and structure array.

```
[txtRpt, sRpt] = sldiagnostics('f14', 'Sizes', 'CompileStats')
```

`find_system` | `get_param`

Introduced in R2006a

sldiagviewer.diary

Log simulation warnings and errors and build information to file

Syntax

```
sldiagviewer.diary
sldiagviewer.diary(filename)
sldiagviewer.diary(toggle)
sldiagviewer.diary(filename, 'UTF-8')
```

Description

`sldiagviewer.diary` intercepts build information, warnings, and errors transmitted to the Command Window or the Diagnostic Viewer and logs them to a text file `diary.txt` in the current folder.

`sldiagviewer.diary(filename)` toggles the logging state of the text file specified by `filename`.

`sldiagviewer.diary(toggle)` turns logging to the log file on or off. The setting applies to the last file name you specified for logging or to `diary.txt` if you did not specify a file name.

`sldiagviewer.diary(filename, 'UTF-8')` specifies the character encoding for the log file `filename`.

Examples

Log Build Information and Simulation Warnings and Errors

Start logging build information and simulation warnings and errors to `diary.txt`.

```
sldiagviewer.diary
open_system('vdp')
rtwbuild('vdp')
```

Open diary.txt to view logs.

```
### Starting build procedure for model: vdp
### Build procedure for model: 'vdp' aborted due to an error.
...
```

Log to Specific File

Set up logging to a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt')
```

Toggle File Logging State

Switch the logging state of a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt') % Start logging
open_system('vdp')
rtwbuild('vdp')

sldiagviewer.diary('off') % Switch off logging
open_system('sldemo_fuelsys')
rtwbuild('sldemo_fuelsys')

sldiagviewer.diary('on') % Resume logging
```

Specify Log File Name and Character Encoding

Set the file name to log to and the character encoding to use.

```
sldiagviewer.diary('C:\MyLogs\log1.txt', 'UTF-8')
```

- “View Diagnostics”
- “Customize Diagnostic Messages”

Input Arguments

toggle — Logging state

'off' | 'on'

Logging state, specified as 'on' or 'off'.

Example: `sldiagviewer.diary('on')`

filename — Name of file to log data to

character vector

Name of file to log data to, specified as a character vector.

Example: `sldiagviewer.diary('C:\Simulations\mySimulationDiary.txt')`

Introduced in R2014a

sldiscmdl

Discretize model that contains continuous blocks

Syntax

```
sldiscmdl('model_name', sample_time)
sldiscmdl('model_name', sample_time, method)
sldiscmdl('model_name', sample_time, options)
sldiscmdl('model_name', sample_time, method, freq)
sldiscmdl('model_name', sample_time, method, options)
sldiscmdl('model_name', sample_time, method, freq, options)
[old_blks, new_blks] =
sldiscmdl('model_name', sample_time, method, freq, options)
```

Description

`sldiscmdl('model_name', sample_time)` discretizes the model named 'model_name' using the specified `sample_time`. The model does not need to be open, and the units for `sample_time` are simulation seconds.

`sldiscmdl('model_name', sample_time, method)` discretizes the model using `sample_time` and the transform method specified by `method`.

`sldiscmdl('model_name', sample_time, options)` discretizes the model using `sample_time` and criteria specified by the `options` cell array. This array consists of four elements: `{target, replace_with, put_into, prompt}`.

`sldiscmdl('model_name', sample_time, method, freq)` discretizes the model using `sample_time`, `method`, and the critical frequency specified by `freq`. The units for `freq` are Hz. When you specify `freq`, `method` must be 'prewarp'.

`sldiscmdl('model_name', sample_time, method, options)` discretizes the model using `sample_time`, `method`, and `options`.

`sldiscmdl('model_name', sample_time, method, freq, options)` discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'.

`[old_blks, new_blks] = sldiscmdl('model_name', sample_time, method, freq, options)` discretizes the model using *sample_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'. The function also returns two cell arrays that contain full path names of the original, continuous blocks and the new, discretized blocks.

Input Arguments

model_name

Name of the model to discretize.

sample_time

Sample-time specification for the model:

Scalar value

Sample time with zero offset, such as 1

Two-element vector

Sample time with nonzero offset, such as
[1 0.1]

method

Method of converting blocks from continuous to discrete mode:

'zoh' (default)

Zero-order hold on the inputs

'foh'

First-order hold on the inputs

'tustin'

Bilinear (Tustin) approximation

'prewarp'

Tustin approximation with frequency prewarping

'matched'

Matched pole-zero method

For single-input, single-output (SISO) systems only

freq

Critical frequency in Hz. This input applies only when the *method* input is 'prewarp'.

options

Cell array {*target*, *replace_with*, *put_into*, *prompt*}, where each element can take the following values:

<i>target</i>	'all' (default)	Discretize all continuous blocks
	'selected'	Discretize only selected blocks in the model
	'full_blk_path'	Discretize specified block
<i>replace_with</i>	'parammask' (default)	Create discrete blocks whose parameters derive from the corresponding continuous blocks
	'hardcoded'	Create discrete blocks with hard-coded parameters placed directly into each block dialog box
<i>put_into</i>	'copy' (default)	Create discretization in a copy of the original model
	'configurable'	Create discretization candidate in a configurable subsystem
	'current'	Apply discretization to the current model
	'untitled'	Create discretization in a new untitled window
<i>prompt</i>	'on' (default)	Show discretization information at the command prompt
	'off'	Do not show discretization information at the command prompt

Examples

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
sldiscmdl('slexAircraftExample',1);
```

Discretize the Aircraft Dynamics Model subsystem in the `slexAircraftExample` model using a 1-second sample time, a 0.1-second offset, and a first-order hold transform method:

```
sldiscmdl('slexAircraftExample',[1 0.1],'foh',...  
{'slexAircraftExample/Aircraft Dynamics Model',...  
'parammask','copy','on'});
```

Discretize the Aircraft Dynamics Model subsystem in the `slexAircraftExample` model and retrieve the full path name of the second discretized block:

```
[old_blks,new_blks] = sldiscmdl('slexAircraftExample',[1 0.1],...  
'foh',{'slexAircraftExample/Aircraft Dynamics Model','parammask',...  
'copy','on'});  
% Get full path name of the second discretized block  
new_blks{2}
```

Topics

“Discretize a Model with the `sldiscmdl` Function”

Introduced before R2006a

slIsFileChangedOnDisk

Determine whether model has changed since it was loaded

Syntax

```
Changed = slIsFileChangedOnDisk('sys')
```

Description

`Changed = slIsFileChangedOnDisk('sys')` Returns true if the file which contains block diagram `sys` was changed on disk since the block diagram was loaded.

Examples

To ensure that code is not generated for a model whose file has changed on disk since it was loaded, include the following in the 'entry' section of the `STF_make_rtw_hook.m` file:

```
if (slIsFileChangedOnDisk(sys))  
    error('File has changed on disk since it was loaded. Aborting code generation.');
```

```
end
```

See Also

Topics

“Model File Change Notification”

Introduced in R2007b

slLibraryBrowser

Open Simulink Library Browser

Syntax

```
slLibraryBrowser
slLibraryBrowser('open')
slLibraryBrowser('noshow')
libraryhandle = slLibraryBrowser
slLibraryBrowser('close')
```

Description

`slLibraryBrowser` opens the Simulink Library Browser.

If you want to load the Simulink block library, use `load_system simulink` instead.

If you want to start Simulink without opening any windows, use the faster `start_simulink` instead.

`slLibraryBrowser('open')` opens the Library Browser.

`slLibraryBrowser('noshow')` loads the Library Browser in memory without making it visible. Use this to make future calls to `slLibraryBrowser('open')` faster.

`libraryhandle = slLibraryBrowser` returns the handle of the Library Browser object.

`slLibraryBrowser('close')` closes the Library Browser.

Examples

Open and Close the Library Browser

```
sLibraryBrowser  
sLibraryBrowser('close')
```

Load the Library Browser and Get a Handle

```
libraryhandle = sLibraryBrowser('noshow')
```

slmdliscui

Open Model Discretizer GUI

Syntax

```
slmdliscui  
slmdliscui('model')
```

Description

`slmdliscui` opens the Model Discretizer. A model does not need to be open.

`slmdliscui('model')` opens the Model Discretizer for the model or library called `'name'`.

To use the Model Discretizer, you must have a Control System Toolbox license, version 5.2 or later.

Examples

Open the Model Discretizer for the `slexAircraftExample` model:

```
slmdliscui('slexAircraftExample')
```

Open the Model Discretizer for the discretizing library:

```
slmdliscui('discretizing')
```

Topics

“Discretize a Model with the Model Discretizer”

Introduced before R2006a

slprofreport

Regenerate profiler report from data, `ProfileData`, saved from previous run

Syntax

```
slprofreport(model_nameProfileData)
```

Description

When you run a model with the profiler enabled, the simulation generates the data and saves it in the variable, `model_nameProfileData`. `slprofreport(model_nameProfileData)` generates a profiler report based on the data in `model_nameProfileData`, saved from the model run.

Input Arguments

ProfileData

Variable that contains profiler data from a model run. The variable name consists of the model name and `ProfileData`, for example, `vdpProfileData`.

Default: None

Examples

Regenerate Simulink Profiler Results

Regenerate the Profiler report for model `vdp`

In the MATLAB Command Window, start the `vdp` model.

In the Simulink editor window, run `vdp` model with Simulink Profiler enabled.

Simulink stores the data to the variable `vdpProfileData`.

To review the report, in the MATLAB Command Window

```
slprofreport(vdpProfileData)
```

The Simulink Profiler Report window is displayed.

- “Save Profiler Results”

slproject.create

Create blank Simulink project

Syntax

```
proj = slproject.create  
proj = slproject.create(path)  
proj = slproject.create(name)
```

Description

`proj = slproject.create` creates and opens a Simulink project using the blank project template from the start page, and returns a project object. Use the project object to manipulate the currently open Simulink project at the command line. The new project is created in the default folder. To change the default folder for new Simulink projects, on the Simulink Project tab, click **Preferences**, and then set the **Default folder**.

`proj = slproject.create(path)` creates the project at the location specified by `path`.

`proj = slproject.create(name)` creates the project in the default folder, with the name specified by `name`.

Examples

Create a Blank Project in the Default Folder

```
slproject.create
```

You can control the default folder for new projects using the project preferences.

Create a Blank Project in a Specified Folder

```
proj = slproject.create('C:\work\myprojectname');
```

Create a Named Blank Project in the Default Folder

```
proj = slproject.create('myprojectname');
```

- “Creating Simulink Projects Programmatically”
- “Automate Simulink Project Tasks Using Scripts”

Input Arguments

path — Path for the new project location

character vector

Path for the new project location, specified as a character vector. If you do not specify the path, `slproject.create` creates the project in the default location. You can change the default location in the project preferences.

Example: `C:\work\projectname`

Data Types: `char`

name — Name for the new project

character vector

Name for the new project, specified as a character vector.

Example: `myproject`

Data Types: `char`

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Information	Information about the project such as the description, source control integration, repository location, and whether it is a top-level project.
Dependencies	Dependencies between project files in a MATLAB digraph object.
Shortcuts	Shortcut files in the project.
ProjectPath	Folders that the project puts on the MATLAB path.
ProjectReferences	Folders that contain referenced projects. Contains read-only project objects for referenced projects.
Categories	Categories of project labels.
Files	Paths and names of project files.
RootFolder	Full path to project root folder.

Introduced in R2017a

addPath

Add folder to path of Simulink project

Syntax

```
folderpath = addPath(project, folder)
```

Description

`folderpath = addPath(project, folder)` adds a folder in a Simulink project to the current project path. The folder must be in the project. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes. To learn more, see “Specify Project Path”.

Examples

Add a Folder to the Project Path

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new folder.

```
folderpath = fullfile(project.RootFolder, 'folder');  
mkdir(folderpath);
```

Add this new folder to the project.

```
projectFile = addFile(project, folderpath);
```

Add this new folder to the project path.

```
folderpath = addPath(project, folderpath);
```

- “Specify Project Path”

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

folder — Path of folder

character vector

Path of the folder to add relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

Output Arguments

folderpath — Path folder

path folder object

Path folder object containing the specified folder path. The project puts the folders on the MATLAB search path when it loads and removes them from the path when it closes.

See Also

`addFile` | `addFolderIncludingChildFiles` | `removePath` | `simulinkproject`

Topics

“Specify Project Path”

Introduced in R2017a

removePath

Remove folder from Simulink project path

Syntax

```
removePath(project, folder)
```

Description

`removePath(project, folder)` removes a folder in a Simulink project from the current project path. The folder must be in the project.

Examples

Remove a Folder from the Project Path

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new folder.

```
folderpath = fullfile(project.RootFolder, 'folder');  
mkdir(folderpath);
```

Add this new folder to the project.

```
projectFile = addFile(project, folderpath);
```

Add the new folder to the project path.

```
folderpath = addPath(project, folderpath);
```

Remove the new folder from the project path.

```
removePath(project, folderpath)
```

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

folder — Path of folder

character vector

Path of the folder to remove relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

See Also

`addPath` | `simulinkproject`

Introduced in R2017a

addReference

Add referenced project to Simulink project

Syntax

```
projreference = addReference(project, folder)
projreference = addReference(project, folder, type)
```

Description

`projreference = addReference(project, folder)` adds a reference to the Simulink project specified by `folder`. The reference is added to the current project, `project`.

`projreference = addReference(project, folder, type)` specifies the type of reference to create. Specify relative or absolute reference.

Examples

Add a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
reload(project);
addReference(project, projectToReference, 'absolute');
```

Find out if a project is a top-level project. 1 indicates a top-level project.

```
project.Information.TopLevel  
  
ans =  
  
    logical  
  
    1
```

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

folder — Path of folder

character vector

Path of the folder to add the reference, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

type — Type of reference

relative | absolute

Type of reference, relative to the project root folder, specified as a character vector.

Output Arguments

projreference — Project reference

project reference object

Project reference object containing information about the referenced project.

See Also

`removeReference` | `simulinkproject`

Introduced in R2017a

removeReference

Add folder to Simulink project path

Syntax

```
removeReference(project, folder)
```

Description

`removeReference(project, folder)` removes the reference to the Simulink project `project` from the current project.

Examples

Remove a Referenced Project

Create a project and get a project object.

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new blank project.

```
projectToReference = slproject.create();
```

Reload the first project and add a reference to the new blank project.

```
project.reload();  
addReference(project, projectToReference, 'absolute');
```

Remove the reference to the blank project.

```
removeReference(project, projectToReference);
```

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

folder — Path of folder

character vector

Path of the folder to the reference to be removed, relative to the project root folder, specified as a character vector. The folder must be within the root folder.

Example: `models/myfolder`

See Also

`addReference` | `simulinkproject`

Introduced in R2017a

addShortcut

Add shortcut to Simulink project

Syntax

```
shortcut = addShortcut(project, file)
```

Description

`shortcut = addShortcut(project, file)` adds a shortcut to the specified file in the Simulink project.

To set the shortcut to run at startup or shutdown, use Simulink Project. See “Automate Startup Tasks”.

Examples

Add a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')  
    new_system('new_model');  
    save_system('new_model', filepath)
```

Add this new model to the project.

```
projectFile = addFile(project, filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project,filepath);
```

- “Automate Startup Tasks”

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

file — Path of file

character vector

Path of the file to add a shortcut to, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: ‘models/myModelName.slx’

Output Arguments

shortcut — Shortcut

shortcut object

Shortcut object containing information about the shortcut.

See Also

`removeShortcut` | `simulinkproject`

Topics

“Automate Startup Tasks”

Introduced in R2017a

removeShortcut

Remove shortcut from Simulink project

Syntax

```
removeShortcut(project, file)
```

Description

`removeShortcut(project, file)` removes the shortcut to the specified file in the Simulink project.

Examples

Remove a Shortcut

Create a project and get a project object.

```
sldemo_slproject_airframe;  
project = simulinkproject;
```

Create a new file.

```
filepath = fullfile(project.RootFolder, 'new_model.slx')  
    new_system('new_model');  
    save_system('new_model', filepath)
```

Add this new model to the project.

```
projectFile = addFile(project, filepath)
```

Add a new shortcut to the new model.

```
shortcut = addShortcut(project, filepath);
```

Remove the shortcut.

```
removeShortcut(project, shortcut);
```

Input Arguments

project — Project

project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink project at the command line.

file — Path of file

character vector

Path of the shortcut file, relative to the project root folder, including the file extension, specified as a character vector. The file must be within the root folder.

Example: 'models/myModelName.slx'

See Also

`addShortcut` | `simulinkproject`

Introduced in R2017a

slproject.getCurrentProject

Manipulate current Simulink Project at command line

Syntax

```
proj = slproject.getCurrentProject
```

Description

`proj = slproject.getCurrentProject` gets the current project open in the Simulink Project Tool and returns a project object `proj` that you can use to manipulate the project programmatically. If no project is open, then you see an error.

Note `slproject.getCurrentProject` will be removed in a future release. Use `slproject.getCurrentProjects` instead.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProject` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe  
proj = slproject.getCurrentProject
```

```
proj =
```

```
    ProjectManager with properties:
```

```
    Name: 'Simulink Project Airframe Example'  
    Categories: [1x1 slproject.Category]  
    Shortcuts: [1x8 slproject.Shortcut]
```

```
ProjectPath: [1x7 slproject.PathFolder]
ProjectReferences: [1x0 slproject.ProjectReference]
Files: [1x30 slproject.ProjectFile]
RootFolder: 'C:\Work\Simulink\Projects\slexamples\airframe'
```

Output Arguments

proj — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open Simulink Project at the command line.

See Also

Functions

`simulinkproject` | `slproject.getCurrentProjects` | `slproject.loadProject`

Introduced in R2013a

slproject.getCurrentProjects

List all top-level Simulink projects

Syntax

```
projects = slproject.getCurrentProjects
```

Description

`projects = slproject.getCurrentProjects` returns a list of all top-level projects open in Simulink Project. Currently only one or zero top-level projects can be loaded. Returns an object array of 1 or 0 `ProjectManager` objects `projects` that you can use to manipulate the project programmatically. Use `slproject.getCurrentProjects` for project automation scripts.

If you execute `slproject.getCurrentProjects` inside a project shortcut, it returns only the project that the shortcut belongs to. If the shortcut belongs to a referenced project, it returns the referenced project.

Examples

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects

proj =
```

```
ProjectManager with properties:
```

```
    Name: 'Simulink Project Airframe Example'
```

```

Categories: [1x1 slproject.Category]
Shortcuts: [1x8 slproject.Shortcut]
ProjectPath: [1x7 slproject.PathFolder]
ProjectReferences: [1x0 slproject.ProjectReference]
Files: [1x30 slproject.ProjectFile]
RootFolder: 'C:\Work\Simulink\Projects\airframe'

```

Find Project Commands

Open the airframe project and create a project object.

```

sldemo_slproject_airframe
proj = slproject.getCurrentProject

```

```
proj =
```

```
ProjectManager with properties:
```

```

Name: 'Simulink Project Airframe Example'
Categories: [1x1 slproject.Category]
Shortcuts: [1x8 slproject.Shortcut]
ProjectPath: [1x7 slproject.PathFolder]
ProjectReferences: [1x0 slproject.ProjectReference]
Files: [1x30 slproject.ProjectFile]
RootFolder: 'C:\Work\Simulink\Projects\airframe'

```

Find out what you can do with your project.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:
```

```

addFile                findCategory
addFolderIncludingChildFiles findFile
close                  isLoaded
createCategory         listModifiedFiles
export                 refreshSourceControl

```

```

reload
removeCategory
removeFile

```

Examine Project Properties

After you get a project object, you can examine project properties.

Open the airframe project and create a project object.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
files =

    1x30 ProjectFile array with properties:

        Path
        Labels
        Revision
        SourceControlStatus
```

Examine the labels of the eighth file.

```
proj.Files(8).Labels
ans =

    Label with properties:

    File: 'C:\Work\airframe\data\system_model.sldd'
        Data: []
        DataType: 'none'
        Name: 'Design'
        CategoryName: 'Classification'
```

Get a particular file.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')
myfile =

    ProjectFile with properties:

    Path: 'C:\Temp\airframe\models\AnalogControl.mdl'
    Labels: [1x1 slproject.Label]
```

```
Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel
removeLabel
findLabel
```

Output Arguments

projects — Projects

object array of 1 or 0 `ProjectManager` objects

Projects, returned as an object array of 1 or 0 `ProjectManager` objects. Use the project object to manipulate the currently open Simulink Project at the command line.

Properties of `ProjectManager` objects in output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files
RootFolder	Full path to project root folder

Tips

Alternatively, you can use `simulinkproject` to get a project object, but `simulinkproject` also opens and gives focus to the Simulink Project Tool. Use

`simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` for project automation scripts.

See Also

Functions

`simulinkproject` | `slproject.getCurrentProject` | `slproject.loadProject`

Introduced in R2016a

slproject.loadProject

Load Simulink project

Syntax

```
slproject.loadProject(projectPath);  
proj = slproject.loadProject(projectPath)
```

Description

`slproject.loadProject(projectPath)` loads the project specified by the `.prj` file or folder `projectPath` in the Simulink Project Tool, and closes any currently open project.

`proj = slproject.loadProject(projectPath)` loads the project and returns a project object `proj` for manipulating the project. Use `slproject.loadProject` for project automation scripts.

Examples

Load Project

Load a project from a folder called `'C:/projects/project1/'`. Replace this path with the location of your project.

```
proj = slproject.loadProject('C:/projects/project1/')
```

Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects

proj =

    ProjectManager with properties:

        Name: 'Simulink Project Airframe Example'
        Categories: [1x1 slproject.Category]
        Shortcuts: [1x8 slproject.Shortcut]
        ProjectPath: [1x7 slproject.PathFolder]
        ProjectReferences: [1x0 slproject.ProjectReference]
        Files: [1x30 slproject.ProjectFile]
        RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

Find Project Commands

Get the Airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Find project commands.

```
methods(proj)
```

```
Methods for class slproject.ProjectManager:
```

```
addFile                findCategory
addFolderIncludingChildFiles  findFile
close                  isLoaded
createCategory         listModifiedFiles
export                 refreshSourceControl
```

```
reload
removeCategory
removeFile
```

Examine Project Properties

After you get a project object, you can examine project properties.

Get the airframe project.

```
sldemo_slproject_airframe  
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files  
  
files =  
  
    1x30 ProjectFile array with properties:  
  
        Path  
        Labels  
        Revision  
        SourceControlStatus
```

Examine the labels of the 13th file.

```
proj.Files(13).Labels  
  
ans =  
  
    Label with properties:  
  
    File: 'C:\Temp\airframe\models\AnalogControl.mdl'  
        Data: []  
        DataType: 'none'  
        Name: 'Design'  
        CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.mdl')  
  
myfile =  
  
    ProjectFile with properties:  
  
        Path: 'C:\Temp\airframe\models\AnalogControl.mdl'  
        Labels: [1x1 slproject.Label]  
        Revision: '2'  
        SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)

Methods for class slproject.ProjectFile:

addLabel
removeLabel
findLabel
```

Input Arguments

projectPath — Full path to project file or folder
character vector

Full path to project .prj file or the path to the project root folder, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

Output Arguments

proj — Project
project object

Project, returned as a project object. Use the project object to manipulate and explore the Simulink Project at the command line.

Properties of `proj` output argument.

Project Property	Description
Name	Project name
Categories	Categories of project labels
Shortcuts	Shortcut files in project
ProjectPath	Folders that the project puts on the MATLAB path
ProjectReferences	Folders that contain referenced projects
Files	Paths and names of project files

Project Property	Description
RootFolder	Full path to project root folder

See Also

Functions

`simulinkproject` | `slproject.getCurrentProjects`

Topics

“What Are Simulink Projects?”

Introduced in R2013a

listModifiedFiles

List modified files in Simulink project

Syntax

```
modifiedfiles = listModifiedFiles(proj)
```

Description

`modifiedfiles = listModifiedFiles(proj)` returns the list of modified project files in the project object `proj`. `listModifiedFiles` refreshes the source control statuses in the project and then returns an array of the project files which are listed in the Modified Files view of the Simulink Project.

Examples

Get a List of Modified Files in the Project

Open the airframe project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Modify a project model file by adding an arbitrary block.

```
open_system('AnalogControl')  
add_block('built-in/SubSystem', 'AnalogControl/test')  
save_system('AnalogControl')
```

Get all the modified files in the project.

```
modifiedfiles = listModifiedFiles(proj)  
  
modifiedfiles =
```

```
1x2 ProjectFile array with properties:
```

```
Path
Labels
Revision
SourceControlStatus
```

Observe two modified files. Compare with the Modified Files view in Simulink Project, where you can see a modified model file, and the corresponding `.SimulinkProject` definition file.

Get the second modified file.

```
modifiedfiles(2)
```

```
ans =
```

```
ProjectFile with properties:
```

```
Path: 'C:\Work\temp\slexamples\airframe2\models\AnalogControl.mdl'
      Labels: [1x1 slproject.Label]
      Revision: '2'
      SourceControlStatus: Modified
```

Observe the file `SourceControlStatus` property is `Modified`. Similarly, `listModifiedFiles` returns any files that are added, conflicted, deleted, etc., that show up in the Modified Files view in Simulink Project.

Get all the project files with a particular source control status. For example, get the files that are `Unmodified`.

```
proj.Files(ismember([proj.Files.SourceControlStatus], matlab.sourcecontrol.Status.Unmod
```

```
ans =
```

```
1x29 ProjectFile array with properties:
```

```
Path
Labels
```

Revision
SourceControlStatus

Input Arguments

proj — Project

project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

Output Arguments

modifiedfiles — Modified files

file object | array

Modified files, returned as an array of file objects.

See Also

Functions

`refreshSourceControl` | `simulinkproject`

Introduced in R2016a

listRequiredFiles

Get project file dependencies

Syntax

```
files = listRequiredFiles(proj, file)
```

Description

`files = listRequiredFiles(proj, file)` returns the files that the specified file requires to run.

Examples

Get Required Files

Open the airframe project, create a project object and get a file.

```
sldemo_slproject_airframe;  
proj = simulinkproject;  
file = 'models/slproject_f14.slx'
```

Get the files required by the specified file.

```
files = listRequiredFiles(project, file);
```

- “Perform Impact Analysis”

Input Arguments

proj — Project
project object

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

file — Path of file

character vector | project file object

Path of the file to add relative to the project root folder, including the file extension, specified as a character vector, an absolute file path or an instance of a project file object. The file must be within the root folder.

Example: `'models/myModelName.slx'`

Output Arguments

file — Project file

cell array of character vectors

Required files, returned as a cell array of character vectors.

See Also

`simulinkproject`

Topics

“Perform Impact Analysis”

Introduced in R2017a

refreshSourceControl

Update source control status of Simulink project files

Syntax

```
refreshSourceControl(proj)
```

Description

`refreshSourceControl(proj)` updates the source control status for all files in the Simulink project `proj`. Use this to get the latest source control information before querying the `SourceControlStatus` property on individual files.

If you use `listModifiedFiles` to find all modified files in the project, you do not need to call `refreshSourceControl` first.

Examples

Refresh Source Control Information on Files in the Project

Open the `airframe` project and create a project object.

```
sldemo_slproject_airframe;  
proj = simulinkproject;
```

Refresh source control status before querying individual files.

```
refreshSourceControl(proj)
```

Input Arguments

proj — Project
project

Project, specified as a project object. Use `simulinkproject` to create a project object to manipulate a Simulink Project at the command line.

See Also

Functions

`listModifiedFiles` | `simulinkproject`

Introduced in R2016a

solverprofiler.profileModel

Examine model for performance analysis

Syntax

```
res = solverprofiler.profileModel(model)
res = solverprofiler.profileModel(model, Name, Value)
```

Description

`res = solverprofiler.profileModel(model)` runs the Solver Profiler on the specified model and stores the results in `res`

`res = solverprofiler.profileModel(model, Name, Value)` specifies the Solver Profiler parameters using one or more `Name, Value` pair arguments.

Examples

Examine a Model with Default Settings

Examine the model `f14` using the default commandline settings.

```
model = 'f14';
res = solverprofiler.profileModel(model);
```

You can see a summary of the results by calling `res.summary`.

```
res.summary

struct with fields:

    solver: 'ode45'
    tStart: 0
    tStop: 60
```

```
absTol: 1.0000e-06
relTol: 1.0000e-04
hMax: 0.1000
hAverage: 0.0444
steps: 1352
profileTime: 0.9974
zcNumber: 0
resetNumber: 600
jacobianNumber: 0
exceptionNumber: 195
```

Open the results in the Solver Profiler dialog to visualize them. This step is equivalent to enabling OpenSP when calling the function.

```
solverprofiler.exploreResult(res)
```

Configure Solver Profiler and Examine a Model

Examine the model `ssc_actuator_custom_pneumatic` with a fully specified configuration.

```
model = 'ssc_actuator_custom_pneumatic';
res = solverprofiler.profileModel(model, ...
    'SaveStates' , 'on', ...
    'SaveSimscapeStates' , 'On', ...
    'SaveJacobian' , 'On', ...
    'StartTime' , 5, ...
    'StopTime' , 50, ...
    'BufferSize' , 10000, ...
    'TimeOut' , 5, ...
    'OpenSP' , 'On', ...
    'DataFullFile' , fullfile(pwd, 'ssc_profiling_result.mat'));
```

Input Arguments

model — Model to examine

character vector (default)

Name of model to be profiled, specified as a character vector.

Example: `h = solverprofiler.profileModel('vdp')`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'StartTime', 0, 'StopTime', 10, 'SaveStates', 'On'`

SaveStates — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Example: `'SaveStates', 'On'`

SaveSimscapeStates — Save states to file

off (default) | on

Enable this parameter to save states to a MAT-file.

Example: `'SaveSimscapeStates', 'On'`

SaveJacobian — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Solver Classification Criteria”.

Example: `'SaveJacobian', 'On'`

StartTime — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

Example: `'StartTime', 5`

StopTime — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

Example: `'StopTime', 30`

BufferSize — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

Example: `'BufferSize', 60000`

TimeOut — Maximum time to wait for solver to resume

positive scalar

Time, in seconds, to wait before the profiler stops running. This option is useful in situations where the simulation is unable to proceed. The profiler waits for the specified time and quits if no progress has been made.

Example: `'TimeOut', 10`

OpenSP — Open the Solver Profiler dialog box

off (default) | on

Choice to open the Solver Profiler dialog box after profiling has completed.

Example: `'OpenSP', 'On'`

DataFullFile — Path and name of saved results

character vector of full file path

By default, the profiling results are saved in a MAT-file named `model_@_dd_Month_YYYY_hh_mm_ss.mat` in the current working folder. You can specify a different file name by which to save the results in the current working folder. To save the file in a different location, specify the full path of the file, including the file name.

Example: 'DataFullFile', 'C:\Users\myusername\Documents\profiled
\vdp_results.mat'

Output Arguments

res — High-level summary of profiling results

structure

Profiling results, returned as a structure with the fields:

file — Full path and name of saved results

character vector

Path and name of the MAT-file where the results of the profiling operation are stored as MAT file. By default, they are stored in the current working folder with a file name having the pattern: model_@_dd_Month_yyyy_hh_mm_ss.mat. To store them in a different location or by a different name, specify DataFullFile when calling solverprofiler.profileModel.

summary — Summary of profiling results

structure

A high-level summary of the results of the profiling operation, returned as a structure. The summary provides an overview of the performance of the simulation and health of the model.

The summary structure contains these fields.

Field	Purpose	Values	Description
solver	Solver used by simulation	any of the solvers supported by Solver Profiler	Solver used by the simulation as configured in the Configuration Parameters for the model. For a list of all the solvers, see “Solver”. The Solver Profiler does not support models without any continuous states.
tStart	Start time of simulation	scalar	Start time, in seconds, for the simulation of the model during the profiling operation.

Field	Purpose	Values	Description
tStop	Stop time of simulation	scalar	Stop time, in seconds, of the simulation during the profiling operation. If StopTime is set to be earlier than the configured Stop Time of the model, the simulation stops at StopTime.
absTol	Absolute tolerance of the solver	positive scalar	Absolute tolerance of the solver as specified in the configuration settings for the model. For more information, see “Absolute tolerance”
relTol	Relative tolerance of the solver	positive scalar	Relative tolerance of the solver as specified in the configuration settings of the model. For more information, see “Relative tolerance”
hMax	Maximum step size	positive scalar	Largest time step that the solver can take. See “Max step size”.
hAverage	Average step size	positive scalar	Average size of the time step taken by the solver.
steps	Total steps taken	positive scalar	Total number of time steps taken by the solver.
profileTime	Time to profile	positive scalar	Time, in seconds, taken by the Solver Profiler to examine the model.
zcNumber	Total number of zero crossings	nonnegative scalar	Number of times zero crossings occur during the simulation of the model. The detection of these zero crossings incurs computational cost and can slow down the simulation. For information on zero-crossing detection, see “Zero-Crossing Detection”.
resetNumber	Number of solver resets	nonnegative scalar	Number of times the solver has to reset its parameters.

Field	Purpose	Values	Description
jacobi anNum ber	Number of Jacobian updates	nonnegative scalar	Number of times the solver Jacobian matrix is updated during a simulation. For more information, see “Explicit Versus Implicit Continuous Solvers”.
except ionNum ber	Number of solver exceptions	nonnegative scalar	Total number of solver exceptions encountered during a simulation. These exceptions are events where the solver is unable to solve the model states to the specified accuracy. As a result, the solver runs adjusted trials which increase computational cost.

Data Types: struct

Introduced in R2017b

start_simulink

Start Simulink without opening any windows

Syntax

```
start_simulink
```

Description

`start_simulink` starts Simulink without opening any models, the Start Page, or the Simulink Library Browser. Use this in startup scripts to start Simulink without any other window taking the focus away from the MATLAB Desktop. For example, use `start_simulink` in the MATLAB `startup.m` file, when starting MATLAB with the `-r` command line option, or in Simulink project startup scripts. Opening a model for the first time in a MATLAB session is much quicker after running `start_simulink`.

If you want to open the Simulink Start Page to create or open models, use the `simulink` function instead.

If you want to open the Library Browser, use `slLibraryBrowser`.

Examples

Start Simulink When Starting MATLAB

Use the `-r` command line option to start Simulink when starting MATLAB, without opening any windows.

On Windows, create a desktop shortcut with the following target:

```
matlabroot\bin\win64\matlab.exe -r start_simulink
```

On Linux® and Mac, enter:

```
matlab -r start_simulink
```

- “Automate Startup Tasks”

Topics

“Automate Startup Tasks”

Introduced in R2015b

slupdate

Replace blocks from previous releases with latest versions

Note `slupdate` will be removed in a future release. The `slupdate` command can only upgrade some parts of your model. Use the Upgrade Advisor instead. See “Model Upgrades”.

Syntax

```
slupdate('sys')
slupdate('sys', prompt)
AnalysisResult = slupdate('sys', 'OperatingMode', 'Analyze')
```

Description

`slupdate('sys')` replaces blocks in model `sys` from a previous release of Simulink software with the latest versions. The `slupdate` function alone cannot perform all upgrade checks on your model. Use the Upgrade Advisor to access the `slupdate` checks and also advice and fixes for all other upgrade checks. See “Model Upgrades”.

Note Best practice is to first open the model, and press CTRL+D to update the model, before you call `slupdate`.

`slupdate('sys', prompt)` specifies whether to prompt you before replacing a block. If `prompt` equals 1, the command prompts you before replacing the block. The prompt asks whether you want to replace the block. Valid responses are

- `y`

Replace the block (the default).

- `n`

Do not replace the block.

- `a`

Replace this and all subsequent obsolete blocks without further prompting.

If `prompt` equals 0, the command replaces all obsolete blocks without prompting you.

In addition to replacing obsolete blocks, `slupdate`

- Reconnects broken links to masked blocks in libraries provided by MathWorks to ensure that the model reflects changes made to the blocks in this release. This will overwrite any custom changes you made to the masks of these blocks.
- Updates obsolete configuration settings for the model.

`AnalysisResult = slupdate('sys', 'OperatingMode', 'Analyze')` performs only the analysis portion without updating or changing the model. This command analyzes referenced models, linked libraries, and S-functions, and then returns a data structure with the following fields:

- `Message` — character vector containing a message summarizing the results
- `blockList` — cell array listing blocks that need to be updated
- `blockReasons` — cell array listing reasons for updating the corresponding blocks
- `modelList` — cell array listing referenced models and the parent model
- `libraryList` — cell array listing non-MathWorks libraries referenced
- `configSetList` — for internal use
- `sfunList` — cell array listing S-functions referenced
- `sfunOK` — logical array representing S-function status, where `false` indicates that an S-function needs updating and `true` indicates otherwise
- `sfunType` — cell array listing apparent S-function type (e.g., `.mex`)

trim

Find trim point of dynamic system

Syntax

```
[x,u,y,dx] = trim('sys')
[x,u,y,dx] = trim('sys',x0,u0,y0)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)
```

Description

A trim point, also known as an equilibrium point, is a point in the parameter space of a dynamic system at which the system is in a steady state. For example, a trim point of an aircraft is a setting of its controls that causes the aircraft to fly straight and level. Mathematically, a trim point is a point where the system's state derivatives equal zero. `trim` starts from an initial point and searches, using a sequential quadratic programming algorithm, until it finds the nearest trim point. You must supply the initial point implicitly or explicitly. If `trim` cannot find a trim point, it returns the point encountered in its search where the state derivatives are closest to zero in a min-max sense; that is, it returns the point that minimizes the maximum deviation from zero of the derivatives. `trim` can find trim points that meet specific input, output, or state conditions, and it can find points where a system is changing in a specified manner, that is, points where the system's state derivatives equal specific nonzero values.

`[x,u,y,dx] = trim('sys')` finds the equilibrium point of the model `'sys'`, nearest to the system's initial state, `x0`. Specifically, `trim` finds the equilibrium point that minimizes the maximum absolute value of $[x-x_0, u, y]$. If `trim` cannot find an equilibrium point near the system's initial state, it returns the point at which the system is nearest to equilibrium. Specifically, it returns the point that minimizes $\text{abs}(dx)$ where `dx` represents the derivative of the system. You can obtain `x0` using this command.

```
[sizes,x0,xstr] = sys([],[],[],0)
```

`[x,u,y,dx] = trim('sys',x0,u0,y0)` finds the trim point nearest to `x0, u0, y0`, that is, the point that minimizes the maximum value of

```
abs([x-x0; u-u0; y-y0])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)` finds the trim point closest to `x0, u0, y0` that satisfies a specified set of state, input, and/or output conditions. The integer vectors `ix, iu, and iy` select the values in `x0, u0, and y0` that must be satisfied. If `trim` cannot find an equilibrium point that satisfies the specified set of conditions exactly, it returns the nearest point that satisfies the conditions, namely,

```
abs([x(ix)-x0(ix); u(iu)-u0(iu); y(iy)-y0(iy)])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)` finds specific nonequilibrium points, that is, points at which the system's state derivatives have some specified nonzero value. Here, `dx0` specifies the state derivative values at the search's starting point and `idx` selects the values in `dx0` that the search must satisfy exactly.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)` specifies an array of optimization parameters that `trim` passes to the optimization function that it uses to find trim points. The optimization function, in turn, uses this array to control the optimization process and to return information about the process. `trim` returns the `options` array at the end of the search process. By exposing the underlying optimization process in this way, `trim` allows you to monitor and fine-tune the search for trim points.

The following table describes how each element affects the search for a trim point. Array elements 1, 2, 3, 4, and 10 are particularly useful for finding trim points.

No.	Default	Description
1	0	Specifies display options. 0 specifies no display; 1 specifies tabular output; -1 suppresses warning messages.
2	10^{-4}	Precision the computed trim point must attain to terminate the search.
3	10^{-4}	Precision the trim search goal function must attain to terminate the search.
4	10^{-6}	Precision the state derivatives must attain to terminate the search.

No.	Default	Description
5	N/A	Not used.
6	N/A	Not used.
7	N/A	Used internally.
8	N/A	Returns the value of the trim search goal function (λ in goal attainment).
9	N/A	Not used.
10	N/A	Returns the number of iterations used to find a trim point.
11	N/A	Returns the number of function gradient evaluations.
12	0	Not used.
13	0	Number of equality constraints.
14	100*(Number of variables)	Maximum number of function evaluations to use to find a trim point.
15	N/A	Not used.
16	10^{-8}	Used internally.
17	0.1	Used internally.
18	N/A	Returns the step length.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)`
sets the time to t if the system is dependent on time.

Note If you fix any of the state, input or output values, `trim` uses the unspecified free variables to derive the solution that satisfies these constraints.

Examples

Consider a linear state-space system modeled using a State-Space block

$$\dot{x} = Ax + Bu$$

$$y = Cx + Du$$

The A , B , C , and D matrices to enter at the command line or in the block parameters dialog are:.

```
A = [-0.09 -0.01; 1 0];
B = [ 0 -7; 0 -2];
C = [ 0 2; 1 -5];
D = [-3 0; 1 0];
```

Example 1

To find an equilibrium point in this model called `sys`, use:

```
[x,u,y,dx,options] = trim('sys')
x =
    0
    0
u =
    0
    0
y =
    0
    0
dx =
    0
    0
```

The number of iterations taken is:

```
options(10)
ans =
     7
```

Example 2

To find an equilibrium point near $x = [1;1]$, $u = [1;1]$, enter

```
x0 = [1;1];
u0 = [1;1];
[x,u,y,dx,options] = trim('sys', x0, u0);
x =
    1.0e-13 *
   -0.5160
   -0.5169
u =
    0.3333
    0.0000
```

```

y =
  -1.0000
   0.3333
dx =
  1.0e-12 *
   0.1979
   0.0035

```

The number of iterations taken is

```

options(10)
ans =
    25

```

Example 3

To find an equilibrium point with the outputs fixed to 1, use:

```

y = [1;1];
iy = [1;2];
[x,u,y,dx] = trim('sys', [], [], y, [], [], iy)
x =
    0.0009
   -0.3075
u =
   -0.5383
    0.0004
y =
    1.0000
    1.0000
dx =
    1.0e-15 *
   -0.0170
    0.1483

```

Example 4

To find an equilibrium point with the outputs fixed to 1 and the derivatives set to 0 and 1, use

```

y = [1;1];
iy = [1;2];
dx = [0;1];

```

```
idx = [1;2];
[x,u,y,dx,options] = trim('sys',[],[],y,[],[],iy,dx,idx)
x =
    0.9752
   -0.0827
u =
   -0.3884
   -0.0124
y =
    1.0000
    1.0000
dx =
    0.0000
    1.0000
```

The number of iterations taken is

```
options(10)
ans =
    13
```

Limitations

The trim point found by `trim` starting from any given initial point is only a local value. Other, more suitable trim points may exist. Thus, if you want to find the most suitable trim point for a particular application, it is important to try a number of initial guesses for `x`, `u`, and `y`.

Algorithms

`trim` uses a sequential quadratic programming algorithm to find trim points. See “Sequential Quadratic Programming (SQP)” (Optimization Toolbox) for a description of this algorithm.

Introduced before R2006a

tunablevars2parameterobjects

Create Simulink parameter objects from tunable parameters

Syntax

```
tunablevars2parameterobjects ('modelName')  
tunablevars2parameterobjects ('modelName', class)
```

Description

`tunablevars2parameterobjects ('modelName')` creates `Simulink.Parameter` objects in the base workspace for the variables listed in the specified model's Tunable Parameters dialog, then deletes the source information from the dialog. To preserve the information, save the resulting Simulink parameter objects into a MAT-file.

If a tunable variable is already defined as a numeric variable in the base workspace, the variable will be replaced by a parameter object and the original variable will be copied to the object's Value property.

If a tunable variable is already defined as a Simulink parameter object, the object will not be modified but the information for the variable will still be deleted from the Tunable Parameters dialog.

If a tunable variable is defined as any other class of variable, the variable will not be modified and the information for the variable will not be deleted from the Tunable Parameters dialog.

`tunablevars2parameterobjects ('modelName', class)` creates objects of the specified class rather than `Simulink.Parameter` objects.

Input Arguments

modelName

Model name or handle

class

Parameter class to use for creating objects

Default: `Simulink.Parameter`

See Also

`Simulink.Parameter`

Topics

“Tunable Parameters”

Introduced in R2007b

ufix

Create `Simulink.NumericType` object describing unsigned fixed-point data type

Syntax

```
a = ufix(WordLength)
```

Description

`ufix(WordLength)` returns a `Simulink.NumericType` object that describes an unsigned fixed-point data type with the specified word length and unspecified scaling.

Note `ufix` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `ufix(WordLength)` with `fixdt(0,WordLength)`.

Examples

Define a 16-bit unsigned fixed-point data type.

```
a = ufix(16)
```

```
a =
```

```
NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: unspecified scaling'  
    Signedness: 'Unsigned'  
    WordLength: 16  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

See Also

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufrac` | `uint`

Introduced before R2006a

ufrac

Create `Simulink.NumericType` object describing unsigned fractional data type

Syntax

```
a = ufrac(WordLength)
a = ufrac(WordLength, GuardBits)
```

Description

`ufrac(WordLength)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type with a word size given by `WordLength`.

`ufrac(WordLength, GuardBits)` returns a `Simulink.NumericType` object that describes the data type of an unsigned fractional data type. The total word size is given by `WordLength` with `GuardBits` bits located to the left of the binary point.

Note `ufrac` is a legacy function. In new coder, use `fixdt` instead. In existing code, replace `ufrac(WordLength)` with `fixdt(0, WordLength, WordLength)` and `ufrac(WordLength, GuardBits)` with `fixdt(0, WordLength, (WordLength - GuardBits))`.

Examples

Define an 8-bit unsigned fractional data type with 4 guard bits. Note that the range of this data type is from 0 to $(1 - 2^{-8}) \cdot 2^4 = 15.9375$.

```
a = ufrac(8,4)
```

```
a =
```

```
    NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: binary point scaling'
```

```
Signedness: 'Unsigned'  
WordLength: 8  
FractionLength: 4  
  IsAlias: 0  
  DataScope: 'Auto'  
HeaderFile: ''  
Description: ''
```

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufix` | `uint`

Introduced before R2006a

uint

Create `Simulink.NumericType` object describing unsigned integer data type

Syntax

```
a = uint(WordLength)
```

Description

`uint(WordLength)` returns a `Simulink.NumericType` object that describes the data type of an unsigned integer with a word size given by `WordLength`.

Note `uint` is a legacy function. In new code, use `fixdt` instead. In existing code, replace `uint(WordLength)` with `fixdt(0,WordLength,0)`.

Examples

Define a 16-bit unsigned integer.

```
a = uint(16)
```

```
a =
```

```
NumericType with properties:
```

```
    DataTypeMode: 'Fixed-point: binary point scaling'  
    Signedness: 'Unsigned'  
    WordLength: 16  
    FractionLength: 0  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

`Simulink.NumericType` | `fixdt` | `float` | `sfix` | `sfrac` | `sint` | `ufix` | `ufrac`

Introduced before R2006a

unpack

Extract signal logging objects from signal logs and write them into MATLAB workspace

Syntax

```
log.unpack  
tsarray.unpack  
log.unpack('systems')  
log.unpack('all')
```

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`log.unpack` or `unpack(log)` extracts the top level elements of the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named **log** (e.g., `log.out`).

`log.unpack('systems')` or `unpack(log, 'systems')` extracts `Simulink.Timeseries` and `Simulink.TsArray` objects from the `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object named `log`. This

`command` does not extract `Simulink.Timeseries` objects from `Simulink.TsArray` objects nor does it write intermediate `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` objects to the MATLAB workspace.

`log.unpack('all')` or `unpack(log, 'all')` extracts all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

`tsarray.unpack` extracts the time-series objects of class `Simulink.Timeseries` from the `Simulink.TsArray` object named `tsarray`.

`Simulink.ModelDataLogs` | `Simulink.SubsysDataLogs` | `Simulink.Timeseries`
| `Simulink.TsArray` | `who` | `whos`

Topics

“Export Signal Data Using Signal Logging”

Introduced before R2006a

upgradeadvisor

Open Upgrade Advisor

Syntax

```
upgradeadvisor('modelname')  
upgrader = upgradeadvisor('modelname')
```

Description

`upgradeadvisor('modelname')` opens the Upgrade Advisor for the model specified by `modelname`. This command loads the model if necessary, but does not open it in the Simulink Editor. Use the Upgrade Advisor to help you upgrade and improve models with the current release.

`upgrader = upgradeadvisor('modelname')` returns an object that you can use to analyze and upgrade a hierarchy of models programmatically. If you specify an output, then the Upgrade Advisor does not open. You can use the methods `analyze` and `upgrade` with the `upgrader` object output of the `upgradeadvisor` function.

- To programmatically analyze a model for recommended upgrades, create an `upgrader` object and use the method `analyze`.
- To programmatically analyze and upgrade a model, create an `upgrader` object and use the method `upgrade`.
- To configure options before running `analyze` or `upgrade`, see “Examples” on page 2-948.

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Simulink Project”.

Input Arguments

modelName

Name or handle to the model, specified as a character vector.

Output Arguments

upgrader

Object for analyzing and upgrading the hierarchy of models programmatically.

Examples

Open Upgrade Advisor on a Model

To open the Upgrade Advisor on the vdp example model:

```
upgradeadvisor('vdp')
```

To open the Upgrade Advisor on the currently selected model:

```
upgradeadvisor(bdroot)
```

Programmatically Analyze and Upgrade a Model

- 1 Get an upgrader object. This example uses a writable copy of the vdp model.

```
load_system('vdp'); save_system('vdp',fullfile(tempdir, 'myvdp'))
upgrader = upgradeadvisor('myvdp')
```

```
upgrader =
```

```
Upgrader with properties:
```

```
ChecksToSkip: {}
SkipLibraries: 0
SkipBlocksets: 1
OneLevelOnly: 0
```

```
ShowReport: 1
RootModel: 'myvdp'
ReportFile: ''
```

- 2 To analyze the model for recommended upgrades, following library links and model references, run:

```
analyze(upgrader);
```

You see a report of issues found.

- 3 To analyze the model and automatically fix all issues (where automated fixes are available), run:

```
upgrade(upgrader);
```

This command follows library links and model references, and saves any fixes to the model files.

You see a report of issues found and actions taken.

- 4 To find the location of the report:

```
reportLocation = upgrader.ReportFile
```

- 5 You can configure options before running analyze or upgrade.

- Specify checks to skip before running analyze or upgrade. Find the ID for a check in the Upgrade Advisor by right-clicking the check and selecting **Send Check ID to Workspace**. Then set the `advisor.ChecksToSkip` property. For example:

```
advisor.ChecksToSkip = {'mathworks.design.CSStoVSSConvert'};
upgrade(upgrader);
```

- Specify running the Upgrade Advisor on only the current model without following library links or model references:

```
upgrader.OneLevelOnly = true; % default false
```

- Specify running the Upgrade Advisor on the current model, following model references but not library links:

```
upgrader.SkipLibraries = true; % default false
```

- Specify running the Upgrade Advisor on the current model, including upgrading files in blocksets or toolboxes:

```
upgrader.SkipBlocksets = false; % default true
```

By default, the Upgrade Advisor does not upgrade files in blocksets or toolboxes. The Upgrade Advisor detects blocksets from the output of `ver` and the existence of a `Contents.m` file.

- To turn off showing the report after analyze or upgrade, set:

```
upgrader.ShowReport = false; % default true
```

Tip For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Simulink Project”.

Tips

- The Upgrade Advisor can identify cases where you can benefit by changing your model to use new features and settings in Simulink. The Advisor provides advice for transitioning to new technologies, and upgrading a model hierarchy.

The Upgrade Advisor can also identify cases where a model will not work because changes and improvements in Simulink require changes to a model.

The Upgrade Advisor offers options to perform recommended actions automatically or instructions for manual fixes.

Alternatives

You can also open the Upgrade Advisor from the Simulink Editor, by selecting **Analysis > Model Advisor > Upgrade Advisor**.

Alternatively, you can open the Upgrade Advisor from the Model Advisor. In the Model Advisor, under `By Task` checks, expand the folder `Upgrading to the Current Simulink Version` and select the check `Open the Upgrade Advisor`.

“Upgrade Simulink Models Using a Simulink Project”

Introduced in R2012b

view_mdrefs

Display graph of model reference dependencies

Syntax

```
view_mdrefs('modelName')
```

Description

`view_mdrefs('modelName')` launches the Model Dependency Viewer, which displays a graph of model reference dependencies for the model specified by `modelName`. The nodes in the graph represent Simulink models. The directed lines indicate model dependencies.

The default display omits library blocks. You could see this same display by opening `modelName` and choosing **Analysis > Model Dependencies > Model Dependency Viewer > Models Only** from the model menu. Use **Analysis > Model Dependencies > Model Dependency Viewer** to see other dependency displays.

The Model Dependency Viewer is the same tool, and provides the same options, whether you launch it by typing `view_mdrefs('modelName')` or by using the Simulink GUI. To see an example of using the Model Dependency Viewer, type `sldemo_mdref_depgraph` in the MATLAB Command Window.

Introduced before R2006a

who

List names of top-level data logging objects in Simulink `ModelDataLogs` data log

Syntax

```
log.who  
tsarray.who  
log.who('systems')  
log.who('all')
```

Description

Note To list names of top-level data logging objects in Dataset format, use `Simulink.SimulationData.Dataset.find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the Dataset format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use Dataset format.

You can convert signal logging data from `ModelDataLogs` to Dataset format. Converting to Dataset format makes it easier to post-process with other logged data (for example, logged states), which can also use Dataset format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`log.who` or `who(log)` lists the names of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.who` or `who(tsarray)` lists the names of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.who('systems')` or `who(log, 'systems')` lists the names of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.who('all')` or `who(log, 'all')` lists the names of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray`, or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `who`, execute `help who` in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

whos

List names and types of top-level data logging objects in Simulink ModelDataLogs data log

Syntax

```
log.whos  
tsarray.whos  
log.whos('systems')  
log.whos('all')
```

Description

Note To list names of top-level data logging objects in Dataset format, use `Simulink.SimulationData.Dataset.find`.

The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

`log.whos` or `whos(log)` lists the names and types of the top-level signal logging objects contained by `log`, where `log` is the handle of a `Simulink.ModelDataLogs` object name.

`tsarray.whos` or `whos(tsarray)` lists the names and types of `Simulink.TimeSeries` objects contained by the `Simulink.TsArray` object named `tsarray`.

`log.whos('systems')` or `whos(log, 'systems')` lists the names and types of all signal logging objects contained by `log` except for `Simulink.Timeseries` objects stored in `Simulink.TsArray` objects contained by `log`.

`log.whos('all')` or `whos(log, 'all')` lists the names and types of all the `Simulink.Timeseries` objects contained by the `Simulink.ModelDataLogs`, `Simulink.TsArray` or `Simulink.SubsysDataLogs` object named `log`.

For information about other uses of `whos`, execute `help whos` in the MATLAB Command Window.

Tip To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Mask Icon Drawing Commands

color	Change drawing color of subsequent mask icon drawing commands
disp	Display text on masked subsystem icon
dpoly	Display transfer function on masked subsystem icon
droots	Display transfer function on masked subsystem icon
fprintf	Display variable text centered on masked subsystem icon
image	Display RGB image on masked subsystem icon
patch	Draw color patch of specified shape on masked subsystem icon
plot	Draw graph connecting series of points on masked subsystem icon
port_label	Draw port label on masked subsystem icon
text	Display text at specific location on masked subsystem icon

color

Change drawing color of subsequent mask icon drawing commands

Syntax

```
color(colorstr)
```

Here, *colorostr* must be a character vector.

Description

`color(colorstr)` sets the drawing color of all subsequent mask drawing commands to the color specified by the string *colorstr*.

colorstr must be one of the following supported color strings.

```
blue  
green  
red  
cyan  
magenta  
yellow  
black
```

Entering any other string or specifying the color using RGB values results in a warning at the MATLAB command prompt; Simulink ignores the color change. The specified drawing color does not influence the color used by the `patch` or `image` drawing commands.

Examples

The following commands

```
color('cyan');  
roots([-1], [-2 -3], 4)
```

```
color('magenta')
port_label('input',1,'in')
port_label('output',1,'out')
```

draw the following mask icon.

See Also

roots | port_label

Introduced in R2006b

disp

Display text on masked subsystem icon

Syntax

```
disp(text)
disp(text, 'texmode', 'on')
```

Description

`disp(text)` displays *text* centered on the block icon. *text* is any MATLAB expression that evaluates to a string.

`disp(text, 'texmode', 'on')` allows you to use TeX formatting commands in *text*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” (MATLAB) for information on the TeX formatting commands supported by Simulink software.

Examples

The following command

```
disp({'\itEquation:' \alpha^2 + \beta^2 \rightarrow \gamma^2,
\chi, \phi_3 = {\bfcool}'}, 'texmode','on')
```

draws the equation that appears on this masked block icon.

See Also

`fprintf` | `port_label` | `text`

Introduced in R2007a

dpoly

Display transfer function on masked subsystem icon

Syntax

```
dpoly(num, den)
```

```
dpoly(num, den, 'character')
```

Description

`dpoly(num, den)` displays the transfer function whose numerator is *num* and denominator is *den*.

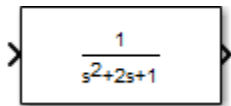

`dpoly(num, den, 'character')` specifies the name of the transfer function independent variable. The default is *s*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a continuous transfer function in descending powers of *s*, enter

```
dpoly(num, den)
```

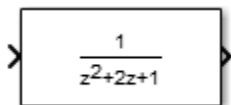

For example, for `num = [0 0 1];` and `den = [1 2 1]` the icon looks like:

$$\frac{1}{s^2+2s+1}$$

- To display a discrete transfer function in descending powers of *z*, enter

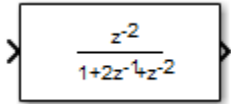

```
dpoly(num, den, 'z')
```

For example, for `num = [0 0 1];` and `den = [1 2 1];` the icon looks like:

$$\frac{1}{z^2+2z+1}$$

- To display a discrete transfer function in ascending powers of $1/z$, enter
`dpoly(num, den, 'z-')`

For example, for *num* and *den* as defined previously, the icon looks like:

$$\frac{z^{-2}}{1+2z^{-1}+z^{-2}}$$

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `roots` | `port_label` | `text`

droots

Display transfer function on masked subsystem icon

Syntax

```
droots(zero, pole, gain)
droots(zero, pole, gain, 'z')
droots(zero, pole, gain, 'z-')
```

Description

`droots(zero, pole, gain)` displays the transfer function whose zero is *zero*, pole is *pole*, and gain is *gain*.

`droots(zero, pole, gain, 'z')` and `droots(zero, pole, gain, 'z-')` expresses the transfer function in terms of *z* or *1/z*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a zero-pole gain transfer function, enter

```
droots(z, p, k)
```

For example, the preceding command creates this icon for these values:

```
z = []; p = [-1 -1]; k = 1;
```

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

See Also

`disp` | `dpoly` | `port_label` | `text`

Introduced in R2007a

fprintf

Display variable text centered on masked subsystem icon

Syntax

```
fprintf(text)
fprintf(format, var)
```

Description

The `fprintf` command displays formatted text centered on the icon and can display *format* along with the contents of *var*.

Note While this `fprintf` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

Examples

The command

```
fprintf('Hello');
```

displays the text 'Hello' on the icon.

The command

```
fprintf('Juhi = %d',17);
```

uses the decimal notation format (%d) to display the variable 17.

See Also

`disp` | `port_label` | `text`

Introduced before R2006a

image

Display RGB image on masked subsystem icon

Syntax

```
image(a)  
image(a, position)  
image(a, position, rotation)
```

Description

`image(a)` displays the image *a*, where *a* is an *m*-by-*n*-by-3 array of RGB values. If necessary, use the MATLAB commands `imread` and `ind2rgb` to read and convert bitmap files (such as GIF) to the necessary matrix format.

`image(a, position)` creates the image at the specified position as follows.

Position	Description
<code>[x, y, w, h]</code>	Position (<i>x</i> , <i>y</i>) and size (<i>w</i> , <i>h</i>) of the image where the position is relative to the lower-left corner of the mask. The image scales to fit the specified size.
<code>'center'</code>	Center of the mask
<code>'top-left'</code>	Top left corner of the mask, unscaled
<code>'bottom-left'</code>	Bottom left corner of the mask, unscaled
<code>'top-right'</code>	Top right corner of the mask, unscaled
<code>'bottom-right'</code>	Bottom right corner of the mask, unscaled

`image(a, position, rotation)` allows you to specify whether the image rotates ('on') or remains stationary ('off') as the icon rotates. The default is 'off'.

Note Images in formats `.cur`, `.hdf4`, `.ico`, `.pcx`, `.ras`, `.xwd`, `.svg` (full version) cannot be used as block mask images.

Examples

You can use different commands depending on your requirement to add an image. These commands can be added in the **Icon & Ports** pane of the Mask Editor dialog box.

Syntax	Description
<code>image('icon.jpg')</code>	Reads the icon image from a JPEG file named <code>icon.jpg</code> in the MATLAB path.
<code>[data, map]=image('label.gif')</code> <code>pic=ind2rgb(data,map);</code>	Reads and converts a GIF file, <code>label.gif</code> , to the appropriate matrix format.
<code>image(pic)</code>	Reads the converted label image.

See Also

`patch` | `plot`

Introduced before R2006a

patch

Draw color patch of specified shape on masked subsystem icon

Syntax

```
patch(x, y)  
patch(x, y, [r g b])
```

Description

`patch(x, y)` creates a solid patch having the shape specified by the coordinate vectors `x` and `y`. The patch's color is the current foreground color.

`patch(x, y, [r g b])` creates a solid patch of the color specified by the vector `[r g b]`, where `r` is the red component, `g` the green, and `b` the blue. For example,

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

Examples

The command

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

Pyramid

See Also

image | plot

Introduced before R2006a

plot

Draw graph connecting series of points on masked subsystem icon

Syntax

```
plot(Y)  
plot(X1, Y1, X2, Y2, ...)
```

Description

`plot(Y)` plots, for a vector *Y*, each element against its index. If *Y* is a matrix, it plots each column of the matrix as though it were a vector.

`plot(X1, Y1, X2, Y2, ...)` plots the vectors *Y1* against *X1*, *Y2* against *X2*, and so on. Vector pairs must be the same length and the list must consist of an even number of vectors.

Plot commands can include `NaN` and `inf` values. When Simulink software encounters `NaN`s or `infs`, it stops drawing, and then begins redrawing at the next numbers that are not `NaN` or `inf`. The appearance of the plot on the icon depends on the units defined by the **Icon units** option in the Mask Editor.

Simulink software displays three question marks (? ? ?) in the block icon and issues warnings in these situations:

- When you have not defined values for the parameters used in the drawing commands (for example, when you first create the mask, but have not yet entered values in the Mask Settings dialog box)
- When you enter a masked block parameter or drawing command incorrectly

Examples

The command

```
plot([0 1 5], [0 0 4])
```

generates the plot that appears on the icon for the Ramp block, in the Sources library.

See Also

image

Introduced before R2006a

port_label

Draw port label on masked subsystem icon

Syntax

```
port_label('port_type', port_number, 'label')  
port_label('port_type', port_number, 'label', 'texmode', 'on')
```

Description

`port_label('port_type', port_number, 'label')` draws a label on a port. Valid values for `port_type` include the following.

Value	Description
input	Simulink input port
output	Simulink output port
lconn	Physical Modeling connection port on the left side of a masked subsystem
rconn	Physical Modeling connection port on the right side of a masked subsystem
Enable	Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem.
trigger	Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem.
action	Label for the action port in a masked Switch Case Action Subsystem.

The input argument `port_number` is an integer, and `label` is text specifying the port's label.

Note Physical Modeling port labels are assigned based on the nominal port location. If the masked subsystem has been rotated or flipped, for example, a port labeled using 'lconn' as the `port_type` may not appear on the left side of the block.

`port_label('port_type', port_number, 'label', 'texmode', 'on')` lets you use TeX formatting commands in `label`. The TeX formatting commands allow you to include symbols and Greek letters in the port label. See “Interpreter” (MATLAB) for information on the TeX formatting commands that the Simulink software supports.

Examples

The command

```
port_label('input', 1, 'a')
```

defines `a` as the label of input port 1.

The command

```
port_label('Enable','En')
```

defines `En` as the label of Enable port.

The command

```
port_label('trigger','Tr')
```

defines `Tr` as the label of trigger port.

The command

```
port_label('action','Switch():')
```

defines `Switch():` as the label of action port.

The command

```
port_label('trigger','$\sqrt{m}$','interpreter','tex')
```

defines the label of trigger port with latex interpretation.

The commands

```
disp('Card\nSwapper');  
port_label('input',1,'\spadesuit','texmode','on');  
port_label('output',1,'\heartsuit','texmode','on');
```

draw playing card symbols as the labels of the ports on a masked subsystem.

See Also

`disp` | `fprintf` | `text`

Introduced before R2006a

text

Display text at specific location on masked subsystem icon

Syntax

```
text(x, y, 'text')
text(x, y, 'text', 'horizontalAlignment', 'halign',
     'verticalAlignment', 'valign')
text(x, y, 'text', 'texmode', 'on')
```

Description

The `text` command places a character vector at a location specified by the point (x, y) whose units are defined by the **Icon units** option in the Mask Editor.

`text(x,y, text, 'texmode', 'on')` allows you to use TeX formatting commands in `text`. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” (MATLAB) for information on the TeX formatting commands supported by Simulink software.

You can optionally specify the horizontal and/or vertical alignment of the text relative to the point (x, y) in the `text` command.

The `text` command offers the following horizontal alignment options.

Option	Aligns
'left'	The left end of the text at the specified point
'right'	The right end of the text at the specified point
'center'	The center of the text at the specified point

The `text` command offers the following vertical alignment options.

Option	Aligns
'base'	The baseline of the text at the specified point
'bottom'	The bottom line of the text at the specified point

Option	Aligns
'middle'	The midline of the text at the specified point
'cap'	The capitals line of the text at the specified point
'top'	The top of the text at the specified point

Note While this `text` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

Examples

Text Alignment

Center the mask icon text foobar.

```
text(0.5, 0.5, 'foobar', 'horizontalAlignment', 'center')
```

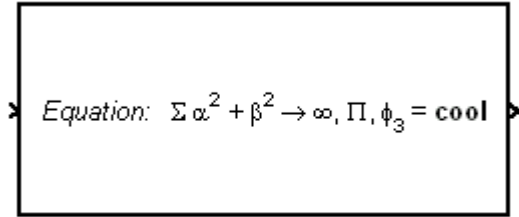

Equation in Mask Icon

Draw a left-aligned equation as the mask icon.

In the Icons & Ports dialog of the Mask Editor, set **Icon units** to Normalized.

In the **Icon drawing commands** text box, enter the following command.

```
text(.05,.5,'\{itEquation:} \Sigma \alpha^2 +  
\beta^2 \rightarrow \infty, \Pi, \phi_3 = {\bfcool}',  
'hor','left','texmode','on')
```

Equation: $\Sigma \alpha^2 + \beta^2 \rightarrow \infty, \Pi, \phi_3 = \text{cool}$

Equation

Simulink Debugger Commands

ashow	Show algebraic loop
atrace	Set algebraic loop trace level
bafter	Insert breakpoint after specified method
break	Insert breakpoint before specified method
bshow	Show specified block
clear	Clear breakpoints from model
continue	Continue simulation
disp	Display block's I/O when simulation stops
ebreak	Enable (or disable) breakpoint on solver errors
elist	List simulation methods in order in which they are executed during simulation
emode	Toggle model execution between accelerated and normal mode
etrace	Enable or disable method tracing
help	Display help for debugger commands
nanbreak	Set or clear nonfinite value break mode
next	Advance simulation to start of next method at current level in model's execution list
probe	I/O and state data for blocks
quit	Stop simulation debugger
rbreak	Break simulation before solver reset
run	Run simulation to completion
slist	Sorted list of model blocks
states	Current state values
status	Debugging options in effect
step	Advance simulation by one or more methods
stimes	Model sample times
stop	Stop simulation
strace	Set solver trace level
systems	List nonvirtual systems of model
tbreak	Set or clear time breakpoint
trace	Display block's I/O each time block executes
undisp	Remove block from debugger's list of display points
4-2 untrace	Remove block from debugger's list of trace points
where	Display current location of simulation in simulation loop
xbreak	Break when debugger encounters step-size-limiting state

ashow

Show algebraic loop

Syntax

```
ashow <gcb | s:b | s#n | clear>
```

```
as <gcb | s:b | s#n | clear>
```

Arguments

<code>gcb</code>	Current block.
<code>s:b</code>	The block whose system index is <code>s</code> and block index is <code>b</code> .
<code>s#n</code>	The algebraic loop numbered <code>n</code> in system <code>s</code> .
<code>clear</code>	Switch that clears loop coloring.

Description

`ashow` without any arguments lists all of a model's algebraic loops in the MATLAB Command Window. `ashow gcb` or `ashow s:b` highlights the algebraic loop that contains the specified block. `ashow s#n` highlights the `n`th algebraic loop in system `s`. The `ashow clear` command removes algebraic loop highlights from the model diagram.

See Also

`atrace` | `slist`

Introduced before R2006a

atrace

Set algebraic loop trace level

Syntax

```
atrace level
```

```
at level
```

Arguments

`level` Trace level (0 = none, 4 = everything).

Description

The `atrace` command sets the algebraic loop trace level for a simulation.

Command	Displays for Each Algebraic Loop
<code>atrace 0</code>	No information
<code>atrace 1</code>	The loop variable solution, the number of iterations required to solve the loop, and the estimated solution error
<code>atrace 2</code>	Same as level 1
<code>atrace 3</code>	Level 2 plus Jacobian matrix used to solve loop
<code>atrace 4</code>	Level 3 plus intermediate solutions of the loop variable

See Also

`states` | `systems`

Introduced before R2006a

bafter

Insert breakpoint after specified method

Syntax

```
bafter
```

```
ba
```

```
bafter m:mid
```

```
bafter <sysIdx:blkIdx | gcb> [meth] [tid:TID]
```

```
bafter <s:sysIdx | gcs> [meth] [tid:TID]
```

```
bafter model [meth] [tid:TID]
```

Arguments

<i>mid</i>	Method ID
<i>sysIdx:blkId</i>	Block ID
<i>x</i>	
gcb	Currently selected block
<i>sysIdx</i>	System ID
gcs	Currently selected system
model	Currently selected model
<i>meth</i>	A method name, e.g., <code>Outputs.Major</code>
TID	Task ID

Description

`bafter` inserts a breakpoint after the current method.

Instead of `bafter`, you can use the short form of `ba` with any of the syntaxes.

`bafter m:mid` inserts a breakpoint after the method specified by `mid` (see “Method ID”).

`bafter sysIdx:blkIdx` inserts a breakpoint after each invocation of the method of the block specified by `sysIdx:blkIdx` (see “Block ID”) in major time steps. `bafter gcb` inserts a breakpoint after each invocation of a method of the currently selected block (see `gcb`) in major times steps.

`bafter s:sysIdx` inserts a breakpoint after each method of the root system or nonvirtual subsystem specified by the system ID: `sysIdx`.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`bafter gcs` inserts a breakpoint after each method of the currently selected nonvirtual system.

`bafter model` inserts a breakpoint after each method of the currently selected model.

The optional `meth` parameter allow you to set a breakpoint after a particular block, system, or model method and task. For example, `bafter gcb Outputs` sets a breakpoint after the `Outputs` method of the currently selected block.

The optional TID parameter allows you to set a breakpoint after invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `bafter gcs Outputs tid:2` sets a breakpoint after the invocation of the subsystem's `Outputs` method that occurs when task 2 is active.

`break` | `clear` | `ebreak` | `nanbreak` | `rbreak` | `slist` | `systems` | `tbreak` | `where`
| `xbreak` | `zcbreak`

Introduced before R2006a

break

Insert breakpoint before specified method

Syntax

```
break
```

```
b
```

```
break m:mid
```

```
break <sysIdx:blkIdx | gcb> [meth] [tid:TID]
```

```
break <s:sysIdx | gcs> [meth] [tid:TID]
```

```
break model [meth] [tid:TID]
```

Arguments

mid Method ID

sysIdx:blkId Block ID

x

gcb Currently selected block

sysIdx System ID

gcs Currently selected system

model Currently selected model

meth A method name, e.g., `Outputs.Major`

TID task ID

Description

`break` inserts a breakpoint before the current method.

Instead of `break`, you can use the short form of `b` with any of the syntaxes.

`break m:mid` inserts a breakpoint before the method specified by *mid* (see “Method ID”).

`break sysIdx:blkIdx` inserts a breakpoint before each invocation of the method of the block specified by *sysIdx:blkIdx* (see “Block ID”) in major time steps. `break gcb` inserts a breakpoint before each invocation of a method of the currently selected block (see *gcb*) in major time steps.

`break s:sysIdx` inserts a breakpoint at each method of the root system or nonvirtual subsystem specified by the system ID: *sysIdx*.

Note The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

`break gcs` inserts a breakpoint at each method of the currently selected nonvirtual system.

`break model` inserts a breakpoint at each method of the currently selected model.

The optional *meth* parameter allow you to set a breakpoint at a particular block, system, or model method. For example, `break gcb Outputs` sets a breakpoint at the `Outputs` method of the currently selected block.

The optional `TID` parameter allows you to set a breakpoint at the invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `break gcs Outputs tid:2` sets a breakpoint at the invocation of the subsystem's `Outputs` method that occurs when task 2 is active.

Introduced before R2006a

bshow

Show specified block

Syntax

```
bshow s:b
```

```
bs s:b
```

Arguments

`s:b` The block whose system index is `s` and block index is `b`.

Description

The `bshow` command opens the model window containing the specified block and selects the block.

See Also

`slist`

Introduced before R2006a

clear

Clear breakpoints from model

Syntax

```
clear  
cl  
clear m:mid  
clear id  
clear <sysIdx:blkIdx | gcb>
```

Arguments

<i>mid</i>	Method ID
<i>id</i>	Breakpoint ID
<i>sysIdx:blkIdx</i>	Block ID
<i>Idx</i>	
gcb	Currently selected block

Description

`clear` clears a breakpoint from the current method.

Instead of `clear`, you can use the short form of `cl` with any of the syntaxes.

`clear m:mid` clears a breakpoint from the method specified by *mid*.

`clear id` clears the breakpoint specified by the breakpoint ID *id*.

`clear sysIdx:blkIdx` clears any breakpoints set on the methods of the block specified by *sysIdx:blkIdx*.

`clear gcb` clears any breakpoints set on the methods of the currently selected block.

See Also

`bafter` | `break` | `slist`

Introduced before R2006a

continue

Continue simulation

Syntax

```
continue
```

```
c
```

Description

The `continue` command continues the simulation from the current breakpoint. If animation mode is not enabled, the simulation continues until it reaches another breakpoint or its final time step. If animation mode is enabled, the simulation continues in animation mode to the first method of the next major time step, ignoring breakpoints.

See Also

```
quit | run | stop
```

Introduced before R2006a

disp

Display block's I/O when simulation stops

Syntax

```
disp
```

```
d
```

```
disp gcb
```

```
disp s:b
```

Arguments

s:b The block whose system index is *s* and block index is *b*.

gcb Current block.

Description

The `disp` command registers a block as a display point. The debugger displays the inputs and outputs of all display points in the MATLAB Command Window whenever the simulation halts. Invoking `disp` without arguments shows a list of display points. Use `undisp` to unregister a block.

Instead of `disp`, you can use the short form of `d` with any of the syntaxes.

See Also

`probe` | `slist` | `trace` | `undisp`

Introduced before R2006a

ebreak

Enable (or disable) breakpoint on solver errors

Syntax

```
ebreak
```

```
eb
```

Description

This command causes the simulation to stop if the solver detects a recoverable error in the model. If you do not set or disable this breakpoint, the solver recovers from the error and proceeds with the simulation without notifying you.

See Also

```
bafter | break | clear | nanbreak | rbreak | slist | systems | tbreak | where  
| xbreak | zcbreak
```

Introduced before R2006a

elist

List simulation methods in order in which they are executed during simulation

Syntax

```
elist
```

```
el
```

```
elist m:mid [tid:TID]
```

```
elist <gcs | s:sysIdx> [meth] [tid:TID]
```

```
elist <gcb | sysIdx:blkIdx> [meth] [tid:TID]
```

Description

Instead of `elist`, you can use the short form of `el` with any of the syntaxes.

`elist m:mid` lists the methods invoked by the system or nonvirtual subsystem method corresponding to the method id *mid* (see the `where` command for information on method IDs), e.g.,

```
(sldebug @19): elist m:19

RootSystem.Outputs 'vdp' [tid=0] : ← Calling method
0:0 Integrator.Outputs 'vdp/x1' [tid=0]
0:1 Outport.Outputs 'vdp/Out1' [tid=0]
0:2 Integrator.Outputs 'vdp/x2' [tid=0]
...

↑      ↑      ↑      ↑
Block id  Method  Block  Task id
```

The method list specifies the calling method followed by the methods that it calls in the order in which they are invoked. The entry for the calling method includes

- The name of the method

The name of the method is prefixed by the type of system that defines the method, e.g., `RootSystem`.

- The name of the model or subsystem instance on which the method is invoked
- The ID of the task that invokes the method

The entry for each called method includes

- The ID (*sysIdx:blkIdx*) of the block instance on which the method is invoked

The block ID is prefixed by a number specifying the system that contains the block (the *sysIdx*). This allows Simulink software to assign the same block ID to blocks residing in different subsystems.

- The name of the method

The method name is prefixed with the type of block that defines the method, e.g., `Integrator`.

- The name of the block instance on which the method is invoked
- The task that invokes the method

The optional task ID parameter (**tid**: *TID*) allows you to restrict the displayed lists to methods invoked for a specified task. You can specify this option only for system or atomic subsystem methods that invoke Outputs or Update methods.

`elist <gcs | s:sysIdx>` lists the methods executed for the currently selected system (specified by the `gcs` command) or the system or nonvirtual subsystem specified by the system ID *sysIdx*, e.g.,

```
(sldebug @19): elist gcs

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'

RootSystem.Initialize 'vdp':
  0:0 Integrator.Initialize 'vdp/x1'
  ...
```

The system ID of a model's root system is 0. You can use the debugger's `systems` command to determine the system IDs of a model's subsystems.

Note The `elist` and `where` commands use block IDs to identify subsystems in their output. The block ID for a subsystem is not the same as the system ID displayed by the `systems` command. Use the `elist sysIdx:blkIdx` form of the `elist` command to display the methods of a subsystem whose block ID appears in the output of a previous invocation of the `elist` or `where` command.

`elist <gcs | s:sysIdx> mth` lists methods of type `mth` to be executed for the system specified by the `gcs` command or the system ID `sysIdx`, e.g.,

```
(sldebug @19): elist gcs Start

RootSystem.Start 'vdp':
  0:0 Integrator.Start 'vdp/x1'
  0:2 Integrator.Start 'vdp/x2'
  0:4 Scope.Start 'vdp/Scope'
  0:5 Fcn.Start 'vdp/Fcn'
  0:6 Product.Start 'vdp/Product'
  0:7 Gain.Start 'vdp/Mu'
  0:8 Sum.Start 'vdp/Sum'
  ...
```

Use `elist gcb` to list the methods invoked by the nonvirtual subsystem currently selected in the model.

See Also

`slist` | `systems` | `where`

Introduced before R2006a

emode

Toggle model execution between accelerated and normal mode

Syntax

emode

em

Description

Toggles the simulation between accelerated and normal mode when using the Accelerator mode in Simulink software. For more information, see “Run Accelerator Mode with the Simulink Debugger”.

Introduced before R2006a

etrace

Enable or disable method tracing

Syntax

```
etrace level level-number
```

```
et level level-number
```

Description

This command enables or disables method tracing, depending on the value of `level`:

Level	Description
0	Turn tracing off.
1	Trace model methods.
2	Trace model and system methods.
3	Trace model, system, and block methods.

When method tracing is on, the debugger prints a message at the command line every time a method of the specified level is entered or exited. The message specifies the current simulation time, whether the simulation is entering or exiting the method, the method id and name, and the name of the model, system, or block to which the method belongs.

See Also

`elist` | `trace` | `where`

Introduced before R2006a

help

Display help for debugger commands

Syntax

```
help
```

```
?
```

```
h
```

Description

The `help` command displays a list of debugger commands in the command window. The list includes the syntax and a brief description of each command.

Introduced before R2006a

nanbreak

Set or clear nonfinite value break mode

Syntax

```
nanbreak
```

```
na
```

Description

The `nanbreak` command causes the debugger to break whenever the simulation encounters a nonfinite (NaN or Inf) value. If nonfinite break mode is set, `nanbreak` clears it.

See Also

```
bafter | break | rbreak | tbreak | xbreak | zcbreak
```

Topics

```
ebreak
```

Introduced before R2006a

next

Advance simulation to start of next method at current level in model's execution list

Syntax

```
next
```

```
n
```

Description

The `next` command advances the simulation to the start of the next method at the current level in the model's method execution list.

Note The `next` command has the same effect as the `step over` command. See `step` for more information.

See Also

`step`

Introduced before R2006a

probe

I/O and state data for blocks

Syntax

```
probe
probe s:b
probe gcb
probe level level-type
p
```

Description

`probe` sets the Simulink debugger to interactive probe mode. In this mode, the debugger displays the I/O of a selected block. To exit interactive probe mode, enter a debugger command or press the **Enter** key.

`probe s:b` displays the I/O of the block whose system index is *s* and block index is *b*.

`probe gcb` displays the I/O of the currently selected block.

`probe level level-type` sets the verbosity level for `probe`, `trace`, and `dis`. If *level-type* is `io`, the debugger displays block I/O. If *level-type* is `all` (default), the debugger displays all information for the current state of a block, including inputs and outputs, states, and zero crossings.

`p` is the short form of the command.

Examples

Display I/O for the currently selected block `Out2` in the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (sldebug @0): `>>`.

2 Enter:

```
probe gcb
```

The MATLAB Command Window displays:

```
probe: Data of 0:3 Outport block 'vdp/Out2':  
U1      = [0]
```

See Also

`disp` | `trace`

Introduced in R2007a

quit

Stop simulation debugger

Syntax

```
quit  
q
```

Description

`quit` stops the Simulink debugger and returns to the MATLAB command prompt.

`q` is the short form of the command.

Examples

Start the Simulink debugger for the model `vdp` and then stop it.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
quit
```

See Also

`stop`

Introduced before R2006a

rbreak

Break simulation before solver reset

Syntax

```
rbreak  
rb
```

Description

`rbreak` enables (or disables) a solver reset breakpoint if the breakpoint is disabled (or enabled). The breakpoint causes the debugger to halt the simulation whenever an event requires a solver reset. The halt occurs before the solver resets.

`rb` is the short form of the command.

Examples

Start Simulink debugger for the model `vdp` and a set breakpoint before a solver reset.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` is replaced with the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
rbreak
```

The MATLAB Command Window displays:

```
Break on solver reset request           : enabled
```

See Also

`bafter` | `break` | `ebreak` | `nanbreak` | `tbreak` | `xbreak` | `zcbreak`

Introduced before R2006a

run

Run simulation to completion

Syntax

```
run  
r
```

Description

`run` starts the simulation from the current breakpoint to its final time step. It ignores breakpoints and display points.

`r` is the short form of the command

Examples

Continue the simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
run
```

See Also

`continue` | `quit` | `stop`

Introduced before R2006a

slist

Sorted list of model blocks

Syntax

```
slist  
sli
```

Description

`slist` displays a list of blocks for the root system and each nonvirtual subsystem sorted according to data dependencies and other criteria.

For each system (root or nonvirtual), `slist` displays:

- Title line specifying the name of the system, the number of nonvirtual blocks that the system contains, and the number of blocks in the system that have direct feedthrough ports.
- Entry for each block in the order in which the blocks appear in the sorted list.

For each block entry, `slist` displays the block ID and the name and type of the block. The block ID consists of a system index and a block index separated by a colon (`sysIdx:blkIdx`).

- Block index is the position of the block in the sorted list.
- System index is the order in which the Simulink software generated the system sorted list. The system index has no special significance. It simply allows blocks that appear in the same position in different sorted lists to have unique identifiers.

Simulink software uses sorted lists to create block method execution lists (see `elist`) for root system and nonvirtual subsystem methods. In general, root system and nonvirtual subsystem methods invoke the block methods in the same order as the blocks appear in the sorted list.

Exceptions occur in the execution order of block methods. For example, execution lists for multicast models group together all blocks operating at the same rate and in the same

task. Slower groups appear later than faster groups. The grouping of methods by task can result in a block method execution order that is different from the block sorted order. However, within groups, methods execute in the same order as the corresponding blocks appear in the sorted list.

`sli` is the short form of the command.

Examples

Display a sorted list of the root system in the `vdp` model using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
slist
```

The MATLAB Command Window displays:

```
---- Sorted list for 'vdp' [9 nonvirtual blocks, directFeed=0]
0:0   'vdp/x1' (Integrator)
0:1   'vdp/Out1' (Outport)
0:2   'vdp/x2' (Integrator)
0:3   'vdp/Out2' (Outport)
0:4   'vdp/Scope' (Scope)
0:5   'vdp/Fcn' (Fcn)
0:6   'vdp/Product' (Product)
0:7   'vdp/Mu' (Gain)
0:8   'vdp/Sum' (Sum)
```

See Also

`elist` | `systems`

Introduced before R2006a

states

Current state values

Syntax

```
states
```

Description

`states` displays a list of the current states of the model. The list includes the index, current value, `system:block:element ID`, state vector name, and block name for each state.

Examples

Display information about the states for the `vdp` model.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
states
```

The MATLAB Command Window displays:

```
Continuous States:
Idx Value (system:block:element Name 'BlockName')
  0  0 (0:0:0 CSTATE 'vdp/x1')
  1  0 (0:2:0 CSTATE 'vdp/x2')
```

Introduced before R2006a

status

Debugging options in effect

Syntax

Description

Display a list of the debugging options in effect.

Examples

View Debugger Status for `vdp`

Start the debugger with `vdp`. The command prompt changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

```
sldebug 'vdp'
```

Display the debugging status.

```
status
```

```
%-----%  
Current simulation time           : 0 (MajorTimeStep)

```

Introduced before R2006a

step

Advance simulation by one or more methods

Syntax

```
step  
step in  
step over  
step out  
step top  
step blockmth  
s
```

Description

`step` or `step in` advances the simulation to the next method in the current time step.

`step over` advances the simulation over the next method.

`step out` advances the simulation the end of the current simulation point hierarchy.

`step top` advances the simulation to the first method executed in the next time step.

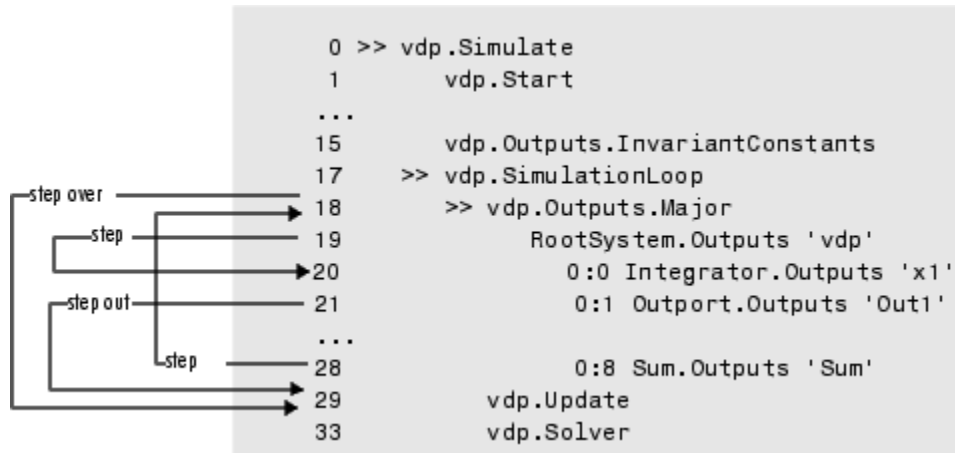

`step blockmth` advances the simulation to the next method that operates on a block.

`s` is the short form of the command.

If `step` advances the simulation to the start of a block method, the debugger points at the block on which the method operates.

Examples

The following diagram illustrates the effect of various forms of the `step` command for the model `vdp`.

See Also

`elist` | `next` | `where`

Introduced in R2007a

stimes

Model sample times

Syntax

```
stimes  
sti
```

Description

`stimes` displays information about the model sample times, including the sample time period, offset, and task ID.

`sti` is the short form of the command.

Examples

Display sample times for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
stimes
```

The MATLAB Command Window displays:

```
--- Sample times for 'vdp' [Number of sample times = 1]  
1. [0      , 0      ] tid=0 (continuous sample time)
```

Introduced before R2006a

stop

Stop simulation

Syntax

```
stop
```

Description

`stop` stops the simulation of the model you are debugging.

Examples

Start and stop a simulation for the model `vdp` using the Simulink debugger.

- 1 Start a debugger session. In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Start a simulation of the model. Enter:

```
run
```

- 3 Stop the simulation. Enter:

```
stop
```

See Also

`continue` | `quit` | `run`

Introduced before R2006a

strace

Set solver trace level

Syntax

```
strace level  
i
```

Description

`strace level` causes the solver to display diagnostic information in the MATLAB Command Window, depending on the value of `level`. Values are 0 (no information) or 1 (maximum information about time steps, integration steps, zero crossings, and solver resets).

`i` is the short form of the command.

Examples

Display maximum information about a simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Get information about the notation `.`. Enter:

```
help time
```

The MATLAB Command Window displays:

```
Time is displayed as:  
TM = <time while in MajorTimeStep>
```

```
Tm = <time while in MinorTimeStep>
Tr = <time while in solver reset>
Tz = <time at or just after zero crossing>
TzL = <time while in major step just before (at left post of) zero crossing>
TzR = <time while in major step at or just after (at right post of) zero crossing>
Ts = <time of successful integration step>
Tf = <time of failed integration step>
Tn = <time while in Newton iteration> (when using implicit solvers)
Tj = <time during Jacobian evaluation> (when using implicit solvers)
```

Step size is displayed as:

```
Hm = <step size at the start of solver phase>
Hs = <successful integration step size>
Hf = <failed integration step size>
Hn = <step size during Newton iteration> (when using implicit solvers)
Hz = <value of 'TM - TzL' during zero crossing search>
Iz = <value of 'Tz - TzL' during zero crossing search>
```

3 Set trace to display all information. Enter:

```
strace 1
```

When diagnostic tracing is on, the debugger displays the sizes of major and minor time steps.

```
[TM = 13.21072088374186 ] Start of Major Time Step
[Tm = 13.21072088374186 ] Start of Minor Time Step
```

The debugger displays integration information. This information includes the time step of the integration method, step size of the integration method, outcome of the integration step, normalized error, and index of the state.

```
[Tm = 13.21072088374186 ] [H = 0.2751116230148764 ] Begin Integration Step
[Tf = 13.48583250675674 ] [Hf = 0.2751116230148764 ] Fail [Er = 1.0404e+000]
 [Ix = 1]
[Tm = 13.21072088374186 ] [H = 0.2183536061326544 ] Retry
[Ts = 13.42907448987452 ] [Hs = 0.2183536061326539 ] Pass [Er = 2.8856e-001]
 [Ix = 1]
```

For zero crossings, the debugger displays information about the iterative search algorithm when the zero crossing occurred. This information includes the time step of the zero crossing, step size of the zero crossing detection algorithm, length of the time interval bracketing the zero crossing, and a flag denoting the rising or falling direction of the zero crossing.

```
[Tz = 3.615333333333301 ] Detected 1 Zero Crossing Event 0[F]
      Begin iterative search to bracket zero crossing event
[Tz = 3.621111157580072 ] [Hz = 0.005777824246771424 ] [Iz = 4.2222e-003] 0[F]
[Tz = 3.621116982080098 ] [Hz = 0.005783648746797265 ] [Iz = 4.2164e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 4.2163e-003] 0[F]
[Tz = 3.621116987943544 ] [Hz = 0.005783654610242994 ] [Iz = 1.1804e-011] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.8962e-012] 0[F]
[Tz = 3.621116987949452 ] [Hz = 0.005783654616151157 ] [Iz = 5.1514e-014] 0[F]
      End iterative search to bracket zero crossing event
```

When a solver resets occur, the debugger displays the time at which the solver was reset.

```
[Tr = 6.246905153573676 ] Process Solver Reset  
[Tr = 6.246905153573676 ] Reset Zero Crossing Cache  
[Tr = 6.246905153573676 ] Reset Derivative Cache
```

Introduced before R2006a

systems

List nonvirtual systems of model

Syntax

```
systems  
sys
```

Description

`systems` displays the nonvirtual subsystems for a model in the MATLAB Command Window.

`sys` is the short form of the command.

Examples

Display the nonvirtual systems for the model `sldemo_enginewc` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'sldemo_enginewc'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
systems
```

The MATLAB Command Window displays the nonvirtual subsystems.

```
0 'sldemo_enginewc'  
2 'sldemo_enginewc/Compression'  
3 'sldemo_enginewc/Controller'  
4 'sldemo_enginewc/Throttle & Manifold/Throttle/TmpAtomicSubsysAtSwitchInport1'  
5 'sldemo_enginewc/valve timing/positive edge to dual edge conversion'
```

See Also

slis

Introduced before R2006a

tbreak

Set or clear time breakpoint

Syntax

```
tbreak
```

```
tb
```

```
tbreak t
```

Description

The `tbreak` command sets a breakpoint at the specified time step. If a breakpoint already exists at the specified time, `tbreak` clears the breakpoint. If you do not specify a time, `tbreak` toggles a breakpoint at the current time step.

Instead of `tbreak`, you can use the short form of `tb`, with or without `t`.

Topics

`ebreak`

Introduced before R2006a

trace

Display block's I/O each time block executes

Syntax

```
trace gcb  
trace s:b
```

```
tr gcb  
trace s:b
```

Arguments

s:b	The block whose system index is <i>s</i> and block index is <i>b</i> .
gcb	Current block.

Description

The `trace` command registers a block as a trace point. The debugger displays the I/O of each registered block each time the block executes.

See Also

`disp` | `probe` | `slist` | `strace` | `untrace`

Introduced before R2006a

undisp

Remove block from debugger's list of display points

Syntax

```
undisp gcb
```

```
und gcb
```

```
undisp s:b
```

```
und s:b
```

Arguments

`s:b` The block whose system index is `s` and block index is `b`.

`gcb` Current block.

Description

The `undisp` command removes the specified block from the debugger's list of display points.

See Also

`disp` | `slist`

Introduced before R2006a

untrace

Remove block from debugger's list of trace points

Syntax

```
untrace gcb
```

```
unt gcb
```

```
untrace s:b
```

```
unt s:b
```

Arguments

`s:b` The block whose system index is `s` and block index is `b`.

`gcb` Current block.

Description

The `untrace` command removes the specified block from the debugger's list of trace points.

See Also

`slist` | `trace`

Introduced before R2006a

where

Display current location of simulation in simulation loop

Syntax

```
where [detail]
```

```
w [detail]
```

Description

The `where` command displays the current location of the simulation in the simulation loop, for example,

```
sldebug @7): where
  0 >> vdp.Simulate
  1   >> vdp.Start
  2     >> RootSystem.Start 'vdp'
  7       >| 0:8 Sum.Start 'Sum'
```

The display consists of a list of simulation nodes with the last entry being the node that is about to be entered or exited. Each entry contains the following information:

- Method ID

The method ID identifies a specific invocation of a method.

- A symbol specifying its state:
 - `>>` (active)
 - `>|` (about to be entered)
 - `<|` (about to be exited)

- Name of the method invoked (e.g., `RootSystem.Start`)
- Name of the block or system on which the method is invoked (e.g., `Sum`)
- System and block ID (`sysIdx:blkIdx`) of the block on which the method is invoked

For example, `0:8` indicates that the specified method operates on block 8 of system 0.

`where detail`, where `detail` is any nonnegative integer, includes inactive nodes in the display.

```
0 >> vdp.Simulate
  1   >> vdp.Start
  2     >> RootSystem.Start 'vdp'
  3       0:4 Scope.Start 'Scope'
  4         0:5 Fcn.Start 'Fcn'
  5         0:6 Product.Start
'Product'
  6         0:7 Gain.Start 'Mu'
  7         >| 0:8 Sum.Start 'Sum'
```

See Also

`step`

Introduced before R2006a

xbreak

Break when debugger encounters step-size-limiting state

Syntax

```
xbreak
```

```
x
```

Description

The `xbreak` command pauses execution of the model when the debugger encounters a state that limits the size of the steps that the solver takes. If `xbreak` mode is already on, `xbreak` turns the mode off.

See Also

`bafter` | `break` | `nanbreak` | `rbreak` | `tbreak` | `zcbreak`

Topics

`ebreak`

Introduced before R2006a

zcbreak

Toggle breaking at nonsampled zero-crossing events

Syntax

```
zcbreak
```

```
zcb
```

Description

The `zcbreak` command causes the debugger to break when a nonsampled zero-crossing event occurs. If zero-crossing break mode is already on, `zcbreak` turns the mode off.

See Also

```
bafter | break | nanbreak | tbreak | xbreak | zclist
```

Introduced before R2006a

zclist

List blocks containing nonsampled zero crossings

Syntax

```
zclist
```

```
zcl
```

Description

The `zclist` command displays a list of blocks in which nonsampled zero crossings can occur. The command displays the list in the MATLAB Command Window.

See Also

`zcbreak`

Introduced before R2006a

Simulink Classes

eventData	Provide information about block method execution events
Simulink.AliasType	Create alias for signal and parameter data type
Simulink.Annotation	Specify properties of model annotation
Simulink.BlockCompDworkData	Provide postcompilation information about block's DWork vector
Simulink.BlockCompInputPortData	Provide postcompilation information about block input port
Simulink.BlockCompOutputPortData	Provide postcompilation information about block output port
Simulink.BlockData	Provide run-time information about block-related data, such as block parameters
Simulink.BlockPath	Fully specified Simulink block path
Simulink.BlockPortData	Describe block input or output port
Simulink.BlockPreCompInputPortData	Provide precompilation information about block input port
Simulink.BlockPreCompOutputPortData	Provide precompilation information about block output port
Simulink.CoderInfo	Specify information needed to generate code for signal or parameter data
Simulink.ConfigSetRef	Link model to configuration set stored independently of any model
Simulink.GlobalDataTransfer	Configure concurrent execution data transfers
Simulink.MDLInfo	Extract model file information without loading block diagram into memory
getDescription	Extract model file description without loading block diagram into memory
getMetadata	Extract model file metadata without loading block diagram into memory
Simulink.ModelAdvisor	Run Model Advisor from MATLAB file
5-2 Simulink.ModelDataLogs	Container for signal data logs of a model
Simulink.SimState.ModelSimState	Access SimState snapshot data

Simulink.ModelWorkspace

Describe model workspace

matlab.io.datastore.sd datastore class

Package: matlab.io.datastore

Datastore for Simulation Data Inspector signals

Description

A `matlab.io.datastore.sd datastore` object enables the Simulation Data Inspector to interact with large sets of data that are too large to fit in memory. An `sd datastore` object references the data for one signal.

Construction

`ds_element = dsrObj.getAsDatastore(arg)` creates the `sd datastore`, `ds_element`, for the signal in the `Simulink.sdi.Datasetref` object selected by the search criterion `arg`.

`ds_element = matlab.io.datastore.sd datastore(signalID)` creates the `sd datastore`, `ds_element` for the signal specified by `signalID`.

Input Arguments

arg — Element selection criterion

character vector | integer

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name based searches, specify `arg` as a character vector. For index based searches, `arg` is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

signalID — Numeric signal identifier

integer

Unique number identifying a signal.

Properties

Name — Signal name

character vector

Name of the signal specified as a character vector.

Example: 'My Signal'

signal — Simulink.sdi.Signal object

Simulink.sdi.Signal object

Simulink.sdi.Signal object associated with the sdi datastore.

Methods

Inherited Methods

hasdata	Determine if data is available to read
preview	Return subset of data from datastore
progress	Return percentage of data that you have read from a datastore
read	Read data in datastore
readall	Read all data in datastore
reset	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create an `sd datastore` Object for a Signal

This example shows how to create a `sd datastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Get the run object
run = Simulink.sdi.getRun(runID);
```

```
% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names =
```

```
10x1 cell array
```

```
 {'EGO Fault Switch:1'      }
 {'air_fuel_ratio'         }
 {'Engine Speed Fault Switch:1' }
 {'speed'                  }
 {'MAP Fault Switch:1'     }
 {'map'                    }
 {'ego'                    }
 {'Throttle Angle Fault Switch:1'}
 {'throttle'               }
 {'fuel'                   }
```

```
% Get sdatastore object for fuel signal  
fuel_ds = run_DSRef.getAsDatastore(10);
```

matlab.io.datastore.SimulationDatastore class

Package: matlab.io.datastore

Datastore for inputs and outputs of Simulink models

Description

A `matlab.io.datastore.SimulationDatastore` object enables a Simulink model to interact with big data. You can load big data as simulation input and log big output data from a simulation. To simulate models with big data, you store the data in a MAT-file and refer to the data through a `SimulationDatastore` object. See “Work with Big Data for Simulations”.

A `SimulationDatastore` object refers to big simulation data (which a MAT-file stores) for one signal. If the MAT-file stores simulation data for a bus signal, a `SimulationDatastore` object refers to the data for one leaf signal element in the bus. You can use the datastore object to inspect and access the data and, through a parent object such as `Simulink.SimulationData.Signal`, simulate a Simulink model with the data.

To analyze the datastore data, you can use the methods and properties of the `SimulationDatastore` object as well as MATLAB tools such as the `tail` function. For more information about the MATLAB tools, see “Getting Started with Datastore” (MATLAB).

Construction

After you store big simulation data in a `Simulink.SimulationData.Dataset` object in a MAT-file, a signal element in the `Dataset` object points to the big data. To create a `matlab.io.datastore.SimulationDatastore` object that refers to the big data:

- 1 At the command prompt or in a script, create a `Simulink.SimulationData.DatasetRef` object that refers to the `Dataset` object in the MAT-file.

2 Use one of these techniques:

- Use one-based, curly-brace indexing (for example, `{1}`) to return an object that represents the target signal element, such as `Simulink.SimulationData.Signal` or `Simulink.SimulationData.State`. For example, for a `DatasetRef` object named `logsout_ref`, to create a `Signal` object that refers to the second signal element, use this code:

```
myLoggedSig = logsout_ref{2}
```

- Use the `getAsDatastore` method of the `DatasetRef` object to return an object that represents the target signal element. For more information, see `Simulink.SimulationData.DatasetRef.getAsDatastore`.

The `SimulationDatastore` object resides in the `Values` property of the returned object.

Properties

FileName — Name and path of file that contains big data

character vector

Name and path of the file that contains the big data, returned as a character vector. This property is read-only.

Data Types: `char`

NumSamples — Total number of samples (time steps) in the datastore

integer

Total number of samples (time steps) in the datastore, returned as an integer. The `readall` method extracts this many samples from the big data. This property is read-only.

Data Types: `uint64`

ReadSize — Amount of data to read at a time

100 (default) | scalar double

Amount of data to read at a time, in number of samples (time steps), specified as a scalar double. The `read` method extracts this many samples from the big data.

Data Types: `double`

Methods

<code>hasdata</code>	Determine if data is available to read
<code>preview</code>	Return subset of data from datastore
<code>progress</code>	Return percentage of data that you have read from a datastore
<code>read</code>	Read data in datastore
<code>readall</code>	Read all data in datastore
<code>reset</code>	Reset datastore to initial state

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Limitations

- `SimulationDatastore` does not support using a parallel pool with Parallel Computing Toolbox installed. To analyze data using tall arrays or run MapReduce algorithms, set the global execution environment to be the local MATLAB session using `mapreducer`. Enter this code:

```
mapreducer(0)
```

For information about controlling parallel resources, see “Run mapreduce on a Parallel Pool” (Parallel Computing Toolbox).

- You cannot use a tall variable as simulation input data.

Examples

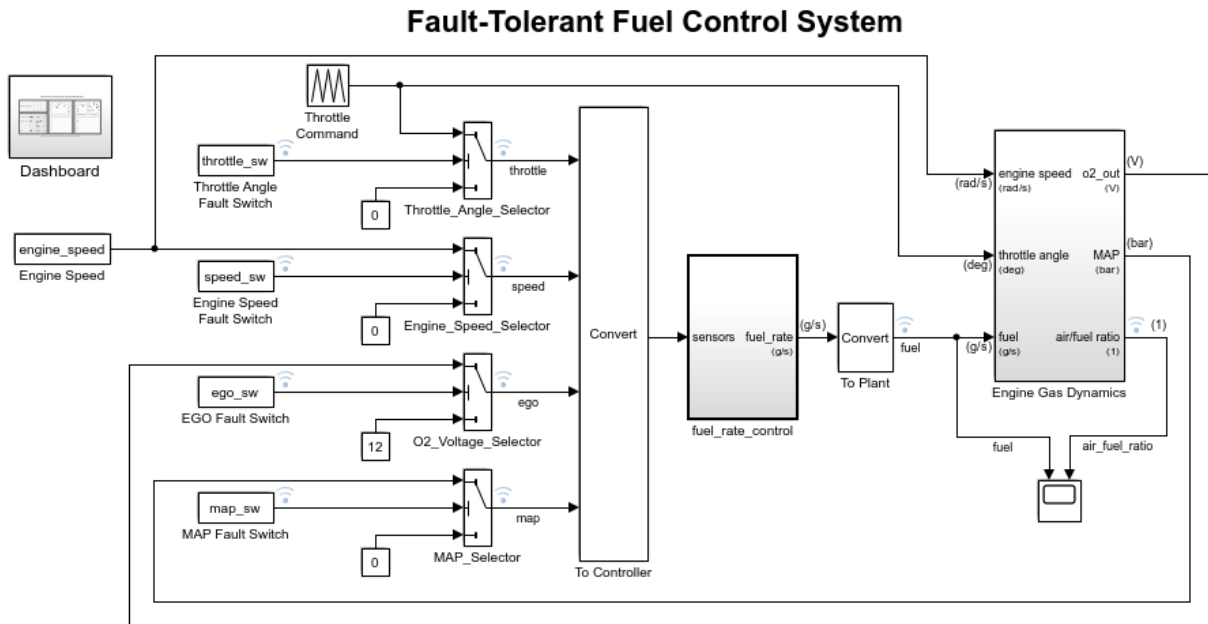

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2016 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
0.055328 sec	1.0652

```
0.055328 sec    1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged fuel data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);  
read(DStore);  
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136
5.81 sec	1.6003
5.82 sec	1.5904
5.83 sec	1.5832

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
3.85 sec	0.999
3.86 sec	0.99219
3.87 sec	0.98538
3.88 sec	0.97858
3.89 sec	0.97179

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

Time	Data
9.7 sec	1.5828
9.71 sec	1.5733
9.72 sec	1.5664
9.73 sec	1.5614
9.74 sec	1.5579
9.75 sec	1.5553
9.76 sec	1.5703
9.77 sec	1.582
9.78 sec	1.5913
9.79 sec	1.5988
9.8 sec	1.605
9.81 sec	1.6101
9.82 sec	1.6145
9.83 sec	1.6184
9.84 sec	1.6049
9.85 sec	1.595

```
9.86 sec    1.5877
9.87 sec    1.5824
9.88 sec    1.5785
9.89 sec    1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a while loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
1.6423
```

hasdata

Class: matlab.io.datastore.SimulationDatastore

Package: matlab.io.datastore

Determine if data is available to read

Syntax

```
tf = hasdata(dst)
```

Description

`tf = hasdata(dst)` returns logical 1 (true) if there is data available to read from the datastore (matlab.io.datastore.SimulationDatastore object) specified by `dst`. Otherwise, it returns logical 0 (false).

Input Arguments

dst — Input datastore

matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a matlab.io.datastore.SimulationDatastore object. To create a SimulationDatastore object, see matlab.io.datastore.SimulationDatastore.

Examples

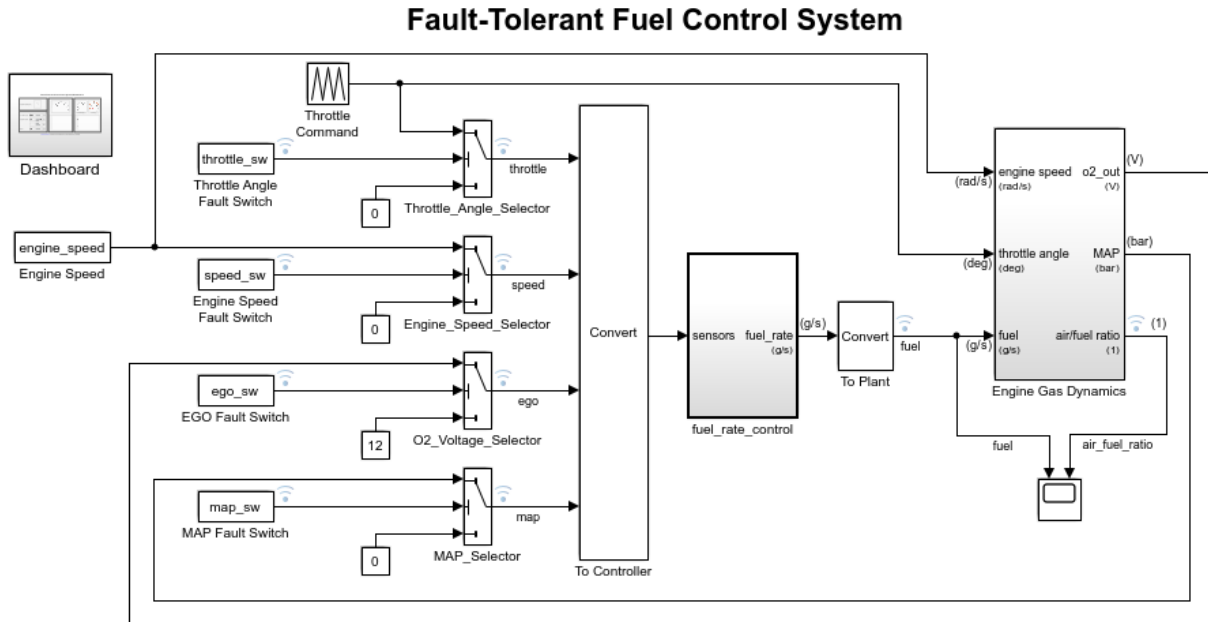

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a matlab.io.datastore.SimulationDatastore object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2016 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset to file**.

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
0 sec	1.209
0.00056199 sec	1.209
0.0033719 sec	1.209
0.01 sec	1.1729
0.02 sec	1.1409
0.03 sec	1.1124
0.04 sec	1.0873
0.05 sec	1.0652
0.055328 sec	1.0652
0.055328 sec	1.0652

Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136
5.81 sec	1.6003
5.82 sec	1.5904
5.83 sec	1.5832

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set ReadSize to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);  
read(DStore);
```

Set ReadSize to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data

Topics

“Work with Big Data for Simulations”

Introduced in R2017a

preview

Class: matlab.io.datastore.SimulationDatastore

Package: matlab.io.datastore

Return subset of data from datastore

Syntax

```
data = preview(dst)
```

Description

`data = preview(dst)` returns a subset of data from datastore (`matlab.io.datastore.SimulationDatastore` object) `dst` without changing its current read position. `preview` returns only the first ten samples (time steps) of data in the datastore. Use this method to quickly inspect and verify that the data appears as you expect.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Subset of data

`timetable` object

Subset of data, returned as a timetable object. For information about timetable, see “Timetables” (MATLAB).

Examples

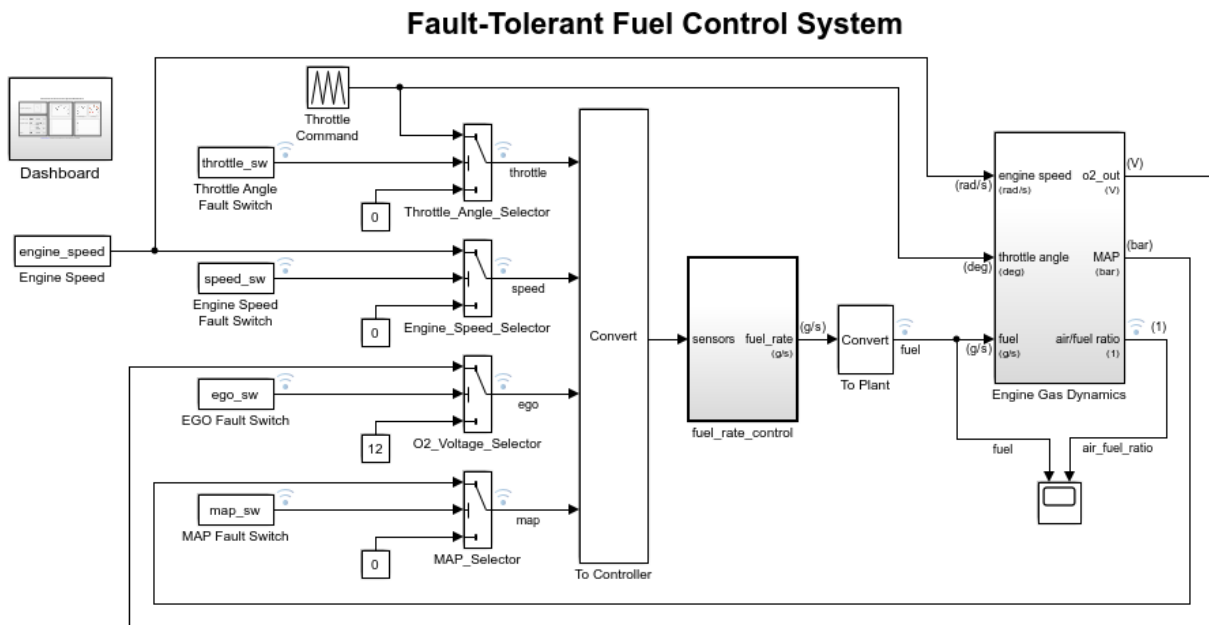

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2016 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset to file.**

```
set_param('sldemo_fuelsys','LoggingToFile','on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat','sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{}` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data
-----	-----
0 sec	1.209
0.00056199 sec	1.209

```
0.0033719 sec      1.209
0.01 sec           1.1729
0.02 sec           1.1409
0.03 sec           1.1124
0.04 sec           1.0873
0.05 sec           1.0652
0.055328 sec      1.0652
0.055328 sec      1.0652
```

Inspect Specific Sample

Inspect the 603rd sample of logged fuel data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
5.79 sec	1.6097
5.8 sec	1.6136

```

5.81 sec    1.6003
5.82 sec    1.5904
5.83 sec    1.5832

```

The third sample of read data is the 603rd sample in the datastore.

Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

Time	Data
3.85 sec	0.999
3.86 sec	0.99219
3.87 sec	0.98538

```
3.88 sec    0.97858
3.89 sec    0.97179
```

Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
    read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

Time	Data
9.7 sec	1.5828
9.71 sec	1.5733
9.72 sec	1.5664
9.73 sec	1.5614
9.74 sec	1.5579
9.75 sec	1.5553
9.76 sec	1.5703
9.77 sec	1.582

```
9.78 sec    1.5913
9.79 sec    1.5988
9.8 sec     1.605
9.81 sec    1.6101
9.82 sec    1.6145
9.83 sec    1.6184
9.84 sec    1.6049
9.85 sec    1.595
9.86 sec    1.5877
9.87 sec    1.5824
9.88 sec    1.5785
9.89 sec    1.5757
```

Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a while loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
    tt = read(DStore);
    rawChunk = tt.Data;
    runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
1.6423
```

Topics

“Work with Big Data for Simulations”

Introduced in R2017a

progress

Class: matlab.io.datastore.SimulationDatastore

Package: matlab.io.datastore

Return percentage of data that you have read from a datastore

Syntax

```
p = progress(dst)
```

Description

`p = progress(dst)` returns the percentage, as a number between 0 and 1, of the data that you have read from a datastore (`matlab.io.datastore.SimulationDatastore` object). For example, a return value of 0.55 means you have read 55% of the data. Use the `progress` method and the `NumSamples` property to determine the current read position.

You read data from a `SimulationDatastore` object by using the `read` method.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object.

To create a `SimulationDatastore` object, see

`matlab.io.datastore.SimulationDatastore`.

Output Arguments

p — Percentage of data that you have read from the datastore

scalar double

Percentage of data that you have read from the datastore, returned as a scalar double.

Data Types: `double`

“Work with Big Data for Simulations”

Introduced in R2017a

read

Class: `matlab.io.datastore.SimulationDatastore`

Package: `matlab.io.datastore`

Read data in datastore

Syntax

```
data = read(dst)
[data,info] = read(dst)
```

Description

`data = read(dst)` returns data from a datastore (`matlab.io.datastore.SimulationDatastore` object). Subsequent calls to the `read` function continue reading from the endpoint of the previous call. Use the `ReadSize` property of the `SimulationDatastore` object to specify the amount of data, in samples (time steps), to read at a time. Use the `progress` method and the `NumSamples` property to determine the current read position.

`[data,info] = read(dst)` also returns information about the extracted data in `info`.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Output Arguments

data — Output data

`timetable` object

Output data, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

info — Information about read data

structure array

Information about read data, returned as a structure. The structure has one field, `FileName`, which is a fully resolved path containing the path string, the name of the file, and the file extension.

Examples

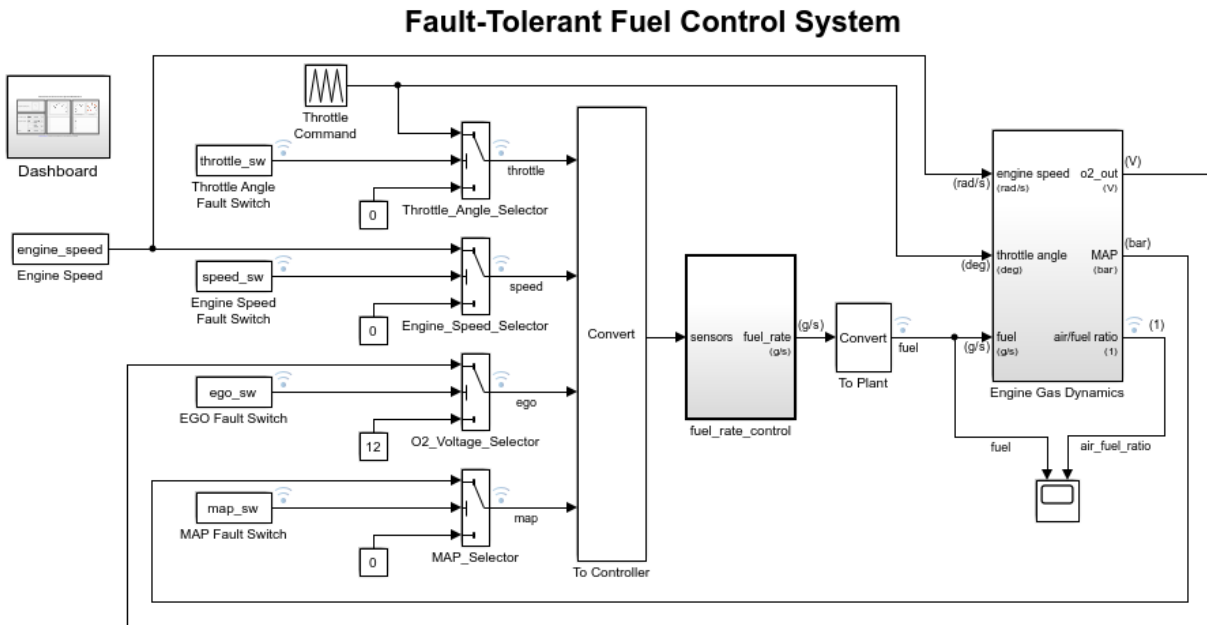

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2016 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset to file**.

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

Time	Data

“Work with Big Data for Simulations”

Introduced in R2017a

readall

Class: matlab.io.datastore.SimulationDatastore

Package: matlab.io.datastore

Read all data in datastore

Syntax

```
data = readall(dst)
```

Description

`data = readall(dst)` returns all the data in the datastore (matlab.io.datastore.SimulationDatastore object) specified by `dst`.

If all the data in the datastore does not fit in memory, `readall` returns an error. To determine how many samples (time steps) a datastore holds, inspect the `NumSamples` property of the `SimulationDatastore` object.

Input Arguments

dst — Input datastore

matlab.io.datastore.SimulationDatastore object

Input datastore, specified as a matlab.io.datastore.SimulationDatastore object. To create a SimulationDatastore object, see matlab.io.datastore.SimulationDatastore.

Output Arguments

data — All data in the datastore

timetable object

All data in the datastore, returned as a `timetable` object. For information about `timetable`, see “Timetables” (MATLAB).

reset

Class: matlab.io.datastore.SimulationDatastore

Package: matlab.io.datastore

Reset datastore to initial state

Syntax

```
reset(dst)
```

Description

`reset(dst)` sets the read position of the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst` to the first sample in the datastore. Use `reset` to reread data from a datastore. You read from a datastore by using the `read` method.

Input Arguments

dst — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

Examples

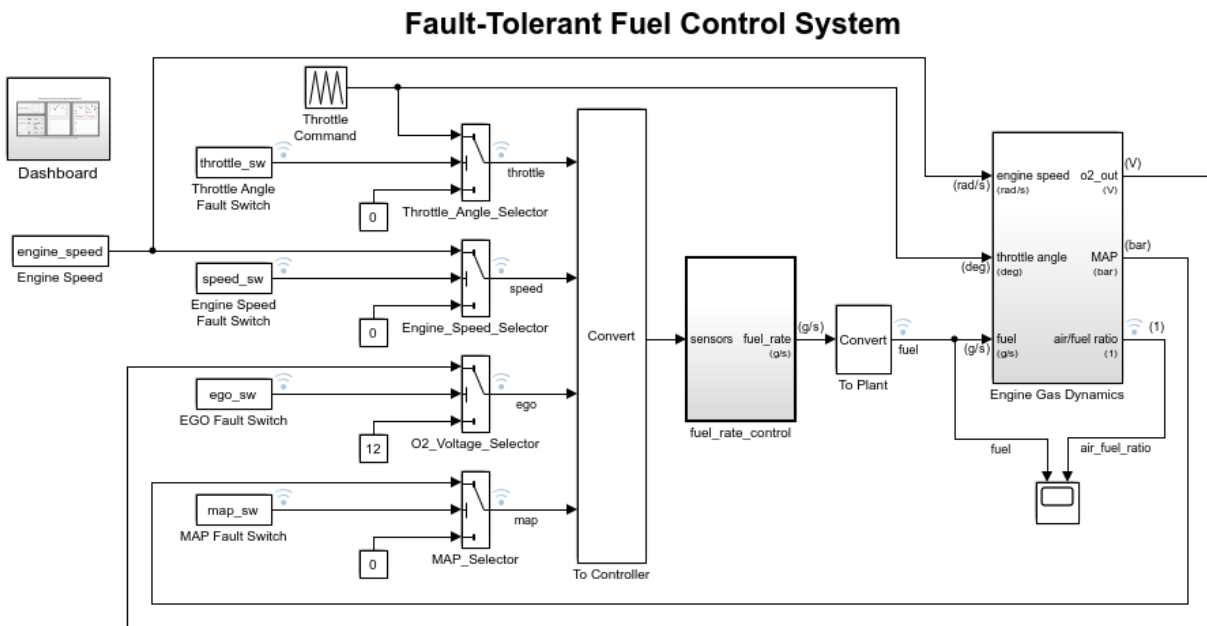

Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

eventData

Provide information about block method execution events

Description

Simulink software creates an instance of this class when a block method execution event occurs during simulation and passes it to any listeners registered for the event (see `add_exec_event_listener`). The instance specifies the type of event that occurred and the block whose method execution triggered the event. See “Access Block Data During Simulation” for more information.

Parent

None

Children

None

Property Summary

Name	Description
“Type” on page 5-51	Type of method execution event that occurred.
“Source” on page 5-51	Block that triggered the event.

Properties

Type

Type of method execution event that occurred. Possible values are:

event	Occurs...
'PreOutputs '	Before a block's Outputs method executes.
'PostOutputs '	After a block's Outputs method executes.
'PreUpdate '	Before a block's Update method executes.
'PostUpdate '	After a block's Update method executes.
'PreDerivatives '	Before a block's Derivatives method executes.
'PostDerivatives '	After a block's Derivatives method executes.

LibraryBrowser.LibraryBrowser2 class

Package: LibraryBrowser

Simulink Library Browser

Description

Programmatically display, hide, size, and position the Simulink Library Browser.

Construction

```
lb = LibraryBrowser.LibraryBrowser2
```

Properties

IsOnTop — Always put library window on top

0 (default) | 1

Always put library window on top of other Simulink Editor windows, specified as 1 for always on top.

Example: `lb.IsOnTop = 1`

Methods

Method	Meaning	Example
refresh	Update the library browser display with changes that affect the library browser. Examples include adding a library to the library browser, removing a library from the library browser, and changes to your custom libraries, <code>slblocks</code> function, or <code>sl_customization.m</code> file. In general, refresh the library browser when you have made any changes that affect libraries on your MATLAB path that are registered in the library browser. .	<pre>lb = LibraryBrowser.LibraryBrowser2; refresh(lb)</pre>
show	Display the library browser.	<pre>lb = LibraryBrowser.LibraryBrowser2; show(lb)</pre>
hide	Hide the library browser.	<pre>lb = LibraryBrowser.LibraryBrowser2; hide(lb)</pre>
getPosition	Get the position of the library browser. Returned as four integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	<pre>lb = LibraryBrowser.LibraryBrowser2; getPosition(lb) ans = 50 279 600 600</pre>
setPosition	Set the position of the library browser. Use an array of integers, in pixels: upper-left x coordinate, upper-left y coordinate, width, and depth.	<pre>lb = LibraryBrowser.LibraryBrowser2; setPosition(lb,[70 250 500 500])</pre>

allowModelReferenceDiscreteSampleTimeInheritanceImpl

Model reference sample time inheritance status for discrete sample times

Syntax

```
flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)
```

Description

`flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)` specifies whether a System object in a reference model is allowed to inherit the sample time of the parent model. Use this method only for System objects that use discrete sample time and are intended for inclusion in Simulink via the MATLAB System block.

During model compilation, Simulink sets the model reference sample time inheritance before the System object `setupImpl` method is called.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object handle

Output Arguments

flag

Flag indicating whether model reference discrete sample time inheritance is allowed for the MATLAB System block containing the System object, returned as a logical value.

The default value for this argument depends on the number of inputs to the System object. To use the default value, you do not need to include this method in your System object class definition file.

Number of System object Inputs	Default Value and Override Effects
No inputs	<p>Default: <code>false</code> — Model reference discrete sample time inheritance is not allowed.</p> <p>If your System object uses discrete sample time in its algorithm, override the default by returning <code>true</code> from <code>allowModelReferenceDiscreteSampleTimeInheritanceImpl</code>.</p>
One or more inputs	<p>Default: <code>true</code> — If no other Simulink constraint prevents it, model reference sample time inheritance is allowed.</p> <p>If your System object does not use sample time in its algorithm, override the default by returning <code>false</code> from <code>allowModelReferenceDiscreteSampleTimeInheritanceImpl</code>.</p>

Examples

Set Sample Time Inheritance for System Object

For a System object that has one or more inputs, to disallow model reference discrete sample time inheritance for that object, set the sample time inheritance to `false`. Include this code in your class definition file for the object.

```
methods (Access = protected)
    function flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(~)
        flag = false;
    end
end
```

getInputNamesImpl

Names of MATLAB System block input ports

Syntax

```
[name1,name2,...] = getInputNamesImpl(obj)
```

Description

[name1,name2,...] = getInputNamesImpl(obj) specifies the names of the input ports of the System object on a MATLAB System block. The number of returned input names matches the number of inputs returned by the getNumInputs method. If you change a property value that changes the number of inputs, the names of those inputs also change.

getInputNamesImpl is called by the getInputNames method by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object

Output Arguments

name1,name2,...

Names of the inputs for the specified object, returned as character vectors

Default: empty character vector

Examples

Specify Input Port Name

Specify in your class definition file the names of two input ports as 'upper' and 'lower'.

```
methods (Access = protected)
    function varargout = getInputNamesImpl(obj)
        numInputs = getNumInputs(obj);
        varargout = cell(1,numInputs);
        varargout{1} = 'upper';
        if numInputs > 1
            varargout{2} = 'lower';
        end
    end
end
end
```

Topics

“Specify Input and Output Names”

getOutputNamesImpl

Names of MATLAB System block output ports

Syntax

```
[name1,name2,...] = getOutputNamesImpl(obj)
```

Description

`[name1,name2,...] = getOutputNamesImpl(obj)` returns the names of the output ports from System object, `obj` implemented in a MATLAB System block. The number of returned output names matches the number of outputs returned by the `getNumOutputs` method. If you change a property value that affects the number of outputs, the names of those outputs also change.

`getOutputNamesImpl` is called by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object

Output Arguments

`name1,name2,...`

Names of the outputs for the specified object, returned as character vectors.

Default: empty character vector

Examples

Specify Output Port Name

Specify the name of an output port as 'count'.

```
methods (Access = protected)
    function outputName = getOutputNamesImpl(~)
        outputName = 'count';
    end
end
```

- “Specify Input and Output Names”

See Also

[getInputNamesImpl](#) | [getNumOutputsImpl](#)

Topics

getPropertyGroupsImpl

Property groups for System object display

Syntax

```
group = getPropertyGroupsImpl
```

Description

`group = getPropertyGroupsImpl` specifies how to group properties for display. You specify property sections (`matlab.system.display.Section`) and section groups (`matlab.system.display.SectionGroup`) within this method. Sections arrange properties into groups. Section groups arrange sections and properties into groups. If a System object, included through the MATLAB System block, has a section, but that section is not in a section group, its properties appear above the block dialog tab panels.

If you do not include a `getPropertyGroupsImpl` method in your code, all public properties are included in the dialog box by default. If you include a `getPropertyGroupsImpl` method but do not list a property, that property does not appear in the dialog box.

When the System object is displayed at the MATLAB command line, the properties are grouped as defined in `getPropertyGroupsImpl`. If your `getPropertyGroupsImpl` defines multiple section groups, only properties from the first section group are displayed at the command line. To display properties in other sections, a link is provided at the end of a System object property display. Group titles are also displayed at the command line. To omit the "Main" title for the first group of properties, set `TitleSource` to 'Auto' in `matlab.system.display.SectionGroup`.

`getPropertyGroupsImpl` is called by the MATLAB System block and when displaying the object at the command line.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

group

Property group or groups

Examples

Define Block Dialog Tabs

Define two block dialog tabs, each containing specific properties. For this example, you use the `getPropertyGroupsImpl`, `matlab.system.display.SectionGroup`, and `matlab.system.display.Section` methods in your class definition file.

```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title','Value parameters',...
            'PropertyList',{'StartValue','EndValue'});

        thresholdGroup = matlab.system.display.Section(...
            'Title','Threshold parameters',...
            'PropertyList',{'Threshold','UseThreshold'});

        mainGroup = matlab.system.display.SectionGroup(...
            'Title','Main', ...
            'Sections',[valueGroup,thresholdGroup]);

        initGroup = matlab.system.display.SectionGroup(...
            'Title','Initial conditions', ...
            'PropertyList',{'IC1','IC2','IC3'});

        groups = [mainGroup,initGroup];
    end
end
```

The resulting dialog box appears as follows.

- “Add Property Groups to System Object and MATLAB System Block”

Topics

“Add Property Groups to System Object and MATLAB System Block”

getSimulateUsingImpl

Specify value for Simulate using parameter

Syntax

```
simmode = getSimulateUsingImpl
```

Description

`simmode = getSimulateUsingImpl` specifies the simulation mode of the System object implemented in a MATLAB System block. The simulation mode restricts your System object to simulation using either code generation or interpreted execution. The associated `showSimulateUsingImpl` method controls whether the **Simulate using** option is displayed on the dialog box.

`getSimulateUsingImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

simmode

Simulation mode, returned as the character vector 'Code generation' or 'Interpreted execution'. If you do not include the `getSimulateUsingImpl` method in your class definition file, the simulation mode is unrestricted. Depending on the value returned by the associated `showSimulateUsingImpl` method, the simulation mode is displayed as either a dropdown list on the dialog box or not at all.

Examples

Specify the Simulation Mode

In the class definition file of your System object, define the simulation mode to display in the MATLAB System block. To prevent **Simulate using** from displaying, see `showSimulateUsingImpl`.

```
methods (Static, Access = protected)
    function simMode = getSimulateUsingImpl
        simMode = 'Interpreted execution';
    end
end
```

- “Control Simulation Type in MATLAB System Block”

See Also

`showSimulateUsingImpl`

Topics

“Control Simulation Type in MATLAB System Block”

showFiSettingsImpl

Fixed point data type tab visibility for System objects

Syntax

```
flag = showFiSettingsImpl
```

Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set code generation.

`showFiSettingsImpl` is called by the MATLAB System block.

The parameters that appear on the Data Types tab, which cannot be customized, are

- **Saturate on integer overflow** is a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.
- **Treat these inherited Simulink signal types as fi objects** is a pull down that indicates which inherited data types to treat as fi data types. Valid options are `Fixed point` and `Fixed point & integer`. The default value is `Fixed point`.
- **MATLAB System fimath** has two radio button options: **Same as MATLAB** and **Specify Other**. The default, **Same as MATLAB**, uses the current MATLAB fixed-point math settings. **Specify Other** enables the edit box for specifying the desired fixed-point math settings. For information on setting fixed-point math, see `fimath`, in the Fixed-Point Designer documentation.

Note If you do not want to display the tab, you do not need to implement this method in your class definition file.

You must set `Access = protected` and `Static` for this method.

Output Arguments

flag

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

Default: `false`

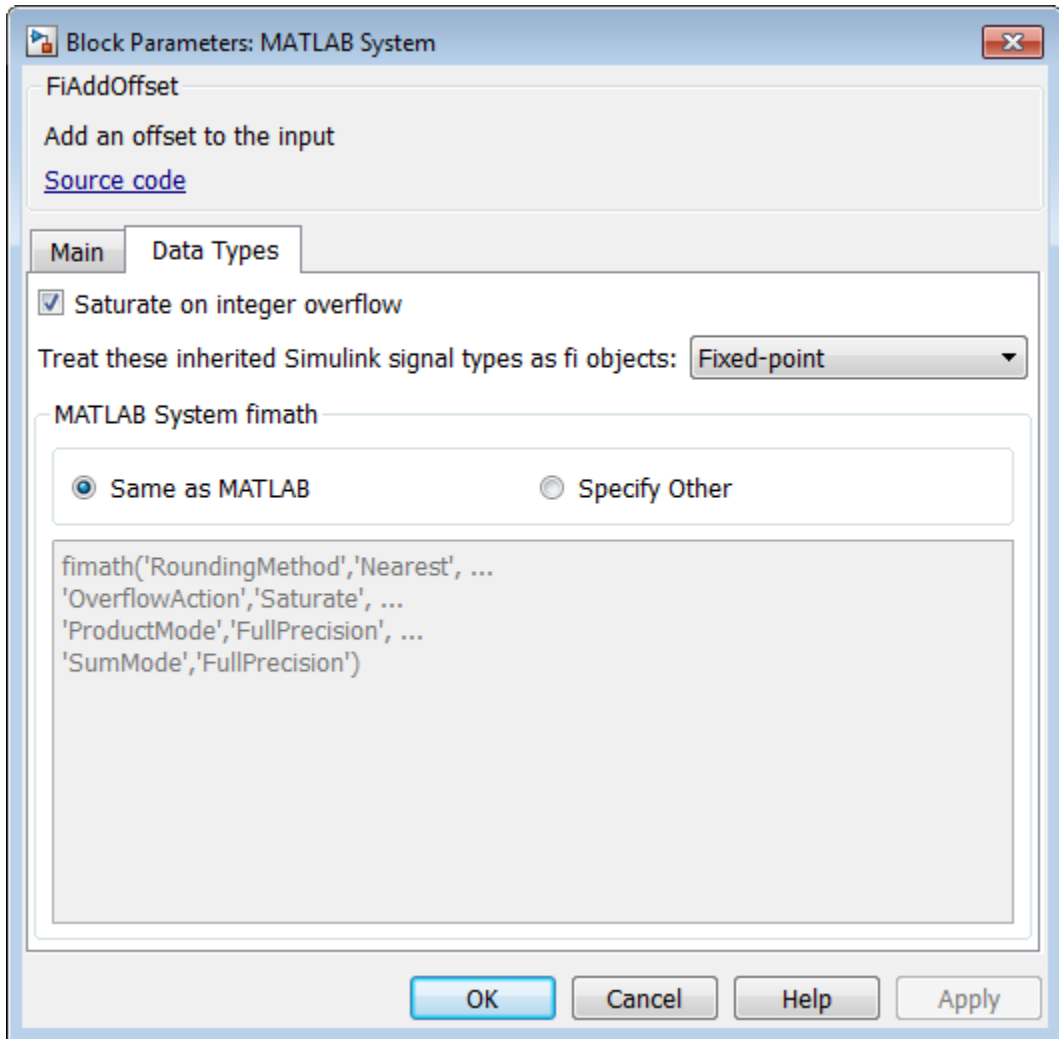

Examples

Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function isVisible = showFiSettingsImpl
        isVisible = true;
    end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.

- “Add Data Types Tab to MATLAB System Block”

Topics

“Add Data Types Tab to MATLAB System Block”

showSimulateUsingImpl

Visibility of `Simulate` using parameter

Syntax

```
flag = showSimulateUsingImpl
```

Description

`flag = showSimulateUsingImpl` specifies whether **Simulation mode** appears on the MATLAB System block dialog box.

`showSimulateUsingImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

flag

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask, returned as a logical scalar value. A `true` value displays the parameter and dropdown list. A `false` value hides the parameter and dropdown list.

Default: `true`

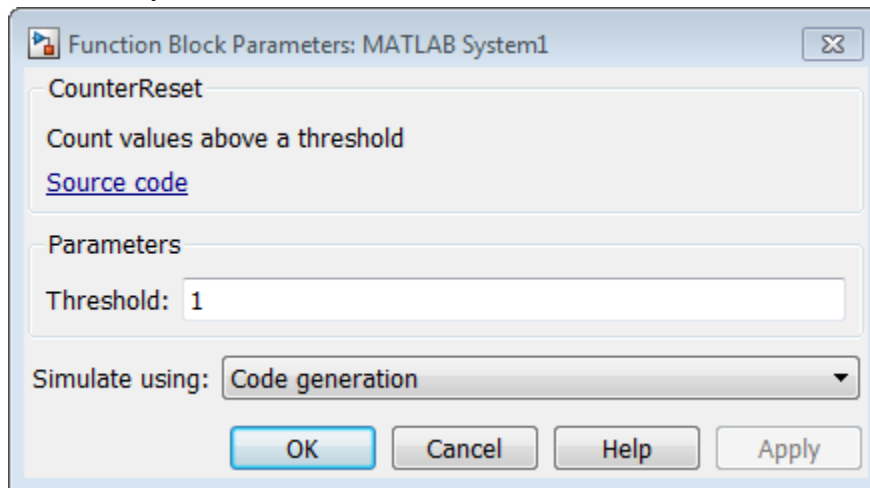

Examples

Hide the Simulate using Parameter

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
    function flag = showSimulateUsingImpl
        flag = false;
    end
end
```

If you set the flag to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

getGlobalNamesImpl

Global variable names for MATLAB System block

Syntax

```
name = getGlobalNamesImpl(obj)
```

Description

`name = getGlobalNamesImpl(obj)` specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in `stepImpl`, `outputImpl`, or `updateImpl`, you must include the `getGlobalNamesImpl` method. You declare global variables in a cell array in the `getGlobalNamesImpl` method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

`getGlobalNamesImpl` is called by the MATLAB System block.

Note You must set `Access = protected` for this method.

Input Arguments

`obj`

System object

Output Arguments

name

Name of the cell array containing the global variable names. The elements of the cell array are character vectors.

Examples

Specify Global Names

Specify two global names in your class definition file.

```
methods(Access = protected)
    function glnames = getGlobalNamesImpl(obj)
        glnames = {'FEE', 'OTHERFEE'};
    end

    function y = stepImpl(obj,u)
        global FEE
        global OTHERFEE
        y = u - FEE * obj.lastData + OTHERFEE;
        obj.lastData = u;
    end
end
```

getHeaderImpl

Header for System object display

Syntax

```
header = getHeaderImpl
```

Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

`getHeaderImpl` is called by the MATLAB System block.

Note You must set `Access = protected` and `Static` for this method.

Output Arguments

header

Header text

Examples

Define Header for System Block Dialog Box

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
    function header = getHeaderImpl
```

```
        header = matlab.system.display.Header('EnhancedCounter', ...
            'Title', 'Enhanced Counter');
    end
end
```

- “Add Header to MATLAB System Block”

See Also

`getPropertyGroupsImpl`

Topics

“Add Header to MATLAB System Block”

getDiscreteStateImpl

Discrete state property values

Syntax

```
s = getDiscreteStateImpl(obj)
```

Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

`getDiscreteStatesImpl` is called by the `getDiscreteState` method, which is called by the `setup` method.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

`obj`

System object handle

Output Arguments

`s`

State values, returned as a struct

Examples

Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to get the discrete states of the object.

```
methods (Access = protected)
    function s = getDiscreteStateImpl(obj)
    end
end
```

See Also

`setupImpl`

Topics

“Define Property Attributes” (MATLAB)

supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

During Simulink model compilation and propagation, the MATLAB System block calls the `supportMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

Output Arguments

flag

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportMultipleInstance` method, is `false`.

Examples

Enable For-Each Support for System Object

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
    function flag = supportsMultipleInstanceImpl(obj)
        flag = true;
    end
end
```

- “Enable For Each Subsystem Support”

See Also

`matlab.System`

Topics

“Enable For Each Subsystem Support”

processTunedPropertiesImpl

Action when tunable properties change

Syntax

```
processTunedPropertiesImpl(obj)
```

Description

`processTunedPropertiesImpl(obj)` specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its `Nontunable` attribute is `false`, which is the default.

`processTunedPropertiesImpl` is called when you run the System object.

Note You must set `Access = protected` for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

`obj`

System object

Examples

Specify Action When Tunable Property Changes

Use `processTunedPropertiesImpl` to recalculate the lookup table if the value of either the `NumNotes` or `MiddleC` property changes before the next call to the System object. `propChange` indicates if either property has changed.

```
methods (Access = protected)
    function processTunedPropertiesImpl(obj)
        propChange = isChangedProperty(obj, 'NumNotes') || ...
                    isChangedProperty(obj, 'MiddleC')
        if propChange
            obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
        end
    end
end
```

- “Validate Property and Input Values” (MATLAB)
- “Define Property Attributes” (MATLAB)

Tips

Use this method when a tunable property affects the value of a different property.

To check if a property has changed since `stepImpl` was last called, use `isChangedProperty` within `processTunedPropertiesImpl`. See “Specify Action When Tunable Property Changes” on page 5-83 for an example.

In MATLAB when multiple tunable properties are changed before running the System object, `processTunedPropertiesImpl` is called only once for all the changes. `isChangedProperty` returns `true` for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls `processTunedPropertiesImpl` before calling `stepImpl`. All tunable parameters are considered changed and `processTunedPropertiesImpl` method is called for each of them. `isChangedProperty` returns `true` for all the dialog properties.

Topics

“Validate Property and Input Values” (MATLAB)

“Define Property Attributes” (MATLAB)

matlab.system.mixin.CustomIcon class

Package: matlab.system.mixin

Custom icon mixin class

Description

`matlab.system.mixin.CustomIcon` is a class that specifies the `getIcon` method. This method customizes the name of the icon used for the `System` object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system &...  
    matlab.system.mixin.CustomIcon
```

Methods

`getIconImpl` Name to display as block icon

See Also

`matlab.System` | `matlab.system.display.Icon`

Topics

“Add Text to Block Icon”

getIconImpl

Class: matlab.system.mixin.CustomIcon

Package: matlab.system.mixin

Name to display as block icon

Syntax

```
icon = getIconImpl(obj)
```

Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`.

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

Note You must set `Access = protected` for this method.

Input Arguments

obj

System object handle

Output Arguments

icon

The text or image to display as the block icon. Each cell is displayed as a separate line.

Examples

Add System Block Icon Name

Specify in your class definition file the name of the block icon as 'Enhanced Counter' using two lines.

```
methods (Access = protected)
    function icon = getIconImpl(~)
        icon = {'Enhanced', 'Counter'};
    end
end
```

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
    function icon = getIconImpl(~)
        % Define icon for System block
        icon = matlab.system.display.Icon('my_icon.png');
    end
end
```

The image now appears on the System block icon.

matlab.system.display.Header class

Package: matlab.system.display

Header for System objects properties

Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (N,V) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- `Title` — Header title. The default value is an empty character vector.
- `Text` — Header description. The default value is an empty character vector.
- `ShowSourceLink` — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- `Title` — Set to the `Obj` class name.
- `Text` — Set to help summary for `Obj`.
- `ShowSourceLink` — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define System Block Header

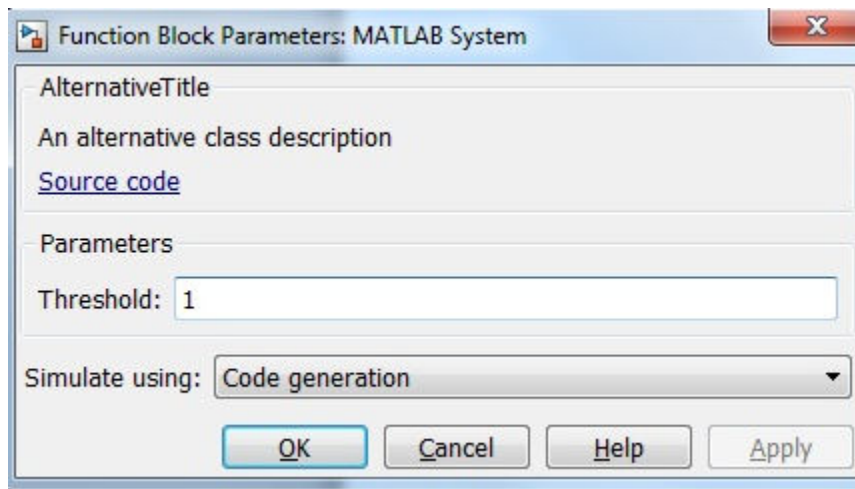

Define a header in your class definition file.

```

methods (Static, Access = protected)
    function header = getHeaderImpl
        header = matlab.system.display.Header(mfilename('class'), ...
            'Title', 'AlternativeTitle', ...
            'Text', 'An alternative class description');
    end
end

```

The resulting output appears as follows. In this case, **Source code** appears because the ShowSourceLink property was set to true.

getHeaderImpl | matlab.system.display.Section |
 matlab.system.display.SectionGroup

Topics

“Object-Oriented Programming” (MATLAB)

“Add Header to MATLAB System Block”

matlab.system.display.Section class

Package: matlab.system.display

Property group section for System objects

Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

Description

`matlab.system.display.Section(N1,V1,...Nn,Vn)` creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use `matlab.system.display.Section` to define property groups using the `getPropertyGroupsImpl` method. The available Section properties are

- **Title** — Section title. The default value is an empty character vector.
- **TitleSource** — Source of section title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the **Title** property. If the **Obj** name is given, the default value is `Auto`, which uses the **Obj** name.
- **Description** — Section description. The default value is an empty character vector.
- **PropertyList** — Section property list as a cell array of property names. The default value is an empty array. If the **Obj** name is given, the default value is all eligible display properties.

Note Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

`matlab.system.display.Section(Obj, ...)` creates a property group section for the specified System object (`Obj`) and sets the following property values:

- `TitleSource` — Set to 'Auto', which uses the `Obj` name.
- `PropertyList` — Set to all publicly-available properties in the `Obj`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Methods

Examples

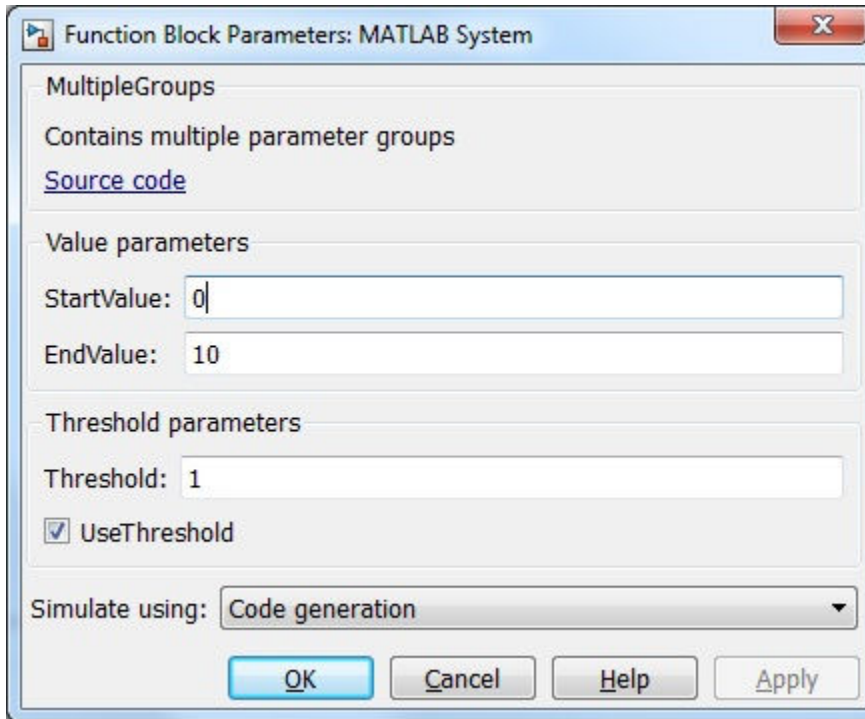

Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title', 'Value parameters', ...
            'PropertyList', {'StartValue', 'EndValue'});

        thresholdGroup = matlab.system.display.Section(...
            'Title', 'Threshold parameters', ...
            'PropertyList', {'Threshold', 'UseThreshold'});
        groups = [valueGroup, thresholdGroup];
    end
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.

- “Add Property Groups to System Object and MATLAB System Block”

matlab.system.display.Action class

Package: matlab.system.display

Custom button

Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

Input Arguments

action

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A `matlab.system.display.ActionData` object is the callback object for a display action. You use the `UserData` property of `matlab.system.display.ActionData` to store persistent data, such as a figure handle.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Properties

You specify these properties as part of the input using `Name, Value` pair arguments. Optionally, you can define them using `object.property` syntax.

- `ActionCalledFcn` — Action to take when the button is pressed. You cannot specify this property using a Name-Value pair argument.
- `Label` — Text to display on the button. The default value is an empty character vector.
- `Description` — Text for the button tooltip. The default value is an empty character vector.
- `Placement` — Character vector indicating where on a separate row in the property group to place the button. Valid values are 'first', 'last', or a property name. If you specify a property name, the button is placed above that property. The default value is 'last'.
- `Alignment` — Character vector indicating how to align the button. Valid values are 'left' and 'right'. The default value is 'left'.

Examples

Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

```

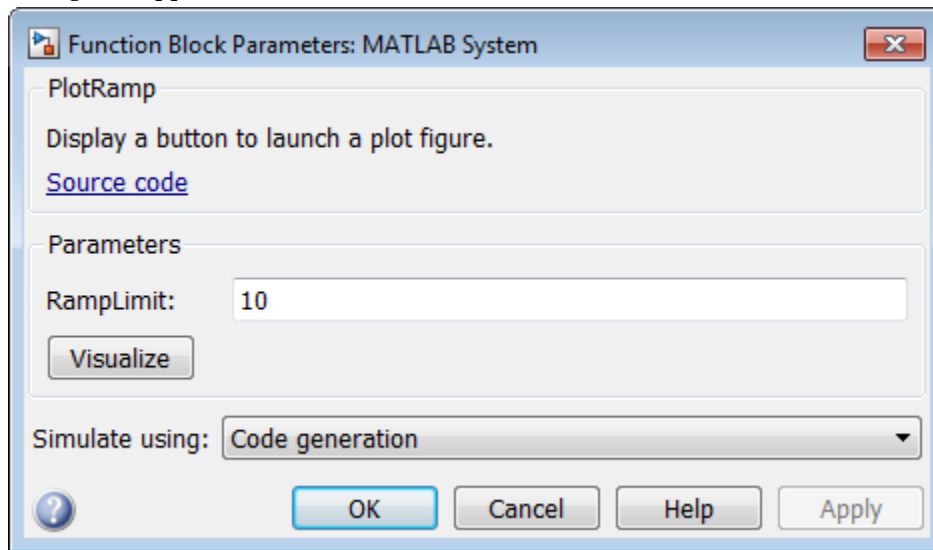

methods(Static,Access = protected)
    function group = getPropertyGroupsImpl
        group = matlab.system.display.Section(mfilename('class'));
        group.Actions = matlab.system.display.Action(@(~,obj) ...
            visualize(obj), 'Label', 'Visualize');
    end
end

methods
    function obj = PlotRamp(varargin)
        setProperties(obj,nargin,varargin{:});
    end

    function visualize(obj)
        figure;
        d = 1:obj.RampLimit;
        plot(d);
    end
end

```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.

To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```

methods(Static,Access = protected)
    function group = getPropertyGroupsImpl
        group = matlab.system.display.Section(mfilename('class'));
        group.Actions = matlab.system.display.Action(@(actionData,obj) ...
            visualize(obj,actionData),'Label','Visualize');
    end
end

methods
    function obj = ActionDemo(varargin)
        setProperties(obj,nargin,varargin{:});
    end

    function visualize(obj,actionData)
        f = actionData.UserData;
        if isempty(f) || ~ishandle(f)
            f = figure;
            actionData.UserData = f;
        else
            figure(f); % Make figure current
        end

        d = 1:obj.RampLimit;
        plot(d);
    end
end

“Add Button to MATLAB System Block”

matlab.system.display.SectionGroup class

Package: matlab.system.display

Section group for System objects

Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (N,V). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are

- **Title** — Group title. The default value is an empty character vector.
- **TitleSource** — Source of group title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting TitleSource to 'Auto'.
- **Description** — Group or tab description that appears above any properties or panels. The default value is an empty character vector.
- **PropertyList** — Group or tab property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.
- **Sections** — Group sections as an array of section objects. If the Obj name is given, the default value is the default section for the Obj.

`matlab.system.display.SectionGroup(Obj,...)` creates a section group for the specified System object (`Obj`) and sets the following property values:

- `TitleSource` — Set to 'Auto'.
- `Sections` — Set to `matlab.system.display.Section` object for `Obj`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

Examples

Define Block Dialog Tabs

Define in your class definition file two tabs, each containing specific properties. For this example, you use the `matlab.system.display.SectionGroup`, `matlab.system.display.Section`, and `getPropertyGroupsImpl` methods.

```
methods (Static, Access = protected)
    function groups = getPropertyGroupsImpl
        valueGroup = matlab.system.display.Section(...
            'Title','Value parameters',...
            'PropertyList',{'StartValue','EndValue'});

        thresholdGroup = matlab.system.display.Section(...
            'Title','Threshold parameters',...
            'PropertyList',{'Threshold','UseThreshold'});

        mainGroup = matlab.system.display.SectionGroup(...
            'Title','Main', ...
            'Sections',[valueGroup,thresholdGroup]);

        initGroup = matlab.system.display.SectionGroup(...
            'Title','Initial conditions', ...
            'PropertyList',{'IC1','IC2','IC3'});

        groups = [mainGroup,initGroup];
    end
end
```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.

matlab.system.display.Icon class

Package: matlab.system.display

Custom icon image

Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

Input Arguments

imageFile — Image file

character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See “Draw Static Icon”.

Example: 'image.png'

Examples

Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
    function icon = getIconImpl(~)
        % Define icon for MATLAB System block
        icon = matlab.system.display.Icon('my_icon.png');
    end
end
```

The image now appears on the MATLAB System block icon.

Introduced in R2017a

matlab.system.mixin.Propagates class

Package: matlab.system.mixin

Signal characteristics propagation mixin class

Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a `System` object. Use this mixin class and its methods when you will include your `System` object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your `System` object.

```
classdef ObjectName < matlab.System &...  
    matlab.system.mixin.Propagates
```

Methods

<code>getDiscreteStateSpecificationImpl</code>	Discrete state size, data type, and complexity
<code>getOutputDataTypeImpl</code>	Data types of output ports
<code>getOutputSizeImpl</code>	Sizes of output ports
<code>isOutputComplexImpl</code>	Complexity of output ports
<code>isOutputFixedSizeImpl</code>	Fixed- or variable-size output ports
<code>propagatedInputComplexity</code>	Complexity of input during Simulink propagation
<code>propagatedInputDataType</code>	Data type of input during Simulink propagation
<code>propagatedInputFixedSize</code>	Fixed-size status of input during Simulink propagation
<code>propagatedInputSize</code>	Size of input during Simulink propagation

Note If your `System` object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

getDiscreteStateSpecificationImpl

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Discrete state size, data type, and complexity

Syntax

```
[sz,dt,cp] = getDiscreteStateSpecificationImpl(obj,propertyname)
```

Description

`[sz,dt,cp] = getDiscreteStateSpecificationImpl(obj,propertyname)` returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block. If you define this method for a property that is not discrete state, an error occurs during model compilation.

You always set the `getDiscreteStateSpecificationImpl` method access to `protected` because it is an internal method that users do not directly call or run.

`getDiscreteStateSpecificationImpl` is called by the MATLAB System block during Simulink model compilation.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

obj

System object handle

propertyname

Name of discrete state property of the System object

Output Arguments

sz

Vector containing the length of each dimension of the property.

Default: [1 1]

dt

Data type of the property. For built-in data types, `dt` is a character vector. For fixed-point data types, `dt` is a `numericType` object.

Default: `double`

cp

Complexity of the property as a scalar, logical value, where `true` = complex and `false` = real.

Default: `false`

Examples

Specify Discrete State Property Size, Data Type, and Complexity

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
    function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
        sz = [1 1];
        dt = 'double';
        cp = false;
```

```
end  
end
```

- “Specify Discrete State Output Specification”

`matlab.system.mixin.Propagates`

Topics

“Specify Discrete State Output Specification”

getOutputDataTypeImpl

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Data types of output ports

Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you subclass from `matlab.system.mixin.Propagates`, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, [], data types. This occurs because Simulink has not completed setting the output data types.

Input Arguments

`obj`

System object

Output Arguments

`dt_1, dt_2, ...`

Data type of the property. For built-in data types, `dt` is a character vector. For fixed-point data types, `dt` is a numeric type object.

Examples

Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the `getOutputDataTypeImpl` method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the `stepImpl` method.

```
classdef DataTypeChange < matlab.System & ...
    matlab.system.mixin.Propagates

    properties(Nontunable)
        Quantize = false
    end

    methods(Access = protected)
```

```
function y = stepImpl(obj,u)
    if obj.Quantize == true
        % Cast for output data type to differ from input.
        y = single(u);
    else
        % Propagate output data type.
        y = u;
    end
end

function out = getOutputDataTypeImpl(obj)
    if obj.Quantize == true
        out = 'single';
    else
        out = propagatedInputDataType(obj,1);
    end
end
end
end
```

Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```
properties(Nontunable)
    OutputBusName = 'myBus'
end

methods (Access = protected)
    function out = getOutputDataTypeImpl(obj)
        out = obj.OutputBusName;
    end
end
```

“Set Output Data Type”

getOutputSizeImpl

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Sizes of output ports

Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

Description

`[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)` returns the size of each output port. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

If your `System` object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case `getOutputSizeImpl` assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the `getOutputSizeImpl` method to define the output size, if:

- Your `System` object has more than one input or output
- You need the output and input sizes to be different.

If the output size differs from the input size, you must also use the `propagatedInputSize` method

During Simulink model compilation and propagation, the MATLAB `System` block calls the `getOutputSize` method, which then calls the `getOutputSizeImpl` method to determine the output size.

All inputs default to variable-size inputs. For these inputs, the output size is the maximum input size.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

`obj`

System object handle

Output Arguments

`sz_1, sz_2, ...`

Vector containing the size of each output port.

Examples

Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
    function sz_1 = getOutputSizeImpl(obj)
        sz_1 = [1 1];
    end
end
```

Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
    function [sz_1,sz_2] = getOutputSizeImpl(obj)
        sz_1 = propagatedInputSize(obj,1);
        sz_2 = [1 1];
    end
end
```

Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
    function varargout = getOutputSizeImpl(obj)
        varargout{1} = propagatedInputSize(obj,1);
        if obj.HasSecondOutput
            varargout{2} = [1 1];
        end
    end
end
```

- “Set Output Size”

`matlab.system.mixin.Propagates` | `propagatedInputSize`

Topics

“Set Output Size”

isOutputComplexImpl

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Complexity of output ports

Syntax

```
[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj)
```

Description

`[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj)` returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

`obj`

System object handle

Output Arguments

`cp_1, cp_2, ...`

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

Examples

Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
    function c1 = isOutputComplexImpl(obj)
        c1 = false;
    end
end
```

Topics

“Set Output Complexity”

isOutputFixedSizeImpl

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Fixed- or variable-size output ports

Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

Description

[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj) returns whether each output port is fixed size. The number of outputs must match the value returned from the getNumOutputs method, which is the number of output arguments listed in the stepImpl method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case isOutputFixedSizeImpl assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the isOutputFixedSizeImpl method to define the output fixed size. You also must use the propagatedInputFixedSize method if the output fixed size status differs from the input fixed size status.

During Simulink model compilation and propagation, the MATLAB System block calls the isOutputFixedSize method, which then calls the isOutputFixedSizeImpl method to determine the output fixed size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

Note You must set `Access = protected` for this method.

You cannot modify any properties in this method.

Input Arguments

`obj`

System object handle

Output Arguments

`flag_1, flag2, ...`

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

Examples

Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
    function c1 = isOutputFixedSizeImpl(obj)
        c1 = true;
    end
end
```

propagatedInputComplexity

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Complexity of input during Simulink propagation

Syntax

```
flag = propagatedInputComplexity(obj, index)
```

Description

`flag = propagatedInputComplexity(obj, index)` returns true or false to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

Input Arguments

obj

System object

index

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag

Complexity of the specified input, returned as `true` or `false`

Examples

Match Input and Output Complexity

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
    function outcomplx = isOutputComplexImpl(obj)
        outcomplx = propagatedInputComplexity(obj,2);
    end
end
```

propagatedInputDataType

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Data type of input during Simulink propagation

Syntax

```
dt = propagatedInputDataType(obj, index)
```

Description

`dt = propagatedInputDataType(obj, index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

Input Arguments

obj

System object

index

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

dt

Data type of the specified input, returned as a character vector for floating-point input or as a numeric type for fixed-point input.

Examples

Match Input and Output Data Type

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
    function dt = getOutputDataTypeImpl(obj)
        if strcmpi(propagatedInputDataType(obj,2), 'double')
            dt = 'int32';
        else
            dt = propagatedInputDataType(obj,2);
        end
    end
end
```

propagatedInputFixedSize

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Fixed-size status of input during Simulink propagation

Syntax

```
flag = propagatedInputFixedSize(obj, index)
```

Description

`flag = propagatedInputFixedSize(obj, index)` returns true or false to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

Input Arguments

obj

System object

index

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

Output Arguments

flag

Fixed-size status of the specified input, returned as `true` or `false`.

Examples

Match Fixed-Size Status of Input and Output

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)
    function outtype = isOutputFixedSizeImpl(obj)
        outtype = propagatedInputFixedSize(obj,3)
    end
end
```

“Specify Whether Output Is Fixed-Size or Variable-Size”

propagatedInputSize

Class: matlab.system.mixin.Propagates

Package: matlab.system.mixin

Size of input during Simulink propagation

Syntax

```
sz = propagatedInputSize(obj,index)
```

Description

`sz = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The `index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

Note For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
 - Simulink — `propagatedInputSize` returns the upper bound of the input sizes.
-

Input Arguments

obj

System object

index

Index of the specified input

Output Arguments

sz

Size of the specified input, returned as a vector

Examples

Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
    function outsz = getOutputSizeImpl(obj)
        sz = propagatedInputSize(obj,2);
        if sz(1) == 1
            outsz = [1,2];
        else
            outsz = [2,1];
        end
    end
end
```

matlab.system.mixin.Nondirect class

Package: matlab.system.mixin

Nondirect feedthrough mixin class

Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a `System` object.

For `System` objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the `System` object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when `System` objects in Simulink use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the `System` object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns `false`, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a `System` object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

Methods

<code>isInputDirectFeedthroughImpl</code>	Direct feedthrough status of input
<code>outputImpl</code>	Output calculation from input or internal state of System object
<code>updateImpl</code>	Update object states based on inputs

See Also

`matlab.System`

Topics

“Use Update and Output for Nondirect Feedthrough”

isInputDirectFeedthroughImpl

Class: matlab.system.mixin.Nondirect

Package: matlab.system.mixin

Direct feedthrough status of input

Syntax

```
[flag1, ..., flagN] = isInputDirectFeedthroughImpl(obj, u1, u2, ..., uN)
```

Description

[flag1, ..., flagN] = isInputDirectFeedthroughImpl(obj, u1, u2, ..., uN) specifies whether each input is a direct feedthrough input. If direct feedthrough is true, the output depends on the input at each time instant.

Note You must set `Access = protected` for this method.

You cannot modify any properties or implement or access tunable properties in this method.

If you do not include the `isInputDirectFeedthroughImpl` method in your System object class definition file, all inputs are assumed to be direct feedthrough.

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.

- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

`isInputDirectFeedthroughImpl` is called by the MATLAB System block.

Input Arguments

`obj`

System object handle

`u1, u2, . . . , uN`

Specifications of the inputs to the algorithm.

Output Arguments

`flag1, . . . , flagN`

Logical value or either `true` or `false`. This value indicates whether the corresponding input is direct feedthrough or not, respectively. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file to mark the inputs as nondirect feedthrough.

```
methods (Access = protected)
    function flag = isInputDirectFeedthroughImpl(~, ~)
        flag = false;
```

```
end  
end
```

Topics

“Use Update and Output for Nondirect Feedthrough”

outputImpl

Class: matlab.system.mixin.Nondirect

Package: matlab.system.mixin

Output calculation from input or internal state of System object

Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. . The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

`outputImpl` is called by the `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Note You must set `Access = protected` for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

obj

System object handle

u1, u2, . . . uN

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

Output Arguments

y1, y2, . . . yN

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

Examples

Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
    function [y] = outputImpl(obj, ~)
        y = obj.PreviousInput(end);
    end
end
```

“Use Update and Output for Nondirect Feedthrough”

updateImpl

Class: matlab.system.mixin.Nondirect

Package: matlab.system.mixin

Update object states based on inputs

Syntax

```
updateImpl(obj, u1, u2, ..., uN)
```

Description

`updateImpl(obj, u1, u2, ..., uN)` specifies the algorithm to update the System object states. You use this method when your algorithm outputs depend only on the object's internal state and internal properties. Do not use this method to update the outputs from the inputs.

`updateImpl` is called by the `update` method and after the `outputImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

Note You must set `Access = protected` for this method.

You cannot modify any tunable properties in this method if its System object will be used in the Simulink MATLAB System block.

Input Arguments

`obj`

System object handle

u1, u2, . . . uN

Inputs to the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method.

Examples

Set Up Output that Does Not Depend on Current Input

Update the object with previous inputs. Use `updateImpl` in your class definition file. This example saves the `u` input and shifts the previous inputs.

```
methods (Access = protected)
    function updateImpl(obj,u)
        obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
    end
end
```

matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Specify the offset time
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

```
classdef MySystemObject < matlab.System & matlab.system.mixin.SampleTime
```

Methods

<code>getSampleTimeImpl</code>	Specify sample time type, offset time, and sample time
<code>getSampleTime</code>	Query sample time
<code>getCurrentTime</code>	Current simulation time in MATLAB System block
<code>createSampleTime</code>	Create sample time specification object

Topics

“Specify Sample Time for MATLAB System Block System Objects”

Introduced in R2017b

getSampleTimeImpl

Class: matlab.system.mixin.SampleTime

Specify sample time type, offset time, and sample time

Syntax

```
sts = getSampleTimeImpl(obj)
```

Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

This method is called during setup by `setupImpl`.

Input Arguments

obj — System object

system object

System object for which you want to specify the sample time.

Output Arguments

sts — Sample time specification object

sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

Examples

Specify Inherited Sample Time

Specify that the MATLAB System block should inherit the sample from upstream blocks.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Inherited');
end
```

Specify Discrete Periodic Sample Time

Specify a discrete periodic sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete Periodic', ...
        'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

getSampleTime

Class: matlab.system.mixin.SampleTime

Query sample time

Syntax

```
sts = getSampleTime(obj)
```

Description

`sts = getSampleTime(obj)` returns the sample time specification for the `System` object `obj` when the `System` object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default `Inherited` sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

Input Arguments

obj — **System object**
system object

System object included in a MATLAB System block that you want to query.

Output Arguments

sts — Sample time specification object

sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see `createSampleTime`.

Examples

Return Sample Time

This example of `stepImpl` returns a count value `y`, the current simulation time `ct`, and the sample time `st`. The sample time is obtained by calling `getSampleTime`.

```
function [y,ct,st] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
    sts = getSampleTime(obj);
    st = sts.SampleTime;
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

getCurrentTime

Class: matlab.system.mixin.SampleTime

Current simulation time in MATLAB System block

Syntax

```
t = getCurrentTime(obj)
```

Description

`t = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

Input Arguments

obj — System object

system object

System object included in a MATLAB System block that you want to query.

Output Arguments

t — Current simulation time

double

The current simulation time of the MATLAB System block that contains the System object.

Examples

Return Current Simulation Time

This example of `stepImpl` returns a count value `y` and the current simulation time `ct`. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
    y = obj.Count + u;
    obj.Count = y;
    ct = getCurrentTime(obj);
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

createSampleTime

Class: matlab.system.mixin.SampleTime

Create sample time specification object

Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj, 'Type', Type)
sts = createSampleTime(obj, Name, Value)
```

Description

`sts = createSampleTime(obj)` creates a sample time object for inherited sample time for the System object `obj`. Use this sample time object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

`sts = createSampleTime(obj, 'Type', Type)` creates a sample time object with the specified sample time type.

`sts = createSampleTime(obj, Name, Value)` creates a sample time object with additional options specified by one or more `Name, Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Input Arguments

obj — System object

system object

System object that you want to specify the sample time.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'SampleTime', 1`

Type — Sample time type

'Inherited' (default) | 'Discrete Periodic' | 'Fixed In Minor Step'

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- 'Inherited' - “Inherited Sample Time”
- 'Discrete Periodic' - “Discrete Sample Time”
- 'Fixed In Minor Step' - “Fixed-in-Minor-Step”

Data Types: character

SampleTime — Time between samples

1 (default) | positive number

For `Discrete Periodic` sample time only.

Specify the time between sample hits in Simulink.

Data Types: single | double

offsetTime — Offset from sample time

0 (default) | nonnegative number less than `SampleTime`

For `Discrete Periodic` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Data Types: single | double

Output Arguments

sts — Sample time specification object

sample time specification object

The sample time specification object. This object has the following properties:

- **Type** — Type of sample time
- **SampleTime** — Time between samples
- **OffsetTime** — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

Examples

Create Inherited Sample Time Objects

Specify that the MATLAB System block should inherit the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj);
end
```

Create Discrete Periodic Sample Time Object

Specify a discrete periodic sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
    sts = createSampleTime(obj, 'Type', 'Discrete Periodic', ...
        'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

ModelAdvisor.Preferences class

Package: ModelAdvisor

Set Model Advisor window preferences by specifying which folders and tabs to display

Description

Use instances of this class to set Model Advisor preferences.

Construction

The constructor `ModelAdvisor.Preferences` creates an instance of this class with default property values.

Create an instance `modelPreferences` of the `ModelAdvisor.Preferences` class.

```
modelPreferences = ModelAdvisor.Preferences;
```

Properties

DeselectByProduct — Deselect the By Product folder

(default) | `true`

Selection of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowAccordion — Display advisors

(default) | `false`

Display of the **Code Generation Advisor**, **Upgrade Advisor**, and **Performance Advisor** in the Model Advisor window. The default value is `false`. You can use these

advisors to help configure your model for code generation, upgrade your model for the current release, or improve performance.

Example: `true`

Data Types: `logical`

ShowByProduct — Display the By Product folder

(default) | `true`

Display of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowByTask — Display the By Task folder

(default) | `true`

Display of the **By Task** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowExclusionsInRpt — Include exclusions in report

(default) | `true`

Include exclusions in the Model Advisor report. The default value is `true`.

Example: `true`

Data Types: `logical`

ShowExclusionTab — Display the Exclusions tab

(default) | `false`

Display of the **Exclusions** tab in the Model Advisor window. The default value is `false`. When you click the **Exclusions** tab, the Model Advisor window displays checks that are excluded from the Model Advisor analysis.

Example: `true`

Data Types: `logical`

ShowSourceTab — Display the Source tab

(default) | `false`

Display of the **Source** tab in the Model Advisor window. The default value is `false`. When you click the **Source** tab, the Model Advisor window displays the check Title, TitleID, and location of the MATLAB source code for the check.

Example: `true`

Data Types: `logical`

Examples

Turn Off Display Of By Product Folder

This example shows how to not display the **By Product** folder in the Model Advisor window:

```
mp = ModelAdvisor.Preferences;  
mp.load;  
mp.ShowByProduct = false;  
mp.save
```

Alternatives

You can set the Model Advisor preferences by using the Model Advisor Preferences dialog box:

- On the Model Advisor menu, select **Settings > Preferences**.
- From the Model Editor, select **Analysis > Model Advisor > Preferences**.

“Run Model Checks”

Introduced in R2014b

Simulink.AliasType

Create alias for signal and parameter data type

Description

This class allows you to designate MATLAB variables as aliases for signal and parameter data types. You designate variables as aliases by creating instances of this class and assigning them to variables in the MATLAB base workspace or a data dictionary (see “Creating a Data Type Alias” on page 5-158). The MATLAB variable to which a `Simulink.AliasType` object is assigned is called a data type alias. The data type to which an alias refers is called its base type. Simulink software allows you to set the `BaseType` property of the object that the variable references, thereby designating the data type for which it is an alias.

Simulink software lets you use aliases instead of actual type names in dialog boxes and `set_param` commands to specify the data types of Simulink block outputs and parameters. Using aliases to specify signal and parameter data types can greatly simplify global changes to the signal and parameter data types that a model specifies. In particular, changing the data type of all signals and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The generated code uses the alias only if you use an ERT-based system target file (Embedded Coder).

To generate `Simulink.AliasType` objects that correspond to `typedef` statements in your external C code, consider using the `Simulink.importExternalCTypes` function.

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

Creating a Data Type Alias

You can use either the Model Explorer or MATLAB commands to create a data type alias. See “MATLAB Commands for Creating Data Type Aliases” on page 5-158.

To use the Model Explorer to create an alias:

- 1 On the Model Explorer **Model Hierarchy** pane, select `Base Workspace`.

You must create data type aliases in the MATLAB workspace or in a data dictionary. If you attempt to create an alias in a model workspace, Simulink software displays an error.

- 2 From the Model Explorer **Add** menu, select **Simulink.AliasType**.

Simulink software creates an instance of a `Simulink.AliasType` object and assigns it to a variable named `Alias` in the MATLAB workspace.

- 3 Rename the variable to a more appropriate name, for example, a name that reflects its intended usage.

To change the name, edit the name displayed in the **Name** field on the Model Explorer **Contents** pane.

- 4 On the Model Explorer **Dialog** pane, in the **Base type** field, enter the name of the data type that this alias represents.

You can specify the name of any existing standard or user-defined data type in this field. Skip this step if the base type is `double` (the default).

MATLAB Commands for Creating Data Type Aliases

Use the following syntax to create a data type alias at the command prompt or in a MATLAB script.

```
ALIAS = Simulink.AliasType;
```

`ALIAS` is the name of the variable that you want to serve as the alias. For example, the following line creates an alias named `MyFloat`.

```
MyFloat = Simulink.AliasType;
```

The following notations get and set the properties of a data type alias, respectively:

```
PROPVALUE = ALIAS.PROPNAME;  
ALIAS.PROPNAME = PROPVALUE;
```

ALIAS is the name of the alias object, PROPNAME is the name of the alias object properties, and PROPVALUE is the property value. For example, the following code saves the current value of MyFloat's BaseType property and assigns it a new value.

```
old = MyFloat.BaseType;  
MyFloat.BaseType = 'single';
```

For information on the names, permitted values, and usage of the properties of data type alias objects, see “Properties” on page 5-164.

Create Alias for Enumerated Data Type

You can use a Simulink.AliasType object to create an alias for an enumerated data type. For example, you can create an alias for an enumerated type called S1DemoSign.

```
myEnumAlias = Simulink.AliasType;  
myEnumAlias.BaseType = 'Enum: S1DemoSign';
```

You can use the expression myEnumAlias to specify the data type of signals or parameters as the enumerated type S1DemoSign.

Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a Simulink.AliasType object, set the BaseType property of the object by using a call to the fixdt function. Because the value of BaseType must be a character vector, wrap the function call in a character vector. For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;  
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

Alternatively, to specify the characteristics of the fixed-point data type interactively, in the property dialog box for myFixptAlias, you can use the Data Type Assistant. To open the property dialog box, at the command prompt, enter:

```
open('myFixptAlias')
```

For information about using the Data Type Assistant, see “Specify Data Types Using Data Type Assistant”.

Data Type Aliases in Generated Code

If you have a Simulink Coder license, you can cause data type aliases to appear in the code generated for a model using any of the following methods:

- Specifying the signal data type of a block in the model as a `Simulink.AliasType` via the **Block Parameters** dialog box.
- Creating a `Simulink.Signal` object that uses the `Simulink.AliasType` as its data type. Use this signal object as the name of a signal in the model and specify that the signal name must resolve to an object in the MATLAB workspace. See “Control Signals and States in Code by Applying Storage Classes” (Simulink Coder) in the Simulink Coder User's Guide.
- Creating a `Simulink.Parameter` object that uses the `Simulink.AliasType` as its data type. Use this parameter object as a block parameter in the model. See “Parameter Data Types in the Generated Code” (Simulink Coder) in the Simulink Coder User's Guide.

Notes

- If you assign a data type in a block dialog box and if you use a `Simulink.Signal` object on the signal feeding into the block, the code is always generated using the data type in the dialog box.
- The Simulink Coder code generator tries to preserve the names of alias types in the generated code. However, in some cases, an alias type name can revert to its underlying equivalent built-in data type. If you have an Embedded Coder license, you can specify that the code generator use the alias type name in the generated code, by using replacement types (see “Model Configuration Parameters: Code Generation Data Type Replacement” (Embedded Coder)).
- The `Simulink.AliasType` class does not support multiword data types for code generation.
- You can specify the data type of a complex signal using the `Simulink.AliasType` class. In this case, if the **DataScope** property of the `Simulink.AliasType` class is set to `Imported` (or `Auto` with a header file specified), provide a definition for the complex type. As shown in the following example, the alias type definition, `IAT_int32`, must contain the name of the complex type prefixed by `c`.

```
#ifndef myAliasTypes_H_
#define myAliasTypes_H_

#include "rtwtypes.h"

typedef int32_T IAT_int32;
typedef cint32_T cIAT_int32;

#endif
```

In the preceding example, while you must define `IAT_int32` in the base workspace, you do not need to define `cIAT_int32` in the base workspace.

- If you define two nested alias types, Simulink Coder generates an error if the **DataScope** property of the alias type is set to `Imported` or if either of the alias types specifies a header file.
-

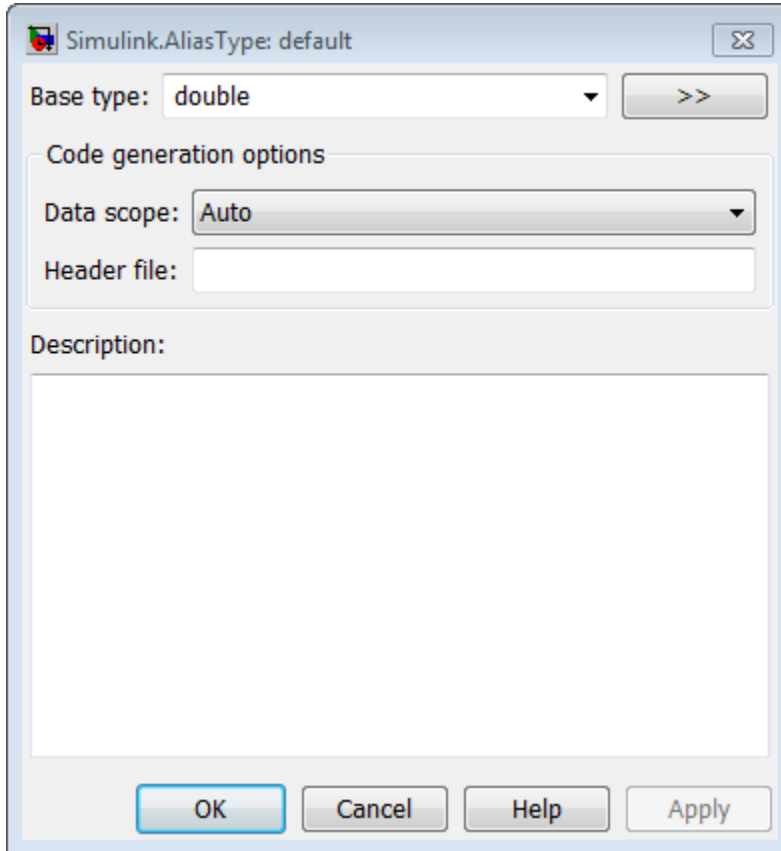

Parent

None

Children

None

Property Dialog Box

Base type

The data type to which this alias refers. The default is `double`. To specify another data type, select the data type from the adjacent drop-down list of standard data types or enter the data type name in the edit field.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `fixdt(0,16,7)`. To specify the characteristics of the type interactively, expand the Data Type Assistant and set **Mode** to `Fixed point`. For information about using the Data Type Assistant, see “Specify Data Types Using Data Type Assistant”.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by entering the data type name in the edit field. The exception is a `Simulink.NumericType` whose `Category` is `Fixed-point: unspecified scaling`.

Note `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType`. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

Data scope

Specifies whether the data type definition is imported from, or exported to, a header file during code generation. The possible values are:

Value	Action
Auto (default)	If no value is specified for Header file , export the type definition to <code>model_types.h</code> , where <code>model</code> is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to <code>rtwtypes.h</code> . If a value is specified for Header file , import the data type definition from the specified header file.
Exported	Export the data type definition to a header file, which can be specified in the Header file field. If no value is specified for Header file , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
Imported	Import the data type definition from a header file, which can be specified in the Header file field. If no value is specified for Header file , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

Header file

Name of a C header file from which a data type definition is imported, or to which a data type definition is exported, based on the value of **Data scope**. If this field is specified, the specified name is used during code generation for importing or exporting. If this field is empty, the value defaults to `type.h` if **Data scope** equals `Imported` or `Exported`, or defaults to `model_types.h` if **Data scope** equals `Auto`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify **Header file** as `<myTypes.h>`.

Description

Describes the usage of the data type referenced by this alias.

Properties

Name	Description
BaseType	A character vector specifying the name of a standard or custom data type. (Base type)
DataScope	A character vector specifying whether the data type definition is imported from, or exported to, a header file during code generation. (Data scope)
Description	A character vector that describes the usage of the data type. Can be a null character vector. (Description)
HeaderFile	A character vector that specifies the name of a C header file from which a data type definition is imported, or to which a data type definition is exported, during code generation. (Header file)

Simulink.Annotation

Specify properties of model annotation

Description

Instances of this class specify the properties of annotations. You can use `getCallbackAnnotation` in an annotation callback function to get the `Simulink.Annotation` instance for the annotation associated with the callback function. You can use `find_system` and `get_param` to get the `Simulink.Annotation` instance associated with any annotation in a model. For example, this code gets the annotation object for the first annotation in the currently selected model and turns on its drop shadow

```
ah = find_system(gcs,'FindAll','on','type','annotation');
ao = get_param(ah(1),'Object');
ao.DropShadow = 'on';
```

Children

None.

Property Summary

Property	Description	Values
<code>AnnotationType</code>	Type of annotation—text (note), area, or image. This property is read only.	<code>note_annotation</code> <code>area_annotation</code> <code>image_annotation</code>

Property	Description	Values
BackgroundColor	Background color of this annotation.	<p>RGB value array [r, g, b, a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored.</p> <p>Annotation background color can also be 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.</p>
ClickFcn	Specifies MATLAB code to execute when you click this annotation. See “Associate a Click Function with an Annotation” for more information.	character vector
DeleteFcn	MATLAB code to execute before deleting this annotation. See “Annotation Callback Functions”.	character vector
Description	Description of this annotation.	character vector
DropShadow	Turn drop shadow display on or off.	'on' {'off'}
FixedHeight	Specify whether the bottom border of the annotation resizes as you add content	'on' {'off'}, where 'off' means that the bottom border resizes as you add content
FixedWidth	Specify whether to use word wrap or to have the width of the annotation expand to accommodate text	'on' {'off'}, where 'off' means to use word wrap

Property	Description	Values
FontAngle	Angle of the annotation font. The default value, 'auto', uses of the default font angle specified for lines in the Font Styles dialog box.	'normal' 'italic' 'oblique' {'auto'}
FontName	Name of annotation font. The default value, 'auto', uses the default font specified for lines in the Font Styles dialog box.	character vector
FontSize	Size of annotation font in points. The default value, -1, uses the default text size for lines specified in the Font Styles dialog box.	decimal number {'-1'}
FontWeight	Weight of the annotation font. The default value, 'auto', use of the default weight for lines specified in the Font Styles dialog box.	'light' 'normal' 'demi' 'bold' {'auto'}
ForegroundColor	Foreground color of this annotation.	<p>RGB value array [r, g, b, a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0, delineated with commas. The alpha value is optional and ignored.</p> <p>Annotation background color can also be 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.</p>
Handle	Annotation handle.	real
HiliteAncestors	For internal use.	

Property	Description	Values
Horizontal-Alignment	Horizontal alignment of this annotation.	'center' {'left'} 'right'
Interpreter	Specifies whether the annotation is interpreted as rich or contains LaTeX commands	'rich' 'tex' {'off'}
IsImage	Specifies whether the annotation is an image-only annotation.	'on' {'off'}
InternalMargins	Space from the bounding box of text to the borders of the annotation.	1x4 array [left top right bottom]. The default is [1 1 1 1]. The maximum value for a coordinate is 32767.
LoadFcn	MATLAB code to execute when the model containing this annotation is loaded. See “Annotation Callback Functions”.	character vector
Name	Text of annotation. Same as Text.	character vector
Parent	Parent name of annotation object.	character vector
Path	Path to the annotation.	character vector
PlainText	Read-only display of the text in the annotation, without formatting	vector
Position	Location of the annotation	1x4 array [left top right bottom]. The maximum value for a coordinate is 32767.
RequirementInfo	For internal use.	character vector
Selected	Specifies whether this annotation is currently selected.	'on' 'off'

Property	Description	Values
Tag	Text to assign to the annotation Tag parameter and save with the annotation.	character vector
TeXMode	Specifies whether to render TeX markup.	'on' {'off'}
Text	Text of annotation. Same as Name.	character vector
Type	Annotation type. This is always 'annotation'.	'annotation'
UseDisplayText-AsClickCallback	<p>Specifies whether to use the contents of the Text property as the click function for this annotation.</p> <p>If set to 'on', the text of the annotation is interpreted as a valid MATLAB expression and run. If set to 'off', clicking the annotation runs the click function, if there is one. If there is no click function, clicking the annotation has no effect.</p> <p>See “Associate a Click Function with an Annotation” for more information.</p>	'on' {'off'}
UserData	Any data that you want to associate with this annotation.	vector
VerticalAlignment	Vertical alignment of this annotation.	'middle' {'top'} 'cap' 'baseline' 'bottom'

Method Summary

Method	Description
delete	Delete this annotation from the Simulink model.
dialog	Display the Annotation properties dialog box.
disp	Display the property names and their settings for this Annotation object.
fitToView	Zoom in on this annotation and highlight it in the model.
get	Return the specified property settings for this annotation.
help	Display a list of properties for this Annotation object with short descriptions.
methods	Display all nonglobal methods of this Annotation object.
set	Set the specified property of this Annotation object with the specified value.
setImage	Set the annotation contents to the specified image file. The resulting annotation is an image-only annotation.
struct	Return and display a MATLAB structure containing the property settings of this Annotation object.
view	Display this annotation in the Simulink Editor with this annotation highlighted.

Introduced before R2006a

Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “Dwork” on page 5-377 method of a block's runtime object after the model containing the block has been compiled.

Parent

`Simulink.BlockData`

Children

None

Property Summary

Name	Description
“Usage” on page 5-171	Usage type of this DWork vector.
“UsedAsDiscState” on page 5-172	True if this DWork vector is being used to store the values of a block's discrete states.

Properties

Usage

Returns a character vector indicating how this DWork vector is used. Permissible values are:

- DWork
- DState
- Scratch
- Mode

character vector

RW for MATLAB S-function blocks, RO for other blocks.

UsedAsDiscState

True if this DWork vector is being used to store the values of a block's discrete states.

Boolean

RW for MATLAB S-Function blocks, RO for other blocks.

Introduced before R2006a

Simulink.BlockComplInputPortData

Provide postcompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-378 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
“DirectFeedthrough” on page 5-173	True if this port has direct feedthrough.
“Overwritable” on page 5-174	True if this port is overwritable.

Properties

DirectFeedthrough

True if this input port has direct feedthrough.

Boolean

RW for MATLAB S functions, RO for other blocks.

Overwritable

True if this input port is overwritable.

Boolean

RW for MATLAB S functions, RO for other blocks.

Introduced before R2006a

Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-379 method of a block's run-time object after the model containing the block has been compiled.

Parent

`Simulink.BlockPortData`

Children

None

Property Summary

Name	Description
“Reusable” on page 5-196	Specifies whether an output port's memory is reusable.

Properties

Reusable

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

character vector

RW for MATLAB S functions, RO for other blocks.

Introduced before R2006a

Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

Parent

None

Children

`Simulink.BlockPortData`, `Simulink.BlockCompDworkData`

Property Summary

Name	Description
"AliasedThroughDataType" on page 5-178	Fundamental base data type.
"AliasedThroughDataTypeID" on page 5-179	Fundamental base data type ID.
"Complexity" on page 5-179	Numeric type (real or complex) of the block data.
"Data" on page 5-179	The block data.
"DataAsDouble" on page 5-179	The block data in <code>double</code> form.
"Datatype" on page 5-180	Data type of the block data.
"DatatypeID" on page 5-180	Index of the data type of the block data.

Name	Description
“Dimensions” on page 5-181	Dimensions of the block data.
“Name” on page 5-181	Name of the block data.
“Type” on page 5-181	Type of block data (e.g., a parameter).

Properties

AliasedThroughDataType

Data type aliases allow a data type (B) to be recursively aliased to another alias type or BaseType (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')
```

```
A =  
Simulink.AliasType  
    Description: ''  
    HeaderFile: ''  
    BaseType: 'double'  
B=Simulink.AliasType('A')
```

```
B =  
Simulink.AliasType  
    Description: ''  
    HeaderFile: ''  
    BaseType: 'A'
```

If the data type of an item of block data is B, this property returns the base type A instead of B.

character vector

RO

AliasedThroughDataTypeID

Index of the data type alias returned by the `AliasedThroughDataType` property.

integer

RO

Complexity

Numeric type (real or complex) of the block data.

character vector

RW for MATLAB S functions, RO for other blocks.

Data

The block data.

The data type specified by the “Datatype” on page 5-180 or “DatatypeID” on page 5-180 properties of this object.

RW

DataAsDouble

The block data's in `double` form.

`double`

RO

Datatype

Data type of the values of the block-related object.

character vector

RO

DatatypeID

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

Data Type	Value
'inherited'	-1
'double'	0
'single'	1
'int8'	2
'uint8'	3
'int16'	4
'uint16'	5
'int32'	6
'uint32'	7
'boolean' or fixed-point data types	8

integer

RW for MATLAB S functions, RO for other blocks

Dimensions

Dimensions of the block-related object, e.g., parameter or DWork vector.

array

RW for MATLAB S functions, RO for other blocks

Name

Name of block-related object, e.g., a block parameter or DWork vector.

character vector

RW for MATLAB S functions, RO for other blocks

Type

Type of block data. Possible values are:

Type	Description
'BlockPreCompInputPortData '	This object contains data for an input port before the model is compiled.
'BlockPreCompOutputPortData '	This object contains data for an output port before the model is compiled.
'BlockCompInputPortData '	This object contains data for an input port after the model is compiled.
'BlockCompOutputPortData '	This object contains data for an output port after the model is compiled.
'BlockPreCompDworkData '	This object contains data for a DWork vector before the model is compiled.

Type	Description
'BlockCompDworkData '	This object contains data for a DWork vector after the model is compiled.
'BlockDialogPrmData '	This object describes a dialog box parameter of a Level-2 MATLAB S-function.
'BlockRuntimePrmData '	This object describes a run-time parameter of a Level-2 MATLAB S-function.
'BlockCompContStatesData '	This object describes the continuous states of the block at the current time step.
'BlockDerivativesData '	This object describes the derivatives of the block's continuous states at the current time step.

character vector

RO

Introduced before R2006a

Simulink.BlockPath

Fully specified Simulink block path

Description

A `Simulink.BlockPath` object represents a fully specified block path that uniquely identifies a block within a model hierarchy, including model reference hierarchies that involve multiple instances of a referenced model. Simulink uses block path objects in a variety of contexts. For example, when you specify normal mode visibility, Simulink uses block path objects to identify the models with Normal mode visibility. For details, see “Normal Mode Visibility”.

The `Simulink.BlockPath` class is very similar to the `Simulink.SimulationData.BlockPath` class.

You must have Simulink installed to use the `Simulink.BlockPath` class. However, you do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
SubPath on page 5-184	Individual component within the block specified by the block path

Method Summary

Name	Description
BlockPath on page 5-184	Create a block path.

Name	Description
convertToCell on page 5-187	Convert a block path to a cell array of character vectors.
getBlock on page 5-188	Get a single block path in the model reference hierarchy.
getLength on page 5-189	Get the length of the block path.
validate on page 5-189	Determine whether the block path represents a valid block hierarchy.

Properties

SubPath

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:  
    'sf_car/shift_logic'  
  
SubPath:  
    'gear_state.first'
```

character vector

RW

Methods

BlockPath

Create block path

```
blockpath_object = Simulink.BlockPath()  
blockpath_object = Simulink.BlockPath(blockpath)  
blockpath_object = Simulink.BlockPath(paths)  
blockpath_object = Simulink.BlockPath(paths, subpath)
```

blockpath

Block path object that you want to copy.

paths

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

When you create a block path for specifying Normal mode visibility:

- The first character vector must represent a block that is in the top model in the model reference hierarchy.
- Character vectors must represent Model blocks that are in Normal mode.
- Character vectors that represent variant models or variant subsystems must refer to an active variant.

You can use `gcb` in the cell array to specify the currently selected block.

subpath

Character vector that represents an individual component within a block.

blockpath_object

Block path that you create.

`blockpath_object = Simulink.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.BlockPath(paths)` creates a block path from the cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy. Simulink builds the full block path based on the character vectors.

`blockpath = Simulink.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Create a block path object called `bp1`, using `gcb` to get the current block.

```
sldemo_mdhref_depgraph
bp1 = Simulink.BlockPath(gcb)
```

The resulting block path is the top-level Model block called `thermostat` (the top-left Model block).

```
bp1 =

    Simulink.BlockPath
    Package: Simulink

    Block Path:
        'sldemo_mdhref_depgraph/thermostat'
```

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdhref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...
'sldemo_mdhref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path

```
bp2 =  
  
    Simulink.BlockPath  
    Package: Simulink  
  
    Block Path:  
    'sldemo_mdllref_depgraph/thermostat'  
    'sldemo_mdllref_heater/Fahrenheit to Celsius'  
    'sldemo_mdllref_F2C/Gain1'
```

convertToCell

Convert block path to cell array of character vectors

```
cellarray = Simulink.BlockPath.convertToCell()
```

```
cellarray
```

Cell array of character vectors representing elements of block path.

`cellarray = Simulink.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

```
sldemo_mdllref_depgraph  
bp2 = Simulink.BlockPath({'sldemo_mdllref_depgraph/thermostat', ...  
    'sldemo_mdllref_heater/Fahrenheit to Celsius', ...  
    'sldemo_mdllref_F2C/Gain1'})  
cellarray_for_bp2 = bp2.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp2 =  
  
    'sldemo_mdllref_depgraph/thermostat'  
    'sldemo_mdllref_heater/Fahrenheit to Celsius'  
    'sldemo_mdllref_F2C/Gain1'
```

getBlock

Get block path in model reference hierarchy

```
block = Simulink.BlockPath.getBlock(index)
```

index

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of n represents a block that the block with index $n-1$ references.

block

The block representing the level in the model reference hierarchy specified by the index argument.

`blockpath = Simulink.BlockPath.getBlock(index)` returns the block path of the block specified by the index argument.

Get the block for the second level in the model reference hierarchy.

```
sldemo_mdhref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...
'sldemo_mdhref_F2C/Gain1'})
blockpath = bp2.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =
```

```
sldemo_mdhref_heater/Fahrenheit to Celsius
```

getLength

Get length of block path

```
length = Simulink.BlockPath.getLength()
```

length

The length of the block path. The length is the number of levels in the model reference hierarchy.

`length = Simulink.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Get the length of block path bp2.

```
sldemo_mdldref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdldref_depgraph/thermostat', ...
'sldemo_mdldref_heater/Fahrenheit to Celsius', ...
'sldemo_mdldref_F2C/Gain1'})
length_bp2 = bp2.getLength()
```

The result reflects that the block path has three elements.

```
length_bp2 =
```

```
3
```

validate

Determine whether block path represents valid block hierarchy

```
Simulink.BlockPath.validate()
Simulink.BlockPath.validate(AllowInactiveVariant)
```

`Simulink.BlockPath.validate()` determines whether the block path represents a valid block hierarchy. If there are any validity issues, messages appear in the MATLAB command window. The method checks that:

- All elements in the block path represent valid blocks.
- Each element except for the last element:
 - Is a valid Model block
 - References the model of the next element

Property Summary

Name	Description
"IsBus" on page 5-192	True if this port is connected to a bus.
"IsSampleHit" on page 5-192	True if this port produces output or accepts input at the current simulation time step.
"SampleTime" on page 5-192	Sample time of this port.
"SampleTimeIndex" on page 5-192	Sample time index of this port.

Properties

IsBus

True if this port is connected to a bus.

Boolean

RO

IsSampleHit

True if this port produces output or accepts input at the current simulation time step.

Boolean

RO

SampleTime

Sample time of this port.

[period offset] where `period` and `offset` are values of type `double`. See “Specify Sample Time” for more information.

RW for MATLAB S functions, RO for other blocks

SampleTimeIndex

Sample time index of this port.

integer

RO

Introduced before R2006a

Simulink.BlockPreCompInputPortData

Provide precompilation information about block input port

Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-378 method of a block's run-time object before the model containing the block has been compiled.

Parent

Property Summary

Name	Description
“Reusable” on page 5-196	Specifies whether an output port's memory is reusable.

Properties

Reusable

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

character vector

RW for MATLAB S functions, RO for other blocks

Introduced before R2006a

Simulink.Breakpoint class

Package: Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure `COM_AXIS` code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

To package lookup table and breakpoint set data into a single structure in the generated code, for example, for `STD_AXIS` code generation, use a `Simulink.LookupTable` object to store all of the data. See “Package Shared Breakpoint and Table Data for Lookup Tables”.

Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button

on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Simulink.Breakpoint: myBreakpointSet

[]	auto	[0 0]	[]	[]	BP		

Code generation options

Data definition:

Storage class: Auto

Struct Type definition

Name:

Data scope: Auto

Header file:

OK Cancel Help Apply

Breakpoints

The breakpoint set information. You can configure these characteristics:

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as degC. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Tunable size name

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input.`

Data definition: Storage class

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “Override Default Parameter Behavior by Creating Global Variables in the Generated Code” (Simulink Coder)

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Control Data Representation by Applying Custom Storage Classes” (Embedded Coder).

Data definition: Alias

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the alias, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is -1 , which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a

generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

Properties

Breakpoints — Breakpoint set data

`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

CoderInfo — Code generation settings for variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See “Support tunable size” on page 5-0 .

Data Types: `logical`

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Share Breakpoint Data Between One-Dimensional Lookup Tables

- 1 Create a `Simulink.Breakpoint` object named `myBpSet`.

```
myBpSet = Simulink.Breakpoint
```

- 2 Specify the breakpoint data.

```
myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
```

- 3 Create a `Simulink.LookupTable` object named `FirstLUTObj`.

```
FirstLUTObj = Simulink.LookupTable;
```

- 4 Specify the table data.

```
FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 5 Configure the lookup table object to refer to the breakpoint set object.

```
FirstLUTObj.Breakpoints = {'myBpSet'};
```

- 6 Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

```
SecondLUTObj = Simulink.LookupTable;  
SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];  
SecondLUTObj.Breakpoints = {'myBpSet'};
```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in `Simulink` package.
- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:
 - A model argument in a model workspace or a model argument value in a Model block.
 - The value of a mask parameter on a CodeReuse Subsystem block.
 - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.

- You cannot generate code according to the `FIX_AXIS` style.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see “Control Fixed-Point Instrumentation and Data Type Override”) only on the subsystem. Instead, set data type override on the entire model.

Simulink.Bus class

Package: Simulink

Specify properties of bus signal

Description

Objects of the `Simulink.Bus` class, used with objects of the `Simulink.BusElement` class, specify the properties of a bus signal. Bus objects validate the properties of bus signals. When you simulate a model or update diagram, Simulink checks whether the buses connected to the blocks have the properties specified by the bus objects. If not, Simulink halts and displays an error message. For a complete list of blocks that support using a bus object as a data type, see “When to Use Bus Objects”.

You can use the Simulink Bus editor or MATLAB commands to create and modify bus objects in the base MATLAB workspace. You cannot store a bus object in a model workspace.

When you use the Bus Editor, you create `Simulink.Bus` and `Simulink.BusElement` objects in the base workspace or the associated Simulink data dictionary.

Also, you can use a bus object to specify the attributes of a signal (for example, at the root level of a model or in a Data Store Memory block).

Construction

`busObj = Simulink.Bus` returns a bus object with these property values:

```
Description: ''
DataScope: 'Auto'
HeaderFile: ''
Alignment: -1
Elements: [0x0 Simulink.BusElement]
```

The name of the bus object is the name of the MATLAB variable to which you assign the bus object. You can set individual properties after you construct the bus object.

Output Arguments

busObject — Bus object

`Simulink.Bus` object

Bus object, returned as a `Simulink.Bus` object.

Properties

Description — Bus object description

character vector

Bus object description, specified as a character vector. Use the description to document information about the bus object, such as the kind of signal it applies to or where the bus object is used. This information does not affect Simulink processing.

Elements — Bus elements

array of `Simulink.BusElement` objects

Bus elements, specified as an array of `Simulink.BusElement` objects. Each bus element object defines the name, data type, dimensions, and other properties of the signal within a bus.

DataScope — Data type definition mode in generated code

'Auto' (default) | 'Exported' | 'Imported'

Data type definition mode in generated code, specified as 'Auto', 'Exported', or 'Imported'. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the `HeaderFile` property.

Value	Action
'Auto' (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
'Exported'	Export the data type definition to the specified header file or to the default header file.

Value	Action
'Imported'	Import the data type definition from the specified header file specified or from the default header file.

HeaderFile — C header file used with data type definition

character vector

C header file used with data type definition, specified as a character vector. The header file is the file to import the data type definition from or export the data type definition to (based on the value of the `DataScope` property). The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `<myTypes.h>`.

Alignment — Data alignment boundary

-1 (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Methods

Method	Purpose
<code>Simulink.Bus.cellToObject</code>	Convert cell array containing bus information to bus objects
<code>Simulink.Bus.createMATLABStruct</code>	Create MATLAB structures using same hierarchy and attributes as bus signals
<code>Simulink.Bus.createObject</code>	Create bus objects from blocks or MATLAB structures

Method	Purpose
<code>Simulink.Bus.objectToCell</code>	Use bus objects to create cell array containing bus information
<code>Simulink.Bus.save</code>	Save bus objects in MATLAB file

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Create Bus Objects and Bus Elements

Create the `CONTROL` bus object and its bus elements. The bus objects are stored in the base workspace.

```
clear elems;
elems(1) = Simulink.BusElement;
elems(1).Name = 'VALVE1';
elems(1).Dimensions = 1;
elems(1).DimensionsMode = 'Fixed';
elems(1).DataType = 'double';
elems(1).SampleTime = -1;
elems(1).Complexity = 'real';

elems(2) = Simulink.BusElement;
elems(2).Name = 'VALVE2';
elems(2).Dimensions = 1;
elems(2).DimensionsMode = 'Fixed';
elems(2).DataType = 'double';
elems(2).SampleTime = -1;
elems(2).Complexity = 'real';

CONTROL = Simulink.Bus;
CONTROL.Elements = elems;
```

This script is similar to the file that you get by saving a bus object to a MATLAB file and choosing the `Object` format.

- “Data Alignment for Code Replacement” (Embedded Coder)
- “Create Bus Objects with the Bus Editor”
- “Save and Import Bus Objects”
- “When to Use Bus Objects”

Alternatives

You can use the Bus Editor to create interactively a bus object and its bus elements. For details, see “Create Bus Objects with the Bus Editor”.

Programmatically, you can create bus objects from:

- Blocks in a model
- MATLAB data
- External C code. See `Simulink.importExternalCTypes`.

Simulink.BusElement class

Package: Simulink

Describe element of bus signal

Description

An object of this class specifies the properties of a signal in a bus. Bus element objects validate the properties of signals in a bus. A `Simulink.Bus` object contains bus elements. A bus element exists only within a bus object. You can specify a bus object, but not a bus element, as a block parameter value. When you simulate a model or update diagram, Simulink checks whether the signals in a bus connected to blocks have the properties specified by the bus elements. If not, Simulink halts and displays an error message.

You can use the Simulink Bus editor (see “Create Bus Objects with the Bus Editor”), or MATLAB commands (see “Create Bus Objects Programmatically”) to create and modify bus objects and bus elements in the base MATLAB workspace.

Construction

`busElementName = Simulink.BusElement` returns a bus element with these property values:

```
Name: 'a'  
Complexity: 'real'  
Dimensions: 1  
    DataType: 'double'  
        Min: []  
        Max: []  
DimensionsMode: 'Fixed'  
    SampleTime: -1  
        Unit: ''  
    Description: ''
```

Output Arguments

busElement — Bus element

`Simulink.BusElement` object

Bus element, returned as a `Simulink.BusElement` object.

Properties

Name — Name of bus element

character vector

Name of bus element, specified as a character vector.

Complexity — Numeric type of bus element

'real' (default) | 'complex'

Numeric type of the bus element, specified as 'real' or 'complex'.

Dimensions — Dimensions of bus element

array

Dimensions of bus element, specified as an array.

DataType — Data type of bus element

built-in Simulink data type | a `Simulink.NumericType` object | a `Simulink.Bus` object

Data type of bus element, specified as a built-in Simulink data type or `Simulink.NumericType` object. Examples of built-in data types include `double` and `uint8`. You can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than 'Fixed-point: unspecified scaling'. Specifying a bus object allows you to create bus objects that specify hierarchical buses (that is, buses that contain other buses).

Min — Minimum value of bus element

double | []

Minimum value of the bus element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

Max — Maximum value of bus element

double | []

Maximum value of the bus element, specified as a double. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

DimensionsMode — How to handle size of bus element

'Fixed' (default) | 'Variable'

How to handle size of bus element, specified as 'Fixed' or 'Variable'.

SampleTime — Sample time of bus element

-1 (default) | double

Sample time of bus element, specified as a double. The sample time is the size of the interval between times when this signal value must be recomputed. If these conditions apply, use the default value of -1:

- The bus element is a bus.
- The bus that includes this element passes through a block that changes the bus sample time, such as a Rate Transition block.

Unit — Physical unit for expressing bus element

character vector

Physical unit for expressing bus element, specified as a character vector (for example, 'inches').

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create Bus Objects and Bus Elements

Create the `CONTROL` bus object and its bus elements. The bus objects are stored in the base workspace.

```
clear elems;
elems(1) = Simulink.BusElement;
elems(1).Name = 'VALVE1';
elems(1).Dimensions = 1;
elems(1).DimensionsMode = 'Fixed';
elems(1).DataType = 'double';
elems(1).SampleTime = -1;
elems(1).Complexity = 'real';

elems(2) = Simulink.BusElement;
elems(2).Name = 'VALVE2';
elems(2).Dimensions = 1;
elems(2).DimensionsMode = 'Fixed';
elems(2).DataType = 'double';
elems(2).SampleTime = -1;
elems(2).Complexity = 'real';

CONTROL = Simulink.Bus;
CONTROL.Elements = elems;
```

This script is similar to the file that you get by saving a bus object to a MATLAB file and choosing the Object format. For information about saving bus objects, see “Save and Import Bus Objects”.

Simulink.CoderInfo

Specify information needed to generate code for signal or parameter data

Description

Simulink creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

Property Dialog Box

Use a data object property dialog box to set the properties of a `Simulink.CoderInfo` object.

Properties

Name	Description
Alias	Alternative name for this data in the generated code.
Alignment	Data alignment boundary for this data. See “Data Alignment for Code Replacement” (Embedded Coder) for more information.
CustomAttributes	Custom storage class attributes of this data. You must set the property <code>StorageClass</code> to 'Custom' to enable this property. See “Introduction to Custom Storage Classes” (Embedded Coder) for more information.
CustomStorageClass	Custom storage class of this data. You must set the property <code>StorageClass</code> to 'Custom' to enable this property.
StorageClass	Storage class of this data. For more information, see “Control Signals and States in Code by Applying Storage Classes” (Simulink Coder) or “Block Parameter Representation in the Generated Code” (Simulink Coder).

ConfigSet

Model configuration set

Description

Use the `ConfigSet` object to access a model configuration set. Get information about your configuration set, manage configuration parameters, and manage components.

Creation

Use the `getActiveConfigSet` function to get the active configuration set for a model. Use the `getConfigSet` function to get a model configuration set by name.

Properties

Components — Components of the configuration set

cell array of `Simulink.ConfigComponent` objects

Components of the configuration set, specified by a cell array of `Simulink.ConfigComponent` objects.

Description — Description of the configuration set

character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

Name — Name of the configuration set

character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

Object Functions

<code>attachComponent</code>	Attach a component to a configuration set
<code>copy</code>	Copy a configuration set
<code>getComponent</code>	Get a configuration set component
<code>getFullName</code>	
<code>getModel</code>	
<code>get_param</code>	Get parameter names and values
<code>isActive</code>	
<code>isValidParam</code>	
<code>saveAs</code>	
<code>setPropEnabled</code>	
<code>set_param</code>	Set system and block parameter values

Examples

“About Configuration Sets”

“Manage a Configuration Set”

Introduced in R2006a

Simulink.ConfigSetRef

Link model to configuration set stored independently of any model

Description

Instances of this handle class allow a model to reference configuration sets that exist outside any model. See “Manage a Configuration Set”, “Overview”, and “Manage a Configuration Reference” for more information.

Property Summary

Name	Description
“Description” on page 5-223	Description of the configuration reference.
“Name” on page 5-223	Name of the configuration reference.
“SourceName” on page 5-224	Name of the variable in the workspace or the data dictionary that contains the referenced configuration set.

Note You can use the **Configuration Reference** dialog box to set the Name, Description, and SourceName properties of a configuration reference. See “Create and Attach a Configuration Reference” for details.

Method Summary

Name	Description
“copy” on page 5-224	Create a copy of a configuration reference.
“getFullName” on page 5-224	Get the full pathname of a configuration reference.
“getModel” on page 5-225	Get the handle of the model that owns a configuration reference.

Name	Description
“get_param” on page 5-225	Get the value of a configuration set parameter indirectly through a configuration reference.
“getRefConfigSet” on page 5-226	Get the configuration set specified by a configuration reference.
“isActive” on page 5-226	Determine whether a configuration reference is the active configuration object of the model.
“refresh” on page 5-226	Update configuration reference after any change to properties or configuration set availability.

Properties

Description

Description of the configuration reference. You can use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

character vector

RW

Name

Name of the configuration reference. This name represents the configuration reference in the GUI.

character vector

RW

SourceName

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set.

character vector

RW

Methods

copy

Create a copy of this configuration reference.

copy

This method creates a copy of this configuration set.

Note You must use this method to create copies of configuration references. This is because `Simulink.ConfigSetRef` is a handle class. See “Handle Versus Value Classes” for more information.

getFullName

Get the full pathname of a configuration reference.

getFullName

This method returns a character vector specifying the full pathname of a configuration reference, e.g., `'vdp/Configuration'`.

getModel

Get the model that owns this configuration reference.

```
getModel
```

Returns a handle to the model that owns this configuration reference.

The following command opens the block diagram of the model that owns the configuration set referenced by the MATLAB workspace variable `hCr`.

```
open_system(hCr.getModel);
```

get_param

Get the value of a configuration set parameter indirectly through a configuration reference.

```
get_param(paramName)
```

```
paramName
```

Character vector specifying the name of the parameter whose value is to be returned.

This method returns the value of the specified parameter from the configuration set to which the configuration reference points. To obtain this value, the method uses the value of `SourceName` to retrieve the configuration set, then retrieves the value of `paramName` from that configuration set. Specifying `paramName` as `'ObjectParameters'` returns the names of all valid parameters in the configuration set. If a valid configuration set is not attached to the configuration reference, the method returns unreliable values.

The inverse method, `set_param`, is not defined for configuration references. To obtain a parameter value through a configuration reference, you must first use the `getRefConfigSet` method to retrieve the configuration set from the reference, then use `set_param` directly on the configuration set itself.

You can also use the `get_param` model construction command to get the values of parameters of a model's active configuration set, e.g., `get_param(bdroot, 'SolverName')` gets the solver name of the currently selected model.

The following command gets the name of the solver used by the selected model's active configuration.

```
hAcs = getActiveConfigSet(bdroot);  
hAcs.get_param('SolverName');
```

getRefConfigSet

Get the configuration set specified by a configuration reference

```
getRefConfigSet
```

Returns a handle to the configuration set specified by the `SourceName` property of a configuration reference.

isActive

Determine whether this configuration set is its model's active configuration set.

```
isActive
```

Returns `true` if this configuration set is the active configuration set of the model that owns this configuration set.

refresh

Update configuration reference after any change to properties or configuration set availability

`refresh`

Updates a configuration reference after using the API to change any property of the reference, or after providing a configuration set that did not exist at the time the set was originally specified in `SourceName`. If you omit executing `refresh` after any such change, the configuration reference handle will be stale, and using it will give incorrect results.

Introduced in R2007a

Simulink.GlobalDataTransfer class

Package: Simulink

Configure concurrent execution data transfers

Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');  
dt.DefaultTransitionBetweenContTasks  
  
ans =  
  
Ensure deterministic transfer (minimum delay)
```

Properties

DefaultTransitionBetweenSyncTasks

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

DefaultTransitionBetweenContTasks

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

DefaultExtrapolationMethodBetweenContTasks

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'None'
- 'Zero Order Hold'
- 'Linear'
- 'Quadratic'

Access: Read/write

AutoInsertRateTranBlk

Setting for whether or not Simulink software automatically inserts hidden Rate Transition blocks between blocks that have different sample rates to ensure the integrity of data transfers between tasks; and optional determinism of data transfers for periodic tasks.

Data Type: Boolean. Can be one of:

- 0
- 1

Access: Read/write

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access the properties of this class.

```
dt=get_param(gcs,'DataTransfer');  
dt.DefaultTransitionBetweenContTasks  
  
ans =  
  
Ensure deterministic transfer (minimum delay)
```

Simulink.HMI.InstrumentedSignals class

Package: Simulink.HMI

Access logged signals in model

Description

`Simulink.HMI.InstrumentedSignals` objects contain a list of all logged signals in a model, including signals from all subsystems, library instances, and Stateflow charts. The list does not include signals inside reference models. You can access the list of logged signals in a reference model by creating a `Simulink.HMI.InstrumentedSignals` object for the reference model.

The `Simulink.HMI.InstrumentedSignals` object provides access to `Simulink.HMI.SignalSpecification` objects using the `get` method.

Construction

`instSigs = get_param(model, 'InstrumentedSignals')` returns `instSigs`, a `Simulink.HMI.InstrumentedSignals` object containing a list of all of the logged signals in the model, `model`.

Input Arguments

model — Model name

character vector

Model name or full path to model.

Example: `'sldemo_fuelsys'`

Example: `fullpath(matlabroot, 'examples', 'simulink', 'ex_sldemo_absbrake.slx')`

'InstrumentedSignals' — Parameter selection

`'InstrumentedSignals'`

Desired return from `get_param`, specified as a character vector. Using a value of `'InstrumentedSignals'`, `get_param` returns a `Simulink.HMI.InstrumentedSignals` object with a list of all the logged signals.

Example: `'InstrumentedSignals'`

Properties

Model — Model name

character vector

Name of the model the aggregation of logged signals corresponds to.

Example: `'sldemo_fuelsys'`

Count — Number of logged signals

integer

Number of logged signals in the model.

Example: 10

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Evaluate and Modify Logged Signals in Model

This example shows how to obtain the block paths for logged signals and remove the logging badge for a signal using `Simulink.HMI.InstrumentedSignals` and `Simulink.HMI.SignalSpecification` objects.

Get InstrumentedSignals Object

```
% Load the model sldemo_absbrake
load_system('sldemo_absbrake')
```

```
% Get logged signals with Simulink.HMI.InstrumentedSignals object
instSigs = get_param('sldemo_absbrake', 'InstrumentedSignals');
```

```
% Check logged signals count
instSigs.Count
```

```
ans =
```

```
uint32
```

```
2
```

Inspect Block Paths with SignalSpecifications Objects

Use the `get` method to get the `Simulink.HMI.SignalSpecification` objects for each of the signals in the `Simulink.HMI.InstrumentedSignals` object

```
% Get Simulink.HMI.SignalSpecification objects
```

```
sig1 = instSigs.get(1);
```

```
sig2 = instSigs.get(2);
```

```
% Inspect block paths for signals
```

```
blockPath1 = sig1.BlockPath
```

```
blockPath2 = sig2.BlockPath
```

```
blockPath1 =
```

```
Simulink.BlockPath
```

```
Package: Simulink
```

```
Block Path:
```

```
'sldemo_absbrake/Bus Creator'
```

Use the `getBlock` method to access block path character vectors from this object.

```
blockPath2 =
```

```
Simulink.BlockPath
```

```
Package: Simulink
```

```
Block Path:
```

```
'sldemo_absbrake/Relative Slip'
```

Use the `getBlock` method to access block path character vectors from this object.

Remove Logging Badge for Bus Signal

Remove the logging badge for the signal from the Bus Creator block.

```
% Get block path string and port index for the Bus Creator signal
blockPath_str = blockPath1.getBlock(1);
portIndex = sig1.OutputPortIndex;

% Clear the logging badge for the Bus Creator signal
Simulink.sdi.markSignalForStreaming(blockPath_str, portIndex, 'off')
```

Save and Restore a Set of Logged Signals

This example shows the capability of using the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different set of signals.

Load Model and Save Initial Configuration

Load the `sldemo_fuelsys` model, and save the initial set of logged signals.

```
% Load model
load_system sldemo_fuelsys

% Get Simulink.HMI.InstrumentedSignals object
initSigs = get_param('sldemo_fuelsys', 'InstrumentedSignals');

% Save logging configuration to file for future use
save initial_instSigs.mat initSigs
```

Remove All Logging Badges

Return to a baseline of no logged signals so you can easily select a different configuration of signals to log.

```
% Clear all logging signals
set_param('sldemo_fuelsys', 'InstrumentedSignals', [])
```

Restore Saved Logging Configuration

After working with a different set of logged signals, you can easily restore a saved configuration with the `Simulink.HMI.InstrumentedSignals` object.

```
% Load the saved configuration
load initial_instSigs.mat

% Restore logging configuration
set_param('sldemo_fuelsys', 'InstrumentedSignals', initSigs)
```

Introduced in R2015b

Simulink.HMI.SignalSpecification class

Package: Simulink.HMI

Information for logging a signal

Description

The `Simulink.HMI.SignalSpecification` object contains the block path and port index required by `Simulink.sdi.markSignalForStreaming` to turn logging on or off for a signal.

Construction

`sigSpec = instSigs.get(index)` returns the `Simulink.HMI.SignalSpecification` object `sigSpec` for the signal at the specified index in the `Simulink.HMI.InstrumentedSignals` object `instSigs`.

Input Arguments

index — Index of signal

integer

Numeric index of the signal within the `Simulink.HMI.InstrumentedSignals` object.

Example: 1

Properties

BlockPath — Block path for signal

`Simulink.BlockPath` object

`Simulink.BlockPath` object with the block path for the signal.

OutputPortIndex — Signal index on block port

integer

Index of the signal on the output port of its block. For Stateflow signals, the OutputPortIndex is set to 1.

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

Examples

Evaluate and Modify Logged Signals in Model

This example shows how to obtain the block paths for logged signals and remove the logging badge for a signal using `Simulink.HMI.InstrumentedSignals` and `Simulink.HMI.SignalSpecification` objects.

Get InstrumentedSignals Object

```
% Load the model sldemo_absbrake
load_system('sldemo_absbrake')

% Get logged signals with Simulink.HMI.InstrumentedSignals object
instSigs = get_param('sldemo_absbrake', 'InstrumentedSignals');

% Check logged signals count
instSigs.Count
```

```
ans =
```

```
uint32
```

```
2
```

Inspect Block Paths with SignalSpecifications Objects

Use the `get` method to get the `Simulink.HMI.SignalSpecification` objects for each of the signals in the `Simulink.HMI.InstrumentedSignals` object

```
% Get Simulink.HMI.SignalSpecification objects
sig1 = instSigs.get(1);
sig2 = instSigs.get(2);

% Inspect block paths for signals
blockPath1 = sig1.BlockPath
blockPath2 = sig2.BlockPath

blockPath1 =

    Simulink.BlockPath
    Package: Simulink

    Block Path:
        'sldemo_absbrake/Bus Creator'

    Use the getBlock method to access block path character vectors from this object.

blockPath2 =

    Simulink.BlockPath
    Package: Simulink

    Block Path:
        'sldemo_absbrake/Relative Slip'

    Use the getBlock method to access block path character vectors from this object.
```

Remove Logging Badge for Bus Signal

Remove the logging badge for the signal from the Bus Creator block.

```
% Get block path string and port index for the Bus Creator signal
blockPath_str = blockPath1.getBlock(1);
portIndex = sig1.OutputPortIndex;

% Clear the logging badge for the Bus Creator signal
Simulink.sdi.markSignalForStreaming(blockPath_str, portIndex, 'off')
```

Simulink.LookupTable class

Package: Simulink

Store and share lookup table and breakpoint data, configure the data for ASAP2 and AUTOSAR code generation

Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure STD_AXIS code generation for calibration, use this technique.

To share a breakpoint set between multiple lookup tables, for example for COM_AXIS code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see “Package Shared Breakpoint and Table Data for Lookup Tables”.

Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button

on the toolbar. The default name for the object is `Object`.

Property Dialog Box

Simulink.LookupTable: LUTObj

Number of table dimensions: 1

Table

Value	Data type	Dimensions	Min	Max	Unit	Field name	Description
[]	auto	[0 0]	[]	[]		Table	

Breakpoints

Specification: Explicit values Support tunable size

Value	Data type	Dimensions	Min	Max	Unit	Field name	Description
1 []	auto	[0 0]	[]	[]		BP1	

Code generation options

Data definition:

Storage class: Auto

Struct Type definition

Name:

Data scope: Auto

Header file:

OK Cancel Help Apply

Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

Table

Information for the table data. You can configure these characteristics:

Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the table data. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the table data. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical units of the elements in the lookup table. You can specify text such as degC. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure. The default value is `Table`. To change the field name, specify text.

Description

Description of the lookup table. You can specify text such as `This lookup table describes the action of a pump.`

Breakpoints

Breakpoint set information. Each row is one breakpoint set. To configure additional breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

Specification

Source for the information of the breakpoint sets, specified as `Explicit` values (default), `Reference`, or `Even spacing`.

- To store all of the table and breakpoint set data in the `Simulink.LookupTable` object, set **Specification** to `Explicit` values.

The `Simulink.LookupTable` object appears in the generated code as a single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Specification** to `Reference`.

The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.

- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

Note When **Specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table.

This property appears only if you set **Specification** to `Explicit values` or `Even spacing`.

Note If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

Value

Data for the breakpoint set. Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Max

Maximum value of the elements in the breakpoint set. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Unit

Physical unit of the elements in the breakpoint set. You can specify text such as degF. See “Unit Specification in Simulink Models”.

Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is BP1 for the first breakpoint set and BP2 for the second set. To change the field name, specify text.

Tunable size name

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is N1 for the first breakpoint set and N2 for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input.`

First point

First point in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Spacing

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Specification** is set to `Even spacing`.

Name

Name of the `Simulink.Breakpoint` object that stores the information for this breakpoint set.

This column appears only if you set **Specification** to `Reference`.

First point name

Name of the `Simulink.Breakpoint` object that stores the information for the first point. This parameter is available when **Specification** is set to `Even spacing`.

Spacing name

Name of the `Simulink.Breakpoint` object that stores the information for the spacing. This parameter is available when **Specification** is set to `Even spacing`.

Data definition: Storage class

Storage class of the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “Override Default Parameter Behavior by Creating Global Variables in the Generated Code” (Simulink Coder)

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Control Data Representation by Applying Custom Storage Classes” (Embedded Coder).

Data definition: Alias

Alternative name for the structure variable (if you set **Specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.LookupTable` object as the name of the structure or array variable. To set the alias, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Specification** to `Explicit` values or `Even spacing`.

Properties

Breakpoints — Breakpoint set information

vector of `Simulink.lookupable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of `Simulink.lookupable.Breakpoint` objects, a cell array of character vectors, or a vector of `Simulink.lookupable.Evenspacing` objects.

If you use a vector of `Simulink.lookupable.Breakpoint` objects, each object represents a breakpoint set. Using a vector of `Simulink.lookupable.Breakpoint` objects sets the property `BreakpointsSpecification` to 'Explicit values'.

If you use a cell array of character vectors, each character vector represents the name of a `Simulink.Breakpoint` object. Using a cell array of character vectors sets the property `BreakpointsSpecification` to 'Reference'.

If you use a vector of `Simulink.lookupable.Evenspacing` objects, each object represents a breakpoint set. Using a vector of `Simulink.lookupable.Evenspacing` objects sets the property `BreakpointsSpecification` to 'Even Spacing'.

BreakpointsSpecification — Source of breakpoint set information

'Explicit values' (default) | 'Reference' | 'Even spacing'

Source of the breakpoint set information, specified as 'Explicit values' (default), 'Even spacing', or 'Reference'. See “Specification” on page 5-0

Data Types: char

CoderInfo — Code generation settings for structure or array variable

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `BreakpointsSpecification` to 'Explicit values' or 'Even spacing') or array variable ('Reference') that stores the lookup table and breakpoint sets, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. See `Simulink.CoderInfo`.

StructTypeInfo — Settings for structure type in the generated code

`Simulink.lookupable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to 'Reference', the `Simulink.LookupTable` object does not appear in the generated code as a structure. The code generator ignores this property.

SupportTunableSize — Option to generate code that enables tunability of table size

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See “Support tunable size” on page 5-0 .

Data Types: `logical`

Table — Information for table data

`Simulink.lookuptable.Table` object

Information for the table data, specified as a `Simulink.lookuptable.Table` object.

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Represent a One-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 3 Specify the breakpoint set data.

```
LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];
```

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use LUTObj in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to `Lookup table object` and **Name** to LUTObj.

Represent a Two-Dimensional Lookup Table

- 1 Create a Simulink.LookupTable object named LUTObj.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
                    6.6 7.7 8.8 9.9 10.1];
```

- 3 Specify the breakpoint set data. In the Breakpoints property, use the vector index 2 to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

LUTObj creates a Simulink.lookuptable.Breakpoint object as the second vector element in the value of the Breakpoints property. Except for the Value property, the new object has default property values.

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use LUTObj in a 2-D Lookup Table block dialog box.

Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the Breakpoint object.

- 1 Create a Simulink.LookupTable object named LUTObj.

```
LUTObj=Simulink.LookupTable
```

```
LUTObj =
```

```
LookupTable with properties:
```

```
        Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Explicit values'
        Breakpoints: [1x1 Simulink.lookuptable.Breakpoint]
SupportTunableSize: 0
        CoderInfo: [1x1 Simulink.CoderInfo]
        StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

2 Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

```
LUTObj =
```

```
LookupTable with properties:
```

```
        Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Even spacing'
        Breakpoints: [1x1 Simulink.lookuptable.Evenspacing]
SupportTunableSize: 0
        CoderInfo: [1x1 Simulink.CoderInfo]
        StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

3 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
Evenspacing with properties:
```

```
    FirstPoint: []
      Spacing: []
    DataType: 'auto'
        Min: []
        Max: []
        Unit: ''
FirstPointName: 'BPFirstPoint1'
  SpacingName: 'BPSpacing1'
TunableSizeName: 'N1'
  Description: ''
```

- 4 To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

- 5 To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

- 6 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
    Evenspacing with properties:
```

```

    FirstPoint: 1
      Spacing: 2
    DataType: 'auto'
         Min: []
         Max: []
         Unit: ''
    FirstPointName: 'BPFirstPoint1'
      SpacingName: 'BPSpacing1'
    TunableSizeName: 'N1'
      Description: ''
```

Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
                    7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the `Breakpoints` property, use the array index 2 to create an additional `Simulink.lookuptable.BreakpointInfo` object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';  
LUTObj.Breakpoints(1).DataType = 'int16';  
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';  
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';  
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class `ExportedGlobal`.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code `LUTStructType`. Export the structure type definition to a generated header file named `myLUTHdr.h`.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';  
LUTObj.StructTypeInfo.DataScope = 'Exported';  
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

```
load_system('myModel_LUTObj')  
set_param('myModel_LUTObj/Lookup Table', 'DataSpecification', 'Lookup table object', ...  
         'LookupTableObject', 'LUTObj')
```

Generate code from the model.

```
rtwbuild('myModel_LUTObj')  
  
### Starting build procedure for model: myModel_LUTObj  
### Successful completion of code generation for model: myModel_LUTObj
```

The generated code defines the structure type `LUTStructType` in the generated header file `myLUTHdr.h`.

```
file = fullfile('myModel_LUTObj_ert_rtw', 'myLUTHdr.h');
rtwdemodbtype(file, 'typedef struct {' ,'} LUTStructType;', 1, 1)
```

```
typedef struct {
    int16_T myBPSet1[2];
    int16_T myBPSet2[5];
    int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable LUTObj to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw', 'myModel_LUTObj.c');
rtwdemodbtype(file, 'LUTStructType LUTObj = {' , '/* Variable: LUTObj', 1, 1)
```

```
LUTStructType LUTObj = {
    { -1, 1 },

    { -2, -1, 0, 1, 2 },

    { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
} ; /* Variable: LUTObj
```

Generate Code That Uses Conditionally Compiled Dimension Lengths

Suppose your handwritten code conditionally allocates memory and initializes a lookup table based on dimension lengths that you specify as #define macros. This example shows how to generate code that uses your external table and breakpoint data.

Symbolic dimensions require that you use an ERT-based system target file, which requires Embedded Coder®.

Explore External Code

In your current folder, copy these macro definitions into a header file named ex_myHdr_LUT.h.

```
#include "rtwtypes.h"

#ifndef _HEADER_MYHDR_H_
#define _HEADER_MYHDR_H_
```

```
#define bp1Len 2
#define bp2Len 2

typedef struct {
    real_T BP1[bp1Len];
    real_T BP2[bp2Len];
    real_T Table[bp1Len * bp2Len];
} LUTObj_Type;

extern LUTObj_Type LUTObj;

#endif
```

Copy this static initialization code into a source file named `ex_mySrc_LUT.c`.

```
#include "ex_myHdr_LUT.h"

#if bp1Len == 2 && bp2Len == 2
LUTObj_Type LUTObj = {
    { 1.0, 2.0 },

    { 3.0, 4.0 },

    { 3.0, 2.0, 4.0, 1.0 }
};
#endif

#if bp1Len == 3 && bp2Len == 3
LUTObj_Type LUTObj = {
    { 1.0, 2.0, 3.0 },

    { 4.0, 5.0, 6.0 },

    { 1.0, 6.0, 2.0, 3.0, 8.0, 9.0, 5.0, 4.0, 7.0 }
};
#endif
```

To generate code that imports this data, create `bp1Len` and `bp2Len` as `Simulink.Parameter` objects in MATLAB. Create `LUTObj` as a `Simulink.LookupTable` object. Use the parameter objects to specify the dimension lengths for the table and breakpoint set data in the `Simulink.LookupTable` object.

Create Example Model

Create the example model `ex_LUTObj` by using an n-D Lookup Table block. In the Lookup Table block dialog box, on the **Table and Breakpoints** tab, set **Number of table dimensions** to 2.

```
open_system('ex_LUTObj')
```

Create Simulink.LookupTable Object

In the Model Explorer **Model Hierarchy** pane, select **Base Workspace**.

On the toolbar, click the **Add Simulink LookupTable** button. A `Simulink.LookupTable` object named `Object` appears in the base workspace.

In the **Contents** pane (the middle pane), rename the object as `LUTObj`.

Alternatively, create the object at the command prompt:

```
LUTObj = Simulink.LookupTable;
```

Configure Simulink.LookupTable Object

In the **Contents** pane, select the new object `LUTObj`. The property dialog box appears in the **Dialog** pane (the right pane).

Set **Number of table dimensions** to 2.

Under **Table**, set **Value** to `[3 4; 2 1]`.

In the first row under **Breakpoints**, set **Value** to `[1 2]`.

In the second row under **Breakpoints**, set **Value** to `[3 4]`. Click **Apply**.

Under **Struct Type definition**, set **Data scope** to `Imported`. Set **Header file** to `ex_myHdr_LUT.h`. Set **Name** to `LUTObj_Type`.

In the Lookup Table block dialog box, set **Data specification** to Lookup table object. Set **Name** to LUTObj. Click **Apply**.

Alternatively, to configure the object and the blocks, use these commands:

```
LUTObj.Breakpoints(1).Value = [1 2];
LUTObj.Breakpoints(2).Value = [3 4];
LUTObj.Table.Value = [3 4; 2 1];
LUTObj.StructTypeInfo.DataScope = 'Imported';
LUTObj.StructTypeInfo.HeaderFileName = 'ex_myHdr_LUT.h';
LUTObj.StructTypeInfo.Name = 'LUTObj_Type';
set_param('ex_LUTObj/Lookup Table', 'LookupTableObject', 'LUTObj')
set_param('ex_LUTObj/Lookup Table', ...
    'DataSpecification', 'Lookup table object')
```

Enable the code generator to use Simulink.Parameter objects as macros that specify dimension lengths. Select the configuration parameter **Allow symbolic dimension specification**.

```
set_param('ex_LUTObj', 'AllowSymbolicDim', 'on')
```

Create the Simulink.Parameter objects that represent the macros bp1Len and bp2Len. To generate code that imports the macros from your header file ex_myHdr_LUT.h, apply the custom storage class ImportedDefine.

```
bp1Len = Simulink.Parameter(2);
bp1Len.Min = 2;
bp1Len.Max = 3;
bp1Len.DataType = 'int32';
bp1Len.CoderInfo.StorageClass = 'Custom';
bp1Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp1Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';

bp2Len = Simulink.Parameter(2);
bp2Len.Min = 2;
bp2Len.Max = 3;
bp2Len.DataType = 'int32';
bp2Len.CoderInfo.StorageClass = 'Custom';
bp2Len.CoderInfo.CustomStorageClass = 'ImportedDefine';
bp2Len.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';
```

Configure the existing Simulink.LookupTable object LUTObj to use the Simulink.Parameter objects. Set the dimension lengths of the breakpoint set data and the table data by using the names of the parameter objects.

```
LUTObj.Breakpoints(1).Dimensions = '[1 bp1Len]';
LUTObj.Breakpoints(2).Dimensions = '[1 bp2Len]';
LUTObj.Table.Dimensions = '[bp1Len bp2Len]';
```

Configure LUTObj as imported data by applying the custom storage class ImportFromFile. To import your definition of LUTObj, add the name of the file ex_mySrc_LUT.c to the model configuration parameter **Configuration Parameters > Code Generation > Custom Code > Additional Build Information > Source files**.

```
LUTObj.CoderInfo.StorageClass = 'Custom';
LUTObj.CoderInfo.CustomStorageClass = 'ImportFromFile';
LUTObj.CoderInfo.CustomAttributes.HeaderFile = 'ex_myHdr_LUT.h';
```

```
set_param('ex_LUTObj', 'CustomSource', 'ex_mySrc_LUT.c')
```

Generate and Inspect Code

Configure the model to compile an executable from the generated code.

```
set_param('ex_LUTObj', 'GenCodeOnly', 'off')
```

Generate code from the model.

```
rtwbuild('ex_LUTObj')

### Starting build procedure for model: ex_LUTObj
### Successful completion of build procedure for model: ex_LUTObj
```

In the code generation report, view the generated file ex_LUTObj.h. The file imports the macro definitions and the structure type definition by including your header file ex_myHdr_LUT.h.

```
file = fullfile('ex_LUTObj_ert_rtw', 'ex_LUTObj.h');
rtwdemodbtype(file, '#include "ex_myHdr_LUT.h"', '#include "ex_myHdr_LUT.h"', 1, 1)
```

```
#include "ex_myHdr_LUT.h"
```

In the source file ex_LUTObj.c, the code algorithm in the model step function passes the breakpoint and table data to the function that performs the table lookup. The algorithm also passes bp1Len so the lookup function can traverse the rows and columns of the table data, which appear in the generated code as a serialized 1-D array.

```
file = fullfile('ex_LUTObj_ert_rtw', 'ex_LUTObj.c');
rtwdemodbtype(file, '/* Model step function */', '/* Model initialize function */', 1, 0)
```

```
/* Model step function */
void ex_LUTObj_step(void)
{
    /* Outport: '<Root>/Out1' incorporates:
     * Inport: '<Root>/In1'
     * Inport: '<Root>/In2'
     * Lookup_n-D: '<Root>/Lookup Table'
     */
    ex_LUTObj_Y.Out1 = look2_binlcapw(ex_LUTObj_U.In1, ex_LUTObj_U.In2,
        (&(LUTObj.BP1[0])), (&(LUTObj.BP2[0])), (&(LUTObj.Table[0])),
        ex_LUTObj_ConstP.LookupTable_maxIndex, (uint32_T)bp1Len);
}
```

Limitations

- You cannot subclass `Simulink.Breakpoint` or `Simulink.LookupTable`. For this reason, you cannot apply custom storage classes other than those in the built-in Simulink package.
- You cannot use `Simulink.Breakpoint` objects or `Simulink.LookupTable` objects that refer to `Simulink.Breakpoint` objects as instance-specific parameter data for reusable components. For example, you cannot use one of these objects as:
 - A model argument in a model workspace or a model argument value in a Model block.
 - The value of a mask parameter on a CodeReuse Subsystem block.
 - The value of a mask parameter on a subsystem that you reuse by creating a custom library.

However, you can use standalone `Simulink.LookupTable` objects, which do not refer to `Simulink.Breakpoint` objects, in these ways.

- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

Simulink.lookupable.Breakpoint class

Package: Simulink.lookupable

Configure breakpoint set data for lookup table object

Description

An object of the `Simulink.lookupable.Breakpoint` class stores breakpoint set information for a lookup table. The object resides in the `Breakpoints` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object.

You can use `Simulink.LookupTable` and `Simulink.Breakpoint` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookupable.Breakpoint` objects in the `Breakpoints` property of a `Simulink.LookupTable` object.

To share a breakpoint set between multiple lookup tables, use a `Simulink.Breakpoint` object to store and configure the breakpoint set information. Use the object in a `Prelookup` block and create `Simulink.LookupTable` objects to use in `Interpolation` Using `Prelookup` blocks.

Construction

When you create a `Simulink.LookupTable` object or `Simulink.Breakpoint` object, a `Simulink.lookupable.Breakpoint` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookupable.Breakpoint` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookupable.Breakpoint` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the

Simulink.lookupable.Breakpoint object with default property values, and sets the property that you specified.

The value of the `Breakpoints` property is an array of Simulink.lookupable.Breakpoint objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named LUTObj. To create more breakpoint sets, access the `Breakpoints` property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object LUTObj creates additional Simulink.lookupable.Breakpoint objects and sets the `Value` property of each object. LUTObj now stores information for three breakpoint sets.

Properties

Data Type — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a Simulink.AliasType object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: `'myTypeAlias'`

Data Types: `char`

Description — Description of breakpoint set

`'` (default) | `character vector`

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

Dimensions — Dimension lengths of breakpoint set

`[0 0]` (default) | `numeric vector`

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of structure field that stores breakpoint set data

`'BP'` (default) | `character vector`

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to `'Explicit values'`.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: `'MyBkptSet1'`

Data Types: `char`

Max — Maximum value of breakpoint set elements

`[]` (default) | `numeric double value`

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

min — Minimum value of breakpoint set elements

`[]` (default) | numeric `double` value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

TunableSizeName — Name of structure field that stores length of breakpoint set

`'N'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:
 - `BreakpointsSpecification` to `'Explicit values'`.
 - `SupportTunableSize` to `true`.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

unit — Physical unit of breakpoint set

`''` (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: 'inches'

Data Types: char

value — Breakpoint set data

[] (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Breakpoint` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30]`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.lookupable.Evenspacing class

Package: Simulink.lookupable

Configure even spacing set data for lookup table object

Description

An object of the `Simulink.lookupable.Evenspacing` class stores event spacing set information for a lookup table. The object resides in the `Evenspacing` property of a `Simulink.LookupTable` object.

You can use `Simulink.LookupTable` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookupable.Evenspacing` objects in the `Evenspacing` property of a `Simulink.LookupTable` object.

Construction

When you create a `Simulink.LookupTable` object and set `BreakpointSpecification` to 'Even spacing', a `Simulink.lookupable.Evenspacing` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookupable.Evenspacing` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookupable.Evenspacing` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the `Simulink.lookupable.Evenspacing` object with default property values, and sets the property that you specified.

The value of the `Breakpoints` property is an array of `Simulink.lookupable.Evenspacing` objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a `Simulink.LookupTable` object named `myLUTObj`. To create more breakpoint sets, access the `Breakpoints` property by specifying scalar indices for `FirstPoint` and `Spacing` properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object `myLUTObj` creates additional `Simulink.lookupable.Evenspacing` objects and sets the `FirstPoint` and `Spacing` properties of each object. `LUTObj` now stores information for three breakpoint sets.

Properties

FirstPoint — First point in evenly spaced breakpoint data

[] (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to `'auto'`, to set the `FirstPoint` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed a `fi` object.

Example: `-1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Spacing — Spacing between points in evenly spaced breakpoint data

[] (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to `'auto'`, to set the `Spacing` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed an `fi` object.

Example: `-1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

`DataType` — Data type of breakpoint set elements

`'auto'` (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, `'auto'`, means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: `'int16'`

Example: `'myTypeAlias'`

Data Types: `char`

`Min` — Minimum value of breakpoint set elements

`[]` (default) | numeric `double` value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

Max — Maximum value of breakpoint set elements

`[]` (default) | numeric `double` value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

Unit — Physical unit of breakpoint set

`' '` (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

FirstPointName — Name of the `Simulink.lookuptable.Evenspacing` object that stores the information for the first point

`'BPFirstPoint1'` (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

SpacingName — Name of the `Simulink.lookuptable.Evenspacing` object that stores the information for the spacing

`'auto'` (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

TunableSizeName — Name of structure field that stores length of breakpoint set`'N'` (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to `'Even spacing'` and `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

Description — Description of breakpoint set`''` (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

`Simulink.LookupTable` | `Simulink.lookuptable.Breakpoint`

Introduced in R2017b

Simulink.lookupable.StructTypeInfo class

Package: Simulink.lookupable

Configure settings for structure type that lookup table object uses in the generated code

Description

An object of the `Simulink.lookupable.StructTypeInfo` class controls the structure type that the generated code creates to store data for lookup table objects. The `Simulink.lookupable.StructTypeInfo` object resides in the `StructTypeInfo` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A `Simulink.LookupTable` object appears as a structure in the generated code when you set the `Specification` property to 'Explicit values'. A `Simulink.Breakpoint` object appears as a structure in the generated code when you set the `SupportTunableSize` property to true.

Construction

When you create a `Simulink.LookupTable` or `Simulink.Breakpoint` object, a `Simulink.lookupable.StructTypeInfo` object appears as the value of the `StructTypeInfo` property.

Properties

DataScope — Scope of structure type definition

'Auto' (default) | 'Exported' | 'Imported'

Scope of structure type definition, specified as a character vector.

Data Types: char

HeaderFileName — Name of header file that contains structure type definition`' '` (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: `'myHdr.h'`

Data Types: `char`

Name — Name of structure type`' '` (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: `char`

Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects (MATLAB).

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.lookupable.Table class

Package: Simulink.lookupable

Configure table data for lookup table object

Description

An object of the `Simulink.lookupable.Table` class stores table information for a lookup table. The object resides in the `Table` property of a `Simulink.LookupTable` object. You can use the `Simulink.LookupTable` object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

Construction

When you create a `Simulink.LookupTable` object, a `Simulink.lookupable.Table` object appears as the value of the `Table` property.

Properties

Data Type — Data type of table data elements

'auto' (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the table data acquire a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in

Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

Description — Description of table data

' ' (default) | character vector

Description of the table data, specified as a character vector.

Example: 'This lookup table describes the action of a pump.'

Data Types: char

Dimensions — Dimension lengths of table data

[0 0] (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

FieldName — Name of a structure field in the generated code

'Table' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the Simulink.LookupTable object to appear in the generated code as a structure.

Example: 'MyPumpTable'

Data Types: char

Max — Maximum value of table data elements

[] (default) | numeric double value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type double.

Example: 17.23

Data Types: `double`

Min — Minimum value of table data elements

`[]` (default) | numeric `double` value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

Unit — Physical unit of table elements

`' '` (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: `'degC'`

Data Types: `char`

Value — Table data

`[]` (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookuptable.Table` object.

When you set `DataType` to `'auto'`, to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30; 40 50 60]`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

`Simulink.Breakpoint` | `Simulink.LookupTable`

Introduced in R2016b

Simulink.MDLInfo class

Package: Simulink

Extract model file information without loading block diagram into memory

Description

The class `Simulink.MDLInfo` extracts information from a model file without loading the block diagram into memory.

You can create an `MdlInfo` object containing all the model information properties, or you can use the static methods for convenient access to individual properties without creating the class first. For example, to get the description only:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

To get the metadata only:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

All model information properties are read only.

Construction

`info = Simulink.MDLInfo('mymodel')` creates an instance of the `MdlInfo` class `info` and populates the properties with the information from the model file `'mymodel'`.

`mymodel` can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`Simulink.MDLInfo` resolves the supplied name by looking at files on the MATLAB path, and ignores any block diagrams in memory. This may cause unexpected results if

you supply the name of a loaded model, but its file is shadowed by another file on the MATLAB path. If a file is shadowed, you see a warning in the command window. To avoid any confusion, supply a fully-qualified file name to `Simulink.MDLInfo`.

Properties

BlockDiagramName

Name of block diagram.

Description

Description of model.

FileName

Name of model file.

Interface

Names and attributes of the block diagram's root inports, outports, model references, etc., describing the graphical interface if you created a Model Reference block from this model.

Structure.

IsLibrary

Whether the block diagram is a library.

LastSavedArchitecture

Platform architecture when saved, for example, 'glnxa64'.

Metadata

Names and attributes of arbitrary data associated with the model.

Structure. The structure fields can be character vectors, numeric matrices of type "double", or more structures. Use the method `getMetadata` to extract this metadata structure without loading the model.

ModelVersion

Model version number.

ReleaseName

Name of release, for example, 'R2016a'.

SavedCharacterEncoding

Character encoding when saved, for example, 'UTF-8'.

SimulinkVersion

Version number of Simulink software that was used to save the model file.

Methods

`getDescription` Extract model file description without loading block diagram into memory

`getMetadata` Extract model file metadata without loading block diagram into memory

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Construct and view a model information object:

```
info = Simulink.MDLInfo('mymodel')
% Get the Version when the model was saved
simulink_version = info.SimulinkVersion;
% Get model metadata
metadata = info.metadata
```

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. For example:

```
metadata.TestStatus = 'untested';
metadata.ExpectedCompletionDate
    = '01/01/2011';
load_system(mymodelname);
set_param(mymodelname, 'Metadata', ...
    metadata) % must be a struct
save_system(mymodelname);
close_system(mymodelname);
```

Construct a model information object for a model named `mpowertrain`, in order to find the names of referenced models without loading the model into memory:

```
info = Simulink.MDLInfo('mpowertrain')
% Get the Interface property
info.Interface
```

Output:

```
ans =
           Inports: [0x1 struct]
           Outports: [0x1 struct]
           Trigports: [0x1 struct]
           Connports: [0x1 struct]
           ModelVersion: '1.122'
           ModelReferences: {2x1 cell}
           ParameterArgumentNames: ''
           TestPointedSignals: [0x1 struct]
```

Get the referenced models:

```
info.Interface.ModelReferences
```

Output is in the form *model name / block path | referenced model name*:

```
ans =
'mpowertrain/Model Variants|manual_transmission'
'mpowertrain/engine model|menginemodel'
```

See Also

`Simulink.MDLInfo.getDescription`; `Simulink.MDLInfo.getMetadata`

Simulink.MDLInfo.getDescription

Class: Simulink.MDLInfo

Package: Simulink

Extract model file description without loading block diagram into memory

Syntax

```
description = Simulink.MDLInfo.getDescription('mymodel')  
description = info.getDescription
```

Description

`description = Simulink.MDLInfo.getDescription('mymodel')` returns the description associated with the file *mymodel*, without loading the model.

mymodel can be:

- A block diagram name (for example, `vdp`)
- The file name for a file on the MATLAB path (for example, `mymodel.slx`)
- A file name relative to the current folder (for example, `mydir/mymodel.slx`)
- A fully qualified file name (for example, `C:\mydir\mymodel.slx`)

`description = info.getDescription` returns the description property of the Simulink.MDLInfo object `info`.

Examples

Get the description without loading the model or creating a Simulink.MDLInfo object:

```
description = Simulink.MDLInfo.getDescription('mymodel')
```

Create a Simulink.MDLInfo object containing all the model information properties, and get the description property:

```
info = Simulink.MDLInfo('mymodel')  
description = info.getDescription
```

See Also

`Simulink.MDLInfo`; `Simulink.MDLInfo.getMetadata`

Simulink.MDLInfo.getMetadata

Class: Simulink.MDLInfo

Package: Simulink

Extract model file metadata without loading block diagram into memory

Syntax

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')  
metadata = info.getMetadata
```

Description

`metadata = Simulink.MDLInfo.getMetadata('mymodel')` extracts the structure metadata associated with the file *mymodel*, without loading the model.

mymodel can be:

- A block diagram name (for example, *vdp*)
- The file name for a file on the MATLAB path (for example, *mymodel.slx*)
- A file name relative to the current folder (for example, *mydir/mymodel.slx*)
- A fully qualified file name (for example, *C:\mydir\mymodel.slx*)

`metadata = info.getMetadata` returns the metadata property of the Simulink.MDLInfo object *info*.

metadata is a structure containing the names and attributes of arbitrary data associated with the model. The structure fields can be character vectors, numeric matrices of type "double", or more structures.

To add metadata to a model, create a metadata structure containing the information you require and use `set_param` to attach it to the model. If it is important to extract the information without loading the model, use `metadata` instead of adding custom user data with `add_param`.

Examples

Create a metadata structure and use `set_param` to attach it to the model:

```
metadata.TestStatus = 'untested';
metadata.ExpectedCompletionDate = '01/01/2011';
load_system('mymodel');
set_param('mymodel','Metadata',metadata) % must be a struct
save_system('mymodel');
close_system('mymodel');
```

Get the metadata without loading the model or creating a `Simulink.MDLInfo` object:

```
metadata = Simulink.MDLInfo.getMetadata('mymodel')
```

Create a `Simulink.MDLInfo` object containing all the model information properties, and get the metadata property:

```
info = Simulink.MDLInfo('mymodel')
metadata = info.getMetadata
```

`Simulink.MDLInfo`; `Simulink.MDLInfo.getDescription`

Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

Description

Use instances of this class in MATLAB programs to run the Model Advisor, for example, to perform a standard set of checks. MATLAB software creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute the following command

```
ma = Simulink.ModelAdvisor.getModelAdvisor(model);
```

where *model* is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object's methods to initialize and run the Model Advisor's checks.

About IDs

Many `Simulink.ModelAdvisor` object methods require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. ID must remain constant. A `Simulink.ModelAdvisor` object includes methods that enable you to retrieve the ID or IDs for all checks, tasks, and groups, checks belonging to groups and tasks, the active check, and selected checks, tasks and groups.

You find check IDs in the Model Advisor, using check context menus.

To Find	Do This
Check Title, ID, or location of the MATLAB source code	<ol style="list-style-type: none"> 1 On the model window toolbar, select Settings > Preferences. 2 In the Model Advisor Preferences dialog box, select Show Source Tab. 3 In the right pane of the Model Advisor window, click the Source tab. The Model Advisor window displays the check Title, TitleId, and location of the MATLAB source code for the check.

To Find	Do This
Check ID	<ol style="list-style-type: none"> 1 In the left pane of the Model Advisor, select the check. 2 Right-click the check name and select Send Check ID to Workspace. The ID is displayed in the Command Window and sent to the base workspace.
Check IDs for selected checks in a folder	<ol style="list-style-type: none"> 1 In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder. 2 Right-click the folder and select Send Check ID to Workspace. An array of the selected check IDs are sent to the base workspace.

Syntax

```
ma = Simulink.ModelAdvisor
```

Arguments

ma

A variable representing the `Simulink.ModelAdvisor` object you create.

Properties

EmitInputParametersToReport

The `EmitInputParametersToReport` property specifies the display of check input parameters in the Model Advisor report.

Value	Description
'true' (default)	Display check input parameters in the Model Advisor report.
'false'	Do not display check input parameters in the Model Advisor report.

Method Summary

Name	Description
“closeReport” on page 5-291	Close Model Advisor report.
“deselectCheck” on page 5-291	Clear checks.
“deselectCheckAll” on page 5-292	Clear all checks.
“deselectCheckForGroup” on page 5-292	Clear a group of checks.
“deselectCheckForTask” on page 5-293	Clear checks that belong to a specified task or set of tasks.
“deselectTask” on page 5-293	Clear tasks.
“deselectTaskAll” on page 5-294	Clear all tasks.
“displayReport” on page 5-294	Display Model Advisor report.
“exportReport” on page 5-295	Copy report to a specified location.
“filterResultWithExclusion” on page 5-295	Filter objects that have been excluded by user-defined exclusions.
“getBaselineMode” on page 5-296	Get baseline mode setting for the Model Advisor.
“getCheckAll” on page 5-297	Get the IDs of the checks performed by the Model Advisor.
“getCheckForGroup” on page 5-297	Get checks belonging to a check group.
“getCheckForTask” on page 5-298	Get checks belonging to a task.
“getCheckResult” on page 5-298	Get check results.
“getCheckResultData” on page 5-299	Get check result data.
“getCheckResultStatus” on page 5-299	Get pass/fail status of a check or set of checks.
“getGroupAll” on page 5-300	Get the IDs of the groups of tasks performed by the Model Advisor.
“getInputParameters” on page 5-300	Get input parameters of a check.
“getListviewParameters” on page 5-301	Get list view parameters of a check.
“getModelAdvisor” on page 5-302	Get the Model Advisor for a model or subsystem.

Name	Description
"getSelectedCheck" on page 5-303	Get selected checks.
"getSelectedSystem" on page 5-303	Get path of system currently targeted by the Model Advisor.
"getSelectedTask" on page 5-303	Get selected tasks.
"getTaskAll" on page 5-304	Get the IDs of the tasks performed by the Model Advisor.
"Simulink.ModelAdvisor.openConfigUI" on page 5-304	Start the Model Advisor Configuration editor.
"Simulink.ModelAdvisor.reportExists" on page 5-305	Determine whether a report exists for a system or subsystem.
"runCheck" on page 5-305	Run selected checks.
"runTask" on page 5-306	Run checks for selected tasks.
"selectCheck" on page 5-306	Select checks.
"selectCheckAll" on page 5-307	Select all checks.
"selectCheckForGroup" on page 5-307	Select a group of checks.
"selectCheckForTask" on page 5-308	Select checks that belong to a specified task.
"selectTask" on page 5-308	Select tasks.
"selectTaskAll" on page 5-309	Select all tasks.
"setActionEnable" on page 5-309	Set enable/disable status for a check action.
"setBaselineMode" on page 5-310	Set baseline mode for the Model Advisor.
"setCheckErrorSeverity" on page 5-311	Set severity of a check failure.
"setCheckResult" on page 5-311	Set result for the currently running check.
"setCheckResultData" on page 5-312	Set result data for the currently running check.
"setCheckResultStatus" on page 5-313	Set pass/fail status for the currently running check.

Name	Description
“setListViewParameters” on page 5-314	Set list view parameters for a check.
“verifyCheckRan” on page 5-314	Verify that checks have run.
“verifyCheckResult” on page 5-315	Generate a baseline set of check results or compare the current set of results to the baseline results.
“verifyCheckResultStatus” on page 5-316	Verify that a model has passed or failed a set of checks.
“verifyHTML” on page 5-317	Generate a baseline report or compare the current report to a baseline report.

Methods

closeReport

Close Model Advisor report

```
closeReport
```

Closes the report associated with this Model Advisor object, which closes the Model Advisor window.

“displayReport” on page 5-294

deselectCheck

Clear check

```
success = deselectCheck(ID)
```

ID

Character vector or cell array that specifies the IDs of the checks to be cleared.

`success`

True (1) if the check is cleared.

This method clears the checks specified by `ID`.

Note This method cannot clear disabled checks.

“`getCheckAll`” on page 5-297, “`deselectCheckForGroup`” on page 5-292, “`selectCheck`” on page 5-306

deselectCheckAll

Clear all checks

```
success = deselectCheckAll
```

`success`

True (1) if all checks are cleared.

Clears all checks that are not disabled.

“`selectCheckAll`” on page 5-307

deselectCheckForGroup

Clear group of checks

```
success = deselectCheckForGroup(groupName)
```

groupName

Character vector or cell array that specifies the names of the groups to be cleared.

success

True (1) if the method succeeds in clearing the specified group.

Clears a specified group of checks.

“selectCheckForGroup” on page 5-307

deselectCheckForTask

Clear checks that belong to specified task or set of tasks

```
success = deselectCheckForTask(ID)
```

ID

Character vector or cell array of character vectors that specify the IDs of tasks whose checks are to be cleared.

success

True (1) if the specified tasks are cleared.

Clears checks belonging to the tasks specified by the *ID* argument.

“getTaskAll” on page 5-304, “selectCheckForTask” on page 5-308

deselectTask

Clear task

```
success = deselectTask(ID)
```

ID

Character vector or cell array that specifies the ID of tasks to be cleared

success

True (1) if the method succeeded in clearing the specified tasks.

Clears the tasks specified by *ID*.

“selectTask” on page 5-308, “getTaskAll” on page 5-304

deselectTaskAll

Clears all tasks

```
success = deselectTaskAll
```

success

True (1) if this method succeeds in clearing all tasks.

Clears all tasks.

“selectTaskAll” on page 5-309

displayReport

Display report in Model Advisor window

```
displayReport
```

Displays the report associated with this Model Advisor object in the Model Advisor window. The report includes the most recent results of running checks on the system

associated with this Model Advisor object and the current selection status of checks, groups, and tasks for the system.

“Simulink.ModelAdvisor.reportExists” on page 5-305

exportReport

Create copy of report generated by Model Advisor

```
[success message] = exportReport(destination)
```

destination

Path name of copy to be made of the report file.

success

True (1) if this method succeeded in creating a copy of the report at the specified location.

message

Empty if the copy was successful; otherwise, the reason the copy did not succeed.

This method creates a copy of the last report generated by the Model Advisor and stores the copy at the specified location.

“Simulink.ModelAdvisor.reportExists” on page 5-305

filterResultWithExclusion

Filter objects that have been excluded by user-defined exclusions.

```
filteredResultHandles = obj.filterResultWithExclusion(ResultHandles)
```

filteredResultHandles

An array of objects causing exclusion enabled checks to warn or fail.

obj

A variable representing the `Simulink.ModelAdvisor.getModelAdvisor` object.

ResultHandles

An array of objects causing a check warning or failure.

This method filters objects that cause a check warning or failure with checks that have exclusions enabled.

Note This method is intended for excluding objects from custom checks created with the Model Advisor's customization API, a feature available with Simulink Check™.

“`getModelAdvisor`” on page 5-302

getBaselineMode

Determine whether Model Advisor is in baseline data generation mode

```
mode = getBaselineMode
```

mode

Boolean value indicating baseline mode.

The `mode` output variable returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification methods of the Model Advisor, for example, “`verifyHTML`” on page 5-317, to generate baseline data.

“`setBaselineMode`” on page 5-310, “`verifyHTML`” on page 5-317, “`verifyCheckResult`” on page 5-315, “`verifyCheckResultStatus`” on page 5-316

getCheckAll

Get IDs of all checks

```
IDs = getCheckAll
```

IDs

Cell array of character vectors specifying the IDs of all checks performed by the Model Advisor.

Returns a cell array of character vectors specifying the IDs of all checks performed by the Model Advisor.

“getTaskAll” on page 5-304, “getGroupAll” on page 5-300

getCheckForGroup

Get checks that belong to check group

```
IDs = getCheckForGroup(groupName)
```

groupName

Character vector specifying the name of a group.

IDs

Cell array of IDs.

Returns a cell array of IDs of the tasks and checks belonging to the group specified by *groupName*.

“getCheckForTask” on page 5-298

getCheckForTask

Get checks that belong to task

```
checkIDs = getCheckForTask(taskID)
```

taskID

ID of a task.

checkIDs

Cell array of IDs of checks belonging to the specified task.

Returns a cell array of IDs of the checks belonging to the task specified by *taskID*.

“getCheckForGroup” on page 5-297

getCheckResult

Get results of running check or set of checks

```
result = getCheckResult(ID)
```

ID

ID of a check or cell array of check IDs.

result

A check result or cell array of check results.

Gets results for the specified checks. The format of the results depends on the checks that generated the data.

Note This method is intended for accessing results generated by custom checks created with the Model Advisor's customization API, an optional feature available with Simulink

Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“getCheckResultData” on page 5-299, “getCheckResultStatus” on page 5-299

getCheckResultData

Get data resulting from running check or set of checks

```
result = getCheckResultData(ID)
```

ID

Check ID or cell array of check IDs.

result

Data from a check result or cell array of data from check results.

Gets the check result data for the specified checks. The format of the data depends on the checks that generated the data.

Note This method is intended for accessing check result data generated by custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“getCheckResult” on page 5-298, “getCheckResultStatus” on page 5-299

getCheckResultStatus

Get status of check or set of checks

```
result = getCheckResultStatus(ID)
```

ID

Check ID or cell array of check IDs.

result

Boolean or a cell array of Boolean values indication the pass or fail status of a check or set of checks.

Invoke this method after running a set of checks to determine whether the checks passed or failed.

“getCheckResult” on page 5-298, “getCheckResultData” on page 5-299

getGroupAll

Get all groups of checks run by Model Advisor

```
IDs = getGroupAll
```

IDs

Cell array of IDs of all groups of checks run by the Model Advisor.

Returns a cell array of IDs of all groups of checks run by the Model Advisor.

“getCheckAll” on page 5-297, “getTaskAll” on page 5-304

getInputParameters

Get input parameters of check

```
params = obj.getInputParameters(check_ID)
```

params

A cell array of `ModelAdvisor.InputParameter` objects.

obj

A variable representing the `Simulink.ModelAdvisor` object.

check_ID

A character vector that uniquely identifies the check.

You can omit the *check_ID* if you use the method inside a check callback function.

Returns the input parameters associated with a check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

`ModelAdvisor.InputParameter`

getListViewParameters

Get list view parameters of check

```
params = obj.getListViewParameters(check_ID)
```

params

A cell array of `ModelAdvisor.ListViewParameter` objects.

obj

A variable representing the `Simulink.ModelAdvisor` object.

check_ID

A character vector that uniquely identifies the check.

You can omit the *check_ID* if you use the method inside a check callback function.

Returns the list view parameters associated with a check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“setListViewParameters” on page 5-314, `ModelAdvisor.ListViewParameter`

getModelAdvisor

Get Model Advisor object for system or subsystem

```
obj = Simulink.ModelAdvisor.getModelAdvisor(system)
obj = Simulink.ModelAdvisor.getModelAdvisor(system, 'new')
```

system

Name of model or subsystem.

'new'

Required when changing Model Advisor working scope from one system to another without closing the previous session. Alternatively, you can close the previous session before invoking `getModelAdvisor`, in which case 'new' can be omitted.

obj

Model Advisor object.

This static method (see “Static Methods”) creates and returns an instance of `Simulink.ModelAdvisor` class for the model or subsystem specified by *system*.

getSelectedCheck

Get currently selected checks

```
IDs = getSelectedCheck
```

IDs

Cell array of IDs of currently selected checks.

Returns the IDs of the currently selected checks in the Model Advisor.

“getSelectedTask” on page 5-303

getSelectedSystem

Get system currently targeted by Model Advisor

```
path = getSelectedSystem
```

path

Path of the selected system.

Gets the path of the system currently targeted by the Model Advisor. That is, the system or subsystem most recently selected for checking either interactively by the user or programmatically via `Simulink.ModelAdvisor.getModelAdvisor`.

“getModelAdvisor” on page 5-302

getSelectedTask

Get selected tasks

```
IDs = getSelectedTask
```

IDs

Cell array of IDs of currently selected tasks.

Returns the IDs of the currently selected tasks in the Model Advisor.

“getSelectedCheck” on page 5-303

getTaskAll

Get tasks run by Model Advisor

```
IDs = getTaskAll
```

IDs

Cell array of IDs of tasks run by the Model Advisor.

Returns a cell array of IDs of tasks run by the Model Advisor.

“getCheckAll” on page 5-297, “getGroupAll” on page 5-300

Simulink.ModelAdvisor.openConfigUI

Starts Model Advisor Configuration editor

```
Simulink.ModelAdvisor.openConfigUI
```

This static method starts the Model Advisor Configuration editor. Use the Model Advisor Configuration editor to create customized configurations for the Model Advisor.

Note The Model Advisor Configuration editor is an optional feature available with Simulink Check software (see “Organize Checks and Folders Using the Model Advisor Configuration Editor” (Simulink Check) for more information).

- Before starting the Model Advisor Configuration editor, ensure that the current folder is writable. If the folder is not writable, you see an error message when you start the Model Advisor Configuration editor.
 - The Model Advisor Configuration editor uses the `slprj` folder in the code generation folder to store reports and other information. If the `slprj` folder does not exist in the code generation folder, the Model Advisor Configuration editor creates it. For more information, see “Model Reference Simulation Targets”.
-

Simulink.ModelAdvisor.reportExists

Determine whether report exists for model or subsystem

```
exists = reportexists('system')
```

system

Character vector specifying path of a system or subsystem.

`exists`

True (1) if a report exists for *system*.

This method returns true (1) if a report file exists for the model (system) or subsystem specified by *system* in the `slprj/modeladvisor` subfolder of the MATLAB working folder.

“exportReport” on page 5-295

runCheck

Run currently selected checks

```
success = runCheck(ID)
```

ID

ID or cell array of IDs of checks to run.

success

True (1) if the checks were run.

Runs the checks currently selected in the Model Advisor. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor window.

“selectCheck” on page 5-306

runTask

Run currently selected tasks

```
success = runTask
```

success

True (1) if the tasks were run.

Runs the tasks currently selected in the Model Advisor. Invoking this method is equivalent to selecting the **Run Selected Checks** button on the Model Advisor window.

“selectTask” on page 5-308

selectCheck

Select check

```
success = selectCheck(ID)
```

ID

ID or cell array of IDs of checks to be selected.

success

True (1) if this method succeeded in selecting the specified checks.

Select the check specified by *ID*. This method cannot select a check that is disabled.

“selectCheckAll” on page 5-307, “selectCheckForGroup” on page 5-307, “deselectCheck” on page 5-291

selectCheckAll

Select all checks

```
success = selectCheckAll
```

success

True (1) if this method succeeded in selecting all checks.

Selects all checks that are not disabled.

“selectCheck” on page 5-306, “selectCheckForGroup” on page 5-307, “deselectCheck” on page 5-291

selectCheckForGroup

Select group of checks

```
success = selectCheckForGroup(ID)
```

ID

ID or cell array of group IDs.

success

True (1) if this method succeeded in selecting the specified groups

Selects the groups specified by *ID*.

“deselectCheckForGroup” on page 5-292

selectCheckForTask

Select checks that belong to specified task or set of tasks

```
success = selectCheckForTask(ID)
```

ID

ID or cell array of IDs of tasks whose checks are to be selected.

success

True (1) if this method succeeded in selecting the checks for the specified tasks

Selects checks belonging to the tasks specified by the *ID* argument.

“deselectCheckForTask” on page 5-293

selectTask

Select task

```
success = selectTask(ID)
```

ID

ID or cell array of IDs of the task to be selected.

success

True (1) if this method succeeds in selecting the specified tasks.

Selects a task.

“deselectTask” on page 5-293

selectTaskAll

Select all tasks

```
success = selectTaskAll
```

success

True (1) if this method succeeds in selecting all tasks.

Selects all tasks.

“deselectTaskAll” on page 5-294

setActionEnable

Set status for check action

```
obj.setActionEnable(value)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

value

Boolean value indicating whether the Action box is enabled or disabled.

- `true` — enable the Action box.
- `false` — Disable the Action box.

The `setActionEnable` method specifies the enables or disables the Action box. Only a check callback function can invoke this method.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

`ModelAdvisor.Action`

setBaselineMode

Set baseline data generation mode for Model Advisor

`setBaselineMode(mode)`

mode

Boolean value indicating setting of Model Advisor's baseline mode, either on (`true`) or off (`false`).

Sets the Model Advisor's baseline mode to *mode*. Baseline mode causes the Model Advisor's verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

“`getBaselineMode`” on page 5-296, “`verifyCheckResult`” on page 5-315, “`verifyHTML`” on page 5-317

setCheckErrorSeverity

Set severity of check failure

```
obj.setCheckErrorSeverity(value)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

value

Integer indicating severity of failure.

- 0 — Check Result = Warning
- 1 — Check Result = Failed

Sets result status for a currently running check that fails to *value*. Only a check callback function can invoke this method.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“setCheckResultStatus” on page 5-313

setCheckResult

Set result for currently running check

```
success = setCheckResult(result)
```

result

Character vector or cell array that specifies the result of the currently running task.

success

True (1) if this method succeeds in setting the check result.

Sets the check result for the currently running check. Only the callback function of a check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“getCheckResult” on page 5-298, “setCheckResultData” on page 5-312,
“setCheckResultStatus” on page 5-313

setCheckResultData

Set result data for currently running check

```
success = setCheckResultData(data)
```

data

Result data to be set.

success

True (1) if this method succeeds in setting the result data for the current check

Sets the check result data for the currently running check. Only the callback function of a check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check

software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“getCheckResultData” on page 5-299, “setCheckResult” on page 5-311,
“setCheckResultStatus” on page 5-313

setCheckResultStatus

Set status for currently running check

```
success = setCheckResultStatus(status)
```

status

Boolean value that indicates the status of the check that just ran, either pass (`true`) or fail (`false`)

success

True (1) if the status was set.

Sets the pass or fail status for the currently running check to *status*. Only the callback function of the check can invoke this method.

Note This method is intended for use with custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“getCheckResultStatus” on page 5-299, “setCheckResult” on page 5-311,
“setCheckResultData” on page 5-312, “setCheckErrorSeverity” on page 5-311

setListViewParameters

Specify list view parameters for check

```
obj.setListViewParameters(check_ID, params)
```

obj

A variable representing the `Simulink.ModelAdvisor` object.

check_ID

A character vector that uniquely identifies the check.

You can omit the *check_ID* if you use the method inside a check callback function.

params

A cell array of `ModelAdvisor.ListViewParameter` objects.

Set the list view parameters for the check.

Note This method is intended for accessing custom checks created with the Model Advisor's customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Checks” (Simulink Check) in the Simulink Check documentation.

“getListViewParameters” on page 5-301, `ModelAdvisor.ListViewParameter`

verifyCheckRan

Verify that Model Advisor has run set of checks

```
[success, missingChecks, additionalChecks] = verifyCheckRan(IDs)
```

IDs

Cell array of IDs of checks to verify.

success

Boolean value specifying whether the checks ran.

missingChecks

Cell array of IDs for specified checks that did not run.

additionalChecks

Cell array of IDs for unspecified checks that ran.

The output variable `success` returns `true` if both:

- All the checks specified by *IDs* ran.
- Only the checks specified by *IDs* ran.

The `missingChecks` argument provides the specified checks that did not run. The `additionalChecks` argument lists unspecified checks that ran.

“`verifyCheckResultStatus`” on page 5-316

verifyCheckResult

Generate baseline Model Advisor check results file or compare current check results to baseline check results

```
[success message] = verifyCheckResult(baseline, checkIDs)
```

baseline

Path of the baseline check results MAT-file.

checkIDs

Cell array of check IDs.

success

Boolean value specifying whether the method succeeded.

message

Character vector specifying an error message.

If the Model Advisor is in baseline mode (see “setBaselineMode” on page 5-310), this method stores the most recent results of running the checks specified by `checkIDs` in a MAT-file at the location specified by `baseline`. If the method is unable to store the check results at the specified location, it returns `false` in the output variable `success` and the reason for the failure in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the most recent results of running the checks specified by `checkIDs` with the report specified by `baseline`. If the current results match the baseline results, this method returns `true` as the value of the `success` output variable.

Note You must run the checks specified by `checkIDs` (see “runCheck” on page 5-305) before invoking `verifyCheckResult`.

This method enables you to compare the most recent check results generated by the Model Advisor with a baseline set of check results. You can use the method to generate the baseline report as well as perform current-to-baseline result comparisons. To generate a baseline report, put the Model Advisor in baseline mode, using “setBaselineMode” on page 5-310. Then invoke this method with the `baseline` argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first ensure that the Model Advisor is not in baseline mode (see “getBaselineMode” on page 5-296). Then invoke this method with the path of the baseline report as the value of the `baseline` input argument.

“setBaselineMode” on page 5-310, “getBaselineMode” on page 5-296, “runCheck” on page 5-305, “verifyCheckResultStatus” on page 5-316

verifyCheckResultStatus

Verify that model has passed or failed set of checks

```
[success message] = verifyCheckResultStatus(baseline, checkIDs)
```

baseline

Array of Boolean variables.

checkIDs

Cell array of check IDs.

success

Boolean value specifying whether the method succeeded.

message

Character vector specifying an error message.

This method compares the pass or fail (*true* or *false*) statuses from the most recent running of the checks specified by *checkIDs* with the Boolean values specified by *baseline*. If the statuses match the baseline, this method returns *true* as the value of the *success* output variable.

Note You must run the checks specified by *checkIDs* (see “runCheck” on page 5-305) before invoking *verifyCheckResultStatus*.

“runCheck” on page 5-305

verifyHTML

Generate baseline Model Advisor report or compare current report to baseline report

```
[success message] = verifyHTML(baseline)
```

baseline

Path of a Model Advisor report.

success

Boolean value specifying whether the method succeeded.

message

Character vector specifying an error message.

If the Model Advisor is in baseline mode (see “setBaselineMode” on page 5-310), this method stores the report most recently generated by the Model Advisor at the location specified by *baseline*. If the method is unable to store a copy of the report at the specified location, it returns *false* in the output variable *success* and the reason for the failure in the output variable *message*. If the Model Advisor is not in baseline mode, this method compares the report most recently generated by the Model Advisor with the report specified by *baseline*. If the current report has exactly the same content as the baseline report, this method returns *true* as the value of the *success* output variable.

This method enables you to compare a report generated by the Model Advisor with a baseline report to determine if they differ. You can use the method to generate the baseline report as well as perform current-to-baseline report comparisons. To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this method with the baseline argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first ensure that the Model Advisor is not in baseline mode (see “getBaselineMode” on page 5-296). Then invoke this method with the path of the baseline report as the value of the *baseline* input argument.

“setBaselineMode” on page 5-310, “getBaselineMode” on page 5-296, “verifyCheckResult” on page 5-315

Introduced in R2006a

Simulink.ModelDataLogs

Container for signal data logs of a model

Description

Note The `ModelDataLogs` class is supported for backwards compatibility. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

In releases before R2016a, if you set **Configuration Parameters > Data Import/Export > Signal logging format** to `ModelDataLogs`, Simulink software created instances of the `Simulink.ModelDataLogs` class to contain signal logs while simulating a model. Logging created an instance of this class for a top model and for each model referenced by the top model that contains signals to be logged. Logging assigned the `ModelDataLogs` object for the top model to a variable in the base workspace. The name of the variable is the name specified in the **Configuration Parameters > Data Import/export > Signal logging name** parameter. The default value is `logout`.

A `ModelDataLogs` object has a variable number of properties. The first property, named `Name`, specifies the name of the model whose signal data the object contains or, if the model is a referenced model, the name of the Model block that references the model. The remaining properties reference objects that contain signal data logged during simulation of the model. The objects may be instances of any of the following types of objects:

- `Simulink.ModelDataLogs`

Container for the data logs of a model

- `Simulink.SubsysDataLogs`

Container for the data logs of a subsystem

- `Simulink.Timeseries`

Data log for any signal except a mux or bus signal

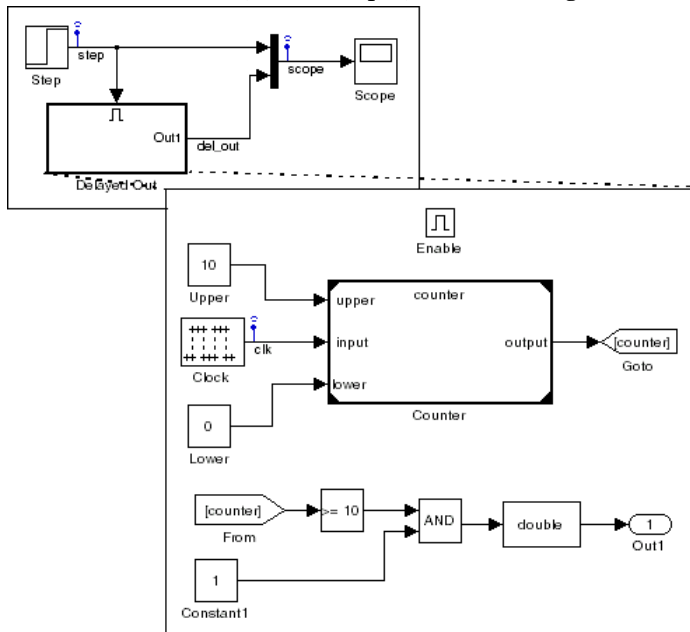

- `Simulink.TsArray`

Data log for a mux or bus signal

The names of the properties identify the data being logged as follows:

- For signal data logs, the name of the signal
- For a subsystem or model log container, the name of the subsystem or model, respectively

Consider, for example, the following model.

As indicated by the testpoint icons, this model specifies that Simulink software should log the signals named `step` and `scope` in the root system and the signal named `clk` in the subsystem named `Delayed Out`. After you simulate this model in a release earlier than R2016a, the MATLAB workspace contains the following variable:

```
Simulink.ModelDataLogs (siglgex):
  Name                elements  Simulink Class
  scope                2        TsArray
  step                 1        Timeseries
  ('Delayed Out')     2        SubsysDataLogs
```

You can use fully qualified object names or the Simulink `unpack` command to access the signal data. For example, to access the amplitudes of the `clk` signal in the `Delayed Out` subsystem in a `logsout` object, enter

```
data = logsout.('Delayed Out').clk.Data;
```

or

```
>> logsout.unpack('all');
>> data = clk.Data;
```

Access Logged Signal Data Saved in ModelDataLogs Format

The `Simulink.ModelDataLogs` object contains signal data objects to capture signal logging information for specific model elements.

Model Element	Signal Data Object
Top-level or referenced model	<code>Simulink.ModelDataLogs</code>
Subsystem in a model	<code>Simulink.SubsysDataLogs</code>
Signal other than a bus or Mux signal	<code>Simulink.Timeseries</code>
Bus signal or Mux signal	<code>Simulink.TsArray</code>

Handling Spaces and Newlines in Logged Names

Signal names in data logs can have spaces or newlines in their names when the signal:

- Is named and the name includes a space or newline character.
- Is unnamed and originates in a block whose name includes a space or newline character.

- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any superior block includes a space or newline character.

The following model shows a signal whose name contains a space, a signal whose name contains a newline, and an unnamed signal that originates in a block whose name contains a newline:

The following example shows how to handle spaces or new lines in logged names, if a model uses ModelDataLogs for the signal logging format.

```
logout
```

```
logout =
```

```
Simulink.ModelDataLogs (model_name):
  Name                Elements  Simulink Class
  ('x y')              1         Timeseries
  ('a
b')                   1         Timeseries
  ('SL_Sine
Wave1')               1         Timeseries
```

You cannot access any of the `Simulink.Timeseries` objects in this log using TAB name completion or by typing the name to MATLAB. This syntax is not recognized because the space or newline in each name appears to the MATLAB parser as a separator between identifiers. For example:

```

logout.x y

??? logout.x y
      |
Error: Unexpected MATLAB expression.

```

To reference a `Simulink.Timeseries` object whose name contains a space, enclose the element containing the space in single quotes:

```

logout.('x y')

    Name: 'x y'
  BlockPath: 'model_name/Sine'
  PortIndex: 1
 SignalName: 'x y'
 ParentName: 'x y'
   TimeInfo: [1x1 Simulink.TimeInfo]
         Time: [51x1 double]
         Data: [51x1 double]

```

To reference a `Simulink.Timeseries` object whose name contains a newline, concatenate to construct the element containing the newline:

```

cr=sprintf('\n')
logout.(['a' cr 'b'])

```

The same techniques work when a space or newline in a data log derives from the name of:

- An unnamed logged signal's originating block
- A subsystem or Model block that contains any logged signal
- Any block that is superior to such a block in the model hierarchy

This code can reference logged data for the signal:

```

logout.(['SL_Sine' cr 'Wave1'])

```

For names with multiple spaces, newlines, or both, repeat and combine the two techniques as needed to specify the intended name to MATLAB.

Bus Signals

ModelDataLogs format stores each logged bus signal data in a separate `Simulink.TsArray` object.

The hierarchy of a bus signal is preserved in the logged signal data. The logged name of a signal in a virtual bus derives from the name of the source signal. The logged name of a signal in a nonvirtual bus derives from the applicable bus object, and can differ from the name of the source signal. See “Composite Signals” for information about those capabilities.

Introduced before R2006a

Simulink.SimState.ModelSimState class

Package: Simulink.SimState

Access SimState snapshot data

Description

The `Simulink.SimState.ModelSimState` class contains all of the information associated with a “snapshot” of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access these data for a block, use the `getBlockSimState` method or the `loggedStates` property.

Properties

description

Specify a description. By default, Simulink generates a character vector based on your model name.

loggedStates

The logged states are the continuous and discrete states of the blocks in a model. These states represent a subset of the complete simulation state (`SimState`) of the model.

If `loggedStates` is in `Dataset` format, you cannot assign a structure or a `Simulink.SimulationData.Dataset` object with a different number of elements than that of the `Dataset` object used for `loggedStates`.

If the `loggedStates` is in `Structure` format, you cannot assign a `Dataset` object.

Attributes:

dependent

`loggedStates` is obtained from the saved states of the block. `loggedStates` depends on the full state being saved in the `SimState` object, unlike, properties like `description`, which are independent of the save states.

snapshotTime

Time at which Simulink takes a “snapshot” of the complete simulation states. This data is read only.

startTime

Time at which the simulation starts. This data is read only.

Methods

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#) in the [MATLAB Programming Fundamentals documentation](#).

Simulink.ModelWorkspace

Describe model workspace

Description

Instances of this class describe model workspaces. Simulink software creates an instance of this class for each model that you open during a Simulink session. See “Model Workspaces” for more information.

Property Summary

Name	Access	Description
DataSource	RW	Specifies the source used to initialize this workspace. Valid values are <ul style="list-style-type: none"> • 'Model File' • 'MAT-File' • 'MATLAB Code' • 'MATLAB File'
FileName	RW	Specifies the name of the MAT-file used to initialize this workspace. Simulink software ignores this property if DataSource is neither 'MAT-File' nor 'MATLAB Code'.
MATLABCode	RW	A character vector specifying MATLAB code used to initialize this workspace. Simulink software ignores this property if DataSource is not 'MATLAB Code'.

Method Summary

Name	Description
“assignin” on page 5-328	Assign a value to a variable in the model's workspace.

Name	Description
“clear” on page 5-329	Clear the model's workspace.
“evalin” on page 5-329	Evaluate an expression in the model's workspace.
“reload” on page 5-330	Reload the model workspace from the workspace's data source.
“save” on page 5-331	Save the model's workspace to a specified MAT-file.
“saveToSource” on page 5-332	Save the workspace to the MAT-file that the workspace designates as its data source.
“whos” on page 5-332	List the variables in the model workspace.
“getVariable” on page 5-329	Get value of variable from workspace.
“hasVariable” on page 5-330	Determine if variable exists in workspace.

Methods

assignin

Assign a value to a variable in the model's workspace.

```
assignin('varname', varvalue)
```

varname

 Name of the variable to be assigned a value.

varvalue

 Value to be assigned the variable.

This method assigns the value specified by `varvalue` to the variable whose name is `varname`.

“evalin” on page 5-329

clear

Clear the model's workspace.

```
clear
```

This method empties the workspace of its variables.

evalin

Evaluate an expression in the model's workspace.

```
evalin('expression')
```

```
expression
```

A MATLAB expression to be evaluated.

This method evaluates expression in the model workspace.

“assignin” on page 5-328

getVariable

Get value of variable from workspace.

```
variableValue = getVariable(workspaceHandle,variableName)
```

```
workspaceHandle
```

Handle to the workspace.

```
variableName
```

Name of the variable.

This method gets the value of a variable from a workspace.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 2-337).

hasVariable

Determine if variable exists in workspace.

```
variableExists = hasVariable(workspaceHandle, variableName)
```

`workspaceHandle`

Handle to the workspace.

`variableName`

Name of the variable.

This method determines whether a variable exists in a workspace.

reload

Reload the model workspace from the workspace's data source.

```
reload
```

This method reloads the model workspace from the data source specified by its `DataSource` parameter. The data source must be 'MAT-File', 'MATLAB Code', or 'MATLAB File'.

“saveToSource” on page 5-332

save

Save the model's workspace to a specified MAT-file.

```
save('filename')
```

filename

Name of a MAT-file.

This method saves the model's workspace to the MAT-file specified by `filename`.

Note This method allows you to save the workspace to a file other than the file specified by the workspace's `FileName` property. If you want to save the model workspace to the file specified by the file's `FileName` property, it is simpler to use the workspace's `saveToSource` method.

```
hws = get_param('myModel','modelworkspace')
hws.DataSource = 'MAT-File';
hws.FileName = 'workspace';
hws.assignin('roll', 30);
hws.saveToSource;
hws.assignin('roll', 40);
hws.save('workspace_test.mat');
```

“reload” on page 5-330, “saveToSource” on page 5-332

saveToSource

Save the workspace to the MAT-file that it designates as its data source.

```
saveToSource
```

This method saves the model workspace designated by its `FileName` property.

```
hws = get_param('mymodel','modelworkspace')
hws.DataSource = 'MAT-File';
hws.FileName = 'params';
hws.assignin('roll', 30);
hws.saveToSource;
```

“save” on page 5-331, “reload” on page 5-330

whos

List the variables in the model workspace.

```
whos
```

This method lists the variables in the model's workspace. The listing includes the size and class of the variables.

```
>> hws = get_param('mymodel','modelworkspace');
>> hws.assignin('k', 2);
>> hws.whos
```

Name	Size	Bytes	Class
k	1x1	8	double array

Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See “Write Level-2 MATLAB S-Functions” for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See “Access Block Data During Simulation” for more information.

The Level-2 MATLAB S-function template `matlabroot/toolbox/simulink/blocks/msfuntmpl.m` shows how to use a number of the following methods.

Parent Class

`Simulink.RunTimeBlock`

Derived Classes

None

Property Summary

Name	Description
“AllowSignalsWithMoreThan2D” on page 5-337	enable Level-2 MATLAB S-function to use multidimensional signals.
“DialogPrmsTunable” on page 5-337	Specifies which of the S-function's dialog parameters are tunable.
“NextTimeHit” on page 5-337	Time of the next sample hit for variable sample time S-functions.

Method Summary

Name	Description
“AutoRegRuntimePrms” on page 5-338	Register this block's dialog parameters as run-time parameters.
“AutoUpdateRuntimePrms” on page 5-338	Update this block's run-time parameters.
“IsDoingConstantOutput” on page 5-338	Determine whether the current simulation stage is the constant sample time stage.
“IsMajorTimeStep” on page 5-339	Determine whether the current simulation time step is a major time step.
“IsSampleHit” on page 5-339	Determine whether the current simulation time is one at which a task handled by this block is active.
“IsSpecialSampleHit” on page 5-340	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
“RegBlockMethod” on page 5-341	Register a callback method for this block.

Name	Description
"RegisterDataTypeFxpBinaryPoint" on page 5-341	Register fixed-point data type with binary point-only scaling.
"RegisterDataTypeFxpFSlopeFixexpBias" on page 5-342	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
"RegisterDataTypeFxpSlopeBias" on page 5-344	Register data type with [Slope Bias] scaling.
"SetAccelRunOnTLC" on page 5-345	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
"SetPreCompInpPortInfoToDynamic" on page 5-345	Set precompiled attributes of this block's input ports to be inherited.
"SetPreCompOutPortInfoToDynamic" on page 5-346	Set precompiled attributes of this block's output ports to be inherited.
"SetPreCompPortInfoToDefaults" on page 5-346	Set precompiled attributes of this block's ports to the default values.
"SetSimViewingDevice" on page 5-346	Specify whether block is a viewer.
"SupportsMultipleExecInstances" on page 5-347	
"WriteRTWParam" on page 5-347	Write custom parameter information to Simulink Coder file.

Properties

AllowSignalsWithMoreThan2D

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the `AllowSignalsWithMoreThan2D` property in the setup method.

Boolean

RW

DialogPrmsTunable

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the “`AutoRegRuntimePrms`” on page 5-338 method. Note that `SimOnlyTunable` parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms      = 3;  
block.DialogPrmsTunable = {'Tunable', 'Nontunable', 'SimOnlyTunable'};
```

array

RW

NextTimeHit

Time of the next sample hit for variable sample-time S-functions.

double

RW

Methods

AutoRegRuntimePrms

Register a block's tunable dialog parameters as run-time parameters.

```
AutoRegRuntimePrms;
```

Use in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

AutoUpdateRuntimePrms

Update a block's run-time parameters.

```
AutoUpdateRuntimePrms;
```

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

IsDoingConstantOutput

Determine whether this is in the constant sample time stage of a simulation.

```
bVal = IsDoingConstantOutput;
```

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see “Constant Sample Time”). Use this method in the `Outputs` method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., `[inf, 0]`.

```
function Outputs(block)
.
.
    if block.IsDoingConstantOutput
        ts = block.OutputPort(1).SampleTime;
        if ts(1) == Inf
            %% Compute port's output.
            end
        end
    end
.
.
%% end of Outputs
```

See “Specifying Port-Based Sample Times” for more information.

IsMajorTimeStep

Determine whether current time step is a major or a minor time step.

```
bVal = IsMajorTimeStep;
```

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the `Outputs` or `Update` methods.

IsSampleHit

Determine whether the current simulation time is one at which a task handled by this block is active.

```
bVal = IsSampleHit(stIdx);
```

`stIdx`

Global index of the sample time to be queried.

Use in `Outputs` or `Update` block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at `stIdx`. The sample time index `stIdx` is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, `block.IsSampleHit(0)` returns true for the rate 0.1, not the rate 0.2.

This block method is similar to `ssIsSampleHit` for C-MeX S-functions, however `ssIsSampleHit` returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, `ssIsSampleHit(S, 0, tid)` returns true for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see `Simulink.BlockPortData`).

IsSpecialSampleHit

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

```
bVal = IsSpecialSampleHit(stIdx1, stIdx1);
```

`stIdx1`

Index of sample time of first task to be queried.

`stIdx2`

Index of sample time of second task to be queried.

Use in `Outputs` or `Update` block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at `stIdx1` and a sample hit has also occurred at `stIdx2` in the same time step (similar to `ssIsSpecialSampleHit` for C-Mex S-functions).

When using the `IsSpecialSampleHit` macro, the slower sample time must be an integer multiple of the faster sample time.

RegBlockMethod

Register a block callback method.

```
RegBlockMethod(methName, methHandle);
```

`methName`

Name of method to be registered.

`methHandle`

MATLAB function handle of the callback method to be registered.

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

RegisterDataTypeFxpBinaryPoint

Register fixed-point data type with binary point-only scaling.

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength,  
fractionalLength, obeyDataTypeOverride);
```

`isSigned`

true if the data type is signed.

false if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalLength`

Number of bits in the data type to the right of the binary point.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-376.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-342 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-344 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpFSlopeFixexpBias

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,  
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

isSigned

true if the data type is signed.

false if the data type is unsigned.

wordLength

Total number of bits in the data type, including any sign bit.

fractionalSlope

Fractional slope of the data type.

fixedexponent

exponent of the slope of the data type.

bias

Bias of the scaling of the data type.

obeyDataTypeOverride

true indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

false indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-376.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-341 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-344 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

RegisterDataTypeFxpSlopeBias

Register data type with [Slope Bias] scaling.

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength,  
totalSlope, bias, obeyDataTypeOverride);
```

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`totalSlope`

Total slope of the scaling of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-376.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-341 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-342 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

SetAccelRunOnTLC

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

```
SetAccelRunOnTLC (bVal) ;
```

bVal

May be 'true' (use TLC file) or 'false' (run block in interpreted mode).

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is 'false', the block runs in interpreted mode. See the S-function *matlabroot/toolbox/simulink/blocks/msfcn_times_two.m* in the Simulink model *msfcdemo_timestwo* for an example.

SetPreCompInpPortInfoToDynamic

Set precompiled attributes of this block's input ports to be inherited.

```
SetPreCompInpPortInfoToDynamic;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function *matlabroot/*

`toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

SetPreCompOutPortInfoToDynamic

Set precompiled attributes of this block's output ports to be inherited.

```
SetPreCompOutPortInfoToDynamic;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

SetPreCompPortInfoToDefaults

Set precompiled attributes of this block's ports to the default values.

```
SetPreCompPortInfoToDefaults;
```

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of `double`.

SetSimViewingDevice

Specify whether this block is a viewer.

```
SetSimViewingDevice(bVal);
```

`bVal`

May be `'true'` (is a viewer) or `'false'` (is not a viewer).

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

SupportsMultipleExecInstances

Specify whether or not a For Each Subsystem supports an S-function inside of it.

```
SupportsMultipleExecInstances (bVal) ;
```

bVal

May be 'true' (S-function is supported) or 'false' (S-function is not supported).

Specify if an S-function can operate within a For Each Subsystem.

WriteRTWParam

Write a custom parameter to the Simulink Coder information file used for code generation.

```
WriteRTWParam(pType, pName, pVal)
```

pType

Type of the parameter to be written. Valid values are 'string' and 'matrix'.

pName

Name of the parameter to be written.

pVal

Value of the parameter to be written.

Use in the `writeRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function `matlabroot/toolbox/simulink/`

`simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

Introduced before R2006a

Simulink.NumericType

Specify floating point, integer, or fixed point data type

Description

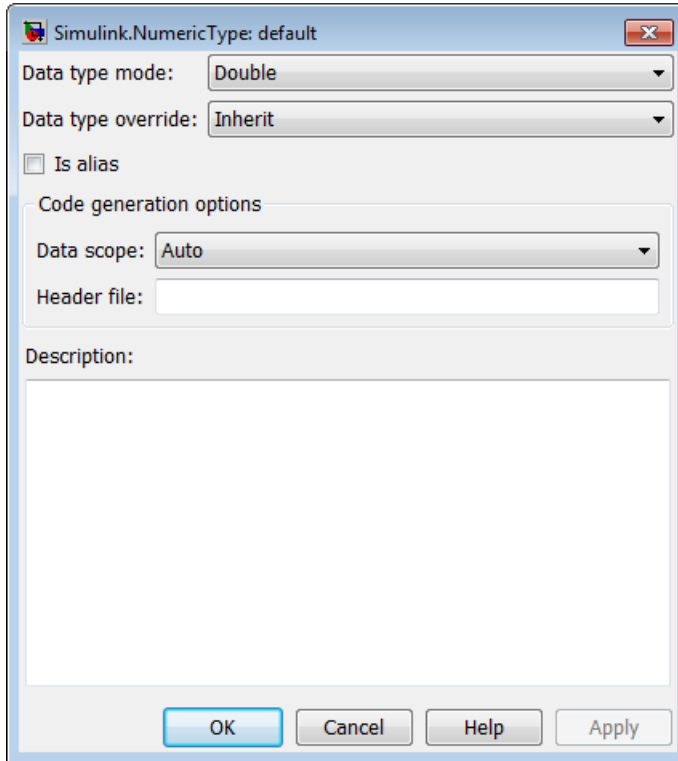

This class allows you to specify a numeric data type as follows:

- 1 Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must disable the **Is alias** option.
- 2 Set the properties of the object to create a custom floating point, integer, or fixed point data type.
- 3 Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (typedef), you can use an object of the class `Simulink.AliasType`.

Property Dialog Box

Data type mode

Data type of this numeric type. The options are listed in this table.

Option	Description
Double	Same as the MATLAB double type.
Single	Same as the MATLAB single type.
Boolean	Same as the MATLAB boolean type.
Fixed-point: unspecified scaling	A fixed-point data type with unspecified scaling.
Fixed-point: binary point scaling	A fixed-point data type with binary-point scaling.

Option	Description
Fixed-point: slope and bias scaling	A fixed-point data type with slope and bias scaling.

Selecting a data type mode causes Simulink software to enable controls on the dialog box that apply to the mode and to disable other controls that do not apply. Selecting a fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer option installed.

Data type override

Data type override setting for this numeric type. The options are listed in this table.

Option	Description
Inherit (default)	Data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
Off	Data type override setting does not affect this numeric type.

Is alias

If you select this option for a workspace object of this type, Simulink software uses the name of the object as the data type for all objects that specify the object as its data type. Otherwise, Simulink software uses the data type mode of the data type as its name, or, if the data type mode is a fixed-point mode, Simulink software generates a name that encodes the type properties, using the encoding specified by Fixed-Point Designer.

Data scope

Specifies whether the data type definition is imported from, or exported to, a header file during code generation. The possible values are listed in this table.

Value	Action
Auto (default)	If no value is specified for Header file , export the type definition to <code>model_types.h</code> . <code>model</code> is the model name. If a value is specified for Header file , import the data type definition from the specified header file.

Value	Action
Exported	Export the data type definition to a header file, which can be specified in the Header file field. If no value is specified for Header file , the header file name defaults to <i>type.h</i> . <i>type</i> is the data type name.
Imported	Import the data type definition from a header file, which can be specified in the Header file field. If no value is specified for Header file , the header file name defaults to <i>type.h</i> . <i>type</i> is the data type name.

Header file

Name of a C header file from which a data type definition is imported, or to which a data type definition is exported, based on the value of **Data scope**. If this field is specified, the specified name is used during code generation for importing or exporting. If this field is empty, the value defaults to *type.h* if **Data scope** equals Imported or Exported, or defaults to *model_types.h* if **Data scope** equals Auto.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify **Header file** as `<myTypes.h>`.

Description

Description of this data type. This field is intended for use in documenting this data type. Simulink software ignores it.

Signedness

Specifies whether the data type is signed or unsigned, or inherits its signedness. Set the option to Signed, Unsigned, or Auto. This option is enabled only for fixed-point data type modes as shown.

Word length

Word length in bits of the fixed-point data type. This option is enabled only for fixed-point data type modes.

Fraction length

Number of bits to the right of the binary point. This option is enabled only if the data type mode is `Fixed-point: binary point scaling`.

Slope

Slope for slope and bias scaling. This option is enabled only if the data type mode is Fixed-point: slope and bias scaling.

Simulink.NumericType: default

Data type mode: Fixed-point: slope and bias scaling

Signedness: Signed

Word length: 16

Slope: 2^0

Bias: 0

Data type override: Inherit

Is alias

Code generation options

Data scope: Auto

Header file:

Description:

OK Cancel Help Apply

Bias

Bias for slope and bias scaling. This option is enabled only if the data type mode is Fixed-point: slope and bias scaling. See the preceding figure.

Properties

Name	Access	Description
Bias	RW	Bias used for slope and bias scaling of a fixed-point data type. This field is intended for use by Fixed-Point Designer. (Bias)
DataScope	RW	A character vector specifying whether the data type definition is imported from, or exported to, a header file during code generation. (Data scope)
DataTypeMode	RW	Character vector that specifies the data type mode of this numeric type. Valid values are 'Double', 'Boolean', 'Single', 'Fixed-point: unspecified scaling', 'Fixed-point: binary point scaling', and 'Fixed-point: slope and bias scaling'. (Data type mode)
DataTypeOverride	RW	Character vector that specifies the data type override mode. Valid values are Inherit and Off. (Data type override)
Description	RW	Description of this data type. (Description)
Fixedexponent	RW	Exponent used for binary point scaling. This property equals $-\text{FractionLength}$. Setting this property causes Simulink software to set the FractionLength and Slope properties accordingly, and vice versa. This property applies only if the DataTypeMode is Fixed-point: binary point scaling or Fixed-point: slope and bias scaling. It does not appear in the object Property dialog box, but can be accessed at the command prompt.

Name	Access	Description
FractionLength	RW	Integer that specifies the size in bits of the fractional portion of the fixed-point number. This property equals <code>-Fixedexponent</code> . Setting this property causes Simulink software to set the <code>Fixedexponent</code> property accordingly, and vice versa. This field is intended for use by Fixed-Point Designer. (Fraction length)
HeaderFile	RW	A character vector that specifies the name of a C header file from which a data type definition is imported, or to which a data type definition is exported, during code generation. (Header file)
IsAlias	RW	Integer that specifies whether to use the name of this object as the name of the data type that it specifies. Valid values are 1 (yes) or 0 (no). (Is alias) The generated code uses the alias only if you use an ERT-based system target file (Embedded Coder).
Signedness	RW	Boolean that specifies whether this data type is signed, unsigned, or inherits its signedness. Valid values are 1 (signed), 0 (unsigned), or <code>Auto</code> (inherit signedness). (Signedness)

Name	Access	Description
Slope	RW	Slope for slope and bias scaling of fixed-point numbers. This property equals $\text{SlopeAdjustmentFactor} * 2^{\text{Fixedexponent}}$. If $\text{SlopeAdjustmentFactor}$ is 1.0, Simulink software displays the value of this field as $2^{\text{SlopeAdjustmentFactor}}$. Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the Fixedexponent and $\text{SlopeAdjustmentFactor}$ properties accordingly, and vice versa. This property appears only if DataTypeMode is Fixed-point: slope and bias scaling. (Slope)
SlopeAdjustmentFactor	RW	Slope for slope and bias scaling of fixed-point numbers. Setting this property causes Simulink software to adjust the Slope property accordingly, and vice versa. This property applies only if DataTypeMode is Fixed-point: slope and bias scaling. It does not appear in the object Property dialog box, but can be accessed at the command prompt.
WordLength	RW	Integer that specifies the word size of this data type. This field is intended for use by Fixed-Point Designer. This property appears only if DataTypeMode is Fixed-point. (Word length)

Methods

Name	Description
isboolean	Determine whether data type is Boolean. Returns 1 when the DataTypeMode is 'Boolean', 0 otherwise.

Name	Description
isdouble	<p>Determine whether data type is double precision.</p> <p>Returns 1 when the <code>DataTypeMode</code> is 'Double', 0 otherwise.</p>
isfixed	<p>Determine whether data type is fixed point.</p> <p>Returns 1 when the <code>DataTypeMode</code> is any of the fixed-point options, 0 otherwise. The fixed-point options are:</p> <ul style="list-style-type: none"> • 'Fixed-point: unspecified scaling' • 'Fixed-point: binary point scaling' • 'Fixed-point: slope and bias scaling'
isfloat	<p>Determine whether data type is floating point.</p> <p>Returns 1 when the <code>DataTypeMode</code> is 'Double' or 'Single', 0 otherwise.</p>
isscalingbinarypoint	<p>Determine whether data type has binary point scaling.</p> <p>Returns 1 when the data type has binary point scaling or trivial slope and bias scaling, 0 otherwise. Slope and bias scaling is trivial when the slope is an integer power of two and the bias is zero.</p>
isscalingslopebias	<p>Determine whether data type has nontrivial slope and bias scaling.</p> <p>Returns 1 when the data type has nontrivial slope and bias scaling, 0 otherwise. Slope and bias scaling is trivial when the slope is an integer power of two and the bias is zero.</p>

Name	Description
isscalingunspecified	Determine whether data type has unspecified scaling. Returns 1 when the data type is fixed point and its scaling has not been specified, 0 otherwise. DataTypeMode is 'Fixed-point: unspecified scaling'
issingle	Determine whether data type is single-precision. Returns 1 when the DataTypeMode is 'Single', 0 otherwise.

Simulink.Parameter

Store, share, and configure block parameter values

Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, not in the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that involves the name of the object. Omit the `Value` property from the expression. For more information, see “Use Parameter Objects”.

For more information about block parameters, see “Set Block Parameter Values” and “Block Parameter Representation in the Generated Code” (Simulink Coder).

Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See “Create, Edit, and Manage Workspace Variables”.
- By using the Model Data Editor. Inspect the **Parameters** tab.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.

- By using the `Simulink.Parameter` function, described below.

Syntax

```
paramObj = Simulink.Parameter  
paramObj = Simulink.Parameter(paramValue)
```

Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the value of the `Value` property by using `paramValue`.

Properties

For information about properties in the property dialog box of a `Simulink.Parameter` object, see “`Simulink.Parameter` Property Dialog Box”.

CoderInfo — Specifications for generating code for parameter object

`Simulink.CoderInfo` object

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

This property is read only. Instead, modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see “Override Default Parameter Behavior by Creating Global Variables in the Generated Code” (Simulink Coder) and “Simulink Package Custom Storage Classes” (Embedded Coder).

Complexity — Numeric complexity of parameter value

'real' (default) | 'complex'

Numeric complexity of the parameter value, returned as `'real'` (if the value is real) or `'complex'` (if the value is complex). Simulink determines the complexity from the parameter value that you specify in the `Value` property. This property is read only.

Data Types: `char`

Data Type — Data type of parameter value

`'auto'` (default) | character vector

Data type of the parameter value that you specify in the `Value` property. When you simulate the model or generate code, Simulink casts the value to the specified data type.

If you specify `'auto'`, the default setting, the parameter object uses the same data type as the block parameters that use the object. See “Reduce Maintenance Effort with Data Type Inheritance”.

When you set the `Value` property by using something other than a double number, the object typically sets the `Data Type` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `Data Type` property to `'int8'`.

To explicitly specify a built-in data type (see “Data Types Supported by Simulink”), specify one of these options:

- `'double'`
- `'single'`
- `'int8'`
- `'uint8'`
- `'int16'`
- `'uint16'`
- `'int32'`
- `'uint32'`
- `'boolean'`

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: `char`

Description — Custom description of parameter object

`''` (empty character vector) (default) | character vector

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have Embedded Coder, you can configure this description to appear in the generated code as a comment. See “Simulink data object descriptions” (Simulink Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

Data Types: `char`

Dimensions — Dimensions of parameter value

`[0 0]` (default) | row vector | character vector

Dimensions of the value stored in the `Value` property, returned as a row vector or specified as a character vector.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a double row vector. The vector is the same vector that the `size` function returns.

To use symbolic dimensions, specify a character vector. See “Implement Dimension Variants for Array Sizes in Generated Code” (Embedded Coder).

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

Max — Maximum value of parameter

`[]` (empty) (default) | real `double` scalar

Maximum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is `[]` (empty), which means the parameter value does not have a maximum.

If you store a complex number in the `Value` property, the `Max` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Max` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object, and specify a maximum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If the parameter value is greater than the maximum value or if the maximum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: `5.32`

Data Types: `double`

Min — Minimum value of parameter

`[]` (empty) (default) | real `double` scalar

Minimum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is `[]` (empty), which means the parameter value does not have a minimum.

If you store a complex number in the `Value` property, the `Min` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Min` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object, and specify a minimum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”

Example: `-0.92`

Data Types: `double`

Unit — Physical unit of parameter value

`empty (default) | valid unit`

Physical unit of parameter value, specified as a character vector. For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

Value — Value to use in target block parameters

`[]` (default) | valid value

Value to use in target block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure

- Scalar or array

You can use MATLAB expressions to specify the value.

Example Expression	Description
<code>15.23</code>	Specifies a scalar value
<code>[3 4; 9 8]</code>	Specifies a matrix
<code>3+2i</code>	Specifies a complex value
<code>struct('A',20,'B',5)</code>	Specifies a structure with two fields, A and B, with double-precision values 20 and 5. Organize block parameters into structures (see “Organize Related Block Parameter Definitions in Structures”) or initialize the signal elements in a bus (see “Specify Initial Conditions for Bus Signals”).

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property, and control the type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is using an expression that is not typed. You can avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: `3.15`

Example: `single([3.15 1.23])`

Example: `1.2 + 3.2i`

Example: `true`

Example: `myEnumType.myEnumValue`

Example: `struct('field1',15,'field2',7.32)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `struct` | `fi`

Complex Number Support: Yes

Examples

Use Parameter Object to Set Value of Gain Parameter

- 1 At the command prompt, create a `Simulink.Parameter` object.

```
myParam = Simulink.Parameter;
```

- 2 Assign a numeric value to the `Value` property.

```
myParam.Value = 15.23;
```

- 3 Specify other characteristics for the block parameter by adjusting the object properties. For example, to specify the minimum and maximum values the parameter can take, use the `Min` and `Max` properties.

```
myParam.Min = 10.11;  
myParam.Max = 25.27;
```

- 4 In a block dialog box, specify the value of a parameter as `myParam`. For example, in a `Gain` block dialog box, specify **Gain** as `myParam`.

During simulation, the **Gain** parameter uses the value 15.23.

Change Value Stored by Parameter Object

- 1 At the command prompt, create a `Simulink.Parameter` object that stores the value 2.52.

```
myParam = Simulink.Parameter(2.52);
```

- 2 Change the value by accessing the `Value` property of the object. This technique preserves the values of the other properties of the object.

```
myParam.Value = 1.13;
```

Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the `DataType` property at its default value, `auto`. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

- 1 At the command prompt, create a `Simulink.Parameter` object that stores the value 18.25.

```
myParam = Simulink.Parameter(18.25);
```

The expression `18.25` returns the number 18.25 with the double-precision, floating-point data type `double`. The `Value` property stores the number 18.25 with double precision.

- 2 Use the `DataType` property to specify the single-precision data type `single`.

```
myParam.DataType = 'single';
```

When you simulate or generate code, the parameter object casts the value of the `Value` property, 18.25, to the data type specified by the `DataType` property, `single`.

Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See “Write Level-2 MATLAB S-Functions” in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See “Access Block Data During Simulation” for more information.

Note `Simulink.RunTimeBlock` objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the runtime object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outport(1).Data = speye(10);
```

Parent Class

None

Derived Classes

`Simulink.MSFcnRuntimeBlock`

Property Summary

Name	Description
“BlockHandle” on page 5-372	Block's handle.
“CurrentTime” on page 5-372	Current simulation time.
“NumDworks” on page 5-372	Number of discrete work vectors used by the block.
“NumOutputPorts” on page 5-373	Number of block output ports.
“NumContStates” on page 5-373	Number of block's continuous states.
“NumDworkDiscStates” on page 5-373	Number of block's discrete states
“NumDialogPrms” on page 5-373	Number of parameters that can be entered on S-function block's dialog box.
“NumInputPorts” on page 5-374	Number of block's input ports.
“NumRuntimePrms” on page 5-374	Number of run-time parameters used by block.
“SampleTimes” on page 5-374	Sample times at which block produces outputs.

Method Summary

Name	Description
“ContStates” on page 5-375	Get a block's continuous states.
“DataTypeIsFixedPoint” on page 5-375	Determine whether a data type is fixed point.
“DatatypeName” on page 5-375	Get name of a data type supported by this block.
“DatatypeSize” on page 5-376	Get size of a data type supported by this block.
“Derivatives” on page 5-376	Get a block's continuous state derivatives.
“DialogPrm” on page 5-377	Get a parameter entered on an S-function block's dialog box.
“Dwork” on page 5-377	Get one of a block's DWork vectors.

Name	Description
“FixedPointNumericType” on page 5-378	Determine the properties of a fixed-point data type.
“InputPort” on page 5-378	Get one of a block's input ports.
“OutputPort” on page 5-379	Get one of a block's output ports.
“RuntimePrm” on page 5-379	Get one of the run-time parameters used by a block.

Properties

BlockHandle

Block's handle.

RO

CurrentTime

Current simulation time.

RO

NumDworks

Number of data work vectors.

RW

`ssGetNumDWork`

NumOutputPorts

Number of output ports.

RW

`ssGetNumOutputPorts`

NumContStates

Number of continuous states.

RW

`ssGetNumContStates`

NumDworkDiscStates

Number of discrete states. In a MATLAB S-function, you need to use `DWorks` to set up discrete states.

RW

`ssGetNumDiscStates`

NumDialogPrms

Number of parameters declared on the block's dialog. In the case of the S-function, it returns the number of parameters listed as a comma-separated list in the **S-function parameters** dialog field.

RW

`ssGetNumSFcnParams`

NumInputPorts

Number of input ports.

RW

`ssGetNumInputPorts`

NumRuntimePrms

Number of run-time parameters used by this block. See “Run-Time Parameters” for more information.

RW

`ssGetNumSFcnParams`

SampleTimes

Block's sample times.

RW for MATLAB S-functions, RO for all other blocks.

Methods

ContStates

Get a block's continuous states.

```
states = ContStates();
```

Get vector of continuous states.

```
ssGetContStates
```

DataTypesFixedPoint

Determine whether a data type is fixed point.

```
bVal = DataTypeIsFixedPoint(dtID);
```

dtID

Integer value specifying the ID of a data type.

Returns `true` if the specified data type is a fixed-point data type.

DatatypeName

Get the name of a data type.

```
name = DatatypeName(dtID);
```

dtID

Integer value specifying ID of a data type.

Returns the name of the data type specified by dtID.

“DatatypeSize” on page 5-376

DatatypeSize

Get the size of a data type.

```
size = DatatypeSize(dtID);
```

dtID

Integer value specifying the ID of a data type.

Returns the size of the data type specified by dtID.

“DatatypeName” on page 5-375

Derivatives

Get derivatives of a block's continuous states.

```
derivs = Derivatives();
```

Get vector of state derivatives.

```
ssGetdX
```

DialogPrm

Get an S-function's dialog parameters.

```
param = DialogPrm(pIdx);
```

pIdx

Integer value specifying the index of the parameter to be returned.

Get the specified dialog parameter. In the case of the S-function, each `DialogPrm` corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

`ssGetSFcnParam`, “RuntimePrm” on page 5-379

Dwork

Get one of a block's DWork vectors.

```
dworkObj = Dwork(dwIdx);
```

dwIdx

Integer value specifying the index of a work vector.

Get information about the DWork vector specified by `dwIdx` where `dwIdx` is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

`ssGetDWork`

FixedPointNumericType

Get the properties of a fixed-point data type.

```
eno = FixedPointNumericType(dtID);
```

dtID

Integer value specifying the ID of a fixed-point data type.

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

Note `embedded.Numeric` is also the class of the `numericType` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see “`numericType` Object Properties” (Fixed-Point Designer).

InputPort

Get an input port of a block.

```
port = InputPort(pIdx);
```

pIdx

Integer value specifying the index of an input port.

Get the input port specified by `pIdx`, where `pIdx` is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains

the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompInputPortData`,
`Simulink.BlockCompInputPortData`, “`OutputPort`” on page 5-379

OutputPort

Get an output port of a block.

```
port = OutputPort(pIdx);
```

`pIdx`

Integer value specifying the index of an output port.

Get the output port specified by `pIdx`, where `pIdx` is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompOutputPortData` or `Simulink.BlockCompOutputPortData`, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompOutputPortData`,
`Simulink.BlockCompOutputPortData`

RuntimePrm

Get an S-function's run-time parameters.

```
param = RuntimePrm(pIdx);
```

pIdx

Integer value specifying the index of a run-time parameter.

Get the run-time parameter whose index is pIdx. This run-time parameter is a Simulink.BlockData on page 5-177 object of type Simulink.BlockRunTimePrmData.

```
ssGetRunTimeParamInfo
```

Introduced before R2006a

Simulink.SampleTime class

Package: Simulink

Object containing sample time information

Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

Properties

Value

A two-element array of doubles that contains the period and offset of the sample time

Description

A $1 \times n$ character array that describes the sample time type

ColorRGBValue

A 1×3 array of doubles that contains the red, green and blue (RGB) values of the sample time color

Annotation

A $1 \times n$ character array that represents the annotation of a specific sample time (for example, 'D1')

OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array `ComponentSampleTimes` contains `Simulink.SampleTime` objects.

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#) in the [MATLAB Programming Fundamentals](#) documentation.

Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =  
  
    1x2 Simulink.SampleTime  
    Package: Simulink  
  
    Properties:  
        Value  
        Description  
        ColorRGBValue  
        Annotation  
        OwnerBlock  
        ComponentSampleTimes  
  
    Methods
```

To examine the values of the properties:

```
ts(1), ts(2)

ans =

Simulink.SampleTime
Package: Simulink

Properties:
    Value: [0 0]
    Description: 'Continuous'
    ColorRGBValue: [0 0 0]
    Annotation: 'Cont'
    OwnerBlock: []
    ComponentSampleTimes: {}

Methods

ans =

Simulink.SampleTime
Package: Simulink

Properties:
    Value: [Inf 0]
    Description: 'Constant'
    ColorRGBValue: [1 0.2600 0.8200]
    Annotation: 'Inf'
    OwnerBlock: []
    ComponentSampleTimes: {}

Methods
```

Simulink.sdi.DatasetRef class

Package: Simulink.sdi

Access data in Simulation Data Inspector repository

Description

The `Simulink.sdi.DatasetRef` class provides access to data in the Simulation Data Inspector repository without loading the entire set of data into memory. The class is compatible with the `Simulink.SimulationData.DatasetRef` class.

Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array containing a `Simulink.sdi.DatasetRef` object for each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array containing a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the selected domain.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to `runID` with the contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatasetRef` object of the run corresponding to `runID` including the contents specified by `domain` from a repository path specified by `repositoryPath`.

Input Arguments

domain — Specify contents of `Simulink.sdi.DatasetRef` objects
'signals' | 'outports' | []

Limits the contents included in the `Simulink.sdi.DatasetRef` object.

- `'signals'` includes only logged signals.
- `'outports'` includes only logged outports.
- `[]` includes all run data.

runID — Run identifier

integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

repositoryPath — Path containing the run

string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

Properties

Name — Run name

character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: `'Run 1'`

Run — Simulink.sdi.Run object

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

numElements — Number of top-level elements in run

`Simulink.sdi.Run` object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

Methods

<code>compare</code>	Compare runs with <code>DatasetRef</code> objects
<code>getAsDatastore</code>	Retrieve element as <code>sdidatastore</code> object
<code>getElement</code>	Retrieve <code>DatasetRef</code> element by index
<code>getElementNames</code>	Get character vectors of element names
<code>getSignal</code>	Return <code>Signal</code> object
<code>plot</code>	Open the Simulation Data Inspector to view and compare data

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Compare Runs with the `Simulink.sdi.DatasetRef` Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames

names =

    2x1 cell array

    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

outputs =

    struct with fields:

        Ww: [1x1 timeseries]
        Vs: [1x1 timeseries]
        Sd: [1x1 timeseries]

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));
```

```
% Open the Simulation Data Inspector to view signals  
run_DSRef.plot
```

compare

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Compare runs with DatasetRef objects

Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

Input Arguments

other — Comparison data

MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a Dataset in the workspace, or a MAT-file.

Example: 'data.mat'

Example: var

Output Arguments

matches — Number of matching signals

integer

Number of signals that matched within tolerance in the comparison.

mismatches — Number of mismatched signals

integer

Number of signals that did not match within tolerance in the comparison.

results — Simulink.sdi.DiffRunResult object with comparison results

Simulink.sdi.DiffRunResult object

Results of the comparison, returned in a Simulink.sdi.DiffRunResult object.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the Simulink.sdi.DatasetRef object by comparing two runs of the ex_sldemo_absbrake system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names =

    2x1 cell array
```

```
{'yout'}
{'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

outputs =

    struct with fields:
        Ww: [1x1 timeseries]
        Vs: [1x1 timeseries]
        Sd: [1x1 timeseries]

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

“How the Simulation Data Inspector Compares Data”

Introduced in R2017b

getAsDatastore

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Retrieve element as sdatastore object

Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

Description

[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg) returns the requested element as a matlab.io.datastore.sdatastoreobject, along with the element name and index.

Input Arguments

arg — Element selection criterion

integer | character vector

Search criterion used to retrieve the element from the Simulink.sdi.DatasetRefobject. For name-based searches, specify arg as a character vector. For index-based searches, arg is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

Output Arguments

elementDatastore — Element as sdatastore

sdatastore object

Element as `matlab.io.datastore.sd datastore` object.

name — Element name

character vector

The name of the element.

index — Element index in DatasetRef object

integer

The index of the element in the `Simulink.sdi.DatasetRef` object.

Examples

Create an `sd datastore` Object for a Signal

This example shows how to create a `sd datastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Get the run object
run = Simulink.sdi.getRun(runID);
```

```
% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names =
```

```
10x1 cell array
```

```
    {'EGO Fault Switch:1'          }
    {'air_fuel_ratio'              }
```

```
{'Engine Speed Fault Switch:1' }
{'speed'                        }
{'MAP Fault Switch:1'          }
{'map'                          }
{'ego'                          }
{'Throttle Angle Fault Switch:1'}
{'throttle'                    }
{'fuel'                        }
```

`% Get sddatastore object for fuel signal`
`fuel_ds = run_DSRef.getAsDatastore(10);`

Alternatives

You can construct a `sddatastore` object for a specified signal using `matlab.io.datastore.sddatastore`.

Introduced in R2017b

getElement

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Retrieve DatasetRef element by index

Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

Description

[element, name, index] = SDIdatasetRef.getElement(index) returns the element within the Run in the Simulink.sdi.DatasetRef object at the specified index.

Input Arguments

index — Index of element

integer

Location of the element in the Simulink.sdi.DatasetRef object.

Output Arguments

element — Run element in the DatasetRef object

signal

Element from the run in the Simulink.sdi.DatasetRef object.

name — Element name

character vector

Name of the element retrieved from the `Simulink.sdi.DatasetRef` object.

index — Location of element

integer

Location of the element within the `Simulink.sdi.DatasetRef` object.

Examples

Compare Runs with the `Simulink.sdi.DatasetRef` Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sldemo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
% Get the run object
run = Simulink.sdi.getRun(runID);
```

```
% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;
```

```
% Get the names of the elements in the object
names = run_DSRef.getElementNames
```

```
names =
```

```
2x1 cell array
```

```
 {'yout'}
 {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);
```

```
% View signals in outputs
outputs = yout.Values

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

outputs =

    struct with fields:
        Ww: [1x1 timeseries]
        Vs: [1x1 timeseries]
        Sd: [1x1 timeseries]

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getElementNames

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Get character vectors of element names

Syntax

```
names = dsrObj.getElementNames
```

Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

Output Arguments

names — Element names

cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals  
load_system('ex_sl-demo-absbrake')
```

```
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names =

    2x1 cell array

    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

outputs =

    struct with fields:

        Ww: [1x1 timeseries]
        Vs: [1x1 timeseries]
        Sd: [1x1 timeseries]
```

```
% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

getSignal

Class: Simulink.sdi.DatasetRef

Package: Simulink.sdi

Return Signal object

Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

Input Arguments

searchArg — Search parameter

character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: 'throttle'

Example: 2

Output Arguments

sigObj — Simulink.sdi.Signal object

Simulink.sdi.Signal object

The `Simulink.sdi.Signal` object corresponding to the search query.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names =

    2x1 cell array

    {'yout'}
    {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

% Get slp signal
slp = run_DSRef.getSignal('slp');
```

```
% Plot signal
slp.Checked = 'true';

outputs =

    struct with fields:

        Ww: [1x1 timeseries]
        Vs: [1x1 timeseries]
        Sd: [1x1 timeseries]

% Create another run for a different Desired relative slip
set_param('ex_sl-demo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl-demo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `Simulink.sdi.DatasetRef.getElement` method to get the `Simulink.sdi.Signal` object by index.

Simulink.sdi.DiffRunResult class

Package: Simulink.sdi

Access run comparison metadata

Description

The `Simulink.sdi.DiffRunResult` class provides access to the run comparison metadata. You can use the `getSignalByIndex` method to access the data and comparison results for each signal in the run comparison.

Construction

`DiffRunResultObj = Simulink.sdi.compareRuns(runID1, runID2)` returns a `Simulink.sdi.DiffRunResult` object to provide access to the comparison results from comparing the runs corresponding to `runID1` and `runID2`.

Input Arguments

runID1 — Baseline run identifier
integer

Numeric run identifier for the **Baseline** run in the comparison.

runID2 — Compare to run identifier
integer

Numeric identifier for the **Compare to** run in the comparison.

Properties

RunID1 — Baseline signal run ID
integer

Run identifier for the **Baseline** signal of the comparison.

RunID2 — Compare to signal run ID

integer

Run identifier for the **Compare to** signal of the comparison.

MatlabVersion — Version used

character vector

Version of MATLAB used.

DateCreated — Object creation date

datetime

Date and time the Simulink.sdi.DiffRunResult object was created.

Data Types: datetime

Count — Number of signals compared

integer

Number of signals aligned between the two runs in the comparison. For more information on how signals are aligned for comparisons, see “How the Simulation Data Inspector Compares Data”.

Methods

getResultByIndex

Return signal comparison result

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

```
% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, '

% Simulate system
sim('slexAircraftExample')

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2)

% Simulate again
sim('slexAircraftExample')

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1, runID2);

% Get signal result
sigResult1 = diffRun1.getResultByIndex(1);

% Check whether signals matched
sigResult1.match

ans =

    logical
```

```
0

% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sig1 = Simulink.sdi.getSignal(sigID1);

% Change absolute tolerance to 0.2
sig1.absTol = 0.2;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1, runID2);
sigResult2 = diffRun2.getResultByIndex(1);

% Check the result
sigResult2.match

ans =

    logical

     1
```

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

getResultByIndex

Class: Simulink.sdi.DiffRunResult

Package: Simulink.sdi

Return signal comparison result

Syntax

```
diffSigObj = diffRunObj.getResultByIndex(index)
```

Description

`diffSigObj = diffRunObj.getResultByIndex(index)` returns the `Simulink.sdi.DiffSignalResult` object `diffSigObj` corresponding to the `index` in the `Simulink.sdi.DiffRunResult` object, `diffRunObj`.

Input Arguments

index — Index of signal in run
integer

Index of the signal in the `Simulink.sdi.DiffRunResult` object.

Output Arguments

diffSigObj — `Simulink.sdi.DiffSignalResult` object corresponding to the index
`Simulink.sdi.DiffSignalResult` object

`Simulink.sdi.DiffSignalResult` object for the signal at the specified index.

Examples

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

```
% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'alpha, rad')

% Simulate system
sim('slexAircraftExample')

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2)

% Simulate again
sim('slexAircraftExample')

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1, runID2);

% Get signal result
sigResult1 = diffRun1.getResultByIndex(1);

% Check whether signals matched
sigResult1.match

ans =

    logical
```

```
0

% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sig1 = Simulink.sdi.getSignal(sigID1);

% Change absolute tolerance to 0.2
sig1.absTol = 0.2;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1, runID2);
sigResult2 = diffRun2.getResultByIndex(1);

% Check the result
sigResult2.match

ans =

    logical

    1
```

Alternatives

You can inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2012b

Simulink.sdi.DiffSignalResult class

Package: Simulink.sdi

Access signal comparison results

Description

The `Simulink.sdi.DiffSignalResult` object provides access to the data and metadata created by a signal comparison. A `Simulink.sdi.DiffSignalResult` object gives access the difference signal, tolerance data, and the synchronized signal data.

Construction

`DiffSignalObj = Simulink.sdi.compareSignals(signalID1, signalID2)` creates a `Simulink.sdi.DiffSignalResult` object to provide access to the results of the comparison of the signals corresponding to `sigID1` and `sigID2`.

`DiffSignalObj = DiffRunObj.getResultByIndex(index)` returns a `Simulink.sdi.DiffSignalResult` object for the signal comparison corresponding to the `index` within a `Simulink.sdi.DiffRunResult` object.

Input Arguments

signalID1 — Signal identifier for Baseline signal

integer

Numeric signal identifier for the **Baseline** signal in comparison.

signalID2 — Signal identifier for Compare to signal

integer

Numeric signal identifier for the **Compare to** signal in comparison

index — Index of signal in run

integer

Index of the signal within the run.

Properties

Diff — Difference signal

timeseries

Difference signal resulting from the comparison as a `timeseries` object.

Match — Logical indicator of signal match

logical

Logical indicator of whether comparison signals match within the tolerances.

- 0 indicates that the difference between the signals is not within tolerance.
- 1 indicates that the difference between the signals is within tolerance.

UnitsMatch — Logical indicator of unit match

logical

Logical indicator of whether comparison signals' units match. Comparisons of signals with units that do not match are always marked out of tolerance, and no difference signal is computed.

- 0 indicates that the signals' units do not match.
- 1 indicates that the signals' units match.

MaxDifference — Maximum difference

double

Maximum difference between the two comparison signals.

SignalID1 — Baseline signal identifier

integer

Unique signal identifier for the **Baseline** comparison signal.

SignalID2 — Compare to signal identifier

integer

Unique signal identifier for the **Compare to** comparison signal.

Sync1 — Synchronized Baseline signal

timeseries

Synchronized **Baseline** signal. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

Sync2 — Synchronized Compare to signal

timeseries

Synchronized **Compare to** signal. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

Tol1 — Tolerance signal

timeseries

Tolerance data for every data point of the comparison. For more information on how the tolerance signal is computed, see “How the Simulation Data Inspector Compares Data”.

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of a control system's input and output signals. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample, and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')
```

```
% Simulate model slxAircraftExample
sim('slxAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

%Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1, signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end

match =

    logical

     0
```

Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

Simulink.sdi.Run class

Package: Simulink.sdi

Access run signals and metadata

Description

The `Simulink.sdi.Run` object manages a run's metadata and the signals that comprise the run. You can use several methods to retrieve `Simulink.sdi.Signal` objects to access the signal data and metadata.

Construction

`runObj = Simulink.sdi.Run.create` creates an empty `Simulink.sdi.Run` object.

`runObj = Simulink.sdi.getRun(runID)` creates a `Simulink.sdi.Run` object, `runObj`, for the run corresponding to `runID`.

You can also use the `Simulink.sdi.createRun` and `Simulink.sdi.createRunOrAddToStreamedRun` functions to create `Run` objects.

Input Arguments

runID — Run identifier

integer

Unique number identifying the run.

Properties

id — Run identifier

integer

Unique numerical identification for the run.

Name — Run name

[] (default) | character vector

Name of the run. By default, name is empty.

Example: 'Run 1'

Description — Run description

[] (default) | character vector

Description of the run. By default, Description is empty.

Example: 'Initial simulation'

Tag — Information tag

[] (default) | character vector

Tag for additional run information. By default, Tag is empty. You can use the Tag parameter to categorize your simulation data or attach extra information to simulation runs.

Example: 'Gain = 2'

DateCreated — Run creation time

datetime object

Date and time the run was created.

Data Types: datetime

SignalCount — Number of signals in run

integer

Number of signals contained in the run.

Model — Model that created the run

character vector

Name of the model that created the run.

SimMode — Simulation mode

character vector

Simulation mode used to create the run, for runs created by simulation.

StartTime — Run start time

integer

First time point shared by all signals in the run.

StopTime — Run stop time

integer

Last time point shared by all signals in the run.

SLVersion — Simulink version used to create run

character vector

Version of Simulink used for the simulation that created the run.

ModelVersion — Model version used to create run

character vector

Version of the model simulated to create the run, taken from the **Model Properties**.

UserID — System account

character vector

System account used for the simulation that created the run. UserID only has a value for runs produced with Simulink simulations.

MachineName — Name of machine used for simulation

character vector

Name of the machine used for the simulation that created the run. MachineName only has a value for runs produced with Simulink simulations.

TaskName — Task name

[] (default) | character vector

Name of the simulation task that created the run for runs created with Parallel Computing Toolbox workers.

SolverType — Type of solver used to create run

'Variable-Step' | 'Fixed-Step'

The type of solver used for the simulation that created the run. SolverType only has a value for runs produced with Simulink simulations.

SolverName — Name of solver used to create run

character vector

Name of the solver used for the simulation that created the run. `SolverName` only has a value for runs produced with Simulink simulations.

Example: `ode45`

ModelInitializationTime — Time to initialize model

double

Amount of time to initialize the model for the simulation that created the run. `ModelInitializationTime` only has a value for runs produced with Simulink simulations.

ModelExecutionTime — Time to execute model

double

Execution time of the model simulation that created the run. `ModelExecutionTime` only has a value for runs produced with Simulink simulations.

ModelTerminationTime — Time to terminate simulation

double

Time to terminate the simulation that created the run. `ModelTerminationTime` only has a value for runs produced with Simulink simulations.

ModelTotalElapsedTime — Total simulation time

double

Total time to run model simulation that created the run. `ModelTotalElapsedTime` only has a value for runs produced with Simulink simulations.

Methods

<code>add</code>	Add signals to run
<code>create</code>	Create a <code>Simulink.sdi.Run</code> object
<code>export</code>	Export run to <code>Simulink.SimulationData.Dataset</code> object
<code>getDatasetRef</code>	Create a <code>Simulink.sdi.DatasetRef</code> object for a run
<code>getSignalByIndex</code>	Get <code>Simulink.sdi.Signal</code> object by index
<code>getSignalIDByIndex</code>	Return signal ID for signal at index
<code>isValidSignalID</code>	Determine whether signal ID is valid within a run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount
```

```
ans =  
  
    int32  
  
    10  
  
% Get signal objects for the signals in the run  
signal1 = run.getSignalByIndex(4);  
signal2 = run.getSignalByIndex(9);  
signal3 = run.getSignalByIndex(10);  
  
% Create sub-plot layout to display signals  
Simulink.sdi.setSubPlotLayout(3, 1)  
  
% Plot signals  
signal1.checked = true;  
signal2.plotOnSubPlot(2, 1, true);  
signal3.plotOnSubPlot(3, 1, true);  
  
%View plots in the Simulation Data Inspector  
Simulink.sdi.view
```

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data  
time = linspace(0, 20, 100);  
  
sine_vals = sin(2*pi/5*time);  
sine_ts = timeseries(sine_vals, time);  
sine_ts.Name = 'Sine, T=5';  
  
cos_vals = cos(2*pi/8*time);  
cos_ts = timeseries(cos_vals, time);  
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport(1)

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
    modelWorkspace.assignin('Ts', Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans =
```

```
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
datasetRef(1)
```

```
ans =
```

```
DatasetRef with properties:
```

```
    Name: 'Run 6: slexAircraftExample'
    Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can view runs and their properties in the Simulation Data Inspector UI. You can also import data to create runs in the Simulation Data Inspector GUI. For more information, see “Populate the Simulation Data Inspector with Your Data”.

See Also

add

Class: Simulink.sdi.Run

Package: Simulink.sdi

Add signals to run

Syntax

```
run.add(sig)
run.add(source, filename)
run.add(source, ts1, ts2)
```

Description

`run.add(sig)` adds the data `sig` to the `Simulink.sdi.Run` object `run` from the base workspace.

`run.add(source, filename)` adds the data in the file `filename` to the `Simulink.sdi.Run` object, `run`.

`run.add(source, ts1, ts2)` allows you to add multiple signals to the run from the base workspace.

Input Arguments

sig — Data to add

Signals to add to the run. Data types that you can add to a run include:

- `timeseries`
- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationOutput`
- `timetable`

- Data logged with `Structure` with `time` format
- Simscape variables

source — Data source selector

'file' | 'vars'

Source of the data to add to the run, specified as a character vector.

- 'file' indicates the data comes from a file.
- 'vars' indicates the data comes from one or more variables in the workspace.

filename — File containing data

character vector

File with data to add to the run.

Example: 'data.mat'

ts1, ts2 — Workspace variables to add to run

timeseries

Data to add to the run in one or more `timeseries` objects.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
```

```
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;

% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

Simulink.sdi.Run.create

Class: Simulink.sdi.Run

Package: Simulink.sdi

Create a Simulink.sdi.Run object

Syntax

```
runObj = Simulink.sdi.Run.create
```

Description

`runObj = Simulink.sdi.Run.create` creates the empty run object, `runObj`. You can add signals to the Run object with the `Simulink.sdi.Run.add` method or the `Simulink.sdi.addToRun` function. For more information on the `Simulink.sdi.Run` object and its properties, see `Simulink.sdi.Run`.

Output Arguments

runObj — Simulink.sdi.Run object
Simulink.sdi.Run object

Empty Simulink.sdi.Run object.

Examples

Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

Create Data for the Run

This example creates `timeseries` objects for a sine and a cosine. To visualize your data, the Simulation Data Inspector requires at least a time vector that corresponds with your data.

```
% Generate timeseries data
time = linspace(0, 20, 100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals, time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'Cosine, T=8';
```

Create a Simulation Data Inspector Run and Add Your Data

To give the Simulation Data Inspector access to your data, use the `create` method and create a run. This example modifies some of the run's properties to help identify the data. You can easily view run and signal properties with the Simulation Data Inspector.

```
% Create a run
run = Simulink.sdi.Run.create;
run.Name = 'Sinusoids';
run.Description = 'Sine and cosine signals with different frequencies';

% Add timeseries data to run
run.add('vars', sine_ts, cos_ts);
```

Plot Your Data Using the `Simulink.sdi.Signal` Object

The `getSignalByIndex` method returns a `Simulink.sdi.Signal` object that can be used to plot the signal in the Simulation Data Inspector. You can also programmatically control aspects of the plot's appearance, such as the color and style of the line representing the signal. This example customizes the subplot layout and signal characteristics.

```
% Get signal, modify its properties, and change Checked property to true
sine_sig = run.getSignalByIndex(1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
sine_sig.Checked = true;
```

```
% Add another subplot for the cosine signal
Simulink.sdi.setSubPlotLayout(2, 1);

% Plot the cosine signal and customize its appearance
cos_sig = run.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.plotOnSubPlot(2, 1, true);

% View the signal in the Simulation Data Inspector
Simulink.sdi.view
```

Close the Simulation Data Inspector and Save Your Data

```
Simulink.sdi.close('sinusoids.mat')
```

export

Class: Simulink.sdi.Run

Package: Simulink.sdi

Export run to Simulink.SimulationData.Dataset object

Syntax

```
ds = runObj.export
```

Description

`ds = runObj.export` exports the Simulink.sdi.Run object `runObj` to the Simulink.SimulationData.Dataset, `ds`.

Output Arguments

ds — Simulink.SimulationData.Dataset object containing run data

Simulink.SimulationData.Dataset object

Simulink.SimulationData.Dataset object containing the run data.

Examples

Export Run Data

This example shows how to export data from a simulation run to a Dataset.

```
% Load model vdp
load_system('vdp')

% Get handles for signal lines in model
SignalHandles = get_param('vdp', 'Lines');
```

```
% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

% Simulate model vdp and get run object
sim('vdp')

% Get run object for simulation run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);

% Export run
simDataset = run.export;
```

Alternatives

You can export run data programmatically using the `Simulink.sdi.exportRun` function, or you can use the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

getDatasetRef

Class: Simulink.sdi.Run

Package: Simulink.sdi

Create a Simulink.sdi.DatasetRef object for a run

Syntax

```
DatasetRef = runObj.getDatasetRef
```

Description

`DatasetRef = runObj.getDatasetRef` creates a `Simulink.sdi.DatasetRef` object with the data in the `Simulink.sdi.Run` object, `runObj`.

Output Arguments

DatasetRef — Simulink.sdi.DatasetRef object

Simulink.sdi.DatasetRef object

Simulink.sdi.DatasetRef object that provides access to the run data.

Examples

Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = run.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names =

    2x1 cell array

    {'yout'}
    {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

outputs =

    struct with fields:

        Ww: [1x1 timeseries]
        Vs: [1x1 timeseries]
        Sd: [1x1 timeseries]
```

```
% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

Alternatives

You can also create a `Simulink.sdi.DatasetRef` object using the `Simulink.sdi.DatasetRef` constructor.

getSignalByIndex

Class: Simulink.sdi.Run

Package: Simulink.sdi

Get Simulink.sdi.Signal object by index

Syntax

```
signal = runObj.getSignalByIndex(index)
```

Description

`signal = runObj.getSignalByIndex(index)` returns a signal object for the signal at the specified index within the Simulink.sdi.Run object, runObj.

Input Arguments

index — Signal index

integer

Index of the signal within the run.

Output Arguments

signal — Simulink.sdi.Signal object

Simulink.sdi.Signal object

Simulink.sdi.Signal object for the signal at the specified index in the run.

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount

ans =

    int32

     10

% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create sub-plot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);
```

```
%View plots in the Simulation Data Inspector  
Simulink.sdi.view
```

Alternatives

You can access signal properties, view signals, and export data to the workspace using the Simulation Data Inspector UI. For more information, see “Organize Your Simulation Data Inspector Workspace”.

getSignalIDByIndex

Class: Simulink.sdi.Run

Package: Simulink.sdi

Return signal ID for signal at index

Syntax

```
signalID = runObj.getSignalIDByIndex(index)
```

Description

`signalID = runObj.getSignalIDByIndex(index)` returns the signal ID for the signal at the specified index in the `Simulink.sdi.Run` object. You can use the signal ID to create a `Simulink.sdi.Signal` object or to perform a signal comparison with `Simulink.sdi.compareSignals`.

Input Arguments

index — Signal index

integer

Index of the signal within the run.

Output Arguments

signalID — Signal identifier

integer

Unique numeric signal identifier.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of a control system's input and output signals. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample, and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

%Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1, signalID2);

    % Check whether signals match within tolerance
    match = diff.match;
end

match =
```

logical

0

Alternatives

You can access signal properties, view signals, and export data to the workspace using the Simulation Data Inspector UI. For more information, see “Organize Your Simulation Data Inspector Workspace”.

isValidSignalID

Class: Simulink.sdi.Run

Package: Simulink.sdi

Determine whether signal ID is valid within a run

Syntax

```
isValid = runObj.isValidSignalID(signalID)
```

Description

`isValid = runObj.isValidSignalID(signalID)` returns a logical indication of whether the `signalID` corresponds to a signal in the `Simulink.sdi.Run` object `runObj`.

Input Arguments

signalID — Signal identifier

integer

Unique numeric signal identifier.

Output Arguments

isValid — Logical indicator

logical

Logical indicator of signal ID validity.

- `true` when the `signalID` corresponds to a signal in the run object.
- `false` when the `signalID` does not correspond to a signal in the run object.

Examples

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of a control system's input and output signals. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample, and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

%Get Run object
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1, signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end

match =
```

Simulink.sdi.Signal class

Package: Simulink.sdi

Access signal data and metadata

Description

A `Simulink.sdi.Signal` object provides access to signal data and metadata. The metadata includes properties for visualizing and comparing signals.

Construction

`signal = Simulink.sdi.getSignal(signalID)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID`.

`signal = runObj.getSignal(signalID)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID`.

`signal = runObj.getSignalByIndex(index)` returns a `Simulink.sdi.Signal` object corresponding to the `signalID` at the index specified by `index` in the Run object `runObj`.

Input Arguments

signalID — Signal identifier

integer

Numeric signal identifier for the signal.

index — Signal index within run

integer

The index of the signal within its run.

Example: 1

Properties

Signal Properties (read only)

ID — Signal identifier

integer

Unique number identifying the signal.

RunID — Run identifier

integer

Run identifier for the run that contains the signal.

Name — Signal name

character vector

Name of the signal.

Units — Signal measurement units

character vector

Signal units of measure.

SampleTime — Signal sample time

character vector

The signal's sample time. A value of 'Continuous' indicates a variable-step simulation.

Model — Name of model that produced signal

character vector

Name of the model that produced the signal.

BlockPath — Path of block that defines signal

character vector

The path to the block that produced the signal.

Example: 'sldemo_fuelsys/Engine Gas Dynamics'

FullBlockPath — Path of the block that defines the signal

character vector

Path to the block that generates the signal including the full model hierarchy. For signals within reference models, `FullBlockPath` is a cell array containing the full path. For other signals, `FullBlockPath` is identical to `BlockPath`.

PortIndex — Block port index

integer

Index of the block port that defines the signal.

Dimensions — Dimensions of matrix containing signal

integer array

Dimensions of the matrix that contains the signal.

Channel — Index of signal within matrix

integer array

Indices of the signal for signals that are part of a vector or matrix.

Values — Signal values

timeseries

Time and data values for the signal. For buses, `Values` is a struct.

RootSource — High-level logging structure containing signal imported from workspace

character vector

Name of the high-level logging structure containing the signal for signals imported from the MATLAB workspace.

TimeSource — Source of signal time data imported from workspace

character vector

Name of the variable containing the signal's time data for signals imported from the MATLAB workspace.

DataSource — Source of data imported from workspace

character vector

Name of the array containing the signal data for signals imported from the MATLAB workspace.

Visualization Properties

Checked — Plotting indicator

false (default) | true

Logical value indicating whether the signal is plotted on any subplot. Setting `Checked` to `false` clears the signal from all subplots. Setting `Checked` to `true` plots the signal on the active subplot.

Data Types: `logical`

LineColor — Signal line color

1×3 vector

Color of signal in plots, specified as a 1×3 RGB vector.

Example: `[0 114 189]`

Data Types: `double`

LineDashed — Signal line style

'-' | '--' | ':' | '-.'

Signal line style.

- '-' specifies a solid line style.
- '--' specifies a dashed line style.
- ':' specifies a dotted line style.
- '-.' specifies a dash-dot line style.

InterpMethod — Interpolation method

'linear' (default) | 'zoh'

Interpolation method used in data visualization and synchronization. 'zoh' specifies zero-order hold, and 'linear' specifies linear interpolation. For more information about the interpolation options, see “How the Simulation Data Inspector Compares Data”.

Comparison Properties

AbsTol — Absolute tolerance

0 (default) | double

Positive-valued absolute tolerance of the signal used for signal and run comparisons. For more information about tolerances, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

RelTol — Relative tolerance

0 (default) | `double`

Positive-valued relative tolerance of the signal used for signal and run comparisons. For example, `0.1` specifies a 10% tolerance. For more information about tolerances, see “How the Simulation Data Inspector Compares Data”.

Example: `'0.1'`

Data Types: `double`

SyncMethod — Synchronization method

'union' (default) | 'intersection'

Method used to synchronize signal time data for comparison. For more information about the synchronization options, see “How the Simulation Data Inspector Compares Data”.

Methods

<code>export</code>	Export signal object to MATLAB timeseries
<code>getAsTall</code>	Return tall timetable with time and data values
<code>plotOnSubPlot</code>	Plot signal on specified sub-plot

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Define Comparison and Visualization Properties for a Signal

Use `Simulink.sdi.createRun` and `Simulink.sdi.getSignal` to create a signal object. Then, modify the signal's comparison and visualization properties.

```
% Configure model "slexAircraftExample" for logging and simulate
simOut = sim('slexAircraftExample','SaveOutput','on',...
            'SaveFormat','StructureWithTime');

% Use Simulink.sdi.createRun to create a run and return
% the list of signal IDs for signals contained in the run
[~,~,signalIDs] = Simulink.sdi.createRun('My Run','base',{'simOut'});

% Get the signal object corresponding to the first signal ID
signalObj = Simulink.sdi.getSignal(signalIDs(1));

% Define comparison and visualization properties for this signal
signalObj.syncMethod = 'intersection';
signalObj.lineColor = [1,0.4,0.6];
signalObj.lineDashed = '-';
signalObj.checked = true;

% View the signal and its parameters in the Simulation Data Inspector
Simulink.sdi.view;
```

Compare Signals Within a Simulation Run

This example uses the `slexAircraftExample` model to demonstrate the comparison of a control system's input and output signals. The example marks the signals for streaming then gets the run object for a simulation run. Signal IDs from the run object specify the signals to be compared.

```
% Load model slexAircraftExample, and mark signals for streaming
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Simulate model slexAircraftExample
sim('slexAircraftExample')

% Get run IDs for most recent run
allIDs = Simulink.sdi.getAllRunIDs;
runID = allIDs(end);

%Get Run object
```

```
run = Simulink.sdi.getRun(runID);

% Get signal IDs
signalID1 = run.getSignalIDByIndex(1);
signalID2 = run.getSignalIDByIndex(2);

if (run.isValidSignalID(signalID1))
    % Change signal tolerance
    signal1 = Simulink.sdi.getSignal(signalID1);
    signal1.AbsTol = 0.1;
end

if (run.isValidSignalID(signalID1) && run.isValidSignalID(signalID2))
    % Compare signals
    diff = Simulink.sdi.compareSignals(signalID1, signalID2);

    % Check whether signals match within tolerance
    match = diff.match
end

match =

    logical

     0
```

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);
```

```

% Check signal count of the run
run.signalCount

ans =

    int32

    10

% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create sub-plot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)

% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

%View plots in the Simulation Data Inspector
Simulink.sdi.view

```

Analyze Simulation Data with Signal Tolerances

You can change tolerance values on a signal-by-signal basis to evaluate the effect of a model parameter change. This example uses the `slexAircraftExample` model and the Simulation Data Inspector to evaluate the effect of changing the time constant for the low-pass filter following the control input.

```

% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, '

% Simulate system
sim('slexAircraftExample')

% Change input filter time constant

```

```
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', 0.2)

% Simulate again
sim('slexAircraftExample')

% Get run data
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);

% Compare runs
diffRun1 = Simulink.sdi.compareRuns(runID1, runID2);

% Get signal result
sigResult1 = diffRun1.getResultByIndex(1);

% Check whether signals matched
sigResult1.match

ans =

    logical

     0

% Get signal object for sigID1
run1 = Simulink.sdi.getRun(runID1);
sigID1 = run1.getSignalIDByIndex(1);
sig1 = Simulink.sdi.getSignal(sigID1);

% Change absolute tolerance to 0.2
sig1.absTol = 0.2;

% Run the comparison again
diffRun2 = Simulink.sdi.compareRuns(runID1, runID2);
sigResult2 = diffRun2.getResultByIndex(1);

% Check the result
sigResult2.match

ans =
```

```
logical
```

```
1
```

Alternatives

Use the Simulation Data Inspector UI to view and modify signals and signal properties.

export

Class: Simulink.sdi.Signal

Package: Simulink.sdi

Export signal object to MATLAB timeseries

Syntax

```
ts = sigObj.export  
ts = sigObj.export(startTime, endTime)
```

Description

`ts = sigObj.export` exports the Simulink.sdi.Signal object `sigObj` to the timeseries `ts` in the MATLAB workspace.

`ts = sigObj.export(startTime, endTime)` exports the portion of the Simulink.sdi.Signal object defined by `startTime` and `endTime` to the timeseries `ts` in the MATLAB workspace.

Input Arguments

startTime — Export start time

integer

Start time for the signal portion to export.

Example: 0

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

endTime — Export end time

integer

End time for the signal portion to export.

Example: 10

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 |
uint32 | uint64

Output Arguments

ts — Exported timeseries

timeseries

Timeseries exported from Simulink.sdi.Signal object.

Examples

Export Signal Data to Timeseries

This example shows how to generate a signal and export the signal data to a timeseries.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys');

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Get a signal
signal = run.getSignalByIndex(2);

% Export signal data to timeseries
ts = signal.export;
```

Alternatives

You can export data to MATLAB or a MAT-file from the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

getAsTall

Class: Simulink.sdi.Signal

Package: Simulink.sdi

Return tall timetable with time and data values

Syntax

```
tt = sigObj.getAsTall
```

Description

`tt = sigObj.getAsTall` returns a tall timetable of the time and data values in the `Simulink.sdi.Signal` object `sigObj`. For more information on working with tall arrays, see “Tall Arrays” (MATLAB).

Output Arguments

tt — Tall timetable

tall timetable

Tall timetable containing the data from the `Simulink.sdi.Signal` object.

Examples

Get Tall Timetable of Signal Data

This example shows how to generate a tall timetable from signal data in a `Simulink.sdi.Signal` object.

```
% Simulate the model sldemo_fuelsys to create a run of logged signals  
sim('sldemo_fuelsys');
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
run = Simulink.sdi.getRun(runID);

% Get a signal
signal = run.getSignalByIndex(2);

% Get tall timetable of signal
tt = signal.getAsTall
```

```
tt =
```

```
Mx1 tall timetable
```

Time	Data
0 sec	0.068493

plotOnSubPlot

Class: Simulink.sdi.Signal

Package: Simulink.sdi

Plot signal on specified sub-plot

Syntax

```
signalObj.plotOnSubplot(r, c, checked)
```

Description

`signalObj.plotOnSubplot(r, c, checked)` plots or clears the signal corresponding to the `Simulink.sdi.Signal` object, `sigObj`, on the sub-plot specified by `r` and `c`.

Input Arguments

r — Row index

scalar

Row index for the sub-plot.

Example: 1

c — Column index

scalar

Column index for the sub-plot.

Example: 2

checked — Signal checked parameter state

true | false

Desired state for signal on sub-plot.

- `true` plots the signal on the sub-plot.
- `false` clears the signal from the sub-plot.

Data Types: `logical`

Examples

Plot Signals from a Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a run created by logging signals to the Simulation Data Inspector. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that you can use to view data.

```
% Simulate model sldemo_absbrake to create a run
sim('sldemo_fuelsys')

% Get runID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get run object for the run
run = Simulink.sdi.getRun(runID);

% Check signal count of the run
run.signalCount

ans =

    int32

    10

% Get signal objects for the signals in the run
signal1 = run.getSignalByIndex(4);
signal2 = run.getSignalByIndex(9);
signal3 = run.getSignalByIndex(10);

% Create sub-plot layout to display signals
Simulink.sdi.setSubPlotLayout(3, 1)
```

```
% Plot signals
signal1.checked = true;
signal2.plotOnSubPlot(2, 1, true);
signal3.plotOnSubPlot(3, 1, true);

%View plots in the Simulation Data Inspector
Simulink.sdi.view
```

Alternatives

You can use the Simulation Data Inspector GUI to modify your plot layout and where you plot signals. For more information, see “Inspect Simulation Data”.

Simulink.sdi.WorkerRun class

Package: Simulink.sdi

Access simulation data from parallel workers

Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

Input Arguments

runID — Run identifier

integer

Run identifier

Methods

<code>getDataset</code>	Create Dataset of worker run data
<code>getDatasetRef</code>	Create DatasetRef for worker run
<code>getLatest</code>	Create worker run for latest run
<code>getLocalRun</code>	Create local run from worker run

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport(1)

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
    modelWorkspace.assignin('Ts', Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
```

```
        workerRun(index) = Simulink.sdi.WorkerRun.getLatest
    end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans =
```

```
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
datasetRef(1)
```

```
ans =
```

```
DatasetRef with properties:
```

```
    Name: 'Run 6: slexAircraftExample'
      Run: [1x1 Simulink.sdi.Run]
```

```
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

See Also

```
Simulink.sdi.Run
```

“Inspect and Compare Data Programmatically”

Introduced in R2017b

getDataset

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create Dataset of worker run data

Syntax

```
dataset = workerRun.getDataset  
dataset = workerRun.getDataset(domain)
```

Description

`dataset = workerRun.getDataset` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

Input Arguments

domain — Scope specifier

'signals' | 'outports'

Scope limiting argument that selects the data to return in the `Simulink.SimulationData.Dataset` object.

- 'signals' limits the data returned in the `Dataset` to signals in the `WorkerRun`.
- 'outports' limits the data returned in the `Dataset` to output data in the `WorkerRun`.

Output Arguments

dataset — **Simulink.SimulationData.Dataset** object

Simulink.SimulationData.Dataset object

Simulink.SimulationData.Dataset object containing the data from the Simulink.sdi.WorkerRun object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport(1)

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
```

```
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans =
```

```
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
    datasetRef(b) = workerRun(b).getDatasetRef;
end
datasetRef(1)
```

```
ans =
```

DatasetRef with properties:

```
Name: 'Run 6: slexAircraftExample'
Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7
    Runs(c) = workerRun(c).getLocalRun;
    Ts_val_str = num2str(Ts_vals(c));
    desc = strcat('Ts = ', Ts_val_str);
    Runs(c).Description = desc;
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

getDatasetRef

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create DatasetRef for worker run

Syntax

```
datasetRef = workerRun.getDatasetRef  
datasetRef = workerRun.getDatasetRef(domain)
```

Description

`datasetRef = workerRun.getDatasetRef` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by `domain`.

Input Arguments

domain — Scope limiting input

'signals' | 'outports'

Scope limiting argument that selects the data to reference in the `Simulink.SimulationData.DatasetRef` object.

- 'signals' limits the data referenced in the `DatasetRef` to signals in the `WorkerRun`.
- 'outports' limits the data referenced in the `DatasetRef` to output data in the `WorkerRun`.

Output Arguments

datasetRef — Simulink.SimulationData.DatasetRef object

Simulink.sdi.DatasetRef object

Simulink.sdi.DatasetRef object referencing the data in the Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

Simulink.sdi.WorkerRun.getLatest

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create worker run for latest run

Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

Output Arguments

runObj — Local `Simulink.sdi.Run` object

`Simulink.sdi.WorkerRun` object

`Simulink.sdi.WorkerRun` object to access the data from the latest Parallel Computing Toolbox worker run.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport(1)

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7  
    Runs(c) = workerRun(c).getLocalRun;  
    Ts_val_str = num2str(Ts_vals(c));  
    desc = strcat('Ts = ', Ts_val_str);  
    Runs(c).Description = desc;
```

```
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);  
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

[Simulink.sdi.WorkerRun.getDatasetRef](#) |
[Simulink.sdi.WorkerRun.getLocalRun](#)

Topics

“Inspect and Compare Data Programmatically”

Introduced in R2017b

getLocalRun

Class: Simulink.sdi.WorkerRun

Package: Simulink.sdi

Create local run from worker run

Syntax

```
runObj = workerRun.getLocalRun
```

Description

`runObj = workerRun.getLocalRun` creates the local `Simulink.sdi.Run` object `runObj` for the `Simulink.sdi.WorkerRun` object `workerRun`. Use `getLocalRun` in the client MATLAB to access the `Simulink.sdi.WorkerRun` data.

Output Arguments

runObj — Local `Simulink.sdi.Run` object

`Simulink.sdi.Run` object

Local `Simulink.sdi.Run` object.

Examples

Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector API.

Generate Data with Parallel Simulations

Create a vector of filter parameter values to use a different value in each simulation. Then, run a parallel simulation, selecting a different filter value for each worker.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport(1)

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];

parfor index = 1:7

    % Select value for Ts
    Ts_val = Ts_vals(index);

    % Load system and select signals to log
    load_system('slexAircraftExample')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
    Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',

    % Change the filter time constant and simulate
    modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
    modelWorkspace.assignin('Ts', Ts_val)
    sim('slexAircraftExample')

    % Create a worker run for each simulation
    workerRun(index) = Simulink.sdi.WorkerRun.getLatest
end
```

Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
    ds(a) = workerRun(a).getDataset;
end
ds(1)
```

```
ans =  
  
Simulink.SimulationData.Dataset '' with 2 elements  
  
          Name          BlockPath  
-----  
1 [1x1 Signal]    alpha, rad    ...rcraftExample/Aircraft Dynamics Model  
2 [1x1 Signal]    Stick         slexAircraftExample/Pilot  
  
- Use braces { } to access, modify, or add elements using index.
```

Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7  
    datasetRef(b) = workerRun(b).getDatasetRef;  
end  
datasetRef(1)
```

```
ans =  
  
DatasetRef with properties:  
  
    Name: 'Run 6: slexAircraftExample'  
    Run: [1x1 Simulink.sdi.Run]  
numElements: 2
```

Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7  
    Runs(c) = workerRun(c).getLocalRun;  
    Ts_val_str = num2str(Ts_vals(c));  
    desc = strcat('Ts = ', Ts_val_str);  
    Runs(c).Description = desc;
```

```
    Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);  
end
```

Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

Simulink.Signal

Specify attributes of signal

Description

This class enables you to create workspace objects that you can use to assign or validate the attributes of a signal or discrete state, such as its data type, numeric type, dimensions, and so on.

You can use a signal object to:

- Assign values to signal attributes that are left unassigned (have a value of `-1` or `auto`) by the signal source.
- Validate signal attributes whose values are explicitly assigned by the signal source. Such attributes have values other than `-1` or `auto`. Successful validation guarantees that the signal has the attributes that you intended it to have.

You can create a `Simulink.Signal` object in the MATLAB workspace or in a model workspace.

Use signal objects to assign or validate signal or discrete state attributes by giving the signal or discrete state the same name as the workspace variable that references the `Simulink.Signal` object.

For more information about using signal objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

Creation

Create a `Simulink.Signal` object:

- By using the Model Data Editor. See “For Signals”.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.

- Directly from a signal properties dialog box or the Property Inspector in a model. See “Create Signal Object from Signal Properties Dialog Box”.
- By using the `Simulink.Signal` function, described below.

Syntax

```
signalObj = Simulink.Signal
```

Description

`signalObj = Simulink.Signal` returns a `Simulink.Signal` object with default property values.

Properties

For information about properties in the property dialog box of a `Simulink.Signal` object, see “Property Dialog Box”.

CoderInfo — Specifications for generating code for signal

`Simulink.CoderInfo` object

Information used by Simulink Coder for generating code for this signal. The value of this property is an object of `Simulink.CoderInfo` class.

For more information, see “Storage Classes for Signals and States” (Simulink Coder) and “Simulink Package Custom Storage Classes” (Embedded Coder).

Complexity — Numeric complexity of signal

'auto' (default) | 'real' | 'complex'

Character vector specifying the numeric type of this signal. Valid values are 'auto' (determined by Simulink), 'real', or 'complex'.

Data Types: char

Data Type — Data type of signal

'auto' (default) | character vector

Character vector specifying the data type of this signal.

The default value, `'auto'`, specifies that Simulink should determine the data type. You can specify a built-in data type (for example, `'uint8'` or `'single'`) or a custom data type. To specify a custom data type, use a MATLAB expression that specifies the type, (for example, the name of a `Simulink.NumericType` object that you create in the base workspace).

To specify a bus object as the data type for the signal object, use the `'Bus: <object_name>'` syntax. See “Bus Support” for details about what you need to do if you specify a bus object as the data type.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: `char`

Description — Custom description of signal

`'` (empty character vector) (default) | character vector

Description of this signal. This field is intended for use in documenting this signal.

This property is used by the Simulink Report Generator and for code generation.

If you have an Embedded Coder license, you can add the signal description as a comment for the variable declaration in generated code:

- Specify a storage class for the signal object other than `Auto`.
- On the **Code Generation > Comments** pane of the model Configuration Parameters dialog box, select the model configuration parameter **Simulink data object descriptions**. For more information, see “Simulink data object descriptions” (Simulink Coder).

Example: `'This signal represents the rotation speed of the engine.'`

Data Types: `char`

Dimensions — Dimensions of signal

-1 (default) | row vector | character vector

Scalar or vector specifying the dimensions of this signal.

Valid values are -1 (the default) specifying any dimensions, N specifying a vector signal of size N, or [M N] specifying an M×N matrix signal.

To use symbolic dimensions, specify a character vector.

Example: [1 3]

Example: '[1 myDimParam]'

Data Types: double | char

Max — Maximum value of signal

[] (empty) (default) | real double scalar

Maximum value that this signal can have.

The default value is [] (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the maximum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the initial value of the signal is greater than the maximum value or if the maximum value is outside the range of the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is greater than the maximum value (see “Simulation range checking”).

Example: 5.32

Data Types: double

Min — Minimum value of signal

[] (empty) (default) | real double scalar

Minimum value that this signal can have.

The default value is [] (unspecified). Specify a finite, real, double, scalar value.

Note If you specify a bus object as the data type for a signal, do not set the minimum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the signal's initial value is less than the minimum value or if the minimum value is outside the range for the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is less than the minimum value (see “Simulation range checking”).

Example: `-0.92`

Data Types: `double`

InitialValue — Initial value of signal or state

' ' (empty character vector) (default) | character vector

Signal or state value before a simulation takes its first time step.

You can specify any MATLAB expression, including the name of a workspace variable, that evaluates to a numeric scalar value or array.

At the command prompt or in a script, even if you use a number, specify the initial value as a character vector.

```
mySigObject.InitialValue='5.3';
```

```
mySigObject.InitialValue = 'myNumericVariable';
```

To specify an initial value for a signal that uses a numeric data type other than double, cast the initial value to the signal data type. For example, you can specify `'single(73.3)'` to use 73.3 as the initial value for a signal of data type `single`.

If you use a bus object as the data type for the signal object, set `InitialValue` to a character vector containing either 0 or a MATLAB structure that matches the bus object. See “Bus Support” for details.

If the initial value evaluates to a MATLAB structure, then in the **Configuration Parameters** dialog box, set “Underspecified initialization detection” to `Simplified`.

If necessary, Simulink converts the initial value to ensure type, complexity, and dimension consistency with the corresponding block parameter value. If you specify an invalid value or expression, an error message appears when you update the model. Also, Simulink performs range checking of the initial value. The software alerts you when the initial value of the signal lies outside a range that corresponds to its specified minimum and maximum values and data type.

Classic initialization mode: In this mode, initial value settings for signal objects that represent the following signals and states override the corresponding block parameter initial values if undefined (specified as `[]`):

- Output signals of conditionally executed subsystems and Merge blocks
- Block states

Simplified initialization mode: In this mode, initial values of signal objects associated with the following blocks are ignored. The initial values of the corresponding blocks are used instead.

- Output blocks of conditionally executed subsystems
- Merge blocks

Example: `'15.23'`

Example: `'myInitParam'`

Data Types: `char`

sampleTime — Sample time of signal

-1 (default) | `double` scalar or array

Rate at which this signal should be updated.

See “Specify Sample Time” for details.

Example: 0.001

Example: 2

Data Types: double

Unit — Physical unit of signal value

' ' (default) | valid unit

Physical unit used for expressing this signal value (for example, inches).

For more information, see “Unit Specification in Simulink Models”.

Example: 'degC'

Data Types: char

Simulink.SimulationData.BlockPath

Fully specified Simulink block path

Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `Simulink.SimulationData.Dataset.getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

Property Summary

Name	Description
SubPath on page 5-184	Individual component within the block specified by the block path

Method Summary

Name	Description
BlockPath on page 5-184	Create a block path.
convertToCell on page 5-187	Convert a block path to a cell array of character vectors.
getBlock on page 5-188	Get a single block path in the model reference hierarchy.
getLength on page 5-189	Get the length of the block path.

Properties

SubPath

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
    'sf_car/shift_logic'

SubPath:
    'gear_state.first'
```

character vector

RW

Methods

BlockPath

Create block path

```
blockpath_object = Simulink.SimulationData.BlockPath()  
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)  
blockpath_object = Simulink.SimulationData.BlockPath(paths)  
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

blockpath

The block path object that you want to copy.

paths

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

subpath

A character vector that represents an individual component within a block.

blockpath_object

The block path that you create.

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

```
bp1 =

  Simulink.BlockPath
  Package: Simulink

  Block Path:
    'sldemo_mdref_depgraph/thermostat'
    'sldemo_mdref_heater/Fahrenheit to Celsius'
    'sldemo_mdref_F2C/Gain1'
```

convertToCell

Convert block path to cell array of character vectors

```
cellarray = Simulink.SimulationData.BlockPath.convertToCell()
```

```
cellarray
```

The cell array of character vectors representing the elements of the block path.

`cellarray = Simulink.SimulationData.BlockPath.convertToCell()` converts a block path to a cell array of character vectors.

```
bp1 = Simulink.SimulationData.BlockPath(...
    {'sldemo_mdldref_depgraph/thermostat', ...
    'sldemo_mdldref_heater/Fahrenheit to Celsius', ...
    'sldemo_mdldref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =
    'sldemo_mdldref_depgraph/thermostat'
    'sldemo_mdldref_heater/Fahrenheit to Celsius'
    'sldemo_mdldref_F2C/Gain1'
```

getBlock

Get single block path in model reference hierarchy

```
block = Simulink.SimulationData.BlockPath.getBlock(index)
```

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of n represents a block that the block with index $n-1$ references.

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...  
{'sldemo_mdref_depgraph/thermostat', ...  
'sldemo_mdref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdref_F2C/Gain1'})  
blockpath = bp1.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =  
  
sldemo_mdref_heater/Fahrenheit to Celsius
```

getLength

Get length of block path

```
length = Simulink.SimulationData.BlockPath.getLength()
```

```
length
```

The length of the block path. The length is the number of levels in the model reference hierarchy.

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

Get the length of block path `bp1`.

```
bp1 = Simulink.SimulationData.BlockPath(...  
{'sldemo_mdref_depgraph/thermostat', ...
```

```
'sldemo_mdref_heater/Fahrenheit to Celsius', ...  
'sldemo_mdref_F2C/Gain1'})  
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =  
  
    3
```

[Simulink.BlockPath](#) | [Simulink.SimulationData.Dataset](#)

Introduced in R2012b

Simulink.SimulationData.Dataset class

Package: Simulink.SimulationData

Create Simulink.SimulationData.Dataset object

Description

Simulink creates `Simulink.SimulationData.Dataset` objects to store data elements when:

- Performing signal logging, which use the `Dataset` format
- Logging states or outputs, if you use the default format of `Dataset`.
- Logging a data store

Using the `Dataset` format for state and output logging offers several advantages compared to `Array`, `Structure`, or `Structure` with `time`. For details, see “Format for State Information Saved Without `SimState`”.

To generate a `Simulink.SimulationData.Dataset` object from the root-level `Inport` blocks in a model, you can use the `createInputDataset` function. Signals in the generated dataset have the properties of the `Inport` blocks and the corresponding ground values at model start and stop times. You can create `timeseries` and `timetable` objects for the time and values for signals for which you want to load data for simulation. The other signals use ground values.

You can use curly braces (`{}`) to streamline indexing syntax to access, set, and add elements in a dataset, instead of using `get`, `getElement`, `setElement`, or `addElement` methods. To get or set an element using curly braces, the index must be a scalar that is not greater than the number of elements in the dataset variable. To add an element, the index must be a scalar that is greater than the total number of elements in the dataset by one. The `get`, `getElement`, `setElement`, or `addElement` methods support specifying an element by name or block path, as well as by index.

For individual non-bus signal data, you can specify these types of data for `Dataset` elements:

- `timeseries`
- `timetable`
- `matlab.io.datastore.SimulationDatastore`
- double vectors or structure of double data
- `timeseries`
- a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.State`, or `Simulink.SimulationData.DataStoreMemory` object

For bus signals, use a structure with a data element for each leaf signal, using one of these formats:

- A MATLAB `timeseries` object
- A MATLAB `timetable` object
- A `matlab.io.datastore.SimulationDatastore` object
- An empty matrix
- An array that meets one of these requirements:
 - An array with time in the first column and the remaining columns each corresponding to an input port. See “Create Data Arrays for Root-Level Inputs”.
 - An $n \times 1$ array for a root inport that drives a function-call subsystem.
- Another structure, with data elements for each signal that are consistent with these requirements for a structure for bus data

Variable-size signals are not supported for `Dataset` data values.

Construction

`convertedDataset = Simulink.SimulationData.Dataset (loggedDataToConvert)` converts the `loggedDataToConvert` to a `Simulink.SimulationData.Dataset` object. You can then use the `Simulink.SimulationData.Dataset.concat` method to combine elements of two `Dataset` objects.

`constructedDataset = Simulink.SimulationData.Dataset (variableName, 'DatasetName', 'dsname')` constructs a

Simulink.SimulationData.Dataset object, adds variable `variableName`, and names the data set `dsname`.

Input Arguments

loggedDataToConvert — Data element to convert

character vector

Data element to convert to a data set, specified as a character vector. You can convert elements such as:

- Array
- Structure

Note Structure inputs cannot be arrays or matrices.

- Structure with time
- MATLAB time series
- Structure of MATLAB time-series elements
- ModelDataLogs

variableName — Variable to add to data set

character vector

Variable to add to data set, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'DatasetName', 'dsname'

DatasetName — Data set name

character vector

Data set name, specified as a character vector.

Output Arguments

convertedDataset — Converted data set

Simulink.SimulationData.Dataset object

Converted data set, returned as a Simulink.SimulationData.Dataset object.

constructedDataset — Constructed data set

Simulink.SimulationData.Dataset object

Constructed data set, returned as a Simulink.SimulationData.Dataset object.

Properties

Name — Name of the data set

same as the logging variable (default) | character vector

Name of the data set, specified as a character vector or logging variable (for example, `logout` for signal logging). Specify a name when you want to distinguish easily one data set from another. For example, you could reset the name when comparing multiple simulations. This property is read/write.

```
ds = Simulink.SimulationData.Dataset
ds.Name = 'Dataset1'
```

Total Elements — Total number of elements

double

Total number of elements in data set, specified as a double. This property is read only. To get this value, use the `Simulink.SimulationData.Dataset.numElements` method.

Methods

<code>addElement</code>	Add element to end of data set
<code>concat</code>	Concatenate dataset to another dataset
<code>get</code>	Get element or collection of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>find</code>	Get element or collection of elements from dataset
<code>numElements</code>	Get number of elements in data set
<code>plot</code>	Plot dataset elements in Signal Preview window or Simulation Data Inspector
<code>setElement</code>	Change element stored at specified index

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Concatenate Dataset `ds1` to Dataset `ds`

Convert data from two To Workspace blocks, convert to `Dataset` format, and concatenate them. `myvdp` is the `vdp` model with two To Workspace blocks with variables named `simout` and `simout1`. These blocks log data in time-series format.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
```

```
ds1 = Simulink.SimulationData.Dataset(simout1);  
dsfinal = concat(ds,ds1)
```

Access, Change, and Add Dataset Elements

Use curly brace indexing syntax to work with a `logouts` signal logging dataset that has three elements.

Get the second element of the `logouts` dataset.

```
logouts{2}
```

Change the name of the third element.

```
logouts{3}.Name = 'thirdSignal'
```

Add a fourth element.

```
time = 0.1*(0:100)';  
element4 = Simulink.SimulationData.Signal;  
element4.Name = 'C';  
element4.Values = timeseries(3*sin(time),time);  
logouts{4} = element4
```

Simulink.SimulationData.DatasetRef class

Package: Simulink.SimulationData

Create `Simulink.SimulationData.DatasetRef` object

Description

To use a reference for accessing a `Simulink.SimulationData.Dataset` object stored in a MAT-file, create a `Simulink.SimulationData.DatasetRef` object. You can use this reference to avoid running out of memory, by retrieving data signal by signal, for data that you log to persistent storage. You can stream a `DatasetRef` object into a root-level input port or you can use it to create a `SimulationDatastore` object to use for streaming. For details, see “Load Big Data for Simulations”.

For parallel simulations, for which you specify an array of `Simulink.SimulationInput` objects, if you are logging to file, Simulink:

- Creates `Simulink.SimulationData.DatasetRef` objects to access output data in the MAT-file and includes those objects in the `SimulationOutput` object data
- Enables the `CaptureErrors` argument for simulation

Construction

`datasetRefObj = Simulink.SimulationData.DatasetRef(location, identifier)` creates a reference to the contents of a `Simulink.SimulationData.Dataset` variable stored in a MAT-file.

Input Arguments

location — MAT-file containing `Simulink.SimulationData.Dataset` object to reference

character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Do not use a file name from one locale in a different locale.

identifier — Name of variable in MAT-file

character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging.

Suppose that you use the default variable name for signal logging (`logouts`) and default MAT-file name for persistent storage logging (`mat.out`). After you simulate the model, then to create a reference to the `Dataset` object for signal logging, at the MATLAB command line, enter:

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logouts');
```

Output Arguments

datasetRefObj — Reference to Dataset object

`Simulink.SimulationData.DatasetRef` object

Reference to logging dataset, returned as a `Simulink.SimulationData.DatasetRef` object.

Properties

Location — MAT-file containing `Simulink.SimulationData.Dataset` object to reference

character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Include the `.mat` extension in the file name. Do not use a file name from one locale in a different locale.

Identifier — Name of variable in MAT-file

character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging (for example, 'logsout' for signal logging data).

Methods

Use the `numElements`, `getElement`, and `getElementNames` methods for a `Simulink.SimulationData.DatasetRef` object the same way that you use those methods for a `Simulink.SimulationData.Dataset` object.

Method	Purpose
<code>numElements</code>	Get number of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<p><code>get</code></p> <p>The <code>get</code> method is an alias for the <code>getElement</code> method.</p> <hr/> <p>Note You can use curly braces to streamline indexing syntax to access elements in a dataset reference, instead of using <code>get</code> or <code>getElement</code> methods. To get an element using curly braces, the index must be a scalar that is not greater than the number of elements in the variable. The <code>get</code> and <code>getElement</code> methods support specifying an element by name or block path, as well as by index.</p>	Get element from dataset
<code>getAsDatastore</code>	Get <code>matlab.io.datastore.SimulationDatastore</code> representation of element from a <code>DatasetRef</code> object
<code>plot</code>	Plot elements from dataset in Signal Preview window

Tip To get the names of `Dataset` variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

Copy Semantics

You can copy `DatasetRef` object properties by value. However, copying the `DatasetRef` object produces a handle object. Copying the `DatasetRef` object does not copy the data in the MAT-file that the object references. For details about copy operations, see [Copying Objects \(MATLAB\)](#) in the MATLAB documentation.

Examples

Create References to Persistent Storage Dataset Objects

This example shows how to construct and use `Simulink.SimulationData.DatasetRef` objects to access data for a model that logs to persistent storage. This simple example shows the basic steps for logging to persistent storage. This example does not represent a realistic situation for logging to persistent storage, because it shows a short simulation with small memory requirements.

Open the `vdp` model.

In the **Configuration Parameters > Data Import/Export** pane, select these parameters:

- **States**
- **Log Dataset data to file**

Set the **Format** parameter to `Dataset`.

Leave the other parameter settings as they are and click **Apply**.

In the model, click a signal and from the action bar, select **Enable Data Logging**.

Simulate the model.

Get a list of `Dataset` variable names in the `out.mat` file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')  
  
varNames =  
  
    1x2 cell array  
  
    'logout'    'xout'
```

Create a reference to the logged states data that is stored in `out.mat`. The variable for the logged states data is `xout`.

```
statesLogRef = Simulink.SimulationData.DatasetRef('out.mat','xout')  
  
statesLogRef =  
  
    Simulink.SimulationData.DatasetRef  
    Characteristics:  
        Location: out.mat (/my_files/out.mat)  
        Identifier: xout  
  
    Resolved Dataset: 'xout' with 2 elements  
  
        Name  BlockPath  
    _____  _____  
    1  ' '      vdp/x1  
    2  ' '      vdp/x2
```

Create a reference to the signal logging data that is stored in `out.mat`. The variable for the signal logging data is `logout`.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout')  
  
sigLogRef =  
  
    Simulink.SimulationData.DatasetRef  
    Characteristics:  
        Location: out.mat (/my_files/out.mat)  
        Identifier: logout  
  
    Resolved Dataset: 'logout' with 1 element  
  
        Name  BlockPath  
    _____  _____  
    1  x1      vdp/x1
```

Use the `numElements` to access the number of elements in the logged states dataset.

```
statesLogRef.numElements

ans =

    2
```

Use the `DatasetRef` to access the first element of the signal logging dataset.

```
sigLogRef{1}

ans =

    Simulink.SimulationData.Signal
    Package: Simulink.SimulationData

    Properties:
        Name: 'x1'
        PropagatedName: ''
        BlockPath: [1x1 Simulink.SimulationData.BlockPath]
        PortType: 'outport'
        PortIndex: 1
        Values: [1x1 timeseries]
```

Methods, Superclasses

Delete the persistent storage MAT-file and try to use one of the `DatasetRef` objects.

```
delete('out.mat');
statesLogRef.get(1)

File does not exist.
```

The `statesLogRef` still exists, but it is a reference to a `Dataset` object that is in a file that no longer exists.

Simulink.SimulationData.DataStoreMemory

Container for data store logging information

Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

Property Summary

Name	Description
BlockPath on page 5-519	Location of Data Store Memory block for the logged data store
DSMWriterBlockPaths on page 5-520	Location of Data Store Write blocks that write to the data store
DSMWriters on page 5-520	Data Store Write blocks for each signal value
Name on page 5-520	Name of the data store dataset
Scope on page 5-521	Scope of the data store: 'local' or 'global'
Values on page 5-521	Time and data that were logged

Properties

BlockPath

Location of Data Store Memory block for the logged data store.

character vector

RW

DSMWriterBlockPaths

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

Vector of `Simulink.SimulationData.BlockPath` objects

RO

DSMWriters

The number of writes in the data store.

The `nth` element of `DSMWriters` contains the index of the element in `DSMWriterBlockPaths` that contains the block path of the writer that performed the `nth` write to `Values`.

Integer vector

RO

Name

Name of the data store dataset

character vector

RO

Scope

Scope of the data store: 'local' or 'global'

character vector

RW

Values

Time and data that were logged

MATLAB timeseries

RW

Simulink.SimulationData.LoggingInfo

Signal logging override settings

Description

This object specifies a set of signal logging override settings.

Use a `Simulink.SimulationData.LoggingInfo` object to specify the signal logging override settings for a signal. You can use this object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object.

Property Summary

Name	Description
<code>DataLogging</code> on page 5-523	Signal logging mode.
<code>NameMode</code> on page 5-523	Source of signal logging name.
<code>LoggingName</code> on page 5-523	Custom signal logging name.
<code>DecimateData</code> on page 5-524	Use subset of sample points.
<code>Decimation</code> on page 5-524	Decimation value (n): Simulink logs every nth data point.
<code>LimitDataPoints</code> on page 5-524	Limit number of data points to log.
<code>MaxPoints</code> on page 5-524	Maximum number of data points to log (N). The set of logged data points is the last N data points generated by the simulation.

Method Summary

Name	Description
<code>LoggingInfo</code> on page 5-525	Create a set of signal logging override settings for a signal.

Properties

DataLogging

Signal logging mode.

Indicates whether logging is enabled for this signal.

logical value — {true} | false

RW

NameMode

Source of signal logging name.

Indicates whether the signal logging name is a custom name ('true') or whether the signal logging name is the same as the signal name ('false').

logical value — true | {false}

RW

LoggingName

Custom signal logging name

The custom signal logging name to use for this signal, if the `NameMode` property is `true`.

character vector

RW

DecimateData

Log a subset of sample points, selecting data points at a specified interval. The first sample point is always logged.

logical value — true | {false}

RW

Decimation

Decimation value (n). If the `DecimateData` property is true, then Simulink logs every nth data point.

positive integer

RW

LimitDataPoints

Limit the number of data points to log.

logical value — true | {false}

RW

MaxPoints

Maximum number of data points to log (N). If the `LimitDataPoints` property is true, then the set of logged data points includes the last N data points generated by the simulation.

positive integer

RW

Methods

LoggingInfo

Create a `Simulink.SimulationData.LoggingInfo` object.

```
logging_info_object = Simulink.SimulationData.LoggingInfo()  
logging_info_object = Simulink.SimulationData.LoggingInfo(object)
```

object

A signal logging override settings object whose property values the constructor uses for the new `Simulink.SimulationData.LoggingInfo` object. The signal logging override object that you specify must be one of the following types of objects:

- `Simulink.SimulationData.LoggingInfo` object
- `Simulink.LoggingInfo` object

logging_info_object

A `Simulink.SimulationData.LoggingInfo` object.

`logging_info_object = Simulink.SimulationData.LoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that has default property values.

`logging_info_object = Simulink.SimulationData.LoggingInfo(object)` creates a `Simulink.SimulationData.LoggingInfo` object that copies the property values from the signal logging override object that you specify with the `object` argument.

The following example creates a `Simulink.SimulationData.LoggingInfo` object with default settings, changes the `DecimateData` and `Decimation` properties, and uses the object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object `mi`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_mdref_cou
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_loggin
log_info = Simulink.SimulationData.LoggingInfo();
log_info.DecimateData = true;
log_info.Decimation = 2;
mi = Simulink.SimulationData.SignalLoggingInfo('ex_bus_logging');
mi.LoggingInfo = log_info
```

```
Simulink.SimulationData.SignalLoggingInfo
  Package: Simulink.SimulationData
```

```
  BlockPath:
    'ex_bus_logging'
```

```
  OutputPortIndex: 1
```

```
  LoggingInfo:
    DataLogging: 1
    NameMode: 0
    LoggingName: ''
    DecimateData: 1
    Decimation: 2
    LimitDataPoints: 0
    MaxPoints: 5000
```

Simulink.SimulationData.ModelLoggingInfo

Signal logging override settings for a model

Description

This class is a collection of `Simulink.SimulationData.SignalLoggingInfo` objects that specify all signal logging override settings for a model.

Use methods and properties of this class to:

- Turn off logging for a signal or a Model block.
- Change logging settings for any signals that are already marked for logging within a model.

You can control whether a top-level model and referenced models use override signal logging settings or use the signal logging settings specified by the model. Use the `LoggingMode` and `LogAsSpecifiedByModels` properties to control which logging settings to apply.

Logging Mode for Models	Property Settings
For top-level model and all referenced models, use logging settings specified in the model.	Set <code>LoggingMode</code> to <code>LogAllAsSpecifiedInModel</code> .
For top-level model and all referenced models, use override signal logging settings.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> .
For top-level model and referenced models, use a mix of override signal logging settings and the signal logging settings specified in the model.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> . In the <code>LogAsSpecifiedByModels</code> cell array, include the models that you do not want to use the override signal logging settings.

For more information and examples, see “Override Signal Logging Settings from MATLAB”.

Property Summary

Name	Description
LoggingMode on page 5-529	Signal logging override status
LogAsSpecifiedByModels on page 5-530	Source of signal logging settings for the top-level model or a top-level Model block
Signals on page 5-531	All signals that have signal override settings

Method Summary

Name	Description
findSignal on page 5-536	Find signals within the Signals vector, using block path and output port index.
verifySignalAndModelPaths on page 5-539	Verify signal and model paths for the model signal logging override object.
getLogAsSpecifiedInModel on page 5-537	Determine whether the model logs signals as specified in the model or uses override settings.
setLogAsSpecifiedInModel on page 5-538	Set the logging mode for the top-level model or a top-level Model block.
createFromModel on page 5-531	Create and populate a model signal logging override object with all logged signals in the model reference hierarchy.
ModelLoggingInfo on page 5-534	Set signals to log or override logging settings.

Properties

LoggingMode

Signal logging override status. Values are:

- `OverrideSignals` — (Default) Uses the logging settings for signals, as specified in the `Signals` property. For models where `getLogAsSpecifiedInModel` is:

- `true` — Logs all signals, as specified in the model.
- `false` — Logs only the signals specified in the `Signals` property.
- `LogAllAsSpecifiedInModel` — Logs signals in the top-level model and all referenced models, as specified in the model. Simulink honors the signal logging indicators (blue antennae) and ignores the `Signals` property.

To change the logging mode for the top-level model or for a given reference model, use the `setLogAsSpecifiedInModel` method.

character array

RW

LogAsSpecifiedByModels

When `LoggingMode` is set to `'OverrideSignals'`, this cell array specifies whether the top-level model or a top-level Model block logs all signals based on the signal logging settings defined in the model.

- For the top-level model and top-level Model blocks that the cell array includes, Simulink ignores the `Signals` property overrides.
- For a model or Model block that the cell array does *not* include, Simulink uses the `Signals` property to determine which signals to log.

When `LoggingMode` is set to `'LogAllAsSpecifiedInModel'`, Simulink ignores the `LogAsSpecifiedByModels` property.

Use the `getLogAsSpecifiedInModel` method to determine whether the top-level model or top-level Model block logs signals as specified in the model (default logging), and use `setLogAsSpecifiedInModel` to turn default logging on and off.

cell array — For the top-level model, specify the model name. For Model blocks, specify the block path.

RW

Signals

Vector of `Simulink.SimulationData.SignalLoggingInfo` objects for all signals with signal logging override settings.

vector of `Simulink.SimulationData.SignalLoggingInfo` objects

RW

Methods

`createFromModel`

Create a `Simulink.SimulationData.ModelLoggingInfo` object for a top-level model, with override settings for each logged signal in the model.

```
model_logging_info_object = ...  
Simulink.SimulationData.ModelLoggingInfo.createFromModel(...  
model,options)
```

`model`

Name of the top-level model for which to create a
`Simulink.SimulationData.ModelLoggingInfo` object.

`options`

You can use any combination of the following option name and value pairs to control the kinds of systems from which to include logged signals.

- `FollowLinks`
 - `on` — (Default) Include logged signals from inside of libraries.
 - `off` — Skip all libraries.
- `LookUnderMasks`

- `all` — (Default) Include logged signals from all masked subsystems.
- `none` — Skip all masked subsystems.
- `graphical` — Include logged signals from masked subsystems that do not have a workspace or dialog box.
- `functional` — Include logged signals from masked subsystems that do not have a dialog box.
- `Variants`
 - `ActiveVariants` — (Default) Include logged signals from only active subsystem and model reference variants.
 - `AllVariants` — Include logged signals from all subsystem and model reference variants.
- `RefModels`
 - `on` — (Default) Include logged signals from referenced models.
 - `off` — Skip all referenced models.

If you select more than one option, then the created `Simulink.SimulationData.ModelLoggingInfo` object includes signals that fit the combinations (the “AND”) of the specified options. For example, if you set `FollowLinks` to `on` and set `RefModels` to `off`, then the model signal logging override object does not include signals from library links that exist inside of referenced models.

```
model_logging_override_object
```

```
    Simulink.SimulationData.ModelLoggingInfo object for the top-level model.
```

```
model_logging_info_object =
```

```
    Simulink.SimulationData.ModelLoggingInfo.createFromModel(model) creates  
    a Simulink.SimulationData.ModelLoggingInfo object for the model that includes  
    logged signals for the following kinds of systems:
```

- Libraries
- Masked subsystems
- Referenced models

- Active variants

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model, options)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model. The included logged signals reflect the options settings for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models
- Variants

The following example creates a model logging override object for the `sldemo_mdref_bus` model and automatically adds each logged signal in the model to that object:

```
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdref_bus')

mi =

    ModelLoggingInfo with properties:

                Model: 'sldemo_mdref_bus'
        LoggingMode: 'OverrideSignals'
  LogAsSpecifiedByModels: {}
                Signals: [1x3 Simulink.SimulationData.SignalLoggingInfo]
```

To apply the model override object settings, use:

```
set_param(sldemo_mdref_bus, 'DataLoggingOverride', mi);
```

The following example explicitly specifies the kinds of systems from which to include signals, rather than use the default settings for each kind of system. This example specifies to include signals from all model reference variants (instead of using the default of including only active variant).

The `sldemo_mdref_variants` model has two variants:

`sldemo_mrv_nonlinear_controller` and `sldemo_controller`. In this example, in each variant, you configure a signal for signal logging, and then create a `Simulink.SimulationData.ModelLoggingInfo` object. The resulting object includes, in the `Signals` property, two signals (one from each variant).

```
sldemo_mrv_nonlinear_controller;
sldemo_mrv_nonlinear_controller;
ph = get_param('sldemo_mrv_nonlinear_controller/Add', 'PortHandles');
set_param(ph.Outport(1), 'DataLogging', 'on');
ph1 = get_param('sldemo_mrv_nonlinear_controller/Add', 'PortHandles');
set_param(ph1.Outport(1), 'DataLogging', 'on');
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdhref_variants', 'Variants', 'AllVariants')

V_NONLINEAR_CONTROLLER =

Simulink.Variant
    Condition: 'CTRL==1'

V_NONLINEAR_CONTROLLER =

Simulink.Variant
    Condition: 'CTRL==2'

CTRL =

    1

mi =

    Simulink.SimulationData.ModelLoggingInfo
    Package: Simulink.SimulationData

    Properties:
        Model: 'sldemo_mdhref_variants'
        LoggingMode: 'OverrideSignals'
        LogAsSpecifiedByModels: {}
        Signals: [1x2 Simulink.SimulationData.SignalLoggingInfo]

    Methods
```

ModelLoggingInfo

Specify signals to log or override logging settings.

```
model_logging_override_object = ....
Simulink.SimulationData.ModelLoggingInfo(model)
```

model

Name of the top-level model for which to create a
Simulink.SimulationData.ModelLoggingInfo object

`model_logging_override_object`

Simulink.SimulationData.ModelLoggingInfo object created for the specified top-level model.

`model_logging_override_object=`

Simulink.SimulationData.ModelLoggingInfo(model) creates a Simulink.SimulationData.ModelLoggingInfo object for the specified top-level model.

If you use the Simulink.SimulationData.ModelLoggingInfo constructor, specify a Simulink.SimulationData.SignalLoggingInfo object for each logged signal for which you want to override logging settings.

To check that you have specified valid signal logging override settings for a model, use the `verifySignalAndModelPaths` method with the Simulink.SimulationData.ModelLoggingInfo object for the model.

The following example shows how to log all signals as specified in the top-level model and all referenced models.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
mi.LoggingMode = 'LogAllAsSpecifiedInModel'
```

```
mi =
```

```
ModelLoggingInfo with properties:
```

```
    Model: 'sldemo_mdref_bus'
  LoggingMode: 'LogAllAsSpecifiedInModel'
LogAsSpecifiedByModels: {}
    Signals: []
```

To apply the model override object settings, use:

```
set_param(sldemo_mdref_bus, 'DataLoggingOverride', mi);
```

The following example shows how to log only signals in the top-level model:

```
mi = ...
Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = mi.setLogAsSpecifiedInModel('sldemo_mdref_bus', true);
set_param('sldemo_mdref_bus', 'DataLoggingOverride', mi);
```

findSignal

Find signals within the `Signals` vector, using a block path and optionally an output port index.

```
signal_indices = ...
    model_logging_override_object.findSignal(block_path)
signal_indices = ...
    model_logging_override_object.findSignal(...
    block_path, port_index)
```

`block_path`

Source block to search. The `block_path` must be one of the following:

- Character vector
- Cell array of character vectors
- `Simulink.BlockPath` object

`port_index`

Index of the output port to search. Specify a scalar greater than, or equal to, 1.

`signal_indices`

Vector of numeric indices into the signals vector of the `Simulink.SimulationData.ModelLoggingInfo` object.

```
signal_indices = model_logging_override_object.findSignal(
block_path) finds the indices of the signals for the block path that you specify.
```

To find a *single* instance of a signal within a referenced model, use a `Simulink.BlockPath` object or a cell array with a *full path*.

To find *all* instances of a signal within a referenced model, use a character vector with the *relative* path of the signal within the referenced model.

To find a logged chart signal within a Stateflow chart, use a `Simulink.BlockPath` object and set the `SubPath` property to the name of the Stateflow chart signal.

`signal_indices = model_logging_override_object.findSignal(block_path, port_index)` finds the indices of the output signal for the port that you specify, for the block path that you specify.

Do not use the `port_index` argument for Stateflow chart signals.

To find a signal that is *not* in a Stateflow chart and that does *not* appear in multiple instances of a referenced model:

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_logging')))
% Open the referenced model
ex_mdref_counter_bus
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
    'ex_bus_logging');
% Click the COUNTERBUSCreator block that is the source of
% the logged COUNTERBUS signal
signal_index = mi.findSignal(gcb)

signal_index =

    1
```

To find a signal in a specific instance of a referenced model that is not in a Stateflow chart, use the following approach:

```
signal_index = mi.findSignal({'ex_bus_logging/CounterA', ...
    'ex_mdref_counter_bus/Bus Creator'})

signal_index =

    4
```

For an example that uses the `findSignal` method with a Stateflow chart, see “Override Logging Properties with the Command-Line API” (Stateflow) in the Stateflow documentation.

getLogAsSpecifiedInModel

Determine whether the model logs as specified in the model or uses override settings.

```
logging_mode = ...
getLogAsSpecifiedInModel(model_logging_override_object, path)
```

`model_logging_override_object`

A `Simulink.SimulationData.ModelLoggingInfo` object.

`path`

The path is a character vector that specifies one of the following:

- Name of the top-level model
- Block path of a Model block in the top-level model

`logging_mode`

The `logging_mode` is:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

`logging_mode =`

`model_logging_override_object.getLogAsSpecifiedInModel(path)` returns:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

In the following example, the `Simulink.SimulationData.ModelLoggingInfo` object `mi` uses the override settings specified in its `Signals` property.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo mdlref_bus');  
logging_mode = getLogAsSpecifiedInModel(mi, 'sldemo mdlref_bus')
```

```
logging_mode =
```

```
0
```

setLogAsSpecifiedInModel

Set logging mode for top-level model or top-level Model block

```
setLogAsSpecifiedInModel(override_object, path)
```

override_object

Simulink.SimulationData.ModelLoggingInfo object.

path

Character vector that specifies one of the following:

- Name of the top-level model
- Block path of a Model block in the top-level model

value

Logging mode:

- true, if the model specified by path is logged as specified in the model
- false, if the model specified by path is logged using the override settings specified in the Signals property.

setLogAsSpecifiedInModel(override_object, path, value) sets the LoggingMode property for a top-level model or a Model block in the top-level model.

The following example shows how to log only signals in the top-level model, using the logging settings specified in that model:

```
sldemo_mdrefref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdrefref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = setLogAsSpecifiedInModel(mi, 'sldemo_mdrefref_bus', true);
set_param('sldemo_mdrefref_bus', 'DataLoggingOverride', mi);
```

verifySignalAndModelPaths

Verify paths in Simulink.SimulationData.ModelLoggingInfo object.

```
verified_object = verifySignalAndModelPaths...
(model_logging_override_object, action)
```

`model_logging_override_object`

The `Simulink.SimulationData.ModelLoggingInfo` object to verify. This argument is required.

`action`

The action that the function performs if verification fails. This argument is optional. Specify one of the following values:

- `error` — (default) Throw an error when verification fails
- `warnAndRemove` — Issue a warning when verification fails and update the `Simulink.SimulationData.ModelLoggingInfo` object.
- `remove` — Silently update the `Simulink.SimulationData.ModelLoggingInfo` object.

`verified_object`

If the method detects no invalid paths, it returns the validated object. For example:

```
verified_object =  
  
Simulink.SimulationData.ModelLoggingInfo  
Package: Simulink.SimulationData  
  
Properties:  
    Model: 'logging_top'  
    LoggingMode: 'OverrideSignals'  
    LogAsSpecifiedByModels: {}  
    Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]
```

If the method detects an invalid path, it performs the action specified by the `action` argument. By default, it issues an error message.

```
verified_object = verifySignalAndModelPaths(  
model_logging_override_object, action)
```

For a `Simulink.SimulationData.ModelLoggingInfo` object, verify that:

- All character vectors in the `LogAsSpecifiedByModels` property are either the name of the top-level model or the block path of a Model block in the top-level model.
- The block paths for signals in the `Signals` property refer to valid blocks within the hierarchy of the top-level model.

- The `OutputPortIndex` property for all signals in the `Signals` property are valid for the given block.
- All signals in the `Signals` property refer to *logged* signals.

The `action` argument specifies what action the method performs. By default, the method returns an error if it detects an invalid path.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor and specify a `Simulink.SimulationData.SignalLoggingInfo` object for each signal, then consider using the `verifySignalAndModelPaths` method to verify that your object definitions are valid.

The following example shows how to validate the signal and block paths in a `Simulink.SimulationData.ModelLoggingInfo` object. Because the `action` argument is `warnAndRemove`, if the validation fails, the `verifySignalAndModelPaths` method issues a warning and updates the `Simulink.SimulationData.ModelLoggingInfo` object.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');  
verified_object = verifySignalAndModelPaths...  
    (mi, 'warnAndRemove')
```

Simulink.SimulationData.SignalLoggingInfo

Signal logging override settings for signal

Description

This object contains the signal override signal logging settings for a single logged signal.

Property Summary

Name	Description
BlockPath on page 5-542	Simulink.BlockPath of source block of a signal to log.
OutputPortIndex on page 5-543	Index of an output port to log.
LoggingInfo on page 5-543	Simulink.SimulationData.LoggingInfo object containing all logging override settings for a signal.

Method Summary

Name	Description
SignalLoggingInfo on page 5-544	Create a signal logging override object for a signal.

Properties

BlockPath

Simulink.BlockPath of source block of signal to log. The block path represents the full model reference hierarchy.

To specify a specific instance of a signal, use an absolute path, reflecting the model reference hierarchy, starting at the top model. For example:

```
sig_log_info = Simulink.SimulationData.SignalLoggingInfo(...  
{'sldemo_mdlref_bus/CounterA', ...  
'sldemo_mdlref_counter_bus/Bus Creator'})
```

Simulink.BlockPath

RW

OutputPortIndex

Index of the output port to log. The index is a 1-based numeric value.

nonzero integer

RW

LoggingInfo

Simulink.SimulationData.LoggingInfo object containing logging override settings for a signal. The logging settings specify whether signal logging is overridden for this signal. The logging settings also can specify a logging name, a decimation factor, and a maximum number of data points.

Simulink.SimulationData.LoggingInfo object

RW

Methods

SignalLoggingInfo

Construct a `Simulink.SimulationData.SignalLoggingInfo` object.

```
signal_logging_info_object = ...  
    Simulink.SimulationData.SignalLoggingInfo()  
signal_loggingInfo_object = ...  
    Simulink.SimulationData.SignalLoggingInfo(path)  
signalLoggingInfo_object = ...  
    Simulink.SimulationData.SignalLoggingInfo(path,index)
```

`path`

The block path of the source block for which the signal logging override settings apply. If you use this argument without also using the `port` argument, then Simulink sets the output port index to 1.

`index`

Output port index to which the signal logging override settings apply.

`signal_logging_object`

`Simulink.SimulationData.SignalLoggingInfo` object that represents the override settings of a signal.

```
signal_logging_override_object =  
Simulink.SimulationData.SignalLoggingInfo() creates a  
Simulink.SimulationData.LoggingInfo object that contains default logging  
settings for a signal.
```

```
signal_logging_override_object =  
Simulink.SimulationData.SignalLoggingInfo(path) creates a  
Simulink.SimulationData.LoggingInfo object, using the specified block path, and  
sets the output port index to 1.
```

```
signal_logging_override_object =  
Simulink.SimulationData.SignalLoggingInfo(path, port) creates a
```

Simulink.SimulationData.LoggingInfo object that contains default logging settings for the specified block path and output port index.

The following example creates a Simulink.SimulationData.SignalLoggingInfo object for the first output port of the Bus Creator block in the sldemo_mdref_bus model.

```
sldemo_mdref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo(...
'sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi.Signals = ...
    Simulink.SimulationData.SignalLoggingInfo(...
        {'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'}, 1)
```

The output is:

```
mi =

    Data.ModelLoggingInfo with properties:

        Model: 'sldemo_mdref_bus'
    LoggingMode: 'OverrideSignals'
    LogAsSpecifiedByModels: {}
        Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]

    Methods
```

Simulink.SimulationData.Signal

Container for signal logging information

Description

Simulink uses `Simulink.SimulationData.Signal` objects to store signal logging information during simulation. The objects contain information about the source block for the signal, including the port type and index.

Property Summary

Name	Description
<code>BlockPath</code> on page 5-547	Block path for the source block for the signal
<code>Name</code> on page 5-548	Name of signal element to use for name-based access
<code>PropagatedName</code> on page 5-548	Propagated signal name, if any
<code>PortIndex</code> on page 5-548	Numeric index of port that was logged
<code>PortType</code> on page 5-549	Type of port that was logged: for signal logging, the port type is 'outport'
<code>Values</code> on page 5-549	Time and data that were logged

Properties

BlockPath

Block path for the source block for the signal

`Simulink.SimulationData.BlockPath`

RW

Name

Name of signal element to use for name-based access

character vector

RW

PropagatedName

Propagated name of signal element

Signal logging and root Output block logging data for a signal captures the propagated signal name if the logging format is `Dataset` and:

- For signal logging, you:
 - Mark the signal for signal logging and in the Signal Properties dialog box select **Show Propagated Signals**.
 - Enable **Configuration Parameters > Data Import/Export > Signal logging**.
- For root Output block logging, you select **Configuration Parameters > Data Import/Export > Output**.

The propagated signal name does not include angle brackets (<>).

character vector

RO

PortIndex

Numeric index of port that was logged

scalar real integer

RW

PortType

Type of port that was logged: for signal logging, the port type is 'outport'

character vector

RW

Values

Time and data that were logged.

For an example of how to use the `Values` property and plot logged signal data, in the `sldemo_mdhref_bus` example, see “Logging Signal Data.”

- MATLAB `timeseries` object
- Structure of MATLAB `timeseries` objects (for bus signals)
- Array of structures of MATLAB `timeseries` objects (for array of buses signals)
- Array of MATLAB `timeseries` objects (for nonbus signals in a For Each subsystem)

Simulink.SimulationData.State class

Package: Simulink.SimulationData

State logging element

Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

Properties

Name — Name of state element to use for name-based access

character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, 'CSTATE' or 'DSTATE' is used, depending on whether it is a continuous or discrete state.

BlockPath — Block path for state source block

a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

Label — Type of state

'CSTATE' | 'DSTATE'

Type of state, returned as 'CSTATE' or 'DSTATE'. Read-only property.

- 'CSTATE' – Continuous state
- 'DSTATE' – Discrete state

Values — State element information

single MATLAB `timeseries` object | a structure of MATLAB `timeseries` objects

State element information, specified as a single MATLAB `timeseries` object or as a structure of MATLAB `timeseries` objects.

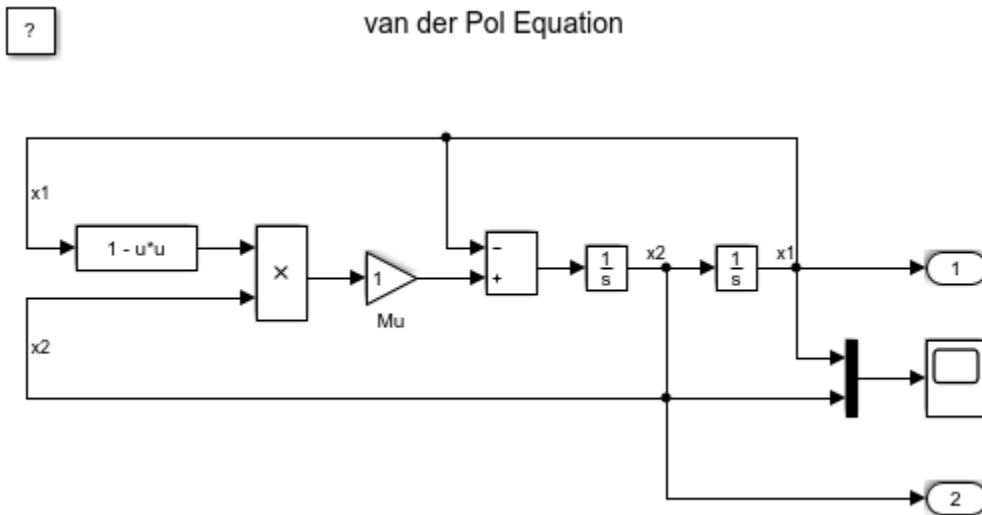

Examples

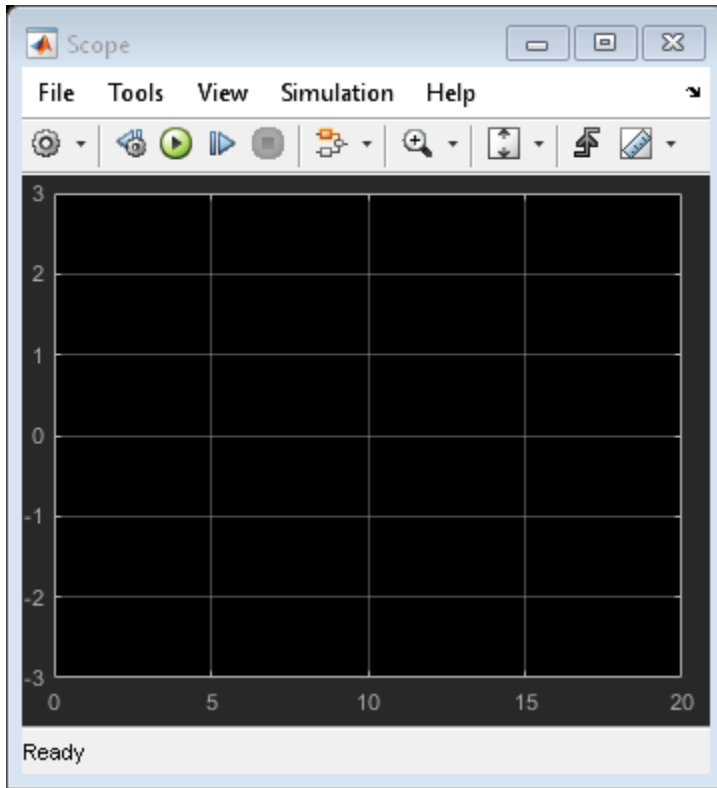

Final State Information in Structure with Dataset Format

Saved final state information in `Dataset` format and access the state data after simulation.

Open the `vdp` model and specify to log final states in `Dataset` format. Use the default logged state variable, `xFinal`.

```
open_system('vdp');  
set_param(gcs, 'SaveFinalState', 'on', 'SaveFormat', 'Dataset');
```

Simulate the model.

```
sim('vdp');
```

View the state logging information in `xFinal`.

```
xFinal
```

```
xFinal =
```

```
Simulink.SimulationData.Dataset 'xFinal' with 2 elements
```

	Name	BlockPath
1	[1x1 State]	vdp/x1
2	[1x1 State]	vdp/x2

- Use braces `{ }` to access, modify, or add elements using index.

Examine the first element of the state dataset.

```
xFinal.get(1)
```

```
ans =
```

```
Simulink.SimulationData.State  
Package: Simulink.SimulationData  
  
Properties:  
  Name: ''  
  BlockPath: [1x1 Simulink.SimulationData.BlockPath]  
  Label: CSTATE  
  Values: [1x1 timeseries]
```

Simulink.SimulationData.Unit class

Package: Simulink.SimulationData

Store units for simulation data

Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Output blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

Input Arguments

unitName — Name of logging data units

character vector

Name of logging data units, specified as a character vector.

Output Arguments

unitsObj — Logging data units

`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

Properties

Name — Name of the units

character vector

Name of the units, specified as a character vector.

Methods

Method	Purpose
<code>Simulink.SimulationData.Unit.setName</code>	Specify name of logging data unit

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB `timeseries` object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);
ts.DataInfo.Units = inchesUnit;
ts.DataInfo.Units
```

```
ans =
```

```
Units with properties:
```

Name: 'inches'

Simulink.SimulationInput class

Package: Simulink

Creates `SimulationInput` objects to make changes to a model for multiple or individual simulations

Description

The `Simulink.SimulationInput` object allows you to make changes to a model and run simulations with those changes. These changes are temporarily applied to the model. Through `Simulink.SimulationInput` object, you can change:

- Initial state
- Model parameters
- Block parameters
- External inputs
- Variables

Through the `Simulink.SimulationInput` object, you can also specify MATLAB functions to run at the start and the end of each simulation by using `in.PreSimFcn` and `in.PostSimFcn`, respectively. `Simulink.SimulationInput` does not support the ability to allow model references to have their own data dictionary.

Construction

`in = Simulink.SimulationInput('modelName')` creates a `SimulationInput` object for a model.

Input Arguments

modelName — Name of the model
character vector

Create a `Simulink.SimulationInput` object by passing the name of the model as an argument.

Example: `in = Simulink.SimulationInput('cstr')`

Properties

ModelName — Name of the model

character vector

Name of the model for which the `SimulationInput` object is created.

InitialState — Initial state

`Simulink.SimState.ModelSimState` object

Initial state of the model for a simulation specified as a `Simulink.SimState.ModelSimState` object

ExternalInput — External Input

numerical array, dataset object, timeseries, character array

External inputs added to the model for a simulation.

BlockParameters — Block parameters

array of `Simulink.Simulation.BlockParameter`

Block parameters of the model that are modified.

Variables — Variables

array of `Simulink.Simulation.Variable`

Variables of the model that are modified.

ModelParameters — Model parameters

array of `Simulink.Simulation.ModelParameter`

Model parameters of the model that are modified .

PreSimFcn — Function

MATLAB function

MATLAB function to run before the start of the simulation.

PostSimFcn — Function

MATLAB function

MATLAB function to run after the simulations.

UserString — User string

character array

Brief description of the simulation specified as a character array.

Methods

Method	Purpose
<code>setModelParameter</code>	Set model parameters to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setBlockParameter</code>	Set block parameters to be used for a specific simulation through <code>SimulationInput</code> object.
<code>setInitialState</code>	Set initial state to be used for a specific simulation through <code>SimulationInput</code> object.
<code>ExternalInput</code>	Set external inputs for a simulation through <code>SimulationInput</code> object.
<code>setVariable</code>	Set variables for a simulation through <code>SimulationInput</code> object.
<code>PreSimFcn</code>	Specify a MATLAB function to run before start of each simulation through <code>SimulationInput</code> object.
<code>PostSimFcn</code>	Specify a MATLAB function to run after each simulation is complete through <code>SimulationInput</code> object.
<code>applyToModel</code>	Apply changes to the model specified through a <code>SimulationInput</code> object.
<code>validate</code>	Validate the contents of the <code>SimulationInput</code> object.

Examples

Create a Simulink.SimulationInput Object

This example shows you how to create a `SimulationInput` object.

Create a single `SimulationInput` object for a model.

```
model = 'sldemo_househeat';  
in = Simulink.SimulationInput(model);
```

Create an Array of Simulink.SimulationInput Objects

This example shows you how to create an array of `SimulationInput` objects.

Create an array of `SimulationInput` objects by using the `for` loop.

```
model = 'vdp';  
for i = 10:-1:1  
    in(i) = Simulink.SimulationInput(model);  
end
```

Set Block Parameters using an Array of Simulink.SimulationInput Objects

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point', 'Value', '300');
```

Simulate the model.

```
out = sim(in)
```

applyToModel

Apply changes to the model specified through a `SimulationInput` object, `in`

Syntax

```
in.applyToModel
```

Description

`in.applyToModel` applies the changes specified through the `SimulationInput` object to the model. You can use it to debug a model or to interactively analyze a simulation.

Examples

Apply Changes Made Through the `Simulink.SimulationInput` Object to the Model

This example shows how to modify a model through a `SimulationInput` object and save those modifications.

Open the model and create a `SimulationInput` object.

```
open_system('sldemo_househeat');  
in = Simulink.SimulationInput('sldemo_househeat');
```

Modify block parameter, model parameters and a variable through `SimulationInput` object.

```
in = in.setBlockParameter('sldemo_househeat/Set Point', 'Value', '75');  
in = in.setVariable('cost', 50, 'Workspace', 'sldemo_househeat');  
in = in.setModelParameter('StartTime', '1', 'StopTime', '5');
```

Apply the modifications made in the above step to the model.

`in.applyToModel`

ExternalInput

Set external inputs for a simulation through `SimulationInput` object, `in`

Syntax

```
in.ExternalInput = [t, u1, ..uN]
in.ExternalInput = ds
in.ExternalInput = ts
```

Description

`in.ExternalInput = [t, u1, ..uN]` allows you to directly specify numerical arrays as inputs to a model if a model has root inports.

`in.ExternalInput = ds` allows you to directly specify dataset objects as external inputs to a model if a model has root inports..

`in.ExternalInput = ts` allows you to directly specify timeseries object as external input if a model has a single root inport.

Examples

Set Numerical Arrays as External Inputs Through a `Simulink.SimulationInput` Object

This example shows how to set numerical arrays as external inputs.

Open the model

```
open_system('sldemo_mdhref_counter');
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput('sldemo_mdhref_counter');
```

Prepare external inputs.

```
t = (0:0.01:10)';  
u1 = 5*ones(size(t));  
u2 = 10*sin(t);  
u3 = -5*ones(size(t));
```

Set external inputs to the model.

```
in.ExternalInput = [t, u1, u2, u3];
```

Simulate the model.

```
out = sim(in);
```

Input Arguments

[t, u1, .. uN] — Numerical array

Numerical array

Numerical array to be used as an external input.

ds — Dataset object

`Simulink.SimulationData.Dataset` object

Dataset object to be used as an external input

ts — Time series

Time object handle

Time series to be used as an external input

“Parallel Simulations Workflow”

Introduced in R2017a

PostSimFcn

Specify a MATLAB function to run after each simulation is complete through `SimulationInput` object, in

Syntax

```
in.PostSimFcn = @(y) myfunction(arg1, arg2...)
```

Description

`in.PostSimFcn = @(y) myfunction(arg1, arg2...)` runs after each simulation is complete. The `Simulink.SimulationOutput` object is passed as the argument `y` to this function. `myfunction` is any MATLAB function and can be used to do the post processing on the output. To return post processed data, you must return it as values in a struct. These values are then packed into the `Simulink.SimulationOutput` output to replace the usual logged data or add new data to the `Simulink.SimulationOutput` object.

Examples

Specify a MATLAB function for Postprocessing of the Output

This example specifies a MATLAB Function through `SimulationInput` object to run after each simulation is complete.

Create a `PostSimFcn` to get the mean of the output.

```
function newout = postsim(out);  
newout.mean = mean(out.yout);  
end
```

Create a `SimulationInput` object for a model.

```
in = Simulink.SimulationInput('vdp');  
in.PostSimFcn = @(x) postsim(x);  
in = setModelParameter(in, 'SaveOutput', 'on');
```

Simulate the model.

```
out = sim(in)
```

View your result

```
out.mean
```

It is best practice to avoid using 'ErrorMessage' and 'SimulationMetadata' as field names in the function.

Input Arguments

y — Copy of `Simulink.SimulationOutput` object for postprocessing

`Simulink.SimulationOutput` object

This is a `Simulink.SimulationOutput` object which is an input to myfunction.

“Parallel Simulations Workflow”

Introduced in R2017a

PreSimFcn

Specify a MATLAB function to run before start of each simulation through `SimulationInput` object, in

Syntax

```
in.PreSimFcn = @(x) myfunction(arg1, arg2...)
```

Description

`in.PreSimFcn = @(x) myfunction(arg1, arg2...)` runs before each simulation starts. The `Simulink.SimulationInput` object is passed as an argument `x` to this function. `myfunction` is any MATLAB function and can be used to modify the `Simulink.SimulationInput` object. If you use `myfunction` to modify the `Simulink.SimulationInput` object, you must return `Simulink.SimulationInput` object as the only output argument.

Examples

Specify a MATLAB Function to Run Before Each Simulation

This example shows how to specify a MATLAB function through `SimulationInput` object to run at before start of each simulation.

Create a `PreSimFcn` function.

```
function presim(in)
signalbuilder('sf_car/User Inputs', 'ActiveGroup', in.Variables.Value)
```

Open the model.

```
model = 'sf_car';
open_system(model);
```

Create an array of `SimulationInput` objects for this model. Use `in.PreSimFcn` to run `presim` before simulation.

```
n = 4;
for idx = n:-1:1
    in(idx) = Simulink.SimulationInput(model);
    in(idx) = in(idx).setVariable('SigIndex', idx);
    in(idx).PreSimFcn = @(x) presim(x);
end
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

x — A `Simulink.SimulationInput` object as input to the myfunction

`Simulink.SimulationInput` object

This is an input to `myfunction` in which you can modify the `Simulink.SimulationInput` object.

See Also

`ExternalInput` | `PostSimFcn` | `Simulation Manager` |
`Simulink.SimulationInput` | `applyToModel` | `parsim` | `setBlockParameter` |

Topics

“Run Multiple Simulations”

“Parallel Simulations Workflow”

Introduced in R2017a

setBlockParameter

Set block parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setBlockParameter(BlockPath, ParameterName, Value, ...  
ParameterNameN, ValueN)
```

Description

`in = in.setBlockParameter(BlockPath, ParameterName, Value, ...
ParameterNameN, ValueN)` sets the parameter on the block specified at `BlockPath` with the properties `ParameterName` and `Value`. You can set multiple block parameters in a model using the same `SimulationInput` object. For more information on block parameter, see “Block-Specific Parameters” on page 6-128.

Examples

Modify a Block Parameter for a Simulation

This example modifies the block parameters of a model through the `SimulationInput` object.

Open the model

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
in = in.setBlockParameter('sldemo_househeat/Set Point','Value','300');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

BlockPath — Path of the block

character vector

BlockPath is the path of the block for which the parameter is changed

Example: 'sldemo_househeat/Set Point'

ParameterName — Block parameter name

character vector

Specify optional comma-separated pairs of ParameterName, Value arguments.

ParameterName is the parameter name and Value is the corresponding value.

ParameterName must appear inside single quotes (' '). Block parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

ParameterNameN, ValueN pairs follow the same syntax as set_param.

Example: 'Value', '350'

setInitialState

Set initial state to be used for a specific simulation through `SimulationInput` object, in

Syntax

```
in.setInitialState = xInitial
```

Description

`in.setInitialState = xInitial` sets the initial state of a model to `xInitial`, a `Simulink.SimState.ModelSimState` object.

Input Arguments

xInitial — `Simulink.SimState.ModelSimState` object

`Simulink.SimState.ModelSimState`

You can change the `Initial State` of a model by assigning it to a `Simulink.SimState.ModelSimState` object.

Introduced in R2017a

setModelParameter

Set model parameters to be used for a specific simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setModelParameter(ParameterName,Value,...ParameterNameN,  
ValueN)
```

Description

`in = in.setModelParameter(ParameterName,Value,...ParameterNameN,ValueN)` sets a model parameter `Name` with a `Value`. You can add multiple model parameters to the model using the same `SimulationInput` object. For more information on model parameters, see “Model Parameters” on page 6-2.

Examples

Modify a Model Parameter for a Simulation

This example modifies the model parameters of through the `SimulationInput` object

Open the model.

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
in = Simulink.SimulationInput(mdl);
```

Modify model parameters.

```
in = in.setModelParameter('StartTime','1','StopTime','4');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

ParameterName — Block parameter name

character vector

Specify optional comma-separated pairs of `ParameterName, Value` arguments. `ParameterName` is the parameter name and `Value` is the corresponding value. `ParameterName` must appear inside single quotes (' '). Model parameter values are typically specified as character vectors. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`. `ParameterNameN, ValueN` pairs follow the same syntax as `set_param`.

Example: `'StartTime', '1'`

Introduced in R2017a

setVariable

Set variables for a simulation through `SimulationInput` object, `in`

Syntax

```
in = in.setVariable(Name,Value)
in = in.setVariable(Name,Value,'Workspace', 'ModelName')
```

Description

`in = in.setVariable(Name,Value)` assigns a `Value` to variable `Name`. You can add multiple variables to the model using the same `SimulationInput` object.

`in = in.setVariable(Name,Value,'Workspace', 'ModelName')` assigns the `Value` to variable `Name`. Variables that are defined through the `SimulationInput` object are placed in the global workspace scope by default. The term global workspace is specific to the `Simulink.SimulationInput` object and its methods. Variables in the global workspace scope take precedence if a variable with the same name exists in the base workspace or the data dictionary. The variables in the model workspace take precedence over the global workspace scope. To change the value of a model workspace variable, set the scope by specifying the model name when you add the variable to the `SimulationInput` object.

For information on using nonscalar variables, structure variables and parameter objects, see “Sweep Nonscalars, Structures, and Parameter Objects”.

Examples

Modify a Variable for a Simulation

This example modifies the model parameters of through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable value to 50.

```
in = in.setVariable('cost',50);
```

By default, this variable is placed in the global workspace scope.

Simulate the model.

```
out = sim(in)
```

Modify a Variable for a Simulation in the Model Workspace

This example modifies the model parameters of through the `SimulationInput` object.

Set path and open the model.

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Set the variable to 50 and set the scope to model workspace.

```
in = in.setVariable('cost',50,'Workspace','sldemo_househeat');
```

Simulate the model.

```
out = sim(in)
```

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of *Name*, *Value* arguments. *Name* is the argument name and *Value* is the literal value of the variable. *Name* must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as *Name1*, *Value1*, . . . , *NameN*, *ValueN*.

Example: 'cost', '65'

Workspace — Workspace for the variable

character vector

Set the scope of the defined variable by specifying the model name

Example: 'Workspace', 'sldemo_househeat'

“Parallel Simulations Workflow”

Introduced in R2017a

validate

Validate the contents of the `SimulationInput` object, `in`

Syntax

```
in.validate
```

Description

`in.validate` validates the changes made to the model through the `SimulationInput` object. This method validates all the changes made to the model through the `SimulationInput` object.

Examples

Validate Changes Made Through the SimulationInput Object

This example modifies and validates the variable of the model through the `SimulationInput` object.

Open the model.

```
mdl = 'sldemo_househeat';  
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
in = Simulink.SimulationInput(mdl);
```

Modify a model parameter

```
in = in.setModelParameter('InvalidParamName', '5');
```

Validate this change

`in.validate`

Simulink.SimulationMetadata class

Package: Simulink

Access metadata of simulation runs

Description

The `SimulationMetadata` class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

`SimulationMetadata` packages this information with the `SimulationOutput` object. To use `SimulationMetadata`, use one of these approaches:

- In **Configuration Parameters > Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use `set_param` to set `ReturnWorkspaceOutputs` to on.

```
set_param(model_name, 'ReturnWorkspaceOutputs', 'on');
```

To retrieve the `SimulationMetadata` object, use the `getSimulationMetadata` method on a `SimulationOutput` object.

Properties

ModelInfo — Information about the model and simulation operating environment
structure

The `ModelInfo` structure has these fields.

Field Name	Type	Description
ModelName	char	Name of the model
ModelVersion	char	Version of the model
ModelFilePath	char	Absolute location of the .mdl/.slx file
UserID	char	System user ID of the machine used for the simulation
MachineName	char	Hostname of the machine used for the simulation
Platform	char	Operating system of the machine used for the simulation
ModelStructuralChecksum	4-by-1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: <ul style="list-style-type: none"> • Fixed-step solvers – Solver type, name, and fixed step size • Variable solvers – Solver type, name, and max step size (initial setting)
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: <ul style="list-style-type: none"> • LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off') • LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').

ExecutionInfo — Structure to store information about a simulation run

structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
StopEvent	Nontranslated character vector	<p>Reason the simulation stopped, represented by one of these.</p> <ul style="list-style-type: none"> • ReachedStopTime – Simulation stopped upon reaching stop time and no errors were reported during execution. StopEvent has value ReachedStopTime, even if errors are reported in the stop callbacks, which are executed after the simulation ends. • ModelStop – Simulation stopped by a block or by solver before reaching stop time • StopCommand – Simulation stopped manually by clicking the Stop button or programmatically using the set_param command • DiagnosticError – Simulation stopped because an error was reported during simulation • KeyboardControlC – Simulation stopped using keystroke Ctrl+C. • PauseCommand – Simulation paused manually by clicking the Pause button or programmatically using the set_param command • ConditionalPause – Simulation paused using a conditional breakpoint • PauseTime – Simulation paused at or after specified pause time • StepForward – Simulation paused after clicking step forward

Field Name	Type	Description
		<ul style="list-style-type: none"> • StepBackward – Simulation paused after clicking step backward • TimeOut – Simulation stopped because execution time exceeded timeout specified by TimeOut
StopEventSource	Simulink.SimulationData.BlockPath	Source of stop event, if it is a valid Simulink object
StopEventDescription	Translated character vector	Super set of information stored in StopEvent and StopEventSource
ErrorDiagnostic	struct	<p>Error reported during simulation, represented by these fields.</p> <ul style="list-style-type: none"> • Diagnostic – MSLDiagnostic object that includes object paths, ID, message, cause, and stack • SimulationPhase – Represented by one of these: Initialization, Execution, or Termination • SimulationTime – Simulation time represented as a double, if reported during Execution; else, represented as [] <p>By passing the name–value pair 'ReturnErrorsInOutput', 'on' to the sim command, errors generated during simulation are reported in ExecutionInfo.ErrorDiagnostic. The sim command does not capture generated errors.</p>

Field Name	Type	Description
WarningDiagnostics	Array of struct	<p>Array of all warnings reported during the simulation. Each array item is represented by these fields.</p> <ul style="list-style-type: none"> Diagnostic – MSLDiagnostic object that includes object paths, ID, message, cause, and stack SimulationPhase – Represented by one of these: Initialization, Execution, or Termination SimulationTime – Simulation time represented as a double, if reported during Execution; else, represented as []

TimingInfo — Structure to store profiling information about the simulation structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
WallClockTimestampStart	character vector	Wall clock time when the simulation started, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
WallClockTimestampStop	character vector	Wall clock time when the simulation stopped, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
InitializationElapsedWallTime	double	Time spent before execution, in seconds
ExecutionElapsedWallTime	double	Time spent during execution, in seconds
TerminationElapsedWallTime	double	Time spent after execution in, seconds
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds

The `ExecutionElapsedWallTime` includes the time that Simulink spent to roll back or step back in a simulation. The `ExecutionElapsedWallTime` does not include the time spent between steps. For example, if you use `Stepper` to step through a simulation, the `ExecutionElapsedWallTime` time does not include the time when the simulation is in a paused state. For more information about using `Stepper`, see “How Simulation Stepper Helps With Model Analysis”.

UserString — Custom character vector to describe the simulation

character vector

Use `Simulink.SimulationOutput.setUserString` to directly store a character vector in the `SimulationMetadata` object that is contained in the `SimulationOutput` object.

UserData — Custom data to store in SimulationMetadata object that is contained in the SimulationOutput object

character vector

Use `Simulink.SimulationOutput.setUserData` to store custom data in the `SimulationMetadata` object that is contained in the `SimulationOutput` object.

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Get a SimulationMetadata Object for vdp Simulation

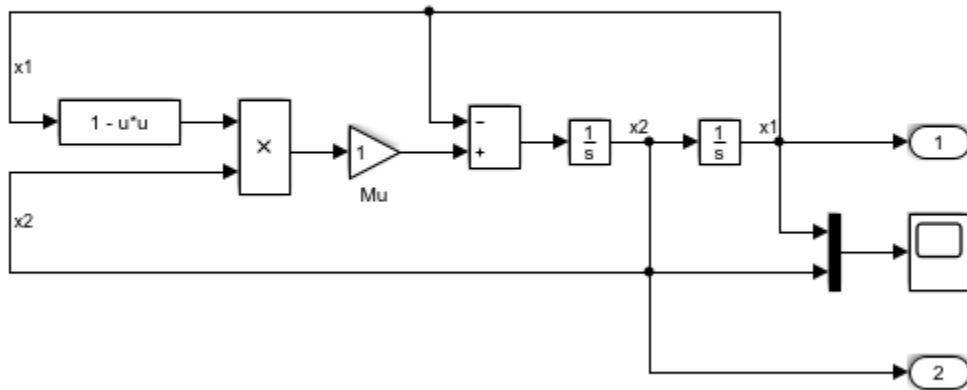

Simulate the `vdp` model. Retrieve metadata from a `SimulationMetadata` object of the simulation.

Simulate the `vdp` model. Save the results of the `Simulink.SimulationOutput` object in `simout`.

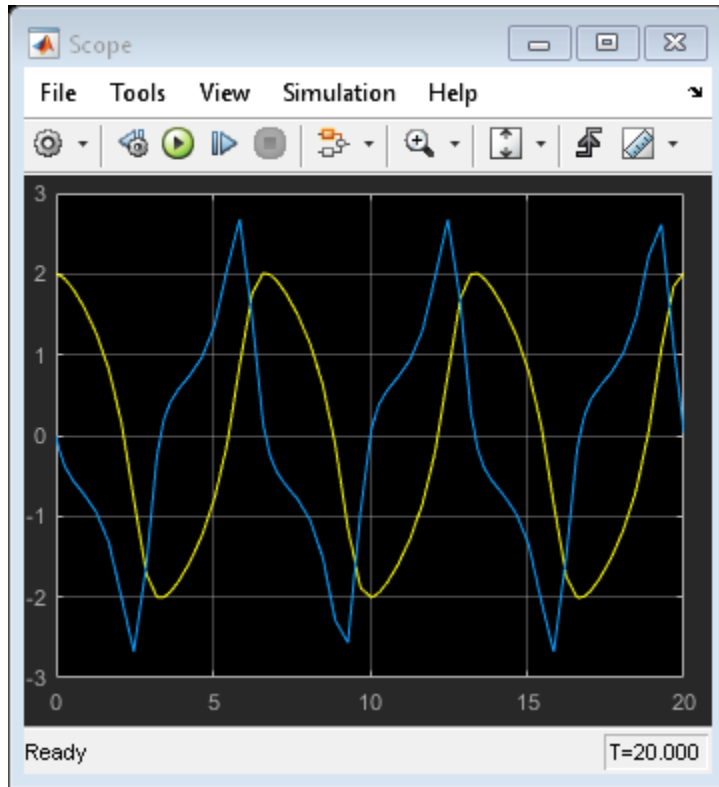

```
open_system('vdp');  
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

?

van der Pol Equation

Copyright 2004-2013 The MathWorks, Inc.

Retrieve metadata information about this simulation using `mData`. This is the `SimulationMetadata` object that `simout` contains.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

```
SimulationMetadata with properties:
```

```

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
    UserData: []

```

Store custom data or string in simout.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'))
simout=simout.setUserString('Store first simulation results');
```

Retrieve the custom data you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserData)
```

mData =

```
SimulationMetadata with properties:

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: 'Store first simulation results'
    UserData: [1x1 struct]

    param1: 'value1'
    param2: 'value2'
    param3: 'value3'
```

Retrieve the custom string you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserString)
```

mData =

```
SimulationMetadata with properties:

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: 'Store first simulation results'
    UserData: [1x1 struct]
```

Store first simulation results

`Simulink.SimulationOutput.setUserString`

Introduced in R2015a

Simulink.SimulationOutput class

Package: Simulink

Access object values of simulation results

Description

The `SimulationOutput` class contains all simulation outputs, including workspace variables.

You can use dot notation to access the data for simulation outputs. For example, to return data for the `xout` variable for a `simOut` `SimulationOutput` object, use a `simOut.tout` command.

Alternatively, you can use `Simulink.SimulationOutput.who` and either `Simulink.SimulationOutput.get` or `Simulink.SimulationOutput.find` methods to access the output variable names and their respective values.

Properties

SimulationMetadata — Metadata for simulation runs

`Simulink.SimulationMetadata` object

Metadata for simulation runs, returned as a `Simulink.SimulationMetadata` object. Fields other than the `UserData` and `UserString` fields are read only.

ErrorMessage — Simulation logging error messages

char vector

Simulation logging error message, returned as a char vector. (read only)

Methods

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#) in the [MATLAB Programming Fundamentals](#) documentation.

Examples

View Simulation Output and Metadata

Simulate a model and place the results of the `Simulink.SimulationOutput` object in `simOut` and view the simulation metadata.

Simulate the `vdp` model.

```
simOut = sim('vdp', 'SimulationMode', 'normal', 'AbsTol', '1e-5', ...
            'SaveState', 'on', 'StateSaveName', 'xoutNew', ...
            'SaveOutput', 'on', 'OutputSaveName', 'youtNew')
```

```
Simulink.SimulationOutput:
```

```
    xoutNew: [65x2 double]
    youtNew: [65x2 double]
```

```
    SimulationMetadata: [1x1 Simulink.SimulationMetadata]
    ErrorMessage: [0x0 char]
```

Get the values of the variable `youtNew`.

```
simOut.youtNew
```

Simulink returns and displays the values.

Get the timing information for the simulation.

```
myMetadata = simOut.SimulationMetadata
```

```
myMetadata =
```

```
SimulationMetadata with properties:

    ModelInfo: [1x1 struct]
    TimingInfo: [1x1 struct]
    ExecutionInfo: [1x1 struct]
    UserString: ''
    UserData: []

myMetadata.TimingInfo

ans =

    struct with fields:

        WallClockTimestampStart: '2016-12-30 08:47:51.739935'
        WallClockTimestampStop: '2016-12-30 08:47:58.185579'
        InitializationElapsedWallTime: 5.9166
        ExecutionElapsedWallTime: 0.1910
        TerminationElapsedWallTime: 0.3380
        TotalElapsedWallTime: 6.4456
```

Simulink.SubsysDataLogs

Container for subsystem signal data logs

Description

Note Before R2016a, the `Simulink.SubsysDataLogs` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases before R2016a, Simulink created instances of this class to contain logs for signals in a subsystem models were logged in `ModelDataLogs` format. Objects of this class have a variable number of properties. The first property, named `Name`, is the name of the subsystem whose log data this object contains. The remaining properties are signal log or signal log container objects containing the data logged for the subsystem specified by this object's `Name` property.

For example, suppose you have this logged data from a model run in a release earlier than R2016a:

```
Simulink.SubsysDataLogs (Gain):
  Name          elements  Simulink Class
  a              1         Timeseries
  m              2         TsArray
```

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `SubsysDataLogs` object. For example, to access the amplitudes logged for signal `a` in the preceding example, you could enter the following at the MATLAB command line:

```
data = logout.Gain.a.Data;
```

or

```
>> logout.unpack('all');  
data = a.Data;
```

See Also

`who`, `whos`, `unpack`

Introduced before R2006a

Simulink.SuppressedDiagnostic class

Package: Simulink

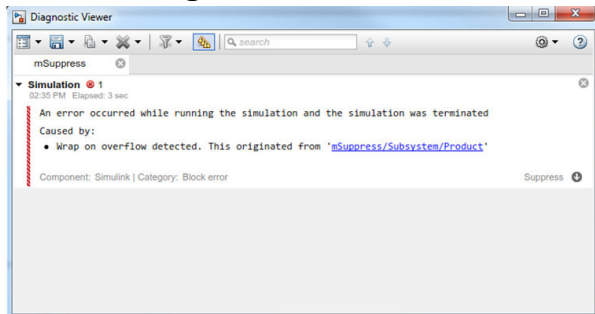

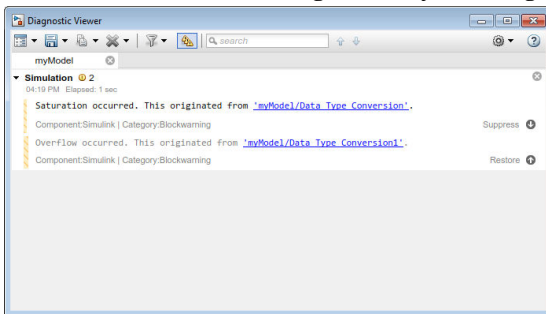

Suppress diagnostic messages from a specified block

Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can restore the diagnostic by clicking **Restore this warning**.

`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

Input Arguments

source — System, block, or model object throwing diagnostic

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

message_id — message identifier of diagnostic

message identifier | cell array of message identifiers

The message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | cell

Properties

Comments — Comments associated with the suppression object

character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: char

ID — Message identifier of the diagnostic that was suppressed

character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: char

LastModified — Date the suppression object was last modified

character vector

Date the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: char

LastModifiedBy — Name of the user who was last to add or edit the suppression object

character vector

Name of the user who last to add or edit the suppression object, specified as a character vector. This property is optional.

Data Types: char

Source — block path of the source of the diagnostic

character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: char

Methods

restore Remove specified diagnostic suppressions

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create a Simulink.SuppresseDiagnostic Object

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a Simulink.SuppresseDiagnostic object, suppression to suppress the parameter precision loss warning thrown by the Constant block, one.

```
suppression = Simulink.SuppresseDiagnostic('Suppressor_CLI_Demo/one', ...  
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model.

Add accountability information to the object by editing the LastModifiedBy and Comments properties of the object.

```
suppression.LastModifiedBy = 'John Doe';  
suppression.Comments = 'Reviewed: Joe Schmoe'
```

```
suppression =
```

```
SuppresseDiagnostic with properties:
```

```
    Source: 'Suppressor_CLI_Demo/one'  
    Id: 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss'  
LastModifiedBy: 'John Doe'  
    Comments: 'Reviewed: Joe Schmoe'  
    LastModified: '2016-Jun-01 17:25:21'
```

You can restore the diagnostic using the restore method.

```
restore(suppression);
```

- “Suppress Diagnostic Messages Programmatically”

restore

Class: Simulink.SuppressedDiagnostic

Package: Simulink

Remove specified diagnostic suppressions

Syntax

```
restore(SuppressedDiagnostic)
```

Description

`restore(SuppressedDiagnostic)` removes the specified suppressed diagnostic object.

Input Arguments

SuppressedDiagnostic — Suppressed diagnostic object to restore

`Simulink.SuppressedDiagnostic` object

`Simulink.SuppressedDiagnostic` object

Examples

Restore a Suppressed Diagnostic

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, suppression to suppress the parameter precision loss warning from the Constant block, one.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...  
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

Restore All Suppressed Diagnostics

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all diagnostic suppressions associated with a model.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util:fxpParameterUnderflowWarning'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo')
```

```
suppressed_diagnostics =
```

```
1×2 SuppressedDiagnostic array with properties:
```

```
Source
Id
LastModifiedBy
Comments
LastModified
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)
    restore(suppressed_diagnostics(iter));
end
```

Simulink.TimeInfo

Provide information about time data in `Simulink.Timeseries` object

Description

Simulink software creates instances of these objects to describe the time data that it includes in `Simulink.Timeseries` objects.

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

Properties

Name	Access	Description
Units	RW	The units, e.g., 'seconds', in which the time series data are expressed in the associated <code>Simulink.Timeseries</code> object.

Name	Access	Description
Start	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the first signal value recorded in the associated <code>Simulink.Timeseries</code> object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became active.
end	RW	If the associated signal is not in a conditionally executed subsystem, this field contains the simulation time of the last signal value recorded in the associated <code>Simulink.Timeseries</code> object. If the signal is in a conditionally executed subsystem, this field contains an array of times when the system became inactive.
Increment	RW	The interval between simulation times at which signal data is logged in the associated <code>Simulink.Timeseries</code> object. If the signal is aperiodic (continuous signal with variable-step solver), this property has a value of <code>NaN</code> . A signal is periodic if it has a discrete sample time (not continuous or constant) or is continuous with a fixed-step solver.
Length	W	The number of signal samples recorded in the associated <code>Simulink.Timeseries</code> object, i.e., the length of the arrays referenced by the object's <code>Time</code> and <code>Data</code> properties.

Simulink.Timeseries

Store data for any signal except mux or bus signal

Description

Note The `Simulink.Timeseries` class is supported for backwards compatibility. The `ModelDataLogs` format created `Simulink.Timeseries` objects for signal logging data. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format. In R2016a or later, when you open a model from an earlier release that had used `ModelDataLogs` format, the model simulated in use `Dataset` format.

You can convert signal logging data from `ModelDataLogs` to `Dataset` format. Converting to `Dataset` format makes it easier to post-process with other logged data (for example, logged states), which can also use `Dataset` format. For more information, see “Convert Logged Data to Dataset Format”.

If you have legacy code that uses the `ModelDataLogs` API, you can encounter situations that require updates to your code or model. See “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

Simulink software creates instances of this class to store signal data that it logs for any signal except a mux or bus signal, which are stored in a `Simulink.TsArray`. See “Export Signal Data Using Signal Logging” for more information.

Properties

Name	Access	Description
Name	RW	Name of this signal log.
BlockPath	RW	Path of the block that output the signal logged in this signal log.

Name	Access	Description
PortIndex	RW	Index of the output port that emitted the signal logged in this signal log.
SignalName	RW	Name of the signal logged in this signal log.
ParentName	RW	Name of the parent of the signal recorded in this log, if the signal is an element of a mux or a virtual bus; otherwise, the same as SignalName.
TimeInfo	RW	An object of <code>Simulink.TimeInfo</code> class that describes the time data in this log.
Time	RW	An array containing the simulation times at which signal data was logged.
Data	RW	An array containing the signal data.

Simulink.TsArray

Store data for mux or bus signal

Description

Note Before R2016a, the `Simulink.TsArray` class was used in conjunction with the `ModelDataLogs` logging data format. Starting in R2016a, you cannot log data in the `ModelDataLogs` format. Signal logging uses the `Dataset` format.

However, you can use data that was logged in a previous release using `ModelDataLogs` format.

In releases earlier than R2016a, Simulink software created instances of this class to contain the data that it logs for a mux or bus signal. Other types of signals were stored in a `Simulink.Timeseries`.

Objects of the `Simulink.TsArray` class have a variable number of properties. The first property, called `Name`, specifies the log name of the logged signal. The remaining properties reference logs for the elements of the logged signal: `Simulink.Timeseries` objects for elementary signals and `Simulink.TsArray` objects for mux or bus signals. The name of each property is the log name of the corresponding signal.

For example, suppose you have this logged data from a model run in a release earlier than R2016a that was configured to log in `ModelDataLogs` format.

```
logout.b2
```

```
Simulink.TsArray (untitled/Bus Creator1):
  Name           elements  Simulink Class
  x1             1         Timeseries
  b1             2         TsArray
```

The `Simulink.ModelDataLogs` object, named `logout`, contains a `Simulink.TsArray` object, named `b2`, that contains the logs for the elements of `b2` (that

is, the elementary signal `x1` and the bus signal `b1`). Entering the fully qualified name of the `Simulink.TsArray` object, (`logouts.b2`) at the MATLAB command line reveals the structure of the signal log for this model.

You can use either fully qualified log names or the `unpack` command to access the signal logs contained by a `Simulink.TsArray` object. For example, to access the amplitudes logged for signal `x1` in the preceding example, you can enter the following at the MATLAB command line:

```
data = logouts.b2.x1.Data;
```

or

```
logouts.unpack('all');  
data = x1.Data;
```

Simulink.Variant class

Package: Simulink

Specify conditions that control variant selection

Description

An object of the `Simulink.Variant` class represents a conditional expression called a variant control. The object allows you to specify a Boolean expression that activates a specific variant choice when it evaluates to `true`.

A variant control comprises one or more variant control variables, specified using MATLAB variables or `Simulink.Parameter` objects.

You specify variant controls for each variant choice represented in a Variant Subsystem or Model Variant block. For a given Variant Subsystem or Model Variant block, only one variant control can evaluate to `true` at a time. When a variant control evaluates to `true`, Simulink activates the variant choice that corresponds to that variant control.

Construction

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control.

Properties

conditionExpression — Variant condition expression

'(default)' | character vector

Variant condition expression, specified as a character vector containing one or more of these operands and operators.

Operands

- Variable names that resolve to MATLAB variables or `Simulink.Parameter` objects with integer or enumerated data type and scalar literal values
- Variable names that resolve to `Simulink.Variant` objects
- Scalar literal values that represent integer or enumerated values

Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bit-wise operators

The variant condition expression evaluates to a Boolean value. This property has read and write access.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

Examples

Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;  
Emission = 1;  
Ratio = 3;
```

Develop conditional expressions using the variables.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');  
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');  
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Create Variant Controls Using `simulink.Parameter` Objects

If you want to generate preprocessor conditionals for code generation, use `Simulink.Parameter` objects instead of MATLAB variables.

Create variant `Simulink.Parameter` objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);  
Emission = Simulink.Parameter(1);  
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file.

Other valid values for the custom storage class are `Define` and `CompilerFlag`.

```
Fuel.CoderInfo.StorageClass = 'Custom';  
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';  
  
Emission.CoderInfo.StorageClass = 'Custom';  
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';  
  
Ratio.CoderInfo.StorageClass = 'Custom';  
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Develop conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');  
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');  
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

Simulink.VariantConfigurationData class

Package: Simulink

Class representing a variant configurations data object

Description

The variant configuration data object, stores a collection of variant configurations, constraints, and the name of the default active configuration. The `Simulink.VariantConfigurationData` class has properties that enable you to add, modify, or remove variant configurations, constraints, and control variables. Use an instance of `Simulink.VariantConfigurationData` class to do the following:

- Define and edit variant configurations.
- Add control variables to variant configurations.
- Add copy of variant configuration.
- Delete existing variant configurations, constraints, and sub model configurations.
- Set a specific configuration as default active.
- Validate model using default or a specific variant configuration.
- Query or create variant configurations data object for a given model.

Properties

VariantConfigurations

Set of variant configurations. The names of the configurations must be unique and valid MATLAB variable names.

Constraints

Set of constraints that must always be satisfied by the model for all variant configurations. The name of the constraints must be unique and valid MATLAB variable names.

DefaultConfigurationName

Name of the variant configuration to be used by default for validation.

Methods

<code>addConfiguration</code>	Add a new variant configuration to the variant configuration data object
<code>addConstraint</code>	Add a constraint to the variant configuration data object
<code>addControlVariables</code>	Add control variables to an existing variant configuration
<code>addCopyOfConfiguration</code>	Add a copy of an existing variant configuration to the variant configuration data object
<code>addSubModelConfigurations</code>	Add to a variant configuration the names of the configurations to be used for submodels
<code>existsFor</code>	Check if variant configuration data object exists for a model
<code>getConfiguration</code>	Returns the variant configuration with a given name from a variant configuration data object
<code>getDefaultConfiguration</code>	Returns default variant configuration, if any, for a variant configuration data object
<code>getFor</code>	Get existing variant configuration data object for a model
<code>getOrCreateFor</code>	Get existing or create a new variant configuration data object for a model
<code>removeConfiguration</code>	Remove a variant configuration with a given name from the variant configuration data object
<code>removeConstraint</code>	Remove a constraint from the variant configuration data object
<code>removeControlVariable</code>	Remove a control variable from a variant configuration
<code>removeSubModelConfiguration</code>	Remove from a variant configuration, the configuration to be used for a sub model.
<code>setDefaultConfigurationName</code>	Set name of the default variant configuration for a variant configuration data object
<code>validateModel</code>	Validate all variant blocks in the model and submodels in the hierarchy during simulation
<code>VariantConfigurationData</code>	Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Examples

```
load_system(model);  
% Create variant config and associate it with model  
variantConfig = Simulink.VariantConfigurationData;  
set_param(model, 'VariantConfigurationObject', 'variantConfig');
```

“Variant Manager Overview”

addConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a new variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
vcdataObj.addConfiguration(name,description,controlVars,
subModelConfigurations)
```

Description

`vcdataObj.addConfiguration(name)` adds a new variant configuration with a given name to the variant configuration data object.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars,subModelConfigurations)` adds a new variant configuration with a given name, optional description, control variables, and submodel configurations to the variant configuration data object.

Input Arguments

name

Name of variant configuration being added.

description

Description text for the variant configuration being added.

controlVars

Control variables for the variant configuration being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp')
```

See Also

```
Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addControlVariables |
Simulink.VariantConfigurationData.addSubModelConfigurations
```

addConstraint

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a constraint to the variant configuration data object

Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint, condition)
vcdataObj.addConstraint(nameOfConstraint, condition, description)
```

Description

`vcdataObj.addConstraint(nameOfConstraint)` adds a new constraint with a given name to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint, condition)` adds a new constraint with a given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint, condition, description)` adds a new constraint with a given name, condition expression, and description to `vcdataObj`.

Input Arguments

nameOfConstraint

Name of constraint being added. Must be unique and valid MATLAB variable name.

condition

Boolean expression that must evaluate to true. When the expression evaluates to true, it means the constraint is satisfied.

description

Text that describes the constraint.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
    || (PlantLocation ~=1))','Description of the constraint')
```

See Also

Simulink.VariantConfigurationData |

Simulink.VariantConfigurationData.removeConstraint

addControlVariables

Class: Simulink.VariantConfigurationData

Package: Simulink

Add control variables to an existing variant configuration

Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration, controlVars)
```

Description

`vcdataObj.addControlVariables(nameOfConfiguration, controlVars)`, adds control variables to a variant configuration.

Input Arguments

nameOfConfiguration

Specifies the name of an existing configuration.

controlVars

Control variables being added. This argument must be a vector of structures with required fields: `Name` and `Value`. The values assigned to the `Name` field must be unique and valid MATLAB variable names. The `Value` field can contain either character vectors or `Simulink.Parameter` objects. The values of control variables are checked during validation of the variant configuration.

Examples

```
% Define the variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add a variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
'Linear Internal Experimental Plant Controller');

% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
    cell2struct({'SmartSensor1Mod', '2';...
                'PlantLocation', '1'},...
                {'Name', 'Value'}, 2))
```

addCopyOfConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Add a copy of an existing variant configuration to the variant configuration data object

Syntax

```
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)
vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration,
nameOfTobeAddedConfiguration)
```

Description

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration)`, adds a new configuration with a default name (default name is based on existing configuration name being copied) as a copy of the existing configuration to the variant configuration data object.

`vcdataObj.addCopyOfConfiguration(nameOfExistingConfiguration, nameOfTobeAddedConfiguration)`, adds a new configuration with a specified name, as a copy of the existing configuration, to the variant configuration data object.

Input Arguments

nameOfExistingConfiguration

Name of existing configuration.

Default:

nameOfTobeAddedConfiguration

Name of new configuration to be added as a copy of the configuration.

Default:**Examples**

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a copy of variant configuration LinInterExp
% and name the copy as LinExtExp
vcdataObj.addCopyOfConfiguration('LinInterExp','LinExtExp')
```

See Also

```
Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addConfiguration |
Simulink.VariantConfigurationData.removeConfiguration |
Simulink.VariantConfigurationData.setDefaultConfiguration
```

addSubModelConfigurations

Class: Simulink.VariantConfigurationData

Package: Simulink

Add to a variant configuration the names of the configurations to be used for submodels

Syntax

```
vcdataObj.addSubModelConfigurations (nameOfConfiguration,  
subModelConfigurations)
```

Description

`vcdataObj.addSubModelConfigurations (nameOfConfiguration, subModelConfigurations)`, specifies names of the configurations to be used for submodels.

Input Arguments

nameOfConfiguration

Name for the configuration of submodels that are model references.

subModelConfigurations

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Examples

```
% Add the path to the model file  
addpath(fullfile(docroot, 'toolbox', 'simulink', 'examples'));
```

```
% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a new submodel configuration to LinInterExp
vcdataObj.addSubModelConfigurations('LinInterExp',...
    [struct('ModelName', 'slexVariantManagementExternalPlantMdlRef',...
        'ConfigurationName', 'LowFid')])
```

existsFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Check if variant configuration data object exists for a model

Syntax

```
Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.existsFor(modelNameOrHandle)` returns true if the variant configuration data object exists for the model.

Input Arguments

modelNameOrHandle

Name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot,'toolbox','simulink','examples'));

% Load the model
load_system('slexVariantManagementExample');

% Checks whether a variant configuration
% data object exists for model
[exists] = Simulink.VariantConfigurationData.existsFor...
('slexVariantManagementExample')
```

See Also

`Simulink.VariantConfigurationData` |
`Simulink.VariantConfigurationData.getFor`

getConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Returns the variant configuration with a given name from a variant configuration data object

Syntax

```
vcdataObj.getConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.getConfiguration(nameOfConfiguration)` returns a specific variant configuration that is associated with the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the variant configuration to be returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add a control variable SmartSensor1Mod
vcdataObj.addControlVariables('LinInterExp',...
    [struct('Name','SmartSensor1Mod','Value','2')]);
```

```
% Obtain information on the variant configuration..  
% LinInterExp from the variant configuration data object  
vc = vcdDataObj.getConfiguration('LinInterExp')
```

getDefaultConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Returns default variant configuration, if any, for a variant configuration data object

Syntax

```
vcdataObj.getDefaultConfiguration
```

Description

`vcdataObj.getDefaultConfiguration` returns the default variant configuration. If no default variant configuration is defined, then [] is returned.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
    'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinExtExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

getFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Get existing variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getFor(modelNameOrHandle)`, returns the variant configuration object for the model. If no default variant configuration is defined, then `[]` is returned.

Input Arguments

modelNameOrHandle

Model name or handle.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot, 'toolbox', 'simulink', 'examples'));

% Load the model
load_system('slexVariantManagementExample');

% Obtain variant configuration data object for the model
% slexVariantManagementExample
vcdataObj = Simulink.VariantConfigurationData.getFor...
('slexVariantManagementExample')
```

getOrCreateFor

Class: Simulink.VariantConfigurationData

Package: Simulink

Get existing or create a new variant configuration data object for a model

Syntax

```
Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)
```

Description

`Simulink.VariantConfigurationData.getOrCreateFor(modelNameOrHandle)`, returns the object if the variant configuration data objects exists otherwise, creates an empty object.

Input Arguments

modelNameOrHandle

Model name or handle to the model.

Examples

```
% Add the path to the model file
addpath(fullfile(docroot, 'toolbox', 'simulink', 'examples'));

% Load the model
load_system('slexVariantManagementExample');

% Obtain existing or create an empty variant configuration
% data object for the slexVariantManagementExample model
vcdataObj = Simulink.VariantConfigurationData.getOrCreateFor...
('slexVariantManagementExample')
```

removeConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a variant configuration with a given name from the variant configuration data object

Syntax

```
vcdataObj.removeConfiguration(nameOfConfiguration)
```

Description

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object.

Input Arguments

nameOfConfiguration

Name of the configuration to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
% to the variant configuration data object
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Remove the LinInterExp configuration
```

```
% from the variant configuration data object  
vcdataObj.removeConfiguration('LinInterExp')
```

removeConstraint

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a constraint from the variant configuration data object

Syntax

```
vcdataObj.removeConstraint(nameOfConstraint)
```

Description

`vcdataObj.removeConstraint(nameOfConstraint)`, removes the constraint from the variant configuration data object.

Input Arguments

nameOfConstraint

Name of the constraint to be removed.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a constraint named LinNotExtern
vcdataObj.addConstraint('LinNotExtern','((Ctrl~=1)...
    || (PlantLocation ~=1))',..
    'Description of the constraint');

% Remove the constraint LinNotExtern
% from the variant configuration
vcdataObj.removeConstraint('LinNotExtern')
```

removeControlVariable

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove a control variable from a variant configuration

Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,  
nameOfControlVariable)
```

Description

`vcdataObj.removeControlVariable(nameOfConfiguration, nameOfControlVariable)` removes a control variable from a variant configuration.

Input Arguments

nameOfConfiguration

Name of the variant configuration.

nameOfControlVariable

Name of the control variable to be deleted.

Examples

```
% Define the variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData;  
  
% Add a variant configuration named LinInterExp  
vcdataObj.addConfiguration('LinInterExp',...  
    'Linear Internal Experimental Plant Controller');
```

```
% Add control variables SmartSensor1Mod and PlanLocation
vcdataObj.addControlVariables('LinInterExp',...
    [struct('Name','SmartSensor1Mod','Value','2')]);

% Remove the control variable SmartSensor1Mod
% from the configuration LinInterExp
vcdataObj.removeControlVariable('LinInterExp',...
    'SmartSensor1Mod')
```

See Also

Simulink.VariantConfigurationData |
Simulink.VariantConfigurationData.addControlVariables

removeSubModelConfiguration

Class: Simulink.VariantConfigurationData

Package: Simulink

Remove from a variant configuration, the configuration to be used for a sub model.

Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,  
nameOfSubModel)
```

Description

`vcdataObj.removeSubModelConfiguration(nameOfConfiguration, nameOfSubModel)`, removes the configuration specified for a submodel.

Input Arguments

nameOfConfiguration

Name of the submodel configuration to be removed.

nameOfSubModel

Name of the submodel from which the configuration must be removed.

Examples

```
% Load the model  
load_system('slexVariantManagementExample');  
  
% Define the variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData;
```

```
% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller',controlvars);

% Add a new submodel configuration to LinInterExp
vcdataObj.addSubModelConfigurations('LinInterExp',...
    [struct('ModelName','slexVariantManagementExternalPlantMdlRef',...
        'ConfigurationName','LowFid')]);

% Remove the submodel configuration LinInterExp
% from the submodel slexVariantManagementExternalPlantMdlRef
vcdataObj.removeSubModelConfiguration('LinInterExp',...
    'slexVariantManagementExternalPlantMdlRef')
```

setDefaultConfigurationName

Class: Simulink.VariantConfigurationData

Package: Simulink

Set name of the default variant configuration for a variant configuration data object

Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name. A variant configuration must exist with the same name. If an empty value is passed, then the default configuration name is cleared.

Input Arguments

nameOfConfiguration

Name of the configuration to be set as the default.

Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
    'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');
```

```
% Obtain the default variant configuration  
dconfig = vcdatabObj.getDefaultConfiguration
```

validateModel

Class: Simulink.VariantConfigurationData

Package: Simulink

Validate all variant blocks in the model and submodels in the hierarchy during simulation

Syntax

```
Simulink.VariantConfigurationData.validateModel(modelName)  
Simulink.VariantConfigurationData.validateModel(modelName,  
configName)
```

Description

`Simulink.VariantConfigurationData.validateModel(modelName)`, validates the model and referenced models during simulation.

`Simulink.VariantConfigurationData.validateModel(modelName, configName)`, validates the model and referenced models during simulation optionally using a variant configuration.

Input Arguments

modelName

Name of the model

configName

Name of the configuration to be validated

Examples

```
% Add the path to the model file
addpath(fullfile(docroot, 'toolbox', 'simulink', 'examples'));

% Load the model
load_system('slexVariantManagementExample');

% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add a variant configuration LinInterExp
vcdataObj.addConfiguration('LinInterExp');

% Add control variables to LinInterExp
vcdataObj.addControlVariables('LinInterExp',...
    cell2struct({'Ctrl', '1';...
                'PlantLocation', '2';...
                'SimType', '2'},...
                {'Name', 'Value'}, 2));

% Associate this object with the model
set_param('slexVariantManagementExample',...
    'VariantConfigurationObject', 'vcdataObj');

% Validate the model slexVariantManagementExample using
% the configuration LinInterExp
[valid, errors] = Simulink.VariantConfigurationData.validateModel...
    ('slexVariantManagementExample', 'LinInterExp')
```

```

VariantConfigurationData

Class: Simulink.VariantConfigurationData

Package: Simulink

Object constructor with optional arguments for variant configurations, constraints, and default configuration name

Syntax

```
vardataObj = Simulink.VariantConfigurationData(  
variantConfigurations)
```

Description

`vardataObj = Simulink.VariantConfigurationData(variantConfigurations)`, constructor that creates an empty variant configuration data object. Optionally, can also accept constraints and a default configuration name as inputs.

Input Arguments

variantConfigurations

Configurations that are part of the variant configuration data object.

constraints

Constraints to be satisfied by the model.

defaultConfigurationName

Name of the default configuration

Examples

```
% Create an empty variant configuration data object  
vcdataObj = Simulink.VariantConfigurationData
```

See Also

```

Simulink.VariantConfigurationData.addSubModelConfigurations
```

Simulink.VariantManager class

Package: Simulink

Class representing a set of Variant Manager functionality

Description

The variant manager class provides a set of methods to access Variant Manager functionality from MATLAB command-line. Use an instance of `Simulink.VariantManager` class to:

- Convert the Subsystems or Model block to a Variant Subsystem.
- Find variables used in Variant control expressions.
- Generate a reduced model for specified variant configurations.
- Display or control behavior of a variant condition legend.

Method

<code>variantLegend</code>	Display or control behavior of variant condition legend
<code>reduceModel</code>	Generate reduced model for specified variant configurations
<code>convertToVariant</code>	Convert Subsystem or Model block to Variant Subsystem block

See Also

Topics

“Variant Manager Overview”

`Simulink.VariantManager.variantLegend`

`Simulink.VariantManager.convertToVariant`

variantLegend

Class: Simulink.VariantManager

Package: Simulink

Display or control behavior of variant condition legend

Syntax

```
Simulink.VariantManager.variantLegend(modelName, action)
```

Description

`Simulink.VariantManager.variantLegend(modelName, action)` displays or performs a specified action on the variant condition legend.

Input Arguments

modelName — Model for which the variant legend is displayed

character vector

Model for which the variant legend is displayed, specified as a character vector.

action — Task to be performed on the variant legend

'open' | 'print' | 'showCodeConditions' | 'close'

Task to be performed on the variant condition legend for the model. You can specify the task as:

- 'open' — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.
- 'print' — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.

- 'showCodeConditions' — Displays code generation conditions column in the variant condition legend. The legend must be open. showCodeConditions is used as a name-value pair and accepts 'on' or 'off' as its values.
- 'close' — Closes the variant condition legend belonging to the specified model.

Examples

```
model = 'sldemo_variant_subsystems';
open_system(model);
% Open the variant condition legend
Simulink.VariantManager.variantLegend(model, 'open');
% Display the code generation conditions
Simulink.VariantManager.variantLegend(model, 'showCodeConditions', 'on');
```

Introduced in R2017b

reduceModel

Class: Simulink.VariantManager

Package: Simulink

Generate reduced model for specified variant configurations

Syntax

```
Simulink.VariantManager.reduceModel(Model)
Simulink.VariantManager.reduceModel(Model, Name, Value)
```

Description

`Simulink.VariantManager.reduceModel(Model)` creates a reduced model for the specified configuration. The referenced models are also reduced. Library blocks used by the model are not reduced. By default, the name of the reduced model and any reduced child referenced model name is the original model name suffixed with `_r`.

`Simulink.VariantManager.reduceModel(Model, Name, Value)` specifies the reduction parameters in the `Name` and `Value` arguments form.

Input Arguments

Model — Model to be reduced

character vector

Required field. Model to be reduced, specified as a character vector.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' ') and is case-insensitive whereas, the value string is case-sensitive. You can

specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Configurations — Variant configuration name

`{}` | character vector | 'cell array'

Specifies the configuration that is must be retained after reduction. By default, the active variant configuration is used to reduce the model.

OutputFolder — Folder to store the reduced model

character vector

Specifies the folder to place the reduced models and related artifacts. By default, the reduced models are generated in `./reducedModel` subfolder in the original model folder.

PreserveSignalAttributes — Preserve the signal attributes in the reduced model

`{true}` | false

When the value is `true`, the Variant Reducer preserves the compiled signal attributes between the original and reduced models by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, compiled sample times, etc.

Verbose — Displays step details

`true` | `{false}`

When the value is `true`, the Variant Reducer displays details of the steps performed during model reduction.

ModelSuffix — Reduced model name suffix

`{_r}`

Specifies the suffix to append to the reduced models and the related artifacts.

Examples

```
% Reduce model based on its variant control variable values in the base workspace.  
  
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');  
  
% Reduce model with Name-Value pair
```

```
Simulink.VariantManager.reduceModel('iv_model', Configurations, ...
    {'LinInterStd', 'NonLinExterHighFid'}, OutputFolder, 'outdir');

% Reduce a model by specifying a variant configuration in the form of struct of variant control variable.
Simulink.VariantManager.reduceModel('iv_model', ...
    struct('V', 1, 'W', [1 2]));
```

“What Are Variants and When to Use Them”

Simulink.VariantManager

Simulink.VariantManager.variantLegend

Introduced in R2016a

convertToVariant

Class: Simulink.VariantManager

Package: Simulink

Convert Subsystem or Model block to Variant Subsystem block

Syntax

```
variant_subsystem = convertToVariant(block)
```

Description

`variant_subsystem = convertToVariant(block)` converts a Subsystem or Model block to a Variant Subsystem block that includes the subsystem or referenced model as a variant. The model uses variants based on the variant controls. A Variant Subsystem can contain subsystems, referenced models, or both.

Note Future releases will no longer support using a Model block to contain model variants. You can use the `convertToVariant` method to convert model variants so that Model blocks are contained in a Variant Subsystem. Use of a Variant Subsystem block provides these advantages:

- Allows you to mix Model and Subsystem blocks as variant systems
- Supports flexible I/O, so that all variants do not need to have the same number of input and output ports

For an example of a model that uses a Variant Subsystem block as a container for variant models, see “Model Reference Variants”.

Limitations

You cannot convert a Subsystem block that meets either of these conditions:

- The subsystem is conditionally executed (in other words, has control ports).
- The Subsystem block is in a Simscape model that has Editing Mode set to **Restricted**.

Input Arguments

block — Subsystem or Model block to convert

block path | block handle

The path or block handle of the Subsystem or Model block to convert to a Variant Subsystem block. Specify a block path as a character vector and a block handle as a scalar.

Output Arguments

variantSubsystem — Handle of Variant Subsystem block

scalar returned by Simulink

If you specify an output argument, the method returns the block handle of the Variant Subsystem block created by the conversion.

Examples

```
open_system('autoMRVar');  
Simulink.VariantManager.convertToVariant('autoMRVar/Engine');
```

Alternative Functionality

Simulink Editor

In the Simulink Editor, right-click the Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**.

“Create a Simple Variant Model”

“What Are Variants and When to Use Them”

Introduced in R2017b

Simulink.WorkspaceVar class

Package: Simulink

Contains information about workspace variables and blocks that use them

Note `Simulink.WorkspaceVar` will be removed in a future release. Use `Simulink.VariableUsage` instead.

Description

A `Simulink.WorkspaceVar` object describes attributes of a workspace variable and lists the blocks that use the variable. The `Simulink.findVars` function returns one or more `Simulink.WorkspaceVar` objects that embody the results of searching for variables.

Tip

Only a `Simulink.WorkspaceVar` constructor can set any field value in a `Simulink.WorkspaceVar` object. The fields are otherwise read-only.

Fields

Name

The name of the variable described by the `Simulink.WorkspaceVar` object

Workspace

The name of the workspace in which the variable resides, for example:

Workspace value	Meaning
'base workspace'	The MATLAB base workspace

Workspace value	Meaning
'MyModel '	The model workspace for the model MyModel.
'MyModel/Mask1 '	The mask workspace for the masked block Mask1 in the model MyModel.

WorkspaceType

The type of workspace in which the variable resides. The possible values are:

- 'base'
- 'model'
- 'mask'

UsedByBlocks

A cell array of character vectors. Each character vector names a block that uses the variable. `Simulink.findVars` populates this field.

Construction

`var = Simulink.WorkspaceVar (VarName, WkspName)`, where both arguments are character vectors, returns a `Simulink.WorkspaceVar` object with Name `VarName` and Workspace `WkspName`. The inputs need not exist in the model. Simulink will provide a `WorkspaceType` automatically.

`vars = Simulink.WorkspaceVar (VarNames, WkspName)`, where `VarNames` is a cell array of character vectors, returns a vector of `Simulink.WorkspaceVar` objects, each with a specified name and `Workspace = WkspName`.

Methods

`[VarsOut] = VarsIn1.setdiff (VarsIn2)` — Calls `setdiff` to return the difference between `VarsIn1` and `VarsIn2`. The arguments and return value are vectors of `Simulink.WorkspaceVar` objects.

`[VarsOut] = VarsIn1.intersect (VarsIn2)` — Calls `intersect` to return the intersection between `VarsIn1` and `VarsIn2`. The arguments and return value are vectors of `Simulink.WorkspaceVar` objects.

Examples

Create a `Simulink.WorkspaceVar` object for the variable 'k' in the base workspace.

```
var = Simulink.WorkspaceVar('k', 'base workspace');
```

Return a vector of `Simulink.WorkspaceVar` objects, one object for each variable returned by `who`.

```
[vars] = Simulink.WorkspaceVar (who, WkspName)
```

Return a vector of `Simulink.WorkspaceVar` objects, one object for each variable returned by `whos`.

```
[vars] = Simulink.WorkspaceVar (who, WkspName)
```

Create a vector of `Simulink.WorkspaceVar` objects that describes all the variables in a model workspace

```
hws = get_param('mymodel', 'ModelWorkspace');  
vars=Simulink.WorkspaceVar(hws.whos, 'MyModel')
```

Create a vector of `Simulink.WorkspaceVar` objects that describes all the variables in a mask workspace

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');  
vars = Simulink.WorkspaceVar(maskVars, 'mymodel/maskblock');
```

- `intersect`

Simulink.VariableUsage class

Package: Simulink

Store information about the relationship between variables and blocks in models

Description

A `Simulink.VariableUsage` object describes where a variable is used in models. Use this information to:

- Prepare to permanently store the variables in files and workspaces. For more information about storing variables for a model, see “Determine Where to Store Variables and Objects for Simulink Models”.
- Reduce the number of variables that you need to store by eliminating unused variables.
- Prepare to partition variables and establish variable ownership when you work in a team.

To analyze variable usage in models, use `Simulink.VariableUsage` objects together with the `Simulink.findVars` function. The function returns and accepts `Simulink.VariableUsage` objects as arguments. For more information, see `Simulink.findVars`.

A `Simulink.VariableUsage` object can also describe the usage of an enumerated data type.

Only a `Simulink.VariableUsage` constructor or the `Simulink.findVars` function can set property values in a `Simulink.VariableUsage` object. The properties are otherwise read only.

Construction

The `Simulink.findVars` function returns `Simulink.VariableUsage` objects.

`vars = Simulink.VariableUsage(VarNames, SourceName)` creates an array of `Simulink.VariableUsage` objects to describe the variables `VarNames`. The constructor

sets the `Name` property of each object to one of the variable names specified by `VarNames`, and sets the `Source` property of all the objects to the source specified by `SourceName`.

You can specify `VarNames` with variables that are not used in any loaded models.

Input Arguments

VarNames — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.VariableUsage` object for each variable name.

Example: 'k'

Example: {'k', 'asdf', 'fuelFlow'}

Data Types: char | cell

SourceName — Name of variable source

character vector

Name of the source that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace or a data dictionary as a source. The constructor also determines and sets the `SourceType` property of each of the returned `Simulink.VariableUsage` objects.

Example: 'base workspace'

Example: 'myModel'

Example: 'myDictionary.sldd'

Data Types: char

Properties

Name — Name of variable or enumerated type

character vector

The name of the variable or enumerated data type the object describes, returned as a character vector.

Source — Name of defining workspace

character vector

The name of the workspace or data dictionary that defines the described variable, returned as a character vector. The table shows some examples.

Source value	Meaning
'base workspace'	MATLAB base workspace
'MyModel'	Model workspace for the model MyModel
'MyModel/Mask1'	Mask workspace for the masked block Mask1 in the model MyModel
'sldemo_fuelsys_dd_controller.sldd'	The data dictionary named 'sldemo_fuelsys_dd_controller.sldd'

The table shows some examples if you created the Simulink.VariableUsage object by using the Simulink.findVars function to find enumerated data types.

Source value	Meaning
'BasicColors.m'	The enumerated type is defined in the MATLAB file 'BasicColors.m'.
' '	The enumerated type is defined dynamically and has no source.
'sldemo_fuelsys_dd_controller.sldd'	The enumerated type is defined in the data dictionary named 'sldemo_fuelsys_dd_controller.sldd'.

SourceType — Type of defining workspace

character vector

The type of the workspace that defines the variable, returned as a character vector. The possible values are:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

If you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types, the possible values are:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

Users — Model blocks that use the variable or models that use the enumerated type
cell array of character vectors

Model blocks that use the variable or models that use the enumerated type, returned as a cell array of character vectors. Each character vector names a block or model that uses the variable or enumerated type. The `Simulink.findVars` function populates this field.

Methods

`intersect` Intersection of two arrays of `Simulink.VariableUsage` objects

`setdiff` Return difference between two arrays of `Simulink.VariableUsage` objects

Examples

Return a `Simulink.VariableUsage` object for the variable 'k' in the base workspace.

```
var = Simulink.VariableUsage('k', 'base workspace');
```

Return an array of `Simulink.VariableUsage` objects containing one object for each variable returned by the `whos` command.

```
vars = Simulink.VariableUsage(whos, 'base workspace')
```

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel', 'ModelWorkspace');  
vars = Simulink.VariableUsage(hws.whos, 'MyModel')
```

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');  
vars = Simulink.VariableUsage(maskVars, 'mymodel/maskblock');
```

intersect

Class: Simulink.VariableUsage

Package: Simulink

Intersection of two arrays of Simulink.VariableUsage objects

Syntax

```
VarsOut = intersect(VarsIn1,VarsIn2)
```

Description

`VarsOut = intersect(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` and in `VarsIn2`, which are arrays of Simulink.VariableUsage objects. If a variable is described by a Simulink.VariableUsage object in `VarsIn1` and in `VarsIn2`, the function returns a Simulink.VariableUsage object that stores the variable usage information from both objects in the `Users` property.

`intersect` compares the `Name`, `Source`, and `SourceType` properties of the Simulink.VariableUsage objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain Simulink.VariableUsage objects that have the same values for these three properties, they both describe the same variable.

To create Simulink.VariableUsage objects that describe the usage of variables in a model, use the Simulink.findVars function.

Input Arguments

VarsIn1 — First array of variables for comparison

array of Simulink.VariableUsage objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

VarsIn2 — Second array of variables for comparison

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

VarsOut — Variables described in both input arrays

array of `Simulink.VariableUsage` objects

Variables that are described in both input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` and in `VarsIn2`.

Examples

Compare Variables Used by Models

Given two models, discover the variables needed by both models.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
commonVars = intersect(model1Vars,model2Vars);
```

See Also

`Simulink.VariableUsage` | `Simulink.findVars` | `setdiff`

Topics

“Model Exploration”

“Variables”

setdiff

Class: Simulink.VariableUsage

Package: Simulink

Return difference between two arrays of Simulink.VariableUsage objects

Syntax

```
VarsOut = setdiff(VarsIn1,VarsIn2)
```

Description

`VarsOut = setdiff(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` but not in `VarsIn2`, which are arrays of Simulink.VariableUsage objects. If a variable is described by a Simulink.VariableUsage object in `VarsIn1` but not in `VarsIn2`, the function returns a copy of the object.

`setdiff` compares the `Name`, `Source`, and `SourceType` properties of the Simulink.VariableUsage objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain a Simulink.VariableUsage object with the same values for these three properties, the objects describe the same variable, and `setdiff` does not return an object to describe it.

To create Simulink.VariableUsage objects that describe the usage of variables in a model, use the Simulink.findVars function.

Input Arguments

VarsIn1 — First array of variables for comparison

array of Simulink.VariableUsage objects

First array of variables for comparison, specified as an array of Simulink.VariableUsage objects.

VarsIn2 — Second array of variables for comparison

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

Output Arguments

varsOut — Variables described in first array but not second array

array of `Simulink.VariableUsage` objects

Variables that are described in the first input array but not in the second input array, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` but not in `VarsIn2`.

Examples

Determine Variable Usage Difference Between Models

Given two models, discover the variables that are needed by the first model but not the second model.

```
model1Vars = Simulink.findVars('model1');  
model2Vars = Simulink.findVars('model2');  
commonVars = setdiff(model1Vars,model2Vars);
```

Find Variables Not Used by Model

Locate all variables in the base workspace that are not used by a loaded model that has been recently compiled.

```
models = find_system('type','block_diagram','LibraryType','None');  
base_vars = Simulink.VariableUsage(who,'base workspace');
```

```
used_vars = Simulink.findVars(models,'WorkspaceType','base');  
unusedVars = setdiff(base_vars,used_vars);
```

Simulink.data.Dictionary class

Package: Simulink.data

Configure data dictionary

Description

An object of the `Simulink.data.Dictionary` class represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

Construction

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

Properties

DataSources — Referenced data dictionaries

cell array of character vectors

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object. This property is read only.

HasUnsavedChanges — Indicator of unsaved changes

0 | 1

Indicator of unsaved changes to the data dictionary, returned as 0 or 1. The value is 1 if changes have been made since last data dictionary save and 0 if not. This property is read only.

NumberOfEntries — Total number of entries in data dictionary

integer

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer. This property is read only.

Methods

<code>addDataSource</code>	Add reference data dictionary to parent data dictionary
<code>close</code>	Close connection between data dictionary and <code>Simulink.data.Dictionary</code> object
<code>discardChanges</code>	Discard changes to data dictionary
<code>filepath</code>	Full path and file name of data dictionary
<code>getSection</code>	Return <code>Simulink.data.dictionary.Section</code> object to represent data dictionary section
<code>hide</code>	Remove data dictionary from Model Explorer
<code>importEnumTypes</code>	Import enumerated type definitions to data dictionary
<code>importFromBaseWorkspace</code>	Import base workspace variables to data dictionary
<code>listEntry</code>	List data dictionary entries
<code>removeDataSource</code>	Remove reference data dictionary from parent data dictionary
<code>saveChanges</code>	Save changes to data dictionary
<code>show</code>	Show data dictionary in Model Explorer

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Create New Data Dictionary and Data Dictionary Object

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `dd1`.

```
dd1 = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
dd1 =
```

```
data dictionary with properties:
```

```
    DataSources: {0x1 cell}  
HasUnsavedChanges: 0  
    NumberOfEntries: 0
```

Open Existing Data Dictionary

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
dd2 =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}  
HasUnsavedChanges: 0  
    NumberOfEntries: 4
```

`Simulink.data.dictionary.create` | `Simulink.data.dictionary.open`

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

addDataSource

Class: Simulink.data.Dictionary

Package: Simulink.data

Add reference data dictionary to parent data dictionary

Syntax

```
addDataSource(dictionaryObj, refDictionaryFile)
```

Description

`addDataSource(dictionaryObj, refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

Examples

Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj, 'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =
```

```
    'myRefDictionary_ex_API.sldd'  
    'mySubDictionary_ex_API.sldd'
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

See Also

`Simulink.data.Dictionary` | `removeDataSource`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

close

Class: Simulink.data.Dictionary

Package: Simulink.data

Close connection between data dictionary and Simulink.data.Dictionary object

Syntax

```
close(dictionaryObj)
```

Description

`close(dictionaryObj)` closes the connection between the Simulink.data.Dictionary object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a Simulink.data.Dictionary object but no longer represents any data dictionary.

Input Arguments

dictionaryObj — Target Simulink.data.Dictionary object

handle to Simulink.data.Dictionary object

Target Simulink.data.Dictionary object, specified as a handle to the object.

Tips

- Use the `close` function in a custom MATLAB function to disassociate a Simulink.data.Dictionary object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.

- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

See Also

`Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Class: Simulink.data.Dictionary

Package: Simulink.data

Discard changes to data dictionary

Syntax

```
discardChanges(dictionaryObj)
```

Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 0
    NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
    HasUnsavedChanges: 1
    NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
```

```
HasUnsavedChanges: 0  
NumberOfEntries: 4
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

filepath

Class: Simulink.data.Dictionary

Package: Simulink.data

Full path and file name of data dictionary

Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =
```

```
C:\Users\jsmith\myDictionary_ex_API.sldd
```

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

getSection

Class: Simulink.data.Dictionary

Package: Simulink.data

Return Simulink.data.dictionary.Section object to represent data dictionary section

Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

Description

`sectionObj = getSection(dictionaryObj,sectionName)` returns a Simulink.data.dictionary.Section object representing one section, `sectionName`, of a data dictionary `dictionaryObj`, a Simulink.data.Dictionary object.

Input Arguments

dictionaryObj — Data dictionary containing target section

Simulink.data.Dictionary object

Data dictionary containing target section, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

sectionName — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: 'Design Data'

Example: 'Configurations'

Data Types: char

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
    Section with properties:
```

```
        Name: 'Design Data'
```

“Store Data in Dictionary Programmatically”

Introduced in R2015a

hide

Class: Simulink.data.Dictionary

Package: Simulink.data

Remove data dictionary from Model Explorer

Syntax

```
hide(dictionaryObj)
```

Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

- “Store Data in Dictionary Programmatically”

Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.
- The `hide` function does not affect the content of the target dictionary.

Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importEnumTypes

Class: Simulink.data.Dictionary

Package: Simulink.data

Import enumerated type definitions to data dictionary

Syntax

```
importedTypes = importEnumTypes(dictionaryObj, targetTypes)
[importedTypes, importFailures] = importEnumTypes(dictionaryObj,
targetTypes)
```

Description

`importedTypes = importEnumTypes(dictionaryObj, targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes, importFailures] = importEnumTypes(dictionaryObj, targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

Input Arguments

dictionaryObj — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary`

object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

targetTypes — Enumerated type definitions to import

cell array of character vectors

Enumerated type definitions to import, specified as a cell array of character vectors. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: `{ 'myEnumType' }`

Example: `{ 'myFirstEnumType', 'mySecondEnumType', 'myThirdEnumType' }`

Data Types: `cell`

Output Arguments

importedTypes — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

importFailures — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

Examples

Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file `myDataEnum_ex_API.m`. The file defines an enumerated type named `InstrumentTypes` using the `Simulink.defineIntEnumType` function and creates three variables based on the new type. Then, import the new variables from the base workspace to `myDictionary_ex_API.sldd`.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj, 'varList', ...
{'firstEnumVariable', 'secondEnumVariable', 'thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to `myDictionary_ex_API.sldd`.

```
importEnumTypes(myDictionaryObj, {'InstrumentTypes'})
```

```
ans =
```

```
    className: 'InstrumentTypes'
  renamedFiles: {}
```

- “Enumerations in Data Dictionary”
- “Store Data in Dictionary Programmatically”

Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.

- You can define an enumerated type using a `classdef` block in a MATLAB file or a P-file. `importEnumTypes` imports type definitions directly from these files if you specify the names of the types to import using the input argument `targetTypes` and if the files defining the types are on your MATLAB path.
- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

“Enumerations in Data Dictionary”

“Store Data in Dictionary Programmatically”

Introduced in R2015a

importFromBaseWorkspace

Class: Simulink.data.Dictionary

Package: Simulink.data

Import base workspace variables to data dictionary

Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj, Name, Value)
[importedVars, existingVars] = importFromBaseWorkspace(____)
```

Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj, Name, Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name, Value` pair arguments.

`[importedVars, existingVars] = importFromBaseWorkspace(____)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

clearWorkspaceVars — Flag to clear base workspace of imported variables

`false` (default) | `true`

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of 'clearWorkspaceVars' and `true` or `false`.

Example: 'clearWorkspaceVars',`true`

Data Types: `logical`

existingVarsAction — Action to take for existing dictionary variables

'none' (default) | 'error' | 'overwrite'

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of 'existingVarsAction' and 'none', 'error', or 'overwrite'.

If you specify 'none', `importFromBaseWorkspace` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify 'error', `importFromBaseWorkspace` returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify `'overwrite'`, `importFromBaseWorkspace` imports all target variables and overwrites any variables that are already in the data dictionary.

Example: `'existingVarsAction','error'`

Data Types: `char`

varList — Variables to import

cell array of character vectors

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of `'varList'` and a cell array of character vectors. If you want to import only one variable, specify the name inside a cell array. If you do not specify `'varList'`, `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: `'varList',{'a','myVariable','fuelFlow'}`

Example: `'varList',{'fuelFlow'}`

Data Types: `cell`

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `'existingVarsAction'` is set to `'none'` which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

Examples

Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';  
myVariable = true;  
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.slidd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.slidd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because  
they already exist in the dictionary:  
    fuelFlow
```

Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';  
mySecondVariable = true;  
airFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.slidd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', ...  
{ 'b', 'mySecondVariable', 'airFlow' });
```

Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'fuelFlow'}, ...  
'existingVarsAction', 'overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;  
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...  
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars =  
  
    'myNewVariable'
```

```
existingVars =  
  
    'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelflow` because it is already in the target data dictionary.

- “Store Data in Dictionary Programmatically”

Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

`Simulink.data.Dictionary` | `importEnumTypes`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

listEntry

Class: Simulink.data.Dictionary

Package: Simulink.data

List data dictionary entries

Syntax

```
listEntry(dictionaryObj)  
listEntry(dictionaryObj, Name, Value)
```

Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj, Name, Value)` displays the entries in a data dictionary with additional options specified by one or more `Name, Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary`

object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Ascending — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of 'Ascending' and `true` or `false`. If you specify `false`, `listEntry` sorts the list in descending order.

Example: 'Ascending', `false`

Data Types: `logical`

Class — Criteria to filter list by class

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of 'Class' and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: 'Class', 'Simulink.Parameter'

Data Types: `char`

LastModifiedBy — Criteria to filter list by user name of last modifier

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of 'LastModifiedBy' and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: 'LastModifiedBy', 'jsmith'

Data Types: `char`

Limit — Maximum number of entries to list

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of 'Limit' and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: 'Limit', 9

Data Types: double

Name — Criteria to filter list by entry name

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of 'Name' and a character vector defining the filter criteria. You can use an asterisk character, *, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: 'Name', 'fuelFlow'

Example: 'Name', 'fuel*'

Data Types: char

Section — Criteria to filter list by data dictionary section

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of 'Section' and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: 'Section', 'Design Data'

SortBy — Flag to sort list by specific property

'Name' (default) | 'Section' | 'LastModified' | 'LastModifiedBy'

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of 'SortBy' and a character vector identifying a property in the list of entries. Valid properties include 'Name', 'Section', 'LastModified', and 'LastModifiedBy'.

Example: 'SortBy', 'LastModifiedBy'

Examples

List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj, 'Ascending', false)
```

Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj, 'Name', 'max*')
```

Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj, 'SortBy', 'LastModified')
```

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

removeDataSource

Class: Simulink.data.Dictionary

Package: Simulink.data

Remove reference data dictionary from parent data dictionary

Syntax

```
removeDataSource(dictionaryObj, refDictionaryFile)
```

Description

`removeDataSource(dictionaryObj, refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

Input Arguments

dictionaryObj — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

refDictionaryFile — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: 'myRefDictionary_ex_API.sldd'

Data Types: char

Examples

Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {'myRefDictionary_ex_API.sldd'}
HasUnsavedChanges: 0
    NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj, 'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
    DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 1  
NumberOfEntries: 3
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

saveChanges

Class: Simulink.data.Dictionary

Package: Simulink.data

Save changes to data dictionary

Syntax

```
saveChanges(dictionaryObj)
```

Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

Examples

Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

```
myDictionaryObj =

    data dictionary with properties:

        DataSources: {0x1 cell}
        HasUnsavedChanges: 0
        NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);
myDictionaryObj
```

```
myDictionaryObj =

    Dictionary with properties:

        DataSources: {0x1 cell}
        HasUnsavedChanges: 1
        NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj
```

```
myDictionaryObj =

    Dictionary with properties:

        DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 0
NumberOfEntries: 1
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

show

Class: Simulink.data.Dictionary

Package: Simulink.data

Show data dictionary in Model Explorer

Syntax

```
show(dictionaryObj)
show(dictionaryObj, openModelExplorer)
```

Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj, openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

Input Arguments

dictionaryObj — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

openModelExplorer — Flag to open Model Explorer

`true` (default) | `false`

Flag to open Model Explorer, specified as `true` or `false`.

Data Types: `logical`

Examples

Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj, false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

- “Store Data in Dictionary Programmatically”

Tips

- Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

See Also

`Simulink.data.Dictionary` | `hide`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.Entry class

Package: Simulink.data.dictionary

Configure data dictionary entry

Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

Construction

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

Properties

DataSource — File name of containing data dictionary

character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

LastModified — Date and time of last modification

character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

LastModifiedBy — Name of last user to modify entry

character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

Name — Name of entry

character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: char

Status — State of entry

'New' | 'Modified' | 'Unchanged' | 'Deleted'

State of entry, returned as 'New', 'Modified', 'Unchanged', or 'Deleted'. The state is valid since the last data dictionary save. If the state is 'Deleted', the represented entry was deleted from its data dictionary. This property is read only.

Methods

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Add Entry to Data Dictionary and Modify its Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry `myEntry` with value 27 to the Design Data section of `myDictionary_ex_API.sldd`. Assign the returned `Simulink.data.dictionary.Entry` object to variable `e`.

```
e = addEntry(dDataSectObj, 'myEntry', 27)
```

```
e =
```

```
Entry with properties:
```

```
    Name: 'myEntry'  
    Value: 27  
    DataSource: 'myDictionary_ex_API.sldd'  
    LastModified: '2014-Aug-26 18:42:08.439709'  
    LastModifiedBy: 'jsmith'  
    Status: 'New'
```

Change the value of `myEntry` from 27 to the character vector 'My New Value'.

```
setValue(e, 'My New Value')
```

```
e
```

```
e =
```

```
Entry with properties:
```

```

        Name: 'myEntry'
        Value: 'My New Value'
        DataSource: 'myDictionary_ex_API.sldd'
        LastModified: '2014-Aug-26 18:45:58.336598'
        LastModifiedBy: 'jsmith'
        Status: 'New'

```

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');

```

Return the value of the entry `fuelFlow` and assign the value to the variable `fuelFlowValue`.

```

fuelFlowValue = getValue(fuelFlowObj)

fuelFlowValue =

```

237

Move Entry Within Data Dictionary Hierarchy

Represent the `Design Data` section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. `myDictionary_ex_API.sldd` references the data dictionary `myRefDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');

```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`, which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```

e = getEntry(dDataSectObj, 'fuelFlow')

```

```
e =  
  
Entry with properties:  
  
    Name: 'fuelFlow'  
    Value: 237  
    DataSource: 'myDictionary_ex_API.sldd'  
    LastModified: '2014-Sep-05 13:12:06.099278'  
    LastModifiedBy: 'jsmith'  
    Status: 'Unchanged'
```

Migrate the entry `fuelFlow` to the reference data dictionary `myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'  
  
e =  
  
Entry with properties:  
  
    Name: 'fuelFlow'  
    Value: 237  
    DataSource: 'myRefDictionary_ex_API.sldd'  
    LastModified: '2014-Sep-05 13:12:06.099278'  
    LastModifiedBy: 'jsmith'  
    Status: 'Modified'
```

Because `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the entry `fuelFlow` between them.

“What Is a Data Dictionary?”

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(entryObj)
```

Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to `'Deleted'`. You can access only the `Status` properties of the objects.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

“Store Data in Dictionary Programmatically”

Introduced in R2015a

discardChanges

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Discard changes to data dictionary entry

Syntax

```
discardChanges(entryObj)
```

Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj, 493);
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'
    Value: 493
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:14:30.661978'
    LastModifiedBy: 'jsmith'
    Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'
    Value: 237
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:12:06.099278'
```

```
LastModifiedBy: 'jsmith'  
Status: 'Unchanged'
```

- “Store Data in Dictionary Programmatically”

Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Search in array of data dictionary entries

Syntax

```
foundEntries = find(targetEntries, PName1, PValue1, ..., PNameN, PValueN)
foundEntries = find(targetEntries, PName1, PValue1, ..., PNameN, PValueN,
options)
```

Description

`foundEntries = find(targetEntries, PName1, PValue1, ..., PNameN, PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1, PValue1, ..., PNameN, PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries, PName1, PValue1, ..., PNameN, PValueN, options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

Input Arguments

targetEntries — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array

`Simulink.data.dictionary.Entry` objects. Before you use this function, represent

the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: `[myEntryObj1,myEntryObj2,myEntryObj3]`

PName1, PValue1, . . . , PNameN, PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy', 'jsmith'`

Example: `'DataSource', 'myRefDictionary_ex_API.slidd'`

options — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

<code>'-value'</code>	This option causes <code>find</code> to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or options arguments.
<code>'-and', '-or', '-xor', or '-not'</code> logical operators	These options modify or combine multiple search criteria or other option codes.
<code>'-property', propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
<code>'-class', className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.

<code>'-isa', className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
<code>'-regexp'</code>	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow <code>'-regexp'</code> .

Example: `'-value'`

Example: `'-value', '-property', 'CoderInfo'`

Example: `'-value', '-class', 'Simulink.Parameter'`

Output Arguments

foundEntries — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples

Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith', '-or', ...  
'-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs, '-regexp', 'Name', 'Press*')
```

Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];  
for i = 1:length(myEntryObjs)  
    if getValue(myEntryObjs(i)) == 237  
        foundEntries = [foundEntries myEntryObjs(i)];  
    end  
end
```

Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs, '-value', '-property', 'DataType')
```

Introduced in R2015a

getValue

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Return value of data dictionary entry

Syntax

```
entryValue = getValue(entryObj)
```

Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.slidd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)  
  
fuelFlowValue =
```

237

`Simulink.data.dictionary.Entry` | `setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

setValue

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Set value of data dictionary entry

Syntax

```
setValue(entryObj, newValue)
```

Description

`setValue(entryObj, newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

newValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493. Then, view the `Value` property of `fuelFlowObj` to observe the change.

```
setValue(fuelFlowObj, 493)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
    Name: 'fuelFlow'
    Value: 493
    DataSource: 'myDictionary_ex_API.sldd'
    LastModified: '2014-Sep-05 13:37:22.161124'
    LastModifiedBy: 'jsmith'
    Status: 'Modified'
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Entry` | `getValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

showChanges

Class: Simulink.data.dictionary.Entry

Package: Simulink.data.dictionary

Display changes made to data dictionary entry

Syntax

```
showChanges(entryObj)
```

Description

`showChanges(entryObj)` opens the Comparison Tool to show changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object. The Comparison Tool displays the properties of `entryObj` as they were when the data dictionary was last saved and as they were when the `showChanges` function was called.

Input Arguments

entryObj — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

Examples

View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.slidd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Make a change to the entry `fuelFlow` by assigning it the new value 494.

```
setValue(fuelFlowObj, 494);
```

Observe the unsaved change to the entry `fuelFlow`. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

`Simulink.data.dictionary.Entry` | `discardChanges`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

Simulink.data.dictionary.EnumTypeDefinition class

Package: Simulink.data.dictionary

Store enumerated type definition in data dictionary

Description

An object of the `Simulink.data.dictionary.EnumTypeDefinition` class defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, objects of this class retain information about an enumerated type but do not define the type for use by other variables or by models.

Construction

When you use the function `importEnumTypes` to import the definitions of enumerated types to a data dictionary, Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.

The constructor `Simulink.data.dictionary.EnumTypeDefinition` creates an instance of this class with default property values and a single enumeration member that has underlying integer value 0.

Properties

AddClassNameToEnumNames — Flag to control enumeration identifiers in generated code
`false` (default) | `true`

Flag to prefix enumerations with the class name in generated code, specified as `true` or `false`.

If you specify `true`, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class

LEDcolor with enumeration members GREEN and RED defines the enumeration members in generated code as LEDcolor_GREEN and LEDcolor_RED.

Data Types: logical

DataScope — Flag to control data type definition in generated code

'Auto' (default) | 'Imported' | 'Exported'

Flag to control data type definition in generated code, specified as 'Auto', 'Imported', or 'Exported'. The table describes the behavior of generated code for each value.

Value	Action
Auto (default)	<p>If you do not specify the property Headerfile, export the data type definition to <i>model_types.h</i>, where <i>model</i> is the model name.</p> <p>If you specify Headerfile, import the data type definition from the specified header file.</p>
Exported	<p>Export the data type definition to a separate header file.</p> <p>If you do not specify the property Headerfile, the header file name defaults to <i>type.h</i>, where <i>type</i> is the data type name.</p>
Imported	<p>Import the data type definition from a separate header file.</p> <p>If you do not specify the property Headerfile, the header file name defaults to <i>type.h</i>, where <i>type</i> is the data type name.</p>

DefaultValue — Default enumeration member

' ' (default) | character vector

Default enumeration member, specified as a character vector. Specify DefaultValue as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, `''`, and Simulink uses the first enumeration member as the default member.

Example: `'enumMember1'`

Description — Description of enumerated data type in generated code

`''` (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: `'Two possible colors of LED indicator: GREEN and RED.'`

Data Types: `char`

HeaderFile — Name of header file defining enumerated data type in generated code

`''` (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a `.h` extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property .

Example: `'myTypeIncludeFile.h'`

Data Types: `char`

StorageType — Data type of underlying integer values

`''` (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- `'int8'`
- `'int16'`
- `'int32'`
- `'uint8'`

- 'uint16'

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, `''`, which is the default value.

Example: 'int16'

''

Methods

`appendEnumeral` Add enumeration member to enumerated data type definition in data dictionary

`removeEnumeral` Remove enumeration member from enumerated data type definition in data dictionary

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition  
    enum1
```

Add some enumeration members to the definition of the type.

```

appendEnumeral(myColors, 'Orange', 1, '')
appendEnumeral(myColors, 'Black', 2, '')
appendEnumeral(myColors, 'Cyan', 3, '')
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan

```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```

removeEnumeral(myColors, 1)
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');

```

Import the object that defines the enumerated type `myColors` to the dictionary.

```

importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});

```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

See Also

`Simulink.data.Dictionary`

Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

Introduced in R2015a

appendEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition

Package: Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

Syntax

```
appendEnumeral (typeObj, memberName, memberValue, memberDesc)
```

Description

`appendEnumeral (typeObj, memberName, memberValue, memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberName — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: `char`

memberValue — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: `single` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `double`

memberDesc — Description of new enumeration member

character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: `'Enumeration member number 1.'`

Example: `''`

Data Types: `char`

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition  
    enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, '')  
appendEnumeral(myColors, 'Black', 2, '')
```

```
appendEnumeral(myColors, 'Cyan', 3, '')
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        enum1
        Orange
        Black
        Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors, 1)
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

See Also

`Simulink.data.dictionary.EnumTypeDefinition` |
`Simulink.data.dictionary.EnumTypeDefinition.removeEnumeral`

Topics

“Store Data in Dictionary Programmatically”
“Use Enumerated Data in Simulink Models”

Introduced in R2015a

removeEnumeral

Class: Simulink.data.dictionary.EnumTypeDefinition

Package: Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

Syntax

```
removeEnumeral(typeObj,memberNum)
```

Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

Input Arguments

typeObj — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

memberNum — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type `BasicColors` has this definition:

```
myColors =
```

```
    Simulink.data.dictionary.EnumTypeDefinition
```

```
Orange  
Black  
Cyan
```

To remove the enumeration member `Black`, specify `memberNum` as 2. To remove the enumeration member `Cyan`, specify 3.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

```
Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 |  
uint64 | double
```

Examples

Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition  
  
myColors =  
  
    Simulink.data.dictionary.EnumTypeDefinition  
    enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, '')  
appendEnumeral(myColors, 'Black', 2, '')  
appendEnumeral(myColors, 'Cyan', 3, '')  
myColors  
  
myColors =  
  
    Simulink.data.dictionary.EnumTypeDefinition  
    enum1  
    Orange
```

```

    Black
    Cyan

```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```

removeEnumeral(myColors,1)
myColors

myColors =

    Simulink.data.dictionary.EnumTypeDefinition
        Orange
        Black
        Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');

```

Import the object that defines the enumerated type `myColors` to the dictionary.

```

importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});

```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

Introduced in R2015a

Simulink.data.dictionary.Section class

Package: Simulink.data.dictionary

Configure data dictionary section

Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

Construction

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

Properties

Name — Name of data dictionary section

character vector

Name of data dictionary section, returned as a character vector. This property is read only.

Methods

<code>addEntry</code>	Add new entry to data dictionary section
<code>assignin</code>	Assign value to data dictionary entry
<code>deleteEntry</code>	Delete data dictionary entry
<code>evalin</code>	Evaluate MATLAB expression in data dictionary section
<code>exist</code>	Check existence of data dictionary entry
<code>exportToFile</code>	Export data dictionary entries from section to MAT-file or MATLAB file
<code>find</code>	Search in data dictionary section
<code>getEntry</code>	Create <code>Simulink.data.dictionary.Entry</code> object to represent data dictionary entry
<code>importFromFile</code>	Import variables from MAT-file or MATLAB file to data dictionary section

Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects (MATLAB).

Examples

Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

Section with properties:

Name: 'Design Data'

- “Store Data in Dictionary Programmatically”

See Also

`Simulink.data.Dictionary` | `getSection`

Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

Introduced in R2015a

addEntry

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Add new entry to data dictionary section

Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

Description

`addEntry(sectionObj,entryName,entryValue)` adds an entry, with name `entryName` and value `entryValue`, to the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object.

`entryObj = addEntry(sectionObj,entryName,entryValue)` returns a `Simulink.data.dictionary.Entry` object representing the newly added data dictionary entry.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

entryName — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: 'myNewEntry'

Data Types: char

entryValue — Value of new data dictionary entry

MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd` an entry `myNewEntry` with value 237.

```
addEntry(dDataSectObj, 'myNewEntry', 237)
```

Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd`. Name the new entry `myNewParam` and assign a `Simulink.Parameter` object to the value.

```
addEntry(dDataSectObj, 'myNewParam', Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

- “Store Data in Dictionary Programmatically”

Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

See Also

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `assignin`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

assignin

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Assign value to data dictionary entry

Syntax

```
assignin(sectionObj,entryName,entryValue)
```

Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the `getSection` function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the functions creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

entryValue — Value to assign to data dictionary entry

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

Examples

Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.slidd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.slidd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.slidd`, create it.

```
assignin(dDataSectObj, 'myAssignedEntry', 237)
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use the Model Explorer window to view and change the values of data dictionary entries.

See Also

`Simulink.data.dictionary.Section | setValue`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

deleteEntry

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Delete data dictionary entry

Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to `'Deleted'`.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Examples

Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj. The Design Data section of myDictionary_ex_API.sldd already contains an entry named fuelFlow.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Delete the entry fuelFlow from the data dictionary myDictionary_ex_API.sldd. myDictionary_ex_API.sldd no longer contains the fuelFlow entry.

```
deleteEntry(dDataSectObj, 'fuelFlow')
```

Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary

`myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
deleteEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
            'myRefDictionary_ex_API.sldd')
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

See Also

`Simulink.data.dictionary.Entry` | `Simulink.data.dictionary.Section` | `addEntry`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

evalin

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

Syntax

```
returnValue = evalin(sectionObj,expression)
```

Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

expression — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

Examples

List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.slidd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.slidd`.

```
evalin(dDataSectObj, 'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

- “Store Data in Dictionary Programmatically”

Tips

- `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

See Also

`Simulink.data.dictionary.Section` | `Simulink.data.evalinGlobal`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exist

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Check existence of data dictionary entry

Syntax

```
doesExist = exist(sectionObj,entryName)
```

Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the `getSection` function.

entryName — Name of target entry

character vector

Name of target entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

Output Arguments

doesExist — Indication of entry existence

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

Examples

Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Determine if an entry `fuelFlow` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj, 'fuelFlow')
```

```
ans =
```

```
1
```

Determine if an entry `myEntry` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj, 'myEntry')
```

```
ans =
```

```
0
```

- “Store Data in Dictionary Programmatically”

Tips

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

Alternatives

You can use Model Explorer to search a data dictionary for an entry.

See Also

`Simulink.data.dictionary.Section` | `Simulink.data.existsInGlobal` | `find`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

exportToFile

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

Syntax

```
exportToFile(sectionObj, fileName)
```

Description

`exportToFile(sectionObj, fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: `'myNewFile.mat'`

Example: 'myNewFile.m'

Data Types: char

Examples

Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

Represent the Configurations section of `myDictionary_ex_API.sldd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');  
configSectObj = getSection(myDictionaryObj, 'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj, 'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj, 'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'  
to MAT-file myDictionaryConfigurations.mat.
```

- “Store Data in Dictionary Programmatically”

Limitation

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

Alternatives

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

`Simulink.data.dictionary.Section` | `importFromFile`

Topics

“Store Data in Dictionary Programmatically”

Introduced in R2015a

find

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Search in data dictionary section

Syntax

```
foundEntries = find(sectionObj, PName1, PValue1, ..., PNameN, PValueN)
foundEntries = find(sectionObj, PName1, PValue1, ..., PNameN, PValueN,
options)
```

Description

`foundEntries = find(sectionObj, PName1, PValue1, ..., PNameN, PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1, PValue1, ..., PNameN, PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj, PName1, PValue1, ..., PNameN, PValueN, options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

Input Arguments

sectionObj — Data dictionary section to search

Simulink.data.dictionary.Section object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the getSection function.

PName1,PValue1,...,PNameN,PValueN — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see Simulink.data.dictionary.Entry. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the '-value' option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: 'LastModifiedBy','jsmith'

Example: 'DataSource','myRefDictionary_ex_API.slidd'

options — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes find to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or options arguments.
'-and','-or','-xor','-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property',propertyName	This name-value pair causes find to search for entries or values that have the property propertyName regardless of the value of the property. Specify propertyName as a character vector.
'-class',className	This name-value pair causes find to search for entries or values that are objects of the class className. Specify className as a character vector.

'-isa', className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

Output Arguments

foundEntries — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

Examples

Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj, '-value', '-class', 'Simulink.Parameter')
```

Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith')
```

Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith', '-or', ...  
    '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, '-regexp', 'Name', 'fuel*')
```

Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];  
for i = 1:length(allEntries)  
    if getValue(allEntries(i)) == 237  
        foundEntries = [foundEntries allEntries(i)];  
    end  
end
```

Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj, '-value', '-property', 'DataType')
```

- “Store Data in Dictionary Programmatically”

Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

getEntry

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Create Simulink.data.dictionary.Entry object to represent data dictionary entry

Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,
entryName, 'DataSource',dictionaryName)
```

Description

`entryObj = getEntry(sectionObj,entryName)` returns an array of Simulink.data.dictionary.Entry objects representing data dictionary entries `entryName` found in the data dictionary section `sectionObj`, a Simulinkdata.dictionary.Section object. `getEntry` returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

`entryObj = getEntry(sectionObj,entryName, 'DataSource',dictionaryName)` returns an object representing a data dictionary entry that is defined in the data dictionary `dictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

Input Arguments

sectionObj — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a

Simulink.data.dictionary.Section object by using, for example, the getSection function.

entryName — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

dictionaryName — Name of data dictionary containing target entry

character vector

File name of data dictionary containing the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary_ex_API.sldd'

Data Types: char

Output Arguments

entryObj — Target data dictionary entry

Simulink.data.dictionary.Entry object

Target data dictionary entry, returned as one or more Simulink.data.dictionary.Entry objects.

Examples

Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary_ex_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493.

```
setValue(fuelFlowObj, 493)
```

Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...  
    'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to 493.

```
setValue(refEntryObj, 493)
```

importFromFile

Class: Simulink.data.dictionary.Section

Package: Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

Syntax

```
importedVars = importFromFile(sectionObj, fileName)
importedVars = importFromFile(sectionObj,
    fileName, 'existingVarsAction', existAction)
[importedVars, existingVars] = importFromFile( ___ )
```

Description

`importedVars = importFromFile(sectionObj, fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj, fileName, 'existingVarsAction', existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars, existingVars] = importFromFile(___)` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

Input Arguments

sectionObj — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

fileName — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `importFromFile` automatically supplies a file extension `.mat` if you do not specify an extension.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

existAction — Action to take for existing dictionary variables

`'none'` (default) | `'overwrite'` | `'error'`

Action to take for existing dictionary variables, specified as `'none'`, `'overwrite'`, or `'error'`.

If you specify `'none'`, `importFromFile` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify `'overwrite'`, `importFromFile` imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify `'error'`, `importFromFile` returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: `'overwrite'`

Data Types: `char`

Output Arguments

importedVars — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromFile` assigns its value to the corresponding entry in the target data dictionary.

existingVars — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `existAction` is set to 'none', which is also the default. In that case `importFromFile` imports only variables that are not already in the target data dictionary.

Examples

Import to Data Dictionary from File

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');  
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary and return a list of successfully imported variables. If any variables are already in `myDictionary_ex_API.sldd`, `importFromFile` returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj, 'myData_ex_API.m')
```

```
Warning: The following variables were not imported because  
they already exist in the dictionary:
```

```
    fuelFlow
```

```
ans =

    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```
importFromFile(dDataSectObj, 'myData_ex_API.m', 'existingVarsAction', 'overwrite')

ans =
```

```
    'fuelFlow'
    'myFirstEntry'
    'mySecondEntry'
    'myThirdEntry'
```

Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromFile(dDataSectObj, 'myData_ex_API.m')  
  
importedVars =  
  
    'myFirstEntry'  
    'mySecondEntry'  
    'myThirdEntry'  
  
  
existingVars =  
  
    'fuelFlow'
```

`importFromFile` does not import the variable `fuelFlow` because it is already in the target data dictionary.

- “Store Data in Dictionary Programmatically”

Tips

- `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See “Import Data to Dictionary from File” for more information.

Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

Description

This class extends the `Simulink.Parameter` class so that you can define an object that stores two scaled values of the same physical value. For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- x is the calibration value.
- y is the main value.
- a and b are the coefficients of the CalToMain compute numerator.
- c and d are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of

parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

You can use the `Simulink.DualScaledParameter` dialog box to define a `Simulink.DualScaledParameter` object. To open the dialog box:

- 1 In the Model Explorer, select the base workspace or a model workspace and select **Add > Add Custom**.
- 2 In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.

Property Dialog Box

Main Attributes Tab

The image shows a screenshot of the Simulink Property Dialog Box for a parameter named 'param'. The dialog box has two tabs: 'Calibration Attributes' and 'Main Attributes', with 'Main Attributes' currently selected. The 'Value' field is empty and contains '[]'. The 'Data type' is set to 'auto' with a dropdown arrow and a '>>' button. The 'Dimensions' field contains '[0 0]' and the 'Complexity' field contains 'real'. The 'Minimum' field contains '[]' and the 'Maximum' field contains '[]'. The 'Unit' field is empty. Below these fields is a section for 'Code generation options' with a 'Storage class' dropdown set to 'Auto'. At the bottom of the dialog is a 'Description' text area, which is currently empty. The dialog box has standard 'OK', 'Cancel', 'Help', and 'Apply' buttons at the bottom right.

Simulink.DualScaledParameter: param

Calibration Attributes Main Attributes

Value: []

Data type: auto >>

Dimensions: [0 0] Complexity: real

Minimum: [] Maximum: []

Unit:

Code generation options

Storage class: Auto

Description:

OK Cancel Help Apply

This tab shows the properties inherited from the `Simulink.Parameter` class. For more information, see `Simulink.Parameter`.

Calibration Attributes Tab

The image shows a dialog box titled "Simulink.DualScaledParameter: param" with a close button (X) in the top right corner. The dialog has two tabs: "Calibration Attributes" (selected) and "Main Attributes".

Under the "Calibration Attributes" tab, there are several input fields:

- Calibration value: []
- Calibration minimum: [] Calibration maximum: []
- CalToMain compute numerator: []
- CalToMain compute denominator: []
- Calibration name: ""
- Calibration units: ""

Below these fields is a section titled "Parameter validation" with a sub-label "Is configuration valid:" and a text input field containing the value "true".

At the bottom of the dialog is a "Diagnostic message:" label followed by a large, empty text area.

At the bottom right of the dialog are four buttons: "OK", "Cancel", "Help", and "Apply".

Calibration value

Calibration value of the parameter. The value that you prefer to use. The default value is [] (unspecified). Specify a finite, real, double value.

Before specifying **Calibration value**, you must specify **CalToMain compute numerator** and **CalToMain compute denominator** to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Calibration minimum

Minimum value for the calibration parameter. The default value is [] (unspecified). Specify a finite, real, double scalar value.

Before specifying **Calibration minimum**, you must specify **CalToMain compute numerator** and **CalToMain compute denominator** to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Calibration maximum

Maximum value for the calibration parameter. The default value is [] (unspecified). Specify a finite, real, double scalar value.

Before specifying **Calibration maximum**, you must specify **CalToMain compute numerator** and **CalToMain compute denominator** to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these

cases, when updating the diagram or starting a simulation, Simulink generates an error.

CalToMain compute numerator

Specify the numerator coefficients *a* and *b* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is [] (unspecified). Specify finite, real, double scalar values for *a* and *b*. For example, [1 1] or, for reciprocal scaling, 1.

Once you have applied CalToMain compute numerator, you cannot change it.

CalToMain compute denominator

Specify the denominator coefficients *c* and *d* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is [] (unspecified). Specify finite, real, double scalar values for *c* and *d*. For example, [1 1].

Once you have applied CalToMain compute denominator, you cannot change it.

Calibration name

Specify the name of the calibration parameter. The default value is ''. Specify a character vector value, for example, 'T1'.

Calibration units

Specify the measurement units for this calibration value. This field is intended for use in documenting this parameter. The default value is ''. Specify a character vector value, for example, 'Fahrenheit'.

Is configuration valid

Simulink indicates whether the configuration is valid. The default value is `true`. If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the **Diagnostic message** field. You cannot set this field.

Diagnostic message

If you specify invalid parameter settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue. You cannot set this field.

Properties

Name	Access	Description
CalibrationValue	RW	Calibration value of this parameter. (Calibration value)
CalibrationMin	RW	Calibration minimum value of this parameter. (Calibration minimum)
CalibrationMax	RW	Calibration maximum value of this parameter. (Calibration maximum)
CalToMainCompuNumerator	RW	Numerator coefficients of the computation method. (CalToMain compute numerator) Once you have applied <code>CalToMainCompuNumerator</code> , you cannot change it.
CalToMainCompuDenominator	RW	Denominator coefficients of the computation method. (CalToMain compute denominator) Once you have applied <code>CalToMainCompuDenominator</code> , you cannot change it.
CalibrationName	RW	Name of the calibration parameter. (Calibration name)
CalibrationDocUnits	RW	Measurement units for this calibration parameter's value. (Calibration units)
IsConfigurationValid	RO	Information about validity of configuration. (Is configuration valid)
DiagnosticMessage	RO	If the configuration is invalid, diagnostic information to help you fix the issue. (Diagnostic message)

Example

Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];  
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212
```

```
Temp =
```

```
DualScaledParameter with properties:
```

```
    CalibrationValue: 212  
    CalibrationMin: []  
    CalibrationMax: []  
    CalToMainCompuNumerator: [1 -32]  
    CalToMainCompuDenominator: 1.8000  
    CalibrationName: ''  
    CalibrationDocUnits: ''  
    IsConfigurationValid: 1  
    DiagnosticMessage: ''  
    Value: 100  
    CoderInfo: [1x1 Simulink.CoderInfo]  
    Description: ''  
    DataType: 'auto'  
    Min: []  
    Max: []  
    Unit: ''  
    Complexity: 'real'  
    Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is 212 (degrees Fahrenheit), so `Temp.Value` is 100 (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';  
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;  
Temp.CalibrationMax = 300;
```

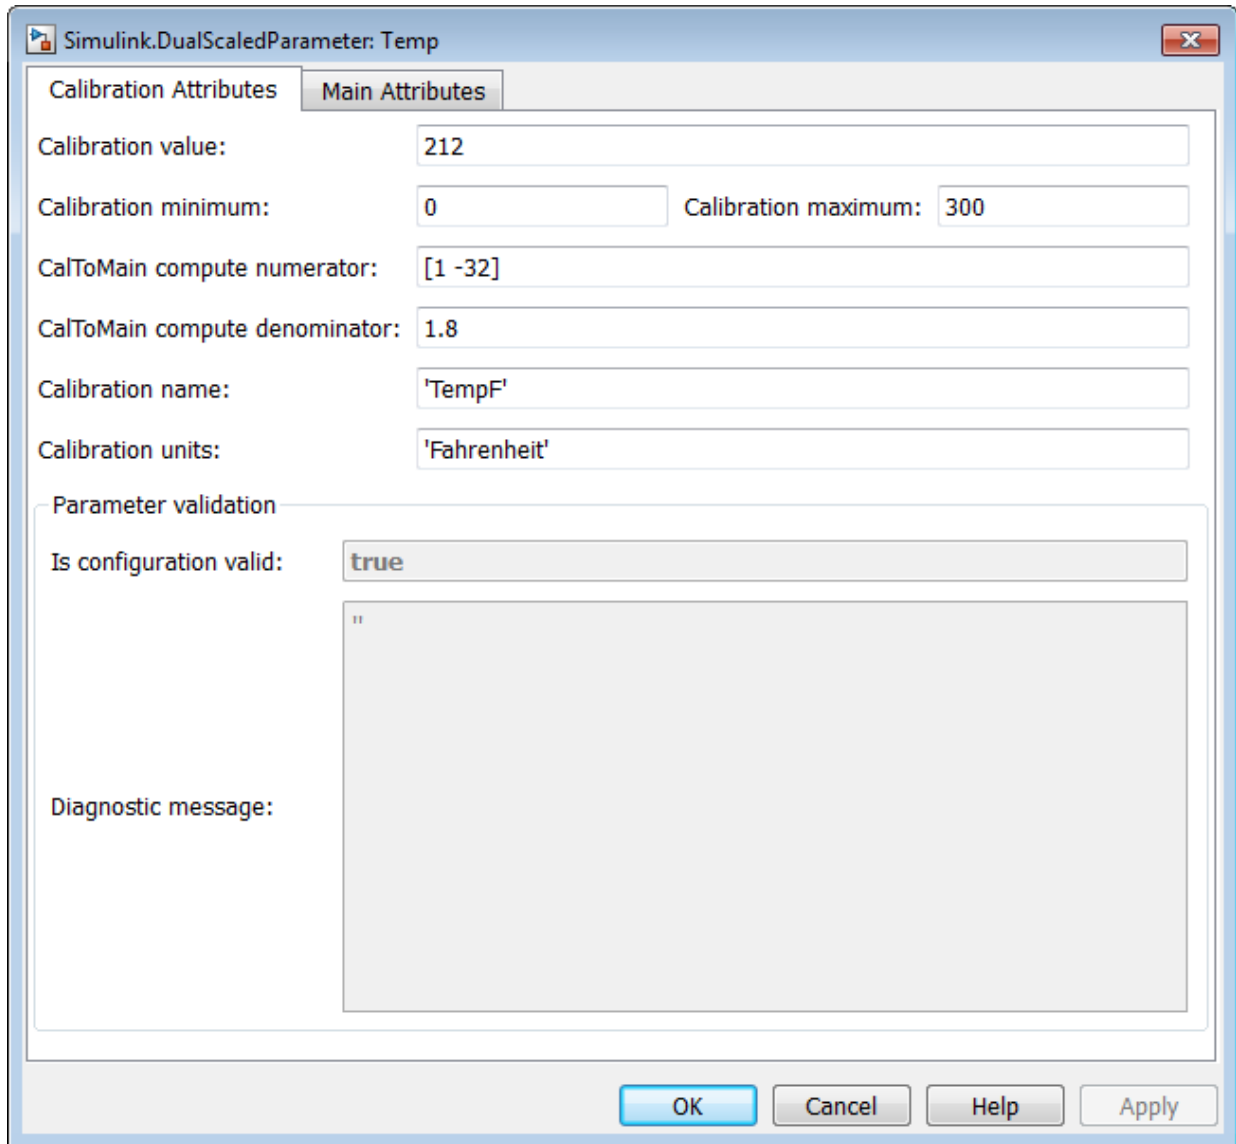

If you specify a calibration value outside this allowable range, Simulink generates a warning.

Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

Open the `Simulink.DualScaledParameter` dialog box.

```
open Temp
```

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.

The screenshot shows a dialog box titled "Simulink.DualScaledParameter: Temp" with two tabs: "Calibration Attributes" and "Main Attributes". The "Main Attributes" tab is selected. The dialog contains the following fields and controls:

- Value:** A text input field containing the number "100".
- Data type:** A dropdown menu set to "auto" with a ">>" button to its right.
- Dimensions:** A text input field containing "[1 1]".
- Complexity:** A dropdown menu set to "real".
- Minimum:** A text input field containing "-17.7778".
- Maximum:** A text input field containing "148.889".
- Unit:** A text input field containing "degC".
- Code generation options:** A section containing a "Storage class:" dropdown menu set to "Auto".
- Description:** A large empty text area for entering a description.

At the bottom of the dialog are four buttons: "OK", "Cancel", "Help", and "Apply".

This tab displays information about the value used by Simulink.

Simulink.Mask class

Package: Simulink

Control masks programmatically

Description

Use an instance of `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

Properties

Type

Specifies the mask type of the associated block.

Type: character vector

Default: Empty character vector

Description

Specifies the block description of the associated block.

Type: character vector

Default: Empty character vector

Help

Specifies the help text that is displayed for the mask.

Type: character vector

Default: Empty character vector

Initialization

Specifies the initialization commands for the associated block.

Type: character vector

Default: Empty character vector

SelfModifiable

Indicates that the block can modify itself and its content.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Display

Specifies MATLAB code for drawing the block icon.

Type: character vector

Default: Empty character vector

IconFrame

Sets the visibility of the block frame. (Visible is on, Invisible is off).

Type: boolean

Values: 'on' | 'off'

Default: 'on'

IconOpaque

Sets the transparency of the icon (Opaque is on, Transparent is off).

Type: boolean

Values: 'on' | 'off'

Default: 'on'

RunInitForIconRedraw

Specifies whether Simulink must run mask initialization before executing the mask icon commands.

Type: enum

Values: 'auto' | 'on' | 'off'

Default: 'auto'

IconRotate

Sets icon to rotate with the block.

Type: enum

Values: 'none' | 'port'

Default: 'none'

PortRotate

Specifies the port rotation policy for the masked block.

Type: enum

Values: 'default' | 'physical'

Default: 'default'

IconUnits

Specifies the units for the drawing commands.

Type: enum

Values: 'pixel' | 'autoscale' | 'normalized'

Default: 'autoscale'

Methods

addParameter	Add a parameter to a mask
copy	Copy a mask from one block to another
create	Create a mask on a Simulink block
delete	Unmask a block and delete the mask from memory
get	Get a block mask as a mask object
addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
getOwner	Determine the block that owns a mask
getParameter	Get a mask parameter using its name
getWorkspaceVariables	Get all the variables defined in the mask workspace for a masked block
numParameters	Determine the number of parameters in a mask
removeDialogControl	Remove dialog control element from mask dialog box
removeParameter	Remove parameter from mask dialog box
removeAllParameters	Remove all existing parameters from a mask
set	Set the properties of an existing mask

addParameter

Class: Simulink.Mask

Package: Simulink

Add a parameter to a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.addParameter(Name, Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.addParameter(Name, Value)` appends a parameter to the mask. If you do not specify name–value pairs as arguments with this command, Simulink creates an unnamed mask parameter with control type set to `edit`.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Type

Type of control that is used to specify the value of this parameter.

Default: edit

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: empty

Prompt

Text that identifies the parameter on the Mask Parameters dialog box.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog box.

Default: Type specific; depends on the `Type` of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: 'on'

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: 'on'

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog box and clicks **Apply**.

Default: empty

TabName

The name of the tab in the Mask Parameters dialog box where the parameter appears.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are 'panel', 'group', and 'tab'.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Add a parameter to the mask without specifying name–value pairs for parameter attributes.

```
p.addParameter;
```

- 3 Add a mask parameter of type popup that cannot be evaluated and appears on a tab named **Properties** in the Mask Parameters dialog box.

```
p.addParameter('Type','popup','TypeOptions',...  
{'Red' 'Blue' 'Green'},'Evaluate','off','TabName','Properties');
```

Simulink.Mask.copy

Class: Simulink.Mask

Package: Simulink

Copy a mask from one block to another

Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `blockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

Input Arguments

srcBlockName

The handle to the source block or the path to the source block inside the model.

Note The source block should be masked.

destBlockName

The handle to the destination block or the path to the destination block inside the model.

Note The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

Examples

- 1 Create an empty mask on the destination block using the block's path.

```
pDest = Simulink.Mask.create('myModel/Subsystem');
```

- 2 Get source mask as an object using the source block's path.

```
pSource = Simulink.Mask.get('myModel/Abs');
```

- 3 Make the destination mask a copy of the source mask.

```
pDest.copy(pSource);
```

See Also

“Block Masks” | `Simulink.Mask`

Simulink.Mask.create

Class: Simulink.Mask

Package: Simulink

Create a mask on a Simulink block

Syntax

```
p = Simulink.Mask.create(blockName)
```

Description

`p = Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Create a mask using a block's handle.

Note In the model, select the block to be masked.

```
p = Simulink.Mask.create(gcbh);
```

- 2 Create a mask using the block's path.

```
p = Simulink.Mask.create('myModel/Subsystem');
```

See Also

“Block Masks” | `Simulink.Mask`

delete

Class: Simulink.Mask

Package: Simulink

Unmask a block and delete the mask from memory

Syntax

```
p = Simulink.Mask.get(blockName)
p.delete
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.delete` unmasks the block and deletes the mask from memory.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Unmask the block using the mask object and delete the mask from memory.

```
p.delete;
```

See Also

“Block Masks” | `Simulink.Mask`

Simulink.Mask.get

Class: Simulink.Mask

Package: Simulink

Get a block mask as a mask object

Syntax

```
p = Simulink.Mask.get(blockName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object. If the specified block is not masked, a null value returns.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's handle.

Note In the model, select the masked block.

```
p = Simulink.Mask.get(gcbh);
```

- 2 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

“Block Masks” | `Simulink.Mask`

addDialogControl

Class: Simulink.Mask

Package: Simulink

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,  
controlIdentifier)  
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType, controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the Name and Value arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

controlType — Value type of dialog control element

character vector

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'

- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifier — Unique identifier for the element
character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names” (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of *Name*, *Value* arguments. *Name* is the argument name and *Value* is the corresponding value. *Name* must appear inside single quotes (' ') and is case-sensitive. You can specify several name and value pair arguments in any order as *Name1*, *Value1*, . . . , *NameN*, *ValueN*.

Type

Type of control that is used to specify the value of this dialog control element. *Type* is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'.

Default: empty

Name

The identifier of the dialog control element. *Name* is a required argument. This field is available for all dialog control types.

Default: empty

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Tooltip

Tooltip for the dialog control element.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: 'on'

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: 'on'

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

Filepath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'

maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

getDialogControl

Class: Simulink.Mask

Package: Simulink

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(cname)
```

Description

`[control, phandle] = handle.getDialogControl(cname)` , search for a specific child dialog control recursively on the mask dialog.

Input Arguments

cname

Name of the dialog control being searched on the mask dialog.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog.

phandle

Parent of the dialog control being searched mask dialog.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

“Block Masks” | `Simulink.Mask`

getOwner

Class: Simulink.Mask

Package: Simulink

Determine the block that owns a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.getOwner
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.getOwner` returns the interface to the block that owns the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the interface to the block that owns the mask.

```
p.getOwner;
```

See Also

“Block Masks” | `Simulink.Mask`

getParameter

Class: Simulink.Mask

Package: Simulink

Get a mask parameter using its name

Syntax

```
p = Simulink.Mask.get(blockName)
param = p.getParameter(paramName)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`param = p.getParameter(paramName)` returns an array of mask parameters.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

paramName

The name of the parameter you want to get.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

See Also

“Block Masks” | `Simulink.Mask`

getWorkspaceVariables

Class: Simulink.Mask

Package: Simulink

Get all the variables defined in the mask workspace for a masked block

Syntax

```
p = Simulink.Mask.get(blockName)
vars = p.getWorkspaceVariables
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`vars = p.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get all the variables defined in the mask workspace for the masked block.

```
vars = p.getWorkspaceVariables;
```

See Also

“Block Masks” | `Simulink.Mask`

numParameters

Class: Simulink.Mask

Package: Simulink

Determine the number of parameters in a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.numParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.numParameters` returns the number of parameters in the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the number of parameters in the mask.

```
p.numParameters;
```

See Also

“Block Masks” | `Simulink.Mask`

removeDialogControl

Class: Simulink.Mask

Package: Simulink

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(  
controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the element

character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.  
maskObj = Simulink.Mask.get('Engine/Gain');  
  
% Remove element named AllTab from mask dialog box.  
  
p = maskObj.removeDialogControl('AllTab');
```

See Also

“Block Masks” | Simulink.Mask

Introduced in R2013b

removeParameter

Class: Simulink.Mask

Package: Simulink

Remove parameter from mask dialog box

Syntax

```
successIndicator = maskVariable.removeParameter(controlIdentifier)
```

Description

`successIndicator = maskVariable.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a parameter returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the parameter

character vector

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

Examples

Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');  
  
% Remove parameter named checkbox1 from mask dialog box.  
  
p = maskObj.removeParameter('checkbox1');
```

Note You can also use the index number as the `controlIdentifier`.

See Also

“Block Masks” | `Simulink.Mask`

Introduced in R2012b

removeAllParameters

Class: Simulink.Mask

Package: Simulink

Remove all existing parameters from a mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.removeAllParameters
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.removeAllParameters` deletes all existing parameters from the mask.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Delete all existing parameters from the mask.

```
p.removeAllParameters;
```

See Also

“Block Masks” | `Simulink.Mask`

set

Class: Simulink.Mask

Package: Simulink

Set the properties of an existing mask

Syntax

```
p = Simulink.Mask.get(blockName)
p.set(Name, Value)
```

Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.set(Name, Value)` sets mask properties that you specify using name–value pairs as arguments.

Input Arguments

blockName

The handle to the block or the path to the block inside the model.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Type

Text used as title for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Description

Text used as summary for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Help

Text used as body text for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

Default: empty

Initialization

MATLAB code that initializes the mask.

Default: empty

SelfModifiable

Option to set whether the mask can modify itself during simulation.

Default: 'off'

Display

MATLAB code that draws the mask icon.

Default: empty

IconFrame

Option to specify whether the mask icon appears inside a visible block frame.

Default: 'on'

MaskIconOpaque

Option to set the mask icon as opaque or transparent.

Default: 'opaque'

RunInitForIconRedraw

Option to specify whether Simulink should run mask initialization before executing the mask icon commands.

Default: 'off'

IconRotate

Option to specify icon rotation.

Default: 'none'

PortRotate

Option to specify port rotation.

Default: 'default'

IconUnits

Option to specify whether mask icon is autoscaled, normalized, or scaled in pixels.

Default: 'autoscale'

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

```
p.set('IconOpaque','off','Type','Random number generator','Description',...  
'This block generates random numbers.');
```

“Block Masks” | `Simulink.Mask`

Simulink.MaskParameter class

Package: Simulink

Control mask parameters programmatically

Description

Use an instance of `Simulink.MaskParameter` to set the properties of mask parameters.

Properties

Type

Specifies the mask parameter type.

Type: character vector

Values:

'edit'|'checkbox'|'popup'|'min'|'max'|'promote'|'combobox'|'radiobutton'|'unidt'|'slider'|'dial'|'spinbox'

Default: 'edit'

TypeOptions

Specifies the option for the parameter if it exists, otherwise, it is empty. Applicable for parameters of type popup, radio, Datatypestr, and promote .

Type: cell array of character vectors

Default: {''}

Name

Specifies the name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Type: character vector

Default: Empty character vector

Prompt

Specifies a character vector that appears as the label associated with the parameter on the mask dialog.

Type: character vector

Default: Empty character vector

Value

Specifies the value of the mask parameter.

Default: Depends on the type of the parameter.

Evaluate

Indicates if the parameter value is to be evaluated in MATLAB or treated as a character vector when the block is evaluated.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Tunable

Indicates if the parameter value can be changed during simulation.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

NeverSave

Indicates if the parameter value gets saved in the model file.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Hidden

Indicates if the parameter should never show on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

ReadOnly

Indicates if the parameter on the mask dialog box is editable or is read-only.

Type: boolean

Values: 'on' | 'off'

Default: 'off'

Enabled

Indicates if the parameter is enabled in the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Indicates if the parameter is visible in the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

ShowTooltip

Indicates if tool tip is enabled for the mask parameter.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Callback

Specifies the MATLAB code that executes when a user changes the parameter value from the mask dialog box.

Type: character vector

Default: Empty character vector

TabName

Specifies the tab name of the mask dialog box where the parameter is displayed.

Type: character vector

Default: Empty character vector

Alias

Specifies the alternate name for mask parameter.

Type: character vector

Default: Empty character vector

Methods

set Set properties of mask parameters

Topics

“Control Masks Programmatically”

“Block Masks”

set

Class: Simulink.MaskParameter

Package: Simulink

Set properties of mask parameters

Syntax

```
Simulink.MaskParameter.set(Name,Value)
```

Description

`Simulink.MaskParameter.set(Name,Value)` sets the properties of a mask parameter.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Type

Type of control that is used to specify the value of this parameter.

Default: edit

TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

Default: empty

Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

Default: empty

Prompt

Text that identifies the parameter on the Mask Parameters dialog.

Default: empty

Value

The default value of the mask parameter in the Mask Parameters dialog.

Default: Type specific; depends on the Type of the parameter

Evaluate

Option to specify whether parameter must be evaluated.

Default: 'on'

Tunable

Option to specify whether parameter is tunable.

Default: 'on'

Enabled

Option to specify whether user can set parameter value.

Default: 'on'

Visible

Option to set whether mask parameter is hidden or visible to the user.

Default: 'on'

Callback

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog and clicks **Apply**.

Default: empty

TabName

The name of the tab in the Mask Parameters dialog where the parameter appears.

Default: empty

Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter.

```
a = p.Parameters(1);
```

- 3 Edit mask parameter so it is of type popup, cannot be evaluated, and appears on a tab named **Properties** in the Mask Parameters dialog.

```
a.set('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},...  
'Evaluate','off','TabName','Properties');
```

Simulink.dialog.Control class

Package: Simulink.dialog

Create instances of dialog control

Description

Use an instance of `Simulink.dialog.Control` class to create, delete, or search dialog controls.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: character vector

See Also

`Simulink.dialog.Button` | `Simulink.dialog.Hyperlink` |
`Simulink.dialog.Image` | `Simulink.dialog.Text` |
`Simulink.dialog.parameter.Control` | `Simulink.dialog.Container` | “Block
Masks”

Simulink.dialog.Container class

Package: Simulink.dialog

Create instances of a container dialog control

Description

Use an instance of `Simulink.dialog.Container` class to add container type dialog control.

Properties

Name

Uniquely identifies the container dialog control and is a required field.

Type: character vector

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the container.

Type: `Simulink.dialog.Control`

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask

addDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Add dialog control elements to mask dialog box

Syntax

```
successIndicator = maskObj.addDialogControl(controlType,  
controlIdentifier)  
successIndicator = maskObj.addDialogControl(Name,Value)
```

Description

`successIndicator = maskObj.addDialogControl(controlType, controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the Name and Value arguments for an element on the mask dialog box. You can specify multiple Name-Value pairs.

Input Arguments

controlType — Value type of dialog control element

character vector

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'

- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

controlIdentifier — Unique identifier for the element

character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names” (MATLAB).

Name-Value Pair Arguments

Specify optional comma-separated pairs of *Name, Value* arguments. *Name* is the argument name and *Value* is the corresponding value. *Name* must appear inside single quotes (' ') and is case-sensitive. You can specify several name and value pair arguments in any order as *Name1, Value1, ..., NameN, ValueN*.

Type

Type of control that is used to specify the value of this dialog control element. *Type* is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'. If the parent dialog control type is 'tabcontainer', the child dialog control must be 'tab'.

Name

The identifier of the dialog control element. *Name* is a required argument. This field is available for all dialog control types.

Prompt

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Default: empty

Enabled

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Default: 'on'

Visible

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Default: 'on'

Callback

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

Default: empty

Row

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Default: empty

FilePath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

Default: empty

Container

Option to specifies a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Examples

Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container
```

```

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';

```

Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```

% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');

```

removeDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Remove dialog control element from mask dialog box

Syntax

```
successIndicator = maskVariable.removeDialogControl(  
controlIdentifier)
```

Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

Input Arguments

controlIdentifier — Unique identifier for the element

character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

Examples

Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.  
maskObj = Simulink.Mask.get('Engine/Gain');  
  
% Remove element named AllTab from mask dialog box.  
maskTab = maskObj.removeDialogControl('AllTab');
```

`Simulink.dialog.Container` | “Block Masks”

Introduced in R2013b

getDialogControl

Class: Simulink.dialog.Container

Package: Simulink.dialog

Search for a specific dialog control on the mask

Syntax

```
[control, phandle] = handle.getDialogControl(controlIdentifier)
```

Description

[control, phandle] = handle.getDialogControl(controlIdentifier), search for a specific child dialog control recursively on the mask dialog box.

Input Arguments

controlIdentifier

Name of the dialog control being searched on the mask dialog box.

Default:

Output Arguments

control

Target dialog control being searched on the mask dialog box.

phandle

Parent of the dialog control being searched mask dialog box.

Examples

Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

Simulink.dialog.Panel class

Package: Simulink.dialog

Create an instance of a panel dialog control

Description

Use an instance of `Simulink.dialog.Panel` class to create an instance of panel dialog control.

Properties

Name

Uniquely identifies the panel dialog control and is a required field.

Type: character vector

Row

Specifies whether panel is placed on the current row or on a new row.

Type: character vector

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether panel is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether panel is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the panel.

Type: Simulink.dialog.Control

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Group class

Package: Simulink.dialog

Create an instance of a group dialog control

Description

Use an instance of `Simulink.dialog.Group` class to create an instance of group dialog control.

Properties

Name

Uniquely identifies the group dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the group.

Type: character vector

Default: Empty character vector

Row

Specifies whether group is placed on the current row or on a new row.

Type: character vector

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether group is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether group is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the group.

Type: Simulink.dialog.Control

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Simulink.dialog.Tab class

Package: Simulink.dialog

Create an instance of a tab dialog control

Description

Use an instance of `Simulink.dialog.Tab` class to create an instance of tab dialog control.

Properties

Name

Uniquely identifies the tab dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the tab.

Type: character vector

Default: Empty character vector

Enabled

Specifies whether tab is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether tab is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the tab dialog control.

Type: Simulink.dialog.Control

Default: Empty array

Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box
getDialogControl	Search for a specific dialog control on the mask

Package: Simulink.dialog

Create an instance of a tab container dialog control

Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

Properties

Name

Uniquely identifies the tab container dialog control and is a required field.

Type: character vector

Row

Specifies whether tab container is placed on the current row or on a new row.

Type: enumerated string

Values: 'current' | 'new'

Default: 'new'

Enabled

Specifies whether tab container is active on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

Visible

Specifies whether tab container is displayed on the mask dialog box.

Type: boolean

Values: 'on' | 'off'

Default: 'on'

DialogControls

Specifies the child dialog controls contained in the group.

`Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

Type: `Simulink.dialog.Tab`

Default: Empty array

Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask

Simulink.dialog.Button class

Package: Simulink.dialog

Create a button dialog control

Description

Use an instance of `Simulink.dialog.Button` class to add a button dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the button dialog control.

Type: character vector

Default: empty

FilePath

Specifies the path to the image file to be shown on the button dialog control.

Type: character vector

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'current'

Enabled

Indicates whether container is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether container is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Package: Simulink.dialog

Create a hyperlink dialog control

Description

Use an instance of `Simulink.dialog.Hyperlink` class to add a hyperlink dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the hyperlink.

Type: character vector

Default: empty

Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

Type: character vector

Default: empty

Row

Specifies whether hyperlink is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether hyperlink is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether hyperlink is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Simulink.dialog.Image class

Package: Simulink.dialog

Create an image dialog control

Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

Properties

Name

Uniquely identifies the dialog control and is a required field.

Type: character vector

FilePath

Specifies the path to the image file to be displayed on the dialog box.

Type: character vector

Default: empty

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether image is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether image is displayed on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Simulink.dialog.Text class

Package: Simulink.dialog

Create a text dialog control

Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

Properties

Name

Uniquely identifies the dialog control element and is a required field.

Type: character vector

Prompt

Specifies the text displayed on the mask dialog box.

Type: character vector

Default: empty

WordWrap

Specifies whether to wrap long text to the next line on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Row

Specifies whether dialog control is placed on the current row or on a new row.

Type: character vector

Value: 'current' | 'new'

Default: 'new'

Enabled

Indicates whether dialog control is active on the mask dialog box.

Type: boolean

Value: 'on' | 'off'

Default: 'on'

Visible

Indicates whether dialog control is displayed on the mask dialog box.

Type: boolean

`Simulink.dialog.Control` | “Block Masks”

Simulink.sfunction.Analyzer class

Package: Simulink.sfunction

Create a Simulink S-function analyzer object

Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in MATLAB path that has same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

Construction

`sfunAnalyzer = Simulink.sfunction.Analyzer(model)` creates a `Simulink.sfunction.Analyzer` object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in MATLAB path that has as the S-function. For example, if the specified model contains an S-function called `mysfun`, and the source file for `mysfun` is a single file `mysfun.c` in the MATLAB path, a `Simulink.sfunction.analyzer.BuildInfo` object is automatically created and included in the analysis.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.BuildInfo` object named `bdInfo`.

```
sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'Options', {opts})
```

creates an `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.Options` object named `opts`.

Input Arguments

model — Specify a model in the path

character vector

Names of the model in the path, specified as a character vector.

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'BuildInfo', {buildInfo}

BuildInfo — Specify the buildinfo object

cell array

A cell array of `buildinfo` objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

Options — Specify the S-function analyzer running options

object

An object to specify S-function analyzer running options. These checks include Polyspace® Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

Methods

<code>run</code>	Perform checks on S-functions
<code>generateReport</code>	Generate an HTML report of S-function checks

See Also

run

Class: Simulink.sfunction.Analyzer

Package: Simulink.sfunction

Perform checks on S-functions

Syntax

```
result = run()
```

Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
TimeGenerated: '19-Jul-2017 19:25:32'  
Platform: 'win64'  
Release: '(R2017b)'  
SimulinkVersion: '9.0'  
ExemptedBlocks: {}  
MexConfiguration: [1x1 mex.CompilerConfiguration]  
Data: [4x4 struct]
```

Output Arguments

result — Sfunction.Analyzer structure

MATLAB structure

MATLAB structure containing the result of S-function analyzer.

Simulink.sfunction.analyzer.BuildInfo class

Package: Simulink.sfunction.analyzer

Create an object to represent build information

Description

`Simulink.sfunction.analyzer.BuildInfo` object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the `Simulink.sfunction.Analyzer` class.

Construction

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a `Simulink.sfunction.analyzer.BuildInfo` object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'ObjFileList', {objfilelist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'LibFileList', {libfilelist}, 'LibPaths', {libpaths})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'PreProcDefList', {preprocdir})` creates a `Simulink.sfunction.analyzer.BuildInfo` object for C-MEX S-function source file and pre-processor directives list.

Input Arguments

SfcnFile — S-function source file

character vector

S-function source file having the same name as the S-function.

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'SrcPath', {srcpath}`

SrcPath — Source file path

cell array of character vectors

Search paths to extra S-function source files that are referenced by `SfcnFile`, specified as a cell array.

ExtraSrcFileList — Extra source file list

cell array of character vectors

List of extra S-function source files, specified as a cell array.

ObjFileList — Extra objective code

cell array

List of objective files used for building, specified as a cell array.

IncPaths — Search paths for header files

cell array of character vectors

Specify paths to include folders for header files, specified as a cell array.

LibFileList — External libraries list

cell array of character vectors

List of external library files used for building, specified as a cell array.

LibPaths — Search paths for external libraries

cell array of character vectors

Search paths for external library files used for building, specified as a cell array.

PreProcDefList — Preprocessor directives

cell array of character vectors

List of the preprocessor directives, specified as a cell array.

Output Arguments

bdInfo — BuildInfo object

object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

Examples

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

Basic Use

```
bdInfo = simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo =
```

```
BuildInfo with properties:
```

```
SfcnFile: 'mysfun.c'  
SfcnName: 'mysfun'
```

```

        SrcType: 'C'
        SrcPaths: {}
    ExtraSrcFileList: {}
        ObjFileList: {}
            IncPaths: {}
        LibFileList: {}
            LibPaths: {}
        PreProcDefList: {}

```

Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```

Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
    'ExtraSrcFileList', {extra1.c,extra2.c},... %speci
    'SrcPaths', {/path1,/path2},... %speci
    'ObjFileList', {o1.obj,o2.obj},... %speci
    'LibFileList', {l1.lib,l2.lib},... %speci
    'LibPaths', {/libpath1},... %speci
    'PreProcDefList', {DEBUG}); %speci

```

Simulink.sfunction.analyzer.Options class

Package: Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

Description

`Simulink.sfunction.analyzer.Options` object is created through the constructor `Simulink.sfunction.analyzer.Options()`. `Simulink.sfunction.analyzer.Options` object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

Construction

`opts= Simulink.sfunction.analyzer.Options()` returns a options object with these property values:

```
EnablePolyspace: 0
EnableRobustness: 0
    ReportPath: ''
ModelSimTimeOut: 10
```

Properties

EnablePolyspace — check

False (default) | True

Boolean type check to determine whether to include Polyspace Code Prover check.

Note These checks usually take some time to run.

EnableRobustness — Parameter robustness check

False (default) | True

Boolean type check to indicate whether to include Robutness checks.

Note These checks usually take some time to run.

ReportPath — Generated report directory

character array

Path to the generated report directory.

ModelSimTimeOut — Maximum model simulation time

positive scalar

Maximum model simulation time in seconds.

findSfunctions

Find and return all eligible S-functions in a model

Syntax

```
sfuns = Simulink.sfunction.analyzer.findSfunctions(model)
```

Description

`sfuns = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

Input Arguments

model — A Simulink model or library in path
Simulink model

A Simulink model or library in path.

Output Arguments

sfuns — A list of all eligible S-functions
cell array

Eligible s-functions in the model, specified as a cell array.

addElement

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Add element to end of data set

Syntax

```
dataset = addElement(dataset,element)
dataset = addElement(dataset,element,name)
```

Description

`dataset = addElement(dataset,element)` adds an element to the `Simulink.SimulationData.Dataset` `dataset`.

`dataset = addElement(dataset,element,name)` adds an element to the `Simulink.SimulationData.Dataset` `data set` and gives the element the name that you specify with the `name` argument. If the object already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set to which to add the element.

element — Element to add

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.State` object | `Simulink.SimulationData.DataStoreMemory` object | `timeseries` object | `matlab.io.datastore.SimulationDatastore` object

Element to add to the data set, specified as a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.DataStoreMemory`, or `matlab.io.datastore.SimulationDatastore` object.

name — Name for element

character vector

Name for element, specified as a character vector.

Output Arguments

dataset — Data set

character vector

The data set to which you add the element, returned as a character vector. The new element is added to the end of the data set.

Examples

Create a Data Set

Create a data set and add three elements to it.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds = addElement(ds,element1);
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds = addElement(ds,element2);
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds = addElement(ds,element3);
ds
```

```
ds =
```

```
Simulink.SimulationData.Dataset '' with 3 elements
```

		Name	BlockPath
1	[1x1 Signal]	A	''
2	[1x1 Signal]	B	''
3	[1x1 Signal]	C	''

- Use braces { } to access, modify, or add elements using index.

- “Migrate Scripts That Use Legacy ModelDataLogs API”
- “Export Signal Data Using Signal Logging”
- “Log Data Stores”
- “Convert Logged Data to Dataset Format”
- “Migrate Scripts That Use Legacy ModelDataLogs API”

Alternative

To streamline indexing syntax, you can use curly braces ({}) to add an element to a dataset, instead of using `addElement`. For the index, use a scalar that is greater than the number of elements by one. The new element becomes the last element of the dataset.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds{1} = element1;
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds{2} = element2;
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds{3} = element3;
```

concat

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Concatenate dataset to another dataset

Syntax

```
dataset1 = concat(dataset1,dataset2)
```

Description

`dataset1 = concat(dataset1,dataset2)` concatenates the elements of `dataset2` to `dataset1`.

Input Arguments

dataset1 — Dataset to concatenate to

data set

Dataset to concatenate to with `dataset2`, returned as a cell array.

dataset2 — Dataset to concatenate

data set

Data set to concatenate to `dataset1`, specified as a cell array.

Output Arguments

dataset1 — Concatenated dataset

data set

Concatenated dataset from `dataset1` and `dataset2`.

Examples

Concatenate ds1 to ds

Convert output from two To Workspace blocks to Dataset format and concatenate them.

```
mdl = 'myvdp';  
open_system(mdl);  
sim(mdl)  
ds = Simulink.SimulationData.Dataset(simout);  
ds1 = Simulink.SimulationData.Dataset(simout1);  
dsfinal = concat(ds,ds1);

get

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
element = get(dataset, index)
element = get(dataset, name)
element = get(dataset, {name})
```

Description

`element = get(dataset, index)` returns the element corresponding to the `index`. The `getElement` method uses the same syntax and behavior as the `get` method.

`element = get(dataset, name)` returns the element whose name matches `name`. When `name` is in a cell array, return the index of the element whose name matches `name`.

`element = get(dataset, {name})` returns a single element if only one element name matches, a `SimulationData.Dataset` if multiple elements with this name exist.

If you use **Log Dataset data to file** to create the MAT-file, use `Simulink.SimulationData.DatasetRef.getAsDatastore` for fast access to the data.

Input Arguments

dataset — Dataset

`SimulationData.Dataset` object

The data set from which to get the element.

index — Index value of element to get

scalar numeric

Index value of element to get. The index reflects the index value of a data set element.

name — Name for data set element

character array | cell array

Name for a data set element, specified as:

- A character array reflecting the name of the data set element
- A cell array containing one character vector. To return a `SimulationData.Dataset` object that can contain one element, use this format. Consider this form when writing scripts.

Output Arguments

element — Element

element | `SimulationData.Dataset` object | empty object

The element that the `get` method finds.

- If `index` is the first argument after the data set, the method returns the element at the `index`.
- If `name` is the first argument after the data set:
 - If the method finds one element, it returns the element.
 - If the method finds more than one element, return a `Dataset` that contains the elements.
 - If the method does not find an element, it returns an empty object.

Examples

Access Dataset Elements

Access `Simulink.SimulationData.Dataset` elements in the top model of the `ex_bus_logging` model. The signal logging dataset is `topOut`.

```

open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_mdhref_counter_bus')));
sim('ex_bus_logging')
topOut

topOut =

    Simulink.SimulationData.Dataset
    Package: Simulink.SimulationData

    Characteristics:
        Name: 'topOut'
        Total Elements: 4

    Elements:
        1: 'COUNTERBUS'
        2: 'OUTPUTBUS'
        3: 'INCREMENTBUS'
        4: 'inner_bus'

    -Use get or getElement to access elements by index, name or
    block path.
    -Use addElement or setElement to add or modify elements.

    Methods, Superclasses

```

Access Dataset Elements with Index

Access the element at index if the first argument is a numeric value.

```
e1 = logcout.get(1);
```

Access Dataset Elements with Characters

Access the element whose name matches name.

```
e1 = logcout.get('name');
```

Access Dataset Elements with Cell Array

Return a dataset if the first argument is a cell array with a character vector as the first element.

```
ds = logouts.get({'my_name'});
```

- “Migrate Scripts That Use Legacy ModelDataLogs API”
- “Export Signal Data Using Signal Logging”
- “Log Data Stores”
- “Convert Logged Data to Dataset Format”
- “Migrate Scripts That Use Legacy ModelDataLogs API”

Alternatives

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `get` or `getElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logouts` dataset.

```
logouts{2}
```

Also, you can use the `find` method to get an element or collection of elements from a dataset.

getElementNames

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Return names of all elements in dataset

Syntax

```
element_list = getElementNames(dataset)
```

Description

`element_list = getElementNames(dataset)` returns the names of all of the elements in the `Simulink.SimulationData.Dataset` object.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set from which to the element name.

Output Arguments

element_list — Data set

cell array

Data set, returned as a cell array of the character vectors containing names of all of the elements of the dataset.

Examples

Return Names of Elements

Return the names of the elements for the `topOut` data set (the signal logging data).

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
    'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
    'examples', 'ex_mdhref_counter_bus')));
sim('ex_bus_logging')
el_names = topOut.getElementNames

el_names =

    'COUNTERBUS'
    'OUTPUTBUS'
    'INCREMENTBUS'
    'inner_bus'

find

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Get element or collection of elements from dataset

Syntax

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...  
Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)
```

Description

`[datasetOut,retIndex]=find(datasetIn,Name,Value,...)` returns a `Simulink.SimulationData.Dataset` object and indices of the elements whose property values match the specified property names and values. Specify optional comma-separated pairs of `Name,Value` properties. `Name` is the property name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name-value pair properties in any order as `Name1,Value1,...,NameN,ValueN`.

`[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...
Name,Value,...)` applies the logical operator to the matching property value. You can combine multiple logical operators. Logical operator can be one of:

- `-or`
- `-and`

If you do not specify an operation, the method assumes `-and`.

`[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)` matches elements using regular expressions as if the value of the property is passed to the `regexp` function as:

```
regexp(element.Name, Value)
```

The method applies regular expression matching to the name-value pairs that appear after `-regexp`. If there is no `-regexp`, the method matches elements as if the value of the property is passed as:

```
isequal(element.Name, Value)
```

For more information on `-regexp`, see “`-regexp With Multiple Block Paths`” on page 5-916.

-regexp With Multiple Block Paths

`-regexp` works with properties of type `char`. To specify multiple block paths, you can use `Simulink.SimulationData.BlockPath` and `Simulink.BlockPath`. For example, when a signal is logged in a referenced model, you can use `Simulink.SimulationData.BlockPath` to specify multiple block paths.

The method returns elements that contain a **BlockPath** property where one or more of the individual block paths match the specified `Value` path when you use:

- `-regexp` with the **BlockPath** Name property.
- `Value` as a character vector or scalar object of type `Simulink.SimulationData.BlockPath` with one block path

Input Arguments

datasetIn — `SimulationData.Dataset`

`SimulationData.Dataset` object

`SimulationData.Dataset` object in which to search for matching elements.

Name — Name of property

character vector

Name of property to find in the element.

value — Value of property

character vector | double | `Simulink.SimulationData.BlockPath`

Value of property to find in the element.

Output Arguments

datasetOut — SimulationData.Dataset data set

SimulationData.Dataset

SimulationData.Dataset object that contains the elements that match the specified criteria. If there is no matching SimulationData.Dataset object, the returned SimulationData.Dataset object contains no elements.

retIndex — Indices

vector

Indices of the elements datasetIn that match the specified criteria.

Examples

Find Block Path

Find a specific block path (specified by character vector) and port index.

```
dsOut = find(dsIn, 'BlockPath', 'vdp/x1', 'PortIndex', 1)
```

Find Elements

Find elements that have either name or propagated name as InValve.

```
dsOut = find(dsIn, 'Name', 'InValve', '-or', 'PropagatedName', 'InValve')
dsOut = find(dsIn, '-regex', 'Name', 'In*', '-or', ...
             '-regex', 'PropagatedName', 'In*')
```

Find and Change Element

Find and replace all elements containing specified_name with a new_name.

```
[dsOut,idxInDs] = find(ds, 'specified_name');
for idx=1: length(idxInDs)
    % process each element
    elm = get(dsOut, idx);
    elm.Name= 'New_Name'
    dsIn = setElement(dsIn, idxInDs(idx), elm);
end
```

Find Signals in subSys Using -regexp

Find all signals logged in a subSys using -regexp.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'mdl/subSys/.*')
```

Find Signals in Referenced Model

Find all signals logged in the Model block.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'refmdl/ModelBlk')
```

numElements

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Get number of elements in data set

Syntax

```
length = numElements(dataset)
```

Description

`length = numElements(dataset)` gets the number of elements in the top-level dataset. To get the number of elements of a nested data set, use `numElements` with the nested data set.

Input Arguments

dataset — Data set

SimulationData.Dataset object

The data set from which to get the number of elements.

Output Arguments

length — Number of elements

double

Number of elements, returned as a double.

Examples

Get Number of Elements

Get the number of elements in the signal logging data set for the `ex_bus_logging`.

```
length = topOut.numElements()
```

plot

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Plot dataset elements in Signal Preview window or Simulation Data Inspector

Syntax

```
plot(ds)  
plot(ds,viewer)
```

Description

`plot(ds)` plots the `Simulink.SimulationData.Dataset` elements against time and interpolates values between samples by using either zero-order-hold or linear interpolation. The plot displays as a read-only plot in the Signal Preview window.

`plot(ds,viewer)` displays the plot in the Signal Preview window or Simulation Data Inspector, depending on the `viewer` value.

Input Arguments

ds — Data set

`SimulationData.Dataset` object

The data set that contains the elements to plot.

viewer — Viewer to display plot

`preview` (default) | `sdi`

Viewer to display the plot, specified as `preview` (Signal Preview window) or `sdi` (Simulation Data Inspector).

Examples

Plot a Data Set

Create a timeseries object `ts` and add elements to plot in Simulation Data Inspector.

```
% Create a timeseries object
ts = timeseries([0;20],[0;10]);
% Create a SimulationData.Dataset
ds = Simulink.SimulationData.Dataset();
% Place timeseries object in dataset
ds = ds.addElement(ts, 'ts');
% Plot the element
plot(ds, 'sdi');

setElement

Class: Simulink.SimulationData.Dataset

Package: Simulink.SimulationData

Change element stored at specified index

Syntax

```
dataset = setElement(dataset,index,... element)
dataset = setElement(index,element, name)
```

Description

`dataset = setElement(dataset,index,... element)` changes the element stored at the specified index, for an existing index. If `index` is one greater than the number of elements in the data set, the function adds the element at the end of the data set.

`dataset = setElement(index,element, name)` changes the element stored at the specified index and gives it the name that you specify. You can use `name` to identify an element that does not have a name. If the signal already has a name, the element instead uses the name you specify by using the `name` argument.

Input Arguments

dataset — Data set

`SimulationData.Dataset` object

The data set for which to set the element.

index — Index

scalar

Index for the added element, specified as a scalar numeric value. The value must be between 1 and the number of elements plus 1.

element — Element to replace existing element

`Simulink.SimulationData.Signal` object |
`Simulink.SimulationData.DataStoreMemory` object

Element to replace existing element or to add to the data set, specified as a `Simulink.SimulationData.Signal` object or `Simulink.SimulationData.DataStoreMemory` object.

name — Element name

character vector

Element name, returned as a character vector.

Output Arguments

dataset — Data set

character vector

Data set in which you change or add an element, specified as a character vector.

Examples

Set Element Name

Set element name.

```
ds = Simulink.SimulationData.Dataset
element1 = Simulink.SimulationData.Signal
element1.Name = 'A'
ds = ds.addElement(element1)
element2 = Simulink.SimulationData.Signal
element2.Name = 'B'
elementNew = Simulink.SimulationData.Signal
ds = ds.setElement(2,elementNew,'B1')
ds

ds =

    Simulink.SimulationData.Dataset
```

```
Package: Simulink.SimulationData
```

```
Characteristics:
```

```
    Name: 'topOut'  
    Total Elements: 2
```

```
Elements:
```

```
    1: 'A'  
    2: 'B1'
```

Use `getElement` to access elements by index, name or block path.

Methods, Superclasses

- “Migrate Scripts That Use Legacy ModelDataLogs API”
- “Export Signal Data Using Signal Logging”
- “Log Data Stores”
- “Migrate Scripts That Use Legacy ModelDataLogs API”

Alternative

You can use curly braces to streamline indexing syntax to change an element in a dataset, instead of using `setElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, change the name of second element of the `logout` dataset.

```
logout{2}.Name = 'secondSignal'
```

coder.BuildConfig class

Package: coder

Build context during code generation

Description

The code generator creates an object of this class to facilitate access to the build context. The build context encapsulates the settings used by the code generator including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

Use `coder.BuildConfig` methods in the methods that you write for the `coder.ExternalDependency` class.

Construction

The code generator creates objects of this class.

Methods

Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods

This example shows how to use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods. In this example, you use:

- `coder.BuildConfig.isMatlabHostTarget` to verify that the code generation target is the MATLAB host. If the host is not MATLAB report an error.
- `coder.BuildConfig.getStdLibInfo` to get the link-time and run-time library file extensions. Use this information to update the build information.

Write a class definition file for an external library that contains the function `adder`.

```
%=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%=====

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(ctx)
            if ctx.isMatlabHostTarget()
                tf = true;
            else
                error('adder library not available for this target');
            end
        end

        function updateBuildInfo(buildInfo, ctx)
            [~, linkLibExt, execLibExt, ~] = ctx.getStdLibInfo();

            % Header files
            hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
            buildInfo.addIncludePaths(hdrFilePath);
        end
    end
end
```

```
% Link files
linkFiles = strcat('adder', linkLibExt);
linkPath = hdrFilePath;
linkPriority = '';
linkPrecompiled = true;
linkLinkOnly = true;
group = '';
buildInfo.addLinkObjects(linkFiles, linkPath, ...
    linkPriority, linkPrecompiled, linkLinkOnly, group);

% Non-build files
nbFiles = 'adder';
nbFiles = strcat(nbFiles, execLibExt);
buildInfo.addNonBuildFiles(nbFiles, '', '');
end

%API for library function 'adder'
function c = adder(a, b)
    if coder.target('MATLAB')
        % running in MATLAB, use built-in addition
        c = a + b;
    else
        % running in generated code, call library function
        coder.cinclude('adder.h');

        % Because MATLAB Coder generated adder, use the
        % housekeeping functions before and after calling
        % adder with coder.ceval.
        % Call initialize function before calling adder for the
        % first time.

        coder.ceval('adder_initialize');
        c = 0;
        c = coder.ceval('adder', a, b);

        % Call the terminate function after
        % calling adder for the last time.

        coder.ceval('adder_terminate');
    end
end
```

```
end  
end
```

`coder.ExternalDependency` | `coder.target`

Introduced in R2013b

coder.ExternalDependency class

Package: coder

Interface to external code

Description

`coder.ExternalDependency` is an abstract class for encapsulating the interface between external code and MATLAB code intended for code generation. You define classes that derive from `coder.ExternalDependency` to encapsulate the interface to external libraries, object files, and C/C++ source code. This encapsulation allows you to separate the details of the interface from your MATLAB code. The derived class contains information about external file locations, build information, and the programming interface to external functions.

To define a class, `myclass`, make the following line the first line of your class definition file:

```
classdef myclass < coder.ExternalDependency
```

You must define all of the methods listed in “Methods” on page 5-934. These methods are static and are not compiled. When you write these methods, use `coder.BuildConfig` methods to access build information.

You also define methods that call the external code. These methods are compiled. For each external function that you want to call, write a method to define the programming interface to the function. In the method, use `coder.ceval` to call the external function. Suppose you define the following method for a class named `AdderAPI`:

```
function c = adder(a, b)
    coder.cinclude('adder.h');
    c = 0;
    c = coder.ceval('adder', a, b);
end
```

This method defines the interface to a function `adder` which has two inputs `a` and `b`. In your MATLAB code, call `adder` this way:

```
y = AdderAPI.adder(x1, x2);
```

Methods

Examples

Encapsulate the interface to an external C dynamic linked library

This example shows how to encapsulate the interface to an external C dynamic linked library using `coder.ExternalDependency`.

Write a function `adder` that returns the sum of its inputs.

```
function c = adder(a,b)
    %#codegen
    c = a + b;
end
```

Generate a library that contains `adder`.

```
codegen('adder', '-args', {-2,5}, '-config:dll', '-report');
```

Write the class definition file `AdderAPI.m` to encapsulate the library interface.

```
%=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%=====

classdef AdderAPI < coder.ExternalDependency
    %#codegen

    methods (Static)

        function bName = getDescriptiveName(~)
            bName = 'AdderAPI';
        end

        function tf = isSupportedContext(ctx)
            if ctx.isMatlabHostTarget()
                tf = true;
            else

```

```
        error('adder library not available for this target');
    end
end

function updateBuildInfo(buildInfo, ctx)
    [~, linkLibExt, execLibExt, ~] = ctx.getStdLibInfo();

    % Header files
    hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
    buildInfo.addIncludePaths(hdrFilePath);

    % Link files
    linkFiles = strcat('adder', linkLibExt);
    linkPath = hdrFilePath;
    linkPriority = '';
    linkPrecompiled = true;
    linkLinkOnly = true;
    group = '';
    buildInfo.addLinkObjects(linkFiles, linkPath, ...
        linkPriority, linkPrecompiled, linkLinkOnly, group);

    % Non-build files
    nbFiles = 'adder';
    nbFiles = strcat(nbFiles, execLibExt);
    buildInfo.addNonBuildFiles(nbFiles, '', '');
end

%API for library function 'adder'
function c = adder(a, b)
    if coder.target('MATLAB')
        % running in MATLAB, use built-in addition
        c = a + b;
    else
        % running in generated code, call library function
        coder.cinclude('adder.h');

        % Because MATLAB Coder generated adder, use the
        % housekeeping functions before and after calling
        % adder with coder.ceval.
        % Call initialize function before calling adder for the
        % first time.

        coder.ceval('adder_initialize');
        c = 0;
    end
end
```

```
        c = coder.ceval('adder', a, b);

        % Call the terminate function after
        % calling adder for the last time.

        coder.ceval('adder_terminate');
    end
end
end
end
```

Write a function `adder_main` that calls the external library function `adder`.

```
function y = adder_main(x1, x2)
    %#codegen
    y = AdderAPI.adder(x1, x2);
end
```

Generate a MEX function for `adder_main`. The MEX Function exercises the `coder.ExternalDependency` methods.

```
codegen('adder_main', '-args', {7,9}, '-report')
```

Copy the library to the current folder using the file extension for your platform.

For Windows, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.dll'));
```

For Linux, use:

```
copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.so'));
```

Run the MEX function and verify the result.

```
adder_main_mex(2,3)
```

Scope Configuration

Control scope appearance and behavior

Description

Scope configuration properties control the appearance and behavior of a scope block. Create a scope configuration object with `get_param`, and then change property values using the object with dot notation.

Creation

`myScopeConfiguration = get_param(gcbh, 'ScopeConfiguration')` creates a scope configuration object for the selected scope block.

Scope Block Properties

Name — Title on a scope window

block name (default) | character vector

Title on a scope window, specified with a character vector.

NumInputPorts — Number of input ports

'1' (default) | character vector

Number of input ports on a scope block, specified by a character vector. Maximum number of input ports is 96.

Block Configuration Property: **Number of input ports**

ActiveDisplay — Display for setting display-specific properties

'1' (default) | character vector

Display for setting display-specific properties, specified as a character vector. The number of a display corresponds to its column-wise placement index.

Dependency: Setting this property selects the display for setting the properties ShowGrid, ShowLegend, Title, PlotAsMagnitudePhase, YLabel, and YLimits.

Block Configuration Property: **Active display**

AxesScaling — How to scale y-axes

'Manual' (default) | 'Auto' | 'Updates'

How to scale y-axes, specified as one of these values:

- 'Manual' — Manually scale y-axes with the **Scale Y-axis Limits** button.
- 'Auto' — Scale y-axes during and after simulation.
- 'Updates' — Scale y-axes after specified number of block updates (time intervals).

Dependency: If this property is set to 'Updates', also specify the property AxesScalingNumUpdates.

Block Configuration Property: **Axes scaling**

AxesScalingNumUpdates — Number of updates before scaling y-axes

'10' (default) | character vector

Number of updates before scaling y-axes. Specified as a character vector.

Dependency: Activate this property by setting AxesScaling to 'Updates'.

Block Configuration Property: **Number of updates**

DataLogging — Save scope data

false (default) | true

Save scope data to a variable in the MATLAB workspace, specified as one of these values:

- false — Inactivate logging and logging properties.
- true — Activate logging and logging properties.

This property does not apply to floating scopes and scope viewers.

Dependency: If this property is set to true, also specify the properties DataLoggingVariableName and DataLoggingSaveFormat.

Block Configuration Property: **Log data to workspace**

DataLoggingVariableName — Variable name for saving scope data

'ScopeData' (default) | character vector

Variable name for saving scope data in the MATLAB workspace, specified as text. This property does not apply to floating scopes and scope viewers.

Dependency: Activate this property by setting `DataLogging` to `true`.

Block Configuration Property: **Variable name**

DataLoggingSaveFormat — Variable format for saving scope data

'Dataset' (default) | 'Structure With Time' | 'Structure' | 'Array'

Variable format for saving scope data to the MATLAB workspace, specified as one of these values:

- 'Dataset' — Save data as a dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- 'StructureWithTime' — Save data as a structure with associated time information. This format does not support single- or multiport frame-based data, or multirate data.
- 'Structure' — Save data as a structure. This format does not support multi-rate data.
- 'Array' — Save data as an array with associated time information. This format does not support multiport sample-based data, single or multiport frame-based data, variable-size data, or multi-rate data.

This property does not apply to floating scopes and scope viewers.

Dependency: Activate this property by setting `DataLogging` to `true`.

Block Configuration Property: **Save format**

DataLoggingLimitDataPoints — Limit buffered data

false (default) | true

Limit buffered data before plotting and saving data, specified as one of these values:

- `false` — Save all the data. Setting this parameter to `false` can cause an out-of-memory error.

- `true` — Save signal data at the end of a simulation.

For simulations with **Stop time** set to `inf`, always set this parameter to `true`.

Dependency: If this property is set to `true`, also specify the number of data values to plot and save with the property `DataLoggingMaxPoints`.

Block Configuration Property: **Limit data points to last**

DataLoggingMaxPoints — Maximum number of data values

`'5000'` (default) | character vector

Maximum number of data values to plot and save, specified as a character vector. The data values are from the end of a simulation.

Dependency: Activate this property by setting `DataLoggingLimitDataPoints` to `true`. Specifying this property limits the data values a scope plots and the data values saved in the MATLAB variable specified in `DataLoggingVariableName`.

Block Configuration Property: Text box to the right of the **Limit data points to last** check box.

DataLoggingDecimateData — Reduce scope data

`false` (default) | `true`

Reduce scope data before plotting and saving, specified as one of these values:

- `false` — Do not reduce buffered data.
- `true` — Reduce buffered data.

Dependency: If this property is set to `true`, also specify `DataLoggingDecimation`.

Block Configuration Property: **Decimation**

DataLoggingDecimation — How signal data is reduced

`'1'` (default) | character vector

How signal data is reduced before plotting and saving, specified as a character vector. The scope buffers every `N`th data point, where `N` is the decimation factor you specify. A value of 1 buffers all data values.

Dependency: Activate this property by setting `DataLoggingDecimateData` to `true`.

Block Configuration Property: Text box to the right of the **Decimation** check box.

FrameBasedProcessing — Frame-based processing of signals

`false` (default for Time Scope block) | `true` (default for Scope block)

Frame-based processing of signals, specified as one of these values:

- `false` — Process signal values in a channel at each time interval (sample based).
- `true` — Process signal values in a channel as a group of values from multiple time intervals (frame based). Frame-based processing is available only with discrete input signals.

Block Configuration Property: **Input processing**

LayoutDimensions — Number of display rows and columns

`[1 1]` (default) | `[numberOfRows numberOfColumns]`

Number of display rows and columns, specified with as a two-element vector. The maximum layout dimension is four rows by four columns.

- If the number of displays is equal to the number of ports, signals from each port appear on separate displays.
- If the number of displays is less than the number of ports, signals from additional ports appear on the last *y*-axis.

Block Configuration Property: **Layout** button to the right of the **Number of input ports** text box

MaximizeAxes — Maximize size of signal plots

`'Auto'` (default) | `'On'` | `'Off'`

Maximize size of signal plots, specified as one of these values:

- `'Auto'` — If `Title` and `YLabel` are not specified, maximize all plots.
- `'On'` — Maximize all plots. Values in `Title` and `YLabel` are hidden.
- `'Off'` — Do not maximize plots.

Each of the plots expands to fit the full display. Maximizing the size of signal plots removes the background area around the plots.

Block Configuration Property: **Maximize axes**

MinimizeControls — Hide menu and toolbar`false` (default) | `true`

Hide menu and toolbar, specified by one of these values:

- `false` — Display menu and toolbar.
- `true` — Hide menu and toolbar.

If you dock the scope, this property is inactive.

OpenAtSimulationStart — Open scope window`true` (default for Time Scope block) | `false` (default for Scope block)

Open scope window, specified as one of these values:

- `true` — Open Scope when simulation starts.
- `false` — Do not open a closed Scope at the start of a simulation.

Block Configuration Property: **Open at simulation start**

PlotAsMagnitudePhase — Magnitude and phase plots`false` (default) | `true`

Magnitude and phase plots, specified by one of these values:

- `false` — Display signal plot.

If the signal is complex, plot the real and imaginary parts on the same *y*-axis (display).

- `true` — Display magnitude and phase plots.

If the signal is real, plot the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values.

Dependency: Set `ActiveDisplay` before setting this property.

Block Configuration Property: **Plot signals as magnitude and phase**

Position — Size and location of Scope`[left bottom width height]`

Size and location of Scope window, specified as a four-element vector consisting of the left, bottom, width, and height positions, in pixels.

By default, a scope window appears in the center of your screen with a width of 560 pixels and height of 420 pixels.

ShowGrid — Vertical and horizontal grid lines

`true` (default) | `false`

Vertical and horizontal grid lines, specified as one of these values:

- `true` — Display grid lines.
- `false` — Hide grid lines.

Dependency: Set `ActiveDisplay` property before setting this property.

Block Configuration Property: **Show grid**

SampleTime — Time interval

'-1' for inherited | character vector

Time interval between Scope block updates during a simulation, specified as a character vector. This property does not apply to floating scopes and scope viewers.

Block Configuration Property: **Sample Time**

ShowLegend — Signal legend

`false` (default) | `true`

Signal legend, specified as one of these values:

- `false` — Hide legend.
- `true` — Show legend on active display.

Names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. See the Scope block reference for an example.

Dependency: Set `ActiveDisplay` property before setting this property.

Block Configuration Property: **Show legend**

ShowTimeAxisLabel — Display or hide x-axis labels`true` (default for Time Scope block) | `false` (default for Scope block)

Display or hide *x*-axis labels, specified as one of these values:

- `true` — Display *x*-axis labels for the active display.
- `false` — Hide *x*-axis labels.

Dependency: Set `ActiveDisplay` property before setting this property. If this property is set to `true`, also set `TimeAxisLabels`. If `TimeAxisLabels` is set to `'None'`, this property is inactive.

Block Configuration Property: **Show time-axis label**

TimeAxisLabels — How x-axis labels display`'All'` (default for Time Scope block) | `'Bottom'` (default for Scope block) | `'None'`

How *x*-axis labels display, specified as one of these values:

- `'All'` — Display *x*-axis labels on all *y*-axes.
- `'Bottom'` — Display *x*-axis label only on the bottom *y*-axis.
- `'None'` — Do not display labels and deactivate `ShowTimeAxisLabel` property.

Dependency: Set `ActiveDisplay` before specifying this property. Activate this property by setting `ShowTimeAxisLabel` to `true` and setting `Maximize axes` to `'Off'`.

Block Configuration Property: **Time-axis labels**

TimeDisplayOffset — X-axis range offset`'0'` (default) | character vector

X-axis range offset, specified as a character vector or vector of character vectors. For input signals with multiple channels, enter a scaler or vector of offsets.

- `Scaler` — Offset all channels of an input signal by the same value.
- `Vector` — Independently offset the channels.

Block Configuration Property: **Time display offset**

TimeSpan — Length of x-axis range to display`'0'` (default) | character vector | `'Auto'`

Length of x -axis range to display, specified as one of these values:

- Positive real number — Value less than the total simulation time.
- 'Auto' — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the x -axis range using the `TimeDisplayOffset` and `TimeSpan` properties. For example, if you set `TimeDisplay` to 10 and the `TimeSpan` to 20, the scope sets the x -axis range from 10 to 30.

Block Configuration Property: **Time span**

TimeSpanOverrunAction — How to display data

'Wrap' (default) | 'Scroll'

How to display data beyond the visible x -axis range, specified as one of these values:

- 'Wrap' — Draw a full screen of data from left to right, clear the screen, and then restart drawing of data.
- 'Scroll' — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

Block Configuration Property: **Time span overrun action**

TimeUnits — Units to display on the x -axis

'Metric' (default for Time Scope block) | 'None' (default for Scope block) | 'Seconds'

Units to display on the x -axis, specified as one of these values:

- 'Metric' — Display time units based on the length of the `TimeSpan` property.
- 'None' — Display Time on the x -axis.
- 'Seconds' — Display Time (seconds) on the x -axis.

Block Configuration Property: **Time units**

Title — Title for display

'%<SignalLabel>' (default) | character vector

Title for a display, specified as text. The default value %<SignalLabel> uses the input signal name for the title.

Dependency: Set `ActiveDisplay` before setting this property.

Block Configuration Property: **Title**

visible — Visibility of scope window

`true` (default) | `false`

Visibility of scope window, specified as one of these values:

- `true` — Scope window visible.
- `false` — Scope window hidden.

Block Configuration Property: No corresponding property

YLabel — Y-axis label

`' '` (default) | character vector

Y-axis label for active display, specified as a character vector.

Dependency: Set `ActiveDisplay` before setting this property. If `PlotAsMagnitudePhase` is `true`, the value of `YLabel` is hidden and plots are labeled **Magnitude and Phase**.

Block Configuration Property: **Y-label**

YLimits — Minimum and maximum values of y-axis

`[-10 10]` (default) | `[ymin ymax]`

Minimum and maximum values of y-axis, specified as a two-element numeric vector.

Dependency: Set `ActiveDisplay` before setting this property. When `PlotAsMagnitudePhase` is `true`, this property specifies the y-axis limits for the magnitude plot. The y-axis limits of the phase plot are always `[-180 180]`.

Block Configuration Property: **Y-limits (Minimum)** and **Y-limits (Maximum)**

Examples

Create Scope Configuration Object

This example creates a scope configuration object using the 'vdp' model.

```
open_system('vdp')
myScopeConfiguration = get_param('vdp/Scope','ScopeConfiguration');
myScopeConfiguration.NumInputPorts = '2';
```

- “Mask Parameters” on page 6-278

Model Parameters

In this section...
“About Model Parameters” on page 6-2
“Examples of Setting Model Parameters” on page 6-108

About Model Parameters

You can query and/or modify the properties (parameters) of a Simulink model from the command line. Parameters that describe a model are model parameters, and parameters that describe a Simulink block are block parameters. Block parameters that are common to Simulink blocks are called common block parameters. There are also block-specific parameters. Masks also have parameters, that is, parameters that describe a masked block.

The model and block properties can also include callbacks, which are commands that execute when certain model or block events occur. These events include opening a model, simulating a model, copying a block, opening a block, and so on.

This table lists, in alphabetical order, parameters that describe a model. You can set these parameters using the `set_param` command. The **Description** column indicates where you can set the value on a dialog box.

For examples, see “Examples of Setting Model Parameters” on page 6-108. The **Values** column shows the type of value required, the possible values (separated with a vertical line), and the default value enclosed in braces.

The table also includes model callback parameters (see “Callbacks for Customized Model Behavior”). Do not use model parameters in a `PreLoadFcn` callback. Instead, use them in a `PostLoadFcn` callback.

Model Parameters in Alphabetical Order

Parameter	Description	Values
AbsTol	Specify the largest acceptable solver error, as the value of the measured state approaches zero. Set by Absolute tolerance on the Solver pane of the Configuration Parameters dialog box.	{'auto'}
AccelVerboseBuild	Controls the verbosity level during code generation for Simulink Accelerator mode, model reference Accelerator mode, and Rapid Accelerator mode. Set by Verbose accelerator builds on the Configuration Parameters dialog box.	{'off'} 'on'
AlgebraicLoopMsg	Specifies diagnostic action to take when there is an algebraic loop. Set by Algebraic loop on the Solver Diagnostics pane of the Configuration Parameters dialog box.	'none' {'warning'} 'error'
ArrayBoundsChecking	Select the diagnostic action to take when blocks write data to locations outside the memory allocated to them. Set by Array bounds exceeded on the Configuration Parameters dialog box.	{'none'} 'warning' 'error'

Parameter	Description	Values
ArtificialAlgebraic-LoopMsg	<p>Specifies diagnostic action to take if algebraic loop minimization cannot be performed for a subsystem because an input port of that subsystem has direct feedthrough.</p> <p>Set by Minimize algebraic loop on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
AssertControl	<p>Enable model verification blocks in the current model either globally or locally.</p> <p>Set by Model Verification block enabling on the Configuration Parameters dialog box.</p>	{'UseLocalSettings'} 'EnableAll' 'DisableAll'
AutoInsertRateTranBlk	<p>Specify whether Simulink software inserts hidden Rate Transition blocks between blocks that have different sample rates.</p> <p>Set by Automatically handle rate transition for data transfer on the Solver pane of the Configuration Parameters dialog box.</p>	'on' {'off'}

Parameter	Description	Values
BlockDescription-StringDataTip	<p>Specifies whether to display the user description for a block as a data tip.</p> <p>In the Simulink Editor, set by Description on the Display > Blocks > Block Tool Tip Options menu.</p>	'on' {'off'}
BlockNameDataTip	<p>Specifies whether to display the block name as a data tip.</p> <p>In the Simulink Editor, set by Block Name on the Display > Blocks > Block Tool Tip Options menu.</p>	'on' {'off'}
BlockParametersDataTip	<p>Specifies whether to display a block parameter in a data tip.</p> <p>In the Simulink Editor, set by Parameter Names & Values on the Display > Blocks > Block Tool Tip Options menu.</p>	'on' {'off'}
BlockPriority-ViolationMsg	<p>Select the diagnostic action to take if Simulink software detects a block priority specification error.</p> <p>Set by Block priority violation on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	{'warning'} 'error'

Parameter	Description	Values
BlockReduction	<p>Enables block reduction optimization.</p> <p>Set by Block reduction on the Configuration Parameters dialog box.</p>	{'on'} 'off'
BlockReductionOpt	See BlockReduction on page 6-0 parameter for more information.	
BooleanDataType	<p>Enable Boolean mode.</p> <p>Set by Implement logic signals as Boolean data (vs. double) on the Configuration Parameters dialog box.</p>	{'on'} 'off'
BrowserLookUnderMasks	<p>Show masked subsystems in the Model Browser.</p> <p>In the Simulink Editor, set by Include Systems with Mask Parameters on the View > Model Browser menu.</p>	'on' {'off'}
BrowserShowLibraryLinks	<p>Show library links in the Model Browser.</p> <p>In the Simulink Editor, set by Include Library Links on the View > Model Browser menu.</p>	'on' {'off'}
BufferReusableBoundary	Insert buffers at reusable subsystem boundaries if needed.	'on' {'off'}

Parameter	Description	Values
BufferReuse	<p>Enable reuse of block I/O buffers.</p> <p>Set by Reuse block outputs on the Optimization > Signals and Parameters pane of the Configuration Parameters dialog box.</p>	{'on'} 'off'
BusNameAdapt	<p>Repair broken selections in the Bus Selector and Bus Assignment block parameters dialog boxes that are due to upstream bus hierarchy changes.</p> <p>Set by “Repair bus selections” on the Diagnostics > Connectivity pane of the Configuration Parameters dialog box.</p>	{'WarnAndRepair'} 'ErrorWithoutRepair'
BusObjectLabelMismatch	<p>Select the diagnostic action to take if the name of a bus element does not match the name specified by the corresponding bus object.</p> <p>Set by Element name mismatch on the Diagnostics > Connectivity pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'

Parameter	Description	Values
CheckExecutionContext- RuntimeOutputMsg	Specify whether to display a warning if Simulink software detects potential output differences from previous releases. Set by Check runtime output of execution context on the Configuration Parameters dialog box.	'on' {'off'}
CheckForMatrix- Singularity	See CheckMatrixSingularityMsg on page 6-0 parameter for more information.	
CheckMatrix- SingularityMsg	Select the diagnostic action to take if the Product block detects a singular matrix while inverting one of its inputs in matrix multiplication mode. Set by Division by singular matrix on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.	{'none'} 'warning' 'error'
CheckModelReference- TargetMessage	Select the diagnostic action to take if Simulink software detects a target that needs to be rebuilt. Set by “Never rebuild diagnostic” on the Model Referencing pane of the Configuration Parameters dialog box.	'none' 'warning' {'error'}

Parameter	Description	Values
CheckSSInitialOutputMsg	<p>Enable checking for undefined initial subsystem output.</p> <p>Set by Check undefined subsystem initial output on the Configuration Parameters dialog box.</p>	{ 'on' } 'off'
CloseFcn	<p>Set the close callback function, which can be a command or a variable.</p> <p>Set by Model close function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{ '' }
CompiledBusType	<p>Return information about whether the signal connected to a port is not a bus, or whether it is a virtual or nonvirtual bus.</p> <p>(Read-only) Get with the <code>get_param</code> command. Specify a port or line handle. See “Display Information About Buses”.</p>	Return values are 'NOT_BUS', VIRTUAL_BUS, and NON_VIRTUAL_BUS
CompiledModelBlockNormalModeVisibility	<p>For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.</p>	Return values indicate which Model blocks have normal mode visibility enabled.

Parameter	Description	Values
ConditionallyExecute-Inputs	<p>Enable conditional input branch execution optimization.</p> <p>Set by Conditional input branch execution on the Configuration Parameters dialog box.</p>	{'on'} 'off'
ConsecutiveZCsStepRelTol	<p>Relative tolerance associated with the time difference between zero-crossing events.</p> <p>Set by Time tolerance on the Solver pane of the Configuration Parameters dialog box.</p>	{'10*128*eps'}
ConsistencyChecking	<p>Select the diagnostic action to take if S-functions have continuous sample times, but do not produce consistent results when executed multiple times.</p> <p>Set by Solver data inconsistency on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
ContinueFcn	<p>Continue simulation callback.</p> <p>Set by Simulation continue function on the Callbacks pane of the Model Properties dialog box.</p>	{''}

Parameter	Description	Values
CovCompData	<p>If CovHtmlReporting is set to on and CovCumulativeReport is set to on, this parameter specifies cvdata objects containing additional model coverage data to include in the model coverage report.</p> <p>Set by Additional data to include in report (cvdata objects) on the Reporting pane of the Configuration Parameters dialog box.</p>	'{'}
CovCumulativeReport	<p>If CovHtmlReporting is set to on, this parameter allows the CovCumulativeReport and CovCompData parameters to specify the number of coverage results displayed in the model coverage report.</p> <p>If set to on, the Simulink Coverage™ software displays the coverage results from successive simulations in the report.</p> <p>If set to off, the software displays the coverage results for the last simulation in the report.</p> <p>Set by the Cumulative runs (on) / Last run (off) options on the Reporting pane of the Configuration Parameters dialog box.</p>	'on' {'off'}

Parameter	Description	Values
CovDataFileName	If CovEnable is set to on, specifies the name of the file to which Simulink Coverage saves the coverage data results.	{ '' }
CovCumulativeVarName	If CovSaveCumulativeToWorkspaceVar is set to on, the Simulink Coverage software saves the results of successive simulations in the workspace variable specified by this property.	{ 'covCumulativeData' }
CovEnable	Enables coverage analysis for Simulink Coverage. Set by Enable coverage analysis on the Coverage pane of the Configuration Parameters dialog box.	'on' {'off'}
CovEnableCumulative	Accumulates model coverage results for Simulink Coverage from successive simulations. Set this and CovSaveCumulativeToWorkspaceVar to on to collect model coverage results for multiple simulations in one cvdata object.	'on' {'off'}

Parameter	Description	Values
CovExternalEMLEnable	Enables coverage for any external MATLAB functions that MATLAB functions for code generation call in your model. The functions can be defined in a MATLAB Function block or in a Stateflow chart. Enable this feature by checking MATLAB Files on the Coverage pane of the Configuration Parameters dialog box.	{'on'} 'off'
CovForceBlockReductionOff	If CovForceBlockReductionOff is set to on, the Simulink Coverage software ignores the value of the Simulink Block reduction parameter. The software provides coverage data for every block in the model that collects coverage.	{'on'} 'off'
CovHighlightResults	Enable model coloring for coverage results. Enabled by selecting Display coverage results using model coloring on the Coverage > Results pane of the Configuration Parameters dialog box.	'on' {'off'}

Parameter	Description	Values
CovHTMLOptions	<p>If CovHtmlReporting is set to on, use this parameter to select from a set of display options for the resulting model coverage report.</p> <p>Select these options in the Results Explorer settings after you record coverage for a model.</p>	<p>Character vector of appended character sets separated by a space. HTML options are enabled or disabled through a value of 1 or 0, respectively, in the following character sets (default values shown):</p> <ul style="list-style-type: none"> • '-sRT=1' — Show report • '-sVT=0' — Web view mode • '-aTS=1' — Include each test in the model summary • '-bRG=1' — Produce bar graphs in the model summary • '-bTC=0' — Use two color bar graphs (red, blue) • '-hTR=0' — Display hit/count ratio in the model summary • '-nFC=0' — Exclude fully covered model objects from report • '-nFD=1' — Exclude fully covered model object details from report • '-scm=1' — Include cyclomatic complexity numbers in summary • '-bcm=1' — Include cyclomatic complexity numbers in block details • '-xEV=0' — Filter Stateflow events from report

Parameter	Description	Values
		<ul style="list-style-type: none"> '-xEM=0' — Filter Execution metric from report
CovIncludeTopModel	Option to include the top-level model in the coverage analysis.	{'on'} {'off'}
CovHtmlReporting	<p>Set to on to tell the Simulink Coverage software to create an HTML report containing the coverage data at the end of simulation.</p> <p>Set by Generate report automatically after analysis on the Coverage > Results pane of the Configuration Parameters dialog box.</p>	'on' {'off'}
CovLogicBlockShortCircuit	<p>Enables the option to treat Simulink logic blocks as short-circuited for coverage analysis. Enabled by selecting Treat Simulink logic blocks as short-circuited on the Coverage pane of the Configuration Parameters dialog box.</p>	'on' {'off'}

Parameter	Description	Values
CovMcdcMode	<p>Determines the definition of Modified Condition Decision Coverage (MCDC) to use during coverage analysis.</p> <p>To record model coverage using the masking MCDC definition, setCovMcdcMode to 'Masking'. To record model coverage using the unique-cause MCDC definition, setCovMcdcMode to 'UniqueCause'.</p>	{'Masking'} 'UniqueCause'

Parameter	Description	Values
CovMetricSettings	<p>Selects coverage metrics for a coverage report.</p> <p>Coverage metrics are enabled by selecting the check boxes for individual coverages in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.</p> <p>Enable options 's' and 'w' by selecting Treat Simulink Logic blocks as short-circuited and Warn when unsupported blocks exist in model, respectively, on the Coverage pane of the Configuration Parameters dialog box.</p> <p>Disable option 'e' by selecting Display coverage results using model coloring in the Results Explorer settings after you record coverage for a model.</p> <hr/> <p>Note The metrics and options set by this parameter can also be set by the following parameters:</p> <ul style="list-style-type: none"> • CovHighlightResults • CovLogicBlockShortCircuit • CovMetricStructuralLevel • CovMetricLookupTable 	<p>{ 'dwe' }</p> <p>Each order-independent value enables a coverage metric or option as follows:</p> <ul style="list-style-type: none"> • 'd' — Enable decision coverage • 'c' — Enable condition coverage and decision coverage • 'm' — Enable MCDC coverage, condition coverage, and decision coverage • 't' — Enable lookup table coverage • 'r' — Enable signal range coverage • 'z' — Enable signal size coverage • 'o' — Enable coverage for Simulink Design Verifier blocks • 'i' — Enable saturation on integer overflow coverage • 'b' — Enable relational boundary coverage • 's' — Treat Simulink logic blocks as short-circuited • 'w' — Warn when unsupported blocks exist in model • 'e' — Eliminate model coloring for coverage results

Parameter	Description	Values
	<ul style="list-style-type: none"> • CovMetricSignalRange • CovMetricSignalSize • CovMetricObjectiveConstraint • CovMetricSaturateOnIntegerOverflow • CovMetricRelationalBoundary • CovUnsupportedBlockWarning 	
CovMetricLookupTable	<p>Enable lookup table coverage. Enabled by selecting Lookup Table in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.</p>	'on' {'off'}
CovMetricObjectiveConstraint	<p>Enable Simulink Design Verifier objectives and constraints coverage. Enabled by selecting Objectives and Constraints in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.</p>	'on' {'off'}
CovMetricRelationalBoundary	<p>Enable relational boundary coverage. Enabled by selecting Relational Boundary in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.</p>	'on' {'off'}

Parameter	Description	Values
CovMetricSaturateOnIntegerOverflow	Enable saturate on integer overflow coverage. Enabled by selecting Saturate on Integer Overflow in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.	'on' {'off'}
CovMetricSignalRange	Enable signal range coverage. Enabled by selecting Signal Range in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.	'on' {'off'}
CovMetricSignalSize	Enable signal size coverage. Enabled by selecting Signal Size in the Coverage metrics section of the Coverage pane of the Configuration Parameters dialog box.	'on' {'off'}
CovMetricStructuralLevel	Define the level of structural coverage. Set by Structural coverage level on the Coverage pane of the Configuration Parameters dialog box.	'BlockExecution' {'Decision'} 'ConditionDecision' 'MCDC'

Parameter	Description	Values
CovModelRefEnable	<p>If CovModelRefEnable is set to on or all, the Simulink Coverage software generates coverage data for all referenced models. If CovModelRefEnable is set to filtered, coverage data is collected for all referenced models except those specified by the parameter CovModelRefExcluded.</p> <p>Set by Coverage for referenced models on the Coverage pane of the Configuration Parameters dialog box.</p>	'on' {'off'} 'all' 'filtered'
CovModelRefExcluded	<p>If CovModelRefEnable is set to filtered, this parameter stores a comma-separated list of referenced models for which coverage is disabled.</p> <p>Set by selecting Coverage for referenced models on the Coverage pane of the Configuration Parameters dialog box and then clicking Select Models.</p>	{' '}

Parameter	Description	Values
CovNameIncrementing	<p>If CovSaveSingleToWorkspaceVar is set to on, setting CovNameIncrementing to on causes the Simulink Coverage software to append numerals to the workspace variable names for results so that earlier results are not overwritten (for example, covdata1, covdata2, etc.)</p> <p>Set by Increment variable name with each simulation below the selected Save last run in workspace variable check box on the Coverage > Results pane of the Configuration Parameters dialog box.</p>	'on' {'off'}
CovOutputDir	<p>If CovEnable is set to on, specifies the directory in which Simulink Coverage saves the coverage output files.</p>	{''}
CovPath	<p>Model path of the subsystem for which the Simulink Coverage software gathers and reports coverage data.</p> <p>Set by selecting Subsystem on the Coverage pane of the Configuration Parameters dialog box and then clicking Select Subsystem.</p>	{ '/' }

Parameter	Description	Values
CovReportOnPause	Specifies that when you pause during simulation, the model coverage report appears in updated form, with coverage results up to the current pause or stop time.	{'on'} 'off'
CovSaveCumulativeTo-WorkspaceVar	If set to on, the Simulink Coverage software accumulates and saves the results of successive simulations in the workspace variable specified by CovCumulativeVarName.	'on' {'off'}
CovSaveName	<p>If CovSaveSingleToWorkspaceVar is set to on, the Simulink Coverage software saves the results of the last simulation run in the workspace variable specified by this property.</p> <p>Set by cvdata object name below the selected Save last run in workspace variable check box on the Coverage > Results pane of the Configuration Parameters dialog box.</p>	{'covdata'}

Parameter	Description	Values
CovSaveSingleTo-WorkspaceVar	<p>If set to on, the Simulink Coverage software saves the results of the last simulation run in the workspace variable specified by CovSaveName.</p> <p>Set by Save last run in workspace variable on the Coverage > Results pane of the Configuration Parameters dialog box.</p>	'on' {'off'}
CovScope	<p>Sets the scope of analysis for coverage recording. Set by the Scope of analysis section of the Coverage pane in the Configuration Parameters dialog box.</p>	{'EntireSystem'} 'ReferencedModels' 'Subsystem'
CovSFcnEnable	<p>Enables coverage for C/C++ S-Function blocks in your model. Enable this feature by checking C/C++ S-Functions on the Coverage pane of the Configuration Parameters dialog box. For more information, see “Coverage for C and C++ S-Functions” (Simulink Coverage).</p>	'on' {'off'}
CovShowResultsExplorer	<p>Option to shows the results explorer after simulation. Enabled by selecting Show Results Explorer on the Coverage > Results pane of the Configuration Parameters dialog box.</p>	{'on'} 'off'

Parameter	Description	Values
CovUnsupportedBlockWarning	Warn when unsupported blocks exist in model. Enabled by selecting Warn when unsupported blocks exist in model on the Coverage pane of the Configuration Parameters dialog box.	'on' {'off'}
Created	Date and time model was created. Set by Created on on the History pane of the Model Properties dialog box. See “Model Information and History” for more information.	character vector
Creator	Name of model creator. Set by Created by on the History pane of the Model Properties dialog box. See “Model Information and History” for more information.	character vector
CurrentBlock	For internal use.	
CurrentOutputPort	For internal use.	

Parameter	Description	Values
DataDictionary	<p>Simulink data dictionary to which this model is linked.</p> <p>Set by Data Dictionary and Base Workspace on the Data pane of the Model Properties dialog box.</p> <p>For basic information about data dictionaries, see “What Is a Data Dictionary?”. To use this parameter programmatically, see “Store Data in Dictionary Programmatically”.</p>	{ '' }
DataLoggingOverride	<p>A Simulink.SimulationData.ModelLoggingInfo object that specifies the signal logging override settings for a model.</p> <p>See “Override Signal Logging Settings”.</p>	Simulink.SimulationData.ModelLoggingInfo — { 'OverrideSignals' } 'LogAllAsSpecifiedInModel'
DatasetSignalFormat	<p>Format for logged Dataset leaf elements.</p> <p>For details, see “Dataset signal format”.</p>	'timetable' { 'timeseries' }
DataTransfer	<p>A Simulink.GlobalDataTransfer object that configures data transfers for models configured for concurrent execution.</p>	'on' { 'off' }

Parameter	Description	Values
DataTypeOverride	<p>Specifies data type used to override fixed-point data types.</p> <p>Set by Data type override on the Fixed-Point Tool.</p>	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
Decimation	<p>Specify that Simulink software output only every N points, where N is the specified decimation factor.</p> <p>Set by “Decimation” on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{'1'}
DefaultParameterBehavior	<p>Enable inlining of block parameters in generated code.</p> <p>Set by Default parameter behavior on the Optimization > Signals and Parameters pane of the Configuration Parameters dialog box. For more information, see Default parameter behavior.</p>	'Inlined' {'Tunable'}
DefaultAnnotationFontName DefaultBlockFontName DefaultLineFontName	<p>Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose FontName property is set to 'auto'.</p> <p>Set with Diagram > Format > Font Styles for Model dialog box.</p>	character vector

Parameter	Description	Values
DefaultAnnotationFontSize DefaultBlockFontSize DefaultLineFontSize	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose <code>FontSize</code> property is set to <code>-1</code> . Set with Diagram > Format > Font Styles for Model dialog box.	positive integer
DefaultAnnotationFontAngle DefaultBlockFontAngle DefaultLineFontAngle	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose <code>FontAngle</code> property is set to <code>'auto'</code> . Set with Diagram > Format > Font Styles for Model dialog box.	{'normal'} 'italic'
DefaultAnnotationFontWeight DefaultBlockFontWeight DefaultLineFontWeight	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose <code>FontWeight</code> property is set to <code>'auto'</code> . Set with Diagram > Format > Font Styles for Model dialog box.	{'normal'} 'bold'

Parameter	Description	Values
DefaultUnderspecifiedData Type	Specify data type to use if Simulink cannot infer the type of a signal during data type propagation. Set by “ Default for underspecified data type ” on the Optimization pane of the Configuration Parameters dialog box.	{'double'} 'single'
DeleteChildFcn	Delete child callback function. Created on the Callbacks pane of the Block Properties dialog box. See “Specify Block Callbacks” for more information.	{''}
Description	Description of this model. Set by Model description on the Description pane of the Model Properties dialog box.	{''}
Dirty	If the parameter is on, the model has unsaved changes.	'on' {'off'}
DiscreteInherit- ContinuousMsg	For internal use.	
DisplayBdSearchResults	For internal use.	
DisplayBlockIO	For internal use.	
DisplayCallgraph- Dominators	For internal use	
DisplayCompileStats	For internal use.	
DisplayCondInputTree	For internal use.	
DisplayCondStIdTree	For internal use.	

Parameter	Description	Values
DisplayErrorDirections	For internal use.	
DisplayInvisibleSources	For internal use.	
DisplaySortedLists	For internal use.	
DisplayVectorAnd-FunctionCounts	For internal use.	
DisplayVect-PropagationResults	For internal use.	
ExecutionContextIcon	<p>Show execution context bars on conditional subsystems that do not propagate execution context across the subsystem boundaries.</p> <p>In the Simulink Editor, set by Execution Context Indicator on the Display > Signals & Ports menu.</p>	'on' {'off'}
ExplicitPartitioning	Specifies whether or not to manually map tasks (explicit mapping) or use the rate-based tasks.	'on' {'off'}
ExpressionFolding	<p>Enables expression folding.</p> <p>Set by Eliminate superfluous local variables (Expression folding) on the Configuration Parameters dialog box.</p>	{'on'} 'off'

Parameter	Description	Values
ExternalInput	<p>Names of MATLAB workspace variables used to designate data and times to be loaded from the workspace.</p> <p>Set by the Input field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{'t, u'}
ExtMode...	<p>Parameters whose names start with ExtMode apply to Simulink External Mode.</p> <p>For more information, see External Mode (Simulink Coder).</p>	
ExtrapolationOrder	<p>Extrapolation order of the ode14x implicit fixed-step solver.</p> <p>Set by Extrapolation order on the Solver pane of the Configuration Parameters dialog box.</p>	integer — 1 2 3 {4}
FastRestart	<p>Enable or disable fast restart mode.</p> <p>In the Simulink Editor toolbar, click the Fast restart button on or off.</p>	{'on'} 'off'

Parameter	Description	Values
FcnCallInpInside-ContextMsg	<p>Specifies diagnostic action to take when Simulink software must compute any function-call subsystem inputs directly or indirectly during execution of a call to a function-call subsystem.</p> <p>Set by Context-dependent inputs on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'Error'} 'Warning'
FileName	For internal use.	
FinalStateName	<p>Names of final states to save to the workspace after a simulation ends.</p> <p>Set by the Final states field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{'xFinal'}
FixedStep	<p>Fixed-step size.</p> <p>Set by Fixed step size (fundamental sample time) on the Solver pane of the Configuration Parameters dialog box.</p>	{'auto'}

Parameter	Description	Values
FixptConstOverflowMsg	<p>Specifies diagnostic action to take when a fixed-point constant overflow occurs during simulation.</p> <p>Set by Detect overflow on the Type Conversion Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
FixptConstPrecisionLossMsg	<p>Specifies diagnostic action to take when a fixed-point constant precision loss occurs during simulation.</p> <p>Set by Detect precision loss on the Type Conversion Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
FixptConstUnderflowMsg	<p>Specifies diagnostic action to take when a fixed-point constant underflow occurs during simulation.</p> <p>Set by Detect underflow on the Type Conversion Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
FixPtInfo	For internal use.	
FollowLinksWhenOpeningFromGotoBlocks	Specifies whether to search for Goto tags in libraries referenced by the model when opening the From block dialog box.	'on' {'off'}
ForceArrayBoundsChecking	For internal use.	

Parameter	Description	Values
ForceConsistencyChecking	For internal use.	
ForceModelCoverage	For internal use.	
ForwardingTable	Specifies the forwarding table for this library. See “Create Forwarding Table” for more information.	{{'old_path_1', 'new_path_1'} ... {'old_path_n', 'new_path_n'}}
ForwardingTableString	For internal use.	
GeneratePreprocessorConditionals	When generating code for an ERT target, this parameter determines whether variant choices are enclosed within C preprocessor conditional statements (<code>#if</code>). When you select this option, Simulink analyzes all variant choices during an update diagram or simulation. This analysis provides early validation of the code generation readiness of all variant choices.	{'off'} 'on'
GridSpacing	Has no effect in Simulink Editor. This parameter will be removed in a future release.	integer — {20}
Handle	Handle of the block diagram for this model.	double
HardwareBoard	Select the type of hardware on which to run your model. Set by “ Hardware board ” on the Hardware Implementation pane of the Configuration Parameters dialog box.	{'none'}

Parameter	Description	Values
HideAutomaticNames	Hides block names given automatically by the Simulink Editor. See “Hide or Display Block Names”.	{'on'} 'off'
HiliteAncestors	For internal use.	
IgnoreBidirectionalLines	For internal use.	
IgnoredZcDiagnostic	Control diagnostic messages related to zero-crossings that are being ignored.	'none' {'warning'} 'error'
InheritedTsInSrcMsg	<p>Message behavior when the sample time is inherited.</p> <p>Set by Source block specifies -1 sample time on the Sample Time Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
InitFcn	<p>Function that is called when this model is first compiled for simulation.</p> <p>Set by Model initialization function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{''}
InitialState	<p>Initial state name or values.</p> <p>Set by the Initial state field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	variable or vector — {'xInitial'}

Parameter	Description	Values
InitialStep	Initial step size. Set by Initial step size on the Solver pane of the Configuration Parameters dialog box.	{'auto'}
InitialStep	Initial step size. Set by Initial step size on the Solver pane of the Configuration Parameters dialog box.	{'auto'}
InitialStep	Initial step size. Set by Initial step size on the Solver pane of the Configuration Parameters dialog box.	{'auto'}

Parameter	Description	Values
InitInArrayFormatMsg	<p>Message behavior when the initial state is an array. You set with the initial state with the Initial state configuration parameter.</p> <p>Avoid using an array for the initial state. If the order of the elements in the array does not match the order in which blocks initialize, the simulation can produce unexpected results. To promote deterministic simulation results, use the default setting or set the diagnostic to <code>error</code>.</p> <p>Alternatively, you can set the message behavior using the “InitInArrayFormatMsg” on the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
InsertRTBMode	<p>Control whether the Rate Transition block parameter Ensure deterministic data transfer (maximum delay) is set for auto-inserted Rate Transition blocks.</p> <p>Set by Deterministic data transfer on the Solver pane of the Configuration Parameters dialog box.</p>	'Always' {'Whenever possible'} 'Never (minimum delay)'

Parameter	Description	Values
InspectSignalLogs	<p>Enable Simulink software to display logged signals in the Simulation Data Inspector tool at the end of a simulation or whenever you pause the simulation.</p> <p>Set by “Record logged workspace data in Simulation Data Inspector” on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	'on' {'off'}
InstrumentedSignals	<p>Returns a <code>Simulink.HMI.InstrumentedSignals</code> object with the properties of model name and the number of signals that are marked for streaming. From this object, you can control signal streaming using the block path and output port index.</p>	object — <code>Simulink.HMI.InstrumentedSignals</code>
Int32ToFloatConvMsg	<p>Specify message behavior when a 32-bit integer is converted to a single-precision float.</p> <p>Set by 32-bit integer to single precision float conversion on the Type Conversion Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'}

Parameter	Description	Values
IntegerOverflowMsg	Specify message behavior when an integer overflow occurs. Set by “Wrap on overflow” in the Signals section on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.	'none' {'warning'} 'error'
IntegerSaturationMsg	Specify message behavior when an integer saturation occurs. Set by “Saturate on overflow” in the Signals section on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.	'none' {'warning'} 'error'
InvalidFcnCallConnMsg	Specify message behavior when an invalid function-call connection exists. Set by Invalid function-call connection on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.	'warning' {'error'}
Jacobian	For internal use.	
LastModifiedBy	User name of the person who last modified this model.	character vector
LastModifiedDate	Date when the model was last saved.	character vector

Parameter	Description	Values
LibraryLinkDisplay	<p>Displays the blocks in the model that are linked or have disabled or modified links.</p> <p>In the Simulink Editor, set by Library Links on the Display menu.</p>	<p>'none' {'disabled'} 'user' 'all'</p> <p>Set to none, does not display the link badge on the block.</p> <p>Set to disabled, displays the disabled link badge on the block.</p> <p>Set to user, displays only links to the user libraries.</p> <p>Set to all, displays all links.</p>
LibraryType	For internal use.	
LifeSpan	<p>Specify how long (in days) an application that contains blocks depending on elapsed or absolute time should be able to execute before timer overflow.</p> <p>Set by Application lifespan (days) on the Optimization pane of the Configuration Parameters dialog box.</p>	{'auto'} any positive, nonzero scalar value
LimitDataPoints	<p>Specify that the number of data points exported to the MATLAB workspace be limited to the number specified.</p> <p>Set by the Limit data points configuration parameter</p>	{'on'} 'off'
LinearizationMsg	For internal use.	
Lines	For internal use.	

Parameter	Description	Values
LoadExternalInput	Load input from workspace. Set by the Input check box on the Data Import/Export pane of the Configuration Parameters dialog box.	'on' {'off'}
LoadInitialState	Load initial state from workspace. Set by the Initial state check box on the Data Import/Export pane of the Configuration Parameters dialog box.	'on' {'off'}
Location	For internal use.	
Lock	Lock or unlock a block library. Setting this parameter to on prevents a user from inadvertently changing a library.	'on' {'off'}
LockLinksToLibrary	Lock or unlock links to a library. Setting this parameter to on prevents a user from inadvertently changing linked blocks from the Simulink Editor.	'on' {'off'}
LoggingFileName	Use when you enable LoggingToFile parameter for logging to persistent storage. Specify the destination MAT-file for data logging.	{'out.mat'} Do not use a file name from one locale in a different locale.

Parameter	Description	Values
LoggingToFile	<p>Store logging data that uses Dataset format to persistent storage (MAT-file). Using a Simulink.SimulationData.DatasetRef object to access signal logging and states logging data loads data into the model workspace incrementally. Accessing data for other kinds of logging loads all of the data at once.</p> <p>Use this feature when logging large amounts of data that can cause memory issues. For details, see “Log Data to Persistent Storage”.</p>	'on' {'off'}
MAModelExclusionFile	<p>Specifies the location of the Model Advisor exclusion file.</p> <p>Set by the File Name field on the Model Advisor Exclusion Editor dialog box.</p>	{' '}
MaskedZcDiagnostic	Control diagnostic messages related to zero-crossings that are being masked.	'none' {'warning'} 'error'

Parameter	Description	Values
MaxConsecutiveMinStep	<p>Maximum number of minimum step size violations allowed during simulation. This option appears when the solver type is Variable-step and the solver is an ode one.</p> <p>Set by Number of consecutive min steps on the Solver pane of the Configuration Parameters dialog box.</p>	{'1'}
MaxConsecutiveZCs	<p>Maximum number of consecutive zero crossings allowed during simulation. This option appears when the solver type is Variable-step and the solver is an ode one.</p> <p>Set by Number of consecutive zero crossings on the Solver pane of the Configuration Parameters dialog box.</p>	{'1000'}
MaxConsecutiveZCsMsg	<p>Specifies diagnostic action to take when Simulink software detects the maximum number of consecutive zero crossings allowed. This option appears when the solver type is Variable-step and the solver is an ode one.</p> <p>Set by Consecutive zero crossings violation on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' 'error'

Parameter	Description	Values
MaxDataPoints	<p>Maximum number of output data points to save.</p> <p>Set by the Limit data points to last field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{ '1000' }
MaxMDLFileLineLength	<p>Controls the line lengths in the model file. Use this to avoid line-wrapping, which can be important for source control tools.</p> <p>Specifies the maximum length in bytes, which may differ from the number of characters in Japanese, and is different from the number of columns when tabs are present.</p>	<p>integer — -1 (unlimited) or >= 80.</p> <p>Default is 120.</p>
MaxNumMinSteps	Maximum number of times the solver uses the minimum step size.	{ '-1' }
MaxOrder	<p>Maximum order for ode15s.</p> <p>Set by Maximum order on the Solver pane of the Configuration Parameters dialog box.</p>	'1' '2' '3' '4' { '5' }
MaxStep	<p>Maximum step size.</p> <p>Set by Max step size on the Solver pane of the Configuration Parameters dialog box.</p>	{ 'auto' }
MdlSubVersion	For internal use	

Parameter	Description	Values
MergeDetectMultiDriving-BlocksExec	<p>Select the diagnostic action to take when the software detects a Merge block with more than one driving block executing at the same time step.</p> <p>Set by Detect multiple driving blocks executing at the same time step on the Configuration Parameters dialog box.</p>	{ 'none' } 'warning' 'error'
Metadata	<p>Names and attributes of arbitrary data associated with the model. To extract this metadata structure without needing to load the model, use the method <code>Simulink.MDLInfo.getMetadata</code>.</p>	Structure. Fields can be character vectors, numeric matrices of type "double", or more structures.
MinMaxOverflow-ArchiveData	For internal use	
MinMaxOverflow-ArchiveMode	<p>Logging type for fixed-point logging.</p> <p>Set by Overwrite or merge model simulation results in the Fixed-Point Tool.</p>	{ 'Overwrite' } 'Merge'
MinMaxOverflowLogging	<p>Setting for fixed-point logging.</p> <p>Set by Fixed-point instrumentation mode in the Fixed-Point Tool.</p>	{ 'UseLocalSettings' } 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'

Parameter	Description	Values
MinStep	<p>Minimum step size for the solver.</p> <p>Set by Min step size on the Solver pane of the Configuration Parameters dialog box.</p>	{'auto'}
MinStepSizeMsg	<p>Message shown when minimum step size is violated.</p> <p>Set by Min step size violation on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	{'warning'} {'error'}
ModelBlockNormalModeVisibility	<p>Use with <code>set_param</code> to set normal mode visibility on for the specified Model blocks.</p> <p>You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see “Specify the Instance Having Normal Mode Visibility”.</p>	<p>With <code>set_param</code>, use an array of <code>Simulink.BlockPath</code> objects or cell array of cell arrays of character vectors of paths to blocks or models.</p> <p>With <code>set_param</code>, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.</p>
ModelBlockNormalModeVisibilityBlockPath	<p>Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.</p>	<p>Return values indicate which Model blocks have normal mode visibility enabled. See “Simulate Models with Multiple Referenced Model Instances”.</p>
ModelBrowserVisibility	<p>Show the Model Browser.</p> <p>In the Simulink Editor, set by Model Browser on the View menu.</p>	'on' {'off'}

Parameter	Description	Values
ModelBrowserWidth	Width of the Model Browser pane in the model window. To display the Model Browser pane, see the ModelBrowserVisibility on page 6-0 parameter.	integer — {200}
ModelDataFile	For internal use.	{ '' }
ModelDependencies	List of model dependencies. Set by Model dependencies on the Model Referencing pane of the Configuration Parameters dialog box.	{ '' }

Parameter	Description	Values
ModelReferenceCS-MismatchMessage	<p>This parameter is maintained for compatibility purposes only. Do not use this parameter.</p> <p>You can use the Model Advisor to identify models referenced in Accelerator mode for which Simulink ignores certain configuration parameters.</p> <ol style="list-style-type: none"> 1 In the Simulink Editor, select Analysis > Model Advisor. 2 Select By Task. 3 Run the Check diagnostic settings ignored during accelerated model reference simulation check. <p>For more information, see “Diagnostic Configuration Parameters Ignored in Accelerator Mode”.</p>	<p>{'none'} 'warning' 'error'</p> <p>Simulink ignores this parameter if you set it to warning or error.</p>
ModelReferenceData-LoggingMessage	<p>Message shown when there is unsupported data logging.</p> <p>Set by Unsupported data logging on the Model Referencing Diagnostics pane of the Configuration Parameters dialog box.</p>	<p>'none' {'warning'} 'error'</p>

Parameter	Description	Values
ModelReferenceExtra-NoncontSigs	<p>Specifies diagnostic action to take when a discrete signal appears to pass through a Model block to the input of a block with continuous states.</p> <p>Set by Extraneous discrete derivative signals on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' {'error'}
ModelReferenceIO-MismatchMessage	<p>Message shown when there is a port and parameter mismatch.</p> <p>Set by Port and parameter mismatch on the Model Referencing Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
ModelReferenceIOMsg	<p>Message shown when there is an invalid root Inport or Outport block connection.</p> <p>Set by Invalid root Inport/Outport block connection on the Model Referencing Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'

Parameter	Description	Values
ModelReferenceMin- AlgLoopOccurrences	Toggles the minimization of algebraic loop occurrences. Set by Minimize algebraic loop occurrences on the Model Referencing pane of the Configuration Parameters dialog box.	'on' {'off'}
ModelReferenceNum- InstancesAllowed	Total number of model reference instances allowed per top model. Set by Total number of instances allowed per top model on the Model Referencing pane of the Configuration Parameters dialog box.	'Zero' 'Single' {'Multi'}
ModelReferencePass- RootInputsByReference	Toggles the passing of scalar root inputs by value. Set by “Pass fixed-size scalar root inputs by value for code generation” on the Model Referencing pane of the Configuration Parameters dialog box.	{'on'} 'off'
ModelReferenceSim- TargetVerbose	This parameter is deprecated and has no effect. Use <code>AccelVerboseBuild</code> instead.	
ModelReferenceSymbol- NameMessage	For referenced models, specifies diagnostic action to take when the Maximum identifier length does not provide enough space to make global identifiers unique across models.	'none' {'warning'} 'error'

Parameter	Description	Values
ModelReferenceTargetType	For internal use.	
ModelReferenceVersionMismatchMessage	<p>Message shown when there is a model block version mismatch.</p> <p>Set by Model block version mismatch on the Model Referencing Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
ModelVersion	Version number of model.	{'1.1'}
ModelVersionFormat	<p>Format of model's version number.</p> <p>Set by Model version on the History pane of the Model Properties dialog box.</p> <p>See “Model Information and History” for more information.</p>	{'1.%<AutoIncrement: 0>'}
ModelWorkspace	References this model's model workspace object.	an instance of the Simulink.ModelWorkspace class
ModifiedByFormat	<p>Format for the display of last modifier.</p> <p>Set by Last saved by on the History pane of the Model Properties dialog box.</p> <p>See “Model Information and History” for more information.</p> <p>Can also be set by Last saved by on the Model history field on the History pane of the Model Explorer.</p>	{'%<Auto>'}

Parameter	Description	Values
ModifiedComment	Field for user comments.	{ '' }
ModifiedDateFormat	<p>Format used to generate the value of the <code>LastModifiedDate</code> parameter.</p> <p>Set by Last saved on on the History pane of the Model Properties dialog box.</p> <p>See “Model Information and History” for more information.</p>	{ '%<Auto>' }
ModifiedHistory	<p>Area for keeping notes about the history of the model.</p> <p>Set by the Model history field on the History pane of the Model Properties dialog box.</p> <p>See “Model Information and History” for more information.</p> <p>Can also be set by the Model history field on the History pane of the Model Explorer.</p>	{ '' }
MultiTaskCondExecSysMsg	<p>Select the diagnostic action to take if Simulink software detects a subsystem that might cause data corruption or nondeterministic behavior.</p> <p>Set by Multitask conditionally executed subsystem on the Sample Time Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' {'error'}

Parameter	Description	Values
MultiTaskDSMMsg	<p>Specifies diagnostic action to take when one task reads data from a Data Store Memory block to which another task writes data.</p> <p>Set by Multitask data store on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' {'error'}
MultiTaskRateTransMsg	<p>Specifies diagnostic action to take when an invalid rate transition takes place between two blocks operating in multitasking mode.</p> <p>Set by Multitask rate transition on the Sample Time Diagnostics pane of the Configuration Parameters dialog box.</p>	'warning' {'error'}
Name	Model name.	character vector
NonBusSignalsTreatedAsBus	<p>Detect when Simulink implicitly converts a non-bus signal to a bus signal to support connecting the signal to a block expecting a bus signal.</p> <p>“Non-bus signals treated as bus signals” on the Diagnostics > Connectivity pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'

Parameter	Description	Values
NumberNewtonIterations	<p>Number of Newton's method iterations performed by the ode14x implicit fixed-step solver.</p> <p>Set by Number Newton's iterations on the Solver pane of the Configuration Parameters dialog box.</p>	integer — {1}
NumStatesForStiffnessChecking	<p>Threshold value of number of continuous states in model for stiffness calculation. If the number of continuous states in the model exceeds the NumStatesForStiffnessChecking value, auto solver uses ode15s.</p> <p>For more information, see “Use Auto Solver to Select a Solver”.</p>	{' '}
ObjectParameters	Names and attributes of model parameters.	structure
Open	For internal use.	
OptimizeBlockIOStorage	<p>Enables signal storage reuse optimization.</p> <p>Set by Signal storage reuse on the Configuration Parameters dialog box.</p>	{'on'} 'off'

Parameter	Description	Values
OutputOption	<p>Time step output options for variable-step solvers.</p> <p>Set by Output options parameter under Configuration Parameters > Data Import/Export > Additional parameters.</p>	'AdditionalOutputTimes' {'RefineOutputTimes'} 'SpecifiedOutputTimes'
OutputSaveName	<p>Workspace variable to store the model outputs.</p> <p>Set by the Output field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{'yout'}
OutputTimes	<p>Output times set when Set by Output options parameter under Configuration Parameters > Data Import/Export > Additional parameters is set to Produce additional output.</p> <p>Set using the Output times parameter.</p>	{'[]'}
PaperOrientation	Printing paper orientation.	'portrait' {'landscape'}
PaperPosition	When PaperPositionMode is set to manual, this parameter determines the position and size of a diagram on paper and the size of the diagram exported as a graphic file in the units specified by PaperUnits.	vector — [left, bottom, width, height]

Parameter	Description	Values
PaperPositionMode	<p>Paper position mode.</p> <ul style="list-style-type: none"> • auto <p>When printing, Simulink software sizes the diagram to fit the printed page. When exporting a diagram as a graphic image, Simulink software sizes the exported image to be the same size as the diagram's normal size on screen.</p> <ul style="list-style-type: none"> • manual <p>When printing, Simulink software positions and sizes the diagram on the page as indicated by PaperPosition. When exporting a diagram as a graphic image, Simulink software sizes the exported graphic to have the height and width specified by PaperPosition.</p> <ul style="list-style-type: none"> • tiled <p>Enables tiled printing.</p> <p>See “Tiled Printing” for more information.</p>	{'auto'} 'manual' 'tiled'
PaperSize	Size of PaperType in PaperUnits.	vector — [width height] (read only)

Parameter	Description	Values
PaperType	Printing paper type.	'usletter' 'uslegal' 'a0' 'a1' 'a2' 'a3' 'a4' 'a5' 'b0' 'b1' 'b2' 'b3' 'b4' 'b5' 'arch-A' 'arch-B' 'arch-C' 'arch-D' 'arch-E' 'A' 'B' 'C' 'D' 'E' 'tabloid'
PaperUnits	Printing paper size units.	'normalized' {'inches'} 'centimeters' 'points'

Parameter	Description	Values
ParallelModelReferenceErrorOnInvalidPool	<p>Specify if you want the Simulink software to perform a consistency check on the parallel pool before starting a parallel build.</p> <p>If you set the parameter to <code>on</code>, the client and the remote workers must meet the following criteria for the parallel build to initiate:</p> <ul style="list-style-type: none"> • The parallel pool is open. • The pool is <code>spmd</code> compatible. • The platform is consistent between workers and client. • The workers have a Simulink Real-Time license. • A common compiler exists across workers and client. <p>If you set the parameter to <code>off</code>, the software displays a warning for the first condition that fails and then performs a sequential build.</p>	{'on'} 'off'

Parameter	Description	Values
ParameterArgumentNames	<p>List of parameters used as arguments when this model is called as a reference.</p> <p>Set by checking the Argument column for variables in the model workspace of the referenced model. See “Parameterize Instances of a Reusable Referenced Model”.</p>	{ '' }
ParameterDowncastMsg	<p>Specifies diagnostic action to take when a parameter downcast occurs during simulation.</p> <p>Set by Detect downcast on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' {'error'}
ParameterOverflowMsg	<p>Specifies diagnostic action to take when a parameter overflow occurs during simulation.</p> <p>Set by Detect overflow on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' {'error'}

Parameter	Description	Values
ParameterPrecision-LossMsg	<p>Specifies diagnostic action to take when parameter precision loss occurs during simulation.</p> <p>Set by Detect precision loss on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
ParameterTunabilityLossMsg	<p>Specifies diagnostic action to take when a parameter cannot be tuned because it uses unsupported functions or operators.</p> <p>Set by Detect loss of tunability on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
ParameterUnderflowMsg	<p>Specifies diagnostic action to take when a parameter underflow occurs during simulation.</p> <p>Set by Detect underflow on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
ParamWorkspaceSource	For internal use.	
Parent	Name of the model or subsystem that owns this object. The value of this parameter for a model is an empty character vector.	{''}

Parameter	Description	Values
Pause	<p>Pause simulation callback.</p> <p>Set by Simulation pause function on the Callbacks pane of the Model Properties dialog box.</p>	{ '' }
PortDataTypeDisplayFormat	<p>When you display port data types in a model by selecting Display > Signals and Ports > Port Data Types, choose whether to display data type aliases, base data types, or both.</p> <p>In the Simulink Editor, set by Display > Signals and Ports > Port Data Type Display Format.</p>	{ 'AliasTypeOnly' 'BaseTypeOnly' 'BaseAndAliasTypes' }
PositivePriorityOrder	<p>Choose the appropriate priority ordering for the real-time system targeted by this model. The Simulink Coder software uses this information to implement asynchronous data transfers.</p> <p>Set by Higher priority value indicates higher task priority on the Solver pane of the Configuration Parameters dialog box.</p>	'on' {'off'}

Parameter	Description	Values
PostLoadFcn	<p>Function invoked just after this model is loaded.</p> <p>Set by Model post-load function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{ ' ' }
PostSaveFcn	<p>Function invoked just after this model is saved to disk. Not executed for blocks inside library links.</p> <p>Set by Model post-save function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{ ' ' }
PreLoadFcn	<p>Preload callback.</p> <p>Set by Model pre-load function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{ ' ' }

Parameter	Description	Values
PreSaveFcn	<p>Function invoked just before this model is saved to disk. Not executed for blocks inside library links, except when you are breaking the link, e.g., with <code>save_system(A, B, 'BreakUserLinks', 'on')</code>.</p> <p>Set by Model pre-save function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{ '' }
ProdBitPerChar	<p>Describes the length in bits of the C <code>char</code> data type supported by the hardware board to be used by this model.</p> <p>Set by Number of bits: char on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	integer — { 8 }
ProdBitPerInt	<p>Describes the length in bits of the C <code>int</code> data type supported by the hardware board to be used by this model.</p> <p>Set by Number of bits: int on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	integer — { 32 }

Parameter	Description	Values
ProdBitPerLong	<p>Describes the length in bits of the C long data type supported by the hardware board to be used by this model.</p> <p>Set by Number of bits: long on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	integer — {32}
ProdBitPerLongLong	<p>Describes the length in bits of the C long data type supported by the hardware board to be used by this model.</p> <p>Set by “Number of bits: long long” on the Hardware Implementation pane of the Configuration Parameters dialog box.</p> <p>The value of this parameter must be greater than or equal to the value of ProdBitPerLong.</p>	integer — {64}
ProdBitPerShort	<p>Describes the length in bits of the C short data type supported by the hardware board to be used by this model.</p> <p>Set by Number of bits: short on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	integer — {16}

Parameter	Description	Values
ProdEndianness	<p>Describes the significance of the first byte of a data word of the hardware board to be used by this model.</p> <p>Set by Byte ordering on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	{'Unspecified'} 'LittleEndian' 'BigEndian'
ProdEqTarget	<p>Specifies that the hardware used to test the code generated from this model is the same as the production hardware or has the same characteristics.</p>	{'on'} 'off'
ProdHWDeviceType	<p>Predefined hardware device to specify the C language constraints for your microprocessor.</p> <p>Set by “Device vendor” and Device type on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	{'Generic->Unspecified (assume 32-bit Generic)'}
ProdIntDivRoundTo	<p>Describes how the C compiler that creates production code for this model rounds the result of dividing one signed integer by another to produce a signed integer quotient.</p> <p>Set by Signed integer division rounds to on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	'Floor' 'Zero' {'Undefined'}

Parameter	Description	Values
ProdLargestAtomicFloat	<p>Specify the largest floating-point data type that can be atomically loaded and stored on the hardware board.</p> <p>Set by “Largest atomic size: floating-point” on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	'Float' 'Double' {'None'}
ProdLargestAtomicInteger	<p>Specify the largest integer data type that can be atomically loaded and stored on the hardware board.</p> <p>Set this parameter to 'LongLong' only if the production hardware supports the C long long data type and you have set ProdLongLongMode to 'on'.</p> <p>Set by “Largest atomic size: integer” on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	{'Char'} 'Short' 'Int' 'Long' 'LongLong'
ProdLongLongMode	<p>Specify that your C compiler supports the C long long data type. Most C99 compilers support long long.</p> <p>Set by “Support long long” on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	'on' {'off'}

Parameter	Description	Values
ProdShiftRightIntArith	<p>Describes whether the C compiler that creates production code for this model implements a signed integer right shift as an arithmetic right shift.</p> <p>Set by Shift right on a signed integer as arithmetic shift on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	{'on'} 'off'
ProdWordSize	<p>Describes the word length in bits of the hardware board to be used by this model.</p> <p>Set by Number of bits: native on the Hardware Implementation pane of the Configuration Parameters dialog box.</p>	integer — {32}
Profile	<p>Enables the simulation profiler for this model.</p> <p>In the Simulink Editor, set by Show Profiler Report on the Analysis menu.</p>	'on' {'off'}

Parameter	Description	Values
PropagateSignalLabelsOutOfModel	<p>Pass propagated signal names to output signals of Model block.</p> <p>Set by Propagate all signal labels out of the model on the Model Referencing pane of the Configuration Parameters dialog box.</p> <p>See “Propagate all signal labels out of the model” for more information.</p>	{'on'} 'off'
PropagateVarSize	<p>Select how variable-size signals propagate through referenced models.</p> <p>Set by Propagate sizes of variable-size signals on the Model Referencing pane of the Configuration Parameters dialog box.</p> <p>See “Model Configuration Parameters: Model Referencing” for more information.</p>	'Infer from blocks in model' 'Only when enabling' 'During execution'
ReadBeforeWriteMsg	<p>Specifies diagnostic action to take when the model attempts to read data from a data store before it has stored data at the current time step.</p> <p>Set by Detect read before write on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'UseLocalSettings'} 'DisableAll' 'EnableAllAsWarning' 'EnableAllAsError'

Parameter	Description	Values
RecordCoverage	<p>If RecordCoverage is set to on, Simulink collects and reports model coverage data during simulation. The format of this report is controlled by the values of the following parameters:</p> <p>CovCompData</p> <p>CovCumulativeReport</p> <p>CovCumulativeVarName</p> <p>CovHTMLOptions</p> <p>CovHtmlReporting</p> <p>CovMetricSettings</p> <p>CovModelRefEnable</p> <p>CovModelRefExcluded</p> <p>CovNameIncrementing</p> <p>CovPath</p> <p>CovReportOnPause</p> <p>CovSaveCumulativeToWorkSpaceVar</p> <p>CovSaveName</p> <p>CovSaveSingleToWorkspaceVar</p>	'on' {'off'}

Parameter	Description	Values
	<p>If set to <code>off</code>, no model coverage data is collected or reported.</p> <p>Set by Entire System on the Coverage pane of the Configuration Parameters dialog box.</p>	
Refine	<p>Refine factor.</p> <p>Set by Refine factor parameter under parameter under Configuration Parameters > Data Import/Export > Additional parameters.</p>	{ '1' }
RelTol	<p>Relative error tolerance.</p> <p>Set by Relative tolerance on the Solver pane of the Configuration Parameters dialog box.</p>	{ '1e-3' }
RemoveDisableFunc	<p>For model referencing contexts for ERT targets, remove the generated disable functions that cannot be reached from anywhere in the generated code.</p> <p>Set by the “Remove disable function” (Embedded Coder) configuration parameter.</p>	'on' {'off'}

Parameter	Description	Values
RemoveResetFunc	<p>For model referencing contexts for ERT targets, remove the generated reset functions that cannot be reached from anywhere in the generated code.</p> <p>Set by the “Remove reset function” (Embedded Coder) configuration parameter.</p>	{ 'on' } 'off'
ReportName	Name of the associated file for the Report Generator.	{ 'simulink-default.rpt' }
ReqHilite	<p>Highlights all the blocks in the Simulink diagram that have requirements associated with them.</p> <p>In the Simulink Editor, set by Highlight Model on the Analysis > Requirements menu.</p>	'on' { 'off' }
RequirementInfo	For internal use.	
RootOutputRequire- BusObject	<p>Specifies diagnostic action to take when a bus enters a root model Output block for which a bus object has not been specified.</p> <p>Set by Unspecified bus object at root Output block on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' { 'warning' } 'error'

Parameter	Description	Values
RTPrefix	<p>Specifies diagnostic action to take when Simulink software encounters an object name that begins with <code>rt</code>.</p> <p>Set by "rt" prefix for identifiers on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' 'warning' {'error'}
RTW...	For information about model parameters beginning with RTW, see Configuration Parameters for Simulink Models and Parameter Reference in the Simulink Coder documentation.	
SampleTimeAnnotations	In the Simulink Editor, set by Annotations on the Display > Sample Time menu.	'on' {'off'}
SampleTimeColors	In the Simulink Editor, set by Colors on the Display > Sample Time Display menu.	'on' {'off'}
SampleTimeConstraint	<p>This option appears when the solver type is Fixed-step.</p> <p>Set by Periodic sample time constraint on the Solver pane of the Configuration Parameters dialog box.</p>	{'Unconstrained'} 'STIndependent' 'Specified'

Parameter	Description	Values
SampleTimeProperty	Specifies and assigns priorities to the sample times implemented by the model. This option appears when Periodic sample time constraint is set to Specified. Set by Sample time properties on the Solver pane of the Configuration Parameters dialog box.	Structure containing the fields SampleTime, Offset, and Priority
SavedCharacterEncoding	Specifies the character set used to encode this model. See the <code>slCharacterEncoding</code> command for more information.	character vector
SaveDefaultBlockParams	For internal use.	
SavedSinceLoaded	Indicates whether the model has been saved since it was loaded. 'on' indicates the model has been saved.	'on' 'off'
SaveFinalState	Save final states to workspace. Set by the Final states check box on the Data Import/Export pane of the Configuration Parameters dialog box.	'on' {'off'}
SaveFormat	Format used to save data to the MATLAB workspace. Set by Format on the Data Import/Export pane of the Configuration Parameters dialog box.	{'Dataset'} 'Structure' 'StructureWithTime' 'Array'

Parameter	Description	Values
SaveOutput	<p>Save simulation output to workspace.</p> <p>Set by the Output check box on the Data Import/Export pane of the Configuration Parameters dialog box.</p> <p>Do not use a variable name that is the same as a <code>Simulink.SimulationOutput</code> object function name or property name.</p>	{ 'on' } 'off'
SaveState	<p>Save states to workspace.</p> <p>Set by the States check box on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	'on' { 'off' }
SaveTime	<p>Save simulation time to workspace.</p> <p>Set by the Time check box on the Data Import/Export pane of the Configuration Parameters dialog box.</p> <p>Do not use a variable name that is the same as a <code>Simulink.SimulationOutput</code> object function name or property name.</p>	{ 'on' } 'off'

Parameter	Description	Values
SaveWithDisabledLinksMsg	<p>Specifies diagnostic action to take when saving a block diagram having disabled library links.</p> <p>Set by Block diagram contains disabled library links on the Saving Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SaveWithParameterized-LinksMsg	<p>Specifies diagnostic action to take when saving a block diagram having parameterized library links.</p> <p>Set by Block diagram contains parameterized library links on the Saving Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
ScreenColor	<p>Background color of the model window.</p> <p>In the Simulink Editor, set by Canvas Color on the Diagram > Format menu.</p>	'black' {'white'} 'red' 'green' 'blue' 'cyan' 'magenta' 'yellow' 'gray' 'lightBlue' 'orange' 'darkGreen' [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
ScrollbarOffset	For internal use.	

Parameter	Description	Values
SFcnCompatibilityMsg	<p>Specifies diagnostic action to take when S-function upgrades are needed.</p> <p>Set by S-function upgrades needed on the Compatibility Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
SFExecutionAtInitializationDiag	<p>Select the diagnostic action to take when Stateflow detects triggered or enabled charts that are not running at initialization.</p> <p>Set by “Execute-at-Initialization disabled in presence of input events” on the Compatibility Diagnostics pane of the Configuration Parameters dialog box.</p>	

Parameter	Description	Values
SFInvalidInputDataAccess- InChartInitDiag	<p>Select the diagnostic action to take when a chart:</p> <ul style="list-style-type: none"> • Has the <code>ExecuteAtInitialization</code> property set to true • Accesses input data on a default transition or associated state entry actions, which execute at chart initialization <p>Set by Invalid input data access in chart initialization on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFMachineParented- DataDiag	<p>Select the diagnostic action to take when Stateflow detects machine-parented data that you can replace with chart-parented data of scope Data Store Memory.</p> <p>Set by “Use of machine-parented data instead of Data Store Memory” on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'

Parameter	Description	Values
SFNoUnconditionalDefault-TransitionDiag	<p>Select the diagnostic action to take when a chart does not have an unconditional default transition to a state or a junction.</p> <p>Set by No unconditional default transitions on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFSelfTransitionDiag	<p>Select the diagnostic action to take when you can remove a self-transition on a leaf state.</p> <p>Set by “Self transition on leaf state” on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFSimEcho	<p>Enables output to appear in the MATLAB Command Window during simulation of a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Echo expressions without semicolons on the Simulation Target pane of the Configuration Parameters dialog box.</p>	{'on'} 'off'

Parameter	Description	Values
SFTemporalDelaySmallerThanSampleTimeDiag	<p>Select the diagnostic action to take when a state or transition absolute time operator uses a time value that is shorter than the sample time for the Stateflow block.</p> <p>Set by “Absolute time temporal value shorter than sampling period” on the Simulation Target pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFTransitionActionBeforeConditionDiag	<p>Select the diagnostic action to take when a transition action is specified before a condition action in a transition path containing multiple segmented transitions.</p> <p>Set by “Transition action specified before condition action” on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFTransitionOutsideNaturalParentDiag	<p>Select the diagnostic action to take when a chart contains a transition that loops outside the parent state or junction.</p> <p>Set by Transition outside natural parent on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'

Parameter	Description	Values
SFUndirectedBroadcast-EventsDiag	<p>Select the diagnostic action to take when a chart contains undirected local event broadcasts.</p> <p>Set by Undirected event broadcasts on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFUnexpectedBacktracking-Diag	<p>Select the diagnostic action to take when a chart junction:</p> <ul style="list-style-type: none"> • Does not have an unconditional transition path to a state or a terminal junction • Has multiple transition paths leading to it <p>Set by Unexpected backtracking on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SFUnreachableExecution-PathDiag	<p>Select the diagnostic action to take when there are chart constructs not on a valid execution path.</p> <p>Set by “Unreachable execution path” on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'

Parameter	Description	Values
SFUnusedDataAndEventsDialog	<p>Select the diagnostic action to take for detection of unused data and events in a chart.</p> <p>Set by Unused data and events on the Diagnostics > Stateflow pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
ShapePreserveControl	<p>At each time step, use derivative information to improve integration accuracy.</p> <p>Set by Shape preservation on the Solver pane of the Configuration Parameters dialog box.</p>	'EnableAll' {'DisableAll'}
ShowGrid	Has no effect in Simulink Editor. This parameter will be removed in a future release.	'on' {'off'}
ShowLinearization-Annotations	Toggles linearization icons in the model.	{'on'} 'off'
ShowLineDimensions	<p>Show signal dimensions on this model's block diagram.</p> <p>In the Simulink Editor, set by Signal Dimensions on the Display > Signal & Ports menu.</p>	'on' {'off'}
ShowLineDimensions-OnError	For internal use.	
ShowLineWidths	Deprecated. Use ShowLineDimensions on page 6-0 instead.	
ShowLoopsOnError	Highlight invalid loops graphically.	{'on'} 'off'

Parameter	Description	Values
ShowModelReference-BlockIO	<p>Toggles display of I/O mismatch on block.</p> <p>In the Simulink Editor, set by Block I/O Mismatch for Referenced Model on the Display > Blocks menu.</p>	'on' {'off'}
ShowModelReference-BlockVersion	<p>Toggles display of version on block.</p> <p>In the Simulink Editor, set by Block Version for Referenced Models on the Display > Blocks menu.</p>	'on' {'off'}
Shown	For internal use.	
ShowPageBoundaries	<p>Toggles display of page boundaries on the Simulink Editor canvas.</p> <p>In the Simulink Editor, set by Show Page Boundaries on the File > Print menu.</p>	'on' {'off'}
ShowPortDataTypes	<p>Show data types of ports on this model's block diagram.</p> <p>In the Simulink Editor, set by Port Data Types on the Display > Signals & Ports menu.</p>	'on' {'off'}
ShowPortDataTypesOnError	For internal use.	

Parameter	Description	Values
ShowPortUnits	<p>Show units of ports, subsystem, and model block icons on the model block diagram.</p> <p>In the Simulink Editor, set Port Units on the Display > Signals & Ports menu.</p>	'on' {'off'}
ShowStorageClass	<p>Show storage classes of signals on this model's block diagram.</p> <p>In the Simulink Editor, set by Storage Class on the Format > Signals & Ports menu.</p>	'on' {'off'}
ShowTestPointIcons	<p>Show test point icons on this model's block diagram.</p> <p>In the Simulink Editor, set by Testpoint & Logging Indicators on the Display > Signals & Ports menu.</p>	{'on'} 'off'
ShowViewerIcons	<p>Show viewer icons on this model's block diagram.</p> <p>In the Simulink Editor, set by Viewer Indicator on the Display > Signals & Ports menu.</p>	{'on'} 'off'

Parameter	Description	Values
SignalHierarchy	<p>If the signal is a bus, returns the name and hierarchy of the signals in the bus.</p> <p>(Read-only) Get with the <code>get_param</code> command. Specify a port or line handle. See “Display Information About Buses”.</p>	Return values reflect the structure of the signal that you specify.
SignalInfNanChecking	<p>Specifies diagnostic action to take when the value of a block output is <code>Inf</code> or <code>NaN</code> at the current time step.</p> <p>Set by Inf or NaN block output on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
SignalLabelMismatchMsg	<p>Specifies diagnostic action to take when a signal label mismatch occurs.</p> <p>Set by Signal label mismatch on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
SignalLogging	<p>Globally enable signal logging for this model.</p> <p>Set by the Signal logging check box on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{'on'} 'off'

Parameter	Description	Values
SignalLoggingName	<p>Name for saving signal logging data to a workspace.</p> <p>Set by the Signal logging field on the Data Import/Export pane of the Configuration Parameters dialog box.</p> <p>Do not use a variable name that is the same as a <code>Simulink.SimulationOutput</code> object function name or property name.</p>	{ 'logouts' }
SignalLoggingSaveFormat	<p>Format for saving signal logging data.</p>	<p>{ 'Dataset' }</p> <p>'ModelDataLogs' is supported for backward compatibility. However, when you open a model in R2016a or later, signal logging uses <code>Dataset</code> format, regardless of the setting of this parameter.</p>
SignalNameFromLabel	<p>Propagate signal names for Bus Creator block input signals whenever you change the name of an input signal programmatically.</p> <p>Set with the <code>set_param</code> command, using either a port or line handle and a character vector specifying the signal name to propagate.</p>	{ '' }

Parameter	Description	Values
SignalRangeChecking	<p>Select the diagnostic action to take when signals exceed specified minimum or maximum values.</p> <p>Set by Simulation range checking on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
SignalResolutionControl	<p>Control which named states and signals get resolved to Simulink signal objects.</p> <p>Set by Signal resolution on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	'None' {'UseLocalSettings'} 'TryResolveAll' 'TryResolveAllWithWarning'
SigSpecEnsureSample-TimeMsg	<p>Specifies diagnostic action to take when the sample time of the source port of a signal specified by a Signal Specification block differs from the signal's destination port.</p> <p>Set by Enforce sample times specified by Signal Specification blocks on the Sample Time Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'

Parameter	Description	Values
SimBuildMode	<p>Specifies how you build the simulation target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Simulation target build mode on the Simulation Target pane of the Configuration Parameters dialog box.</p>	<p>{'sf_incremental_build'} 'sf_nonincremental_build' 'sf_make' 'sf_make_clean' 'sf_make_clean_objects'</p>
SimCompilerOptimization	<p>Specifies the compiler optimization level during acceleration code generation.</p> <p>Set by Compiler optimization level on the Configuration Parameters dialog box.</p>	<p>'on' {'off'}</p>
SimCtrlC	<p>Enables responsiveness checks in code generated for MATLAB Function blocks.</p> <p>Set by “Ensure responsiveness” on the Simulation Target pane of the Configuration Parameters dialog box.</p>	<p>{'on'} 'off'</p>

Parameter	Description	Values
SimCustomHeaderCode	<p>Enter code lines to appear near the top of a generated header file for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Header file on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ ' ' }
SimCustomInitializer	<p>Enter code statements that execute once at the start of simulation for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Initialize function on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ ' ' }
SimCustomSourceCode	<p>Enter code lines to appear near the top of a generated source code file for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Source file on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ ' ' }

Parameter	Description	Values
SimCustomTerminator	<p>Enter code statements that execute at the end of simulation for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Terminate function on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ '' }
SimIntegrity	<p>Detects violations of memory integrity while building MATLAB Function blocks and stops simulation with a diagnostic.</p> <p>Set by “Ensure memory integrity” on the Simulation Target pane of the Configuration Parameters dialog box.</p>	{ 'on' } 'off'
SimParseCustomCode	<p>Specify whether or not to parse the custom code and report unresolved symbols in the model.</p> <p>Set by Parse custom code symbols on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ 'on' } 'off'

Parameter	Description	Values
SimReservedNameArray	<p>Enter the names of variables or functions in the generated code that match the names of variables or functions specified in custom code. This action prevents naming conflicts between identifiers in the generated code and in custom code for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Reserved names on the Simulation Target > Symbols pane of the Configuration Parameters dialog box.</p>	character vector array — <code>{{}}</code>
SimulationCommand	<p>Executes a simulation command.</p> <hr/> <p>Note You cannot use <code>set_param</code> to run a simulation in a MATLAB session that does not have a display, i.e., if you used <code>matlab -nodisplay</code> to start the session.</p>	'start' 'stop' 'pause' 'continue' 'step' 'update' 'WriteDataLogs' 'SimParamDialog' 'connect' 'disconnect' 'WriteExtModeParamVect' 'AccelBuild'
SimulationMode	<p>Indicates whether Simulink software should run in Normal, Accelerator, Rapid Accelerator, SIL, PIL, or External mode.</p> <p>In the Simulink Editor, set by the Simulation > Mode menu.</p>	{'normal'} 'accelerator' 'rapid-accelerator' 'external' 'Software-in-the-loop (SIL)' 'Processor-in-the-loop (PIL)'

Parameter	Description	Values
SimulationStatus	Indicates simulation status.	{'stopped'} 'updating' 'initializing' 'running' 'compiled' 'paused' 'terminating' 'external'
SimulationTime	Current time value for the simulation.	double — {0}
SimStateInterfaceChecksumMismatchMsg	Check to ensure that the interface checksum is identical to the model checksum before loading the SimState.	'none' 'warning' 'error'
SimStateOlderReleaseMsg	Check to report that the SimState was generated by an earlier version of Simulink. In the Diagnostics pane of the Configuration Parameters dialog box, configure the diagnostic to allow Simulink to report the message as error or warning.	'error' 'warning'
SimUserDefines	<p>Enter a space-separated list of preprocessor macro definitions to be added to the generated code for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Defines on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{' '}

Parameter	Description	Values
SimUserIncludeDirs	<p>Enter a space-separated list of directory paths that contain files you include in the compiled target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Include directories on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	<p>{ ' ' }</p> <hr/> <p>Note If your list includes any Windows path names that contain spaces, each instance must be enclosed in double quotes within the argument, for example,</p> <p>'C:\Project "C:\Custom Files"'</p> <hr/>
SimUserLibraries	<p>Enter a space-separated list of static libraries that contain custom object code to link into the target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Libraries on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ ' ' }
SimUserSources	<p>Enter a space-separated list of source files to compile and link into the target for a model that contains MATLAB Function blocks, Stateflow charts, or Truth Table blocks.</p> <p>Set by Source files on the Simulation Target > Custom Code pane of the Configuration Parameters dialog box.</p>	{ ' ' }

Parameter	Description	Values
SingleTaskRateTransMsg	<p>Specifies diagnostic action to take when a rate transition takes place between two blocks operating in single-tasking mode.</p> <p>Set by Single task rate transition on the Sample Time Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
Solver	<p>Solver used for the simulation.</p> <p>Set by the Solver drop-down list on the Solver pane of the Configuration Parameters dialog box.</p>	'VariableStepDiscrete' {'ode45'} 'ode23' 'ode113' 'ode15s' 'ode23s' 'ode23t' 'ode23tb' 'FixedStepDiscrete' 'ode8' 'ode5' 'ode4' 'ode3' 'ode2' 'ode1' 'ode14x'
EnableMultiTasking	<p>Solver mode for this model. This option appears when the solver type is Fixed-step.</p> <p>Set by “Treat each discrete rate as a separate task” on the Solver pane of the Configuration Parameters dialog box.</p>	{'On'} 'Off'
SolverName	<p>Solver used for the simulation. See Solver on page 6-0 parameter for more information.</p>	

Parameter	Description	Values
SolverPrmCheckMsg	<p>Enables diagnostics to control when Simulink software automatically selects solver parameters. This option notifies you if:</p> <ul style="list-style-type: none"> • Simulink software changes a user-modified parameter to make it consistent with other model settings • Simulink software automatically selects solver parameters for the model, such as FixedStepSize <p>Set by Automatic solver parameter selection on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
SolverResetMethod	<p>This option appears when the solver type is Variable-step and the solver is ode15s (stiff/NDF), ode23t (Mod. stiff/Trapezoidal), or ode23tb (stiff/TR-BDF2).</p> <p>Set by Solver reset method on the Solver pane of the Configuration Parameters dialog box.</p>	{'Fast'} 'Robust'

Parameter	Description	Values
SolverType	<p>Solver type used for the simulation.</p> <p>Set by Type on the Solver pane of the Configuration Parameters dialog box.</p>	{'Variable-step'} 'Fixed-step'
SortedOrder	<p>Show the sorted order of this model's blocks on the block diagram.</p> <p>In the Simulink Editor, set by Sorted Execution Order on the Display > Blocks menu.</p>	'on' {'off'}
StartFcn	<p>Start simulation callback.</p> <p>Set by Simulation start function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{''}
StartTime	<p>Simulation start time.</p> <p>Set by Start time on the Solver pane of the Configuration Parameters dialog box.</p>	{'0.0'}
StateNameClashWarn	<p>Select the diagnostic action to take when a name is used for more than one state in the model.</p> <p>Set by State name clash on the Solver Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'}

Parameter	Description	Values
StateSaveName	<p>State output name to be saved to workspace.</p> <p>Set by the States field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	{ 'xout' }
StatusBar	<p>Has no effect in Simulink Editor. This parameter will be removed in a future release.</p> <p>In the Simulink Editor, set by Status Bar on the View menu.</p>	{ 'on' } 'off'
StiffnessThreshold	<p>Threshold value to determine if the model is stiff.</p> <p>A model is stiff if the stiffness exceeds the <code>StiffnessThreshold</code> value. The default value for this parameter is 1000. For more information, see “Use Auto Solver to Select a Solver”.</p>	{ '' }
StopFcn	<p>Stop simulation callback.</p> <p>Set by Simulation stop function on the Callbacks pane of the Model Properties dialog box.</p> <p>See “Create Model Callbacks” for more information.</p>	{ '' }

Parameter	Description	Values
StopTime	Simulation stop time. Set by Stop time on the Solver pane of the Configuration Parameters dialog box.	{'10.0'}
StrictBusMsg	Specifies diagnostic action to take when Simulink software detects a signal that some blocks treat as a mux or vector, while other blocks treat the signal as a bus. To be enabled, several options in MathWorks products require this parameter be set to 'ErrorLevel1' or 'ErrorOnBusTreatedAsVector'. Set by Bus signal treated as vector on the Diagnostics Connectivity pane of the Configuration Parameters dialog box.	{'ErrorLevel1' 'WarnOnBusTreatedAsVector' 'ErrorOnBusTreatedAsVector' '
Tag	User-specified text that is assigned to the model's Tag parameter and saved with the model.	{''}
TargetBitPerChar	Describes the length in bits of the C char data type supported by the hardware used to test generated code.	integer — {8}
TargetBitPerInt	Describes the length in bits of the C int data type supported by the hardware used to test generated code.	integer — {32}

Parameter	Description	Values
TargetBitPerLong	Describes the length in bits of the C long data type supported by the hardware used to test generated code.	integer — {32}
TargetBitPerLongLong	Describes the length in bits of the C long long data type supported by the hardware used to test generated code. The value of this parameter must be greater than or equal to the value of TargetBitPerLong.	integer — {64}
TargetBitPerShort	Describes the length in bits of the C short data type supported by the hardware used to test generated code.	integer — {16}
TargetEndianness	Describes the significance of the first byte of a data word of the hardware used to test generated code.	{'Unspecified' 'LittleEndian' 'BigEndian'}
TargetHWDeviceType	Describes the characteristics of the hardware used to test generated code.	{'Generic->Unspecified (assume 32-bit Generic)'}
TargetIntDivRoundTo	Describes how the C compiler that creates test code for this model rounds the result of dividing one signed integer by another to produce a signed integer quotient.	'Floor' 'Zero' {'Undefined'}
TargetLargestAtomicFloat	Specify the largest floating-point data type that can be atomically loaded and stored on the hardware used to test code.	'Float' 'Double' {'None'}

Parameter	Description	Values
TargetLargestAtomicInteger	Specify the largest integer data type that can be atomically loaded and stored on the hardware used to test code. Set this parameter to 'LongLong' only if the test hardware supports the C long long data type and you have set TargetLongLongMode to 'on'.	{'Char'} 'Short' 'Int' 'Long' 'LongLong'
TargetLongLongMode	Specify that your C compiler supports the C long long data type. Most C99 compilers support long long.	'on' {'off'}
TargetShiftRightIntArith	Describes whether the C compiler that creates test code for this model implements a signed integer right shift as an arithmetic right shift.	{'on'} 'off'
TargetTypeEmulationWarnSuppressLevel	Specifies whether Simulink Coder software displays or suppresses warning messages when emulating integer sizes in rapid prototyping environments.	integer — {0}
TargetWordSize	Describes the word length in bits of the hardware used to test generated code.	integer — {32}

Parameter	Description	Values
TasksWithSamePriorityMsg	<p>Specifies diagnostic action to take when tasks have equal priority.</p> <p>Set by Tasks with equal priority on the Sample Time Diagnostics pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
TiledPageScale	Scales the size of the tiled page relative to the model.	{'1'}
TiledPaperMargins	Controls the size of the margins associated with each tiled page. Each element in the vector represents a margin at the particular edge.	vector — [left, top, right, bottom]
TimeAdjustmentMsg	<p>Specifies diagnostic action to take if Simulink software makes a minor adjustment to a sample hit time while running the model.</p> <p>Set by Sample hit time adjusting on the Configuration Parameters dialog box.</p>	{'none'} 'warning'
TimeSaveName	<p>Simulation time name.</p> <p>Set by the Time field on the Data Import/Export pane of the Configuration Parameters dialog box.</p>	variable — {'tout'}

Parameter	Description	Values
TLC...	Parameters whose names begin with TLC are used for code generation. See the Simulink Coder documentation for more information.	
ToolBar	<p>Has no effect in Simulink Editor. This parameter will be removed in a future release.</p> <p>In the Simulink Editor, hide or display all toolbars with Toolbars on the View menu or, hide or display specific toolbars using File > Simulink Preferences > Editor Default toolbar options.</p>	{'on'} 'off'
TryForcingSFcnDF	This flag is used for backward compatibility with user S-functions that were written prior to R12.	'on' {'off'}
TunableVars	<p>List of global (tunable) parameters.</p> <p>Set in the Model Parameter Configuration dialog box.</p>	{''}
TunableVarsStorageClass	<p>List of storage classes for their respective tunable parameters.</p> <p>Set in the Model Parameter Configuration dialog box.</p>	{''}

Parameter	Description	Values
TunableVarsTypeQualifier	List of storage type qualifiers for their respective tunable parameters. Set in the Model Parameter Configuration dialog box.	{ '' }
Type	Simulink object type (read only).	{ 'block_diagram' }
UnconnectedInputMsg	Unconnected input ports diagnostic. Set by Unconnected block input ports on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.	'none' {'warning'} 'error'
UnconnectedLineMsg	Unconnected lines diagnostic. Set by Unconnected line on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.	'none' {'warning'} 'error'
UnconnectedOutputMsg	Unconnected block output ports diagnostic. Set by Unconnected block output ports on the Connectivity Diagnostics pane of the Configuration Parameters dialog box.	'none' {'warning'} 'error'

Parameter	Description	Values
UnderSpecifiedData- TypeMsg	<p>Detect usage of heuristics to assign signal data types.</p> <p>Set by Underspecified data types on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'
UnderspecifiedInitial- izationDetection	<p>Select how Simulink software handles initialization of initial conditions for conditionally executed subsystems, Merge blocks, subsystem elapsed time, and Discrete-Time Integrator blocks.</p> <p>Set by Underspecified initialization detection on the Configuration Parameters dialog box.</p>	{'classic'} 'simplified'
UniqueDataStoreMsg	<p>Specifies diagnostic action to take when the model contains multiple Data Store Memory blocks that specify the same data store name.</p> <p>Set by Duplicate data store names on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning' 'error'

Parameter	Description	Values
UnknownTsInhSupMsg	<p>Detect blocks that have not set whether they allow the model containing them to inherit a sample time.</p> <p>Set by Unspecified inheritability of sample time on the Diagnostics > Sample Time pane of the Configuration Parameters dialog box.</p>	'none' {'warning'} 'error'
UnnecessaryDatatype-ConvMsg	<p>Detect unnecessary data type conversion blocks.</p> <p>Set by Unnecessary type conversions on the Type Conversion Diagnostics pane of the Configuration Parameters dialog box.</p>	{'none'} 'warning'
UpdateHistory	<p>Specifies when to prompt the user about updating the model history.</p> <p>Set by Prompt to update model history on the History pane of the Model Properties dialog box or Prompt to update model history on the History pane of the Model Explorer.</p> <p>See “Model Information and History” for more information.</p>	{'UpdateHistoryNever'} 'UpdateHistoryWhenSave'

Parameter	Description	Values
UpdateModelReference-Targets	Specify whether to rebuild simulation and Simulink Coder targets for referenced models before updating, simulating, or generating code for this model. Set by Rebuild options on the Model Referencing pane of the Configuration Parameters dialog box.	'IfOutOfDate' 'Force' 'AssumeUpToDate' {'IfOutOfDateOrStructuralChange'}
UseAnalysisPorts	For internal use.	
UseDivisionForNetSlopeComputation	Use division to handle net slope computations when simplicity and accuracy conditions are met.	{'off'} 'on' 'UseDivisionForReciprocalsOfIntegersOnly'
VectorMatrix-ConversionMsg	Detect vector-to-matrix or matrix-to-vector conversions. Set by Vector/matrix block input conversion on the Type Conversion Diagnostics pane of the Configuration Parameters dialog box.	{'none'} 'warning' 'error'
Version	Simulink version you are currently running, e.g., '7.6'. If you are using a service pack, the <code>ver</code> function returns an additional digit, e.g., 7.4.1 (R2009bSP1). To get version information without loading the block diagram into memory, see <code>Simulink.MDLInfo</code> .	double (read only)

Parameter	Description	Values
VersionLoaded	<p>Simulink version that last saved the model, e.g., '7.6'. If you are using a service pack, the <code>ver</code> function returns an additional digit, e.g., 7.4.1 (R2009bSP1). See also <code>SavedSinceLoaded</code>.</p> <p>To get version information without loading the block diagram into memory, see <code>Simulink.MDLInfo</code>.</p>	double (read only)
VisualizeLoggedSignalsWhenLoggingToFile	<p>Control visualization of logged signals when <code>LoggingToFile</code> is enabled. The default is 'off', which logs to a MAT-file without the overhead of visualizing signals. Set the value to 'on' to stream logged data to these visualization tools also:</p> <ul style="list-style-type: none"> • Simulation Data Inspector • Message Viewer blocks • Dashboard blocks • Logic Analyzer <p>Logging big data to visualization tools can cause memory and disk space overhead.</p>	'on' {'off'}

Parameter	Description	Values
WideLines	<p>Draws lines that carry vector or matrix signals wider than lines that carry scalar signals.</p> <p>In the Simulink Editor, set by Wide Nonscalar Lines on the Display > Signals & Ports menu.</p>	'on' {'off'}
WideVectorLines	<p>Deprecated. Use WideLines on page 6-0 instead.</p>	
WriteAfterReadMsg	<p>Specifies diagnostic action to take when the model attempts to store data in a data store after previously reading data from it in the current time step.</p> <p>Set by Detect write after read on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'UseLocalSettings'} 'DisableAll' 'EnableAllAsWarning' 'EnableAllAsError'
WriteAfterWriteMsg	<p>Specifies diagnostic action to take when the model attempts to store data in a data store twice in succession in the current time step.</p> <p>Set by Detect write after write on the Data Validity Diagnostics pane of the Configuration Parameters dialog box.</p>	{'UseLocalSettings'} 'DisableAll' 'EnableAllAsWarning' 'EnableAllAsError'

Parameter	Description	Values
ZCThreshold	<p>Specifies the deadband region used during the detection of zero crossings. Signals falling within this region are defined as having crossed through zero.</p> <p>Set by Signal threshold on the Solver pane of the Configuration Parameters dialog box.</p>	{'auto'} any real number greater than or equal to zero
ZeroCross	For internal use.	
ZeroCrossAlgorithm	<p>Specifies the algorithm to detect zero crossings when you select a variable-step solver.</p> <p>Set by Algorithm on the Solver pane of the Configuration Parameters dialog box.</p>	{'Nonadaptive'} 'Adaptive'
ZeroCrossControl	<p>Enable zero-crossing detection.</p> <p>Set by Zero-crossing control on the Solver pane of the Configuration Parameters dialog box.</p>	{'UseLocalSettings'} 'EnableAll' 'DisableAll'
ZoomFactor	<p>Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords FitSystem or FitSelection.</p> <p>In the Simulink Editor, set by the zoom commands on the View menu.</p>	{'100'} 'FitSystem' 'FitSelection'

Examples of Setting Model Parameters

These examples show how to set model parameters for the `mymodel` system.

This command sets the simulation start and stop times.

```
set_param('mymodel','StartTime','5','StopTime','100')
```

This command sets the solver to `ode15s` and changes the maximum order.

```
set_param('mymodel','Solver','ode15s','MaxOrder','3')
```

This command associates a `PostSaveFcn` callback.

```
set_param('mymodel','PostSaveFcn','my_save_cb')
```

Common Block Properties

In this section...
“About Common Block Properties” on page 6-109
“Examples of Setting Block Properties” on page 6-126

About Common Block Properties

This table lists the properties common to all Simulink blocks, including block callback properties (see “Callbacks for Customized Model Behavior”). Examples of commands that change these properties follow this table (see “Examples of Setting Block Properties” on page 6-126).

Common Block Properties

Property	Description	Values
AncestorBlock	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
AttributesFormatString	Block annotation text (corresponds to block properties).	character vector
BackgroundColor	Block background color.	color value '[r,g,b]' '[r,g,b,a]' r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (a) is ignored. Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
BlockDescription	Block description shown in the Block Properties dialog box.	character array
BlockDiagramType	Returns <code>model</code> if it is in an open Simulink block diagram. Returns <code>library</code> if it is a Simulink library.	'model' 'library'
BlockType	Block type (read only).	character array
ClipboardFcn	Function called when block is copied to the clipboard (Ctrl+C) or when the menu item Copy is selected.	function character vector
CloseFcn	Function called when <code>close_system</code> is run on block.	function character vector

Property	Description	Values
Commented	Exclude block from simulation.	{'off'} 'on' 'through'
CompiledPortComplexSignals	Complexity of port signals after updating diagram. You must compile the model before querying this property. For example: <pre>vdp([], [], [], 'compile'); d = get_param(gcb, 'CompiledPortComplexSignals'); vdp([], [], [], 'term');</pre>	structure array
CompiledIsActive	Specifies whether the block status is active or not at compile time. CompiledIsActive returns off if any one of these conditions is true at compile time: <ul style="list-style-type: none"> • Block is inactive path of Inline Variant. • Block is inactive choice of Variant Subsystem. • Block is commented out is within a Subsystem block that is commented out. • Block is inactive due to condition propagated from Variant Subsystem block. 	'off' 'on'
CompiledPortDataTypes	Data types of port signals after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals on page 6-0 .	structure array

Property	Description	Values
CompiledPortDesignMin	<p>Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); min = get_param(ports.Outport, 'CompiledPortDesignMin'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDesignMax	<p>Design maximum of port signals at compile time. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); max = get_param(ports.Outport, 'CompiledPortDesignMax'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDimensions	<p>Dimensions of port signals after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals on page 6-0 .</p>	numeric array
CompiledPortDimensionsMode	<p>Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See “Programmatically Determine Whether Signal Line Has Variable Size”.</p>	double number. 0 indicates the signal does not have a variable size. 1 indicates the signal has a variable size.

Property	Description	Values
CompiledPortFrameData	Frame mode of port signals after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals on page 6-0 .	structure array
CompiledPortWidths	Structure of port widths after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals on page 6-0 .	structure array
CompiledSampleTime	Block sample time after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals on page 6-0 .	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2];....[sample time n, offset time n]}
ContinueFcn	Function called at the restart of a simulation (after a pause).	function character vector
CopyFcn	Function called when block is copied. See “Block Callback Parameters” for details.	function character vector
DataTypeOverrideCompiled	For internal use.	
DeleteFcn	Function called when block is deleted. See “Block Callback Parameters” for details.	MATLAB expression
DestroyFcn	Function called when block is destroyed. See “Block Callback Parameters” for details.	MATLAB expression

Property	Description	Values
Description	Description of block. Set by the Description field in the General pane of the Block Properties dialog box.	text and tokens
Diagnostics	For internal use.	
DialogParameters	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
DropShadow	Display drop shadow.	{'off'} 'on'
ExtModeLoggingSupported	Enable a block to support uploading of signal data in external mode (for example, with a scope block).	{'off'} 'on'
ExtModeLoggingTrig	Enable a block to act as the trigger block for external mode signal uploading.	{'off'} 'on'
ExtModeUploadOption	Enable a block to upload signal data in external mode when the Select all check box on the External Signal & Triggering dialog box is not selected. A value of <code>log</code> indicates the block uploads signals. A value of <code>none</code> indicates the block does not upload signals. The value <code>monitor</code> is currently not in use. If the Select all check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	{'none'} 'log' 'monitor'
FontAngle	Font angle.	'normal' 'italic' 'oblique' {'auto'}
FontName	Font name.	character array

Property	Description	Values
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the DefaultBlockFontSize model parameter.	real {'-1'}
FontWeight	Font weight.	'light' 'normal' 'demi' 'bold' {'auto'}
ForegroundColor	Foreground color of block icon.	<p>color value '[r,g,b]' '[r,g,b,a]'</p> <p>r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color (ScreenColor parameter). Use get_param to return the actual value. If specified, the alpha value (a) is ignored.</p> <p>Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.</p>
Handle	Block handle.	real

Property	Description	Values
HideAutomaticName	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of 'on'. (The HideAutomaticNames parameter for the model must also be set to 'on'.) Set to 'off' to display the name, and also set the block ShowName parameter to 'on'. Blocks whose ShowName parameter is 'off' are hidden regardless of this setting. For more information on how the parameters interact, see “Hide or Display Block Names”.	{'on'} 'off'
HiliteAncestors	For internal use.	
InitFcn	Initialization function for a block. Created on the Callbacks pane of the Model Properties dialog box. For more information, see “Create Model Callbacks”. On non-masked blocks, updating the diagram or running the simulation call this function.	MATLAB expression
InputSignalNames	Names of input signals.	cell array

Property	Description	Values
IntrinsicDialogParameters	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of DialogParameters if you want block-specific parameters for masked or unmasked blocks.	structure
IOSignalStrings	Block paths to objects that are connected to the Signal & Scope Manager. Simulink software saves these paths when the model is saved.	list
IOType	Signal & Scope Manager type. For internal use.	
LibraryVersion	For a linked block, the initial value of this property is the ModelVersion of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — <code>{'1.1'}</code>
LineHandles	Handles of lines connected to block.	structure

Property	Description	Values
LinkData	<p>Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use [] to reset to deparameterized, e.g.,</p> <pre>set_param(gcb, 'linkData', []).</pre> <p>See “Restore Disabled or Parameterized Links”.</p>	cell array
LinkStatus	<p>Link status of block. Updates out-of-date linked blocks when queried using <code>get_param</code>.</p> <p>See “Control Linked Block Programmatically”.</p>	'none' 'resolved' 'unresolved' 'implicit' 'inactive' 'restore' 'propagate' 'propagateHierarchy' 'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression
MinMaxOverflowLogging_Compiled	For internal use.	
ModelCloseFcn	Function called when model is closed. The <code>ModelCloseFcn</code> is called prior to the block's <code>DeleteFcn</code> and <code>DestroyFcn</code> callbacks, if either are set.	MATLAB expression
ModelParamTableInfo	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block name.	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression

Property	Description	Values
NamePlacement	Position of block name.	{'normal'} 'alternate'
ObjectParameters	Names/attributes of block's parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'} 'left' 'up' 'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}
ParentCloseFcn	Function called when parent subsystem is closed. The ParentCloseFcn of blocks at the root model level is not called when the model is closed.	MATLAB expression
PauseFcn	Function called at the pause of a simulation.	function character vector

Property	Description	Values
PortConnectivity	<p>The value of this property is an array of structures, each of which describes one of the block's input or output ports. Each port structure has the following fields:</p> <ul style="list-style-type: none"> • Type <p>Specifies the port's type and/or number. The value of this field can be:</p> <ul style="list-style-type: none"> • n, where n is the number of the port for data ports • 'enable' if the port is an enable port • 'trigger' if the port is a trigger port • 'state' for state ports • 'ifaction' for action ports • 'LConn#' for a left connection port where # is the port's number • 'RConn#' for a right connection port where # is the port's number • Position <p>The value of this field is a two-element vector, $[x\ y]$, that specifies the port's position.</p> • SrcBlock 	structure array

Property	Description	Values
	<p>Handle of the block connected to this port. This field is null for output ports and -1 for unconnected input ports. <code>SrcBlock</code> property is a valid source handle for Variant Subsystem blocks.</p> <ul style="list-style-type: none"> • <code>SrcPort</code> <p>Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports.</p> <ul style="list-style-type: none"> • <code>DstBlock</code> <p>Handle of the block to which this port is connected. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.</p> <ul style="list-style-type: none"> • <code>DstPort</code> <p>Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.</p>	

Property	Description	Values
PortHandles	<p>The value of this property is a structure that specifies the handles of the block's ports. The structure has the following fields:</p> <ul style="list-style-type: none"> • Inport Handles of the block's input ports. • Outport Handles of the block's output ports. • Enable Handle of the block's enable port. • Trigger Handle of the block's trigger port. • State Handle of the block's state port. • LConn Handles of the block's left connection ports (for blocks that support Physical Modeling tools). • RConn Handles of the block's right connection ports (for blocks that support Physical Modeling tools). 	structure array

Property	Description	Values
	<ul style="list-style-type: none"> • Ifaction <p>Handle of the block's action port.</p> <ul style="list-style-type: none"> • Reset <p>Handle of the block's reset port.</p>	
PortRotationType	Type of port rotation used by this block. This is a read-only property.	'default' 'physical'
Ports	<p>A vector that specifies the number of each kind of port this block has. The order of the vector's elements corresponds to the following port types:</p> <ul style="list-style-type: none"> • Inport • Outport • Enable • Trigger • State • LConn • RConn • Ifaction • Reset 	vector

Property	Description	Values
Position	<p>Position of block in model window.</p> <p>To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use <code>get_param</code> to return the actual position.</p>	<p>vector of coordinates, in pixels: [left top right bottom]</p> <p>The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. The maximum absolute value for a coordinate is 32767. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.</p>
PostSaveFcn	Function called after the block is saved.	MATLAB expression
PreCopyFcn	Function called before the block is copied. See “Block Callback Parameters” for details.	MATLAB expression
PreDeleteFcn	Function called before the block is deleted. See “Block Callback Parameters” for details.	MATLAB expression
PreSaveFcn	Function called before the block is saved. See “Block Callback Parameters” for details.	MATLAB expression
Priority	Specifies the block's order of execution relative to other blocks in the same model. Set by the Priority field on the General pane of the Block Properties dialog box.	character vector { ' ' }
ReferenceBlock	Name of the library block to which this block links.	character vector { ' ' }
RequirementInfo	For internal use.	

Property	Description	Values
RTWData	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section “S-Function RTWdata” (Simulink Coder) for details.	
SampleTime	Value of the sample time parameter. See “Specify Sample Time” for more details.	character vector
Selected	Status of whether or not block is selected.	{ 'on' } 'off'
ShowName	Display or hide block name. To display a block name given by the Simulink Editor (automatic names), set the block 'HideAutomaticName' parameter to 'off' and ShowName to 'on'. To hide an automatic block name given by the Editor, set ShowName to 'on', HideAutomaticName to 'on', and HideAutomaticNames on the model to 'on'. For more information on how the parameters interact, see “Hide or Display Block Names”.	{ 'on' } 'off'
StartFcn	Function called at the start of a simulation.	MATLAB expression
StatePerturbation-ForJacobian	State perturbation size to use during linearization. See “Change Perturbation Level of Blocks Perturbed During Linearization” (Simulink Control Design) for details.	character vector

Property	Description	Values
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using <code>get_param</code> . See also <code>LinkStatus</code> .	'none' 'resolved' 'unresolved' 'implicit' 'inactive' 'restore' 'propagate' 'propagateHierarchy' 'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression
Tag	Text that appears in the block label that Simulink software generates. Set by the Tag field on the General pane of the Block Properties dialog box.	character vector {''}
Type	Simulink object type (read only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{'[]'}
UserDataPersistent	Status of whether or not <code>UserData</code> will be saved in the model file.	'on' {'off'}

Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the `mymodel` system so it faces the opposite direction (right to left).

```
set_param('mymodel/Gain', 'Orientation', 'left')
```

This command associates an `OpenFcn` callback with the Gain block in the `mymodel` system.

```
set_param('mymodel/Gain', 'OpenFcn', 'my_open_cb')
```

This command sets the `Position` property of the Gain block in the `mymodel` system. The block is 75 pixels wide by 25 pixels high.

```
set_param('mymodel/Gain','Position',[50 250 125 275])
```

Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters (see “Model Parameters” on page 6-2). Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see “Common Block Properties” on page 6-109). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see “Mask Parameters” on page 6-278).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model,

simulating a model, copying a block, opening a block, etc. See “Model, Block, and Port Callbacks”.

Tip For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

The maximum number of characters that a parameter edit field can contain is 49,000.

Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation "masked subsystem" after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see “Common Block Properties” on page 6-109). The type listed for masked blocks is the value of the `MaskType` parameter (see “Mask Parameters” on page 6-278).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

Continuous Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (Derivative)		
CoefficientInTFapproximation	Coefficient c in the transfer function approximation $s/(c*s+1)$ used for linearization	{'inf'}
Integrator (Integrator)		
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either' 'level' 'level hold'
InitialConditionSource	Initial condition source	{'internal'} 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
LimitOutput	Limit output	{'off'} 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} 'on'
ShowStatePort	Show state port	{'off'} 'on'
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} 'on'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
ContinuousStateAttributes	State Name	{''} user-defined
WrapState	Enable wrapping of states	{'off'} 'on'
WrappedStateUpperValue	Upper value of wrapped state	scalar or vector — {'pi'}
WrappedStateLowerValue	Lower value of wrapped state	scalar or vector — {'-pi'}
Second-Order Integrator (SecondOrderIntegrator)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ICSourceX	Initial condition source x	{'internal'} 'external'
ICX	Initial condition x	scalar or vector — {'0'}
LimitX	Limit x	{'off'} 'on'
UpperLimitX	Upper limit x	scalar or vector — {'inf'}
LowerLimitX	Lower limit x	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of x	{'off'} 'on'
WrappedUpperValueX	Upper value for wrapping x	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping x	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance x	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
StateNameX	State name x	{ } user-defined
ICSourceDXDT	Initial condition source dx/dt	{'internal'} 'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'} 'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
StateNameDXDT	State name dx/dt	{ } user-defined
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either'
ZeroCross	Enable zero-crossing detection	{'on'} 'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'} 'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'} 'on'
ShowOutput	Show output	{'both'} 'x' 'dxdt'

Block (Type)/Parameter	Dialog Box Prompt	Values
State-Space (StateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
ContinuousStateAttributes	State Name	{''} user-defined
Transfer Fcn (TransferFcn)		
Numerator	Numerator coefficients	vector or matrix — {'[1]'} user-defined
Denominator	Denominator coefficients	vector — {'[1 1]'} user-defined
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any real scalar or vector
ContinuousStateAttributes	State Name	{''} user-defined
Transport Delay (TransportDelay)		
DelayTime	Time delay	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
BufferSize	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
Variable Time Delay (VariableTimeDelay)		

Block (Type)/Parameter	Dialog Box Prompt	Values
VariableDelayType	Select delay type	'Variable transport delay' {'Variable time delay'}
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
ZeroDelay	Handle zero delay	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{''} user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'} 'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'} 'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'} 'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any positive real scalar or vector
ContinuousStateAttributes	State Name	{''} user-defined

Block (Type)/Parameter	Dialog Box Prompt	Values
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'}
Poles	Poles	vector — {'[0 -1]'}
Gain	Gain	vector — {'[1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'} {'-1'} any positive real scalar or vector
ContinuousStateAttributes	State Name	{''} user-defined

Discontinuities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Backlash (Backlash)		
BacklashWidth	Deadband width	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Coulomb & Viscous Friction (Coulombic and Viscous Friction) (masked subsystem)		
offset	Coulomb friction value (Offset)	{'[1 3 2 0]'}
gain	Coefficient of viscous friction (Gain)	{'1'}
Dead Zone (DeadZone)		
LowerValue	Start of dead zone	scalar or vector — {'-0.5'}
UpperValue	End of dead zone	scalar or vector — {'0.5'}
SaturateOnIntegerOverflow	Saturate on integer overflow	'off' {'on'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Dead Zone Dynamic (Dead Zone Dynamic) (masked subsystem)		
Hit Crossing (HitCross)		
HitCrossingOffset	Hit crossing offset	scalar or vector — {'0'}
HitCrossingDirection	Hit crossing direction	'rising' 'falling' {'either'}
ShowOutputPort	Show output port	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Quantizer (Quantizer)		
QuantizationInterval	Quantization interval	scalar or vector — {'0.5'}

Block (Type)/Parameter	Dialog Box Prompt	Values
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Rate Limiter (RateLimiter)		
RisingSlewLimit	Rising slew rate	{'1'}
FallingSlewLimit	Falling slew rate	{'-1'}
SampleTimeMode	Sample time mode	'continuous' {'inherited'}
InitialCondition	Initial condition	{'0'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
Rate Limiter Dynamic (Rate Limiter Dynamic) (masked subsystem)		
Relay (Relay)		
OnSwitchValue	Switch on point	{'eps'}
OffSwitchValue	Switch off point	{'eps'}
OnOutputValue	Output when on	{'1'}
OffOutputValue	Output when off	{'0'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: All ports same datatype'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Saturation (Saturate)		
UpperLimit	Upper limit	scalar or vector — {'0.5'}
LowerLimit	Lower limit	scalar or vector — {'-0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: Same as input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
Saturation Dynamic (Saturation Dynamic) (masked subsystem)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Same as second input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate on integer overflow	{'off'} 'on'
Wrap To Zero (Wrap To Zero) (masked subsystem)		
Threshold	Threshold	{'255'}

Discrete Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Delay (Delay)		
DelayLengthSource	Delay length > Source	{'Dialog'} 'Input port'
DelayLength	Delay length > Value	{'2'}
DelayLengthUpperLimit	Delay length > Upper limit	{'100'}
InitialConditionSource	Initial condition > Source	{'Dialog'} 'Input port'
InitialCondition	Initial condition > Value	{'0.0'}
ExternalReset	External reset	{'None'} 'Rising' 'Falling' 'Either' 'Level' 'Level hold'
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} 'Inherited'
UseCircularBuffer	Use circular buffer for state	{'off'} 'on'
PreventDirectFeedthrough	Prevent direct feedthrough	{'off'} 'on'
RemoveDelayLengthCheckInGeneratedCode	Remove delay length check in generated code	{'off'} 'on'
DiagnosticForDelayLength	Diagnostic for delay length	{'None'} 'Warning' 'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
CodeGenStateStorageType Qualifier	Code generation storage type qualifier	{''}
Difference (Difference) (masked subsystem)		
ICPrevInput	Initial condition for previous input	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Discrete Derivative (Discrete Derivative) (masked subsystem)		
gainval	Gain value	{'1.0'}
ICPrevScaledInput	Initial condition for previous weighted input $K*u/Ts$	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Discrete FIR Filter (Discrete FIR Filter)		
CoefSource	Coefficient source	{'Dialog parameters'} 'Input port'
FilterStructure	Filter structure	{'Direct form'} 'Direct form symmetric' 'Direct form antisymmetric' 'Direct form transposed' 'Lattice MA' Note You must have a DSP System Toolbox license to use a filter structure other than Direct form.
Coefficients	Coefficients	vector — {'[0.5 0.5]'} <hr/>
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} <hr/>
InitialStates	Initial states	scalar or vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CoefMin	Coefficients minimum	{'[]'}
CoefMax	Coefficients maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
TapSumDataTypeStr	Tap sum data type	{'Inherit: Same as input'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
CoefDataTypeStr	Coefficients data type	{'Inherit: Same word length as input'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)'
ProductDataTypeStr	Product output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'
StateDataTypeStr	State data type	'Inherit: Same as input' {'Inherit: Same as accumulator'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Same as input' {'Inherit: Same as accumulator'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
Discrete Filter (DiscreteFilter)		
Numerator	Numerator coefficients	vector — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 0.5]'}
IC	Initial states	{'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'} 'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
StateDataTypeStr	State data type	{'Inherit: Same as input'} 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
NumCoefDataTypeStr	Numerator coefficient data type	{'Inherit: Inherit via internal rule'} 'int8' 'int16' 'int32' 'fixdt(1,16)' 'fixdt(1,16,0)'
DenCoefDataTypeStr	Denominator coefficient data type	{'Inherit: Inherit via internal rule'} 'int8' 'int16' 'int32' 'fixdt(1,16)' 'fixdt(1,16,0)'
NumProductDataTypeStr	Numerator product output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageTypeQualifier	Code generation storage type qualifier	{ '' }
Discrete State-Space (DiscreteStateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{ '1' }
StateName	State name	{ '' }
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{ 'off' } 'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{ 'Auto' } 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
RTWStateStorageTypeQualifier	Code generation storage type qualifier	{ '' }
Discrete Transfer Fcn (DiscreteTransferFcn)		
Numerator	Numerator coefficients	vector — {'[1]'} { '1' }
Denominator	Denominator coefficients	vector — {'[1 0.5]'} { '1' }
InitialStates	Initial states	{ '0' }
SampleTime	Sample time (-1 for inherited)	{ '1' }

Block (Type)/Parameter	Dialog Box Prompt	Values
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{ 'off' } 'on'
NumCoefMin	Numerator coefficient minimum	{ '[]' }
NumCoefMax	Numerator coefficient maximum	{ '[]' }
DenCoefMin	Denominator coefficient minimum	{ '[]' }
DenCoefMax	Denominator coefficient maximum	{ '[]' }
OutMin	Output minimum	{ '[]' }
OutMax	Output maximum	{ '[]' }
StateDataTypeStr	State data type	{ 'Inherit: Same as input' } 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
NumCoefDataTypeStr	Numerator coefficient data type	{ 'Inherit: Inherit via internal rule' } 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
DenCoefDataTypeStr	Denominator coefficient data type	{ 'Inherit: Inherit via internal rule' } 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
NumProductDataTypeStr	Numerator product output data type	{ 'Inherit: Inherit via internal rule' } 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
DenProductDataTypeStr	Denominator product output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
NumAccumDataTypeStr	Numerator accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
DenAccumDataTypeStr	Denominator accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Same as product output' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'int8' 'int16' 'int32' 'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
StateName	State name	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
RTWStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Discrete Zero-Pole (DiscreteZeroPole)		
Zeros	Zeros	vector — {'[1]'} vector — {'[0 0.5]'} {'1'}
Poles	Poles	
Gain	Gain	
SampleTime	Sample time (-1 for inherited)	{'1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class Code generation storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageType Qualifier	Code generation storage type qualifier	{''}
Discrete-Time Integrator (DiscreteIntegrator)		
IntegratorMethod	Integrator method	{'Integration: Forward Euler'} 'Integration: Backward Euler' 'Integration: Trapezoidal' 'Accumulation: Forward Euler' 'Accumulation: Backward Euler' 'Accumulation: Trapezoidal'
gainval	Gain value	{'1.0'}
ExternalReset	External reset	{'none'} 'rising' 'falling' 'either' 'level' 'sampled level'
InitialConditionSource	Initial condition source	{'internal'} 'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
InitialConditionSetting	Initial condition setting	{'State (most efficient)'} 'Output' 'Compatibility'
SampleTime	Sample time (-1 for inherited)	{'1'}
LimitOutput	Limit output	{'off'} 'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'} 'on'
ShowStatePort	Show state port	{'off'} 'on'
IgnoreLimit	Ignore limit and reset when linearizing	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
StateName	State name	{''}
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWStateStorageType Qualifier	Code generation storage type qualifier	{ '' }
First-Order Hold (First-Order Hold) (masked subsystem)		
Ts	Sample time	{ '1' }
Memory (Memory)		
InitialCondition	Initial condition	scalar or vector — { '0' }
InheritSampleTime	Inherit sample time	{ 'off' } 'on'
LinearizeMemory	Direct feedthrough of input during linearization	{ 'off' } 'on'
LinearizeAsDelay	Treat as a unit delay when linearizing with discrete sample time	{ 'off' } 'on'
StateName	State name	{ '' }
StateMustResolveTo SignalObject	State name must resolve to Simulink signal object	{ 'off' } 'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{ 'Auto' } 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
RTWStateStorageType Qualifier	Code generation storage type qualifier	{ '' }
Tapped Delay (S-Function) (Tapped Delay Line) (masked subsystem)		
vinit	Initial condition	{ '0.0' }
samptime	Sample time	{ '-1' }
NumDelays	Number of delays	{ '4' }

Block (Type)/Parameter	Dialog Box Prompt	Values
DelayOrder	Order output vector starting with	{'Oldest'} 'Newest'
includeCurrent	Include current input in output vector	{'off'} 'on'
Transfer Fcn First Order (First Order Transfer Fcn) (masked subsystem)		
PoleZ	Pole (in Z plane)	{'0.95'}
ICPrevOutput	Initial condition for previous output	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Lead or Lag (Lead or Lag Compensator) (masked subsystem)		
PoleZ	Pole of compensator (in Z plane)	{'0.95'}
ZeroZ	Zero of compensator (in Z plane)	{'0.75'}
ICPrevOutput	Initial condition for previous output	{'0.0'}
ICPrevInput	Initial condition for previous input	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Real Zero (Transfer Fcn Real Zero) (masked subsystem)		
ZeroZ	Zero (in Z plane)	{'0.75'}
ICPrevInput	Initial condition for previous input	{'0.0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Unit Delay (UnitDelay)		
InitialCondition	Initial condition	scalar or vector — {'0'}
InputProcessing	Input processing	'Columns as channels (frame based)' {'Elements as channels (sample based)'} 'Inherited'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'} 'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Zero-Order Hold (ZeroOrderHold)		
SampleTime	Sample time (-1 for inherited)	{'1'}

Logic and Bit Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (Bit Clear) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bit Set (Bit Set) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bitwise Operator (S-Function) (Bitwise Operator) (masked subsystem)		
logicop	Operator	{'AND'} {'OR'} {'NAND'} {'NOR'} {'XOR'} {'NOT'}
UseBitMask	Use bit mask ...	'off' {'on'}
NumInputPorts	Number of input ports	{'1'}
BitMask	Bit Mask	{'bin2dec('11011001')'}
BitMaskRealWorld	Treat mask as	'Real World Value' {'Stored Integer'}
Combinatorial Logic (CombinatorialLogic)		
TruthTable	Truth table	{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Compare To Constant (Compare To Constant) (masked subsystem)		
relop	Operator	'==' '~=' '<' {'<='} '>' {'>='}
const	Constant value	{'3.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Compare To Zero (Compare To Zero) (masked subsystem)		
relop	Operator	'==' '~=' '<' {'<='} '>' {'>='}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'

Block (Type)/Parameter	Dialog Box Prompt	Values
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Detect Change (Detect Change) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Decrease (Detect Decrease) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Fall Negative (Detect Fall Negative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Fall Nonpositive (Detect Fall Nonpositive) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Increase (Detect Increase) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Rise Nonnegative (Detect Rise Nonnegative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Detect Rise Positive (Detect Rise Positive) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Extract Bits (Extract Bits) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
bitsToExtract	Bits to extract	{'Upper half'} 'Lower half' 'Range starting with most significant bit' 'Range ending with least significant bit' 'Range of bits'
numBits	Number of bits	{'8'}
bitIdxRange	Bit indices ([start end], 0-based relative to LSB)	{'[0 7]}'
outScalingMode	Output scaling mode	{'Preserve fixed-point scaling'} 'Treat bit field as an integer'
Interval Test (Interval Test) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' {'on'}
uplimit	Upper limit	{'0.5'}
IntervalClosedLeft	Interval closed on left	'off' {'on'}
lowlimit	Lower limit	{'-0.5'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Interval Test Dynamic (Interval Test Dynamic) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off' {'on'}
IntervalClosedLeft	Interval closed on left	'off' {'on'}
OutDataTypeStr	Output data type	{'boolean'} 'uint8'
Logical Operator (Logic)		
Operator	Operator	{'AND'} 'OR' 'NAND' 'NOR' 'XOR' 'NXOR' 'NOT'
Inputs	Number of input ports	{'2'}
IconShape	Icon shape	{'rectangular'} 'distinctive'
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
AllPortsSameDT	Require all inputs and output to have the same data type	{'off'} 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' {'boolean'} 'fixdt(1,16)'
Relational Operator (RelationalOperator)		
Operator	Relational operator	'==' '~=' '<' {'<='} '>=' '>' 'isInf' 'isNaN' 'isFinite'
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)' {'boolean'} 'fixdt(1,16)'
Shift Arithmetic (ArithShift)		
BitShiftNumberSource	Bits to shift > Source	{'Dialog'} 'Input port'
BitShiftDirection	Bits to shift > Direction	'Left' 'Right' {'Bidirectional'}
BitShiftNumber	Bits to shift > Number	{'8'}
BinPtShiftNumber	Binary points to shift > Number	{'0'}
DiagnosticForOORShift	Diagnostic for out-of-range shift value	{'None'} 'Warning' 'Error'

Block (Type)/Parameter	Dialog Box Prompt	Values
CheckOORBitShift	Check for out-of-range 'Bits to shift' in generated code	{'off'} 'on'
nBitShiftRight	Deprecated in R2011a	
nBinPtShiftRight	Deprecated in R2011a	

Lookup Tables Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (Cosine) (masked subsystem)		
Formula	Output formula	'sin(2*pi*u)' {'cos(2*pi*u)'} 'exp(j*2*pi*u)' 'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'} 'Precision'
Direct Lookup Table (n-D) (LookupNDDirect)		
NumberOfTableDimensions	Number of table dimensions	'1' {'2'} '3' '4'
InputsSelectThisObjectFromTable	Inputs select this object from table	{'Element'} 'Column' '2-D Matrix'
TableIsInput	Make table an input	{'off'} 'on'
Table	Table data	{'[4 5 6;16 19 20;10 18 23]}'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	'None' {'Warning'} 'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableMin	Table minimum	{'[]'}
TableMax	Table maximum	{'[]'}
TableDataTypeStr	Table data type	{'Inherit: Inherit from 'Table data''} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
maskTabDims	Deprecated in R2009b	
explicitNumDims	Deprecated in R2009b	
outDims	Deprecated in R2009b	
tabIsInput	Deprecated in R2009b	
mxTable	Deprecated in R2009b	
clipFlag	Deprecated in R2009b	
samptime	Deprecated in R2009b	
Interpolation Using Prelookup (Interpolation_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' {'2'} '3' '4'
Table	Table data > Value	{'sqrt([1:11]' * [1:11])'}
TableSource	Table data > Source	{'Dialog'} 'Input port'
TableSpecification	Specification	{'Explicit values'} 'Lookup table object' To set this parameter from 'Explicit values' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example: <pre>set_param('myModel/myInterpBlock', ... 'TableSpecification', ... 'Lookup table object', ... 'LookupTableObject', 'myLUTObject')</pre>
LookupTableObject	Name of lookup table object	{''}
InterpMethod	Interpolation method	'Flat' {'Linear'}
ExtrapMethod	Extrapolation method	'Clip' {'Linear'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ValidIndexMayReachLast	Valid index input may reach last index	{'off'} 'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'} 'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsData TypeStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as output' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' {'Inherit: Inherit from table data'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} 'Precision'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
CheckIndexInCode	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (Lookup_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1' '2' '3' '4'. Default is '1' for 1-D Lookup Table, '2' for 2-D Lookup Table, '3' for n-D Lookup Table.

Block (Type)/Parameter	Dialog Box Prompt	Values
DataSpecification	(n-D Lookup Table) Data specification	<p>{'Table and breakpoints'} 'Lookup table object'</p> <p>To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:</p> <pre>set_param('myModel/myLookupBlock', ... 'DataSpecification', 'Lookup table... object', ... 'LookupTableObject', 'myLUTObject')</pre>
LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape repmat([4 5 6;16 19 20;10 18 23],1,2), [3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'} 'Even spacing'
BreakpointsForDimension1FirstPoint	First point	{'1'}
BreakpointsForDimension2FirstPoint	First point	{'1'}
BreakpointsForDimension3FirstPoint	First point	{'1'}
...
BreakpointsForDimension30FirstPoint	First point	{'1'}
BreakpointsForDimension1Spacing	Spacing	{'1'}
BreakpointsForDimension2Spacing	Spacing	{'1'}
BreakpointsForDimension3Spacing	Spacing	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
...
BreakpointsForDimension30Spacing	Spacing	{'1'}
BreakpointsForDimension1	Breakpoints 1	{'[10,22,31]'}
BreakpointsForDimension2	Breakpoints 2	{'[10,22,31]'}
BreakpointsForDimension3	Breakpoints 3	{'[5, 7]'}
...
BreakpointsForDimension30	Breakpoints 30	{'[1:3]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InterpMethod	Interpolation method	'Flat' {'Linear'} 'Cubic spline'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'} 'Cubic spline'
UseLastTableValue	Use last table value for inputs at or above last breakpoint	{'off'} 'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} 'on'
IndexSearchMethod	Index search method	'Evenly spaced points' 'Linear search' {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
UseOneInputPortForAll InputData	Use one input port for all input data	{'off'} 'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'} 'on'
MaximumIndicesForEach Dimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data'' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1 DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data'' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension1 Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1 Max	Breakpoints 1 > Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension2 DataTypeStr	Breakpoints 2 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension2 Min	Breakpoints 2 > Minimum	{'[]'}
BreakpointsForDimension2 Max	Breakpoints 2 > Maximum	{'[]'}
...
BreakpointsForDimension30 DataTypeStr	Breakpoints 30 > Data Type	{'Inherit: Same as corresponding input'} 'Inherit: Inherit from 'Breakpoint data' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointsForDimension30 Min	Breakpoints 30 > Minimum	{'[]'}
BreakpointsForDimension30 Max	Breakpoints 30 > Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} 'double' 'single' 'fixdt(1,16,0)'
IntermediateResults DataTypeStr	Intermediate results > Data Type	'Inherit: Inherit via internal rule' {'Inherit: Same as output'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation' 'Inherit: Inherit from table data' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'} 'Precision'
InputSameDT	Require all inputs to have the same data type	'off' {'on'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' 'Nearest' 'Round' {'Simplest'} 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
ProcessOutOfRangeInput	Deprecated in R2009b	

Block (Type)/Parameter	Dialog Box Prompt	Values
Lookup Table Dynamic (Lookup Table Dynamic) (masked subsystem)		
LookUpMeth	Lookup Method	'Interpolation-Extrapolation' {'Interpolation-Use End Values'} 'Use Input Nearest' 'Use Input Below' 'Use Input Above'
OutDataTypeStr	Output data type	{'fixdt('double')} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Prelookup (PreLookup)		

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsSpecification	Specification	<p>{'Explicit values'} 'Even spacing' 'Breakpoint object'</p> <p>To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to set_param to set the parameter BreakpointObject. For example:</p> <pre>set_param('myModel/myPrelookupBlock', ... 'BreakpointsSpecification', ... 'Breakpoint object', ... 'BreakpointObject', 'myBPObject')</pre>
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'} 'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points' 'Linear search' {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'} 'on'
OutputOnlyTheIndex	Output only the index	{'off'} 'on'
ExtrapMethod	Extrapolation method	'Clip' {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'} 'Warning' 'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
BreakpointDataTypeStr	Breakpoint > Data Type	{'Inherit: Same as input'} 'Inherit: Inherit from 'Breakpoint data' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
BreakpointMin	Breakpoint > Minimum	{'[]'}
BreakpointMax	Breakpoint > Maximum	{'[]'}
IndexDataTypeStr	Index > Data Type	'int8' 'uint8' 'int16' 'uint16' 'int32' {'uint32'} 'fixdt(1,16)'
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'} 'double' 'single' 'fixdt(1,16,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (Sine) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Formula	Output formula	{ 'sin(2*pi*u)' } 'cos(2*pi*u)' 'exp(j*2*pi*u)' 'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{ '(2^5)+1' }
OutputWordLength	Output word length	{ '16' }
InternalRulePriority	Internal rule priority for lookup table	{ 'Speed' } 'Precision'

Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'} 'round'
Inputs	List of signs	{'++'}

Block (Type)/Parameter	Dialog Box Prompt	Values
CollapseMode	Sum over	{'All dimensions'} 'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'Inherit: Same as accumulator' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
Algebraic Constraint (Algebraic Constraint)		
Constraint	Constraint on input signal	{'f(z) = 0'} 'f(z) = z'
Solver	Algebraic Loop Solver	{'auto'} 'Trust Region' 'Line Search'
Tolerance	Solver Tolerance	{'auto'}
InitialGuess	Initial guess	{'0'}
Assignment (Assignment)		
NumberOfDimensions	Number of output dimensions	{'1'}
IndexMode	Index mode	'Zero-based' {'One-based'}
OutputInitialize	Initialize output (Y)	{'Initialize using input port <Y0>'} 'Specify size for each dimension in table'
IndexOptionArray	Index Option	'Assign all' {'Index vector (dialog)'} 'Index vector (port)' 'Starting index (dialog)' 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
DiagnosticForDimensions	Action if any output element is not assigned	'Error' 'Warning' {'None'}
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IndexOptions	See IndexOptionArray on page 6-0 parameter for more information.	
Indices	See IndexParamArray on page 6-0 parameter for more information.	
OutputSizes	See OutputSizeArray on page 6-0 parameter for more information.	
Bias (Bias)		
Bias	Bias	{'0.0'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Complex to Magnitude-Angle (ComplexToMagnitudeAngle)		
Output	Output	'Magnitude' 'Angle' {'Magnitude and angle'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Complex to Real-Imag (ComplexToRealImag)		
Output	Output	'Real' 'Imag' {'Real and imag'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Divide (Product)		
Inputs	Number of inputs	{'*/'}
Multiplication	Multiplication	{'Element-wise(.*)'} 'Matrix(*)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off' {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as first input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Find (Find)		
IndexOutputFormat	Index output format	{'Linear indices'} 'Subscripts'
NumberOfInputDimensions	Number of input dimensions	integer — {'1'}
IndexMode	Index mode	{'Zero-based'} 'One-based'

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowOutputForNonzero InputValues	Show output port for nonzero input values	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)'
Gain (Gain)		
Gain	Gain	{'1'}
Multiplication	Multiplication	{'Element-wise (K.*u)'} 'Matrix(K*u)' 'Matrix(u*K)' 'Matrix(K*u) (u vector)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'Inherit: Same as input' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed- point tools	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
ParamMin	Parameter minimum	{'[]'}
ParamMax	Parameter maximum	{'[]'}
ParamDataTypeStr	Parameter data type	{'Inherit: Inherit via internal rule'} 'Inherit: Same as input' 'Inherit: Inherit from Gain' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
Magnitude-Angle to Complex (MagnitudeAngleToComplex)		
Input	Input	'Magnitude' 'Angle' {'Magnitude and angle'}
ConstantPart	Magnitude or Angle	{'0'}
ApproximationMethod	Approximation method	{'None'} 'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
ScaleReciprocalGainFactor	Scale output by reciprocal of gain factor	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Math Function (Math)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Operator	Function	{'exp'} 'log' '10^u' 'log10' 'magnitude^2' 'square' 'pow' 'conj' 'reciprocal' 'hypot' 'rem' 'mod' 'transpose' 'hermitian'
OutputSignalType	Output signal type	{'auto'} 'real' 'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule' 'Inherit: Inherit via back propagation' {'Inherit: Same as first input'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed- point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off' {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Matrix Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	'Vector' {'Multidimensional array'}
ConcatenateDimension	Concatenate dimension	{'2'}
MinMax (MinMax)		
Function	Function	{'min'} 'max'
Inputs	Number of input ports	{'1'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'} 'on'

Unary Minus (UnaryMinus)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} 'Multidimensional array'
Weighted Sample Time Math (SampleTimeMath)		

Block (Type)/Parameter	Dialog Box Prompt	Values
TsampMathOp	Operation	{ '+' } '-' '*' '/' 'Ts Only' '1/Ts Only'
weightValue	Weight value	{ '1.0' }
TsampMathImp	Implement using	{ 'Online Calculations' } 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{ 'Inherit via internal rule' } 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' { 'Floor' } 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{ 'off' } 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	

Model Verification Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Assertion (Assertion)		
Enabled	Enable assertion	'off' {'on'}
AssertionFailFcn	Simulation callback when assertion fails	{''}
StopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Check Dynamic Gap (Checks_DGap) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Range (Checks_DRange) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Gap (Checks_SGap) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Range (Checks_SRange) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off' {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off' {'on'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Discrete Gradient (Checks_Gradient) (masked subsystem)		
gradient	Maximum gradient	{'1'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Lower Bound (Checks_DMin) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Dynamic Upper Bound (Checks_DMax) (masked subsystem)		
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Input Resolution (Checks_Resolution) (masked subsystem)		
resolution	Resolution	{'1'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
Check Static Lower Bound (Checks_SMin) (masked subsystem)		
min	Lower bound	{'0'}
min_included	Inclusive boundary	'off' {'on'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'
Check Static Upper Bound (Checks_SMax) (masked subsystem)		
max	Upper bound	{'0'}
max_included	Inclusive boundary	'off' {'on'}
enabled	Enable assertion	'off' {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off' {'on'}
export	Output assertion signal	{'off'} 'on'
icon	Select icon type	{'graphic'} 'text'

Model-Wide Utilities Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Block Support Table (Block Support Table) (masked subsystem)		
DocBlock (DocBlock) (masked subsystem)		
ECoderFlag	Embedded Coder Flag	{ '' }
DocumentType	Document Type	{ 'Text' } 'RTF' 'HTML'
Model Info (CMBlock) (masked subsystem)		
InitialSaveTempField	InitialSaveTempField	{ '' }
InitialBlockCM	InitialBlockCM	{ 'None' }
BlockCM	BlockCM	{ 'None' }
Frame	Show block frame	'off' { 'on' }
SaveTempField	SaveTempField	{ '' }
DisplayStringWithTags	DisplayStringWithTags	{ 'Model Info' }
MaskDisplayString	MaskDisplayString	{ 'Model Info' }
HorizontalTextAlignment	Horizontal text alignment	{ 'Center' }
LeftAlignmentValue	LeftAlignmentValue	{ '0.5' }
SourceBlockDiagram	SourceBlockDiagram	{ 'untitled' }
TagMaxNumber	TagMaxNumber	{ '20' }
CMTag1	CMTag1	{ '' }
CMTag2	CMTag2	{ '' }
CMTag3	CMTag3	{ '' }
CMTag4	CMTag4	{ '' }
CMTag5	CMTag5	{ '' }
CMTag6	CMTag6	{ '' }
CMTag7	CMTag7	{ '' }
CMTag8	CMTag8	{ '' }
CMTag9	CMTag9	{ '' }

Block (Type)/Parameter	Dialog Box Prompt	Values
CMTag10	CMTag10	{''}
CMTag11	CMTag11	{''}
CMTag12	CMTag12	{''}
CMTag13	CMTag13	{''}
CMTag14	CMTag14	{''}
CMTag15	CMTag15	{''}
CMTag16	CMTag16	{''}
CMTag17	CMTag17	{''}
CMTag18	CMTag18	{''}
CMTag19	CMTag19	{''}
CMTag20	CMTag20	{''}
Timed-Based Linearization (Timed Linearization) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (Triggered Linearization) (masked subsystem)		
TriggerType	Trigger type	{'rising'} 'falling' 'either' 'function-call'
SampleTime	Sample time (of linearized model)	{'0'}

Ports & Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (ActionPort)		
InitializeStates	States when execution is resumed	{'held'} 'reset'
PropagateVarSize	Propagate sizes of variable-size signals	{'Only when execution is resumed'} 'During execution'
Atomic Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
PropExecContextOutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}
FunctionInterfaceSpec	Function interface This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'void_void'} 'Allow arguments'
FunctionWithSeparateData	“Function with separate data” on page 1-0 This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWMemSecFuncInitTerm	<p>“Memory section for initialize/terminate functions” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecFuncExecute	<p>“Memory section for execution functions” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataConstants	<p>“Memory section for constants” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataInternal	<p>“Memory section for internal data” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package
RTWMemSecDataParameters	<p>“Memory section for parameters” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	{'Inherit from model'} 'Default' list of memory sections from model's package

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
SimViewingDevice	No dialog box prompt If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'} 'on'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchical Resolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	'Auto' 'Inline' 'Nonreusable function' {'Reusable function'}
RTWFcnNameOpts	Function name options	'Auto' {'Use subsystem name'} 'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	'Auto' {'Use subsystem name'} 'Use function name' 'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWMemSecFuncInitTerm	<p>“Memory section for initialize/terminate functions” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	<p>{'Inherit from model'} 'Default' list of memory sections from model's package</p>
RTWMemSecFuncExecute	<p>“Memory section for execution functions” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	<p>{'Inherit from model'} 'Default' list of memory sections from model's package</p>
RTWMemSecDataConstants	<p>“Memory section for constants” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	<p>{'Inherit from model'} 'Default' list of memory sections from model's package</p>
RTWMemSecDataInternal	<p>“Memory section for internal data” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	<p>{'Inherit from model'} 'Default' list of memory sections from model's package</p>
RTWMemSecDataParameters	<p>“Memory section for parameters” on page 1-0</p> <p>This parameter requires a license for Embedded Coder software and an ERT-based system target file.</p>	<p>{'Inherit from model'} 'Default' list of memory sections from model's package</p>

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Configurable Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{'self'}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'

MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
For Each(ForEach)		
InputPartition	Partition	cell array of character vectors
InputPartitionDimension	Partition dimension for input signal	cell array of character vectors
InputPartitionWidth	Width of partition for input signal	cell array of character vectors
OutputConcatenationDimension	Concatenation dimension of output signal	cell array of character vectors
For Iterator (ForIterator)		
ResetStates	States when starting	{'held'} 'reset'
IterationSource	Iteration limit source	{'internal'} 'external'
IterationLimit	Iteration limit	{'5'}
ExternalIncrement	Set next i (iteration variable) externally	{'off'} 'on'
ShowIterationPort	Show iteration variable	'off' {'on'}
IndexMode	Index mode	'Zero-based' {'One-based'}
IterationVariableDataType	Iteration variable data type	{'int32'} 'int16' 'int8' 'double'
For Iterator Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'

RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'Off'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'} 'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'} 'on'
Interpolate	Interpolate data	'off' {'on'}
UseBusObject	Specify properties via bus object	{'off'} 'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'} 'real' 'complex'
Model (ModelReference)		
ModelNameDialog	The name of the referenced model exactly as you typed it in, with any surrounding whitespace removed. When you set ModelNameDialog programmatically or with the GUI, Simulink automatically sets the values of ModelName and ModelFile based on the value of ModelNameDialog.	{'<Enter Model Name>'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelName	<p>The value of ModelNameDialog stripped of any filename extension that you provided. For backward compatibility, setting ModelName programmatically actually sets ModelNameDialog, which then sets ModelName as described. You cannot use get_param to obtain the ModelName of a protected model, because the name without a suffix would be ambiguous. Use get_param on ModelFile instead. You can test ProtectedModel to determine programmatically whether a referenced model is protected.</p>	<p>character vector — Set automatically when ModelNameDialog is set.</p>
ModelFile	<p>The value of ModelNameDialog with a filename extension. The suffix of the first match Simulink finds becomes the suffix of ModelFile. Setting ModelFile programmatically actually sets ModelNameDialog, which then sets ModelFile as described.</p>	<p>character vector — Set automatically when ModelNameDialog is set.</p>
ProtectedModel	<p>Read-only boolean indicating whether the model referenced by the block is protected (on) or unprotected (off).</p>	<p>boolean — 'off' 'on' — Set automatically when ModelNameDialog is set.</p>

Block (Type)/Parameter	Dialog Box Prompt	Values
ParameterArgumentNames	Names of model arguments that the referenced model defines. Corresponds to the Name column in the table under Arguments > Model arguments .	{ '' }
ParameterArgumentValues	Values for model arguments. Corresponds to the Value column in the table under Arguments > Model arguments .	structure with no fields
SimulationMode	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	'Normal' 'Accelerator' 'Software-in-the-loop (SIL)' 'Processor-in-the-loop (PIL)'

Block (Type)/Parameter	Dialog Box Prompt	Values
Variant	<p>Specifies whether the Model block references variant models.</p> <hr/> <p>Note For new models, use a Model block for model variants only if you need to use variants that are conditionally executed models (models with control ports). Model variants are supported for backward compatibility. However, support for model variants will be removed in a future release.</p> <p>To convert a Model block that contains variant models to a Variant Subsystem block, right-click the Model block and select Subsystems & Model Reference > Convert to > Variant Subsystem. This conversion can require that you update scripts that use the Variants command-line parameter.</p>	{'off'} 'on'
Variants	<p>An array of variant structures where each element specifies one variant. The structure fields are as follows:</p> <p>variant.Name – The name of the Simulink.Variant object that represents the variant to which this element applies.</p>	array — [] { '' }

Block (Type)/Parameter	Dialog Box Prompt	Values
	variant.ModelName – The name of the referenced model associated with the specified variant object in the Model block.	{ '' }
	variant.ParameterArgument Names – Read-only character vector containing the names of the model arguments for which the Model block must supply values.	{ '' }
	variant.ParameterArgument Values – The values to supply for the model arguments when this variant is the active variant.	{ '' }
	variant.SimulationMode – The execution mode to use when this variant is the active variant.	{'Accelerator'} 'Normal' 'Processor-in-the-loop (PIL)'
VariantConfigurationObject	Specifies the variant configuration object that is associated with the model.	{ '' } The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a Simulink.VariantConfigurationData object.
OverrideUsingVariant	Whether to override the variant conditions and make a specified variant the active variant, and if so, the name of that variant.	{ '' } The value is the empty character vector if no overriding variant object is specified; or the name of the overriding object.

Block (Type)/Parameter	Dialog Box Prompt	Values
ActiveVariant	The variant that is currently active, either because its variant condition is true or OverrideUsingVariant has overridden the variant conditions and specified this variant.	{''} The value is the empty character vector if no variant is active; or the name of the active variant.
GeneratePreprocessorConditionals	Locally controls whether generated code contains preprocessor conditionals. This parameter applies only to Simulink Coder code generation and has no effect on the behavior of a model in Simulink. The parameter is available only for ERT targets. For more information, see “Variant Systems” (Embedded Coder).	{'off'} 'on'
DefaultDataLogging		{'off'} 'on'
Out1 (Outport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
UseBusObject	Specify properties via bus object	{'off'} 'on'
BusObject	Bus object for validating input bus	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal

Block (Type)/Parameter	Dialog Box Prompt	Values
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} 'real' 'complex'
OutputWhenDisabled	Output when disabled	{'held'} 'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} 'on'
Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'

Block (Type)/Parameter	Dialog Box Prompt	Values
TreatAsAtomicUnit	Treat as atomic unit	{'off'} 'on'
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off' {'on'}
VariantControl	Variant control	{'Variant'} '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
PropExecContext OutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} 'on'
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'on'} 'off' Read-only
Virtual	For internal use	
Switch Case (SwitchCase)		
CaseConditions	Case conditions (e.g., {1,[2,3]})	{' {1}'}
ShowDefaultCase	Show default case	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CaseShowDefault	Deprecated in R2009b	
Switch Case Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
PropExecContextOutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Trigger (TriggerPort)		
TriggerType	Trigger type	{'rising'} 'falling' 'either' 'function-call'
IsSimulinkFunction	Configure the Function-call subsystem to be a Simulink Function	{'off'} 'on'
StatesWhenEnabling	States when enabling	{'held'} 'reset' 'inherit'
PropagateVarSize	Propagate sizes of variable-size signals	{'During execution'} 'Only when enabling'
ShowOutputPort	Show output port	{'off'} 'on'
OutputDataType	Output data type	{'auto'} 'double' 'int8'
SampleTimeType	Sample time type	{'triggered'} 'periodic'
SampleTime	Sample time	{'1'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
TriggerSignalSampleTime	Trigger signal sample time	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
Interpolate	Interpolate data	'off' {'on'}
Triggered Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
PropExecContextOutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
CheckFcnCallInp InsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only
Unit Conversion		

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
Unit System Configuration		
AllowAllUnitSystems	Allow or restrict unit systems.	boolean — {'on'} 'off'
UnitSystems	Displays allowed unit system.	cell array of character vectors — {'SI', 'English', SI (extended)', 'CGS'}
While Iterator (WhileIterator)		
MaxIters	Maximum number of iterations (-1 for unlimited)	{'5'}
WhileBlockType	While loop type	{'while'} 'do-while'
ResetStates	States when starting	{'held'} 'reset'
ShowIterationPort	Show iteration number port	{'off'} 'on'
OutputDataType	Output data type	{'int32'} 'int16' 'int8' 'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels Note The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none' {'FromPortIcon'} 'FromPortBlockName' 'SignalName' 'off' 'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'} 'ReadOnly' 'NoReadOrWrite'

Block (Type)/Parameter	Dialog Box Prompt	Values
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'} 'ExplicitOnly' 'None'
TreatAsAtomicUnit	Treat as atomic unit	'off' {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'} 'on'
PropExecContextOutsideSubsystem	Propagate execution context across subsystem boundary	{'off'} 'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'} 'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'} 'Inline' 'Nonreusable function' 'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'} 'Use subsystem name' 'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'} 'Use subsystem name' 'Use function name' 'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by Data type override on the Fixed-Point Tool.	{'UseLocalSettings'} 'ScaledDouble' 'Double' 'Single' 'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by Fixed-point instrumentation mode on the Fixed-Point Tool.	{'UseLocalSettings'} 'MinMaxAndOverflow' 'OverflowOnly' 'ForceOff'
IsSubsystemVirtual		boolean — {'off'} 'on' Read-only

Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (BusToVector)		
Data Type Conversion (DataTypeConversion)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via back propagation'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
ConvertRealWorld	Input and output to have equal	{'Real World Value (RWV)'} 'Stored Integer (SI)'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Data Type Conversion Inherited (Conversion Inherited) (masked subsystem)		
ConvertRealWorld	Input and Output to have equal	{'Real World Value'} 'Stored Integer'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Data Type Duplicate (DataTypeDuplicate)		
NumInputPorts	Number of input ports	{'2'}
Data Type Propagation (Data Type Propagation) (masked subsystem)		
PropDataTypeMode	1. Propagated data type	'Specify via dialog' {'Inherit via propagation rule'}
PropDataType	1.1. Propagated data type (e.g., fixdt(1,16), fixdt('single'))	{'fixdt(1,16)'} {'single'}
IfRefDouble	1.1. If any reference input is double, output is	{'double'} 'single'
IfRefSingle	1.2. If any reference input is single, output is	'double' {'single'}
IsSigned	1.3. Is-Signed	'IsSigned1' 'IsSigned2' {'IsSigned1 or IsSigned2'} 'TRUE' 'FALSE'
NumBitsBase	1.4.1. Number-of-Bits: Base	'NumBits1' 'NumBits2' {'max([NumBits1 NumBits2])'} 'min([NumBits1 NumBits2])' 'NumBits1+NumBits2'
NumBitsMult	1.4.2. Number-of-Bits: Multiplicative adjustment	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
NumBitsAdd	1.4.3. Number-of-Bits: Additive adjustment	{'0'}
NumBitsAllowFinal	1.4.4. Number-of-Bits: Allowable final values	{'1:128'}
PropScalingMode	2. Propagated scaling	'Specify via dialog' 'Inherit via propagation rule' 'Obtain via best precision'
PropScaling	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2 ⁻⁹	{'2 ⁻¹⁰ '}
ValuesUsedBestPrec	2.1. Values used to determine best precision scaling	{'[5 -7]}'}
SlopeBase	2.1.1. Slope: Base	'Slope1' 'Slope2' 'max([Slope1 Slope2])' 'min([Slope1 Slope2])' 'Slope1*Slope2' 'Slope1/Slope2' 'PosRange1' 'PosRange2' 'max([PosRange1 PosRange2])' 'min([PosRange1 PosRange2])' 'PosRange1*PosRange2' 'PosRange1/PosRange2'
SlopeMult	2.1.2. Slope: Multiplicative adjustment	{'1'}
SlopeAdd	2.1.3. Slope: Additive adjustment	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'} 'Bias2' 'max([Bias1 Bias2])' 'min([Bias1 Bias2])' 'Bias1*Bias2' 'Bias1/Bias2' 'Bias1+Bias2' 'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off' {'on'}
ProbeSampleTime	Probe sample time	'off' {'on'}
ProbeComplexSignal	Detect complex signal	'off' {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off' {'on'}
ProbeFramedSignal	Detect framed signal	'off' {'on'}
ProbeWidthDataType	Data type for width	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'

Block (Type)/Parameter	Dialog Box Prompt	Values
ProbeComplexityDataType	Data type for signal complexity	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'} 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'Same as input'
Rate Transition (RateTransition)		
Integrity	Ensure data integrity during data transfer	'off' {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off' {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'} 'Inherit' 'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
Signal Conversion (SignalConversion)		
ConversionOutput	Output	{'Signal copy'} 'Virtual bus' 'Nonvirtual bus'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'Bus: <object name>'
OverrideOpt	Exclude this block from 'Block reduction' optimization	{'off'} 'on'
Signal Specification (SignalSpecification)		
Dimensions	Dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
BusOutputAsStruct	Require nonvirtual bus	{'off'} 'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'} '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalType	Signal type	{'auto'} 'real' 'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+' '-' '*' '/' {'Ts Only'} '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'} 'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'} 'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'} 'Inherit via back propagation' 'All ports same datatype'

Block (Type)/Parameter	Dialog Box Prompt	Values
DataType	Output data type	{ 'double' } 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32'

Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (BusAssignment)		
AssignedSignals	Signals that are being assigned	{ '' }
InputSignals	Signals in the bus	matrix — {'{ }'}
Bus Creator (BusCreator)		
InheritFromInputs	Override bus signal names from inputs	{ 'on' } 'off' If set to 'on', overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
Inputs	Number of inputs	{ '2' }
DisplayOption		'none' 'signals' {'bar'}
NonVirtualBus	Output as nonvirtual bus	{ 'off' } 'on'
OutDataTypeStr	Data type	{ 'Inherit: auto' } 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
Bus Selector (BusSelector)		
OutputSignals	Selected signals	character vector — in the form 'signal1, signal2'
OutputAsBus	Output as bus	{ 'off' } 'on'
InputSignals	Signals in bus	matrix — {'{ }'}
Data Store Memory (DataStoreMemory)		
DataStoreName	Data store name	{ 'A' }

Block (Type)/Parameter	Dialog Box Prompt	Values
ReadBeforeWriteMsg	Detect read before write	'none' {'warning'} 'error'
WriteAfterWriteMsg	Detect write after write	'none' {'warning'} 'error'
WriteAfterReadMsg	Detect write after read	'none' {'warning'} 'error'
InitialValue	Initial value	{'0'}
StateMustResolveToSignalObject	Data store name must resolve to Simulink signal object	{'off'} 'on'
DataLogging	Log Signal Data	'off' {'on'}
DataLoggingNameMode	Logging Name	{'SignalName'} 'Custom'
DataLoggingName	Logging Name	{''}
DataLoggingLimitDataPoints	Limit data points to last	'off' {'on'}
DataLoggingMaxPoints	Limit data points to last	non-zero integer {5000}
DataLoggingDecimateData	Decimation	'off' {'on'}
DataLoggingLimitDataPoints	Decimation	non-zero integer {2}
StateStorageClass	Storage class	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
StateSignalObject	Signal object class Storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
RTWStateStorageTypeQualifier	Code generation type qualifier	{''}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowAdditionalParam	Show additional parameters	{'off'} 'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalType	Signal type	{'auto'} 'real' 'complex'
Data Store Read (DataStoreRead)		
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		
Outputs	Number of outputs	{'2'}
DisplayOption	Display option	'none' {'bar'}
BusSelectionMode	Bus selection mode	{'off'} 'on'
Environment Controller (Environment Controller) (masked subsystem)		
From (From)		
GotoTag	Goto tag	{'A'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IconDisplay	Icon display	'Signal name' {'Tag'} 'Tag and signal name'
Goto (Goto)		
GotoTag	Tag	{'A'}
IconDisplay	Icon display	'Signal name' {'Tag'} 'Tag and signal name'
TagVisibility	Tag visibility	{'local'} 'scoped' 'global'
Goto Tag Visibility (GotoTagVisibility)		
GotoTag	Goto tag	{'A'}
Index Vector (MultiPortSwitch)		
DataPortOrder	Data port order	{'Zero-based contiguous'} 'One-based contiguous' 'Specify indices'
Inputs	Number of data ports	{'1'}
zeroidx	Deprecated in R2010a	
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} 'on'
Manual Switch (Manual Switch) (masked subsystem)		
varsize	Allow different input sizes (Results in variable-size output signal)	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Merge (Merge)		
Inputs	Number of inputs	{'2'}
InitialOutput	Initial output	{'[]'}
AllowUnequalInputPortWidths	Allow unequal port widths	{'off'} 'on'
InputPortOffsets	Input port offsets	{'[]'}
Multiport Switch (MultiPortSwitch)		
DataPortOrder	Data port order	'Zero-based contiguous' {'One-based contiguous'} 'Specify indices'
Inputs	Number of data ports	{'3'}
zeroidx	Deprecated in R2010a	
DataPortIndices	Data port indices	{' {1,2,3}' }

Block (Type)/Parameter	Dialog Box Prompt	Values
DataPortForDefault	Data port for default case	{'Last data port'} 'Additional data port'
DiagnosticForDefault	Diagnostic for default case	'None' 'Warning' {'Error'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'} 'on'
Mux (Mux)		
Inputs	Number of inputs	{'2'}

Block (Type)/Parameter	Dialog Box Prompt	Values
DisplayOption	Display option	'none' 'signals' {'bar'}
UseBusObject	For internal use	
BusObject	For internal use	
NonVirtualBus	For internal use	
Selector (Selector)		
NumberOfDimensions	Number of input dimensions	{'1'}
IndexMode	Index mode	'Zero-based' {'One-based'}
IndexOptionArray	Index Option	'Select all' {'Index vector (dialog)'} 'Index vector (port)' 'Starting index (dialog)' 'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
InputPortWidth	Input port size	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See IndexOptionArray on page 6-0 parameter for more information.	
Indices	See IndexParamArray on page 6-0 parameter for more information.	
OutputSizes	See OutputSizeArray on page 6-0 parameter for more information.	
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'} 'u2 > Threshold' 'u2 ~= 0'
Threshold	Threshold	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ZeroCross	Enable zero-crossing detection	'off' {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'} 'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'} 'Inherit: Inherit via back propagation' 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'} 'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'} 'on'
Variant Source (tVariantSource)		
VariantControls	Variant control	{'Variant'} '(default)'
OverrideUsingVariant	Override variant conditions and use the following variant	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
AllowZeroVariantControls	Allow zero active variant controls	{'off'} 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} 'on'
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} 'on'
CompiledActiveVariantControl		string - {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string - {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		
VariantControls	Variant control	{'Variant'} '(default)'
OverrideUsingVariant	Override variant conditions and use the following variant	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'} 'on'
ShowConditionOnBlock	Show variant condition on block	{'off'} 'on'
GeneratePreprocessorConditionals	Analyze all choices during update diagram and generate preprocessor conditionals	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
CompiledActiveVariantControl		string – {''} The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'} The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'} 'Multidimensional array'

Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (Display)		
Format	Format	{'short'} 'long' 'short_e' 'long_e' 'bank' 'hex (Stored Integer)' 'binary (Stored Integer)' 'decimal (Stored Integer)' 'octal (Stored Integer)'
Decimation	Decimation	{'1'}
Floating	Floating display	{'off'} 'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Floating Scope (Scope)		
Floating		'off' {'on'}
Location		vector — {'[376 294 700 533]'} 533]']
Open		{'off'} 'on'
NumInputPorts		Do not change this parameter with the command-line. Instead, use the Number of axes parameter in the Scope parameters dialog.
TickLabels		'on' 'off' {'OneTimeTick'}
ZoomMode		{'on'} 'xonly' 'yonly'
AxesTitles		character vector
Grid		'off' {'on'} 'xonly' 'yonly'
TimeRange		{'auto'}

Block (Type)/Parameter	Dialog Box Prompt	Values
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'} 'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'} 'Structure' 'Array'
LimitDataPoints		'off' {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'} 'on'
SampleTime		{'0'}
Out1 (Outport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name' {'Port number'} 'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'} 'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'} 'No' 'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)' 'Enum: <class name>' 'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Output Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Output Blocks” (Simulink Coder).	{'Auto'} 'SimulinkGlobal' 'ExportedGlobal' 'ImportedExtern' 'ImportedExternPointer' 'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'} 'real' 'complex'
OutputWhenDisabled	Output when disabled	{'held'} 'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'} 'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Scope (Scope)		
Floating		{'off'} 'on'
Location		vector — {'[188 390 512 629]'} 629]'
Open		{'off'} 'on'
NumInputPorts		Do not change this parameter with the command-line. Instead, use the Number of axes parameter in the Scope parameters dialog.

ConRadixGroup	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
Signal Builder (Sigbuilder block) (masked subsystem)		
Signal Editor (SignalEditor)		
Filename	File name	{'untitled.mat'}
ActiveScenario	Active scenario	{'Scenario'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ActiveSignal	Signals	{'Signal 1'}
IsBus	Output a bus signal	'on' {'off'}
OutputBusObjectStr	Select bus object	{'Bus: BusObject'}
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	{'off'} 'on'
ZeroCross	Enable zero-crossing detection	{'off'} 'on'
OutputAfterFinalValue	Form output after final data value by	{'Setting to zero'} 'Extrapolation' 'Holding final value'
Unit	Unit	{'inherit'}
Signal Generator (SignalGenerator)		
WaveForm	Wave form	{'sine'} 'square' 'sawtooth' 'random'
TimeSource	Time (t)	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Frequency	Frequency	{'1'}
Units	Units	'rad/sec' {'Hertz'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Sine Wave (Sin)		
SineType	Sine type	{'Time based'} 'Sample based'
TimeSource	Time	{'Use simulation time'} 'Use external signal'
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Step (Step)		
Time	Step time	{'1'}
Before	Initial value	{'0'}
After	Final value	{'1'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
ZeroCross	Enable zero-crossing detection	'off' {'on'}
Uniform Random Number (UniformRandomNumber)		
Minimum	Minimum	{'-1'}
Maximum	Maximum	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off' {'on'}
Waveform Generator (WaveformGenerator)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation' {'Inherit: Inherit from table data'} 'double' 'single' 'int8' 'uint8' 'int16' 'uint16' 'int32' 'uint32' 'boolean' 'fixdt(1,16)' 'fixdt(1,16,0)' 'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'} 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' 'Floor' {'Nearest'} 'Round' 'Simplest' 'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'} 'on'
SelectedSignal	Output signal	{'1'}
SampleTime	Sample time	{'0'}

User-Defined Functions Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
MATLAB Function (Stateflow) (masked subsystem)		
MATLAB System (MATLABSystem)		
System	System object class name	{ '' }
Fcn (Fcn)		
Expr	Expression	{ 'sin(u(1))*exp(2.3*(-u(2)))' }
SampleTime	Sample time (-1 for inherited)	{ '-1' }
Level-2 MATLAB S-Function (M-S-Function)		
FunctionName	S-function name	{ 'mlfile' }
Parameters	Parameters	{ '' }
Interpreted MATLAB Function (MATLABFcn)		
MATLABFcn	MATLAB function	{ 'sin' }
OutputDimensions	Output dimensions	{ '-1' }
OutputSignalType	Output signal type	{ 'auto' } 'real' 'complex'
Output1D	Collapse 2-D results to 1-D	'off' { 'on' }
SampleTime	Sample time (-1 for inherited)	{ '-1' }
S-Function (S-Function)		
FunctionName	S-function name	{ 'system' }
Parameters	S-function parameters	{ '' }
SFunctionModules	S-function modules	{ '' }
S-Function Builder (S-Function Builder) (masked subsystem)		
FunctionName	S-function name	{ 'system' }
Parameters	S-function parameters	{ '' }
SFunctionModules	S-function modules	{ '' }

Additional Discrete Block Library Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Fixed-Point State-Space (Fixed-Point State-Space) (masked subsystem)		
A	State Matrix A	{ '[2.6020 -2.2793 0.6708; 1 0 0; 0 1 0]'
B	Input Matrix B	{ '[1; 0; 0]'
C	Output Matrix C	{ '[0.0184 0.0024 0.0055]'
D	Direct Feedthrough Matrix D	{ '[0.0033]'
X0	Initial condition for state	{ '0.0'
InternalDataType	Data type for internal calculations	{ 'fixdt('double')'
StateEqScaling	Scaling for State Equation AX +BU	{ '2^0'
OutputEqScaling	Scaling for Output Equation CX +DU	{ '2^0'
LockScale	Lock output data type setting against changes by the fixed-point tools	{ 'off' } 'on'
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{ 'off' } 'on'
Transfer Fcn Direct Form II (Transfer Fcn Direct Form II) (masked subsystem)		
NumCoefVec	Numerator coefficients	{ '[0.2 0.3 0.2]'
DenCoefVec	Denominator coefficients excluding lead (which must be 1.0)	{ '[-0.9 0.6]'
vinit	Initial condition	{ '0.0'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Transfer Fcn Direct Form II Time Varying (Transfer Fcn Direct Form II Time Varying) (masked subsystem)		
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling' 'Convergent' {'Floor'} 'Nearest' 'Round' 'Simplest' 'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'} 'on'
Unit Delay Enabled (Unit Delay Enabled) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled External IC (Unit Delay Enabled External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable (Unit Delay Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable External IC (Unit Delay Enabled Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay External IC (Unit Delay External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Resettable (Unit Delay Resettable) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Resettable External IC (Unit Delay Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled (Unit Delay With Preview Enabled) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable (Unit Delay With Preview Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable External RV (Unit Delay With Preview Enabled Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable (Unit Delay With Preview Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable External RV (Unit Delay With Preview Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}

Additional Math: Increment - Decrement Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Decrement Real World (Real World Value Decrement) (masked subsystem)		
Decrement Stored Integer (Stored Integer Value Decrement) (masked subsystem)		
Decrement Time To Zero (Decrement Time To Zero) (masked subsystem)		
Decrement To Zero (Decrement To Zero) (masked subsystem)		
Increment Real World (Real World Value Increment) (masked subsystem)		
Increment Stored Integer (Stored Integer Value Increment) (masked subsystem)		

Mask Parameters

About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See “Masking Fundamentals” and “Mask Editor Overview” for information about block masks and the Mask Editor.

Mask Parameters

Parameter	Description/Prompt	Values
Mask	Turns mask on or off.	{ 'on' } 'off'
MaskCallbackString	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the Dialog callback field on the Parameters pane of the Mask Editor dialog box. For more information, see “Mask Callback Code”.	pipe-delimited character vector { '' }
MaskCallbacks	Cell array version of MaskCallbackString.	cell array { ' [] ' }
MaskDescription	Block description. Set by the Mask description field on the Documentation pane of the Mask Editor dialog box.	character vector { '' }
MaskDisplay	Drawing commands for the block icon. Set by the Icon Drawing commands field on the Icon & Ports pane of the Mask Editor dialog box.	character vector { '' }
MaskEditorHandle	For internal use only.	
MaskEnableString	Option that determines whether a parameter is greyed out in the dialog. Set by the Enable parameter check box on the Parameters pane of the Mask Editor dialog box.	pipe-delimited character vector { '' }
MaskEnables	Cell array version of MaskEnableString.	cell array of character vectors, each either 'on' or 'off' { ' [] ' }

Parameter	Description/Prompt	Values
MaskHelp	Block help. Set by the Mask help field on the Documentation pane of the Mask Editor dialog box.	character vector {''}
MaskIconFrame	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the Block Frame option on the Icon & Ports pane of the Mask Editor dialog box.	{'on'} 'off'
MaskIconOpaque	Set the transparency of the icon. Set by the Icon Transparency option on the Icon & Ports pane of the Mask Editor dialog box.	{'opaque'} 'transparent' 'opaque-with-ports'
MaskIconRotate	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the Icon Rotation option on the Icon & Ports pane of the Mask Editor dialog box.	'on' {'off'}
MaskIconUnits	Set the units for the drawing commands. Set by the Icon Units option on the Icon & Ports pane of the Mask Editor dialog box.	'pixel' {'autoscale'} 'normalized'
MaskInitialization	Initialization commands. Set by the Initialization commands field on the Initialization pane of the Mask Editor dialog box.	MATLAB command {''}
MaskNames	Cell array of mask dialog parameter names. Set inside the Variable column in the Parameters pane of the Mask Editor dialog box.	matrix {'[]'}

Parameter	Description/Prompt	Values
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the Port Rotation area on the Icon & Ports pane of the Mask Editor dialog box. For more information, see “Adjust Visual Presentation to Improve Model Readability”.	{'default'} 'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	cell array of character vectors {'[]'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	character vector {''}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {''}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'} 'on' 'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the Allow library block to modify its contents check box on the Initialization pane of the Mask Editor dialog box.	'on' {'off'}

Parameter	Description/Prompt	Values
MaskStyles	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the Type column in the Parameters pane of the Mask Editor dialog box.	cell array { ' [] ' }
MaskStyleString	Comma-separated version of MaskStyles.	character vector { ' ' }
MaskTabNameString	For internal use only.	
MaskTabNames	For internal use only.	
MaskToolTipsDisplay	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of 'on' or 'off' values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by MaskNames.	cell array of 'on' and 'off' {}
MaskToolTipString	Comma-delimited version of MaskToolTipsDisplay.	character vector { ' ' }
MaskTunableValues	Allows the changing of mask dialog values during simulation. Set by the Tunable column in the Parameters pane of the Mask Editor dialog box.	cell array of character vectors { ' [] ' }
MaskTunableValueString	Comma-delimited character vector version of MaskTunableValues.	delimited character vector { ' ' }
MaskType	Mask type. Set by the Mask type field on the Documentation pane of the Mask Editor dialog box.	character vector { 'Stateflow' }

Parameter	Description/Prompt	Values
MaskValues	Dialog parameter values.	cell array { ' [] ' }
MaskValueString	Delimited character vector version of MaskValues.	delimited character vector { ' ' }
MaskVarAliases	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's MaskValues parameter.	cell array { ' [] ' }
MaskVarAliasString	For internal use only.	
MaskVariables	List of the dialog parameters' variables (see below). Set inside the Dialog parameters area on the Parameters pane of the Mask Editor dialog box.	character vector { ' ' }
MaskVisibilities	Specifies visibility of parameters. Set with the Show parameter check box in the Options for selected parameter area on the Parameters pane of the Mask Editor dialog box.	matrix { ' [] ' }
MaskVisibilityString	Delimited character vector version of MaskVisibilities.	character vector { ' ' }
MaskWSVariables	List of the variables defined in the mask workspace (read only).	matrix { ' [] ' }

See *Control Masks Programmatically*, for more information on setting the mask parameters from the MATLAB command line.

Fixed-Point Tool

- “Fixed-Point Tool Parameters and Dialog Box” on page 7-2
- “Advanced Settings” on page 7-20

Fixed-Point Tool Parameters and Dialog Box

The Fixed-Point Tool includes the following components:

- **Main** toolbar
- **Model Hierarchy** pane
- **Contents** pane
- **Dialog** pane

Main Toolbar

The Fixed-Point Tool's main toolbar appears near the top of the Fixed-Point Tool window under the Fixed-Point Tool's menu.

The toolbar contains the following buttons that execute commonly used Fixed-Point Tool commands:

Button	Usage
	Open the Fixed-Point Advisor to prepare the model for conversion to fixed point.
	Simulate a model and store the run results.
	Pause a simulation.
	Stop a simulation.
	Analyze model and store derived minimum and maximum results.
	Propose data types. Propose fraction lengths for specified word lengths or propose word lengths for specified fraction lengths.
	Apply accepted data types.
	Compare selected runs.
	Create a difference plot for the selected signals.
	Plot the selected signal.

Button	Usage
	Create a histogram plot for the selected signal.

The toolbar also contains the **Show** option:

The **Show** option specifies the type of results to display in the **Contents** pane. The **Contents** pane displays information only after you simulate a system or propose fraction lengths. If there are no results that satisfy a particular filter option, the list will be blank.

Show Option	Result
All results	Displays all results for the selected tree node.
Signal Logging results	For the selected tree node, displays blocks whose output ports have logged signal data. The Fixed-Point tool marks these blocks with the logged signal icon  . Note You can plot simulation results associated with logged signal data using the Simulation Data Inspector.
Min/Max results	For the selected tree node, displays blocks that record design Min/Max, simulation Min/Max, and overflow data. Prerequisites: Fixed-point instrumentation mode should not be set to <code>Force Off</code> .
Overflows	For the selected tree node, displays blocks that have non-zero overflows recorded. If a block has its Saturate on integer overflow option selected, overflow information appears in the Saturations column, otherwise it appears in the OverflowWraps column.

Show Option	Result
<p>Conflicts with proposed data types</p>	<p>For the selected tree node, displays results that have potential data typing or scaling issues.</p> <p>Prerequisites: This information is available only after you propose data types.</p> <p>The Fixed-Point Tool marks these results with a yellow or red icon, as shown here:</p> <div data-bbox="581 574 1347 795" style="border: 1px solid black; padding: 5px;"> <p> The proposed data type poses potential issues for this object. Open the Result Details tab to review these issues.</p> <p> The proposed data type will introduce errors if applied to this object. Open the Result Details tab for details about how to resolve these issues.</p> </div>
<p>Groups that must share the same data type</p>	<p>For the selected tree node, displays blocks that must share the same data type because of data type propagation rules.</p> <p>Prerequisites: This information is available only after you propose fraction lengths.</p> <p>The Fixed-Point Tool allocates an identification tag to blocks that must share the same data type. This identification tag is displayed in the DTGroup column as follows:</p> <ul style="list-style-type: none"> • If the selected tree node is the model root <p>All results for the model are listed. The DTGroup column is sorted by default so that you can easily view all blocks in a group.</p> • If the selected tree node is a subsystem <p>The identification tags have a suffix that indicates the total number of results in each group. For example, G2 (2) means group G2 has 2 members. This information enables you to see how many members of a group belong to the selected subsystem and which groups share data types across subsystem boundaries.</p>

Model Hierarchy Pane

The **Model Hierarchy** pane displays a tree-structured view of the Simulink model hierarchy. The first node in the pane represents a Simulink model. Expanding the root node displays subnodes that represent the model's subsystems, MATLAB Function blocks, Stateflow charts, and referenced models.

The Fixed-Point Tool's **Contents** pane displays elements that comprise the object selected in the **Model Hierarchy** pane. The **Dialog** pane provides parameters for specifying the selected object's data type override and fixed-point instrumentation mode. You can also specify an object's data type override and fixed-point instrumentation mode by right-clicking on the object. The **Model Hierarchy** pane indicates the value of these parameters by displaying the following abbreviations next to the object name:

Abbreviation	Parameter Value
Fixed-point instrumentation mode	
mno	Minimums, maximums and overflows
o	Overflows only
fo	Force off
Data type override	
scl	Scaled double
dbl	Double
sgl	Single
off	Off

Contents Pane

The **Contents** pane displays a tabular view of objects that log fixed-point data in the system or subsystem selected in the **Model Hierarchy** pane. The table rows correspond to model objects, such as blocks, block parameters, and Stateflow data. The table columns correspond to attributes of those objects, such as the data type, design minimum and maximum values, and simulation minimum and maximum values.

The **Contents** pane displays information only after you simulate a system, analyze the model to derive minimum and maximum values, or propose fraction lengths.

You can control which of the following columns the Fixed-Point Tool displays in this pane. For more information, see “Customizing the Contents Pane View” on page 7-8.

Column Label	Description
Accept	Check box that enables you to selectively accept the Fixed-Point Tool's data type proposal.
CompiledDesignMax	Compile-time information for DesignMax .
CompiledDesignMin	Compile-time information for DesignMin .
CompiledDT	Compile-time data type. This data type appears on the signal line in <code>sfix</code> format. See “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).
DerivedMax	Maximum value the Fixed-Point tool derives for this signal from design ranges specified for blocks.
DerivedMin	Minimum value the Fixed-Point tool derives for this signal from design ranges specified for blocks.
DesignMax	Maximum value the block specifies in its parameter dialog box, for example, the value of its Output maximum parameter.
DesignMin	Minimum value the block specifies in its parameter dialog box, for example, the value of its Output minimum parameter.
DivByZero	Number of divide-by-zero instances that occur during simulation.
DTGroup	Identification tag associated with objects that share data types.
InitValueMax	<p>Maximum initial value for a signal or parameter. Some model objects provide parameters that allow you to specify the initial values of their signals. For example, the Constant block includes a Constant value that initializes the block output signal.</p> <hr/> <p>Note The Fixed-Point Tool uses this parameter when it proposes data types.</p>

Column Label	Description
InitValueMin	<p>Minimum initial value for a signal or parameter. Some model objects provide parameters that allow you to specify the initial values of their signals. For example, the Constant block includes a Constant value that initializes the block output signal.</p> <hr/> <p>Note The Fixed-Point Tool uses this parameter when it proposes data types.</p>
LogSignal	<p>Check box that allows you to enable or disable signal logging for an object.</p>
ModelRequiredMin	<p>Minimum value of a parameter used during simulation. For example, the n-D Lookup Table block uses the Breakpoints and Table data parameters to perform its lookup operation and generate output. In this example, the block uses more than one parameter so the Fixed-Point Tool sets ModelRequiredMin to the minimum of the minimum values of all these parameters.</p> <hr/> <p>Note The Fixed-Point Tool uses this parameter when it proposes data types.</p>
ModelRequiredMax	<p>Maximum value of a parameter used during simulation. For example, the n-D Lookup Table block uses the Breakpoints and Table data parameters to perform its lookup operation and generate output. In this example, the block uses more than one parameter so the Fixed-Point Tool sets ModelRequiredMax to the maximum of the maximum values of all these parameters.</p> <hr/> <p>Note The Fixed-Point Tool uses this parameter when it proposes data types.</p>
Name	<p>Identifies path and name of block.</p>
OverflowWraps	<p>Number of overflows that wrap during simulation.</p>
ProposedDT	<p>Data type that the Fixed-Point Tool proposes.</p>

Column Label	Description
ProposedMax	Maximum value that results from the data type the Fixed-Point Tool proposes.
ProposedMin	Minimum value that results from the data type the Fixed-Point Tool proposes.
Run	Indicates the run name for these results.
Saturations	Number of overflows that saturate during simulation.
SimDT	Data type the block uses during simulation. This data type appears on the signal line in <code>sfix</code> format. See “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).
SimMax	Maximum value that occurs during simulation.
SimMin	Minimum value that occurs during simulation.
SpecifiedDT	Data type the block specifies in its parameter dialog box, for example, the value of its Output data type parameter.

Customizing the Contents Pane View

You can customize the **Contents** pane in the following ways:

- “Using Column Views” on page 7-8
- “Changing Column Order and Width” on page 7-10
- “Sorting by Columns” on page 7-10

Using Column Views

The Fixed-Point Tool provides the following standard Column Views:

View Name	Columns Provided	When Does the Fixed-Point Tool Display this View?
Simulation View (default)	Name, Run, CompiledDT, SpecifiedDT, SimMin, SimMax, DesignMin, DesignMax, OverflowWraps, Saturations	After a simulating minimum and maximum values.

View Name	Columns Provided	When Does the Fixed-Point Tool Display this View?
Automatic Data Typing View	Name, Run, CompiledDT, CompiledDesignMax, CompiledDesignMin, Accept, ProposedDT, SpecifiedDT, DesignMin, DesignMax, DerivedMin, DerivedMax, SimMin, SimMax, OverflowWraps, Saturations, ProposedMin, ProposedMax	After proposing data types if proposal is based on simulation, derived, and design min/max.
Automatic Data Typing With Simulation Min/Max View	Name, Run, CompiledDT, Accept, ProposedDT, SpecifiedDT, SimMin, SimMax, DesignMin, DesignMax, OverflowWraps, Saturations, ProposedMin, ProposedMax	After proposing data types if the proposal is based on simulation and design min/max.
Automatic Data Typing With Derived Min/Max View	Name, Run, CompiledDesignMax, CompiledDesignMin, Accept, ProposedDT, SpecifiedDT, DerivedMin, DerivedMax, ProposedMin, ProposedMax	After proposing data types if the proposal is based on design min/max and/or derived min/max.
Data Collection View	Name, Run, CompiledDT, SpecifiedDT, DerivedMin, DerivedMax, SimMin, SimMax, OverflowWraps, Saturations	After simulating or deriving minimum and maximum values if the results have simulation min/max, derived min/max, and design min/max.
Derived Min/Max View	Name, Run, CompiledDesignMax, CompiledDesignMin, DerivedMin, DerivedMax	After deriving minimum and maximum values.

By selecting **Show Details**, you can:

- Customize the standard column views

- Create your own column views
- Export and import column views saved in MAT-files, which you can share with other users
- Reset views to factory settings

If you upgrade to a new release of Simulink, and the column views available in the Fixed-Point Tool do not match the views described in the documentation, reset your views to factory settings. When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future.

You can prevent the Fixed-Point Tool from automatically changing the column view of the contents pane by selecting **View > Lock Column View** in the Fixed-Point Tool menu. For more information on controlling views, see “Customize Model Explorer Views”.

Changing Column Order and Width

You can alter the order and width of columns that appear in the **Contents** pane as follows:

- To move a column, click and drag the head of a column to a new location among the column headers.
- To make a column wider or narrower, click and drag the right edge of a column header. If you double-click the right edge of a column header, the column width changes to fit its contents.

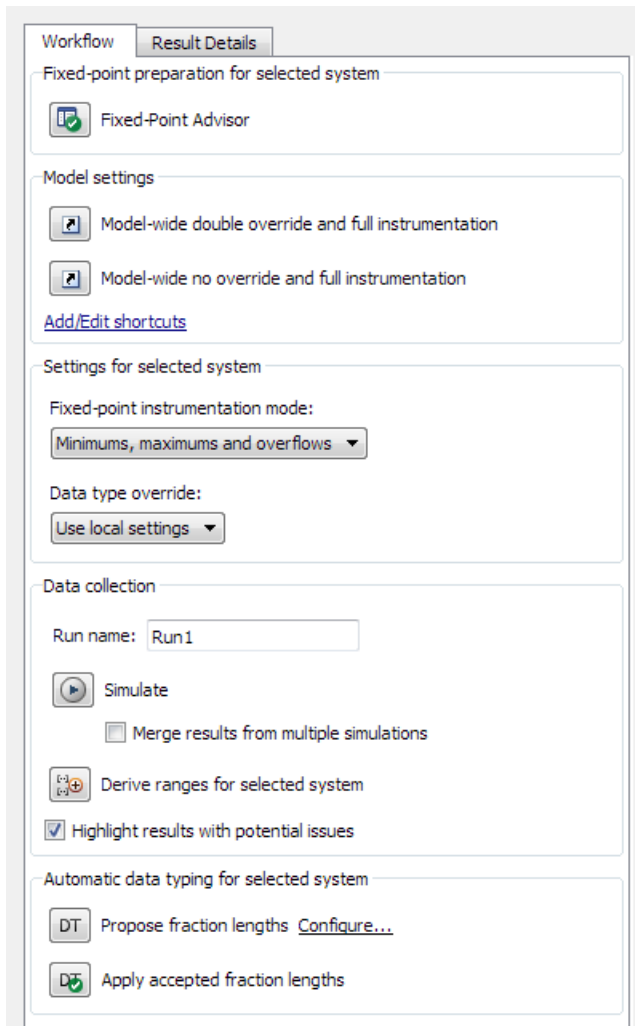

Sorting by Columns

By default, the **Contents** pane displays its contents in ascending order of the **Name** column. You can alter the order in which the **Contents** pane displays its rows as follows:

- To sort all the rows in ascending order of another column, click the head of that column.
- To change the order from ascending to descending, simply click again on the head of that column.

Dialog Pane

Use the Dialog pane to view and change properties associated with the system under design.

The Dialog pane includes the following components:

Component	Description
System under design	Displays the system under design for conversion. You can change the selected system by clicking Change .

Component	Description
Fixed-point preparation	Contains the Fixed-Point Advisor button. Use this button to open the Fixed-Point Advisor to guide you through the tasks to prepare your floating-point model for conversion to fixed point. For more information, see “Fixed-Point Advisor” on page 7-12.
Configure model settings	Contains default configurations that set up run parameters, such as the run name and data type override settings, by clicking a button. For more information, see “Configure model settings” on page 7-13.
Range collection	Contains controls to collect simulation or derived minimum and maximum data for your model.
Automatic data typing	Contains controls to propose and, optionally, accept data type proposals.
Result Details tab	Use this tab to view data type information about the object selected in the Contents pane.

Tips

From the Fixed-Point Tool **View** menu, you can customize the layout of the **Dialog** pane. Select:

- **Show Fixed-Point Preparation** to show/hide the **Fixed-Point Advisor** button. By default, the Fixed-Point Tool displays this button.
- **Show Dialog View** to show/hide the **Dialog** pane. By default, the Fixed-Point Tool displays this pane.
- **Settings for selected system** to show/hide the **Settings for selected system** pane. By default, the Fixed-Point Tool displays this pane.

Fixed-Point Advisor

Open the Fixed-Point Advisor to guide you through the tasks to prepare a floating-point model for conversion to fixed point. Use the Fixed-Point Advisor if your model contains blocks that do not support fixed-point data types.

Configure model settings

Use the configurations to set up model-wide data type override and instrumentation settings prior to simulation. The Fixed-Point Tool provides:

- Frequently-used factory default configurations
- The ability to add and edit custom configurations

Note The factory default configurations apply to the whole model. You cannot use these shortcuts to configure subsystems.

Factory Defaults

Factory Default Configuration	Description
<p>Range collection using double override</p>	<p>Use this configuration to observe ideal numeric behavior of the model and collect ranges for data type proposals.</p> <p>This configuration sets:</p> <ul style="list-style-type: none"> • Run name to DoubleOverride • Fixed-point instrumentation mode to Minimums, maximums and overflows • Data type override to Double • Data type override applies to to All numeric types <p>By default, a button for this configuration appears in the Configure model settings pane.</p>

Factory Default Configuration	Description
Range collection with specified data types	<p>Use this configuration to collect ranges of actual model and to validate current behavior.</p> <p>This configuration sets:</p> <ul style="list-style-type: none"> • Run name to NoOverride • Fixed-point instrumentation mode to Minimums, maximums and overflows • Data type override to Use local settings <p>By default, a button for this shortcut appears in the Configure model settings pane.</p>
Remove overrides and disable range collection	<p>Use this configuration to cleanup settings after finishing fixed-point conversion and to restore maximum simulation speed.</p> <p>This configuration sets:</p> <ul style="list-style-type: none"> • Fixed-point instrumentation mode to Off • Data type override to Use local settings <p>By default, a button for this shortcut appears in the Configure model settings pane.</p>

Advanced settings

Use **Advanced settings** to add new configurations or edit existing user-defined configurations.

Run name

Specifies the run name

If you use a default configuration to set up a run, the Fixed-Point Tool uses the run name associated with this configuration. You can override the run name by entering a new name in this field.

Tips

- To store data for multiple runs, provide a different run name for each run. Running two simulations with the same run name overwrites the original run unless you select **Merge results from multiple simulations**.
- You can edit the run name in the Contents pane **Run** column.

For more information, see “Run Management” (Fixed-Point Designer).

Simulate

Simulates model and stores results.

Action

Simulates the model and stores the results with the run name specified in **Run name**. The Fixed-Point Tool displays the run name in the **Run** column of the **Contents** pane.

Merge instrumentation results from multiple simulations

Control how simulation results are stored

Settings

Default: Off

On

Merges new simulation minimum and maximum results with existing simulation results in the run specified by the run name parameter. Allows you to collect complete range information from multiple test benches. Does not merge signal logging results.

Off

Clears all existing simulation results from the run specified by the run name parameter before displaying new simulation results.

Command-Line Alternative

Parameter: 'MinMaxOverflowArchiveMode'

Type: string

Value: 'Overwrite' | 'Merge'

Default: 'Overwrite'

Tip

Select this parameter to log simulation minimum and maximum values captured over multiple simulations. For more information, see “Propose Data Types For Merged Simulation Ranges” (Fixed-Point Designer).

Derive ranges for selected system

Derive minimum and maximum values for signals for the selected system.

The Fixed-Point Tool analyzes the selected system to compute derived minimum and maximum values based on design minimum and maximum values specified on blocks. For example, using the **Output minimum** and **Output maximum** for block outputs.

Action

Analyzes the selected system to compute derived minimum and maximum information based on the design minimum and maximum values specified on blocks.

By default, the Fixed-Point Tool displays the `Derived Min/Max View` with the following information in the **Contents** pane.

Command-Line Alternative

No command line alternative available.

Dependencies

Range analysis:

- Requires a Fixed-Point Designer license.

Propose

Signedness

Select whether you want The Fixed-Point Tool to propose signedness for results in your model. The Fixed-Point Tool proposes signedness based on collected range data and block constraints. By default, the **Signedness** check box is selected.

When the check box is selected, signals that are always strictly positive get an unsigned data type proposal. If you clear the check box, the Fixed-Point Tool proposes a signed data type for all results that currently specify a floating-point or an inherited output data type unless other constraints are present. If a result specifies a fixed-point output data type, the Fixed-Point Tool will propose a data type with the same signedness as the currently specified data type unless other constraints are present.

Word length or fraction length

Select whether you want the Fixed-Point Tool to propose word lengths or fraction lengths for the objects in your system.

- If you select **Word length**, the Fixed-Point Tool proposes a data type with the specified fraction length and the minimum word length to avoid overflows.
- If you select **Fraction length**, the Fixed-Point Tool proposes a data type with the specified word length and best-precision fraction length while avoiding overflows.

If a result currently specifies a fixed-point data type, that information will be used in the proposal. If a result specifies a floating-point or inherited output data type, and the **Inherited** and **Floating point** check boxes are selected, the Fixed-Point Tool uses the settings specified under **Automatic data typing** to make a data type proposal.

Propose for

Inherited

Propose data types for results that specify one of the inherited output data types.

Floating-point

Propose data types for results that specify floating-point output data types.

Default fraction length

Specify the default fraction length for objects in your model. The Fixed-Point Tool proposes a data type with the specified fraction length and the minimum word length that avoids overflows.

Command-Line Alternative

No command line alternative available.

Default word length

Specify the default word length for objects in your model. The Fixed-Point Tool will propose best-precision fraction lengths based on the specified default word length.

Command-Line Alternative

No command line alternative available.

When proposing types use

Specify the types of ranges to use for data type proposals.

Design and derived ranges

The Fixed-Point Tool uses the design ranges in conjunction with derived ranges to propose data types. Design ranges take precedence over derived ranges.

Design and simulation ranges

The Fixed-Point Tool uses the design ranges in conjunction with collected simulation ranges to propose data types. Design ranges take precedence over simulation ranges.

The **Safety margin for simulation min/max (%)** parameter specifies a range that differs from that defined by the simulation range. For more information, see “Safety margin for simulation min/max (%)” on page 7-18

All collected ranges

The Fixed-Point Tool uses design ranges in addition to derived and simulation ranges to propose data types.

Design minimum and maximum values take precedence over simulation and derived ranges.

Command-Line Alternative

No command line alternative available.

Safety margin for simulation min/max (%)

Specify safety factor for simulation minimum and maximum values.

Settings

Default: 0

The simulation minimum and maximum values are adjusted by the percentage designated by this parameter, allowing you to specify a range different from that obtained from the simulation run. The specified safety margin must be a real number greater than -100. For example, a value of 55 specifies that a range *at least* 55 percent larger is desired. A value of -15 specifies that a range *up to* 15 percent smaller is acceptable.

Dependencies

Before performing automatic data typing, you must specify design minimum and maximum values or run a simulation to collect simulation minimum and maximum data, or collect derived minimum and maximum values.

Command-Line Alternative

No command line alternative available.

Advanced Settings

In this section...
“Advanced Settings Overview” on page 7-20
“Fixed-point instrumentation mode” on page 7-20
“Data type override” on page 7-21
“Data type override applies to” on page 7-23
“Name of shortcut” on page 7-25
“Allow modification of fixed-point instrumentation settings” on page 7-25
“Allow modification of data type override settings” on page 7-26
“Allow modification of run name” on page 7-27
“Run name” on page 7-27
“Capture system settings” on page 7-27
“Fixed-point instrumentation mode” on page 7-27
“Data type override” on page 7-28
“Data type override applies to” on page 7-29

Advanced Settings Overview

Use the Advanced Settings dialog to control the fixed-point instrumentation mode, and data type override settings. You can also use the Advanced Settings dialog to add or edit user-defined configurations. You cannot modify the factory default configurations. If you add a new configuration and want it to appear as a button on the Fixed-Point Tool **Configure model settings** pane, use the controls in the **Shortcuts** tab.

Fixed-point instrumentation mode

Control which objects log minimum, maximum and overflow data during simulation.

Settings

Default: Use local settings

Use local settings

Logs data according to the value of this parameter set for each subsystem. Otherwise, settings for parent systems always override those of child systems.

Minimums, maximums and overflows

Logs minimum value, maximum value, and overflow data for all blocks in the current system or subsystem during simulation.

Overflows only

Logs only overflow data for all blocks in the current system or subsystem.

Force off

Does not log data for any block in the current system or subsystem. Use this selection to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

Tips

- You cannot change the instrumentation mode for linked subsystems or referenced models.

Dependencies

The value of this parameter for parent systems controls min/max logging for all child subsystems, unless `Use local settings` is selected.

Command-Line Alternative

Parameter: 'MinMaxOverflowLogging'

Type: string

Value: 'UseLocalSettings' | 'MinMaxAndOverflow' | 'OverflowOnly' | 'ForceOff'

Default: 'UseLocalSettings'

Data type override

Control data type override of objects that allow you to specify data types in their dialog boxes.

Settings

Default: Use local settings

The value of this parameter for parent systems controls data type override for all child subsystems, unless `Use local settings` is selected.

`Use local settings`

Overrides data types according to the setting of this parameter for each subsystem.

`Scaled double`

Overrides the data type of all blocks in the current system and subsystem with doubles; however, the scaling and bias specified in the dialog box of each block is maintained.

`Double`

Overrides the output data type of all blocks in the current system or subsystem with doubles. The overridden values have no scaling or bias.

`Single`

Overrides the output data type of all blocks in the current system or subsystem with singles. The overridden values have no scaling or bias.

`Off`

No data type override is performed on any block in the current system or subsystem. The settings on the blocks are used.

Tips

- Set this parameter to `Double` or `Single` and the **Data type override applies to** parameter to `All numeric types` to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.
- You cannot change the **Data type override** setting on linked subsystems or referenced models.
- Data type override never applies to `boolean` data types.
- When you set the **Data type override** parameter of a parent system to `Double`, `Single`, `Scaled double` or `Off`, this setting also applies to all child subsystems and you cannot change the data type override setting for these child subsystems. When the **Data type override** parameter of a parent system is `Use local settings`, you can set the **Data type override** parameter for individual children.
- Use this parameter with the **Data type override applies to** parameter. The following table details how these two parameters affect the data types in your model.

Fixed-Point Tool Settings		Block Local Settings	
Data type override	Data type override applies to	Floating-point types	Fixed-point types
Use local settings/Off	N/A	Unchanged	Unchanged
Double	All numeric types	Double	Double
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Double
Single	All numeric types	Single	Single
	Floating-point	Single	Unchanged
	Fixed-point	Unchanged	Single
Scaled double	All numeric types	Double	Scaled double equivalent of fixed-point type
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Scaled double equivalent of fixed-point type

Dependencies

- The following Simulink blocks allow you to set data types in their block masks, but ignore the **Data type override** setting:
 - Probe
 - Trigger
 - Width

Command-Line Alternative

Parameter: 'DataTypeOverride'

Type: string

Value: 'UseLocalSettings' | 'ScaledDouble' | 'Double' | 'Single' | 'Off'

Default: 'UseLocalSettings'

Data type override applies to

Specifies which data types the Fixed-Point Tool overrides

Settings

Default: All numeric types

All numeric types

Data type override applies to all numeric types, floating-point and fixed-point. It does not apply to `boolean` or enumerated data types.

Floating-point

Data type override applies only to floating-point data types, that is, `double` and `single`.

Fixed-point

Data type override applies only to fixed-point data types, for example, `uint8`, `fixdt`.

Tips

- Use this parameter with the **Data type override** parameter.
- Data type override never applies to `boolean` or enumerated data types or to buses.
- When you set the **Data type override** parameter of a parent system to `Double`, `Single`, `Scaled double` or `Off`, this setting also applies to all child subsystems and you cannot change the data type override setting for these child subsystems. When the **Data type override** parameter of a parent system is `Use local setting`, you can set the **Data type override** parameter for individual children.
- The following table details how these two parameters affect the data types in your model.

Fixed-Point Tool Settings		Block Local Settings	
Data type override	Data type override applies to	Floating-point types	Fixed-point types
Use local settings/Off	N/A	Unchanged	Unchanged
Double	All numeric types	Double	Double
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Double
Single	All numeric types	Single	Single
	Floating-point	Single	Unchanged
	Fixed-point	Unchanged	Single

Fixed-Point Tool Settings		Block Local Settings	
Data type override	Data type override applies to	Floating-point types	Fixed-point types
Scaled double	All numeric types	Double	Scaled double equivalent of fixed-point type
	Floating-point	Double	Unchanged
	Fixed-point	Unchanged	Scaled double equivalent of fixed-point type

Dependencies

This parameter is enabled only when **Data type override** is set to Scaled double, Double or Single.

Command-Line Alternative

Parameter: 'DataTypeOverrideAppliesTo'

Type: string

Value: 'AllNumericTypes' | 'Floating-point' | 'Fixed-point'

Default: 'AllNumericTypes'

Name of shortcut

Enter a unique name for your shortcut. By default, the Fixed-Point Tool uses this name as the **Run name** for this shortcut.

If the shortcut name already exists, the new settings overwrite the existing settings.

See Also

- “Run Management” (Fixed-Point Designer)

Allow modification of fixed-point instrumentation settings

Select whether to change the model fixed-point instrumentation settings when you apply this shortcut to the model.

Settings

Default: On

On

When you apply this shortcut to the model, changes the fixed-point instrumentation settings of the model and its subsystems to the setting defined in this shortcut.

Off

Does not change the fixed-point instrumentation settings when you apply this shortcut to the model.

Tip

If you want to control data type override settings without altering the fixed-point instrumentation settings on your model, clear this option.

See Also

- “Run Management” (Fixed-Point Designer)

Allow modification of data type override settings

Select whether to change the model data type override settings when you apply this shortcut to the model

Settings

Default: On

On

When you apply this shortcut to the model, changes the data type override settings of the model and its subsystems to the settings defined in this shortcut .

Off

Does not change the fixed-point instrumentation settings when you apply this shortcut to the model.

Allow modification of run name

Select whether to change the run name on the model when you apply this shortcut to the model

Settings

Default: On

On

Changes the run name to the setting defined in this shortcut when you apply this shortcut to the model.

Off

Does not change the run name when you apply this shortcut to the model.

Run name

Specify the run name to use when you apply this shortcut.

By default, the run name uses the name of the shortcut. Run names are case sensitive.

Dependency

Allow modification of run name enables this parameter.

Capture system settings

Copy the model and subsystem fixed-point instrumentation mode and data type override settings into the Shortcut editor.

Fixed-point instrumentation mode

Control which objects in the shortcut editor log minimum, maximum and overflow data during simulation.

This information is stored in the shortcut. To use the current model setting, click **Capture system settings**.

Settings

Default: Same as model setting

Use local settings

Logs data according to the value of this parameter set for each subsystem. Otherwise, settings for parent systems always override those of child systems.

Minimums, maximums and overflows

Logs minimum value, maximum value, and overflow data for all blocks in the current system or subsystem during simulation.

Overflows only

Logs only overflow data for all blocks in the current system or subsystem.

Force off

Does not log data for any block in the current system or subsystem. Use this selection to work with models containing fixed-point enabled blocks if you do not have a Fixed-Point Designer license.

Dependency

Allow modification of fixed-point instrumentation settings enables this parameter.

Data type override

Control data type override of objects that allow you to specify data types in their dialog boxes.

This information is stored in the shortcut. To use the current model settings, click **Capture system settings**.

Settings

Default: Same as model

The value of this parameter for parent systems controls data type override for all child subsystems, unless Use local settings is selected.

Use local settings

Overrides data types according to the setting of this parameter for each subsystem.

Scaled double

Overrides the data type of all blocks in the current system and subsystem with doubles; however, the scaling and bias specified in the dialog box of each block is maintained.

Double

Overrides the output data type of all blocks in the current system or subsystem with doubles. The overridden values have no scaling or bias.

Single

Overrides the output data type of all blocks in the current system or subsystem with singles. The overridden values have no scaling or bias.

Off

No data type override is performed on any block in the current system or subsystem. The settings on the blocks are used.

Dependency

Allow modification of data type override settings enables this parameter.

Data type override applies to

Specifies which data types to override when you apply this shortcut.

This information is stored in the shortcut. To use the current model setting, click **Capture system settings**.

Settings

Default: All numeric types

All numeric types

Data type override applies to all numeric types, floating-point and fixed-point. It does not apply to boolean or enumerated data types.

Floating-point

Data type override applies only to floating-point data types, that is, double and single.

Fixed-point

Data type override applies only to fixed-point data types, for example, uint8, fixdt.

Dependency

Allow modification of data type override settings enables this parameter.

Simulink Check Overview

Use the Simulink Model Advisor checks to configure your model for simulation.

See Also

- “Run Model Checks”
- “Simulink Coder Checks” (Simulink Coder)
- “Simulink Check Checks” (Simulink Check)

Migrating to Simplified Initialization Mode Overview

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

Use the Model Advisor checks in **Migrating to Simplified Initialization Mode** to help migrate your model to simplified initialization mode.

See Also

- “Simplified Initialization Mode”
- “Classic Initialization Mode”
- “Underspecified initialization detection”
- “Check usage of Merge blocks” on page 8-32
- “Check usage of Outport blocks” on page 8-35
- “Check usage of Discrete-Time Integrator blocks” on page 8-47
- “Check model settings for migration to simplified initialization mode” on page 8-48

Identify unconnected lines, input ports, and output ports

Check ID: `mathworks.design.UnconnectedLinesPorts`

Check for unconnected lines or ports.

Description

This check lists unconnected lines or ports. These can have difficulty propagating signal attributes such as data type, sample time, and dimensions.

Note Ports connected to ground/terminator blocks will pass this test.

Results and Recommended Actions

Condition	Recommended Action
Lines, input ports, or output ports are unconnected.	Connect the signals. Double-click the list of unconnected items to locate failure.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

Use the `PortConnectivity` command to obtain an array of structures describing block input or output ports.

See Also

“Common Block Properties” on page 6-109 for information on the `PortConnectivity` command.

“What Is a Model Advisor Exclusion?” (Simulink Check)

Check root model Inport block specifications

Check ID: `mathworks.design.RootInportSpec`

Check that root model Inport blocks fully define dimensions, sample time, and data type.

Description

Using root model Inport blocks that do not fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink software back-propagates dimensions, sample times and data types from downstream blocks unless you explicitly assign them values.

Results and Recommended Actions

Condition	Recommended Action
Root-level Inport blocks have undefined attributes.	Fully define the attributes of the root-level Inport blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to `Ensure sample time independent`
- For export-function models, *inherited sample time* is not flagged.

See Also

- “About Data Types in Simulink”.
- “Determine Output Signal Dimensions”.
- “Specify Sample Time”.
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check optimization settings

Check ID: `mathworks.design.OptimizationSettings`

Check for optimizations that can lead to non-optimal code generation and simulation.

Description

This check reviews the status of optimizations that can improve code efficiency and simulation time.

Results and Recommended Actions

Condition	Recommended Action
The specified optimizations are off.	<p>Select the following optimization check boxes on the Optimization pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Remove root level I/O zero initialization” • “Remove internal data zero initialization” <p>Select the following optimization check boxes on the Optimization > Signals and Parameters pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Inline invariant signals” (only if you have a Simulink Coder license) <p>Select the following optimization check boxes in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • “Block reduction” • “Conditional input branch execution” • “Implement logic signals as Boolean data (vs. double)” • “Use memset to initialize floats and doubles to 0.0” • “Remove code from floating-point to integer conversions that wraps out-of-range values” (only if you have a Simulink Coder license) • “Signal storage reuse” • “Enable local block outputs” • “Reuse local block outputs” • “Eliminate superfluous local variables (Expression folding)” <p>Select the following optimization check boxes on the Optimization > Stateflow pane in the Configuration Parameters dialog box:</p> <hr/> <p>Note Model Advisor checks these parameters only if there is a Stateflow chart in the model.</p> <hr/> <ul style="list-style-type: none"> • “Use bitsets for storing state configuration”

Condition	Recommended Action
	<ul style="list-style-type: none"> • “Use bitsets for storing Boolean data”
“Application lifespan (days)” is set as infinite. This could lead to expensive 64-bit counter usage.	Choose a stop time if this is not intended.
The specified diagnostics, which can increase the time it takes to simulate your model, are set to warning or error.	Select none for: <ul style="list-style-type: none"> • Solver data inconsistency • Array bounds exceeded • Diagnostics > Data Validity > Simulation range checking
The specified Embedded Coder parameters are off.	If you have an Embedded Coder license and you are using an ERT-based system target file: <ul style="list-style-type: none"> • Select Single output/update function. For details, see “Single output/update function” (Simulink Coder). • Select Ignore test point signals. For details, see “Ignore test point signals” (Simulink Coder). • Set Optimization > Signals and Parameters > Pass reusable subsystem outputs as to <code>Individual arguments</code>. For details, see “Pass reusable subsystem outputs as”.

Tips

If the system contains Model blocks and the referenced model is in Accelerator mode, simulating the model requires generating and compiling code.

See Also

- “Optimization Pane: General”.

Check diagnostic settings ignored during accelerated model reference simulation

Check ID: `mathworks.design.ModelRefSIMConfigCompliance`

Checks for referenced models for which Simulink changes configuration parameter settings during accelerated simulation.

Description

For models referenced in accelerator mode, Simulink ignores the settings of the following configuration parameters that you set to a value other than `None`.

- **Array bounds exceeded**
- **Diagnostics > Data Validity > Inf or NaN block output**
- **Diagnostics > Data Validity > Division by singular matrix**
- **Diagnostics > Data Validity > Wrap on overflow**

Also, for models referenced in accelerator mode, Simulink ignores the following **Configuration Parameters > Diagnostics > Data Validity > Data Store Memory block** parameters if you set them to a value other than `Disable all`. For details, see “Data Store Diagnostics”.

- **Detect read before write**
- **Detect write after read**
- **Detect write after write**

Results and Recommended Actions

Condition	Recommended Action
You want to see the results of running the identified diagnostics with settings to produce warnings or errors.	Simulate the model in Normal mode and resolve diagnostic warnings or errors.

Check for parameter tunability information ignored for referenced models

Check ID: `mathworks.design.ParamTunabilityIgnored`

Checks if parameter tunability information is included in the Model Parameter Configuration dialog box.

Description

Simulink software ignores tunability information specified in the Model Parameter Configuration dialog box. This check identifies those models containing parameter

tunability information that Simulink software will ignore if the model is referenced by other models.

Results and Recommended Actions

Condition	Recommended Action
Model contains ignored parameter tunability information.	Click the links to convert to equivalent Simulink parameter objects in the MATLAB workspace.

See Also

“Block Parameter Representation in the Generated Code” (Simulink Coder).

Check for implicit signal resolution

Check ID: `mathworks.design.ImplicitSignalResolution`

Identify models that attempt to resolve named signals and states to `Simulink.Signal` objects.

Description

Requiring Simulink software to resolve all named signals and states is inefficient and slows incremental code generation and model reference. This check identifies those signals and states for which you may turn off implicit signal resolution and enforce resolution.

Results and Recommended Actions

Condition	Recommended Action
Not all signals and states are resolved.	Turn off implicit signal resolution and enforce resolution for each signal and state that does resolve.

See Also

“Resolve Signal Objects for Output Data”.

Check for optimal bus virtuality

Check ID: `mathworks.design.OptBusVirtuality`

Identify virtual buses that could be made nonvirtual. Making these buses nonvirtual improves generated code efficiency.

Description

This check identifies blocks incorporating virtual buses that cross a subsystem boundary. Changing these to nonvirtual improves generated code efficiency.

Results and Recommended Actions

Condition	Recommended Action
Blocks that specify a virtual bus crossing a subsystem boundary.	Change the highlighted bus to nonvirtual.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Signal Basics”.
- “Virtual and Nonvirtual Buses”.
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check for Discrete-Time Integrator blocks with initial condition uncertainty

Check ID: `mathworks.design.DiscreteTimeIntegratorInitCondition`

Identify Discrete-Time Integrator blocks with state ports and initial condition ports that are fed by neither an Initial Condition nor a Constant block.

Description

Discrete-Time Integrator blocks with state port and initial condition ports might not be suitably initialized unless they are fed from an Initial Condition or Constant block. This is more likely to happen when Discrete-Time Integrator blocks are used to model second-order or higher-order dynamic systems.

Results and Recommended Actions

Condition	Recommended Action
Discrete-Time Integrator blocks are not initialized during the model initialization phase.	Add a Constant or Initial Condition block to feed the external Initial Condition port.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- IC block
- Discrete-Time Integrator block
- Constant block
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Identify disabled library links

Check ID: `mathworks.design.DisabledLibLinks`

Search model for disabled library links.

Description

Disabled library links can cause unexpected simulation results. Resolve disabled links before saving a model.

Note This check may overlap with “Check model for block upgrade issues” on page 8-56.

Results and Recommended Actions

Condition	Recommended Action
Library links are disabled.	Click the Library Link > Resolve link option in the context menu.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Use the Model Browser to find library links.
- To enable a broken link, right-click a block in your model to display the context menu. Select **Library Link > Resolve link**.

See Also

“Restore Disabled or Parameterized Links”

“What Is a Model Advisor Exclusion?” (Simulink Check)

Check for large number of function arguments from virtual bus across model reference boundary

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReferenceArgs`

Checks virtual bus signals that cross model reference boundaries and flags cases where using virtual buses across a model reference boundary increases the number of function arguments significantly.

Description

To improve the speed of the code generation process, you can use this check to reduce the number of generated function arguments. If the check finds a model that where many arguments will be generated for a function, you can click **Update Model** to modify the model so that it generates fewer arguments.

Results and Recommended Action

Methods that generate many function arguments as the result of a virtual bus signal crossing model reference boundary slow down the code generation process.

Condition	Recommended Action
Methods are listed that generate a large number of arguments for the current the model configuration that this check can reduce by modifying the model.	Click Update Model .

Clicking **Update Model** resets Inport and Outport block parameters and inserts Signal Conversion blocks, as necessary, to reduce the number of generated function arguments for the model.

See Also

“Bus Data Crossing Model Reference Boundaries”

Identify parameterized library links

Check ID: `mathworks.design.ParameterizedLibLinks`

Search model for parameterized library links.

Description

Parameterized library links that are unintentional can result in unexpected parameter settings in your model. This can result in improper model operation.

Results and Recommended Actions

Condition	Recommended Action
Parameterized links are listed.	Verify that the links are intended to be parameterized.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

- Right-click a block in your model to display the context menu. Choose `Link Options` and click `Go To Library Block` to see the original block from the library.
- To parameterize a library link, choose `Look Under Mask`, from the context menu and select the parameter.

See Also

“Restore Disabled or Parameterized Links”

“What Is a Model Advisor Exclusion?” (Simulink Check)

Identify unresolved library links

Check ID: `mathworks.design.UnresolvedLibLinks`

Search the model for unresolved library links, where the specified library block cannot be found.

Description

Check for unresolved library links. Models do not simulate while there are unresolved library links.

Results and Recommended Actions

Condition	Recommended Action
Library links are unresolved.	Locate missing library block or an alternative.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

“Fix Unresolved Library Links”

“What Is a Model Advisor Exclusion?” (Simulink Check)

Identify model reference variants and variant subsystems that override variant choice

Check ID: `mathworks.design.VariantOverride`

Identify model or subsystem for model reference variants and variant subsystems that specify variant choice using the override option instead of using the active variant object.

Results and Recommended Actions

Condition	Recommended Action
Model reference variants or variant subsystems that override variant choice are identified.	Specify variant choice using active variant object.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

“Working with Variant Choices”

“What Is a Model Advisor Exclusion?” (Simulink Check)

Identify configurable subsystem blocks for converting to variant subsystem blocks

Check ID: `mathworks.design.CSStoVSSConvert`

Search the model to identify configurable subsystem blocks at the model or subsystem level.

Results and Recommended Actions

Condition	Recommended Action
Configurable subsystem blocks are identified.	Convert these blocks to variant subsystem blocks to avoid compatibility issues. See Configurable Subsystem.

Capabilities and Limitations

You can run this check on your library models.

See Also

“Set up Model Variants Using a Model Block”

Check usage of function-call connections

Check ID: `mathworks.design.CheckForProperFcnCallUsage`

Check model diagnostic settings that apply to function-call connectivity and that might impact model execution.

Description

Check for connectivity diagnostic settings that might lead to non-deterministic model execution.

Results and Recommended Actions

Condition	Recommended Action
Diagnostics > Connectivity > Invalid function-call connection is set to warning. This might lead to non-deterministic model execution.	Set Diagnostics > Connectivity > Invalid function-call connection to error.
Diagnostic > Connectivity > Context-dependent inputs is set to Disable All or Use local settings. This might lead to non-deterministic model execution.	Set Diagnostics > Connectivity > Context-dependent inputs to Enable all as errors.

See Also

Function-Call Subsystem

Check model for upgradable Simulink Scope blocks

Check model for Simulink Scope blocks that you can upgrade to Simulink Time Scope blocks

Description

In a future release, Simulink Scope blocks will be removed and replaced with Simulink Time Scope blocks.

Results and Recommended Actions

Condition	Recommended Action
Model does not have Simulink Scope blocks.	No action required.
Model includes at least one Simulink Scope block.	Select the Check model for upgradable Simulink Scope blocks check, click the Run This Check button, review the list of scope blocks, and then click the Upgrade button.

Check Data Store Memory blocks for multitasking, strong typing, and shadowing issues

Check ID: `mathworks.design.DataStoreMemoryBlkIssue`

Look for modeling issues related to Data Store Memory blocks.

Description

Checks for multitasking data integrity, strong typing, and shadowing of data stores of higher scope.

Results and Recommended Actions

Condition	Recommended Action
The Duplicate data store names check is set to none or warning.	Consider setting the “Duplicate data store names” check to error in the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane.
<p>The data store variable names are not strongly typed in one of the following:</p> <ul style="list-style-type: none"> • Signal Attributes pane of the Block Parameters dialog for the Date Store Memory block • Global data store name 	<p>Specify a data type other than auto by taking one of the following actions:</p> <ul style="list-style-type: none"> • Choose a data type other than <code>Inherit: auto</code> on the Signal Attributes pane of the Block Parameters dialog for the Date Store Memory block. • If you are using a global data store name, then specify its data type in the <code>Simulink.Signal</code> object.
The Multitask data store check is set to none or warning.	Consider setting the “Multitask data store” check to error in the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Local and Global Data Stores”
- “Storage Classes for Data Store Memory Blocks” (Simulink Coder)
- Data Store Memory
- Data Store Read
- Data Store Write
- “Duplicate data store names”
- “Multitask data store”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check if read/write diagnostics are enabled for data store blocks

Check ID: `mathworks.design.DiagnosticDataStoreBlk`

For data store blocks in the model, enable the read-and-write diagnostics order checking to detect run-time issues.

Description

Check for the read-and-write diagnostics order checking. By enabling the read-and-write diagnostics, you detect potential run-time issues.

Results and Recommended Actions

Condition	Recommended Action
The Detect read before write check is disabled.	Consider enabling “Detect read before write” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.
The Detect write after read check is disabled.	Consider enabling “Detect write after read” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.
The Detect write after write check is disabled.	Consider enabling “Detect write after write” in the Configuration Parameter dialog box Diagnostics> Data Validity pane.

Capabilities and Limitations

Exclude blocks and charts from this check if you have a Simulink Check license.

Tips

.

- The run-time diagnostics can slow simulations down considerably. Once you have verified that Simulink does not generate warnings or errors during simulation, set them to `Disable all`.

See Also

- “Local and Global Data Stores”
- Data Store Memory
- Data Store Read
- Data Store Write
- “Detect read before write”
- “Detect write after read”
- “Detect write after write”
- “Check for potential ordering issues involving data store access” on page 8-23
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check data store block sample times for modeling errors

Check ID: `mathworks.design.DataStoreBlkSampleTime`

Identify modeling errors due to the sample times of data store blocks.

Description

Check data store blocks for continuous or fixed-in-minor-step sample times.

Results and Recommended Actions

Condition	Recommended Action
Data store blocks in your model have continuous or fixed-in-minor-step sample times.	Consider making the listed blocks discrete or replacing them with either Memory or Goto and From blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Local and Global Data Stores”
- Data Store Memory

- Data Store Read
- Data Store Write
- “Fixed-in-Minor-Step”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check for potential ordering issues involving data store access

Check ID: `mathworks.design.OrderingDataStoreAccess`

Look for read/write issues which may cause inaccuracies in the results.

Description

During an **Update Diagram**, identify potential issues relating to read-before-write, write-after-read, and write-after-write conditions for data store blocks.

Results and Recommended Actions

Condition	Recommended Action
Reading and writing (read-before-write or write-after-read condition) occur out of order.	Consider restructuring your model so that the Data Store Read block executes before the Data Store Write block.
Multiple writes occur within a single time step.	Change the model to write data only once per time step or refer to the following Tips section.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

This check performs a static analysis which might not identify every instance of improper usage. Specifically, Function-Call Subsystems, Stateflow Charts, MATLAB for code generation, For Iterator Subsystems, and For Each Subsystems can cause both missed detections and false positives. For a more comprehensive check, consider enabling the following diagnostics on the **Diagnostics > Data Validity** pane in the Configuration Parameters dialog box: “Detect read before write”, “Detect write after read”, and “Detect write after write”.

See Also

- “Local and Global Data Stores”

- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check structure parameter usage with bus signals

Check ID: `mathworks.design.MismatchedBusParams`

Identify blocks and `Simulink.Signal` objects that initialize bus signals by using mismatched structures.

Description

In a model, you can use a MATLAB structure to initialize a bus signal. For example, if you pass a bus signal through a Unit Delay block, you can set the **Initial condition** parameter to a structure. For basic information about initializing buses by using structures, see “Specify Initial Conditions for Bus Signals”.

Run this check to generate efficient and readable code by matching the shape and numeric data types of initial condition structures with those of bus signals. Matching these characteristics avoids unnecessary explicit typecasts and replaces field-by-field structure assignments with, for example, calls to `memcpy`.

Partial Structures

This check lists blocks and `Simulink.Signal` objects that initialize bus signals by using partial structures. During the iterative process of creating a model, you can use partial structures to focus on a subset of signal elements in a bus. For a mature model, use full structures to:

- Generate readable and efficient code.

- Support a modeling style that explicitly initializes unspecified signals. When you use partial structures, Simulink implicitly initializes unspecified signals.

For more information about full and partial structures, see “Create Full Structures for Initialization” and “Create Partial Structures for Initialization”.

Data Type Mismatches

This check lists blocks and `Simulink.Signal` objects whose initial condition structures introduce data type mismatches. The fields of these structures have numeric data types that do not match the data types of the corresponding bus signal elements.

When you configure an initial condition structure to appear as a tunable global structure in the generated code, avoid unnecessary explicit typecasts by matching the data types. See “Generate Tunable Initial Condition Structure for Bus Signal” (Simulink Coder).

Results and Recommended Actions

Condition	Recommended Action
Block or signal object uses partial structure	Consider using the function <code>Simulink.Bus.createMATLABStructure</code> to create a full initial condition structure.
Data types of structure fields do not match data types of corresponding signal elements	Consider defining the structure as a <code>Simulink.Parameter</code> object, and creating a <code>Simulink.Bus</code> object to use as the data type of the bus signal and of the parameter object. To control numeric data types, use the <code>Simulink.BusElement</code> objects in the bus object.

Check Delay, Unit Delay and Zero-Order Hold blocks for rate transition

Check ID: `mathworks.design.ReplaceZOHDelayByRTB`

Identify Delay, Unit Delay, or Zero-Order Hold blocks that are used for rate transition. Replace these blocks with actual Rate Transition blocks.

Description

If a model uses Delay, Unit Delay, or Zero-Order Hold blocks to provide rate transition between input and output signals, Simulink makes a hidden replacement of these blocks with built-in Rate Transition blocks. In the compiled block diagram, a yellow symbol and the letters “RT” appear in the upper-left corner of a replacement block. This replacement can affect the behavior of the model, as follows:

- These blocks lose their algorithmic design properties to delay a signal or implement zero-order hold. Instead, they acquire rate transition behavior.
- This modeling technique works only in specific transition configurations (slow-to-fast for Delay and Unit Delay blocks, and fast-to-slow for Zero-Order Hold block). Set the block sample time to be equal to the slower rate (source for the Delay and Unit Delay blocks and destination for the Zero-Order Hold block).
- When the block sample time of a downstream or upstream block changes, these Delay, Unit Delay and Zero-Order Hold blocks might not perform rate transition. For example, setting the source and destination sample times equal stops rate transition. The blocks then assume their original algorithmic design properties.
- The block sample time shows incomplete information about sample time rates. The block code runs at two different rates to handle data transfer. However, the block sample time and sample time color show it as a single-rate block. Tools and MATLAB scripts that use sample time information base their behavior on this information.

An alternative is to replace Delay, Unit Delay, or Zero-Order Hold blocks with actual Rate Transition blocks.

- The technique ensures unambiguous results in block behavior. Delay, Unit Delay, or Zero-Order Hold blocks act according to their algorithmic design to delay and hold signals respectively. Only Rate Transition blocks perform actual rate transition.
- Using an actual Rate Transition block for rate transition offers a configurable solution to handle data transfer if you want to specify deterministic behavior or the type of memory buffers to implement.

Use this check to identify instances in your model where Delay, Unit Delay or Zero-Order Hold blocks undergo hidden replacement to provide rate transition between signals. Click **Upgrade Model** to replace these blocks with actual Rate Transition blocks.

Results and Recommended Actions

Condition	Recommended Action
Model has no instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	No action required.
Model has instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	<p>The check identifies these instances and allows you to upgrade the model.</p> <ol style="list-style-type: none"> 1 Click Upgrade Model to replace with actual Rate Transition blocks. 2 Save changes to your model.

If you do not choose to replace the Delay, Unit Delay, and/or Zero-Order Hold blocks with actual Rate Transition blocks, Simulink continues to perform a hidden replacement of these blocks with built-in rate transition blocks.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Check for calls to `slDataTypeAndScale`

Check ID: `mathworks.design.CallsSlDataTypeAndScale`

Identify calls to the internal function `slDataTypeAndScale`.

Description

In some previous versions of Simulink, opening a model that had been saved in an earlier version triggers an automatic upgrade to code for data type handling. The automatic upgrade inserts calls to the internal function `slDataTypeAndScale`. Although Simulink continues to support some uses of the function, if you eliminate calls to it, you get cleaner and faster code.

Simulink does not support calls to `slDataTypeAndScale` when:

- The first argument is a `Simulink.AliasType` object.
- The first argument is a `Simulink.NumericType` object with property `IsAlias` set to `true`.

Running **Check for calls to `slDataTypeAndScale`** identifies calls to `slDataTypeAndScale` that are required or recommended for replacement. In most cases, running the check and following the recommended action removes the calls. You can ignore calls that remain. Run the check unless you are sure there are not calls to `slDataTypeAndScale`.

Results and Recommended Actions

Condition	Recommended Action
Required Replacement Cases	Manually or automatically replace calls to <code>slDataTypeAndScale</code> . Cases listed require you to replace calls to <code>slDataTypeAndScale</code> .
Recommended Replacement Cases	For the listed cases, it is recommended that you manually or automatically replace calls to <code>slDataTypeAndScale</code> .
Manual Inspection Cases	Inspect each listed case to determine whether it should be manually upgraded.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Tips

- Do not manually insert a call to `slDataTypeAndScale` into a model. The function was for internal use only.

- Running **Check for calls to slDataTypeAndScale** calls the Simulink function `slRemoveDataTypeAndScale`. Calling this function directly provides a wider range of conversion options. However, you very rarely need more conversion options.

See Also

- For more information about upgrading data types and scales, in the MATLAB Command Window, execute the following:
 - `help slDataTypeAndScale`
 - `help slRemoveDataTypeAndScale`
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check bus signals treated as vectors

Check ID: `mathworks.design.BusTreatedAsVector`

Identify bus signals that Simulink treats as vectors.

Description

You cannot use bus signals that the Simulink software implicitly converts to vectors. Instead, either insert a Bus to Vector conversion block between the bus signal and the block input port that it feeds, or use the `Simulink.BlockDiagram.addBusToVector` command.

Results and Recommended Actions

Condition	Recommended Action
Bus signals are implicitly converted to vectors.	Use <code>Simulink.BlockDiagram.addBusToVector</code> or insert a Bus to Vector block.
Model is not configured to identify bus signals that Simulink treats as vectors.	In the Configuration Parameters dialog box, on the Diagnostics > Connectivity pane, set Bus signal treated as vector to error .

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks that implicitly convert bus signals to vectors.

Tips

- Run this check before running **Check consistency of initialization parameters for Output and Merge blocks**.
- For more information, see “Correct Buses Used as Vectors”.

Check for potentially delayed function-call subsystem return values

Check ID: `mathworks.design.DelayedFcnCallSubsys`

Identify function-call return values that might be delayed because Simulink software inserted an implicit Signal Conversion block.

Description

So that signals reside in contiguous memory, Simulink software can automatically insert an implicit Signal Conversion block in front of function-call initiator block input ports. This can result in a one-step delay in returning signal values from calling function-call subsystems. The delay can be avoided by ensuring the signal originates from a signal block within the function-call system. Or, if the delay is acceptable, insert a Unit Delay block in front of the affected input ports.

Results and Recommended Actions

Condition	Recommended Action
The listed block input ports could have an implicit Signal Conversion block.	Decide if a one-step delay in returning signal values is acceptable for the listed signals. <ul style="list-style-type: none"> • If the delay is not acceptable, rework your model so that the input signal originates from within the calling subsystem. • If the delay is acceptable, insert a Unit Delay block in front of each listed input port.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

“What Is a Model Advisor Exclusion?” (Simulink Check)

Identify block output signals with continuous sample time and non-floating point data type

Check ID: `mathworks.design.OutputSignalSampleTime`

Find continuous sample time, non-floating-point output signals.

Description

Non-floating-point signals might not represent continuous variables without loss of information.

Results and Recommended Actions

Condition	Recommended Action
Signals with continuous sample times have a non-floating-point data type.	On the identified signals, either change the sample time to be discrete or fixed-in-minor-step ([0 1]).

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

Check usage of Merge blocks

Check ID: `mathworks.design.MergeBlkUsage`

Identify Merge blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 8-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in the Merge blocks in your model that can cause problems if you use classic initialization mode. It also recommends settings for consistent behavior of Merge blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode.

Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check the run-time diagnostic setting of the Merge block.	<ol style="list-style-type: none"> <li data-bbox="788 418 1338 557">1 In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” to <code>error</code>. <li data-bbox="788 562 1338 666">2 Verify that the model simulates without errors before running this check again.
Check for Model blocks that are using the PIL simulation mode.	The simplified initialization mode does not support the Processor-in-the-loop (PIL) simulation for model references.
Check for library blocks with instances that cannot be migrated.	Examine the failed subcheck results for each block to determine the corrective actions.
Check for single-input Merge blocks.	<p data-bbox="788 887 1338 986">Replace both the Mux block used to produce the input signal and the Merge block with one multi-input Merge block.</p> <p data-bbox="788 1013 1338 1112">Single-input Merge blocks are not supported in the simplified initialization mode.</p>
Check for root Merge blocks that have an unspecified Initial output value.	<p data-bbox="788 1117 1338 1286">If you do not specify an explicit value for the Initial output parameter of root Merge blocks, then Simulink uses the default initial value of the output data type.</p> <p data-bbox="788 1308 1338 1472">A root Merge block is a Merge block with an output port that does not connect to another Merge block. For information on the default initial value, see “Initializing Signal Values”.</p>

Condition	Recommended Action
Check for Merge blocks with nonzero input port offsets.	<p>Clear the Allow unequal port widths parameter of the Merge block.</p> <hr/> <p>Note Consider using Merge blocks only for signal elements that require true merging. You can combine other elements with merged elements using the Concatenate block.</p>
Check for Merge blocks that have unconnected inputs or that have inputs from non-conditionally executed subsystems.	<p>Set the Number of inputs parameter of the Merge block to the number of Merge block inputs. You must connect each input to a signal.</p> <p>Verify that each Merge block input is driven by a conditionally executed subsystem. Merge blocks cannot be driven directly by an Iterator Subsystem or a block that is not a conditionally executed subsystem.</p>
Check for Merge blocks with inputs that are combined or reordered outside of conditionally executed subsystems.	Verify that combinations or reordering of Merge block input signals takes place within a conditionally executed subsystem. Such designs may use Mux, Bus Creator, or Selector blocks.
Check for Merge blocks with inconsistent input sample times.	<p>Verify that input signals to each Merge block have the same Sample time.</p> <p>Failure to do so could result in unpredictable behavior. Consequently, the simplified initialization mode does not allow inconsistent sample times.</p>
Check for Merge blocks with multiple input ports that are driven by a single source.	Verify that the Merge block does not have multiple input signals that are driven by the same conditionally executed subsystem or conditionally executed Model block.

Condition	Recommended Action
Check for Merge blocks that use signal objects to specify the Initial output value.	<p data-bbox="795 305 1240 361">Verify that the following behavior is acceptable.</p> <p data-bbox="795 395 1331 614">In the simplified initialization mode, signal objects cannot specify the Initial output parameter of the Merge block. While you can still initialize the output signal for a Merge block using a signal object, the initialization result may be overwritten by that of the Merge block.</p> <hr data-bbox="795 670 1331 673"/> <p data-bbox="795 677 1299 765">Note Simulink generates a warning that the initial value of the signal object has been ignored.</p>

Check usage of Outport blocks

Check ID: `mathworks.design.InitParamOutportMergeBlk`

Identify Outport blocks and conditional subsystems with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 8-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies Outport blocks and conditional subsystems in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Outport blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for blocks inside of the Iterator Subsystem that require elapsed time.	Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions. Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.

Condition	Recommended Action
<p>Check for Outport blocks that have conflicting signal buffer requirements.</p>	<p>The Outport block has a function-call trigger or function-call data dependency signal passing through it, along with standard data signals. Some of the standard data signals require an explicit signal buffer for the initialization of the output signal of the corresponding subsystem. However, buffering function-call related signals lead to a function-call data dependency violation.</p> <p>Consider modifying the model to pass function-call related signals through a separate Outport block. For examples of function-call data dependency violations, see the example model <code>sl_subsys_semantics</code>.</p> <p>A standard data signal may require an additional signal copy for one of the following reasons:</p> <ul style="list-style-type: none"> • The Outport block is driven by a block with output that cannot be overwritten. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.

Condition	Recommended Action
Check for Outport blocks that are driven by a bus signal and whose Initial output value is not scalar.	For Outport blocks driven by bus signals, classic initialization mode does not support Initial Condition (IC) structures, while simplified initialization mode does. Hence, when migrating a model from classic to simplified mode, specify a scalar for the Initial Output parameter. After migration completes, to specify different initial values for different elements of the bus signal, use IC structures. For more information, see “Create Initial Condition Structures”.

Condition	Recommended Action
<p>Check for Outport blocks that require an explicit signal copy.</p>	<p>An explicit copy of the bus signal driving the Outport block is required for the initialization of the output signal of the corresponding subsystem.</p> <p>Insert a Signal Conversion block before the Outport block, then set the Output parameter of the Signal Conversion block to <code>Bus copy</code>.</p> <p>A standard data signal may require an additional signal copy for one or more of the following reasons:</p> <ul style="list-style-type: none"> • A block with output that cannot be overwritten is driving the Outport block. The Ground block and the Constant block are examples of such blocks. • The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value. • The Outport block connects to the input of a Merge block • One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.
<p>Check for merged Outport blocks that inherit the Initial Output value from Outport blocks that have been configured to reset when the blocks become disabled.</p>	<p>When Outport blocks are driving a Merge block, do not set their Output when disabled parameters to <code>reset</code>.</p>

Condition	Recommended Action
Check for merged Output blocks that are driven by nested conditionally executed subsystems.	Determine if the new behavior of the Output blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.
Check for merged Output blocks that reset when the blocks are disabled.	Set the Output when disabled parameter of the Output block to <code>held</code> . This setting is required because the Output block connects to a Merge block. For more information, see Output .
Check for Output blocks that have an undefined Initial output value with invalid initial condition sources.	Verify that the following behavior is acceptable. When the Initial output parameter is unspecified (<code>[]</code>), it inherits the initial output from the source blocks. If at least one of the sources of the Output block is not a valid source to inherit the initial value, the block uses the default initial value for that data type. For simplified initialization mode, valid sources an Output blocks can inherit the Initial output value from are: Constant, Initial Condition, Merge (with initial output), Stateflow chart, function-call model reference, or conditionally executed subsystem blocks.

Condition	Recommended Action
Check Outport blocks that have automatic rate transitions.	<p>Simulink has inserted a Rate Transition block at the input of the Outport block. Specify the Initial output parameter for each Outport block.</p> <p>Otherwise, perform the following procedure:</p> <ol style="list-style-type: none"> 1 In the Configuration Parameters dialog box, on the Solver pane, clear the option “Automatically handle rate transition for data transfer”. 2 Run this Model Advisor check again.
Check Outport blocks that have a special signal storage requirement and have an undefined Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>Specify the Initial output parameter for the Outport block. Set this value to [] (empty matrix) to use the default initial value of the output data type.</p>
Check the Initial output setting of Outport blocks that reset when they are disabled.	<p>Specify the Initial output parameter of the Outport block.</p> <p>You must specify the Initial output value for blocks that are configured to reset when they become disabled.</p>
Check the Initial output setting for Outport blocks that pass through a function-call data dependency signal.	<p>You cannot specify an Initial output value for the Outport block because function-call data dependency signals are passing through it. To set the Initial output value:</p> <ol style="list-style-type: none"> 1 Set the Initial output parameter of the Outport block to []. 2 Provide the initial value at the source of the data dependency signal rather than at the Outport block.

Condition	Recommended Action
Check for Outport blocks that use signal objects to specify the Initial output value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the Initial output parameter of an Outport block. You can still initialize the input or output signals for an Outport block using signal objects, but the initialization results may be overwritten by those of the Outport block.</p> <hr/> <p>Note If you are working with a conditionally executed subsystem Outport block, Simulink generates a warning that the initial value of the signal object has been ignored.</p>
Check for library blocks with instances that have warnings.	Examine the warning subcheck results for each block before migrating to the simplified initialization mode.
Check for merged Outport blocks that are either unconnected or connected to a Ground block.	<p>Verify that the following behavior is acceptable.</p> <p>The Outport block is driving a Merge block, but its inputs are either unconnected or connected to Ground blocks. In the classic initialization mode, unconnected or grounded outports do not update the merge signal even when their parent conditionally executed subsystems are executing. In the simplified initialization mode, however, these outports will update the merge signal with a value of zero when their parent conditionally executed subsystems are executing.</p>

Condition	Recommended Action
<p>Check for Outport blocks that obtain the Initial output value from an input signal when they are migrated.</p>	<p>Verify that the following behavior is acceptable.</p> <p>The Initial output parameter of the Outport block is not specified. As a result, the simplified initialization mode will assume that the Initial output value for the Outport block is derived from the input signal. This assumption may result in different initialization behavior.</p> <p>If this behavior is not acceptable, modify your model before you migrate to the simplified initialization mode.</p>
<p>Check for outer Outport blocks that have an explicit Initial output.</p>	<p>Verify that the following behavior is acceptable.</p> <p>In classic initialization mode, the Initial output and Output when disabled parameters of the Outport block must match those of their source Outport blocks.</p> <p>In simplified initialization mode, Simulink sets the Initial output parameter of outer Outport blocks to [] (empty matrix) and Output when disabled parameter to held.</p>
<p>Check for conditionally executed subsystems that propagate execution context across the output boundary.</p>	<p>Verify that the following behavior is acceptable.</p> <p>The Propagate execution context across subsystem boundary parameter is selected for the subsystem. Execution context will still be propagated across input boundaries; however, the propagation will be disabled on the output side for the initialization in the simplified initialization mode.</p>

Condition	Recommended Action
<p>Check for blocks that read input from conditionally executed subsystems during initialization.</p>	<p>Verify that the following behavior is acceptable.</p> <p>Some blocks, such as the Discrete-Time Integrator block, read their inputs from conditionally executed subsystems during initialization in the classic initialization mode. Simulink performs this step as an optimization technique.</p> <p>This optimization is not allowed in the simplified initialization mode because the output of a conditionally executed subsystem at the first time step after initialization may be different than the initial value declared in the corresponding Outport block. In particular, this discrepancy occurs if the subsystem is active at the first time step.</p>
<p>Check for a migration conflict for Outport blocks that use a <code>Dialog</code> as the Source of initial output value.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block will maintain its current settings and use its specified Initial output value.</p>

Condition	Recommended Action
<p>Check for a migration conflict for Outport blocks that use <code>Input</code> signal as the Source of initial output value.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block currently specifies an Initial output of <code>[]</code> (empty matrix), and the Output when disabled as <code>held</code>. This means that each outport does not perform initialization, but implicitly relies on source blocks to initialize its input signal.</p> <p>After migration, the parameter Source of initial output value will be set to <code>Input</code> signal to reflect this behavior.</p>
<p>Check for a migration conflict for Outport blocks that have <code>SimEvents@</code> semantics.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport blocks will continue to use an Initial output value of <code>[]</code> (empty matrix) and an Output when disabled setting of <code>held</code>. Simulink will maintain these settings because their parent conditionally executed subsystems are connected to <code>SimEvents</code> blocks.</p>

Condition	Recommended Action
<p>Check for a migration conflict for innermost Outport blocks with variable-size input and unspecified Initial output.</p>	<p>For these Outport blocks, the signal size varies only when the parent subsystem of the block is re-enabled. Therefore, Simulink implicitly assumes that the Initial output parameter is equal to 0, even though the parameter is unspecified, []. Consequently, unless you specify the parameter, the Model Advisor will explicitly set the parameter to 0 when the model is migrated to the simplified initialization mode.</p> <p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the Check for library blocks with instances that cannot be migrated to learn about the different migration paths for other instances of each Outport block.</p>
<p>Check for a migration conflict for Outport blocks that use a default ground value as the Initial output.</p>	<p>The parameter Initial output is set to [] (empty matrix) and the source of the Outport is an invalid initial condition source. Thus, the block uses the default initial value as the initial output in the simplified initialization mode. Other instances of Outport blocks with the same library link either have errors or are being migrated differently.</p>

Condition	Recommended Action
Check for a migration conflict for merged Outport blocks without explicit specification of Initial output .	Review the results from the subcheck Check for library blocks with instances that cannot be migrated to learn about different migration paths for other instances of each Outport block. For the remaining Outport blocks, Initial output is set to [] (empty matrix) and Output when disabled is set to held respectively, in simplified initialization mode.

Check usage of Discrete-Time Integrator blocks

Check ID: `mathworks.design.DiscreteBlock`

Identify Discrete-Time Integrator blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Note Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 8-5.

Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in Discrete-Time Integrator blocks in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Discrete-Time Integrator blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the

model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

Results and Recommended Actions

Condition	Recommended Action
Check for Discrete-Time Integrator blocks whose parameter Initial condition setting is set to <code>Output</code> .	Determine if the new behavior of the Discrete-Time Integrator blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.
Check for Discrete-Time Integrator blocks whose Initial condition setting parameter is set to <code>State</code> (most efficient) and are in a subsystem that uses triggered sample time.	Use periodic sample time for the block, or set Initial Condition setting to <code>Output</code> .
Check for blocks inside of the Iterator Subsystem that require elapsed time.	<p>Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.</p> <p>Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.</p>

Check model settings for migration to simplified initialization mode

Note Do not run this check in isolation. Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 8-5.

Check ID: `mathworks.design.ModelLevelMessages`

Identify settings in Model blocks and model configuration parameters that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

Description

Simplified initialization mode was introduced in R2008b to improve consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies issues in the model configuration parameters and Model blocks in your model that can cause problems when you migrate to simplified initialization mode. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

After running this Model Advisor consistency check, if you click **Explore Result** button, the messages pertain only to blocks that are not library-links.

Note Because it is difficult to undo these changes, select **File > Save Restore Point As** to back up your model before migrating to the simplified initialization mode.

For more information, see “Model Configuration Parameters: Connectivity Diagnostics”.

Results and Recommended Actions

Condition	Recommended Action
Verify that all Model blocks are using the simplified initialization mode.	Migrate the model referenced by the Model block to the simplified initialization mode, then migrate the top model.
Verify simplified initialization mode setting	Set Configuration Parameters > Underspecified initialization detection to Simplified.

Action Results

Clicking **Modify Settings** causes the following:

- The Model parameter is set to `simplified`
- If an Outport block has the **Initial output** parameter set to the empty character vector, `[]`, then the `SourceOfInitialOutputValue` parameter is set to **Input signal**.
- If an Outport has an empty **Initial output** and a variable-size signal, then the **Initial output** is set to zero.

Check S-functions in the model

Check ID: `mathworks.design.SFuncAnalyzer`

Perform quality checks on S-functions in Simulink models or subsystems.

Description

The S-function analyzer performs quality checks on S-functions to identify improvements and potential problems in the specified model.

Results and Recommended Actions

Condition	Recommended Action
Continuous states are modified in <code>mdlOutputs</code> method.	Modify Continuous States at a major time step and use <code>ssSetSolverNeedsReset</code> function in S-function code.
Contionuous states are modified in the <code>mdlUpdate</code> method.	Modify Continous States only at a major time step and use <code>ssSetSolverNeedsReset</code> function in S-function code.
S-function discrete states are modified in the <code>mdlOutputs</code> at a minor step.	Modify the discrete states only at a major step guarded by <code>ssIsMajorTimeStep</code> function.

Condition	Recommended Action
S-function mode vector is modified in the <code>mdlOutputs</code> method at a minor step.	Modify the mode vector only at a major step guarded by <code>ssIsMajorTimeStep</code> function.
S-function is using static or global variables to declare internal states.	Declare the states explicitly using <code>ssSetNumDiscStates</code> function or “Model Global Data by Creating Data Stores”.
S-function has continuous states but sample time is not declared continuous.	Specify continuous sample time using <code>ssSetSampleTime</code> function.
S-function has discrete states but the <code>mdlOutputs</code> and <code>mdlUpdate</code> methods are combined.	Define the <code>mdlOutputs</code> and <code>mdlUpdate</code> methods separately and modify discrete states only in <code>mdlUpdate</code> method.
S-function sets the <code>SS_OPTION_CAN_BE_CALLED_CONDITIONALLY</code> option when having state-like data or multiple sample times.	Remove the options when the S-function has state-like data or multiple sample times.
MEX compilers do not exist on the machine.	Check for the presence or install MEX compilers on the machine.
S-function encounters errors while compiling the model.	Check the Diagnostics Viewer output and recompile the model.

Check for non-continuous signals driving derivative ports

Check ID: `mathworks.design.NonContSigDerivPort`

Identify noncontinuous signals that drive derivative ports.

Description

Noncontinuous signals that drive derivative ports cause the solver to reset every time the signal changes value, which slows down simulation.

Results and Recommended Actions

Condition	Recommended Action
There are noncontinuous signals in the model driving derivative ports.	<ul style="list-style-type: none"> • Make the specified signals continuous. • Replace the continuous blocks receiving these signals with discrete state versions of the blocks.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Modeling Dynamic Systems”
- “Simulation Phases in Dynamic Systems”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Runtime diagnostics for S-functions

Check ID: `mathworks.design.DiagnosticSFcn`

Check array bounds and solver consistency if S-Function blocks are in the model.

Description

Validates whether S-Function blocks adhere to the ODE solver consistency rules that Simulink applies to its built-in blocks.

Results and Recommended Actions

Condition	Recommended Action
Solver data inconsistency is set to none.	In the Configuration Parameters dialog box, set Solver data inconsistency to warning or error.
Array bounds exceeded is set to none.	In the Configuration Parameters dialog box, set Array bounds exceeded to warning or error

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “What Is an S-Function?”
- “How S-Functions Work”

Check model for foreign characters

Check ID: `mathworks.design.characterEncoding`

Check for characters that are incompatible with the current encoding

Description

Check for characters in the model file that cannot be represented in the current encoding. These can cause errors during simulation, and may be corrupted when saving the model.

Results and Recommended Actions

Condition	Recommended Action
Incompatible characters found	Change the current encoding to the encoding specified in the model file, using <code>slCharacterEncoding</code> . To change the current encoding you need to close the models, and this closes the Model Advisor.

Tips

The Upgrade Advisor report shows the encoding you need, or you can retrieve the encoding from the model using the command:

```
get_param(modelname, 'SavedCharacterEncoding')
```

Use `slCharacterEncoding` to change the encoding. This setting applies to the current MATLAB session, so if you restart MATLAB and want to open the same model, you will need to make the same change to the current encoding again.

For more information see:

- `slCharacterEncoding`
- “Open a Model with Different Character Encoding”
- “Save Models with Different Character Encodings”

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify unit mismatches in the model

Check ID: `mathworks.design.UnitMismatches`

Identify instances of unit mismatches between ports in the model.

Description

Check for instances of unit mismatches between ports in the model.

Results and Recommended Actions

Condition	Recommended Action
Unit mismatches found	Change one of the mismatched unit settings to match the unit settings for the other port.

See Also

- “Unit Specification in Simulink Models”.

Identify automatic unit conversions in the model

Check ID: `mathworks.design.AutoUnitConversions`

Identify instances of automatic unit conversions in the model.

Description

Identify instances of automatic unit conversions in the model.

Results and Recommended Actions

Condition	Recommended Action
Automatic unit conversions found	Check that the converted units are expected for the model.

See Also

- “Unit Specification in Simulink Models”.

Identify disallowed unit systems in the model

Check ID: `mathworks.design.DisallowedUnitSystems`

Identify instances of disallowed unit systems in the model.

Description

Identify instances of disallowed unit systems in the model.

Results and Recommended Actions

Condition	Recommended Action
Disallowed unit systems found	Either choose a unit that conforms to the configured unit system, or select another unit system. For more information, see “Restricting Unit Systems”.

See Also

- “Unit Specification in Simulink Models”.

Identify undefined units in the model

Check ID: `mathworks.design.UndefinedUnits`

Identify instances of unit specifications, not defined in the unit database, in the model.

Description

Identify instances of unit specifications, not defined in the unit database, in the model.

Results and Recommended Actions

Condition	Recommended Action
Undefined units found	Change the unit to one that Simulink supports.

See Also

- “Unit Specification in Simulink Models”.
- Allowed Units

Check model for block upgrade issues

Check ID: `mathworks.design.Update`

Check for common block upgrade issues.

Description

Check blocks in the model for compatibility issues resulting from using a new version of Simulink software.

Results and Recommended Actions

Condition	Recommended Action
Blocks with compatibility issues found.	Click Modify to fix the detected block issues.
Check update status for the Level 2 API S-functions.	Consider replacing Level 1 S-functions with Level 2.

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- “Write Level-2 MATLAB S-Functions”.
- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Check model for block upgrade issues requiring compile time information

Check ID: `mathworks.design.UpdateRequireCompile`

Check for common block upgrade issues.

Description

Check blocks for compatibility issues resulting from upgrading to a new version of Simulink software. Some block upgrades require the collection of information or data when the model is in the compile mode. For this check, the model is set to compiled mode and then checked for upgrades.

Results and Recommended Actions

Condition	Recommended Action
Model contains Lookup Table or Lookup Table (2-D) blocks and some of the blocks specify Use Input Nearest or Use Input Above for a lookup method.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Do not apply Use Input Nearest or Use Input Above for lookup methods; select another option.
Model contains Lookup Table or Lookup Table (2-D) blocks and some blocks perform multiplication first during interpolation.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. However, because the n-D Lookup Table block performs division first, this replacement might cause a numerical difference in the result.
Model contains Lookup Table or Lookup Table (2-D) blocks. Some of these blocks specify Interpolation-Extrapolation as the Lookup method but their input and output are not the same floating-point type.	Replace Lookup Table blocks and Lookup Table (2-D) blocks with n-D Lookup Table blocks. Then change the extrapolation method or the port data types for block replacement.
Model contains Unit Delay blocks with Sample time set to -1 that inherit a continuous sample time.	Replace Unit Delay blocks with Memory blocks.

Action Results

Clicking **Modify** replaces blocks from a previous release of Simulink software with the latest versions.

See Also

- n-D Lookup Table
- Unit Delay
- “Consult the Upgrade Advisor”

Check that the model is saved in SLX format

Check ID: `mathworks.design.UseSLXFile`

Check that the model is saved in SLX format.

Description

Check whether the model is saved in SLX format.

Results and Recommended Actions

Condition	Recommended Action
Model not saved in SLX format	Consider upgrading to the SLX file format to use the latest features in Simulink.

Capabilities and Limitations

You can run this check on your library models.

Tips

Simulink Projects can help you upgrade models to SLX format and preserve file revision history in source control. See “Upgrade Model Files to SLX and Preserve Revision History”.

See Also

- “Save Models in the SLX File Format”
- “Consult the Upgrade Advisor”.

Check model for SB2SL blocks

Check ID: `mathworks.simulink.SB2SL.Check`

Check that the model does not have outdated SB2SL blocks.

Description

Check if the model contains outdated SB2SL blocks.

Results and Recommended Actions

Condition	Recommended Action
Model contains outdated SB2SL blocks	Consider upgrading the model to current SB2SL blocks.

Action Results

Clicking **Update SB2SL Blocks** replaces blocks with the latest versions.

See Also

- “Consult the Upgrade Advisor”.

Check Model History properties

Check ID: `mathworks.design.SLXModelProperties`

Check for edited model history properties

Description

Check models for edited Model History property values that could be used with source control tool keyword substitution. This keyword substitution is incompatible with SLX file format.

In the MDL file format you can configure some model properties to make use of source control tool keyword substitution. If you save your model in SLX format, source control tools cannot perform keyword substitution. Information in the model file from such keyword substitution is cached when you first save the MDL file as SLX, and is not updated again. The Model Properties History pane and Model Info blocks in your model show stale information from then on.

Results and Recommended Actions

Condition	Recommended Action
Edited model history properties	Manually or automatically reset the properties to the default values. Click the button to reset, or to inspect and change these properties manually, open the Model Properties dialog and look in the History pane.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify Model Info blocks that can interact with external source control tools

Check ID: `mathworks.design.ModelInfoKeywordSubstitution`

Use this check to find Model Info blocks that can be altered by external source control tools through keyword substitution.

Description

This check searches for character vectors in the Model Info block enclosed within dollar signs that can be overwritten by an external source control tool. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
The Model Info block contains fields like this: \$keyword\$	Review the list of fields in the report, then remove the keyword character vectors from the Model Info block.

See Also

- “Consult the Upgrade Advisor”.
- “About Source Control with Projects”

Identify Model Info blocks that use the Configuration Manager

Check ID: `mathworks.design.ModelInfoConfigurationManager`

Use this check to find Model Info blocks that use the Configuration Manager.

Description

Model Info blocks using the Configuration Manager allow risky keyword substitution using external source control tools. Using third-party source control tool keyword expansion might corrupt your model files when you submit them. Keyword substitution is not available in SLX model file format. The Configuration Manager for the Model Info block will be removed in a future release.

For a more flexible interface to source control tools, use a Simulink project instead of the Model Info block. See “About Source Control with Projects”.

Results and Recommended Actions

Condition	Recommended Action
A Model Info block is using the Configuration Manager.	Click Remove the Configuration Manager .

See Also

- “Consult the Upgrade Advisor”.
- “About Source Control with Projects”

Check model for legacy 3DoF or 6DoF blocks

Check ID: `mathworks.design.Aeroblks.CheckDOF`

Lists 3DoF and 6DoF blocks are outdated.

Description

This check searches for 3DoF and 6DoF blocks from library versions prior to 3.13 (R2014a).

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of 3DoF or 6DoF blocks found.	Click Replace 3DoF and 6DoF Blocks to replace the blocks with latest versions.

Action Results

Clicking **Replace 3DoF and 6DoF Blocks** replaces blocks with the latest versions.

See Also

- “Equations of Motion” (Aerospace Blockset)

Check model and local libraries for legacy Aerospace Blockset blocks

Check ID: `mathworks.design.Aeroblks.CheckFG`

Lists blocks configured to use FlightGear versions that are outdated or not supported.

Description

This check searches and lists blocks configured to use FlightGear versions that are outdated or not supported.

Results and Recommended Actions

Condition	Recommended Action
Blocks configured with old versions of FlightGear are found.	Click Update FlightGear blocks to change block settings to latest supported version of FlightGear. Then, download latest version of FlightGear that MATLAB supports.

Action Results

Clicking **Update FlightGear blocks** changes block settings to the latest supported version of FlightGear.

See Also

- “Flight Simulator Interfaces” (Aerospace Blockset)

Check and update masked blocks in library to use promoted parameters

Check ID: `mathworks.design.CheckAndUpdateOldMaskedBuiltinBlocks`

Check for libraries that should be updated to use promoted parameters.

Description

This check searches libraries created before R2011b for masked blocks that should be updated to use promoted parameters. Since R2011b, if a block parameter is not promoted, its value in the linked block is locked to its value in the library block. This check excludes blocks of type Subsystem, Model reference, S-Function and M-S-Function.

Results and Recommended Actions

Condition	Recommended Action
Libraries that need to be updated are found	Click Update . Once the libraries have been updated, run the check again

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check and update mask image display commands with unnecessary imread() function calls

Check ID: `mathworks.design.CheckMaskDisplayImageFormat`

Check identifies masks using image display commands with unnecessary calls to the `imread()` function.

Description

This check searches for the mask display commands that make unnecessary calls to the `imread()` function, and updates them with mask display commands that do not call the `imread()` function. Since 2013a, a performance and memory optimization is available for mask images specified using the image path instead of the RGB triple matrix.

Results and Recommended Actions

Condition	Recommended Action
Mask display commands that make unnecessary calls to the <code>imread()</code> function are found.	Click Update . Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check and update mask to affirm icon drawing commands dependency on mask workspace

Check ID: `mathworks.design.CheckMaskRunInitFlag`

Check identifies if the mask icon drawing commands have dependency on the mask workspace.

Description

This check identifies if the mask icon drawing commands have dependency on the mask workspace and updates the `RunInitForIconRedraw` property accordingly. If there is no mask workspace dependency, the value of `RunInitForIconRedraw` is set to `off`, whereas, if there is mask workspace dependency the values is set to `on`.

Setting the values of `RunInitForIconRedraw` to `off` when there is no mask workspace dependency optimizes the performance by not executing the mask initialization code before drawing the block icon.

Results and Recommended Actions

Condition	Recommended Action
Mask drawing commands that are dependent or independent of the mask workspace are found.	Click Update . Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Identify masked blocks that specify tabs in mask dialog using MaskTabNames parameter

Check ID: `mathworks.design.CheckAndUpdateOldMaskTabnames`

This check identifies masked blocks that specify tabs in mask dialog using the `MaskTabNames` parameter.

Description

This check identifies masked blocks that use the `MaskTabNames` parameter to programmatically create tabs in the mask dialog. Since R2013b, dialog controls are used to group parameters in a tab on the mask dialog.

Results and Recommended Actions

Condition	Recommended Action
Masked blocks that use the <code>MaskTabNames</code> parameter to create tabs programmatically in the mask dialog are found.	Click Upgrade available in the Action section. Once the blocks have been updated, run the check again.

Capabilities and Limitations

You can run this check on your library models.

See Also

- “Consult the Upgrade Advisor”.
- “Model Upgrades”

Identify questionable operations for strict single-precision design

Check ID: `mathworks.design.StowawayDoubles`

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Description

For a strict single-precision design, this check identifies the blocks that introduce double-precision operations, and non-optimal model settings.

Results and Recommended Actions

Condition	Recommended Action
Double-precision floating-point operations found in model.	Verify that: <ul style="list-style-type: none"> • Block input and output data types are set correctly. • In the Configuration Parameters dialog box, on the Optimization pane, Default for underspecified data type is set to <code>single</code>.
Model uses a library standard that is not optimal for strict-single designs.	Verify that: <ul style="list-style-type: none"> • All target-specific math libraries used by the model support single-precision implementations. <p style="text-align: center;">Set Configuration Parameters > Standard math library to C99 (ISO).</p>
Logic signals are not implemented as Boolean data.	Verify that: <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, Implement logic signals as Boolean data is selected.

Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

See Also

- “Validate a Floating-Point Embedded Model”
- “Consult the Upgrade Advisor”.
- “Model Upgrades”
- “What Is a Model Advisor Exclusion?” (Simulink Check)

Check `get_param` calls for block `CompiledSampleTime`

Check ID: `mathworks.design.CallsGetParamCompiledSampleTime`

Use this check to identify MATLAB files in your working environment that contain `get_param` function calls to return the block `CompiledSampleTime` parameter.

Description

For multi-rate blocks (including subsystems), Simulink returns the block compiled sample time as a cell array of the sample rates in the block. The return value is a cell array of pairs of doubles. MATLAB code that accepts this return value only as pairs of doubles can return an error when called with a multi-rate block. Use this check to identify such code in your environment. Modify these instances of code to accept a cell array of pairs of doubles instead.

For example, consider a variable `blkTs`, which has been assigned the compiled sample time of a multi-rate block.

```
blkTs = get_param(block, 'CompiledSampleTime');
```

Here are some examples in which the original code works only if `blkTs` is a pair of doubles and the block is a single-rate block:

- Example 1

```
if isinf(blkTs(1))
    disp('found constant sample time')
end
```

Since `blkTs` is now a cell array, Simulink gives this error message:

```
Undefined function 'isinf' for input arguments of type 'cell'
```

Instead, use this code, for which `blkTs` can be a cell array or a pair of doubles.

```

if isequal(blkTs, [inf,0])
    disp('found constant sample time')
end

```

- **Example 2**

```

if all(blkTs == [-1,-1])
    disp('found triggered sample time')
end

```

For the above example, since blkTs is now a cell array, Simulink gives this error:

```

Undefined function 'eq' for input arguments of type 'cell'

```

Instead, use this code, for which blkTs can be a cell array or a pair of doubles.

```

if isequal(blkTs, [-1,-1])
    disp('found triggered sample time')
end

```

- **Example 3**

```

if (blkTs(1) == -1)
    disp('found a triggered context')
end

```

Again, since blkTs is now a cell array, Simulink gives this error:

```

Undefined function 'eq' for input arguments of type 'cell'

```

Instead, use this code.

```

if ~iscell(blkTs)
    blkTs = {blkTs};
end
for idx = 1:length(blkTs)
    thisTs = blkTs{idx};
    if (thisTs(1) == -1)
        disp('found a triggered context')
    end
end

```

The above code checks for a triggered type sample time (triggered or async). In cases in which a block has constant sample time ([inf,0]) in addition to triggered or async or when a block has multiple async rates, this alternative property detects the triggered type sample time.

This check scans MATLAB files in your environment. If the check finds instances of MATLAB code that contain `get_param` calls to output the block compiled sample time, Upgrade Advisor displays these results. It suggests that you modify code that accepts the block compiled sample time from multi-rate blocks.

Results and Recommended Actions

Condition	Recommended Action
No MATLAB files call <code>get_param(block,CompiledSampleTime)</code>	None
Some MATLAB files call <code>get_param(block,CompiledSampleTime)</code>	If files use the block <code>CompiledSampleTime</code> parameter from multi-rate blocks, modify these files to accept the parameter as a cell array of pairs of doubles.

See Also

- “Sample Times in Subsystems”
- “Block Compiled Sample Time”

Check model for parameter initialization and tuning issues

Check ID: `mathworks.design.ParameterTuning`

Use this check to identify issues in the model that occur when you initialize parameters or tune them.

Description

This check scans your model for parameter initialization and tuning issues like:

- Rate mismatch between blocks
- Divide by zero issue in conditionally executed subsystems
- Invalid control port value in Index Vector blocks

Results and Recommended Actions

Condition	Recommended Action
The model has rate transition issues.	Select Automatically handle rate transition for data transfer in the Solver pane of the model configuration parameters.
The model has a divide by zero issue in a conditionally executed subsystem with a control port.	At the command prompt, run <code>set_param(control_port, 'DisallowConstTsAndPrmTs'</code>
The model has an invalid control port value in a conditionally executed subsystem.	At the command prompt, run <code>set_param(control_port, 'DisallowConstTsAndPrmTs'</code>

Action Results

Select **Upgrade model** to resolve issues in the model related to parameter initialization and tuning.

See Also

- “Automatic Rate Transition”

Check for virtual bus across model reference boundaries

Check ID: `mathworks.design.CheckVirtualBusAcrossModelReference`

Check virtual bus signals that cross model reference boundaries.

Description

This check identifies root-level Inport and Outport blocks in referenced models and Model blocks with virtual bus outputs that require updates to change to nonvirtual bus signals.

If the check identifies issues, click **Update Model** to convert root-level Inport and Outport blocks configured for virtual buses to use nonvirtual buses in these situations:

- For root-level Inport blocks — Enable the **Output as nonvirtual bus** parameter and insert a Signal Conversion block after the Inport block. The Signal Conversion block is configured to output a virtual bus.

- For root-level Outputport blocks — Enable the **Output as nonvirtual bus in parent model** parameter.
- For Model blocks — For ports whose Outputport blocks were updated to address issues, insert a Signal Conversion block after the corresponding ports of the Model block. The Signal Conversion block is configured to output a virtual bus.

Recommended Action and Results

To resolve issues, click **Upgrade Model**.

Note Run the **Analyze model hierarchy and continue upgrade sequence** check on the top-level model and then down through the model reference hierarchy.

Clicking **Upgrade Model** converts affected root-level Inport and Outputport blocks configured for virtual buses to use nonvirtual buses in models where you:

- Use function prototype control
- Perform C++ code generation with the `I/O arguments step` method option.

Alternatively, you can change the C++ code generation function specification setting to `Default step method`:

- 1 In the **Configuration Parameters > Code Generation > Interface** pane, click **Configure C++ Class Interface**.
 - 2 In the dialog box, set the **Function specification** parameter to `Default step method`.
- Use buses that have variable-dimension signals
 - Use an associated non-auto storage class for Outputport block signals
 - The conversion for non-auto storage class occurs only if you have the target generation license that the model requires. For example, an ERT target requires an Embedded Coder license.
 - Use Export-function models where an Outputport block is driven by a nonvirtual bus
 - Have Model blocks that reference models containing Outputport blocks that have been fixed — Clicking **Upgrade Model** updates Model blocks referencing the models that had Outputport blocks fixed by the **Analyze model hierarchy and continue upgrade sequence** check.

See Also

- “Bus Data Crossing Model Reference Boundaries”

Check model for custom library blocks that rely on frame status of the signal

Check ID: `mathworks.design.DSPFrameUpgrade`

This check identifies custom library blocks in the model that depend on the frame status of the signal.

Description

This check searches for the custom library blocks in a model that depend on the frame status of the signal. The check analyzes the blocks, recommends fixes, and gives reasons for the fixes. You must make the fixes manually.

Results and Recommended Actions

Condition	Recommended Action
The check finds custom library blocks that depend on the frame status of the signal.	Follow the recommendation given by the Upgrade Advisor.

Capabilities and Limitations

You can run this check only on custom library blocks in your model.

You must make the fixes manually.

This check appears only if you have the DSP System Toolbox installed.

See Also

“Frame-based processing” (DSP System Toolbox)

Check Rapid accelerator signal logging

Check ID: `mathworks.design.CheckRapidAcceleratorSignalLogging`

When simulating your model in rapid accelerator mode, use this check to find signals logged in your model that are globally disabled. Rapid accelerator mode supports signal logging. Use this check to enable signal logging globally.

Description

This check scans your model to see if a simulation is in rapid accelerator mode and whether the model contains signals with signal logging. If the check finds an instance and signal logging is globally disabled, an option to turn on signal logging globally appears.

Results and Recommended Actions

Condition	Recommended Action
Simulation mode is not rapid accelerator.	None You can enable signal logging in rapid accelerator mode.
Simulation mode is rapid accelerator. Upgrade Advisor did not find signals with signal logging enabled.	NoneThe model does not use signal logging. Enable signal logging for signals and globally if you want to log signals.
Simulation mode is rapid accelerator. Upgrade Advisor found signals with signal logging enabled. However, global setting for signal logging was disabled.	Enable signal logging globally if you want to log signals with signal logging enabled.
Signal logging was already globally enabled.	None

Action Results

Selecting **Modify** enables signal logging globally in your model.

See Also

- “Signal Logging in Rapid Accelerator Mode”
- “Consult the Upgrade Advisor”.

Check virtual bus inputs to blocks

Check ID: `mathworks.design.VirtualBusUsage`

Check bus input signals for a set of blocks.

Description

Check bus input signals for a set of blocks.

Starting in R2015b, virtual bus signal inputs to blocks that require nonbus or nonvirtual bus input can cause an error. Examples of blocks that can specify a bus object as their output data type include a Bus Creator block and a root Inport block. The blocks that cause an error when they have a virtual bus input in this situation are:

- Assignment
- Delay

The Delay block causes an error only if you use the Block Parameters dialog box to:

- Set an initial condition that is a MATLAB structure or zero.
- Specify a value for **State name**.
- Permute Dimension
- Reshape
- Selector
- Unit Delay

The Unit Delay block causes an error only if you use the Block Parameters dialog box to:

- Set an initial condition that is a MATLAB structure or zero.
- Specify a value for **State name**.
- Vector Concatenate

Results and Recommended Actions

Condition	Recommended Action
Virtual bus signal input to these blocks: <ul style="list-style-type: none"> • Assignment • Delay (if you specify an initial condition from the dialog box that is a MATLAB structure or zero and the value for State name is not empty) • Permute Dimension • Reshape • Selector • Unit Delay (if you specify an initial condition that is a MATLAB structure or zero and the value for State name is not empty) • Vector Concatenate 	In the Upgrade Advisor, click Modify . The check inserts a Bus to Vector block to attempt to convert virtual bus input signals to vector signals. For issues that the Upgrade Advisor identifies but cannot fix, modify the model manually. For details, see “Correct Buses Used as Vectors”.

Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks.

For many models, running the Upgrade Advisor modifies your model so that bus signals are not treated as vectors. However, for some models you can encounter compatibility issues even after running the check. Modify your model manually to address those issues.

After you compile the model using Upgrade Advisor, the Simulink Editor sometimes indicates that you need to save the model (the model is dirty), even though you did not make changes. To prevent this issue from reoccurring for this model, save the model.

Modeling Pattern	Issue	Solution
Data Store Memory block with Data Type set to <code>Inherit: auto</code>	A Data Store Memory block whose associated Data Store Read or Data Store Write blocks read or write bus signal data must use a bus object.	In the Data Store Memory block, set the Data Type signal attribute to <code>Bus: <BusObject></code> .

Modeling Pattern	Issue	Solution
Signal Conversion block Output parameter matches input bus type	<p>A Signal Conversion block whose Output parameter is set to <code>Nonvirtual</code> bus requires a virtual bus input.</p> <p>A Signal Conversion block whose Output parameter is set to <code>Virtual</code> bus requires a nonvirtual bus input.</p>	To create a copy of the input signal, set Output to <code>Signal copy</code> .
Merge, Switch, or Multiport Switch block with multiple bus inputs	Merge, Switch, or Multiport Switch blocks with multiple bus inputs require those inputs to have the same names and hierarchy.	Reconfigure the model so that the bus inputs have the same names and hierarchy.
Root Inport block outputting a virtual bus and specifying a value for Port dimensions	A root Inport block that outputs to a virtual bus must inherit the dimensions.	Set the Inport block Port dimensions signal attribute to <code>1</code> or <code>-1</code> (<code>inherit</code>).
Mux block with nonvirtual bus inputs	A Mux block cannot accept nonvirtual bus signals.	<p>To treat the output as an array, replace the Mux block with a Vector Concatenate block.</p> <p>If you want a virtual bus output, use a Bus Creator block to combine the signals.</p>
Bus to Vector block without a virtual bus signal input	A nonbus signal does not need a Bus to Vector block.	Remove the Bus to Vector block.
Assignment block with virtual bus inputs	The Upgrade Advisor converts the Assignment block <code>Y0</code> port bus input to a vector.	Add a Bus to Vector block before the Assignment block.

Modeling Pattern	Issue	Solution
S-function using a nonvirtual bus	An S-function that is not a Level-2 C S-function does not support nonvirtual bus signals.	Change the S-function to be a Level-2 C S-function. Consider using an S-Function Builder block to create a Level-2 C S-function.
Stateflow chart with parameterized data type	In a Stateflow chart, you cannot parameterize the data type of an input or output in terms of another input or output if the data type is a bus object.	For the parameterized port, set Data Type to Bus: <object name>.
Subsystem with bus operations in a Stateflow chart	An Inport block inside a subsystem in a Stateflow chart requires a bus object data type if its signal is a bus.	In the Inport block, set Data type to Bus: <object name>.
Ground block used as a bus source	The output signal of a Ground block cannot be a source for a bus.	Use a Constant block with Constant value set to 0 and the Output data type signal attribute set to Bus: <object name>.
Root Outputport block with a single-element bus object data type	The input to the Outputport block must be a bus if it specifies a bus object as its data type.	In the Outputport block, set Data type to Inherit: auto.

Check for root outputports with constant sample time

Check ID: `mathworks.design.CheckConstRootOutputportWithInterfaceUpgrade`

Use this check to identify root outputports with a constant sample time used with an AUTOSAR target, Function Prototype Control, or the model C++ class interface.

Description

Root outports with constant sample time are not supported when using an AUTOSAR target, Function Prototype Control, or the model C++ class interface. Use this check to identify root Output blocks with this condition and modify the blocks as recommended.

Results and Recommended Actions

Condition	Recommended Action
Root output with constant sample time used with an AUTOSAR target, Function Prototype Control or the model C++ class interface.	Consider one of the following: <ul style="list-style-type: none"> • Set the sample time of the block to the fundamental sample time. • Identify the source of the constant sample time and set its sample time to the fundamental sample time. • Place a Rate Transition block with inherited sample time (-1) before the block.

- “Consult the Upgrade Advisor”.

Analyze model hierarchy and continue upgrade sequence

Check ID: `com.mathworks.Simulink.UpgradeAdvisor.UpgradeModelHierarchy`

Check for child models and guide you through upgrade checks.

Description

This check identifies child models of this model, and guides you through upgrade checks to run both non-compile and compile checks. The Advisor provides tools to help with these tasks:

- If the check finds child models, it offers to run the Upgrade Advisor upon each child model in turn and continue the upgrade sequence. If you have a model hierarchy you need to check and update each child model in turn.

- If there are no child models, you still need to continue the check sequence until you have run both non-compile and compile checks.

You must run upgrade checks in this order: first the checks that do not require compile time information and do not trigger an Update Diagram, then the compile checks.

Click **Continue Upgrade Sequence** to run the next checks. If there are child models, this will open the next model. Keep clicking **Continue Upgrade Sequence** until the check passes.

Results and Recommended Actions

Condition	Recommended Action
Child models found	Click Continue Upgrade Sequence to run the next checks. If there are child models, this will close the current Upgrade Advisor session, and open Upgrade Advisor for the next model in the hierarchy.
No child models, but more checks to run	If there are no child models, click Continue Upgrade Sequence to refresh the Upgrade Advisor with compilation checks selected. The compile checks trigger an Update Diagram (marked with ^). Run the next checks and take advised actions. When you return to this check, click Continue Upgrade Sequence until this check passes.

Tips

Best practice for upgrading a model hierarchy is to check and upgrade each model starting at the leaf end and working up to the root model.

When you click **Continue Upgrade Sequence**, the Upgrade Advisor opens the leaf model as far inside the hierarchy as it can find. Subsequent steps guide you through upgrading your hierarchy from leaf to root model.

When you open the Upgrade Advisor, the checks that are selected do not require compile time information and do not trigger an Update Diagram. Checks that trigger an Update

Diagram are not selected to run by default, and are marked with \wedge . When you use the Upgrade Advisor on a hierarchy, keep clicking **Continue Upgrade Sequence** to move through this sequence of analysis:

- 1 The Upgrade Advisor opens each model and library in turn, from leaf to root, and selects the non-compile checks. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model and continue.
- 2 When you reach the root end of the hierarchy, the Upgrade Advisor then opens each model again in the same order (but not libraries) and selects only the checks that require a model compile. Run the checks, take any advised actions, then click **Continue Upgrade Sequence** to open the next model. Continue until you reach the end of the hierarchy and this check passes.

Check Access to Data Stores

Check ID: `mathworks.design.ConflictsForDataStoreReadWriters`

Identify potential execution order sensitivity when reading and writing to data stores.

Description

The execution order of blocks that read and write to the same data store can change the simulation result. When blocks in the same hierarchy access the same data store, the execution order is not deterministic.

Results and Recommended Actions

Condition	Recommended Action
Data Store Memory block accessed by multiple blocks in the same hierarchy.	To enforce execution order for the blocks, consider the following: <ul style="list-style-type: none"><li data-bbox="632 423 1203 453">• Add a data dependency between the blocks.<li data-bbox="632 465 887 494">• Set block priority.<li data-bbox="632 506 1307 571">• Move blocks into separate Function-Call Subsystem blocks and schedule them.

Model Reference Conversion Advisor

Model Reference Conversion Advisor

Check Conversion Input Parameters

Use input parameters to configure the actions the advisor performs and the output it produces.

You can use the default parameters to run the advisor without changing any parameters.

Input Parameter	Description
New model name	<p>The advisor provides a model name that is based on the Subsystem block name and is unique in the MATLAB path.</p> <p>The model name cannot exceed 59 characters.</p> <hr/> <p>Tip If the advisor generates an error indicating that the target referenced model already exists, then use the New model name parameter to specify a new file name.</p>
Conversion data file name	<p>The advisor creates a file for storing data created during the conversion. By default, the advisor uses the model name at the beginning of the file name and appending <code>_conversion_data.mat</code>. For example, if the subsystem is in a model named <code>myModel</code>, the conversion file name is <code>myModel_conversion_data.mat</code>.</p> <p>You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a <code>.m</code> file extension, the advisor serializes all variables to a MATLAB file.</p> <hr/> <p>Note If the top model uses a data dictionary, you cannot select this option.</p>
Fix errors automatically	<p>By default, if an advisor check finds any errors and the advisor can fix the error, the advisor provides a Fix button that you can click to have the advisor fix the issue.</p> <p>If you enable this parameter, the advisor fixes all conversion errors that it can, without displaying the Fix button.</p>

Input Parameter	Description
Replace content of a subsystem with a Model block	<p>By default, the advisor updates the original model by inserting a Model block in the model. The advisor action depends on whether you use the automatic fix options.</p> <ul style="list-style-type: none">• If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the advisor includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.• If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block. <p>Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created referenced model. The advisor does not update the original model in the other Simulink Editor window.</p> <hr/> <p>Note If you are converting a variant subsystem, do not use this option. See “Convert Each Variant Subsystem”.</p>

Input Parameter	Description
Check simulation results after conversion	<p>Compare the results of simulating the top model for the referenced model to the results of simulating the baseline model that has the subsystem.</p> <p>To use this option, before performing the conversion, enable signal logging for the subsystem output signals of interest in the model. Set these advisor options:</p> <ul style="list-style-type: none"> • Model block simulation mode — Use the same simulation mode as in the original model. • Replace content of a subsystem with a Model block — Enable this option. • Stop time — Specify when you want the simulations to end. The default is the stop time of the top model. If the top model stop time is set to <code>inf</code>, the advisor stops after 10 seconds. • Absolute tolerance — Specify a value if you do not want to use the default of <code>'1e-06'</code>. • Relative tolerance — Specify a value if you do not want to use the default of <code>'1e-03'</code>. <p>To see the results after the conversion is complete, click View comparison results. The advisor displays the results of the comparison in the Simulation Data Inspector. For more information, see “Compare Simulation Results Before and After Conversion”.</p>
Stop time	<p>By default, the advisor uses the stop time of the top model, unless the stop time of the top model is <code>inf</code>. If the stop time of the top model is <code>inf</code>, the advisor uses a default stop time of 10. You can specify a different stop time. For details, see “Specify Simulation Start and Stop Time”.</p> <p>To use this option, select Check simulation results after conversion.</p>

Input Parameter	Description
Absolute tolerance	The absolute signal tolerance for the simulation run comparison. The default is $1e-06$. To use this option, select Check simulation results after conversion .
Relative tolerance	The relative signal tolerance for the simulation run comparison. The default is $1e-03$. To use this option, select Check simulation results after conversion .
Model block simulation mode	Simulation mode for the new Model block that references the referenced model. <ul style="list-style-type: none">• Normal (default)• Accelerator

After you configure the advisor, to start the conversion checks, click **Run this task**.

Simulink Performance Advisor Check Overview

Use Performance Advisor checks to improve model simulation time.

See Also

“Improve Simulation Performance Using Performance Advisor”

Baseline

Establish a measurement to compare the performance of a simulation after Performance Advisor implements improvements.

See Also

“Create a Performance Advisor Baseline Measurement”

Checks that Require Update Diagram

These checks require that **Update Diagram** occurs in order to run.

See Also

“Improve Simulation Performance Using Performance Advisor”

Checks that Require Simulation to Run

These checks require simulation to run in order to collect sufficient performance data. Performance Advisor reports the results after simulation completes.

See Also

“Improve Simulation Performance Using Performance Advisor”

Check Simulation Modes Settings

These checks evaluate simulation modes (Normal, Accelerator, Rapid Accelerator, Rapid Accelerator with up-to-date check off) and identify the optimal mode to achieve fastest simulation.

See Also

“What Is Acceleration?”

Check Compiler Optimization Settings

Use these checks to select compiler optimization settings for improved performance.

See Also

“Compiler optimization level”

Create baseline

Select this check to create a baseline when Performance Advisor runs. You can also create a baseline manually. A baseline is the measurement of simulation performance before you run checks in Performance Advisor. The baseline includes the time to run the simulation and the simulation results (signals logged). Before you create a baseline for a model, in the **Data Import/Export** pane of the Configuration Parameters dialog box:

- Select the **States** check box.
- Set the **Format** parameter to `Structure with time`.

See Also

“Create a Performance Advisor Baseline Measurement”

Identify resource-intensive diagnostic settings

To improve simulation speed, disable diagnostics where possible. For example, some diagnostics, such as **Solver data inconsistency** or **Array bounds exceeded**, incur run-time overheads during simulations.

See Also

- “Diagnostics”
- “Improve Simulation Performance Using Performance Advisor”

Check optimization settings

To improve simulation speed, enable optimizations where possible. For example, if some optimizations, such as Block Reduction, are disabled, enable these optimizations to improve simulation speed.

You can also trade off compile-time speed for simulation speed by setting the compiler optimization level. Compiler optimizations for accelerations are disabled by default. Enabling them accelerates simulation runs but results in longer build times. The speed and efficiency of the C compiler used for Accelerator and Rapid Accelerator modes also affects the time required in the compile step.

- “Optimize Generated Code for Lookup Table Blocks”
- “Optimize Breakpoint Spacing in Lookup Tables”
- “Improve Simulation Performance Using Performance Advisor”

Check MATLAB System block simulation mode

In general, to improve simulation speed, choose `Code generation` for the **Simulate using** parameter of the MATLAB System block. Because data exchange between MATLAB and Simulink passes through several software layers, `Interpreted execution` usually slows simulations, particularly if the model needs many data exchanges.

This check identifies which MATLAB System blocks can generate code and changes the **Simulate using** parameter value to `Code generation` where possible.

While `Code generation` does not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By using this `Code generation`, you can improve performance.

See Also

- MATLAB System
- “Simulation Modes”
- “Improve Simulation Performance Using Performance Advisor”

Identify Interpreted MATLAB Function blocks

To improve simulation speed, replace Interpreted MATLAB Function blocks with MATLAB Function blocks where possible. Because data exchange between MATLAB and Simulink passes through several software layers, Interpreted MATLAB Function blocks usually slow simulations, particularly if the model needs many data exchanges.

Additionally, because you cannot compile an Interpreted MATLAB Function, an Interpreted MATLAB Function block impedes attempts to use an acceleration mode to speed up simulations.

While MATLAB Function blocks do not support all MATLAB functions, the subset of the MATLAB language that it does support is extensive. By replacing your interpreted MATLAB code with code that uses only this embeddable MATLAB subset, you can improve performance.

See Also

- MATLAB Function
- “Improve Simulation Performance Using Performance Advisor”

Identify simulation target settings

To improve simulation speed, disable simulation target settings where possible. For example, in the Configuration Parameters dialog box, clear the **Simulation Target > Echo expression without semicolons** check box to improve simulation speed.

See Also

- “Model Configuration Parameters: Simulation Target”
- “Improve Simulation Performance Using Performance Advisor”

Check model reference rebuild setting

To improve simulation speed, in the Configuration Parameters dialog box, verify that the **Model Referencing > Rebuild** parameter is set to `If any changes in known dependencies detected`.

See Also

- “Rebuild”
- “Improve Simulation Performance Using Performance Advisor”

Identify Scope blocks

Opened and uncommented Scope blocks can impact simulation performance. To improve simulation performance, close and comment out Scope blocks. Right-click a scope block, and then select **Comment Out**.

For opened Scopes, you can improve simulation speed by reducing updates. From the Scope **Simulation** menu, select **Reduce Updates to Improve Performance**.

See Also

- “Improve Simulation Performance Using Performance Advisor”

Identify active instrumentation settings on the model

Identify active instrumentation settings on the model. The fixed-point instrumentation mode controls which objects log minimum, maximum, and overflow data during simulation. Instrumentation is required to collect simulation ranges using the Fixed-Point Tool. These ranges are used to propose data types for the model (requires Fixed-Point Designer). When you are not actively converting your model to fixed point, disable the fixed-point instrumentation to restore the maximum simulation speed to your model.

From the model **Analysis** menu, select **Data Type Design > Fixed-Point Tool**. Under **System under design**, click **Continue**.

In the Model Hierarchy pane, the Fixed-Point Tool denotes systems that currently have instrumentation turned on with `(mmO)`, or `(O)`. Right-click the system in the model hierarchy and, under `Fixed-point instrumentation mode`, select `Use local settings` or `Force off`.

See Also

- Fixed-Point Instrumentation and Data Type Override (Fixed-Point Designer)

Check model reference parallel build

To improve simulation, verify the number of referenced models in the model. If there are two or more referenced models, build the model in parallel if possible.

Performance Advisor analyzes the model and estimates the build time on the current computer as if it were using several cores. It also estimates the parallel build time for the model in the same way an estimation would be performed if Parallel Computing Toolbox or MATLAB Distributed Computing Server™ software were installed on the computer. Performance Advisor performs this estimate as follows:

- 1** Search the model for referenced models that do not refer to other referenced models.
- 2** Calculate the average number of blocks in each of the referenced models that do not refer to other referenced models.
- 3** Of the list of referenced models that do not refer to others, select a referenced model whose number of blocks is closest to the calculated average.
- 4** Build this model to obtain the build time.
- 5** Based on the number of blocks and the build time for this referenced model, estimate the build time for all other referenced models.
- 6** Based on these build times, estimate the parallel build time for the top model.

To calculate the overhead time introduced by the parallel build mechanism, set the Parallel Build Overhead Time Estimation Factor. Performance Advisor calculates the estimated build time with overhead as:

$$(1 + \text{Parallel Build Overhead Time Estimation Factor}) * (\text{Build time on a single machine})$$

See Also

- “Enable parallel model reference builds”
- “Improve Simulation Performance Using Performance Advisor”

Check Delay block circular buffer setting

To improve simulation, check that each Delay block in the model uses the appropriate buffer type. By default, the block uses an array buffer (the **Use circular buffer for state** option is not selected). However, when the delay length is large, a circular buffer can improve execution speed by keeping the number of copy operations constant.

If the Delay block is currently using an array buffer, and all of the following conditions are true, Performance Advisor selects a circular buffer:

- The Delay block is in sample-based mode, i.e., either the **Input processing** parameter is set to `Elements as channels (sample based)`, or the input signal type is set to `Sample based`.
- The value or upper limit of the delay length is 10 or greater.
- The size of the state—equal to the delay length multiplied by the total of all output signal widths—is 1000 or greater.

See Also

- Delay
- “Improve Simulation Performance Using Performance Advisor”

Check continuous and discrete rate coupling

If your model contains both discrete and continuous rates, the coupling between these rates can slow down simulation. Performance Advisor checks for these conditions in your model.

- The model is using a variable step solver.
- The model contains both continuous and discrete rates.
- The fastest discrete rate is relatively smaller than **Max step size** determined by the solver.

Setting the `DecoupledContinuousIntegration` parameter to `on` might speed up simulation.

See Also

- “About Solvers”

- “Speed Up Simulation”
- “Improve Simulation Performance Using Performance Advisor”

Check discrete signals driving derivative port

Run this check if your simulation has many unnecessary resets. A discrete signal driving a block with continuous states triggers a reset at every sample time hit of the block. These resets are computationally expensive. Performance Advisor checks for these signals and blocks and provides a list of the same.

You can edit the model around the discovered discrete signals that drive these blocks to remove such cases. For example, inserting a Zero Order Hold block between the discrete signal and the corresponding block with continuous states might help resolve the issue.

See Also

- “Speed Up Simulation”
- “Modeling Techniques That Improve Performance”

Check solver type selection

To improve simulation, check that the model uses the appropriate solver type.

Explicit vs. Implicit Solvers

Selecting a solver depends on the approximation of the model stiffness at the beginning of the simulation. A stiff system has both slowly and quickly varying continuous dynamics. Implicit solvers are specifically designed for stiff problems, whereas explicit solvers are designed for non-stiff problems. Using non-stiff solvers to solve stiff systems is inefficient and can lead to incorrect results. If a non-stiff solver uses a very small step size to solve your model, check to see if you have a stiff system.

Model	Recommended Solver
Represents a stiff system	ode15s
Does not represent a stiff system	ode45

Performance Advisor uses the heuristic shown in the table to choose between explicit and implicit solvers.

Original Solver	Performance Advisor Action
Variable step solver	Calculates the system stiffness at 0 first. Then: <ul style="list-style-type: none"> • If the stiffness is greater than 1000, Performance Advisor chooses ode15s. • If the stiffness is less than 1000, Performance Advisor chooses ode45.
Fixed-step continuous solver	<ul style="list-style-type: none"> • If the stiffness is greater than 1000, Performance Advisor chooses ode14x. • If the stiffness is less than 1000, Performance Advisor chooses ode3.

This heuristic works best if the system stiffness does not vary during simulation. If the system stiffness varies with time, choose the most appropriate solver for that system rather than the one Performance Advisor suggests.

See Also

- “About Solvers”
- “Speed Up Simulation”
- “Improve Simulation Performance Using Performance Advisor”

Select simulation mode

To achieve fastest simulation time, use this check to evaluate the following modes and identify the optimal selection:

- Normal
- Accelerator
- Rapid Accelerator
- Rapid Accelerator with up-to-date check off

In Normal mode, Simulink interprets your model during each simulation run. If you change the model frequently, this is generally the preferred mode to use because it requires no separate compilation step. It also offers the most flexibility to make changes to your model.

In Accelerator mode, Simulink compiles a model into a binary shared library or DLL where possible, eliminating the block-to-block overhead of an interpreted simulation in

Normal mode. Accelerator mode supports the debugger and profiler, but not runtime diagnostics.

In Rapid Accelerator mode, simulation speeds are fastest but this mode only works with models where C-code is available for all blocks in the model. Also, this mode does not support the debugger or profiler.

When choosing Rapid Accelerator with up-to-date check off, Performance Advisor does not perform an up-to-date check during simulation. You can run the Rapid Accelerator executable repeatedly while tuning parameters without incurring the overhead of up-to-date checks. For instance, if you have a large model or a model that makes extensive use of model reference, this method of execution can increase efficiency.

For models with 3-D signals, Normal or Accelerator modes work best.

See Also

- “How Acceleration Modes Work”
- “Choosing a Simulation Mode”
- “Comparing Performance”
- “Run Simulations Programmatically”

Select compiler optimizations on or off

Use this check to determine whether performing compiler optimization can help improve simulation speed. The optimization can only be performed in Accelerator or Rapid Accelerator modes.

Note This check will be skipped if MATLAB is not configured to use an optimizing compiler.

See Also

- “How Acceleration Modes Work”
- “Choosing a Simulation Mode”
- “Comparing Performance”
- “Improve Simulation Performance Using Performance Advisor”

Final Validation

This check validates the overall performance improvement of simulation time and accuracy in a model. If the performance is worse than the original model, Performance Advisor discards all changes to the model and loads the original model.

Global settings for validation do not apply to this check. If you have not validated the performance improvement from changes resulting from other checks, use this check to perform a final validation of all changes to a model.

Simulink Limits

Maximum Size Limits of Simulink Models

The following table documents some limits on the size and complexity of Simulink models.

Model Feature	Limit
Maximum number of levels in a block diagram	1024
Maximum number of branches in a line	1024
Maximum length of a parameter name	63
Maximum length of a parameter character vector value	32768
Maximum value of a model window coordinate	32768
Maximum number of bytes of logged simulation data	$2^{31}-1$ bytes on 32-bit systems, $2^{48}-1$ bytes on 64-bit systems
Maximum number of bytes for the total block I/O buffer length in a model	$2^{31}-1$ bytes on 32-bit systems and on 64-bit systems
Maximum length of integer and fixed-point data types	128 bits

Create Bus Ports in a Subsystem

This example shows adding In Bus Element and Out Bus Element blocks to create bus element ports in a subsystem for selecting signals from an input bus and creating an output bus signal.

Model Structure

Open the model. The top model has three constant signals combined into a bus that feeds a subsystem input port outputs a bus signal to a Scope block.

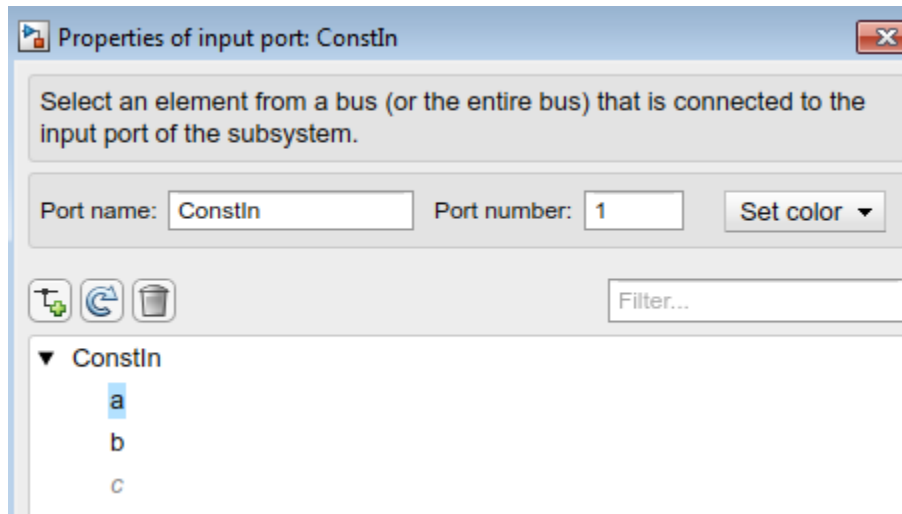

The subsystem includes two In Bus Element and Out Bus Element blocks.

Set the Port Name and Color for an In Bus Element Block

Open the Block Parameters dialog box for the ConstIn.a block. The Port name parameter is set to ConstIn, which changes the subsystem input port name from the default InBus. This block selects the a signal. The block color is set to green instead of the default black.

The In Bus Element block feeds a Gain block, and the Gain block connects to an Out Bus Element block that includes an $a*3$ signal in the output bus signal.

Create an In Bus Element Block and an Out Bus Element Block

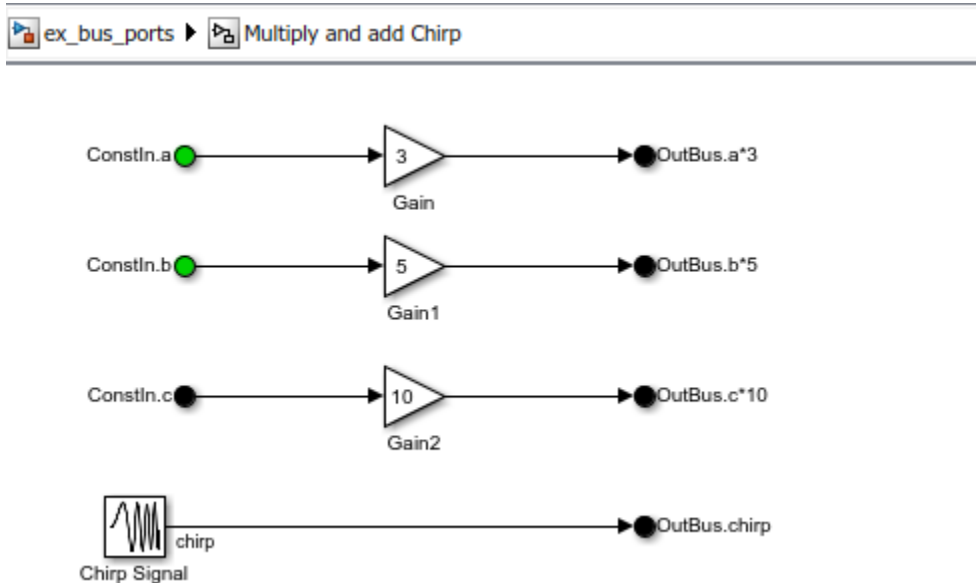

Create a third In Bus Element block for the c signal. In the Simulink Editor, right-click and drag the ConstIn.b block to make a copy of the block. Specify to use the existing port. Edit the block icon text to say ConstIn.c. Select the block and override the green block color by specifying black. Feed the output of the In Bus Element block to a third Gain block and set the gain to 10.

Copy the OutBus.b*5 block to create another Out Bus Element block, specifying to use the same port. Connect the Gain block to the Out Bus Element block that uses the same port. Connect the Gain block output signal to the Out Bus Element block and edit the icon text to say OutBus.c*10.

Add a Chirp Block and Include Its Output Signal in the Bus Output Signal

Add a Chirp Signal block and connect it to a new Out Bus Element block that uses the same port as the other Out Bus Element blocks (OutBus). Open the Out Bus Element dialog box, double-click the selected signal, and change the signal name to chirp.

The virtual bus signal that the subsystem outputs contains the output signals of the three Gain blocks and the Chirp block.

Convert Bus Signal to a Vector

This example shows how to use a Bus to Vector block to convert a bus signal to a vector, to provide a signal that the Gain block can accept.

Open a Simulink® model and simulate it.

```
model = fullfile(matlabroot, 'examples', 'simulink', 'ex_bus_to_mux_ok');  
open_system(model);  
sim(model)
```

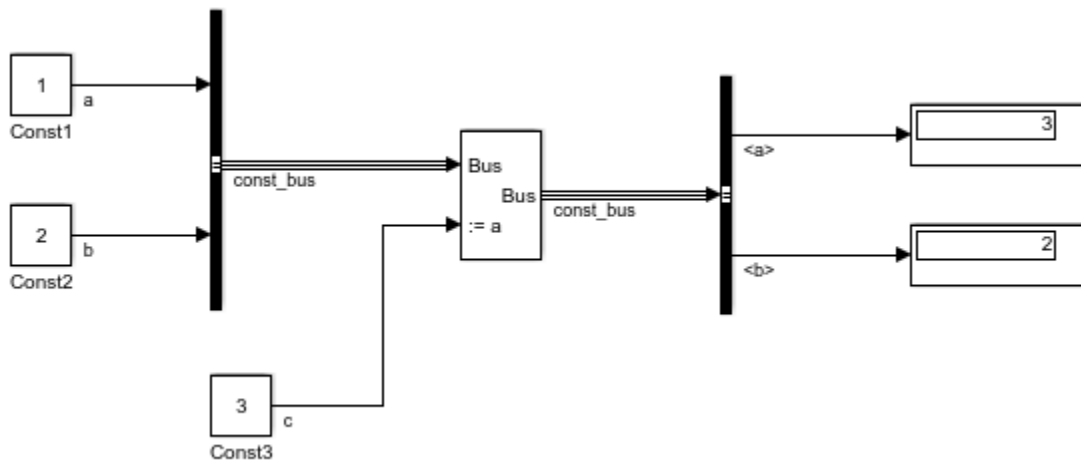

The Gain block cannot accept a bus signal. Inserting a Bus to Vector block provides the type of input signal (a vector) that the Gain block can accept. The Bus to Vector block has no user-accessible parameters.

Assign Signal Values to a Bus

This example shows how to use a Bus Assignment block to change a bus element value without adding Bus Selector and Bus Creator blocks to select bus elements and reassemble them into a bus.

Open the model and simulate it.

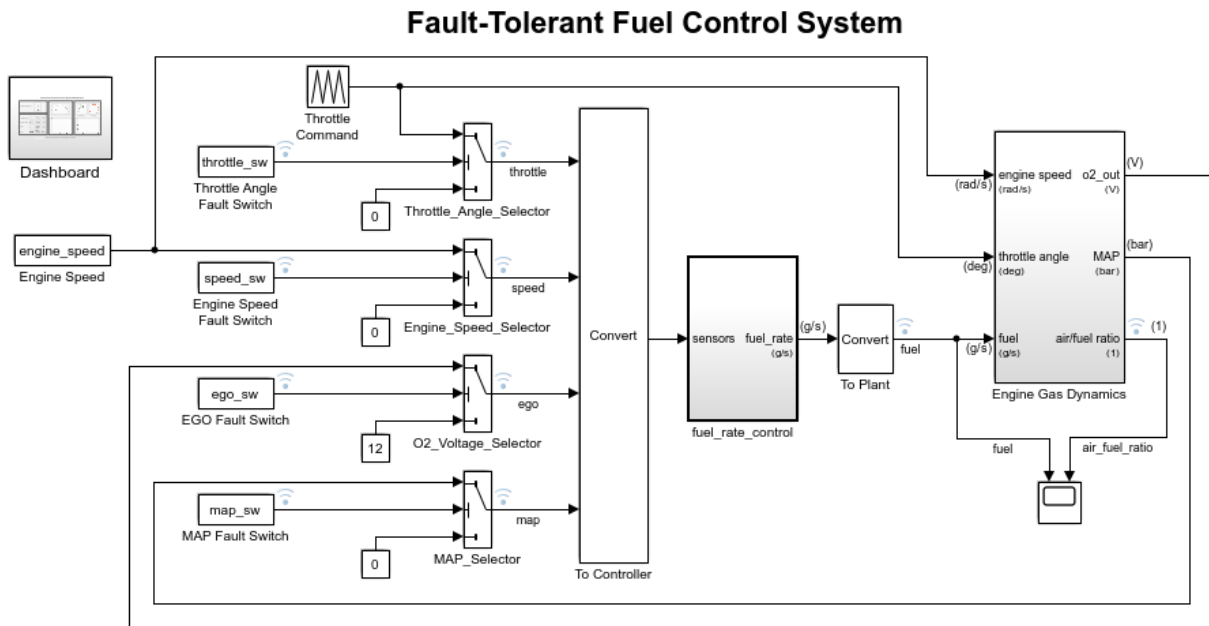

Initially, the value of signal a is 1. However, the Bus Assignment block replaces that initial value of signal a with the value of signal c, which is 3. The const_bus output signal has a value of 3 for signal a, as the Display block shows.

Initialize Your Model Using the Callback Button Block

This example shows how to use the Callback Button block to perform initialization routines on your model.

Explore the Model

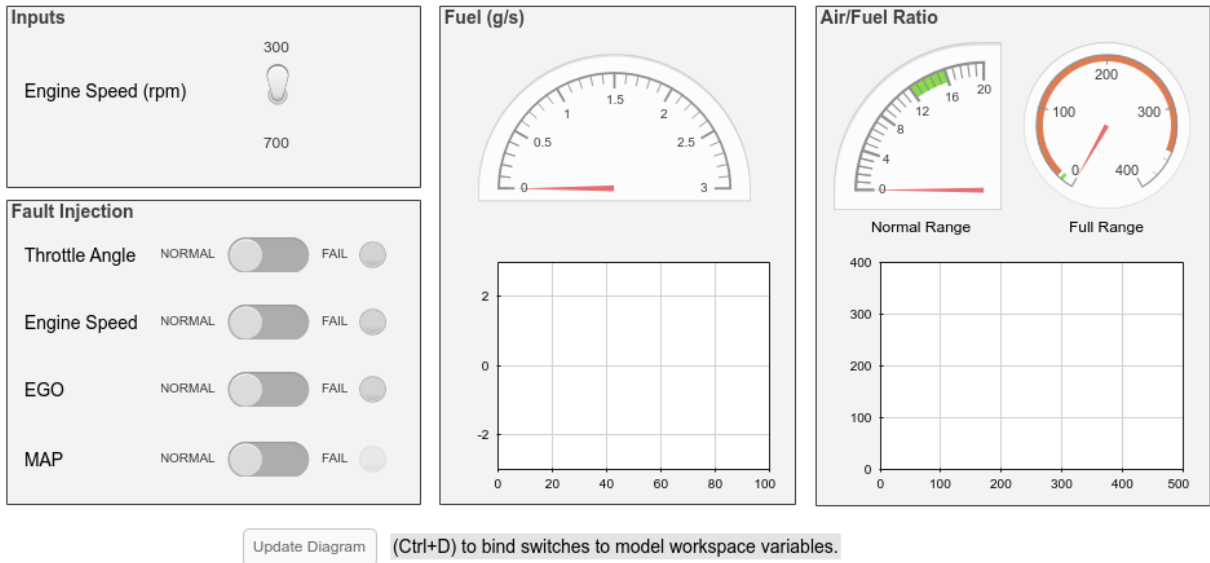

The example model builds on the `sldemo_fuelsys` featured model. When you open the model, to bind the workspace variables to their Dashboard blocks, you have to update the model diagram. Here, the Callback Button block at the bottom of the Dashboard subsystem in the model has been configured to update the diagram on the release of the mouse button when you click the block.

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2016 The MathWorks, Inc.

Fault-Tolerant Fuel Control System Dashboard

You do not need to start a simulation for the Callback Button to react to your input. Just select and then click the Callback Button to run the initialization code. Double-click the Callback Button block to view and edit its parameters, including the press and click scripts.

See Also

Callback Button

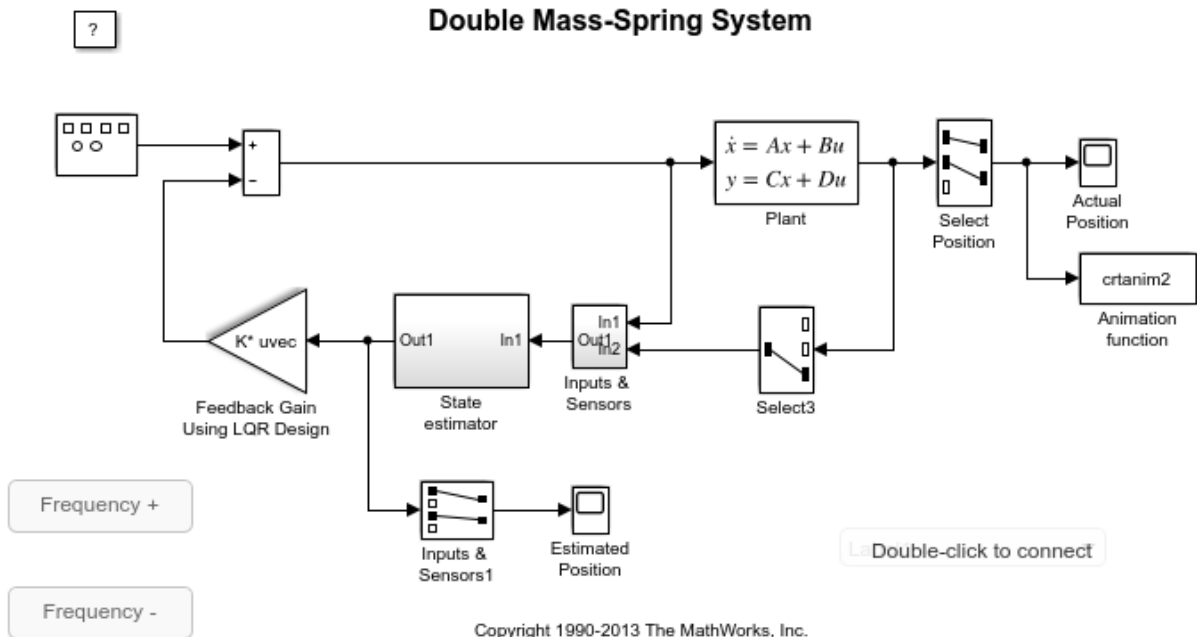

“Control a Parameter Value with Callback Button Blocks” on page 12-9

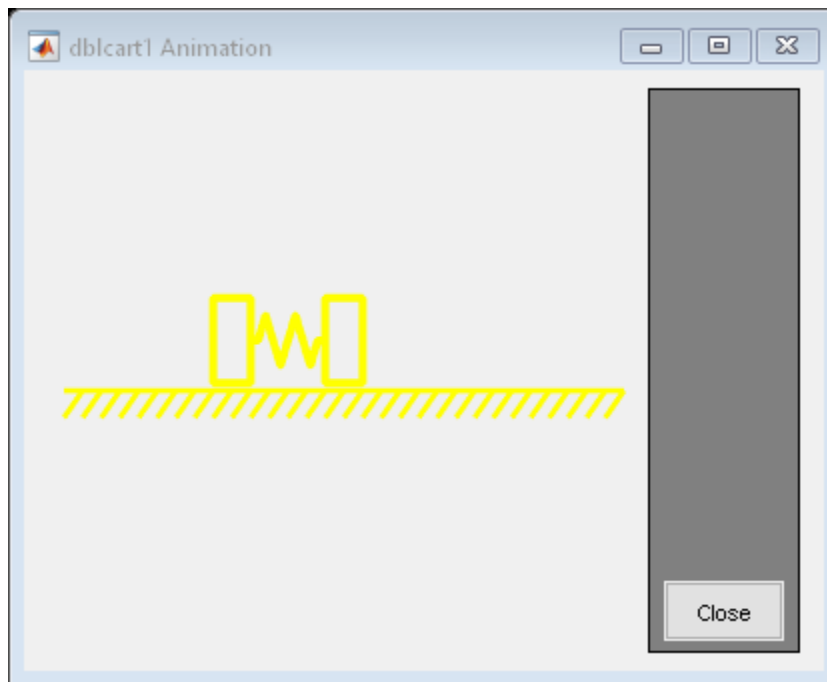

Control a Parameter Value with Callback Button Blocks

This example models control of a system that consists of two masses attached on either side of a spring. A control loop damps the oscillation of the spring that results when an external force acts on the system. The model uses Callback Button blocks to provide an interface for you to adjust the frequency of the external force before and during simulation.

Explore the Model

The model for this example adds two Callback Button blocks, labeled Frequency + and Frequency - to the Double Mass-Spring System model. When you simulate the model, an animation visualizes the system.

Click the button labeled `Frequency +` to increase the oscillation frequency. When you adjust the frequency of the external force, the `Callback Button` block displays a message in the command window indicating the new frequency value. You can adjust the parameter during a simulation and while the model is idle.

Both `Callback Button` blocks in this model are configured with a `ClickFcn` that responds to your clicks and a `PressFcn` that executes when you press the `Callback Button` block. Double-click the `Frequency + Callback Button` block to view its parameters.

When you click the `Frequency + Callback Button` block, the `ClickFcn` increases the frequency of the external force by 0.1. If you press the `Callback Button` block for more than the 500 ms `Press Delay`, the `PressFcn` increases the frequency of the external force by 0.1 every second.

`Callback Button`

“Initialize Your Model Using the Callback Button Block” on page 12-7

Solve a Linear System of Algebraic Equations

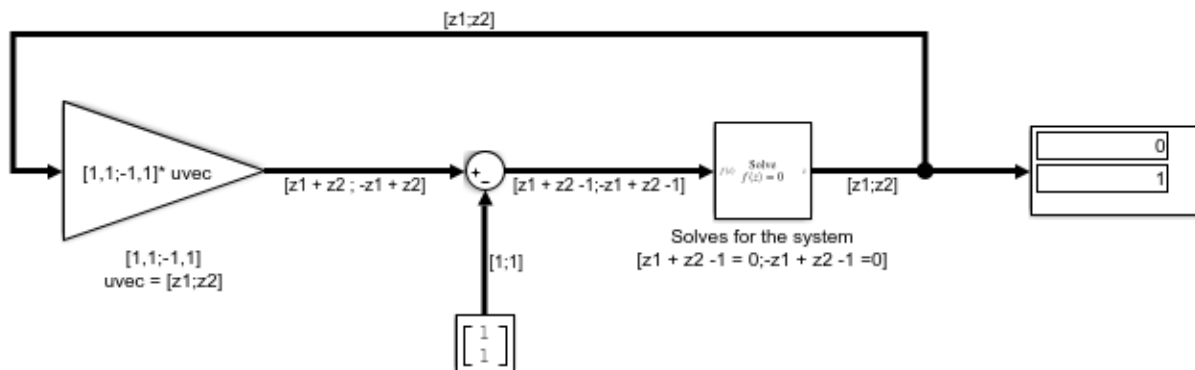

Use the Algebraic Constraint block to solve the system

$$z_1 + z_2 = 1$$

$$z_2 - z_1 = 1$$

The model represents the problem in a vectorized form as

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The signal fed to the Algebraic Constraint block $f(z)$ is a 2×1 vector of the form

$$\begin{bmatrix} z_1 + z_2 - 1 \\ -z_1 - 1 + z_2 - 1 \end{bmatrix}$$

The block is configured to constrain $f(z)$ to 0. Thus solving for $f(z) = 0$ yields the solution $z_1 = 0, z_2 = 1$

Model a Planar Pendulum

Consider a point mass m suspended by a massless rod of length l under the influence of gravity. The position of the mass can be expressed in Cartesian coordinates by (x,y) .

Modeling the System

A force balance of the mass gives the equations of motion in the x and y directions.

$$m\ddot{x} = F \sin \theta \quad (1)$$

$$m\ddot{y} + F \cos \theta = -mg \quad (2)$$

Let (u, v) be the velocities in (x, y) respectively. The system can be rewritten as a system of first order ODEs

$$\dot{x} = u \quad (3)$$

$$\dot{u} = -F \frac{x}{ml} \quad (4)$$

$$\dot{y} = v \quad (5)$$

$$\dot{v} = -F \frac{y}{ml} - g \quad (6)$$

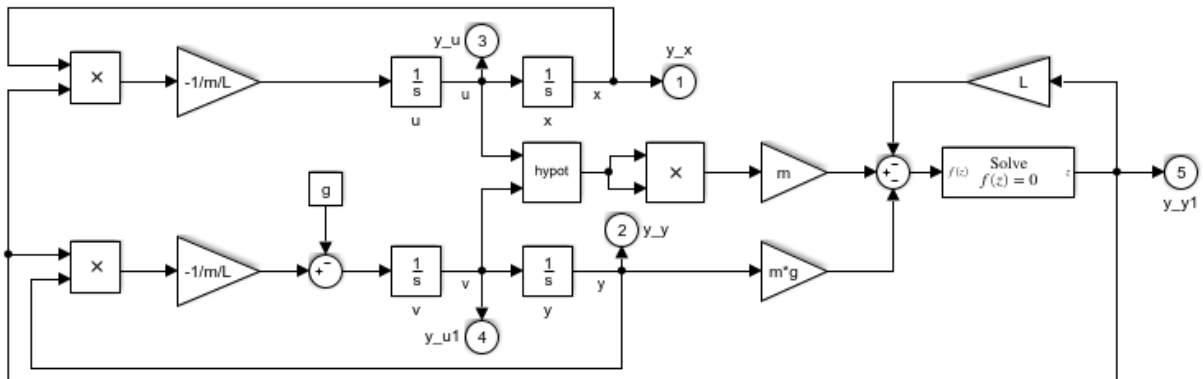

where F is the tension in the rod. The system also possesses the geometric constraint $x^2 + y^2 = l^2$ (7)

Differentiate (7) twice with respect to time t to arrive at $m(u^2 + v^2) - Fl - mgy = 0$ (8)

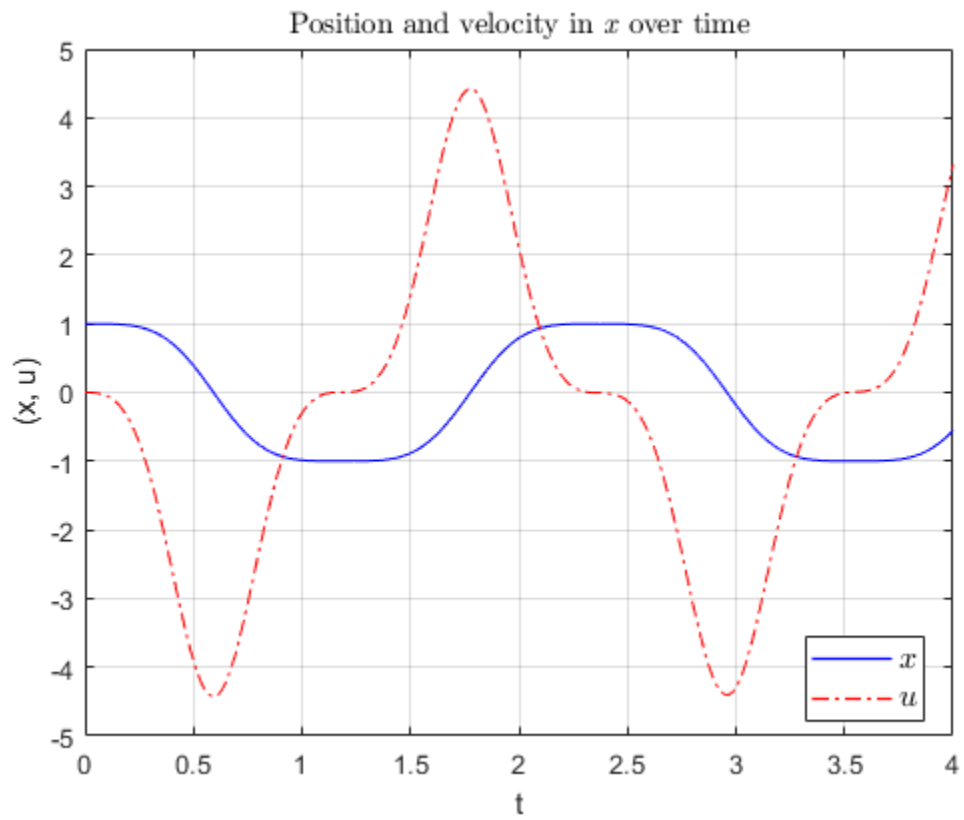

This relationship is useful since it allows F to be determined at every step for use in modeling the kinematics of the system.

Simulating the System

The system is simulated as shown in the figure below

Equation (8) contains one unknown F and is of the form $f(z) = 0$ where $f(z) = m(u^2 + v^2) - Fl - mgy$. The Algebraic Constraint block constrains $f(z)$ to 0 and solves for F in accordance with (8).
