## Rotational Inertia

Ideal mechanical rotational inertia

**Library:** Drivetrain / Couplings

## Description

The Rotational Inertia block implements an ideal mechanical rotational inertia.

## Ports

### Input

#### RTrq — Input torque

scalar

Applied input drive shaft torque, in N·m.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

#### CTrq — Load torque

scalar

Load drive shaft torque, in N·m.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

#### R — Angular velocity and torque

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

### Dependencies

To create this port, for **Port Configuration**, select Two-way connection.

### Inertia – Input

scalar

Additional inertia input, in  $\text{kg}\cdot\text{m}^2$ .

### Dependencies

To create this port, select the **External inertia input** parameter.

## Output

### Spd – Drive shaft speed

scalar

Angular drive shaft speed, in rad/s.

### Dependencies

To create this port, for **Port Configuration**, select Simulink.

### C – Angular velocity and torque

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

### Dependencies

To create this port, for **Port Configuration**, select Two-way connection.

## Parameters

### Block Options

#### Port Configuration – Specify configuration

Simulink (default) | Two-way connection

Specify the port configuration.

### **Dependencies**

Specifying Simulink creates these ports:

- RTrq
- CTrq
- Spd

Specifying Two-way connection creates these ports:

- R
- C

### **Rotational inertia, J — Inertia**

scalar

Rotational inertia, in  $\text{kg}\cdot\text{m}^2$ .

### **Torsional damping, b — Damping**

scalar

Torsional damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

### **Initial velocity, omega\_o — Angular**

scalar

Initial angular velocity, in  $\text{rad}/\text{s}$ .

### **External inertia input — Input inertia**

off (default) | on

Select to create an input port for additional inertia.

Split Torsional Compliance | Torsional Compliance

**Introduced in R2017a**

# Split Torsional Compliance

Split torsional coupler

**Library:** Drivetrain / Couplings

## Description

The Split Torsional Compliance block implements parallel spring-damper coupling between shafts. You can specify the type of coupling by selecting one of the **Coupling Configuration** parameters:

- **Shaft split** — Single input shaft coupled to two output shafts
- **Shaft merge** — Two input shafts coupled to a single output shaft

In fuel economy and emissions studies, you can use the Split Torsional Compliance block to model mechanical rotational compliance between common driveline elements such as motors, planetary gears, and clutches. For example, use the **Shaft split** configuration to couple a motor and two planetary gear sets. Use the **Shaft merge** configuration to couple a dual clutch transmission to an output shaft.

## Shaft Split

For the **Shaft split** configuration, the block implements this schematic and equations.

$$T_{in} = -(\omega_{in} - \omega_{1out})b_1 - (\omega_{in} - \omega_{2out})b_2 - \theta_1 k_1 - \theta_2 k_2$$

$$T_{1out} = (\omega_{in} - \omega_{1out})b_1 + \theta_1 k_1$$

$$T_{2out} = (\omega_{in} - \omega_{2out})b_2 + \theta_2 k_2$$

$$\dot{\theta}_1 = (\omega_{in} - \omega_{1out})$$

$$\dot{\theta}_2 = (\omega_{in} - \omega_{2out})$$

To account for frequency-dependent damping, both damping terms incorporate a low-pass filter.

The equations use these variables.

$T_{in}$	Resulting applied input reaction torque
$\omega_{in}$	Input shaft rotational velocity
$T_{1out}$	Resulting applied torque to first output shaft
$\omega_{1out}$	First output shaft rotational velocity
$T_{2out}$	Resulting applied torque to second output shaft
$\omega_{2out}$	Second output shaft rotational velocity
$b_1, b_2$	First, second shaft viscous damping

$k_1, k_2$  First, second shaft torsional stiffness

## Shaft Merge

For the Shaft merge configuration, the block implements this schematic and equations.

$$T_{out} = (-\omega_{out} + \omega_{1in})b_1 + (-\omega_{out} + \omega_{2in})b_2 + \theta_1 k_1 + \theta_2 k_2$$

$$T_{1out} = (\omega_{out} - \omega_{1in})b_1 - \theta_1 k_1$$

$$T_{2out} = (\omega_{out} - \omega_{2in})b_2 - \theta_2 k_2$$

$$\dot{\theta}_1 = (\omega_{1in} - \omega_{out})$$

$$\dot{\theta}_2 = (\omega_{2in} - \omega_{out})$$

To account for frequency-dependent damping, both damping terms incorporate a low-pass filter.

The equations use these variables.

$T_{out}$  Resulting applied output torque

$\omega_{out}$  Output shaft rotational velocity

$T_{1in}$	Resulting reaction torque to first input shaft
$\omega_{1in}$	First input shaft rotational velocity
$T_{2in}$	Resulting reaction torque to second input shaft
$\omega_{2in}$	Second input shaft rotational velocity
$b_1, b_2$	First, second shaft viscous damping
$k_1, k_2$	First, second shaft torsional stiffness

## Ports

### Input

#### **RSpd — Input shaft speed**

scalar

Input shaft rotational velocity,  $\omega_{in}$ , in rad/s.

#### **Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

#### **C1Spd — First output shaft speed**

scalar

First output shaft rotational velocity,  $\omega_{1out}$ , in rad/s.

#### **Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

#### **C2Spd — Second output shaft speed**

scalar

Second output shaft rotational velocity,  $\omega_{2out}$ , in rad/s.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

**CSpd — Input speed**

scalar

Output shaft rotational velocity,  $\omega_{out}$ , in rad/s.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R1Spd — First input shaft speed**

scalar

First input shaft rotational velocity,  $\omega_{1in}$ , in rad/s.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R2Spd — Second input shaft speed**

scalar

Second input shaft rotational velocity,  $\omega_{2in}$ , in rad/s.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

## **R — Input shaft angular velocity and torque**

two-way connector port

Input shaft angular velocity,  $\omega_{in}$ , in rad/s and torque,  $T_{in}$ , in N·m.

### **Dependencies**

To create this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft split

## **R1 — First input shaft angular velocity and torque**

two-way connector port

First input shaft angular velocity,  $\omega_{1in}$ , in rad/s and torque,  $T_{1in}$ , in N·m.

### **Dependencies**

To create this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft merge

## **R2 — Second input shaft angular velocity and torque**

two-way connector port

Second input shaft angular velocity,  $\omega_{2in}$ , in rad/s and torque,  $T_{2in}$ , in N·m.

### **Dependencies**

To create this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft merge

## **Output**

### **RTrq — Input shaft torque**

scalar

Input shaft torque,  $T_{in}$ , in N·m.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

**C1Trq – First output shaft torque**

scalar

First output shaft torque,  $T_{1out}$ , in N·m.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

**C2Trq – Second output shaft torque**

scalar

Second output shaft torque,  $T_{2out}$ , in N·m.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft split

**CTrq – Output shaft torque**

scalar

Output shaft torque,  $T_{out}$ , in N·m.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R1Trq — First input shaft torque**

scalar

First input shaft torque,  $T_{1in}$ , in N·m.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**R2Trq — Second input shaft torque**

scalar

Second input shaft torque,  $T_{2in}$ , in N·m.

**Dependencies**

To create this port, set both of these parameters:

- **Port Configuration** to Simulink
- **Coupling Configuration** to Shaft merge

**C1 — First output shaft angular velocity and torque**

two-way connector port

First output shaft angular velocity,  $\omega_{1out}$ , in rad/s and torque,  $T_{1out}$ , in N·m.

**Dependencies**

To create this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft split

**C2 — Second output shaft angular velocity and torque**

two-way connector port

Second output shaft angular velocity,  $\omega_{2out}$ , in rad/s and torque,  $T_{2out}$ , in N·m.

**Dependencies**

To create this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft split

### **C – Output shaft angular velocity and torque**

two-way connector port

Output shaft angular velocity,  $\omega_{out}$ , in rad/s and torque,  $T_{out}$ , in N·m.

#### **Dependencies**

To create this port, select:

- **Port Configuration**>Two-way connection
- **Coupling Configuration**>Shaft merge

## **Parameters**

### **Block Options**

#### **Port Configuration – Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

#### **Coupling Configuration – Specify configuration**

Shaft split (default) | Shaft merge

Specify the coupling type.

#### **Coupling 1**

#### **Torsional stiffness, k1 – Stiffness**

scalar

Rotational inertia,  $k_1$ , in N·m/rad.

#### **Torsional damping, b1 – Damping**

scalar

Torsional damping,  $b_1$ , in N·m·s/rad.

**Damping cutoff frequency, omega1\_c — Frequency**

scalar

Damping cutoff frequency, in rad/s.

**Coupling 2**

**Torsional stiffness, k2 — Stiffness**

scalar

Rotational inertia,  $k_2$ , in N·m/rad.

**Torsional damping, b2 — Damping**

scalar

Torsional damping,  $b_2$ , in N·m· s/rad.

**Damping cutoff frequency, omega2\_c — Frequency**

scalar

Damping cutoff frequency, in rad/s.

**See Also**

# Torsional Compliance

Parallel spring-damper

**Library:** Drivetrain / Couplings

## Description

The Torsional Compliance block implements a parallel spring-damper.

## Ports

### Input

**RSpd — Input angular velocity**

scalar

Input angular velocity, in rad/s.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

**CSpd — Load torque angular velocity**

scalar

Input angular velocity due to load torque, in rad/s.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

**R — Angular velocity and torque**

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

### **Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

## **Output**

### **RT<sub>rq</sub> — Input torque**

scalar

Applied input drive shaft torque, in N·m.

### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

### **CT<sub>rq</sub> — Load torque**

scalar

Load drive shaft torque, in N·m.

### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

### **C — Angular velocity and torque**

two-way connector port

Angular velocity in rad/s. Torque is in N·m.

### **Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

## **Parameters**

### **Block Options**

#### **Port Configuration — Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Dependencies**

Specifying Simulink creates these ports:

- RSpd
- CSpd
- RTrq
- CTrq

Specifying Two-way connection creates these ports:

- R
- C

**Torsional stiffness, k – Inertia**

scalar

Torsional stiffness, in N·m/rad.

**Torsional damping, b – Damping**

scalar

Torsional damping, in N·m·s/rad.

**Initial deflection, theta\_o – Angular**

scalar

Initial deflection, in rad.

**Initial velocity difference, domega\_o – Angular**

scalar

Initial velocity difference, in rad/s.

**Damping cut-off frequency, omega\_c – Frequency**

scalar

Damping cut-off frequency, in rad/s.

# Limited Slip Differential

Limited differential as a planetary bevel gear

**Library:** Drivetrain / Final Drive Unit

## Description

The Limited Slip Differential block implements a differential as a planetary bevel gear train. The block matches the drive shaft bevel gear to the crown (ring) bevel gear. You can specify:

- Carrier-to-drive shaft ratio
- Crown wheel location
- Viscous and damping coefficients for the axles and carrier
- Type of slip coupling

Use the block in system-level driveline analysis to account for the power transfer from the transmission to the wheels. The block is suitable for use in hardware-in-the-loop (HIL) and optimization workflows. All the parameters are tunable.

In a limited slip differential, to prevent one of the wheels from slipping, the differential splits the torque applied to the left and right axles. With different torque applied to the axles, the wheels can move at different angular velocities, preventing slip. The block implements three methods for coupling the different torques applied to the axes:

- Pre-loaded ideal clutch
- Slip speed dependent torque data
- Input torque dependent torque data

The block uses a coordinate system that produces positive tire and vehicle motion for standard engine, transmission, and differential configurations. The arrows indicate positive motion.

## Equations

The Limited Slip Differential block implements these differential equations to represent the mechanical dynamic response for the crown gear, left axle, and right axle.

Mechanical Dynamic Response	Differential Equation
Crown Gear	$\dot{\omega}_d J_d = T_d - \omega_d b_d - T_i$
Left Axle	$\dot{\omega}_1 J_1 = T_1 - \omega_1 b_1 - T_{i1}$
Right Axle	$\dot{\omega}_2 J_2 = T_2 - \omega_2 b_2 - T_{i2}$

The block assumes rigid coupling between the crown gear and axles. These constraint equations apply.

$$T_1 = T_2 = \frac{N}{2}T_i + T_c$$

$$\omega_d = \frac{N}{2}(\omega_1 + \omega_2)$$

The equations use these variables.

$N$	Carrier-to-drive shaft gear ratio
$J_d$	Rotational inertia of the crown gear assembly
$b_d$	Crown gear linear viscous damping
$\omega_d$	Driveshaft angular speed
$\varpi$	Slip speed
$J_1$	Axle 1 rotational inertia
$b_1$	Axle 1 linear viscous damping
$\omega_1$	Axle 1 speed
$J_2$	Axle 2 rotational inertia
$b_2$	Axle 2 linear viscous damping
$\omega_2$	Axle 2 angular speed
$T_d$	Driveshaft torque
$T_1$	Axle 1 torque
$T_2$	Axle 2 torque
$T_i$	Axle internal resistance torque
$T_{i1}$	Axle 1 internal resistance torque
$T_{i2}$	Axle 2 internal resistance torque
$\mu$	Coefficient of friction
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius

$R_i$	Annular disk inner radius
$F_c$	Clutch force
$T_c$	Clutch torque
$\mu$	Coefficient of friction

Table blocks in Limited Slip Differential have these parameter settings:

- **Interpolation method** — Linear
- **Extrapolation method** — Clip

The ideal clutch coupling model uses the axle slip speed and friction to calculate the clutch torque. The friction coefficient is a function of the slip speed.

$$T_c = F_c N \mu(|\varpi|) R_{eff} \tanh(4|\varpi|)$$

The disc radii determine the effective clutch radius over which the clutch force acts.

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The angular velocities of the axles determine the slip speed.

$$\varpi = \omega_1 - \omega_2$$

To calculate the clutch torque, the slip speed coupling model uses torque data that is a function of slip speed. The angular velocities of the axles determine the slip speed.

$$\varpi = \omega_1 - \omega_2$$

To calculate the clutch torque, the input torque coupling model uses torque data that is a function of input torque.

The Open Differential block assumes rigid coupling between the crown gear and axles. These constraint equations apply.

$$T_1 = T_2 = \frac{N}{2} T_i$$

$$\omega_{d=} = \frac{N}{2} (\omega_1 + \omega_2)$$

## Ports

### Inputs

#### DriveshftTrq — Torque

scalar

Applied input torque, typically from the engine crankshaft, in N·m.

#### Axl1Trq — Torque

scalar

Axle 1 torque,  $T_1$ , in N·m.

#### Axl2Trq — Torque

scalar

Axle 2 torque,  $T_2$ , in N·m.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Units
Driveshft	DriveshftTrq	Drive shaft torque	N·m
	DriveshftSpd	Drive shaft speed	rad/s
Axl1	Axl1Trq	Axle 1 torque	N·m

Signal		Description	Units
	Axl1Spd	Axle 1 speed	rad/s
Axl2	Axl2Trq	Axle 2 torque	N·m
	Axl2Spd	Axle 2 speed	rad/s
Cplng	CplngTrq	Torque coupling	N·m
	CplngSlipSpd	Slip speed	rad/s

**DriveshaftSpd — Angular speed**

scalar

Drive shaft angular speed,  $\omega_d$ , in rad/s.

**Axl1Spd — Angular speed**

scalar

Axle 1 angular speed,  $\omega_1$ , in rad/s.

**Axl2Spd — Angular speed**

scalar

Axle 2 angular speed,  $\omega_2$ , in rad/s.

## Parameters

**Open Differential**

**Crown wheel (ring gear) located — Specify crown wheel connection**

To the left of center-line (default) | To the right of center-line

Specify the crown wheel connection to the drive shaft.

**Carrier to drive shaft ratio, NC/ND — Ratio**

scalar

Carrier-to-drive shaft gear ratio,  $N$ .

**Carrier inertia, Jd — Inertia**

scalar

Rotational inertia of the crown gear assembly,  $J_d$ , in  $\text{kg}\cdot\text{m}^2$ . You can include the drive shaft inertia.

**Carrier damping, bd – Damping**

scalar

Crown gear linear viscous damping,  $b_d$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Driveshaft 1 inertia, Jw1 – Inertia**

scalar

Driveshaft 1 rotational inertia,  $J_1$ , in  $\text{kg}\cdot\text{m}^2$ .

**Driveshaft 1 damping, bw1 – Damping**

scalar

Driveshaft 1 linear viscous damping,  $b_1$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Driveshaft 2 inertia, Jw2 – Inertia**

scalar

Driveshaft 2 rotational inertia,  $J_2$ , in  $\text{kg}\cdot\text{m}^2$ .

**Driveshaft 2 damping, bw2 – Damping**

scalar

Driveshaft 2 linear viscous damping,  $b_2$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Driveshaft 1 initial velocity, omegaw1o – Angular velocity**

scalar

Driveshaft 1 initial velocity,  $\omega_{o1}$ , in  $\text{rad}/\text{s}$ .

**Driveshaft 2 initial velocity, omegaw2o – Angular velocity**

scalar

Driveshaft 2 initial velocity,  $\omega_{o2}$ , in  $\text{rad}/\text{s}$ .

**Slip Coupling**

**Coupling type – Torque coupling**

Ideal pre-loaded clutch (default) | Slip speed dependent torque data |  
Input torque dependent torque data

Specify the type of torque coupling.

**Number of disks, Ndisks — Torque coupling**

scalar

Number of disks.

**Dependencies**

To enable the ideal clutch parameters, select `Ideal pre-loaded clutch` for the **Coupling type** parameter.

**Effective radius, Reff — Radius**

scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

**Dependencies**

To enable the clutch parameters, select `Ideal pre-loaded clutch` for the **Coupling type** parameter.

**Nominal preload force, Fc — Force**

scalar

Nominal preload force, in N.

**Dependencies**

To enable the clutch parameters, select `Ideal pre-loaded clutch` for the **Coupling type** parameter.

**Friction coefficient vector,  $\mu$  – Friction**  
vector

Friction coefficient vector.

**Dependencies**

To enable the clutch parameters, select Ideal pre-loaded clutch for the **Coupling type** parameter.

**Slip speed vector,  $d\omega$  – Angular velocity**  
vector

Slip speed vector, in rad/s.

**Dependencies**

To enable the clutch parameters, select Ideal pre-loaded clutch for the **Coupling type** parameter.

**Torque - slip speed vector,  $T_{d\omega}$  – Torque**  
vector

Torque vector, in N·m.

**Dependencies**

To enable the slip speed parameters, select Slip speed dependent torque data for the **Coupling type** parameter.

**Slip speed vector,  $d\omega_T$  – Angular velocity**  
vector

Slip speed vector, in rad/s.

**Dependencies**

To enable the slip speed parameters, select Slip speed dependent torque data for the **Coupling type** parameter.

**Torque - input torque vector,  $T_{Tin}$  – Torque**  
vector

Torque vector, in N·m.

### **Dependencies**

To enable the input torque parameters, select Input torque dependent torque data for the **Coupling type** parameter.

### **Input torque vector, $T_{in}$ — Torque vector**

Torque vector, in N·m.

### **Dependencies**

To enable the input torque parameters, select Input torque dependent torque data for the **Coupling type** parameter.

### **Coupling time constant, $\tau_C$ — Constant scalar**

Coupling time constant, in s.

# Open Differential

Differential as a planetary bevel gear

**Library:** Drivetrain / Final Drive Unit

## Description

The Open Differential block implements a differential as a planetary bevel gear train. The block matches the drive shaft bevel gear to the crown (ring) bevel gear. You can specify:

- Carrier-to-drive shaft ratio
- Crown wheel location
- Viscous and damping coefficients for the axles and carrier

Use the Open Differential block to:

- Dynamically couple the post-transmission drive shaft to the wheel axles or universal joints
- Model simplified or older drivetrains when optimal traction control does not require passive or active torque vectoring
- Model mechanical power splitting in generic gearbox and drive line scenarios

The block is suitable for use in hardware-in-the-loop (HIL) and optimization workflows. All the parameters are tunable.

The block uses a coordinate system that produces positive tire and vehicle motion for standard engine, transmission, and differential configurations. The arrows indicate positive motion.

## Equations

The Open Differential block implements these differential equations to represent the mechanical dynamic response for the crown gear, left axle, and right axle.

Mechanical Dynamic Response	Differential Equation
Crown Gear	$\dot{\omega}_d J_d = T_d - \omega_d b_d - T_i$
Left Axle	$\dot{\omega}_1 J_1 = T_1 - \omega_1 b_1 - T_{i1}$
Right Axle	$\dot{\omega}_2 J_2 = T_2 - \omega_2 b_2 - T_{i2}$

The Open Differential block assumes rigid coupling between the crown gear and axles. These constraint equations apply.

$$T_1 = T_2 = \frac{N}{2}T_i$$

$$\omega_{d=} = \frac{N}{2}(\omega_1 + \omega_2)$$

The equations use these variables.

$N$	Carrier-to-drive shaft gear ratio
$J_d$	Rotational inertia of the crown gear assembly
$b_d$	Crown gear linear viscous damping
$\omega_d$	Drive shaft angular speed
$J_1$	Axle 1 rotational inertia
$b_1$	Axle 1 linear viscous damping
$\omega_1$	Axle 1 speed
$J_2$	Axle 2 rotational inertia
$b_2$	Axle 2 linear viscous damping
$\omega_2$	Axle 2 angular speed
$T_d$	Drive shaft torque
$T_1$	Axle 1 torque
$T_2$	Axle 2 torque
$T_i$	Drive shaft internal resistance torque
$T_{i1}$	Axle 1 internal resistance torque
$T_{i2}$	Axle 2 internal resistance torque

## Ports

### Inputs

#### DriveshftTrq — Torque

scalar

Applied input torque, typically from the engine crankshaft, in N·m.

#### Axl1Trq — Torque

scalar

Axle 1 torque,  $T_1$ , in N·m.

#### Axl2Trq — Torque

scalar

Axle 2 torque,  $T_2$ , in N·m.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Units
Driveshft	DriveshftTrq	Drive shaft torque	N·m
	DriveshftSpd	Drive shaft speed	rad/s
Axl1	Axl1Trq	Axle 1 torque	N·m
	Axl1Spd	Axle 1 speed	rad/s
Axl2	Axl2Trq	Axle 2 torque	N·m
	Axl2Spd	Axle 2 speed	rad/s

#### DriveshftSpd — Angular speed

scalar

Drive shaft angular speed,  $\omega_d$ , in rad/s.

**Axl1Spd — Angular speed**

scalar

Axle 1 angular speed,  $\omega_1$ , in rad/s.**Axl2Spd — Angular speed**

scalar

Axle 2 angular speed,  $\omega_2$ , in rad/s.

## Parameters

**Crown wheel (ring gear) located — Specify crown wheel connection**

To the left of center-line (default) | To the right of center-line

Specify the crown wheel connection to the drive shaft.

**Carrier to drive shaft ratio, Ndiff — Ratio**

scalar

Carrier-to-drive shaft gear ratio,  $N$ , dimensionless.**Carrier inertia, Jd — Inertia**

scalar

Rotational inertia of the crown gear assembly,  $J_d$ , in  $\text{kg}\cdot\text{m}^2$ . You can include the drive shaft inertia.**Carrier damping, bd — Damping**

scalar

Crown gear linear viscous damping,  $b_d$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Axle 1 inertia, Jw1 — Inertia**

scalar

Axle 1 rotational inertia,  $J_1$ , in  $\text{kg}\cdot\text{m}^2$ .**Axle 1 damping, bw1 — Damping**

scalar

Axle 1 linear viscous damping,  $b_1$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Axle 2 inertia, Jw2 — Inertia**

scalar

Axle 2 rotational inertia,  $J_2$ , in kg\*m<sup>2</sup>.

**Axle 2 damping, bw2 — Damping**

scalar

Axle 2 linear viscous damping,  $b_2$ , in N·m·s/rad.

**Axle 1 initial velocity, omegaw1o — Angular velocity**

scalar

Axle 1 initial velocity,  $\omega_{o1}$ , in rad/s.

**Axle 2 initial velocity, omegaw2o — Angular velocity**

scalar

Axle 2 initial velocity,  $\omega_{o2}$ , in rad/s.

# Longitudinal Wheel

Longitudinal wheel with disc, drum, or mapped brake

**Library:** Drivetrain / Wheels

## Description

The Longitudinal Wheel block implements the longitudinal behavior of an ideal wheel. You can specify the longitudinal force and rolling resistance calculation method, and brake type. Use the block in driveline and longitudinal vehicle simulations where low frequency tire-road and braking forces are required to determine vehicle acceleration, braking, and wheel-rolling resistance. For example, you can use the block to determine the torque and power requirements for a specified drive cycle or braking event. The block is not suitable for applications that require combined lateral slip.

There are four types of Longitudinal Wheel blocks. Each block implements a different brake type.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - No Brake	None	None
Longitudinal Wheel - Disc Brake	Disc	Brake that converts the brake cylinder pressure into a braking force.
Longitudinal Wheel - Drum Brake	Drum	Simplex drum brake that converts the applied force and brake geometry into a net braking torque.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - Mapped Brake	Mapped	Lookup table that is a function of the wheel speed and applied brake pressure.

The block models longitudinal force as a function of wheel slip relative to the road surface. To calculate the longitudinal force, specify one of these **Longitudinal Force** parameters.

Setting	Block Implementation
Magic Formula constant value	Magic Formula with constant coefficient for stiffness, shape, peak, and curvature.
Magic Formula pure longitudinal slip	Magic Formula with load-dependent coefficients that implement equations 4.E9 through 4.E18 in <i>Tire and Vehicle Dynamics</i> .
Mapped force	Lookup table that is a function of the normal force and wheel slip ratio.

To calculate the rolling resistance torque, specify one of these **Rolling Resistance** parameters.

Setting	Block Implementation
None	None
Pressure and velocity	Method in <i>Stepwise Coastdown Methodology for Measuring Tire Rolling Resistance</i> . The rolling resistance is a function of tire pressure, normal force, and velocity.
Magic Formula	Magic formula equations from 4.E70 in <i>Tire and Vehicle Dynamics</i> . The magic formula is an empirical equation based on fitting coefficients.
Mapped torque	Lookup table that is a function of the normal force and spin axis longitudinal velocity.

To calculate vertical motion, specify one of these **Vertical Motion** parameters.

Setting	Block Implementation
None	Block passes the applied chassis forces directly through to the rolling resistance and longitudinal force calculations.
Mapped stiffness and damping	Vertical motion depends on wheel stiffness and damping. Stiffness is a function of tire sidewall displacement and pressure. Damping is a function of tire sidewall velocity and pressure.

## Rotational Wheel Dynamics

The block calculates the inertial response of the wheel subject to:

- Axle losses
- Brake and drive torque
- Tire rolling resistance
- Ground contact through the tire-road interface

The input torque is the summation of the applied axle torque, braking torque, and moment arising from the combined tire torque.

$$T_i = T_a - T_b + T_d$$

For the moment arising from the combined tire torque, the block implements tractive wheel forces and rolling resistance with first order dynamics. The rolling resistance has a time constant parameterized in terms of a relaxation length.

$$\dot{T}_d = \frac{\omega R_e}{L_e + \omega R_e} (F_x R_e + M_y)$$

To calculate the rolling resistance torque, you can specify one of these **Rolling Resistance** parameters.

Setting	Block Implementation
None	Block sets rolling resistance, $M_y$ , to zero.

Setting	Block Implementation
Pressure and velocity	Block uses the method in <i>Stepwise Coastdown Methodology for Measuring Tire Rolling Resistance</i> . The rolling resistance is a function of tire pressure, normal force, and velocity. Specifically, $M_y = R_e \{a + b V_x  + cV_x^2\} \{F_z^\beta p_i^\alpha\} \tanh(4V_x)$
Magic Formula	Block calculates the rolling resistance, $M_y$ , using the Magic formula equations from 4.E70 in <i>Tire and Vehicle Dynamics</i> . The magic formula is an empirical equation based on fitting coefficients.
Mapped torque	For the rolling resistance, $M_y$ , the block uses a lookup table that is a function of the normal force and spin axis longitudinal velocity.

If the brakes are enabled, the block determines the braking locked or unlocked condition based on an idealized dry clutch friction model. Based on the lock-up condition, the block implements these friction and dynamic models.

If	Lock-Up Condition	Friction Model	Dynamic Model
$\omega \neq 0$ or $T_S <  T_i + T_f - \omega b $	Unlocked	$T_f = T_k$ where, $T_k = F_c R_{eff} \mu_k \tanh[4(-\omega_d)]$	$\dot{\omega} J = -\omega b + T_i + T_o$
$\omega = 0$ and $T_S \geq  T_i + T_f - \omega b $	Locked	$T_s = F_c R_{eff} \mu_s$ $T_f = T_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$	$\omega = 0$

The equations use these variables.

- $\omega$  Wheel angular velocity
- $a$  Velocity independent force component

---

$b$	Linear velocity force component
$c$	Quadratic velocity force component
$L_e$	Tire relaxation length
$J$	Moment of inertia
$M_y$	Rolling resistance torque
$T_a$	Applied axle torque
$T_b$	Braking torque
$T_d$	Combined tire torque
$T_f$	Frictional torque
$T_i$	Net input torque
$T_k$	Kinetic frictional torque
$T_o$	Net output torque
$T_s$	Static frictional torque
$F_c$	Applied clutch force
$F_x$	Longitudinal force developed by the tire road interface due to slip
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius
$R_e$	Effective tire radius while under load and for a given pressure
$V_x$	Longitudinal axle velocity
$F_z$	Vehicle normal force
$\alpha$	Tire pressure exponent
$\beta$	Normal force exponent
$p_i$	Tire pressure
$\mu_s$	Coefficient of static friction
$\mu_k$	Coefficient of kinetic friction

## Brakes

If you specify the **Brake Type** parameter `Disc`, the block implements a disc brake. This figure shows the side and front views of a disc brake.

A disc brake converts brake cylinder pressure from the brake cylinder into force. The disc brake applies the force at the brake pad mean radius.

The block uses these equations to calculate brake torque for the disc brake.

$$T = \begin{cases} \frac{\mu P \pi B_a^2 R_m N_{pads}}{4} & \text{when } N \neq 0 \\ \frac{\mu_{static} P \pi B_a^2 R_m N_{pads}}{4} & \text{when } N = 0 \end{cases}$$

$$R_m = \frac{R_o + R_i}{2}$$

The equations use these variables.

$T$	Brake torque
$P$	Applied brake pressure
$N$	Wheel speed
$N_{pads}$	Number of brake pads in disc brake assembly
$\mu_{static}$	Disc pad-rotor coefficient of static friction
$\mu$	Disc pad-rotor coefficient of kinetic friction
$B_a$	Brake actuator bore diameter
$R_m$	Mean radius of brake pad force application on brake rotor
$R_o$	Outer radius of brake pad
$R_i$	Inner radius of brake pad

If you specify the **Brake Type** parameter Drum, the block implements a static (steady-state) simplex drum brake. A simplex drum brake consists of a single two-sided hydraulic actuator and two brake shoes. The brake shoes do not share a common hinge pin.

The simplex drum brake model uses the applied force and brake geometry to calculate a net torque for each brake shoe. The drum model assumes that the actuators and shoe geometry are symmetrical for both sides, allowing a single set of geometry and friction parameters to be used for both shoes.

The block implements equations that are derived from these equations in *Fundamentals of Machine Elements*.

$$T_{rshoe} = \left( \frac{\pi \mu c r (\cos \theta_2 - \cos \theta_1) B_a^2}{2\mu(2r(\cos \theta_2 - \cos \theta_1) + a(\cos^2 \theta_2 - \cos^2 \theta_1)) + ar(2\theta_1 - 2\theta_2 + \sin 2\theta_2 - \sin 2\theta_1)} \right) P$$

$$T_{lshoe} = \left( \frac{\pi \mu c r (\cos \theta_2 - \cos \theta_1) B_a^2}{-2\mu(2r(\cos \theta_2 - \cos \theta_1) + a(\cos^2 \theta_2 - \cos^2 \theta_1)) + ar(2\theta_1 - 2\theta_2 + \sin 2\theta_2 - \sin 2\theta_1)} \right) P$$

$$T = \begin{cases} T_{rshoe} + T_{lshoe} & \text{when } N \neq 0 \\ (T_{rshoe} + T_{lshoe}) \frac{\mu_{static}}{\mu} & \text{when } N = 0 \end{cases}$$

The equations use these variables.

$T$  Brake torque

$P$	Applied brake pressure
$N$	Wheel speed
$\mu_{static}$	Disc pad-rotor coefficient of static friction
$\mu$	Disc pad-rotor coefficient of kinetic friction
$T_{rshoe}$	Right shoe brake torque
$T_{lshoe}$	Left shoe brake torque
$a$	Distance from drum center to shoe hinge pin center
$c$	Distance from shoe hinge pin center to brake actuator connection on brake shoe
$r$	Drum internal radius
$B_a$	Brake actuator bore diameter
$\Theta_1$	Angle from shoe hinge pin center to start of brake pad material on shoe
$\Theta_2$	Angle from shoe hinge pin center to end of brake pad material on shoe

If you specify the **Brake Type** parameter Mapped, the block uses a lookup table to determine the brake torque.

$$T = \begin{cases} f_{brake}(P, N) & \text{when } N \neq 0 \\ \left( \frac{\mu_{static}}{\mu} \right) f_{brake}(P, N) & \text{when } N = 0 \end{cases}$$

The equations use these variables.

$T$	Brake torque
$f_{brake}(P, N)$	Brake torque lookup table
$P$	Applied brake pressure
$N$	Wheel speed
$\mu_{static}$	Friction coefficient of drum pad-face interface under static conditions
$\mu$	Friction coefficient of disc pad-rotor interface

The lookup table for the brake torque,  $f_{brake}(P, N)$ , is a function of applied brake pressure and wheel speed, where:

- $T$  is brake torque, in N·m.
- $P$  is applied brake pressure, in bar.
- $N$  is wheel speed, in rpm.

## Longitudinal Force

To model the Longitudinal Wheel block longitudinal forces, you can use the Magic Formula. The model provides a steady-state *tire characteristic function*  $F_x = f(\kappa, F_z)$ , the longitudinal force  $F_x$  on the tire, based on:

- Vertical load  $F_z$
- Wheel slip  $\kappa$

The Magic Formula model uses these variables.

$\Omega$	Wheel angular velocity
$r_w$	Wheel radius
$V_x$	Wheel hub longitudinal velocity
$r_w\Omega$	Tire tread longitudinal velocity
$V_{sx} = r_w\Omega - V_x$	Wheel slip velocity
$\kappa = V_{sx}/ V_x $	Wheel slip
$F_z, F_{z0}$	Vertical load and nominal vertical load on tire
$F_x = f(\kappa, F_z)$	Longitudinal force exerted on the tire at the contact point. Also a characteristic function $f$ of the tire.

If you set **Longitudinal Force** to Magic Formula constant value, the block implements the Magic Formula as a specific form of the tire characteristic function, characterized by four dimensionless coefficients ( $B, C, D, E$ ), or stiffness, shape, peak, and curvature:

$$F_x = f(\kappa, F_z) = F_z D \sin\left(C \tan^{-1}\left[\left\{B\kappa - E\left[B\kappa - \tan^{-1}(B\kappa)\right]\right\}\right]\right)$$

The slope of  $f$  at  $\kappa = 0$  is  $BCD \cdot F_z$ .

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

If you set **Longitudinal Force** to Magic Formula pure longitudinal slip, the block implements a more general Magic Formula using dimensionless coefficients that are functions of the tire load. The block implements the longitudinal force equations in Chapter 4 of *Tire and Vehicle Dynamics*, including 4.E9 through 4.E18:

$$F_{x0} = D_x \sin \left( C_x \tan^{-1} \left[ \{ B_x \kappa_x - E_x [ B_x \kappa_x - \tan^{-1} ( B_x \kappa_x ) ] \} \right] \right) + S_{Vx}$$

where:

$$\kappa_x = \kappa + S_{Hx}$$

$$C_x = p_{Cx1} \lambda_{Cx}$$

$$D_x = \mu_x F_z \zeta_1$$

$$\mu_x = (p_{Dx1} + p_{Dx2} df_z)(1 + p_{px3} dp_i + p_{px4} dp_i^2)(1 - p_{Dx3} \gamma^2) \lambda_{\mu x}^*$$

$$E_x = (p_{Ex1} + p_{Ex2} df_z + p_{Ex3} df_z^2) [1 - p_{Ex4} \text{sgn}(\kappa_x)] \lambda_{Ex}$$

$$K_{xx} = F_z (p_{Kx1} + p_{Kx2} df_z) \exp(p_{Kx3} df_z) (1 + p_{px1} dp_i + p_{px2} dp_i^2)$$

$$B_x = K_{xx} / (C_x D_x + \varepsilon_x)$$

$$S_{Hx} = p_{Hx1} + p_{Hx2} df_z$$

$$S_{Vx} = F_z \cdot (p_{Vx1} + p_{Vx2} df_z) \lambda_{Vx} \lambda_{\mu x}^* \zeta_1$$

$S_{Hx}$  and  $S_{Vx}$  represent offsets to the slip and longitudinal force in the force-slip function, or horizontal and vertical offsets if the function is plotted as a curve.  $\mu_x$  is the longitudinal load-dependent friction coefficient.  $\varepsilon_x$  is a small number inserted to prevent division by zero as  $F_z$  approaches zero.

## Vertical Dynamics

If you select no vertical degrees-of-freedom by setting **Vertical Motion** to **None**, the block passes the applied chassis forces directly through to the rolling resistance and longitudinal force calculations.

If you set **Vertical Motion** to **Mapped stiffness and damping**, the vertical motion depends on wheel stiffness and damping. Stiffness is a function of tire sidewall displacement and pressure. Damping is a function of tire sidewall velocity and pressure.

$$F_{ztire}(z, \dot{z}, P_{tire}) = F_{zk}(z, P_{tire}) + F_{zb}(\dot{z}, P_{tire})$$

The block determines the vertical response using this differential equation.

$$\ddot{m} = F_{ztire} - F_z - mg$$

When you disable the vertical degree-of-freedom, the input normal force from the vehicle passes directly to the longitudinal and rolling force calculations.

$$\ddot{z} = \dot{z} = m = 0$$

$$F_{ztire} = mg$$

The block uses the wheel-fixed frame to resolve the vertical forces.

The equations use these variables.

$F_{ztire}$	Tire normal force along the wheel-fixed $z$ -axis
$m$	Axle mass
$F_{zk}$	Tire normal force due to wheel stiffness along the wheel-fixed $z$ -axis
$F_{zb}$	Tire normal force due to wheel damping along the wheel-fixed $z$ -axis
$F_z$	Suspension or vehicle normal force along the wheel-fixed $z$ -axis
$P_{Tire}$	Tire pressure
$z, \dot{z}, \ddot{z}$	Tire displacement, velocity, and acceleration, respectively, along the wheel-fixed $z$ -axis

## Ports

### Input

#### **BrkPrs — Brake pressure**

scalar

Brake pressure, in Pa.

#### **Dependencies**

To create this port, for the **Brake Type** parameter, specify one of these types:

- Disc
- Drum
- Mapped

#### **AxlTrq — Axle torque**

scalar

Axle torque,  $T_a$ , about wheel spin axis, in N·m.

#### **Vx — Velocity**

scalar

Axle longitudinal velocity along vehicle(body)-fixed  $x$ -axis, in m/s.

#### **Fz — Normal force**

scalar

Absolute value of suspension or vehicle normal force along body-fixed z-axis, in N.

### **Gnd — Ground displacement**

scalar

Ground displacement,  $Gndz$ , along negative wheel-fixed z-axis, in m.

### **Dependencies**

To create Gnd:

- Set **Vertical Motion** to Mapped stiffness and damping.
- On the **Vertical** pane, select **Input ground displacement**.

### **lam\_mux — Friction scaling factor**

scalar

Longitudinal friction scaling factor, dimensionless.

### **Dependencies**

To create this port, select **Input friction scale factor**.

### **TirePrs — Tire pressure**

scalar

Tire pressure, in Pa.

### Dependencies

To create this port:

- Set one of these parameters:
  - **Longitudinal Force** to Magic Formula pure longitudinal slip.
  - **Rolling Resistance** to Pressure and velocity or Magic Formula.
  - **Vertical Motion** to Mapped stiffness and damping.
- On the **Wheel Dynamics** pane, select **Input tire pressure**.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
AxlTrq	Axle torque about body-fixed y-axis	N·m
Omega	Wheel angular velocity about body-fixed y-axis	rad/s
Fx	Longitudinal vehicle force along body-fixed x-axis	N
Fz	Vertical vehicle force along body-fixed z-axis	N
My	Rolling resistance torque about body-fixed y-axis	N·m
Kappa	Slip ratio	NA
Vx	Vehicle longitudinal velocity along body-fixed x-axis	m/s
Re	Wheel effective radius along wheel-fixed z-axis	m
BrkTrq	Brake torque about body-fixed y-axis	N·m
BrkPrs	Brake pressure	Pa

Signal	Description	Units
z	Wheel vertical deflection along wheel-fixed z-axis	m
zdot	Wheel vertical velocity along wheel-fixed z-axis	m/s
Gndz	Ground displacement along negative of wheel-fixed z-axis (positive input produces wheel lift)	m
GndFz	Vertical wheel force on ground along negative of wheel-fixed z-axis	N
TirePrs	Tire pressure	Pa

**Fx — Longitudinal axle force**

scalar

Longitudinal force acting on axle, along body-fixed x-axis, in N. Positive force acts to move the vehicle forward.

**Omega — Wheel angular velocity**

scalar

Wheel angular velocity, about body-fixed y-axis, in rad/s.

**z — Wheel vertical deflection**

scalar

Wheel vertical deflection along wheel-fixed z-axis, in m.

**Dependencies**

To create this port, set **Vertical Motion** to Mapped stiffness and damping.

**zdot — Wheel vertical velocity**

scalar

Wheel vertical velocity along wheel-fixed z-axis, in m/s.

**Dependencies**

To create this port, set **Vertical Motion** to Mapped stiffness and damping.

## Parameters

### Block Options

#### Longitudinal Force — Select type

Magic Formula constant value (default) | Magic Formula pure longitudinal slip | Mapped force

The block models longitudinal force as a function of wheel slip relative to the road surface. To calculate the longitudinal force, specify one of these **Longitudinal Force** parameters.

Setting	Block Implementation
Magic Formula constant value	Magic Formula with constant coefficient for stiffness, shape, peak, and curvature.
Magic Formula pure longitudinal slip	Magic Formula with load-dependent coefficients that implement equations 4.E9 through 4.E18 in <i>Tire and Vehicle Dynamics</i> .
Mapped force	Lookup table that is a function of the normal force and wheel slip ratio.

**Brake Type — Select type**

None | Disc | Drum | Mapped

There are four types of Longitudinal Wheel blocks. Each block implements a different brake type.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - No Brake	None	None
Longitudinal Wheel - Disc Brake	Disc	Brake that converts the brake cylinder pressure into a braking force.

Block Name	Brake Type Setting	Brake Implementation
Longitudinal Wheel - Drum Brake	Drum	Simplex drum brake that converts the applied force and brake geometry into a net braking torque.
Longitudinal Wheel - Mapped Brake	Mapped	Lookup table that is a function of the wheel speed and applied brake pressure.

### Vertical Motion – Select type

None (default) | Mapped stiffness and damping

To calculate vertical motion, specify one of these **Vertical Motion** parameters.

Setting	Block Implementation
None	Block passes the applied chassis forces directly through to the rolling resistance and longitudinal force calculations.
Mapped stiffness and damping	Vertical motion depends on wheel stiffness and damping. Stiffness is a function of tire sidewall displacement and pressure. Damping is a function of tire sidewall velocity and pressure.

**Longitudinal scaling factor, lam\_x — Friction scaling factor**

1 (default)

Longitudinal friction scaling factor, dimensionless.

**Dependencies**

To enable this parameter, clear **Input friction scale factor**.

**Input friction scale factor — Selection**

Off (default)

Create input port for longitudinal friction scaling factor.

**Dependencies**

Selecting this parameter:

- Creates Input port `lam_mux`.
- Disables parameter **Longitudinal scaling factor, `lam_x`**.

## Wheel Dynamics

**Axle viscous damping coefficient, `br` – Damping**  
scalar

Axle viscous damping coefficient, *br*, in N·m·s/rad.

**Wheel inertia, `Iyy` – Inertia**  
scalar

Wheel inertia, in Km\*m<sup>2</sup>.

**Wheel initial angular velocity, `omegao` – Wheel speed**  
scalar

Initial angular velocity of wheel, along body-fixed y-axis, in rad/s.

**Relaxation length, `Lrel` – Relaxation length**  
scalar

Wheel relaxation length, in m.

**Loaded radius, `Re` – Loaded radius**  
scalar

Loaded wheel radius, *Re*, in m.

**Unloaded radius, UNLOADED\_RADIUS** — Unloaded radius  
scalar

Unloaded wheel radius, in m.

**Dependencies**

To create this parameter, set **Rolling Resistance** to Pressure and velocity or Magic Formula.

**Nominal longitudinal speed, LONGVL** — Speed  
scalar

Nominal longitudinal speed along body-fixed x-axis, in m/s.

**Dependencies**

To enable this parameter, set **Longitudinal Force** to Magic Formula pure longitudinal slip.

**Nominal camber angle, gamma** — Camber  
scalar

Nominal camber angle, in rad.

**Dependencies**

To enable this parameter, set either:

- **Longitudinal Force** to Magic Formula pure longitudinal slip.
- **Rolling Resistance** to Magic Formula.

### Nominal pressure, **NOMPRES** — Pressure scalar

Nominal pressure, in Pa.

#### Dependencies

To enable this parameter, set either:

- **Longitudinal Force** to Magic Formula pure longitudinal slip.
- **Rolling Resistance** to Magic Formula.

### Pressure, **press** — Pressure scalar

Pressure, in Pa.

#### Dependencies

To enable this parameter:

- Set one of these:
  - **Longitudinal Force** to Magic Formula pure longitudinal slip.
  - **Rolling Resistance** to Pressure and velocity or Magic Formula.
  - **Vertical Motion** to Mapped stiffness and damping.
- On the **Wheel Dynamics** pane, clear **Input tire pressure**.

## Longitudinal

### Magic Formula Constant Value

### Pure longitudinal peak factor, **Dx** — Factor scalar

Pure longitudinal peak factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

<b>Surface</b>	<b>B</b>	<b>C</b>	<b>D</b>	<b>E</b>
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

**Pure longitudinal shape factor, Cx — Factor**  
scalar

Pure longitudinal shape factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

<b>Surface</b>	<b>B</b>	<b>C</b>	<b>D</b>	<b>E</b>
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

**Pure longitudinal stiffness factor, Bx — Factor**  
scalar

Pure longitudinal stiffness factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

### Dependencies

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

### Pure longitudinal curvature factor, Ex – Factor scalar

Pure longitudinal curvature factor, dimensionless.

The coefficients are based on empirical tire data. These values are typical sets of constant Magic Formula coefficients for common road conditions.

Surface	B	C	D	E
Dry tarmac	10	1.9	1	0.97
Wet tarmac	12	2.3	0.82	1
Snow	5	2	0.3	1
Ice	4	2	0.1	1

### Dependencies

To create this parameter, select the **Longitudinal Force** parameter Magic Formula constant value.

### Magic Formula Pure Longitudinal Slip

### Cfx shape factor, PCX1 – Factor scalar

Cfx shape factor, PCX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal friction at nominal normal load, PDX1 — Factor**

scalar

Longitudinal friction at nominal normal load, PDX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Frictional variation with load, PDX2 — Factor**

scalar

Frictional variation with load, PDX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Frictional variation with camber, PDX3 — Factor**

scalar

Frictional variation with camber, PDX3, 1/rad<sup>2</sup>.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal curvature at nominal normal load, PEX1 — Factor**

scalar

Longitudinal curvature at nominal normal load, PEX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of curvature factor with load, PEX2 – Factor**  
scalar

Variation of curvature factor with load, PEX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of curvature factor with square of load, PEX3 – Factor**  
scalar

Variation of curvature factor with square of load, PEX3, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal curvature factor with slip, PEX4 – Factor**  
scalar

Longitudinal curvature factor with slip, PEX4, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal slip stiffness at nominal normal load, PKX1 – Factor**  
scalar

Longitudinal slip stiffness at nominal normal load, PKX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of slip stiffness with load, PKX2 – Factor**  
scalar

Variation of slip stiffness with load, PKX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Slip stiffness exponent factor, PKX3 — Factor**  
scalar

Slip stiffness exponent factor, PKX3, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Horizontal shift in slip ratio at nominal normal load, PHX1 — Factor**  
scalar

Horizontal shift in slip ratio at nominal normal load, PHX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of horizontal slip ratio with load, PHX2 — Factor**  
scalar

Variation of horizontal slip ratio with load, PHX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Vertical shift in load at nominal normal load, PVX1 — Factor**  
scalar

Vertical shift in load at nominal normal load, PVX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Variation of vertical shift with load, PVX2 – Factor**

scalar

Variation of vertical shift with load, PVX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Linear variation of longitudinal slip stiffness with tire pressure, PPX1 – Factor**

scalar

Linear variation of longitudinal slip stiffness with tire pressure, PPX1, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Quadratic variation of longitudinal slip stiffness with tire pressure, PPX2 – Factor**

scalar

Quadratic variation of longitudinal slip stiffness with tire pressure, PPX2, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Linear variation of peak longitudinal friction with tire pressure, PPX3 – Factor**

scalar

Linear variation of peak longitudinal friction with tire pressure, PPX3, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Quadratic variation of peak longitudinal friction with tire pressure, PPX4 — Factor**

scalar

Quadratic variation of peak longitudinal friction with tire pressure, PPX4, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Slip speed decay fuction scaling factor, lam\_muV — Factor**

scalar

Slip speed decay function scaling factor, lam\_muV, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Brake slip stiffness scaling factor, lam\_Kxkappa — Factor**

scalar

Brake slip stiffness scaling factor, lam\_Kxkappa, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal shape scaling factor, lam\_Cx — Factor**

scalar

Longitudinal shape scaling factor, lam\_Cx, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal curvature scaling factor, lam\_Ex — Factor**

scalar

Longitudinal curvature scaling factor, lam\_Ex, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal horizontal shift scaling factor, lam\_Hx – Factor**  
scalar

Longitudinal horizontal shift scaling factor, lam\_Hx, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Longitudinal vertical shift scaling factor, lam\_Vx – Factor**  
scalar

Longitudinal vertical shift scaling factor, lam\_Vx, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Magic Formula pure longitudinal slip.

**Mapped Force**

**Slip ratio breakpoints, kappaFx – Breakpoints**  
vector

Slip ratio breakpoints, dimensionless.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Mapped force.

**Normal force breakpoints, FzFx – Breakpoints**  
vector

Normal force breakpoints, N.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Mapped force.

**Longitudinal force map, FxMap — Lookup table**

array

Longitudinal force versus slip ratio and normal force, N.

**Dependencies**

To create this parameter, select the **Longitudinal Force** parameter Mapped force.

**Rolling Resistance**

**Pressure and Velocity**

**Velocity independent force coefficient, aMy — Force coefficient**

scalar

Velocity independent force coefficient, in s/m.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.

**Linear velocity force component, bMy — Force component**

scalar

Linear velocity force component, in s/m.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.

**Quadratic velocity force component, cMy — Force component**

scalar

Quadratic velocity force component, in  $s^2/m^2$ .

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.

**Tire pressure exponent,  $\alpha_{My}$  – Pressure exponent**

scalar

Tire pressure exponent, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.

**Normal force exponent,  $\beta_{My}$  – Force exponent**

scalar

Normal force exponent, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Pressure and velocity.

**Magic Formula****Rolling resistance torque coefficient,  $Q_{SY1}$  – Torque coefficient**

scalar

Rolling resistance torque coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Longitudinal force rolling resistance coefficient,  $Q_{SY2}$  – Force resistance coefficient**

scalar

Longitudinal force rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Linear rotational speed rolling resistance coefficient,  $Q_{SY3}$  – Linear speed coefficient**

scalar

Linear rotational speed rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Quartic rotational speed rolling resistance coefficient, QSY4 — Quartic speed coefficient**

scalar

Quartic rotational speed rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Camber squared rolling resistance torque, QSY5 — Camber resistance torque**

scalar

Camber squared rolling resistance torque, in  $1/\text{rad}^2$ .

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Load based camber squared rolling resistance torque, QSY6 — Load resistance torque**

scalar

Load based camber squared rolling resistance torque, in  $1/\text{rad}^2$ .

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Normal load rolling resistance coefficient, QSY7 — Normal resistance coefficient**

scalar

Normal load rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Pressure load rolling resistance coefficient, QSY8 – Pressure resistance coefficient**

scalar

Pressure load rolling resistance coefficient, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Rolling resistance scaling factor, lam\_My – Scale**

scalar

Rolling resistance scaling factor, dimensionless.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Magic Formula.

**Mapped****Spin axis velocity breakpoints, VxMy – Breakpoints**

vector

Spin axis velocity breakpoints, in m/s.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Mapped torque.

**Normal force breakpoints, FzMy – Breakpoints**

vector

Normal force breakpoints, in N.

**Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Mapped torque.

**Rolling resistance torque map, MyMap – Lookup table**

scalar

Rolling resistance torque versus axle speed and normal force, in N·m.

### **Dependencies**

To create this parameter, select the **Rolling Resistance** parameter Mapped torque.

## **Brake**

### **Static friction coefficient, mu\_static — Static friction**

scalar

Static friction coefficient, dimensionless.

### **Dependencies**

To enable this parameter, for the **Brake Type** parameter, specify one of these types:

- Disc
- Drum
- Mapped

### **Kinetic friction coefficient, mu\_kinetic — Kinetic friction**

scalar

Kinematic friction coefficient, dimensionless.

### **Dependencies**

To enable this parameter, for the **Brake Type** parameter, specify one of these types:

- Disc
- Drum
- Mapped

### **Disc**

### **Disc brake actuator bore, disc\_abore — Bore distance**

scalar

Disc brake actuator bore, in m.

### **Dependencies**

To enable the disc brake parameters, select Disc for the **Brake Type** parameter.

**Brake pad mean radius, Rm — Radius**

scalar

Brake pad mean radius, in m.

**Dependencies**To enable the disc brake parameters, select Disc for the **Brake Type** parameter.**Number of brake pads, num\_pads — Count**

scalar

Number of brake pads.

**Dependencies**To enable the disc brake parameters, select Disc for the **Brake Type** parameter.**Drum****Drum brake actuator bore, disc\_abore — Bore distance**

scalar

Drum brake actuator bore, in m.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Shoe pin to drum center distance, drum\_a — Distance**

scalar

Shoe pin to drum center distance, in m.

**Dependencies**To enable the drum brake parameters, select Drum for the **Brake Type** parameter.**Shoe pin center to force application point distance, drum\_c — Distance**

scalar

Shoe pin center to force application point distance, in m.

**Dependencies**

To enable the drum brake parameters, select Drum for the **Brake Type** parameter.

**Drum internal radius, drum\_r — Radius**

scalar

Drum internal radius, in m.

**Dependencies**

To enable the drum brake parameters, select Drum for the **Brake Type** parameter.

**Shoe pin to pad start angle, drum\_theta1 — Angle**

scalar

Shoe pin to pad start angle, in deg.

**Dependencies**

To enable the drum brake parameters, select Drum for the **Brake Type** parameter.

**Shoe pin to pad end angle, drum\_theta2 — Angle**

scalar

Shoe pin to pad end angle, in deg.

**Dependencies**

To enable the drum brake parameters, select Drum for the **Brake Type** parameter.

**Mapped**

**Brake actuator pressure breakpoints, brake\_p\_bpt — Breakpoints**

vector

Brake actuator pressure breakpoints, in bar.

**Dependencies**

To enable the mapped brake parameters, select Mapped for the **Brake Type** parameter.

**Wheel speed breakpoints, brake\_n\_bpt — Breakpoints**

vector

Wheel speed breakpoints, in rpm.

## Dependencies

To enable the mapped brake parameters, select Mapped for the **Brake Type** parameter.

### Brake torque map, $f_{brake\_t}$ — Lookup table

array

The lookup table for the brake torque,  $f_{brake}(P, N)$ , is a function of applied brake pressure and wheel speed, where:

- $T$  is brake torque, in N·m.
- $P$  is applied brake pressure, in bar.
- $N$  is wheel speed, in rpm.

## Dependencies

To enable the mapped brake parameters, select Mapped for the **Brake Type** parameter.

## Vertical

### Nominal normal force, $FNOMIN$ — Force

scalar

Nominal rated wheel load along wheel-fixed z-axis, in N.

## Dependencies

To enable this parameter, set either:

- **Longitudinal Force** to Magic Formula pure longitudinal slip.
- **Rolling Resistance** to Magic Formula.

**Nominal rated load scaling factor, lam\_Fzo — Factor**  
scalar

Nominal rated load scaling factor, dimensionless. Used to scale the normal for specific applications and load conditions.

**Dependencies**

To enable this parameter, set **Longitudinal Force** to Magic Formula pure longitudinal slip.

**Wheel and unsprung mass, m — Mass**  
scalar

Wheel and unsprung mass, in kg. Used in the vertical motion calculations.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Initial deflection, zo — Deflection**  
scalar

Initial axle displacement along wheel-fixed z-axis, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Initial velocity, zdoto — Velocity**  
scalar

Initial axle velocity along wheel-fixed z-axis, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Gravitational acceleration, g — Gravity**  
scalar

Gravitational acceleration, in m/s<sup>2</sup>.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Ground displacement, Gndz — Displacement**

scalar

Ground displacement, Gndz, along negative wheel-fixed z-axis, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Mapped Stiffness and Damping****Vertical deflection breakpoints, zFz — Breakpoints**

vector

Vector of sidewall deflection breakpoints corresponding to the force table, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Pressure breakpoints, pFz — Breakpoints**

vector

Vector of pressure data points corresponding to the force table, in Pa.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Force due to deflection, Fzz — Force**

vector

Force due to sidewall deflection and pressure along wheel-fixed z-axis, in N.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Vertical velocity breakpoints, zdotFz — Breakpoints**

scalar

Vector of sidewall velocity breakpoints corresponding to the force due to velocity table, in m.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Force due to velocity, Fzzdot — Force**

scalar

Force due to sidewall velocity and pressure along wheel-fixed z-axis, in N.

**Dependencies**

To enable this parameter, set **Vertical Motion** to Mapped stiffness and damping.

**Simulation Setup**

**Minimum normal force, FZMIN — Force**

scalar

Minimum normal force, in N. Used with all vertical force calculations.

**Maximum normal force, FZMAX — Force**

scalar

Maximum normal force, in N. Used with all vertical force calculations.

**Max allowable slip ratio (absolute), kappamax – Ratio**  
scalar

Maximum allowable absolute slip ratio, dimensionless.

**Velocity tolerance used to handle low velocity situations, VXL0W – Tolerance**  
scalar

Velocity tolerance used to handle low-velocity situations, in m/s.

## Planetary Gear

Ideal planetary gear with sun, ring, and carrier

**Library:** Drivetrain / Couplings

### Description

The Planetary Gear block implements an ideal planetary gear coupling consisting of a rigidly coupled sun, ring, and carrier gears. The block calculates the dynamic response to the sun, carrier, and ring input torques.

In fuel economy and powertrain studies, you can use the Planetary Gear block as a power-split device by coupling it to common driveline elements such as transmissions, engines, clutches, and differentials.

These equations of motion represent the dynamic response of the planetary gear.

$$\begin{aligned}\dot{\omega}_s J_s &= \dot{\omega}_s b_s + T_s + T_{ps} \\ \dot{\omega}_c J_c &= \dot{\omega}_c b_c + T_c + T_{pc} \\ \dot{\omega}_r J_r &= \dot{\omega}_r b_r + T_r + T_{pr} \\ \dot{\omega}_p J_p &= \dot{\omega}_p b_p + T_{rp} + T_{sp} + T_{cp}\end{aligned}$$

To reduce the equations of motion, the block uses these kinematic and geometric constraints.

$$\begin{aligned}\omega_c r_c &= r_s \omega_s + r_p \omega_p \\ \omega_r r_r &= r_c \omega_c + r_p \omega_p \\ r_c &= r_s + r_p \\ r_r &= r_c + r_p\end{aligned}$$

The equations use these variables.

$\omega_c, \omega_p, \omega_r, \omega_s$	Carrier, planet, ring, and sun gear angular speed
$r_c, r_p, r_r, r_s$	Carrier, planet, ring, and sun gear angular radius
$J_c, J_p, J_r, J_s$	Carrier, planet, ring, and sun gear inertia
$T_c, T_p, T_r, T_s$	Applied carrier, planet, ring, and sun gear torque
$T_{ps}$	Torque applied from planet gear on sun gear
$T_{pc}$	Torque applied from planet gear on carrier gear
$T_{pr}$	Torque applied from planet gear on ring gear
$T_{rp}$	Torque applied from ring gear on planet gear
$T_{sp}$	Torque applied from sun gear on planet gear
$T_{cp}$	Torque applied from carrier gear on planet gear

## Ports

### Input

**SunTrq** – Sun gear applied torque  
scalar

Sun gear input torque,  $T_s$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**CarrTrq — Carrier gear applied torque**

scalar

Carrier gear input torque,  $T_c$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**RingTrq — Ring gear applied torque**

scalar

Ring gear applied torque,  $T_r$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**C — Carrier gear angular speed and torque**

two-way connector port

Carrier gear angular speed,  $\omega_c$ , in rad/s. Carrier gear applied torque,  $T_c$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
Sun	SunTrq Sun gear applied torque	$T_s$	N.m

Signal		Description	Variable	Units
	SunSpd	Sun gear angular speed	$\omega_s$	rad/s
Carr	CarrTrq	Carrier gear applied torque	$T_c$	N.m
	CarrSpd	Carrier gear angular speed	$\omega_c$	rad/s
Ring	RingTrq	Ring gear applied torque	$T_r$	N.m
	RingSpd	Ring gear angular speed	$\omega_r$	rad/s

### SunSpd — Sun gear angular speed

scalar

Sun gear angular speed,  $\omega_s$ , in rad/s.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

### CarrSpd — Carrier gear angular speed

scalar

Carrier gear angular speed,  $\omega_c$ , in rad/s.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

### RingSpd — Ring gear angular speed

scalar

Ring gear angular speed,  $\omega_r$ , in rad/s.

#### Dependencies

To create this port, for **Port Configuration**, select Simulink.

### S — Sun gear angular speed and torque

two-way connector port

Sun gear angular speed,  $\omega_s$ , in rad/s. Sun gear applied torque,  $T_s$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

**R — Ring gear angular speed and torque**

two-way connector port

Ring gear angular speed,  $\omega_r$ , in rad/s. Ring gear applied torque,  $T_r$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

## Parameters

**Block Options**

**Port Configuration — Specify configuration**

Simulink (default) | Two-way connection

Specify the port configuration.

**Dependencies**

Specifying Simulink creates these ports:

- SunTrq
- CarrTrq
- RingTrq
- SunSpd
- CarrSpd
- RingSpd

Specifying Two-way connection creates these ports:

- C
- S
- R

**Sun to planet ratio,  $N_{sp}$  – Ratio**

scalar

Sun-to-planet gear ratio, dimensionless.

**Sun to ring ratio,  $N_{sr}$  – Ratio**

scalar

Sun-to-ring gear ratio, dimensionless.

**Sun inertia,  $J_s$  – Inertia**

scalar

Sun gear inertia,  $J_s$ , in  $\text{kg}\cdot\text{m}^2$ .**Planet inertia,  $J_p$  – Inertia**

scalar

Planet gear inertia,  $J_p$ , in  $\text{kg}\cdot\text{m}^2$ .**Ring inertia,  $J_r$  – Inertia**

scalar

Ring gear inertia,  $J_r$ , in  $\text{kg}\cdot\text{m}^2$ .**Carrier inertia,  $J_c$  – Inertia**

scalar

Carrier gear inertia,  $J_c$ , in  $\text{kg}\cdot\text{m}^2$ .**Sun viscous damping,  $b_s$  – Damping**

scalar

Sun gear viscous damping,  $b_s$ ,  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Ring viscous damping,  $b_r$  – Damping**

scalar

Ring gear viscous damping,  $b_r$ ,  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Planet viscous damping,  $b_p$  – Damping**

scalar

Planet gear viscous damping,  $b_p$ , N·m· s/rad.

**Carrier viscous damping,  $b_c$  — Damping**

scalar

Carrier gear viscous damping,  $b_c$ , N·m· s/rad.

**Initial sun velocity,  $ws_o$  — Angular speed**

scalar

Initial sun gear angular speed, in rad/s.

**Initial carrier velocity,  $wc_o$  — Angular speed**

scalar

Initial carrier gear angular speed, in rad/s.

**Introduced in R2017a**

# Gearbox

Ideal rotational gearbox

**Library:** Drivetrain / Couplings

## Description

The Gearbox block implements an ideal rotational gearbox. The block uses the gear inertias and damping to calculate the velocity response to the base and follower gear pair input torques.

In fuel economy and powertrain efficiency studies, you can use the Gearbox block to model ideal gear coupling and the power transfer between common driveline elements such as transmissions, engines, clutches, and differentials.

The Gearbox block uses these equations to approximate the transmission dynamics.

$$\begin{aligned}\dot{\omega}_B J_B &= \omega_B b_B + N T_F \\ \dot{\omega}_F J_F &= \omega_F b_F + T_F\end{aligned}$$

This constraint equation reduces the system to a 1 DOF system.

$$\omega_B = N \omega_F$$

To express the ideal torque transfer, the block uses this relationship.

$$N T_B + T_F = 0$$

The equations use these variables.

$T_B$	Base gear input torque
$T_F$	Follower gear output torque
$\omega_B$	Base gear angular velocity
$\omega_F$	Follower gear angular velocity
$J_B$	Base gear rotational inertia
$J_F$	Follower gear rotational inertia
$b_B$	Base gear rotational viscous damping
$b_F$	Follower gear rotational viscous damping
$N$	Torque transmission gear ratio

## Ports

### Input

#### **BTrq — Base gear input torque**

scalar

Base gear input torque,  $T_B$ , in N.m.

#### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

#### **FTrq — Follower gear output torque**

scalar

Follower gear output torque,  $T_F$ , in N.m.

#### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

#### **B — Base gear angular velocity and torque**

two-way connector port

Base gear angular velocity,  $\omega_B$ , in rad/s. Base gear torque,  $T_B$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units
Base	BaseTrq	Base gear input torque	$T_B$	N.m
	BaseSpd	Base gear angular velocity	$\omega_B$	rad/s
Flwr	FlwrTrq	Follower gear torque	$T_F$	N.m
	FlwrSpd	Follower gear angular velocity	$\omega_F$	rad/s

**BSpd — Base gear angular velocity**

scalar

Base gear angular velocity,  $\omega_B$ , in rad/s.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**FSpd — Follower gear angular velocity**

scalar

Follower gear angular velocity,  $\omega_F$ , in rad/s.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**F — Follower gear angular velocity and torque**

two-way connector port

Follower gear angular velocity,  $\omega_F$ , in rad/s. Follower gear torque,  $T_F$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select `Two-way connection`.

## Parameters

**Block Options**

**Port Configuration — Specify configuration**

Simulink (default) | `Two-way connection`

Specify the port configuration.

**Dependencies**

Specifying `Simulink` creates these ports:

- BSpd
- FSpd
- BTrq
- FTrq

Specifying `Two-way connection` creates these ports:

- B
- F

**Follower shaft rotates in same direction as input — Rotation**

off (default) | on

Select to specify that the output shaft rotates in the same direction as the input.

**Follower to base gear ratio, N — Ratio**

scalar

Base-to-follower gear ratio, dimensionless.

**Base shaft inertia, J1 — Inertia**

scalar

Base shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

**Follower shaft inertia, J2 – Inertia**

scalar

Follower shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

**Base viscous shaft damping, b1 – Damping**

scalar

Base viscous shaft damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Follower viscous shaft damping, b2 – Damping**

scalar

Follower viscous shaft damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Base shaft initial velocity, w1\_o – Initial velocity**

scalar

Base shaft initial velocity, in  $\text{rad}/\text{s}$ .

# Disc Clutch

Idealized disc clutch coupler  
**Library:** Drivetrain / Couplings

## Description

The Disc Clutch block implements an idealized disc clutch coupler. The block couples the rotary input and output shafts through an idealized friction model. To determine the output torque, the block uses friction parameters, relative slip velocity, and applied input pressure.

In fuel economy and powertrain efficiency studies, you can use the Disc Clutch block to model the mechanical power transfer between common driveline elements such as transmissions, engines, and differentials.

To approximate the torque response, the Disc Clutch block implements friction and dynamic models that depend on the clutch lockup condition. The block determines the locked or unlocked condition based on an idealized dry clutch friction model. This table summarizes the logic the block uses to determine the clutch condition.

Clutch Condition	When
Unlocked	$\omega_i \neq \omega_o$ or $T_{fmax} < \left  \frac{J_o T_i - (J_o b_i - J_i b_o) \omega_{i/o}}{J_o + J_i} \right $

Clutch Condition	When
Locked	$\omega_i = \omega_o$ and

This table summarizes the friction and dynamic models that the block uses for locked or unlocked clutch conditions.

Clutch Condition	Friction Model	Dynamic Model
Unlocked	$T_{fmax} = T_k$ where, $T_k = N_{disc} P_c A_{eff} R_{eff} \mu_k \tanh[4(\omega_i - \omega_o)]$	$\dot{\omega}_i J_i = T_i - T_f - \omega_i b_i$ $\dot{\omega}_o J_o = T_f + T_o - \omega_o b_o$
Locked	$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$ $T_{fmax} = T_s$ where, $T_s = N_{disc} P_c A_{eff} R_{eff} \mu_s$	$\dot{\omega}_i (J_o + J_i) = T_o - \omega_i (b_i + b_o) + T_i$ $\omega_i = \omega_o$

The equations use these variables:

- $\omega_i$  Input shaft angular speed
- $\omega_o$  Output shaft angular speed
- $b_i$  Input shaft viscous damping
- $b_o$  Output shaft viscous damping
- $J_i$  Input shaft moment of inertia

$J_o$	Output shaft moment of inertia
$T_f$	Frictional torque
$T_i$	Net input torque
$T_k$	Kinetic frictional torque
$T_o$	Net output torque
$T_s$	Static frictional torque
$T_{fmax}$	Maximum frictional torque before slipping
$P_c$	Applied clutch pressure
$A_{eff}$	Effective area
$N_{disc}$	Number of frictional discs
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius
$R_e$	Effective tire radius while under load and for a given pressure
$\mu_s$	Coefficient of static friction
$\mu_k$	Coefficient of kinetic friction

## Ports

### Input

#### **Press — Applied clutch pressure**

scalar

Base gear input torque,  $P_c$ , in  $N.m^2$ .

#### **BTrq — Applied input torque**

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N.m.

#### **Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**FTrq — Applied load torque**

scalar

Applied load torque,  $T_o$ , typically from the differential or drive shaft, in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Simulink.

**B — Applied drive shaft angular speed and torque**

two-way connector port

Applied drive shaft angular speed,  $\omega_i$ , in rad/s. Applied drive shaft torque,  $T_i$ , in N.m.

**Dependencies**

To create this port, for **Port Configuration**, select Two-way connection.

**Output****Info — Bus signal**

**Clutch force equivalent net radius,  $R_{eff}$  – Radius**  
scalar

Clutch force equivalent net radius, in m.

**Number of disks,  $N_{disk}$  – Ratio**  
scalar

Number of disks, dimensionless.

**Effective applied pressure area,  $A_{eff}$  – Pressure area**  
scalar

Effective applied pressure area, in  $m^2$ .

**Input shaft inertia,  $J_{in}$  – Inertia**  
scalar

Input shaft inertia, in  $kg \cdot m^2$ .

**Output shaft inertia,  $J_{out}$  – Inertia**  
scalar

Output shaft inertia, in  $kg \cdot m^2$ .

**Kinetic friction coefficient,  $\mu_k$  – Coefficient**  
scalar

Kinetic friction coefficient, dimensionless.

**Static friction coefficient,  $\mu_s$  — Coefficient**  
scalar

Static friction coefficient, dimensionless.

**Input shaft viscous damping,  $b_{in}$  — Damping**  
scalar

Input shaft viscous damping, in  $N \cdot m \cdot s/rad$ .

**Output shaft viscous damping,  $b_{out}$  — Damping**  
scalar

Output shaft viscous damping, in  $N \cdot m \cdot s/rad$ .

**Initial input shaft velocity,  $w_{in\_o}$  — Initial velocity**  
scalar

Input shaft initial velocity, in rad/s.

**Initial output shaft velocity,  $w_{out\_o}$  — Initial velocity**  
scalar

Input shaft initial velocity, in rad/s.

**Clutch actuation time constant,  $\tau_c$  — Constant**  
scalar

Clutch actuation time constant, in s.

**Clutch initially locked — Select to initially lock clutch**  
off (default)

Select to lock clutch initially.

## Vehicle Body 1DOF Longitudinal

Two-axle vehicle in forward and reverse motion

**Library:** Vehicle Dynamics

### Description

The Vehicle Body 1DOF Longitudinal block implements a one degree-of-freedom (1DOF) rigid vehicle body with constant mass undergoing longitudinal (that is, forward and reverse) motion. Use the block:

- In powertrain and fuel economy studies to represent the vehicle inertial and drag loads when weight transfer from vertical and pitch motions are negligible.
- To determine the engine torque and power required for the vehicle to follow a specified drive cycle.

### Vehicle Body Model

The vehicle axles are parallel and form a plane. The longitudinal direction lies in this plane and is perpendicular to the axles. If the vehicle is traveling on an inclined slope, the normal direction is not parallel to gravity but is always perpendicular to the axle-longitudinal plane.

The block uses the net effect of all the forces and torques acting on it to determine the vehicle motion. The longitudinal tire forces push the vehicle forward or backward. The weight of the vehicle acts through its center of gravity (CG). The grade angle changes the direction of the resolved gravitational force acting on the vehicle CG. Similarly, the block resolves the resistive aerodynamic drag force on the vehicle CG.

The Vehicle Body 1DOF Longitudinal block implements these equations.

$$m\dot{V}_x = F_x - F_d - mg \cdot \sin \gamma$$

$$F_x = N_f F_{xf} + N_r F_{xr}$$

$$F_d = \frac{1}{2} C_d \rho A (V_x + V_w)^2 \cdot \text{sgn}(V_x + V_w)$$

Zero normal acceleration and zero pitch torque determine the normal force on each front and rear wheel.

$$F_{zf} = \frac{-h(F_d + mg \sin \gamma + m\dot{V}_x) + b \cdot mg \cos \gamma}{N_f(a + b)}$$

$$F_{zr} = \frac{+h(F_d + mg \sin \gamma + m\dot{V}_x) + a \cdot mg \cos \gamma}{N_r(a + b)}$$

The wheel normal forces satisfy this equation.

$$N_f F_{zf} + N_r F_{zr} = mg \cos \gamma$$

The equations use these variables.

$F_{xf}, F_{xr}$	Longitudinal forces on each wheel at the front and rear ground contact points, respectively
$F_{zf}, F_{zr}$	Normal load forces on each wheel at the front and rear ground contact points, respectively
$F_d$	Aerodynamic drag force
$V_x$	Velocity of the vehicle. When $V_x > 0$ , the vehicle moves forward. When $V_x < 0$ , the vehicle moves backward.
$V_w$	Wind speed. When $V_w > 0$ , the wind is headwind. When $V_w < 0$ , the wind is tailwind.
$N_f, N_r$	Number of wheels on front and rear axle, respectively
$\gamma$	Angle of road grade, in degrees
$m$	Vehicle body mass
$a, b$	Distance of front and rear axles, respectively, from the normal projection point of vehicle CG onto the common axle plane
$h$	Height of vehicle CG above the axle plane
$C_d$	Frontal air drag coefficient
$A$	Frontal area
$\rho$	Mass density of air
$g$	Gravitational acceleration

## Limitations

The Vehicle Body 1DOF Longitudinal block lets you model only longitudinal dynamics, parallel to the ground and oriented along the direction of motion. The vehicle is assumed to be in pitch and normal equilibrium. The block does not model pitch or vertical movement. To model a vehicle with three degrees-of-freedom (DOF), use the Vehicle Body 3DOF Longitudinal.

## Ports

### Input

#### **FwF — Total longitudinal force on front axle**

scalar

Longitudinal force on the front axle,  $F_{xf}$ , along vehicle-fixed x-axis, in N.

#### **FwR — Total longitudinal force on rear axle**

scalar

Longitudinal force on the rear axle,  $F_{wR}$ , along vehicle-fixed x-axis, in N.

#### **Grade — Road grade angle**

scalar

Road grade angle,  $\gamma$ , in deg.

#### **WindX — Longitudinal wind speed**

scalar

Longitudinal wind speed,  $V_w$ , along vehicle-fixed x-axis, in m/s.

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block values.

**xdot — Vehicle body longitudinal velocity**

scalar

Vehicle body longitudinal velocity along the earth-fixed reference frame X-axis, in m/s.

**FzF — Front axle normal force**

scalar

Normal load force on the front axle,  $F_{zf}$ , along vehicle-fixed z-axis, in N.

**FzR — Rear axle normal force**

scalar

Normal force on rear axle,  $F_{zr}$ , along vehicle-fixed z-axis, in N.

## Parameters

### Longitudinal

**Number of wheels on front axle, NF — Front wheel count**  
scalar

Number of wheels on front axle,  $N_F$ , dimensionless.

**Number of wheels on rear axle, NR — Rear wheel count**  
scalar

Number of wheels on rear axle,  $N_R$ , dimensionless.

**Mass, m — Vehicle mass**  
scalar

Vehicle mass,  $M$ , in kg.

**Horizontal distance from CG to front axle, a — Front axle distance**  
scalar

Horizontal distance  $a$  from the vehicle CG to the front wheel axle, in m.

**Horizontal distance from CG to rear axle, b — Rear axle distance**  
scalar

Horizontal distance  $b$  from the vehicle CG to the rear wheel axle, in m.

**CG height above axles, h — Height**  
scalar

Height of vehicle CG above the ground,  $h$ , in m.

**Drag coefficient, Cd — Drag**  
scalar

Air drag coefficient,  $C_d$ .

**Frontal area,  $A_f$  – Area**

scalar

Effective vehicle cross-sectional area,  $A$ , to calculate the aerodynamic drag force on the vehicle, in  $\text{m}^2$ .

**Initial position,  $x_o$  – Position**

scalar

Vehicle body longitudinal initial position along the vehicle-fixed  $x$ -axis,  $x_o$ , in m.

**Initial velocity,  $\dot{x}_o$  – Velocity**

scalar

Vehicle body longitudinal initial velocity along the vehicle-fixed  $x$ -axis,  $\dot{x}_o$ , in m/s.

**Environment****Absolute Pressure,  $P_{abs}$  – Pressure**

scalar

Environmental absolute pressure,  $P$ , in Pa.

**Air Temp,  $T$  – Temperature**

scalar

Environmental absolute temperature,  $T$ , in K.

**Gravitational acceleration,  $g$  – Gravity**

## Vehicle Body 3DOF Longitudinal

3DOF rigid vehicle body to calculate longitudinal, vertical, and pitch motion

**Library:** Vehicle Dynamics

### Description

The Vehicle Body 3DOF Longitudinal block implements a three degrees-of-freedom (3DOF) rigid vehicle body model with configurable axle stiffness to calculate longitudinal, vertical, and pitch motion. The block accounts for body mass, aerodynamic drag, road incline, and weight distribution between the axles due to acceleration and the road profile.

You can specify the type of axle attachment to the vehicle:

- **Grade angle** — Vertical axle displacement from road surface to axles remains constant. The block uses tabular stiffness and damping parameters to model the suspension forces acting between the vehicle body and axles.
- **Axle displacement** — Axles have input-provided vertical displacement and velocity with respect to the road grade. The block uses tabular stiffness and damping parameters to model the suspension forces acting between the vehicle body and axle.
- **External suspension** — Axles have externally applied forces for coupling the vehicle body to custom suspension models.

If the weight transfer from vertical and pitch motions are not negligible, consider using this block to represent vehicle motion in powertrain and fuel economy studies. For example, in studies with heavy braking or acceleration or road profiles that contain larger vertical changes.

The block uses rigid-body vehicle motion, suspension system forces, and wind and drag forces to calculate the normal forces on the front and rear axles. The block resolves the force components and moments on the rigid vehicle body frame:

$$F_x = F_{wF} + F_{wR} - F_{d,x} - F_{sx,F} - F_{sx,R} + F_{g,x}$$

$$F_z = F_{d,z} - F_{sz,F} - F_{sz,R} + F_{g,z}$$

$$M_y = aF_{sz,F} - bF_{sz,R} + h(F_{wF} + F_{wR} + F_{sx,F} + F_{sx,R}) - M_{d,y}$$

The equations use these variables.

$F_x$	Longitudinal force on vehicle
$F_z$	Normal force on vehicle
$M_y$	Torque on vehicle about vehicle-fixed y-axis
$F_{wF}, F_{wR}$	Longitudinal force on front and rear axles along vehicle-fixed x-axis
$F_{d,x}, F_{d,z}$	Longitudinal and normal drag force on vehicle CG
$F_{sx,F}, F_{sx,R}$	Longitudinal suspension force on front and rear axles
$F_{sz,F}, F_{sz,R}$	Normal suspension force on front and rear axles
$F_{g,x}, F_{g,z}$	Longitudinal and normal gravitational force on vehicle along vehicle-fixed frame
$M_{d,y}$	Torque due to drag on vehicle about vehicle-fixed y-axis
$a, b$	Distance of front and rear axles, respectively, from the normal projection point of vehicle CG onto the common axle plane
$h$	Height of vehicle CG above the axle plane along vehicle-fixed z-axis
$F_{sF}, F_{sR}$	Front and rear axle suspension force along vehicle-fixed z-axis

$Z_{wF}, Z_{wR}$	Front and rear vehicle normal position along earth-fixed Z-axis
$\Theta$	Vehicle pitch angle about vehicle-fixed y-axis
$m$	Vehicle body mass
$N_F, N_R$	Number of front and rear wheels
$I_{yy}$	Vehicle body moment of inertia about the vehicle-fixed y-axis
$x, \dot{x}, \ddot{x}$	Vehicle longitudinal position, velocity, and acceleration along vehicle-fixed x-axis
$z, \dot{z}, \ddot{z}$	Vehicle normal position, velocity, and acceleration along vehicle-fixed z-axis
$Fk_F, Fk_R$	Front and rear wheel suspension stiffness force along vehicle-fixed z-axis
$Fb_F, Fb_R$	Front and rear wheel suspension damping force along vehicle-fixed z-axis
$Z_F, Z_R$	Front and rear vehicle vertical position along earth-fixed Z-axis
$\dot{Z}_F, \dot{Z}_R$	Front and rear vehicle vertical velocity along vehicle-fixed z-axis
$\bar{Z}_F, \bar{Z}_R$	Front and rear wheel axle vertical position along vehicle-fixed z-axis
$\dot{\bar{Z}}_F, \dot{\bar{Z}}_R$	Front and rear wheel axle vertical velocity along earth-fixed z-axis
$dZ_F, dZ_R$	Front and rear axle suspension deflection along vehicle-fixed z-axis
$d\dot{Z}_F, d\dot{Z}_R$	Front and rear axle suspension deflection rate along vehicle-fixed z-axis
$C_d$	Frontal air drag coefficient acting along vehicle-fixed x-axis
$C_l$	Lateral air drag coefficient acting along vehicle-fixed z-axis
$C_{pm}$	Air drag pitch moment acting about vehicle-fixed y-axis
$A_f$	Frontal area
$P_{abs}$	Environmental absolute pressure
$R$	Atmospheric specific gas constant
$T$	Environmental air temperature
$w$	Wind speed along vehicle-fixed axis

## Rigid-Body Vehicle Motion

The vehicle axles are parallel and form a plane. The longitudinal direction lies in this plane and is perpendicular to the axles. If the vehicle is traveling on an inclined slope, the normal direction is not parallel to gravity but is always perpendicular to the axle-longitudinal plane.

The block uses the net effect of all the forces and torques acting on it to determine the vehicle motion. The longitudinal tire forces push the vehicle forward or backward. The weight of the vehicle acts through its center of gravity (CG). Depending on the inclined angle, the weight pulls the vehicle to the ground and either forward or backward. Whether the vehicle travels forward or backward, aerodynamic drag slows it down. For simplicity, the drag is assumed to act through the CG.

The Vehicle Body 3DOF Longitudinal implements these equations.

$$\begin{aligned}\ddot{x} &= \frac{F_x}{m} - qz \\ \ddot{z} &= \frac{F_z}{m} - qx \\ \dot{q} &= \frac{M_y}{I_{yy}} \\ \dot{\theta} &= q\end{aligned}$$

## Suspension System Forces

If you configure the block with the **Ground interaction type** parameter `Grade angle` or `Axle displacement, velocity`, the block uses nonlinear stiffness and damping parameters to model the suspension system.

The front and rear axle suspension forces are given by:

$$\begin{aligned}Fs_F &= N_F [Fk_F + Fb_F] \\ Fs_R &= N_R [Fk_R + Fb_R]\end{aligned}$$

The block uses lookup tables to implement the front and rear suspension stiffness. To account for kinematic and material nonlinearities, including collisions with end-stops, the tables are functions of the stroke.

$$Fk_F = f(dZ_F)$$

$$Fk_R = f(dZ_R)$$

The block uses lookup tables to implement the front and rear suspension damping. To account for nonlinearities, compression, and rebound, the tables are functions of the stroke rate.

$$Fb_F = f(d\dot{Z}_F)$$

$$Fb_R = f(d\dot{Z}_R)$$

The stroke is the difference in the vehicle vertical and axle positions. The stroke rate is the difference in the vertical and axle velocities.

$$dZ_F = Z_F - \bar{Z}_F$$

$$dZ_R = Z_R - \bar{Z}_R$$

$$d\dot{Z}_F = \dot{Z}_F - \dot{\bar{Z}}_F$$

$$d\dot{Z}_R = \dot{Z}_R - \dot{\bar{Z}}_R$$

When the **Ground interaction type** parameter is **Grade angle**, the axle vertical positions ( $\bar{Z}_F, \bar{Z}_R$ ) and velocities ( $\dot{\bar{Z}}_F, \dot{\bar{Z}}_R$ ) are set to 0.

## Wind and Drag Forces

The block subtracts the wind speeds from the vehicle velocity components to obtain a net relative airspeed. To calculate the drag force and moments acting on the vehicle, the block uses the net relative airspeed:

$$F_{d,x} = \frac{1}{2TR} C_d A_f P_{abs} (\dot{x} - w)^2$$

$$F_{d,z} = \frac{1}{2TR} C_l A_f P_{abs} (\dot{x} - w)^2$$

$$M_{d,y} = \frac{1}{2TR} C_{pm} A_f P_{abs} (\dot{x} - w)^2 (a + b)$$

## Ports

### Input

#### **FwF — Total longitudinal force on the front axle**

scalar

Longitudinal force on the front axle,  $F_{wF}$ , along vehicle-fixed x-axis, in N.

#### **FwR — Total longitudinal force on the rear axle**

scalar

Longitudinal force on the rear axle,  $F_{wR}$ , along vehicle-fixed x-axis, in N.

#### **Grade — Road grade angle**

scalar

Road grade angle,  $\gamma$ , in deg.

#### **FsF — Suspension force on front axle per wheel**

vector

Suspension force on front axle,  $F_{sF}$ , along vehicle-fixed z-axis, in N.

#### **Dependencies**

To create this port, for the **Ground interaction type** parameter, select External suspension.

#### **FsR — Suspension force on rear axle per wheel**

vector

Suspension force on rear axle,  $F_{sR}$ , along vehicle-fixed z-axis, in N.

#### **Dependencies**

To create this port, for the **Ground interaction type** parameter, select External suspension.

#### **WindXYZ — Wind speed**

vector

Longitudinal wind speed,  $V_{windxyz}$ , in m/s.

**zF,R — Forward and rear axle positions**  
vector

Forward and rear axle positions along the vehicle-fixed z-axis,  $\bar{Z}_F, \bar{Z}_R$ , in m.

**Dependencies**

To create this port, for the **Ground interaction type** parameter, select Axle displacement, velocity.

**zdotF,R — Forward and rear axle velocities**  
vector

Forward and rear axle velocities along the vehicle-fixed z-axis,  $\dot{\bar{Z}}_F, \dot{\bar{Z}}_R$ , in m/s.

**Dependencies**

To create this port, for the **Ground interaction type** parameter, select Axle displacement, velocity.

**Output**

**x<sub>dot</sub> — Vehicle longitudinal velocity**

scalar

Vehicle CG velocity along vehicle-fixed x-axis, in m/s.

**F<sub>zF</sub> — Front axle normal force**

scalar

Normal force on front axle,  $F_{zF}$ , along vehicle-fixed z-axis, in N.

**F<sub>zR</sub> — Rear axle normal force**

scalar

Normal force on rear axle,  $F_{zR}$ , along vehicle-fixed z-axis, in N.

## Parameters

**Longitudinal****Number of wheels on front axle, N<sub>F</sub> — Front wheel count**

scalar

Number of wheels on front axle,  $N_F$ , dimensionless.

**Number of wheels on rear axle, N<sub>R</sub> — Rear wheel count**

scalar

Number of wheels on rear axle,  $N_R$ , dimensionless.

**Mass, m — Vehicle mass**

scalar

Vehicle mass,  $m$ , in kg.

**Horizontal distance from CG to front axle,  $a$  — Front axle distance**  
scalar

Horizontal distance  $a$  from the vehicle CG to the front wheel axle, in m.

**Horizontal distance from CG to rear axle,  $b$  — Rear axle distance**  
scalar

Horizontal distance  $b$  from the vehicle CG to the rear wheel axle, in m.

**CG height above axles,  $h$  — Height**  
scalar

Height of vehicle CG above the axles,  $h$ , in m.

**Drag coefficient,  $C_d$  — Drag**  
scalar

Air drag coefficient,  $C_d$ , dimensionless.

**Frontal area,  $A_f$  — Area**  
scalar

Effective vehicle cross-sectional area,  $A_f$  to calculate the aerodynamic drag force on the vehicle, in  $\text{m}^2$ .

**Initial position,  $x_o$  — Position**  
scalar

Vehicle body longitudinal initial position along earth-fixed x-axis,  $x_o$ , in m.

**Initial velocity,  $\dot{x}_o$  — Velocity**  
scalar

Vehicle body longitudinal initial velocity along earth-fixed x-axis,  $\dot{x}_o$ , in m/s.

**Vertical**

**Lift coefficient,  $C_l$  — Lift**  
scalar

Lift coefficient,  $C_l$ , dimensionless.

**Initial vertical position,  $z_o$  – Position**

scalar

Initial vertical CG position,  $z_o$ , along the vehicle-fixed z-axis, in m.**Initial vertical velocity,  $\dot{z}_o$  – Velocity**

scalar

Initial vertical CG velocity,  $\dot{z}_o$ , along the vehicle-fixed z-axis, in m.**Pitch****Inertia,  $I_{yy}$  – About body y-axis**

scalar

Vehicle body moment of inertia about body z-axis.

**Pitch drag moment coefficient,  $C_{pm}$  – Drag coefficient**

scalar

Pitch drag moment coefficient, dimensionless.

**Initial pitch angle,  $\theta_o$  – Pitch**

scalar

Initial pitch angle about body z-axis, in rad.

**Initial angular velocity,  $q_o$  – Pitch velocity**

scalar

Initial vehicle body angular velocity about body z-axis, in rad/s.

**Suspension****Front axle stiffness force data,  $F_{skF}$  – Force**

vector

Front axle stiffness force data,  $F_{k_F}$ , in N.**Dependencies**To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Front axle displacement data, dzsF — Displacement**

vector

Front axle displacement data, in m.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Front axle damping force data, FsbF — Damping force**

vector

Front axle damping force, in N.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Front axle velocity data, dzdotsF — Velocity**

vector

Front axle velocity data, in m/s.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Rear axle stiffness force data, FskR — Force**

vector

Rear axle stiffness force data, in N.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Rear axle displacement data, dzsR — Displacement**

vector

Rear axle displacement data, in m.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Rear axle damping force data, FsbR — Damping force**

vector

Rear axle damping force, in N.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Rear axle velocity data, dzdotsR — Velocity**

vector

Rear axle velocity data, in m/s.

**Dependencies**

To enable this parameter, for the **Ground interaction type** parameter, select Grade angle or Axle displacement, velocity.

**Environment****Absolute Pressure, Pabs — Pressure**

scalar

Environmental absolute pressure,  $P_{abs}$ , in Pa.

**Air Temp, T — Temperature**

scalar

Environmental absolute temperature,  $T$ , in K.

**Gravitational acceleration, g — Gravity**

scalar

Gravitational acceleration,  $g$ , in  $\text{m/s}^2$ .

**Introduced in R2017a**

# Vehicle Body Total Road Load

Vehicle motion using coast-down testing coefficients

**Library:** Vehicle Dynamics

## Description

The Vehicle Body Total Road Load block implements a one degree-of-freedom (1DOF) rigid vehicle model using coast-down testing coefficients. You can use this block in a vehicle model to represent the load that the driveline and chassis applies to a transmission or engine. It is suitable for system-level performance, component sizing, fuel economy, or drive cycle tracking studies. The block calculates the dynamic powertrain load with minimal parameterization or computational cost.

You can configure the block for kinematic, force, or total power input.

- Kinematic — Block uses the vehicle longitudinal velocity and acceleration to calculate the tractive force and power.
- Force — Block uses the tractive force to calculate the vehicle longitudinal displacement and velocity.
- Power — Block uses the engine or transmission power to calculate the vehicle longitudinal displacement and velocity.

## Equations

To calculate the total road load acting on the vehicle, the block implements this equation.

$$F_{road} = a + b\dot{x} + c\dot{x}^2 + mg \sin(\theta)$$

To determine the coefficients  $a$ ,  $b$ , and  $c$ , you can use a test procedure similar to the one described in *Road Load Measurement and Dynamometer Simulation Using Coastdown Techniques*. You can also use Simulink® Design Optimization™ to fit the coefficients to measured data.

To calculate the vehicle motion, the block uses Newton's law for rigid bodies.

$$F_{total} = m\ddot{x} + F_{road}$$

Total power input is a product of the total force and longitudinal velocity. Power due to road and gravitational forces is a product of the road force and longitudinal velocity.

$$P_{total} = F_{total}\dot{x}$$

$$P_{road} = F_{road}\dot{x}$$

The equations use these variables.

$a$	Steady-state rolling resistance coefficient
$b$	Viscous driveline and rolling resistance coefficient
$c$	Aerodynamic drag coefficient
$g$	Gravitational acceleration
$x$	Vehicle longitudinal displacement with respect to ground, in vehicle-fixed frame
$\dot{x}$	Vehicle longitudinal velocity with respect to ground, in vehicle-fixed frame
$\ddot{x}$	Vehicle longitudinal acceleration with respect to ground, vehicle-fixed frame
$m$	Vehicle body mass
$\Theta$	Road grade angle
$F_{total}$	Total force acting on vehicle
$F_{road}$	Resistive road load due to losses and gravitational load
$P_{total}$	Total tractive input power
$P_{road}$	Total power due to losses and gravitational load

## Ports

### Input

#### **xdot — Vehicle longitudinal velocity**

scalar

Vehicle total longitudinal velocity,  $\dot{x}$ , in m/s.

#### **Dependencies**

To create this port, for the **Input Mode** parameter, select Kinematic.

#### **xddot — Vehicle longitudinal acceleration**

scalar

Vehicle total longitudinal acceleration,  $\ddot{x}$ , in m/s<sup>2</sup>.

#### **Dependencies**

To create this port, for the **Input Mode** parameter, select Kinematic.

#### **PwrTot — Tractive input power**

scalar

Tractive input power,  $P_{total}$ , in W.

#### **Dependencies**

To create this port, for the **Input Mode** parameter, select Power.

#### **ForceTot — Tractive input force**

scalar

Tractive input force,  $F_{total}$ , in N.

#### **Dependencies**

To create this port, for the **Input Mode** parameter, select Force.

#### **Grade — Road grade angle**

scalar

Road grade angle,  $\theta$ , in deg.

**xdot — Vehicle longitudinal velocity**

scalar

Vehicle total longitudinal velocity,  $\dot{x}$ , in m/s.

**Dependencies**

To create this port, for the **Input Mode** parameter, select Power or Force.

**ForceTot — Tractive input force**

scalar

Tractive input force,  $F_{total}$ , in N.

**Dependencies**

To create this port, for the **Input Mode** parameter, select Kinematic.

**Parameters**

**Input Mode — Specify input mode**

Kinematic (default) | Force | Power

Specify the input type.

- **Kinematic** — Block uses the vehicle longitudinal velocity and acceleration to calculate the tractive force and power. Use this configuration for powertrain, driveline, and braking system design, or component sizing.
- **Force** — Block uses the tractive force to calculate the vehicle longitudinal displacement and velocity. Use this configuration for system-level performance, fuel economy, or drive cycle tracking studies.

- **Power** — Block uses the engine or transmission power to calculate the vehicle longitudinal displacement and velocity. Use this configuration for system-level performance, fuel economy, or drive cycle tracking studies.

### Dependencies

This table summarizes the port and input mode configurations.

Input Mode	Creates Ports
Kinematic	xdot xddot
Force	Force
Power	Power

### Mass — Vehicle body mass

scalar

Vehicle body mass,  $m$ , in kg.

### Rolling resistance coefficient, $a$ — Rolling

scalar

Steady-state rolling resistance coefficient,  $a$ , in N.

### Rolling and driveline resistance coefficient, $b$ — Rolling and driveline

scalar

Viscous driveline and rolling resistance coefficient,  $b$ , in N\*s/m.

### Aerodynamic drag coefficient, $c$ — Drag

scalar

Aerodynamic drag coefficient,  $c$ , in N\*s<sup>2</sup>/m.

### Gravitational acceleration, $g$ — Gravity

scalar

Gravitational acceleration,  $g$ , in m/s<sup>2</sup>.

### Initial velocity, $\dot{x}_o$ — Velocity

scalar

Vehicle longitudinal initial velocity with respect to ground, in m/s.

## Datasheet Battery

Lithium-ion, lithium-polymer, or lead-acid battery

**Library:** Energy Storage and Auxiliary Drive / Datasheet Battery

## Description

The Datasheet Battery block implements a lithium-ion, lithium-polymer, or lead-acid battery that you can parameterize using manufacturer data. To create the open-circuit voltage and internal resistance parameters that you need for the block, use the manufacturer discharge characteristics by temperature data. For an example, see “Generate Parameter Data for Datasheet Battery Block”.

To determine the battery output voltage, the block uses lookup tables for the battery open-circuit voltage and the internal resistance. The lookup tables are functions of the state-of charge (SOC) and battery temperature, characterizing the battery performance at various operating points:

$$E_m = f(SOC)$$

$$R_{int} = f(T, SOC)$$

To calculate the voltage, the block implements these equations.

$$V_T = E_m - I_{batt} R_{int}$$

$$I_{batt} = \frac{I_{in}}{N_p}$$

$$V_{out} = N_s V_T$$

$$SOC = \frac{-1}{Cap_{batt}} \int_0^t I_{batt} dt$$

Positive current indicates battery discharge. Negative current indicates battery charge.

The equations use these variables.

$SOC$	State-of-charge
$E_m$	Battery open-circuit voltage
$I_{batt}$	Per module battery current
$I_{in}$	Combined current flowing from the battery network
$R_{int}$	Battery internal resistance
$N_s$	Number of cells in series
$N_p$	Number of cells in parallel
$V_{out}$	Combined voltage of the battery network
$V_T$	Per module battery voltage
$Cap_{batt}$	Battery capacity

## Ports

### Inputs

#### CapInit — Battery capacity

scalar

Rated battery capacity at the nominal temperature,  $Cap_{batt}$ , in Ah.

#### Dependencies

To create this port, select External Input for the **Initial battery capacity** parameter.

#### BattCurr — Battery load current

scalar

Combined current flowing from the battery network,  $I_{in}$ , in A.

#### BattTemp — Battery temperature

scalar

Temperature measured at the battery housing,  $T$ , in K.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
BattCurr	Combined current flowing from the battery network	A
BattAmpHr	Normalized current flowing from the battery network	A*h
BattSoc	State-of-charge capacity	NA
BattVolt	Combined voltage of the battery network	V
BattPwr	Battery power	W

### BattVolt — Battery output voltage

scalar

Combined voltage of the battery network,  $V_{out}$  in V.

## Parameters

### Block Options

#### Initial battery capacity — Input or parameter

Parameter (default) | External Input

Initial battery capacity,  $Cap_{batt}$  in Ah.

### Dependencies

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit

Block Parameter Initial battery capacity Option	Creates
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

**Output battery voltage – Unfiltered or Filter**

Unfiltered (default) | Filtered

Select Filtered to apply a first-order filter to the output batter voltage.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**Rated capacity at nominal temperature, BattChargeMax – Constant scalar**

Rated battery capacity at the nominal temperature, in Ah.

**Open circuit voltage table data, Em – 1-D lookup table**

1-by-P matrix

Open-circuit voltage data curve,  $E_m$ , as a function of the discharged capacity for P operating points, in V.

**Open circuit voltage breakpoints 1, CapLUTBp – Breakpoints**

1-by-P matrix

Discharge capacity breakpoints for P operating points, dimensionless.

Although this parameter is the same as the **Battery capacity breakpoints 2, CapSOCBp** parameter, the block uses unique parameters for calibration flexibility.

**Internal resistance table data, RInt – 2-D lookup table**

N-by-M matrix

Internal resistance map,  $R_{int}$ , as a function of N temperatures and M SOCs, in ohms.

**Battery temperature breakpoints 1, BattTempBp – Breakpoints**

1-by-N matrix

Battery temperature breakpoints for N temperatures, in K.

**Battery capacity breakpoints 2, CapSOCBp — Breakpoints**

1-by-M matrix

Battery capacity breakpoints for M SOCs, dimensionless.

Although this parameter is the same as the **Open circuit voltage breakpoints 1, CapLUTBp** parameter, the block uses unique parameters for calibration flexibility.

**Number of cells in series, Ns — Integer**

scalar

Number of cells in series, dimensionless,  $N_s$ .

**Number of cells in parallel, Np — Integer**

scalar

Number of cells in parallel, dimensionless,  $N_p$ .

**Initial battery capacity, BattCapInit — Capacity**

scalar

Initial battery capacity,  $Cap_{batt}$  in Ah.

**Dependencies**

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

**Output battery voltage time constant, Tc — Filter time constant**

scalar

Output battery voltage time constant,  $T_c$  in s. Used in a first-order voltage filter.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**Output battery voltage initial value – Filter initial voltage**  
scalar

Output battery voltage initial value,  $V_{init}$ , in V. Used in a first-order voltage filter.

#### **Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

## Estimation Equivalent Circuit Battery

Resistor-capacitor (RC) circuit battery that creates lookup tables

**Library:** Energy Storage and Auxiliary Drive / Network Battery

### Description

The Estimation Equivalent Circuit Battery block implements a resistor-capacitor (RC) circuit battery model that you can use to create lookup tables for the Equivalent Circuit Battery block. The lookup tables are functions of the state-of-charge (SOC).

The Estimation Equivalent Circuit Battery block calculates the combined voltage of the network battery using parameter lookup tables. The tables are functions of the SOC. To acquire the SOC, the block integrates the charge and discharge currents.

Specifically, the block implements these parameters as lookup tables that are functions of the SOC:

- Series resistance,  $R_o=f(SOC)$
- Battery open-circuit voltage,  $E_m=f(SOC)$
- Network resistance,  $R_n=f(SOC)$
- Network capacitance,  $C_n=f(SOC)$

To calculate the combined voltage of the battery network, the block uses these equations.

$$V_T = E_m - I_{batt}R_o - \sum_1^n V_n$$

$$V_n = \int_0^t \left[ \frac{I_{batt}}{C_n} - \frac{V_n}{R_n C_n} \right] dt$$

$$SOC = \frac{-1}{C_{batt}} \int_0^t I_{batt} dt$$

$$I_{batt} = I_{in}$$

$$V_{out} = V_T$$

Positive current indicates battery discharge. Negative current indicates battery charge.

The equations use these variables.

$SOC$	State-of-charge
$E_m$	Battery open-circuit voltage
$I_{batt}$	Per module battery current
$I_{in}$	Combined current flowing from the battery network
$R_o$	Series resistance
$n$	Number of RC pairs in series
$V_{out}, V_T$	Combined voltage of the battery network
$V_n$	Voltage for $n$ -th RC pair
$R_n$	Resistance for $n$ -th RC pair
$C_n$	Capacitance for $n$ -th RC pair
$C_{batt}$	Battery capacity

## Ports

### Inputs

#### **BattCurr** — Battery network current

scalar

Combined current flowing from the battery network,  $I_{in}$ , in A.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
CapVolt	Voltage for $n$ -th RC pair	$V_n$	V

### BattVolt — Battery output voltage

scalar

Combined voltage of the battery network,  $V_{out}$ , in V.

### BattSoc — Battery SOC

scalar

Battery state-of-charge,  $SOC$ .

## Parameters

### Core Battery

#### Number of series RC pairs — RC pairs

1 (default) | 2 | 3 | 4 | 5

Number of series RC pairs. For lithium, typically 1 or 2.

#### Open circuit voltage Em table data, Em — Voltage table

array

Open-circuit voltage table,  $E_m$ , in V. Function of SOC.

#### Series resistance table data, R0 — Resistance

array

Series resistance table,  $R_o$ , in ohms. Function of SOC.

**State of charge breakpoints, SOC\_BP – SOC breakpoints**

vector

State-of-charge (SOC) breakpoints, dimensionless.

**Battery capacity, BattCap – Capacity**

scalar

Battery capacity,  $C_{batt}$ , in Ah.**Initial battery capacity, BattCapInit – Capacity**

scalar

Initial battery capacity,  $C_{batt0}$ , in Ah.**Initial capacitor voltage, InitialCapVoltage – Voltage**

vector

Initial capacitor voltage, in V. Dimension of vector must equal the **Number of series RC pairs**.**R and C Table Data****Network resistance table data, Rn – Lookup table**

array

Network resistance table data for  $n$ -th RC pair, as a function of SOC, in ohms.**Network capacitance table data, Cn – Lookup table**

array

Network capacitance table data for  $n$ -th RC pair, as a function of SOC, in F.**Cell Limits****Upper Integrator Voltage Limit, Vu – Maximum**

scalar

Upper voltage limit, in V.

**Lower Integrator Voltage Limit, Vl – Minimum**

scalar

Lower voltage limit, in V.

## Equivalent Circuit Battery

Resistor-capacitor (RC) circuit battery

**Library:** Energy Storage and Auxiliary Drive / Network Battery

### Description

The Equivalent Circuit Battery block implements a resistor-capacitor (RC) circuit battery that you can parameterize using equivalent circuit modeling (ECM). To simulate the state-of-charge (SOC) and terminal voltage, the block uses load current and internal core temperature.

The Equivalent Circuit Battery block calculates the combined voltage of the network battery using parameter lookup tables. The tables are functions of the SOC and battery temperature. You can use the Estimation Equivalent Circuit Battery block to help create the lookup tables.

Specifically, the Equivalent Circuit Battery block implements these parameters as lookup tables that are functions of the SOC and battery temperature:

- Series resistance,  $R_o=f(SOC,T)$
- Battery open-circuit voltage,  $E_m=f(SOC,T)$
- Battery capacity,  $C_{batt}=f(T)$
- Network resistance,  $R_n=f(SOC,T)$
- Network capacitance,  $C_n=f(SOC,T)$

To calculate the combined voltage of the battery network, the block uses these equations.

$$V_T = E_m - I_{batt}R_o - \sum_1^n V_n$$

$$V_n = \int_0^t \left[ \frac{I_{batt}}{C_n} - \frac{V_n}{R_n C_n} \right] dt$$

$$SOC = \frac{-1}{C_{batt}} \int_0^t I_{batt} dt$$

$$I_{batt} = \frac{I_{in}}{N_p}$$

$$V_{out} = N_s V_T$$

Positive current indicates battery discharge. Negative current indicates battery charge.

To calculate the battery power, the block uses this equation.

$$P_{batt} = I_{batt}^2 R_o + \sum_1^n \frac{V_n^2}{R_n}$$

The equations use these variables.

$SOC$	State-of-charge
$E_m$	Battery open-circuit voltage
$I_{batt}$	Per module battery current
$I_{in}$	Combined current flowing from the battery network
$R_o$	Series resistance
$N_p$	Number parallel branches
$N_p$	Number of RC pairs in series
$V_{out}, V_T$	Combined voltage of the battery network
$V_n$	Voltage for $n$ -th RC pair
$R_n$	Resistance for $n$ -th RC pair
$C_n$	Capacitance for $n$ -th RC pair
$C_{batt}$	Battery capacity

$P_{batt}$  Resistive battery power loss  
 $T$  Battery temperature

## Ports

### Inputs

#### CapInit — Battery capacity

scalar

Rated battery capacity at the nominal temperature,  $Cap_{batt}$ , in Ah.

#### Dependencies

To create this port, select External Input for the **Initial battery capacity** parameter.

#### BattCurr — Battery network current

scalar

Combined current flowing from the battery network,  $I_{in}$ , in A.

#### BattTemp — Battery temperature

scalar

Battery temperature,  $T$ , in K.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
BattCurr	Combined current flowing from the battery network	A
BattSoc	State-of-charge capacity	NA

Signal	Description	Units
BattVolt	Combined voltage of the battery network	V
BattPwr	Battery power	W
BattPwrLoss	Battery power loss	W

### **BattVolt – Battery output voltage** scalar

Combined voltage of the battery network,  $V_{out}$  in V.

## Parameters

### Block Options

#### **Initial battery capacity – Input or parameter**

Parameter (default) | External Input

Initial battery capacity,  $Cap_{batt}$  in Ah.

### Dependencies

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

#### **Output battery voltage – Unfiltered or Filter**

Unfiltered (default) | Filtered

Select Filtered to apply a first-order filter to the output batter voltage.

### Dependencies

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**

- **Output battery voltage initial value, Vinit**

#### **Core Battery**

##### **Number of series RC pairs — RC pairs**

1 (default) | 2 | 3 | 4 | 5

Number of series RC pairs. For lithium, typically 1 or 2.

##### **Open circuit voltage Em table data, Em — Voltage table**

array

Open circuit voltage table,  $E_m$ , in V. Function of SOC and battery temperature.

##### **Series resistance table data, R0 — Resistance**

array

Series resistance table,  $R_o$ , in ohms. Function of SOC and battery temperature.

##### **State of charge breakpoints, SOC\_BP — SOC breakpoints**

vector

State-of-charge (SOC) breakpoints, dimensionless.

##### **Temperature breakpoints, Temperature\_BP — Battery**

vector

Battery temperature breakpoints, K.

##### **Battery capacity table, BattCap — Capacity**

array

Battery capacity,  $C_{batt}$ , in Ah. Function of battery temperature.

##### **Initial capacitor voltage, InitialCapVoltage — Voltage**

vector

Initial capacitor voltage, in V. Dimension of vector must equal the **Number of series RC pairs**.

##### **Initial battery capacity, BattCapInit — Capacity**

scalar

Initial battery capacity,  $Cap_{batt}$ , in Ah.

**Dependencies**

Block Parameter Initial battery capacity Option	Creates
External Input	Input port CapInit
Parameter	Parameter <b>Initial battery capacity, BattCapInit</b>

**Output battery voltage time constant, Tc – Filter time constant**

scalar

Output battery voltage time constant,  $T_c$ , in s. Used in a first-order voltage filter.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**Output battery voltage initial value, Vinit – Filter initial voltage**

scalar

Output battery voltage initial value,  $V_{init}$ , in V. Used in a first-order voltage filter.

**Dependencies**

Setting **Output battery voltage** parameter to Filtered creates these parameters:

- **Output battery voltage time constant, Tc**
- **Output battery voltage initial value, Vinit**

**R and C Table Data****Network resistance table data, Rn – Lookup table**

array

Network resistance table data for  $n$ -th RC pair, in ohms, as a function of SOC and battery temperature.

**Network capacitance table data, Cn – Lookup table**

array

Network capacitance table data for  $n$ -th RC pair, in F, as a function of SOC and battery temperature.

**Cell Limits**

**Upper integrator voltage limit,  $V_u$  — Maximum**  
scalar

Upper voltage limit, in V.

**Lower integrator voltage limit,  $V_l$  — Minimum**  
scalar

Lower voltage limit, in V.

## Reduced Lundell Alternator

Reduced Lundell (claw-pole) alternator with an external voltage regulator

**Library:** Energy Storage and Auxiliary Drive / Alternator

### Description

The Reduced Lundell Alternator block implements a reduced Lundell (claw-pole) alternator with an external voltage regulator. The back-electromotive force (EMF) voltage is proportional to the input velocity and field current. The motor operates as a source torque to the internal combustion engine.

Use the Reduced Lundell Alternator block:

- To model an automotive electrical system
- In an engine model with a front-end accessory drive (FEAD)

The calculated motor shaft torque is in the opposite direction of the engine speed. You can:

- Tune the external voltage regulator to a desired bandwidth. The stator current and two diode drops reduce the stator voltage.
- Filter the load current to desired bandwidth. The load current has a lower saturation of 0 A.

### Equations

The Reduced Lundell Alternator block implements equations for the electrical, control, and mechanical systems that use these variables.

$v_{ref}$	Alternator output voltage command
$v_f$	Field winding voltage

$i_f$	Field winding current
$i_s$	Stator winding current
$V_d$	Diode voltage drop
$R_f$	Field winding resistance
$R_s$	Stator winding resistance
$L_f$	Field winding inductance
$K_v$	Voltage constant
$F_v$	Voltage regulator bandwidth
$F_c$	Input current filter bandwidth
$V_{fmax}$	Field control voltage upper saturation limit
$V_{fmin}$	Field control voltage lower saturation limit
$K_c$	Coulomb friction coefficient
$K_b$	Viscous friction coefficient
$K_w$	Windage coefficient
$\omega$	Motor shaft angular speed
$i_{load}$	Alternator load current
$v_s$	Alternator output voltage
$\tau_{mech}$	Motor shaft torque

To calculate voltages, the block uses these equations.

Calculation	Equations
Alternator output voltage	$v_s = K_v i_f \omega - R_s i_s - 2V_d$
Field winding voltage	$v_f = R_f i_f + L_f \frac{di_f}{dt}$

The controller assumes no resistance or voltage drop.

Calculation	Equations
Field winding voltage transform	$V_f(s) = R_f I_f(s) + sL_f I_f(s)$
Field winding current transform	$I_f(s) = \frac{V_f(s)}{(R_f + sL_f)}$
Open loop electrical transfer function	$G(s) = \frac{V_s(s)}{V_f(s)} = \frac{K_v \omega}{(R_f + sL_f)}$
Open loop voltage regulator transfer function	$G_C(s) = \frac{V_f(s)}{V_{ref}(s)}$
Closed loop transfer function	$T(s) = \frac{G(s)G_C(s)}{1 + G(s)G_C(s)}$
Closed loop controller design	$T(s) = \frac{1}{\tau s + 1} \rightarrow G(s)G_C(s) = \frac{1}{\tau s}$ $G_C(s) = K_g \left( K_p + \frac{K_i}{s} \right)$ $G(s)G_C(s) = \frac{K_v \omega}{(R_f + sL_f)} K_g \left( K_p + \frac{K_i}{s} \right)$ $K_p = L_f, K_i = R_f, \text{ and } K_g = \frac{2\pi f}{K_v \omega}$

To calculate torques, the block uses these equations.

Calculation	Equations
Electrical torque	$\tau_{elec} = (K_v i_f \omega) i_{load}$

Calculation	Equations
Frictional torque	$\tau_{friction} = K_b \omega$
Windage torque	$\tau_{windage} = K_w \omega^2$
Torque at start	$\tau_{start} = K_c$ when $\omega = 0$
Motor shaft torque	$\tau_{mech} = \tau_{elec} + \tau_{friction} + \tau_{windage} + \tau_{start}$

## Ports

### Inputs

#### **RefVOLT** – Alternator output voltage command

scalar

Alternator output voltage command, in V.

#### **AltSpd** – Angular speed

scalar

Motor shaft input angular speed, in rad/s.

#### **LdCurr** – Alternator load current

scalar

Alternator load current, in A.

### Output

#### **Info** – Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
FldVlt	Field winding voltage	A
FldFlux	Field flux	Wb

**AltVlt — Alternator output voltage**

scalar

Alternator output voltage, in V.

**LdTrq — Motor shaft torque**

scalar

Motor shaft torque, in N.m.

## Parameters

**Machine Configuration****Voltage constant, Kv — Constant**

scalar

Voltage constant, in V/rad/s.

**Field winding resistance, Rf — Resistance**

scalar

Field winding resistance, in ohm.

**Field winding inductance, Lf — Inductance**

scalar

Field winding inductance, in H.

**Stator winding resistance, Rs — Resistance**

scalar

Stator winding resistance, in ohm.

**Diode voltage drop, Vd — Voltage**

scalar

Diode voltage drop, in V.

### **Voltage Regulator**

#### **Regulator bandwidth, $F_v$ — Bandwidth**

scalar

The regulator bandwidth, in Hz.

#### **Current filter bandwidth, $F_c$ — Bandwidth**

scalar

The current filter bandwidth, in Hz.

#### **Field voltage max, $V_{fmax}$ — Maximum field voltage**

scalar

The maximum field voltage, in V.

#### **Field voltage min, $V_{fmin}$ — Minimum field voltage**

scalar

The minimum field voltage, in V.

### **Mechanical Losses**

#### **Coulomb friction, $K_c$ — Friction**

scalar

Coulomb friction, in N.m.

#### **Viscous friction, $K_b$ — Friction**

scalar

Viscous friction, in N.m/rad/s.

#### **Windage, $K_w$ — Windage**

scalar

Windage, in N.m/rad<sup>2</sup>/s<sup>2</sup>.

## References

## See Also

Starter

**Introduced in R2017a**

# Starter

Starter as a DC motor

**Library:** Energy Storage and Auxiliary Drive / Starter

## Description

The Starter block implements a starter assembly as a separately excited DC motor, permanent magnet DC motor, or series connection DC motor. The motor operates as a torque source to an internal combustion engine.

Use the Starter block:

- In an engine model with a front-end accessory drive (FEAD)
- To model engine start and stop scenarios

The Starter block supports only an angular speed input to the DC motor. A load torque input requires engine dynamics.

## Equations

The block implements equations that use these variables.

$R_a$	Armature winding resistance
$L_a$	Armature winding inductance
$EMF$	Counter-electromotive force
$R_f$	Field winding resistance
$L_f$	Field winding inductance
$L_{af}$	Field and armature mutual inductance
$i_a$	Armature winding current
$i_f$	Field winding current

$K_t$	Motor torque constant
$\omega$	Motor shaft angular speed
$V_a$	Armature winding voltage
$V_f$	Field winding voltage
$V_{af}$	Field and armature winding voltage
$i_{af}$	Field and armature series current
$R_{ser}$	Series connected field and armature resistance
$L_{ser}$	Series connected field and armature inductance
$i_{load}$	Starter motor current load
$T_{mech}$	Starter motor shaft torque

In a separately excited DC motor, the field winding is connected to a separate source of DC power.

The relationship between the field winding voltage, field resistance, and field inductance is given by:

$$V_f = L_f \frac{di_f}{dt} + R_f i_f$$

The counter-electromotive force is a product of the field resistance, mutual inductance, and motor shaft angular speed:

$$EMF = L_a i_f L_{af} \omega$$

The armature voltage is given by:

$$V_a = L_a \frac{di_a}{dt} + R_a i_a + EMF$$

The starter motor current load is the sum of the field winding current and armature winding current:

$$i_{load} = i_f + i_a$$

The starter motor shaft torque is the product of the armature current, field current, and mutual inductance:

$$T_{mech} = i_a i_f L_{af}$$

In a permanent magnet DC motor, the magnets establish the excitation flux, so there is no field current.

The counter-electromotive force is proportional to the motor shaft angular speed:

$$EMF = K_t \omega$$

The armature voltage is given by:

$$V_a = L_a \frac{di_a}{dt} + R_a i_a + EMF$$

The starter motor current load is equal to the armature winding current:

$$i_{load} = i_a$$

The starter motor shaft torque is proportional to the armature winding current:

$$T_{mech} = K_t i_a$$

A series excited DC motor connects the armature and field windings in series with a common DC power source.

The counter-electromotive force is a product of the field and armature initial series current, field, and armature mutual inductance and motor shaft angular speed:

$$EMF = i_{af} L_{af} \omega$$

The field and armature winding voltage is given by:

$$V_{af} = L_{ser} \frac{di_{af}}{dt} + R_{ser} i_{af} + EMF$$

The starter motor current load is equal to the field and armature series current:

$$i_{load} = i_{af}$$

The starter motor shaft torque is the product of the squared field and armature series current and the field and armature mutual inductance:

$$T_{mech} = i_{af}^2 L_{af}$$

For motor stability, the motor shaft angular speed must be greater than the ratio of the series connected field and armature resistance to the mutual inductance:

$$\omega > -\frac{R_{ser}}{L_{af}}$$

## Ports

### Inputs

#### **MtrSpd — Angular speed**

scalar

Motor shaft angular speed, in rad/s.

#### **StartVolt — Armature and field voltage**

scalar

- Armature winding voltage  $V_a$  and field winding voltage  $V_f$ , in V.
- In series excited DC motor, armature and field winding voltage  $V_{af}$ .

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
ArmCurr	Armature winding current	A
FldCurr	Field winding current	A

### LdCurr — Starter motor load current

scalar

Starter motor load current, in A.

### MtrTrq — Starter motor shaft torque

scalar

Starter motor shaft torque, in N.m.

## Parameters

### Configuration

#### Motor Type — Select motor type

Separately Excited DC Motor (default) | Permanent Magnet Excited DC Motor  
| Series Connection DC Motor

Select one of the three motor types.

### Dependencies

The table summarizes the motor parameter dependencies.

Motor Type	Enables Motor Parameter
Separately Excited DC Motor	Armature winding resistance, Ra
	Armature winding inductance, La
	Field winding resistance Rf
	Field winding inductance, Lf
	Mutual inductance, Laf
	Initial armature and field current, Iaf
Permanent Magnet Excited DC Motor	Armature winding resistance, Rapm

<b>Motor Type</b>	<b>Enables Motor Parameter</b>
	<b>Armature winding inductance, <math>L_{apm}</math></b>
	<b>Torque constant, <math>K_t</math></b>
	<b>Initial armature current, <math>I_a</math></b>
Series Connection DC Motor	<b>Total resistance, <math>R_{ser}</math></b>
	<b>Total inductance, <math>L_{ser}</math></b>
	<b>Initial current, <math>I_{afser}</math></b>
	<b>Mutual inductance, <math>L_{afser}</math></b>

**Separately Excited DC Motor**

**Armature winding resistance,  $R_a$  — Resistance**

scalar

Armature winding resistance, in ohm.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Armature winding inductance,  $L_a$  — Inductance**

scalar

Armature winding inductance, in H.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Field winding resistance,  $R_f$  — Resistance**

scalar

Field winding resistance, in ohm.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Field winding inductance,  $L_f$  – Inductance**

scalar

Field winding inductance, in H.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Mutual inductance,  $L_{af}$  – Inductance**

scalar

Mutual inductance, in H.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Initial armature and field current,  $I_{af}$  – Current**

vector

Initial armature and field current, in A.

**Dependencies**

To enable this parameter, select Separately Excited DC Motor for the **Motor Type** parameter.

**Permanent Magnet Excited DC Motor****Armature winding resistance,  $R_{apm}$  – Resistance**

scalar

Armature winding resistance, in ohm.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Armature winding inductance,  $L_{apm}$  – Inductance**

scalar

Armature winding inductance, in H.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Torque constant,  $K_t$  — Motor torque constant**

scalar

Motor torque constant, in N.m/A.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Initial armature current,  $I_a$  — Current**

scalar

Initial armature current, in A.

**Dependencies**

To enable this parameter, select Permanent Magnet Excited DC Motor for the **Motor Type** parameter.

**Series Excited DC Motor**

**Total resistance,  $R_{ser}$  — Resistance**

scalar

Series connected field and armature resistance, in ohm.

**Dependencies**

To enable this parameter, select Series Excited DC Motor for the **Motor Type** parameter.

**Total inductance,  $L_{ser}$  — Inductance**

scalar

## Bidirectional DC-DC

DC-to-DC converter that supports bidirectional boost and buck

**Library:** Energy Storage and Auxiliary Drive / DC-DC

### Description

The Bidirectional DC-DC block implements a DC-to-DC converter that supports bidirectional boost and buck (lower) operation. Unless the DC-to-DC conversion limits the power, the output voltage tracks the voltage command. You can specify electrical losses or measured efficiency.

Depending on your battery system configuration, the voltage might not be at a potential that is required by electrical system components such as inverters and motors. You can use the block to boost or buck the voltage. Connect the block to the battery and one of these blocks:

- Mapped Motor
- IM Controller
- Interior PM Controller
- Surface Mount PM Controller

To calculate the electrical loss during the DC-to-DC conversion, use **Parameterize losses by**.

Parameter Option	Description
Single efficiency measurement	Electrical loss calculated using a constant value for conversion efficiency.

Parameter Option	Description
Tabulated loss data	Electrical loss calculated as a function of load current and voltage. DC-to-DC converter data sheets typically provide loss data in this format. When you use this option, provide data for all the operating quadrants in which the simulation will run. If you provide partial data, the block assumes the same loss pattern for other quadrants. The block does not extrapolate loss that is outside the range voltage and current that you provide. The block allows you to account for fixed losses that are still present for zero voltage or current.
Tabulated efficiency data	Electrical loss calculated using conversion efficiency that is a function of load current and voltage. When you use this option, provide data for all the operating quadrants in which the simulation will run. If you provide partial data, the block assumes the same efficiency pattern for other quadrants. The block: <ul style="list-style-type: none"> <li>Assumes zero loss when either the voltage or current is zero.</li> <li>Uses linear interpolation to determine the loss. At lower power conditions, for calculation accuracy, provide efficiency at low voltage and low current.</li> </ul>

**Note** The block does not support inversion. The polarity of the input voltage matches the polarity of the output voltage.

## Theory

The Bidirectional DC-DC block uses the commanded voltage and the actual voltage to determine whether to boost or buck (lower) the voltage. You can specify a time constant for the voltage response.

If	Then
$Volt_{cmd} > Src_{Volt}$	Boost
$Volt_{cmd} < Src_{Volt}$	Buck

The Bidirectional DC-DC block uses a time constant-based regulator to provide a fixed output voltage that is independent of load current. Using the output voltage and current, the block determines the losses of the DC-to-DC conversion. The block uses the conversion losses to calculate the input current. The block accounts for:

- Bidirectional current flow
  - Source to load — Battery discharge
  - Load to source — Battery charge
- Rated power limits

The block provides voltage control that is power limited based on these equations. The voltage is fixed. The block does not implement a voltage drop because the load current approximates DC-to-DC conversion with a bandwidth that is greater than the load current draw.

DC-to-DC converter load voltage	$LdVolt_{Cmd} = \min(Volt_{Cmd}, \frac{P_{limit}}{Ld_{Amp}}, 0)$ $LdVolt = LdVolt_{Cmd} \cdot \frac{1}{\tau s + 1}$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Volt} \cdot Ld_{Amp}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot  Ld_{Volt} \cdot Ld_{Amp} $
Power loss for tabulated efficiency	$Prw_{Loss} = f(Ld_{Volt}, Ld_{Amp})$
Source current draw from DC-to-DC converter	$Src_{Amp} = \frac{Ld_{Pwr} + Prw_{Loss}}{Src_{Volt}}$
Source power from DC-to-DC converter	$Src_{Pwr} = Src_{Amp} \cdot Src_{Volt}$

The equations use these variables.

$Volt_{Cmd}$	DC-to-DC converter commanded output voltage
$Src_{Volt}$	Source input voltage to DC-to-DC converter
$Ld_{Amp}$	Load current of DC-to-DC converter
$Ld_{Volt}$	Load voltage of DC-to-DC converter
$Src_{Amp}$	Source current draw from DC-to-DC converter
$\tau$	Conversion time constant
$V_{init}$	Initial load voltage of the DC-to-DC converter
$P_{limit}$	Output power limit for DC-to-DC converter
$Eff$	Input to output efficiency
$Src_{Pwr}$	Source power to DC-to-DC converter
$Ld_{Pwr}$	Load power from DC-to-DC converter
$Pwr_{Loss}$	Power loss
$LdVolt_{Cmd}$	Commanded load voltage of DC-to-DC converter before application of time constant

## Ports

### Inputs

#### **VoltCmd — Commanded voltage**

scalar

DC-to-DC converter commanded output voltage,  $Volt_{Cmd}$ , in V.

#### **SrcVolt — Input voltage**

scalar

Source input voltage to DC-to-DC converter,  $Src_{Volt}$ , in V.

#### **LdCurr — Load current**

scalar

Load current of DC-to-DC converter,  $Ld_{Amp}$ , in A.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
SrcPwr	Source power to DC-to-DC converter	$Src_{Pwr}$	W
LdPwr	Load power from DC-to-DC converter	$Ld_{Pwr}$	W
PwrLoss	Power loss	$Pwr_{Loss}$	W
LdVltCmd	Commanded load voltage of DC-to-DC converter before application of time constant	$LdVlt_{Cmd}$	V

### LdVlt — Load voltage

scalar

Load voltage of DC-to-DC converter,  $Ld_{Vlt}$ , in V.

### SrcCurr — Source current

scalar

Source current draw from DC-to-DC converter,  $Src_{Amp}$ , in A.

## Parameters

### Electrical Control

#### Converter response time constant — Constant

scalar

Converter response time,  $\tau$ , in s.

#### Converter response initial voltage, Vinit — Voltage

scalar

Initial load voltage of the DC-to-DC converter,  $V_{init}$ , in V.

### Converter power limit, $P_{limit}$ – Power

scalar

Initial load voltage of the DC-to-DC converter,  $P_{limit}$ , in W.

### Electrical Losses

#### Parameterize losses by – Loss calculation

Single efficiency measurement (default) | Tabulated loss data  
Tabulated efficiency data

This table summarizes the loss options used to calculate electrical options.

Parameter Option	Description

# Propulsion Blocks — Alphabetical List

---

## Boost Drive Shaft

Boost drive shaft speed

**Library:** Propulsion / Combustion Engine Components / Boost

## Description

The Boost Drive Shaft block uses the compressor, turbine, and external torques to calculate the drive shaft speed. Use the block to model turbochargers and superchargers in an engine model.

You can specify these configurations:

- Turbocharger — Connect the compressor to the turbine
  - Two-way ports for turbine and compressor connections
  - Option to add an externally applied input torque
- Compressor only — Connect the drive shaft to the compressor
  - Two-way port for compressor connection
  - Externally applied input torque
- Turbine only — Connect the drive shaft to the turbine
  - Two-way port for turbine connection
  - Externally applied load torque

For the Turbine only and Turbocharger configurations, the block modifies the turbine torque with a mechanical efficiency.

## Equations

The Boost Drive Shaft block applies Newton’s Second Law for Rotation. Positive torques cause the drive shaft to accelerate. Negative torques impose a load and decelerate the drive shaft.

The block also calculates the power loss due to mechanical inefficiency.

Calculation	Equations
Shaft dynamics	$\frac{d\omega}{dt} = \frac{1}{J_{shaft}} (\eta_{mech} \tau_{turb} + \tau_{comp} + \tau_{ext})$ with initial speed $\omega_0$
Speed constraint	$\omega_{min} \leq \omega \leq \omega_{max}$
Power loss	$\dot{W}_{loss} = \omega \tau_{turb} (1 - \eta_{mech})$

The equations use these variables.

$\omega$	Shaft speed
$\omega_0$	Initial drive shaft speed
$\omega_{min}$	Minimum drive shaft speed
$\omega_{max}$	Maximum drive shaft speed
$J_{shaft}$	Shaft inertia
$\eta_{max}$	Mechanical efficiency of turbine
$\tau_{comp}$	Compressor torque
$\tau_{turb}$	Turbine torque
$\tau_{ext}$	Externally applied torque.
$\dot{W}_{loss}$	Power loss due to mechanical inefficiency

## Ports

### Input

#### Cmprs — Compressor torque

two-way connector port

Compressor torque,  $\tau_{comp}$ , in N.m.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Compressor only.

**Turb — Turbine torque**

two-way connector port

Turbine torque,  $\tau_{turb}$ , in N.m.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Turbine only.

**ExtTrq — Externally applied torque**

scalar

Externally applied torque,  $\tau_{ext}$ , in N.m.

**Dependencies**

For turbocharger configurations, to create this port, set **Additional torque input** to External torque input.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
DriveshftSpd	Shaft speed	$\omega$	rad/s
MechPwrLoss	Mechanical power loss	$\dot{W}_{loss}$	W
ExtTrq	Applied external torque	$\tau_{ext}$	N.m

**Cmprs — Compressor speed**

two-way connector port

Compressor speed,  $\omega$ , in rad/s.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Compressor only.

**Turb — Turbine speed**

two-way connector port

Turbine speed,  $\omega$ , in N.m.

**Dependencies**

To create this port, for the **Configuration** parameter, select Turbocharger or Turbine only.

## Parameters

**Block Options****Configuration — Specify configuration**

Turbocharger (default) | Turbine only | Compressor only

**Dependencies**

- Selecting Turbocharger or Compressor only creates the Cmprs port.
- Selecting Turbocharger or Turbine only creates the Turb port.

**Additional torque input — Specify external torque input**

External torque input (default) | No external torque input

**Dependencies**

- To enable this parameter, select a Turbocharger configuration.
- To create the Trq port, select External torque input.

**Shaft inertia, J\_shaft — Inertia**

scalar

Shaft inertia,  $J_{shaft}$ , in  $\text{kg}\cdot\text{m}^2$ .

**Initial shaft speed, w\_0 — Speed**

scalar

Initial drive shaft speed,  $\omega_0$ , in rad/s.

**Min shaft speed, w\_min — Speed**  
scalar

Minimum drive shaft speed,  $\omega_{min}$ , in rad/s.

**Max shaft speed, w\_max — Speed**  
scalar

Maximum drive shaft speed,  $\omega_{max}$ , in rad/s.

**Turbine mechanical efficiency, eta\_mech — Efficiency**  
scalar

Mechanical efficiency of turbine  $\eta_{max}$ .

**Dependencies**

To enable this parameter, select the Turbocharger or Turbine only configuration.

# CI Controller

Compression-ignition controller that includes air mass flow, torque, and EGR estimation

**Library:** Propulsion / Combustion Engine Controllers

## Description

The CI Controller block implements a compression-ignition (CI) controller with air mass flow, torque, exhaust gas recirculation (EGR) flow, exhaust back-pressure, and exhaust gas temperature estimation. You can use the CI Controller block in engine control design or performance, fuel economy, and emission tradeoff studies. The core engine block requires the commands that are output from the CI Controller block.

The block uses the commanded torque and measured engine speed to determine these open-loop actuator commands:

- Injector pulse-width
- Fuel injection timing
- Variable geometry turbocharger (VGT) rack position
- EGR valve area percent

The CI Controller block has two subsystems:

- The Controller subsystem — Determines the commands based on tables that are functions of commanded torque and measured engine speed.

<b>Based On</b>	<b>Determines Commands for</b>
Commanded torque	Injector pulse-width
Measured engine speed	Fuel injection timing
	VGT rack position
	EGR valve area percent

- The Estimator subsystem — Determines estimates based on these engine attributes.

<b>Based On</b>	<b>Estimates</b>
Measured engine speed	Air mass flow
Fuel injection timing	Torque
Cycle average intake manifold pressure and temperature	Exhaust gas temperature
Fuel injector pulse-width	Exhaust gas back-pressure
Absolute ambient pressure	EGR valve gas mass flow
EGR valve area percent	
VGT rack position	
VGT speed	

The figure illustrates the signal flow.

The figure uses these variables.

$N$	Engine speed
$MAP$	Cycle average intake manifold absolute pressure
$MAT$	Cycle average intake manifold gas absolute temperature
$EGR_{ap}$ , $EGR_{cmd}$	EGR valve area percent and EGR valve area percent command, respectively
$VGT_{pos}$	VGT rack position
$N_{vgt}$	Corrected turbocharger speed
$RP_{cmd}$	VGT rack position command
$Pw_{inj}$	Fuel injector pulse-width
$MAINSOI$	Start of injection timing for main fuel injection pulse

The Model-Based Calibration Toolbox™ was used to develop the tables that are available with the Powertrain Blockset.

## Controller

The controller governs the combustion process by commanding VGT rack position, EGR valve area percent, fuel injection timing, and injector pulse-width. Feedforward lookup tables, which are functions of measured engine speed and commanded torque, determine the control commands.

The controller commands the EGR valve area percent and VGT rack position. Changing the VGT rack position modifies the turbine flow characteristics. At low-requested torques, the rack position can reduce the exhaust back pressure, resulting in a low turbocharger speed and boost pressure. When the commanded fuel requires additional air mass flow, the rack position is set to close the turbocharger vanes, increasing the turbocharger speed and intake manifold boost pressure.

The variable geometry turbocharger (VGT) rack position lookup table is a function of commanded torque and engine speed

$$RP_{cmd} = f_{RP_{cmd}}(Trq_{cmd}, N)$$

where:

- $RP_{cmd}$  is VGT rack position command, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N.m.
- $N$  is engine speed, in rpm.

The commanded exhaust gas recirculation (EGR) valve area percent lookup table is a function of commanded torque and engine speed

$$EGR_{cmd} = f_{EGRcmd}(Trq_{cmd}, N)$$

where:

- $EGR_{cmd}$  is commanded EGR valve area percent, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N.m.
- $N$  is engine speed, in rpm.

To initiate combustion, a CI engine injects fuel directly into the combustion chamber. After the injection, the fuel spontaneously ignites, increasing cylinder pressure. The total mass of the injected fuel and main injection timing determines the torque production.

Assuming constant fuel rail pressure, the CI controller commands the injector pulse-width based on the total requested fuel mass:

$$Pw_{inj} = \frac{F_{cmd,tot}}{S_{inj}}$$

The equation uses these variables.

$Pw_{inj}$	Fuel injector pulse-width
$S_{inj}$	Fuel injector slope
$F_{cmd,tot}$	Commanded total fuel mass per injection
$MAINSOI$	Main start-of-injection timing
$N$	Engine speed

The commanded total fuel mass per injection table is a function of the torque command and engine speed

$$F_{cmd,tot} = f_{F_{cmd,tot}}(Trq_{cmd}, N)$$

where:

- $F_{cmd,tot} = F$  is commanded total fuel mass per injection, in mg per cylinder.
- $Trq_{cmd}$  is commanded engine torque, in N.m.
- $N$  is engine speed, in rpm.

The main start-of-injection (SOI) timing lookup table is a function of commanded fuel mass and engine speed

$$MAINSOI = f(F_{cmd,tot}, N)$$

where:

- $MAINSOI$  is the main start-of-injection timing, in degrees crank angle after top dead center (degATDC).
- $F_{cmd,tot} = F$  is commanded fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

When the commanded torque is below a threshold value, the idle speed controller regulates the engine speed.

If	Idle Speed Controller
$Trq_{cmd,input} < Trq_{idlecmd,enable}$	Enabled
$Trq_{idlecmd,enable} \leq Trq_{cmd,input}$	Not enabled

The idle speed controller uses a discrete PI controller to regulate the target idle speed by commanding a torque.

The PI controller uses this transfer function:

$$C_{idle}(z) = K_{p,idle} + K_{i,idle} \frac{t_s}{z-1}$$

The idle speed commanded torque must be less than the maximum commanded torque:

$$0 \leq Trq_{idlecmd} \leq Trq_{idlecmd,max}$$

Idle speed control is active under these conditions. If the commanded input torque drops below the threshold for enabling the idle speed controller ( $Trq_{cmd,input} < Trq_{idlecmd,enable}$ ), the commanded engine torque is given by:

$$Trq_{cmd} = \max(Trq_{cmd,input}, Trq_{idlecmd}).$$

The equations use these variables.

$Trq_{cmd}$	Commanded engine torque
$Trq_{cmd,input}$	Input commanded engine torque
$Trq_{idlecmd,enable}$	Threshold for enabling idle speed controller
$Trq_{idlecmd}$	Idle speed controller commanded torque
$Trq_{idlecmd,max}$	Maximum commanded torque
$N_{idle}$	Base idle speed
$K_{p,idle}$	Idle speed controller proportional gain
$K_{i,idle}$	Idle speed controller integral gain

## Estimator

Using the CI Core Engine block, the CI Controller block estimates the air mass flow rate, EGR valve mass flow, exhaust back-pressure, engine torque, AFR, and exhaust temperature from sensor feedback. The Info port provides the estimated values, but block does not use them to determine the open-loop engine actuator commands.

To calculate the air mass flow, the compression-ignition (CI) engine uses the “CI Engine Speed-Density Air Mass Flow Model”. The speed-density model uses the speed-density equation to calculate the engine air mass flow, relating the engine intake port mass flow to the intake manifold pressure, intake manifold temperature, and engine speed.

To calculate the estimated exhaust gas recirculation (EGR) valve mass flow, the block calculates the EGR flow that would occur at standard temperature and pressure conditions, and then corrects the flow to actual temperature and pressure conditions. The block EGR calculation uses estimated exhaust back-pressure, estimated exhaust temperature, standard temperature, and standard pressure.

$$\dot{m}_{egr,est} = \dot{m}_{egr,std} \frac{P_{exh,est}}{P_{std}} \sqrt{\frac{T_{std}}{T_{exh,est}}}$$

- The standard exhaust gas recirculation (EGR) mass flow is a lookup table that is a function of the standard flow pressure ratio and EGR valve flow area

$$\dot{m}_{egr,std} = f\left(\frac{MAP}{P_{exh,est}}, EGR_{ap}\right)$$

where:

- $\dot{m}_{egr,std}$  is the standard EGR valve mass flow, in g/s.
- $P_{exh,est}$  is the estimated exhaust back-pressure, in Pa.
- $MAP$  is the cycle average intake manifold absolute pressure, in Pa.
- $EGR_{ap}$  is the measured EGR valve area, in percent.

The equations use these variables.

$\dot{m}_{egr,est}$	Estimated EGR valve mass flow
$\dot{m}_{egr,std}$	Standard EGR valve mass flow
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$T_{exh,est}$	Estimated exhaust manifold gas temperature
$MAP$	Measured cycle average intake manifold absolute pressure
$P_{exh,est}$	Estimated exhaust back-pressure
$P_{Amb}$	Absolute ambient pressure

*EGRap* Measured EGR valve area percent

To estimate the EGR valve mass flow, the block requires an estimate of the exhaust back-pressure. To estimate the exhaust back-pressure, the block uses the ambient pressure and the turbocharger pressure ratio.

$$P_{exh,est} = P_{Amb} Pr_{turbo}$$

For the turbocharger pressure ration calculation, the block uses two lookup tables. The first lookup table determines the approximate turbocharger pressure ratio as a function of turbocharger mass flow and corrected turbocharger speed. Using a second lookup table, the block corrects the approximate turbocharger pressure ratio for VGT rack position.

$$Pr_{turbo} = f(\dot{m}_{airstd}, N_{vgtcorr}) f(VGT_{pos})$$

where:

$$N_{vgtcorr} = \frac{N_{vgt}}{\sqrt{T_{exh,est}}}$$

The equations use these variables.

$\dot{m}_{egr,est}$	Estimated EGR valve mass flow
$\dot{m}_{egr,std}$	Standard EGR valve mass flow
$\dot{m}_{port,est}$	Estimated intake port mass flow rate
$\dot{m}_{airstd}$	Standard air mass flow
<i>EGRap</i>	Measured EGR valve area
<i>MAP</i>	Measured cycle average intake manifold absolute pressure
<i>MAT</i>	Measured cycle average intake manifold gas absolute temperature
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature

$T_{exh,est}$	Estimated exhaust manifold gas temperature
$Pr_{vgtcorr}$	Turbocharger pressure ratio correction for VGT rack position
$Pr_{turbo}$	Turbocharger pressure ratio
$P_{exh,est}$	Estimated exhaust back-pressure
$P_{Amb}$	Absolute ambient pressure
$N_{vgtcorr}$	Corrected turbocharger speed
$VGT_{pos}$	Measured VGT rack position

The exhaust-back pressure calculation uses these lookup tables:

- The turbocharger pressure ratio, corrected for variable geometry turbocharger (VGT) speed, is a lookup table that is a function of the standard air mass flow and corrected turbocharger speed,  $Pr_{turbo} = f(\dot{m}_{airstd}, N_{vgtcorr})$ , where:

- $Pr_{turbo}$  is the turbocharger pressure ratio, corrected for VGT speed.
- $\dot{m}_{airstd}$  is the standard air mass flow, in g/s.
- $N_{vgtcorr}$  is the corrected turbocharger speed, in rpm/K<sup>(1/2)</sup>.

To calculate the standard air mass flow through the turbocharger, the block uses conservation of mass, the estimated intake port, and EGR mass flows (from the last estimated calculation). The calculation assumes negligible exhaust manifold filling dynamics.

$$\dot{m}_{airstd} = (\dot{m}_{port,est} - \dot{m}_{egr,est}) \frac{P_{std}}{MAP} \sqrt{\frac{MAT}{T_{std}}}$$

- The variable geometry turbocharger pressure ratio correction is a function of the rack position,  $Pr_{vgtcorr} = f(VGT_{pos})$ , where:
  - $Pr_{vgtcorr}$  is the turbocharger pressure ratio correction.
  - $VGT_{pos}$  is the variable geometry turbocharger (VGT) rack position.

To calculate the engine torque, you can configure the CI controller to use either of these torque models.

Brake Torque Model	Description
“CI Engine Torque Structure Model”	Model accounts for the reduction in engine torque as these engine conditions vary from nominal: <ul style="list-style-type: none"> <li>• Fuel injection timing</li> <li>• Intake manifold gas temperature and pressure</li> <li>• Unburned cylinder air mass</li> </ul>
“CI Engine Simple Torque Model”	For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.

The lookup table for the exhaust temperature is a function of injected fuel mass and engine speed

$$T_{exh} = f_{T_{exh}}(F, N)$$

where:

- $T_{exh}$  is exhaust temperature, in K.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

The measured engine speed and fuel injector pulse-width determine the commanded fuel mass flow rate:

$$\dot{m}_{fuel,cmd} = \frac{NS_{inj}Pw_{inj}N_{cyl}}{Cps \left( \frac{60s}{min} \right) \left( \frac{1000mg}{g} \right)}$$

The commanded total fuel mass flow and estimated port mass flow rates determine the estimated AFR:

$$AFR_{est} = \frac{\dot{m}_{port,est}}{\dot{m}_{fuel,cmd}}$$

The equations use these variables.

$Pw_{inj}$	Fuel injector pulse-width
$AFR_{est}$	Estimated air-fuel ratio
$\dot{m}_{fuel,cmd}$	Commanded fuel mass flow rate
$S_{inj}$	Fuel injector slope
$N$	Engine speed
$N_{cyl}$	Number of engine cylinders
$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$\dot{m}_{port,est}$	Total estimated engine air mass flow at intake ports

## Ports

### Input

#### **TrqCmd — Commanded engine torque**

scalar

Commanded engine torque,  $Trq_{cmd,input}$ , in N.m.

scalar

Main start-of-injection timing,  $MAINSOI$ , in degrees crank angle after top dead center (degATDC).

**TurbRackPosCmd — Rack position**

scalar

VGT rack position command,  $RP_{cmd}$ .

**EgrVlvAreaPctCmd — Intake cam phaser angle command**

scalar

EGR valve area percent command,  $EGR_{cmd}$ .

## Parameters

### Configuration

**Torque estimation model — Select torque estimation model**

Torque Structure (default) | Simple Torque Lookup

To calculate the engine torque, you can configure the CI controller to use either of these torque models.

Brake Torque Model	Description
“CI Engine Torque Structure Model”	<p>Model accounts for the reduction in engine torque as these engine conditions vary from nominal:</p> <ul style="list-style-type: none"> <li>• Fuel injection timing</li> <li>• Intake manifold gas temperature and pressure</li> <li>• Unburned cylinder air mass</li> </ul>
“CI Engine Simple Torque Model”	For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.

**Dependencies**

The table summarizes the parameter dependencies.

## Controls

### Air

#### EGR valve area percent, $f_{egr\_cmd}$ – Lookup table

array

The commanded exhaust gas recirculation (EGR) valve area percent lookup table is a function of commanded torque and engine speed

$$EGR_{cmd} = f_{EGRcmd}(Trq_{cmd}, N)$$

where:

- $EGR_{cmd}$  is commanded EGR valve area percent, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N.m.
- $N$  is engine speed, in rpm.

**Commanded torque breakpoints,  $f_{egr\_tq\_bpt}$  — Breakpoints**  
vector

Commanded torque breakpoints, in N.m.

**Speed breakpoints,  $f_{egr\_n\_bpt}$  — Breakpoints**  
vector

Speed breakpoints, in rpm.

**VGT rack position table,  $f_{rpcmd}$  — Lookup table**  
array

The variable geometry turbocharger (VGT) rack position lookup table is a function of commanded torque and engine speed

$$RP_{cmd} = f_{RPcmd}(Trq_{cmd}, N)$$

where:

- $RP_{cmd}$  is VGT rack position command, in percent.
- $Trq_{cmd}$  is commanded engine torque, in N.m.
- $N$  is engine speed, in rpm.

**Commanded torque breakpoints,  $f_{rp\_tq\_bpt}$  — Breakpoints**  
vector

Breakpoints, in N.m.

**Speed breakpoints, f\_rp\_n\_bpt – Breakpoints**  
vector

Breakpoints, in rpm.

**Fuel**

**Injector slope, S<sub>inj</sub> – Slope**  
scalar

Fuel injector slope,  $S_{inj}$ , in mg/ms.

**Stoichiometric air-fuel ratio, afr\_stoich – Ratio**  
scalar

Stoichiometric air-fuel ratio,  $AFR_{stoich}$ .

**Fuel mass per injection table, f\_fcnd\_tot – Lookup table**  
array

The commanded total fuel mass per injection table is a function of the torque command and engine speed

$$F_{cmd,tot} = f_{F_{cmd,tot}}(Trq_{cmd}, N)$$

where:

- $F_{cmd,tot} = F$  is commanded total fuel mass per injection, in mg per cylinder.
- $Trq_{cmd}$  is commanded engine torque, in N.m.
- $N$  is engine speed, in rpm.

### Fuel main injection timing table, $f_{main\_soi}$ — Lookup table array

The main start-of-injection (SOI) timing lookup table is a function of commanded fuel mass and engine speed

$$MAINSOI = f(F_{cmd,tot}, N)$$

where:

- $MAINSOI$  is the main start-of-injection timing, in degrees crank angle after top dead center (degATDC).
- $F_{cmd,tot} = F$  is commanded fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Fuel main injection timing fuel breakpoints,  $f\_main\_soi\_f\_bpt$  — Breakpoints**

vector

Fuel main injection timing fuel breakpoints, in mg per injection.

**Fuel main injection timing speed breakpoints,  $f\_main\_soi\_n\_bpt$  — Breakpoints**

vector

Fuel main injection timing speed breakpoints, in rpm.

**Commanded torque breakpoints,  $f\_f\_tot\_tq\_bpt$  — Breakpoints**

vector

Commanded torque breakpoints, in N·m.

**Speed breakpoints,  $f\_f\_tot\_n\_bpt$  — Breakpoints**

vector

Speed breakpoints, in rpm.

**Idle Speed****Base idle speed,  $N\_idle$  — Speed**

scalar

Base idle speed,  $N_{idle}$ , in rpm.**Enable torque command limit,  $Trq\_idlecmd\_enable$  — Torque**

scalar

Torque to enable the idle speed controller,  $Trq_{idlecmd,enable}$ , in N.m.**Maximum torque command,  $Trq\_idlecmd\_max$  — Torque**

scalar

Maximum idle controller commanded torque,  $Trq_{idlecmd,max}$ , in N.m.**Proportional gain,  $Kp\_idle$  — PI Controller**

scalar

Proportional gain for idle speed control,  $K_{p,idle}$ , in N.m/rpm.

**Integral gain,  $K_{i\_idle}$  — PI Controller**

scalar

Integral gain for idle speed control,  $K_{i\_idle}$ , in N.m/(rpm\*s).

**Estimation**

**Air**

**Number of cylinders,  $N_{Cyl}$  — Engine cylinders**

scalar

Number of engine cylinders,  $N_{cyl}$ .

**Crank revolutions per power stroke,  $Cps$  — Revolutions per stroke**

scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.

**Total displaced volume,  $V_d$  — Volume**

scalar

Displaced volume,  $V_d$ , in  $m^3$ .

**Ideal gas constant air,  $R_{air}$  — Constant**

scalar

Ideal gas constant,  $R_{air}$ , in J/(kg\*K).

**Air standard pressure,  $P_{std}$  — Pressure**

scalar

Standard air pressure,  $P_{std}$ , in Pa.

**Air standard temperature,  $T_{std}$  — Temperature**

scalar

Standard air temperature,  $T_{std}$ , in K.

**Speed density volumetric efficiency,  $f_{nv}$  – Lookup table**

array

The volumetric efficiency lookup table is a function of the intake manifold absolute pressure at intake valve closing (IVC) and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

**Speed density intake manifold pressure breakpoints,  $f_{nv\_prs\_bpt}$  – Breakpoints**

vector

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

**Speed density engine speed breakpoints,  $f_{nv\_n\_bpt}$  – Breakpoints**

vector

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

**EGR valve standard flow calibration,  $f_{egr\_stdflow}$  — Lookup table**  
array

The standard exhaust gas recirculation (EGR) mass flow is a lookup table that is a function of the standard flow pressure ratio and EGR valve flow area

$$\dot{m}_{egr,std} = f\left(\frac{MAP}{P_{exh,est}}, EGRap\right)$$

where:

- $\dot{m}_{egr,std}$  is the standard EGR valve mass flow, in g/s.
- $P_{exh,est}$  is the estimated exhaust back-pressure, in Pa.
- $MAP$  is the cycle average intake manifold absolute pressure, in Pa.
- $EGRap$  is the measured EGR valve area, in percent.

**EGR valve standard flow pressure ratio breakpoints,  $f_{egr\_stdflow\_pr\_bpt}$  — Breakpoints**  
vector

EGR valve standard flow pressure ratio breakpoints, dimensionless.

**EGR valve standard flow area percent breakpoints,  $f_{egr\_stdflow\_egrap\_bpt}$  — Breakpoints**  
vector

EGR valve standard flow area percent breakpoints, in percent.

### Turbocharger pressure ratio, $f\_turbo\_pr$ – Lookup table

array

The turbocharger pressure ratio, corrected for variable geometry turbocharger (VGT) speed, is a lookup table that is a function of the standard air mass flow and corrected

turbocharger speed,  $Pr_{turbo} = f(\dot{m}_{airstd}, N_{vgtcrr})$ , where:

- $Pr_{turbo}$  is the turbocharger pressure ratio, corrected for VGT speed.
- $\dot{m}_{airstd}$  is the standard air mass flow, in g/s.
- $N_{vgtcrr}$  is the corrected turbocharger speed, in  $\text{rpm}/\text{K}^{(1/2)}$ .

### Turbocharger pressure ratio standard flow breakpoints, $f\_turbo\_pr\_stdflow\_bpt$ – Breakpoints

vector

Turbocharger pressure ratio standard flow breakpoints, in g/s.

### Turbocharger pressure ratio corrected speed breakpoints, $f\_turbo\_pr\_corrspd\_bpt$ – Breakpoints

vector

Turbocharger pressure ratio corrected speed breakpoints, in  $\text{rpm}/\text{K}^{(1/2)}$ .

### Turbocharger pressure ratio vgt position correction, $f\_turbo\_pr\_vgtposcorr$ – Lookup table

array

The variable geometry turbocharger pressure ratio correction is a function of the rack position,  $Pr_{vgtcorr} = f(VGT_{pos})$ , where:

- $Pr_{vgtcorr}$  is the turbocharger pressure ratio correction.
- $VGT_{pos}$  is the variable geometry turbocharger (VGT) rack position.

**Turbocharger pressure ratio vgt position correction breakpoints, f\_turbo\_pr\_vgtposcorr\_bpt — Breakpoints**  
vector

Turbocharger pressure ratio VGT position correction breakpoints, dimensionless.

**Torque**

**Torque table, f\_tq\_nf — Lookup table**  
array

For the simple torque lookup table model, the CI engine uses a lookup table as a function of engine speed and injected fuel mass,  $T_{brake} = f_{Tnf}(F, N)$ , where:

- $Tq = T_{brake}$  is engine brake torque after accounting for engine mechanical and pumping friction effects, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table fuel mass per injection breakpoints, `f_tq_nf_f_bpt` – Breakpoints vector

Torque table fuel mass per injection breakpoints, in mg per injection.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table speed breakpoints, `f_tq_nf_n_bpt` – Breakpoints vector

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Inner torque table, `f_tq_inr` – Lookup table array

The inner torque lookup table,  $f_{Tq_{inr}}$ , is a function of engine speed and injected fuel mass,  $Tq_{inr} = f_{Tq_{inr}}(F, N)$ , where:

- $Tq_{inr}$  is inner torque based on gross indicated mean effective pressure, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Friction torque table, $f_{Tq_{fric}}$ — Lookup table array

The friction torque lookup table,  $f_{Tq_{fric}}$ , is a function of engine speed and injected fuel mass,  $Tq_{fric} = f_{Tq_{fric}}(F, N)$ , where:

- $Tq_{fric}$  is friction torque offset to inner torque, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Engine temperature modifier on friction torque, $f_{fric\_temp\_mod}$ – Lookup table vector

Engine temperature modifier on friction torque,  $f_{fric\_temp}$ , dimensionless.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Engine temperature modifier breakpoints, $f_{fric\_temp\_bpt}$ – Breakpoints vector

Engine temperature modifier breakpoints, in K.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Pumping torque table, $f_{tq\_pump}$ – Lookup table array

The pumping torque lookup table,  $f_{T_{pump}}$ , is a function of engine speed and injected fuel mass,  $T_{pump} = f_{T_{pump}}(F, N)$ , where:

- $T_{pump}$  is pumping torque, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Inner torque fuel mass per injection breakpoints, $f_{tq\_inr\_f\_bpt}$ — Breakpoints

vector

Inner torque fuel mass per injection breakpoints, in mg per injection.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Inner torque speed breakpoints, $f_{tq\_inr\_n\_bpt}$ — Breakpoints

vector

Inner torque speed breakpoints.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Main start of injection timing modifier on torque, $f_{tq\_mainsoi\_mod}$ — Lookup table

array

The main start-of-injection (MAINSOI) torque modifier lookup table is a function of MAINSOI and engine speed  $Tmod_{mainsoi} = f_{mainsoi}(MAINSOI, N)$ , where:

- $Tmod_{mainsoi}$  is the torque modifier due to MAINSOI torque loss.
- $MAINSOI$  is the main start-of-injection timing, in degrees crank angle after top dead center (degATDC).
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Main start of injection timing modifier breakpoints, **f\_tq\_mainsoi\_bpt** – Breakpoints vector

Main start of injection timing modifier breakpoints, in degrees crank angle after top dead center (degATDC).

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas temperature modifier on torque, **f\_tq\_mat\_mod** – Lookup table array

The intake manifold gas temperature (MAT) torque modifier lookup table is a function of MAT and engine speed,  $Tmod_{mat} = f_{mat}(MAT, N)$ , where:

- $Tmod_{mat}$  is the torque modifier due to MAT torque loss.
- $MAT$  is the measured intake manifold gas pressure, in C.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas temperature modifier breakpoints, $f_{tq\_mat\_bpt}$ — Breakpoints vector

Intake manifold gas temperature modifier breakpoints, in °C.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas pressure modifier on torque, $f_{tq\_map\_mod}$ — Lookup table array

The intake manifold absolute pressure (MAP) torque modifier lookup table is a function of MAP and engine speed,  $Tmod_{map} = f_{map}(MAP, N)$ , where:

- $Tmod_{map}$  is the torque modifier due to MAP torque loss.
- $MAP$  is the measured intake manifold absolute pressure, in kPa.

- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas pressure modifier breakpoints, $f_{tq\_map\_bpt}$ — Breakpoints vector

Intake manifold gas pressure modifier breakpoints, in kPa.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Unburned air mass per cylinder modifier on torque, $f_{tq\_apc\_mod}$ — Lookup table array

The unburned air per cylinder (APC) torque modifier lookup table is a function of APC and engine speed,  $Tmod_{apc} = f_{apc}(APC, N)$ , where:

- $Tmod_{apc}$  is the torque modifier due to APC torque loss.
- $APC$  is the unburned air per cylinder, in mg.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Unburned air mass per cylinder modifier breakpoints, $f_{tq\_apc\_bpt}$ — Breakpoints

vector

Unburned air mass per cylinder modifier breakpoints, in mg.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Exhaust

### Exhaust temperature table, $f_{t\_exh}$ — Lookup table

array

The lookup table for the exhaust temperature is a function of injected fuel mass and engine speed

$$T_{exh} = f_{T_{exh}}(F, N)$$

where:

- $T_{exh}$  is exhaust temperature, in K.
- $F$  is injected fuel mass, in mg per injection.

- $N$  is engine speed, in rpm.

### Fuel mass per injection breakpoints, $f\_t\_exh\_f\_bpt$ – Breakpoints vector

Engine load breakpoints used for exhaust temperature lookup table.

### Speed breakpoints, $f\_t\_exh\_n\_bpt$ – Breakpoints vector

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

# CI Core Engine

Compression-ignition engine from intake to exhaust port

**Library:** Propulsion / Combustion Engine Components / Core Engine

## Description

The CI Core Engine block implements a compression-ignition (CI) engine from intake to the exhaust port. You can use the block for hardware-in-the-loop (HIL) engine control design or vehicle-level fuel economy and performance simulations.

The CI Core Engine block calculates:

- Brake torque
- Fuel flow
- Air mass flow, including exhaust gas recirculation (EGR)
- Air-fuel ratio (AFR)
- Exhaust temperature and exhaust mass flow rate
- Engine-out (EO) exhaust emissions:
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM)

## Air Mass Flow

To calculate the air mass flow, the compression-ignition (CI) engine uses the “CI Engine Speed-Density Air Mass Flow Model”. The speed-density model uses the speed-density equation to calculate the engine air mass flow, relating the engine intake port mass flow to the intake manifold pressure, intake manifold temperature, and engine speed.

## Brake Torque

To calculate the engine torque, you can configure the CI controller to use either of these torque models.

Brake Torque Model	Description
“CI Engine Torque Structure Model”	Model accounts for the reduction in engine torque as these engine conditions vary from nominal: <ul style="list-style-type: none"> <li>• Fuel injection timing</li> <li>• Intake manifold gas temperature and pressure</li> <li>• Unburned cylinder air mass</li> </ul>
“CI Engine Simple Torque Model”	For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.

## Fuel Flow

To calculate the engine fuel mass flow, the CI Core Engine block uses fuel mass flow delivered by the injectors and the engine airflow.

$$\dot{m}_{fuel} = \frac{N \cdot N_{cyl}}{Cps \left( \frac{60s}{min} \right) \left( \frac{1000mg}{g} \right)} \sum m_{fuel,inj}$$

The equation uses these variables.

- $\dot{m}_{fuel}$  Engine fuel mass flow, g/s
- $m_{fuel,inj}$  Fuel mass per injection

$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed, rpm

## Air-Fuel Ratio

To calculate the air-fuel (AFR) ratio, the CI Core Engine and SI Core Engine blocks implement this equation.

$$AFR = \frac{\dot{m}_{air}}{\dot{m}_{fuel}}$$

To calculate the exhaust gas recirculation (EGR), the blocks implement this equation. The calculation expresses the EGR as a percent of the total intake port flow.

$$EGR_{pct} = 100 \frac{\dot{m}_{intk,b}}{\dot{m}_{intk}} = 100 y_{intk,b}$$

The equations use these variables.

$AFR$	Air-fuel ratio
$\dot{m}_{intk}$	Engine air mass flow
$\dot{m}_{fuel}$	Fuel mass flow
$y_{intk,b}$	Intake burned mass fraction
$EGR_{pct}$	EGR percent
$\dot{m}_{intk,b}$	Recirculated burned gas mass flow rate

## Exhaust

The block calculates the:

- Exhaust gas temperature
- Exhaust gas-specific enthalpy
- Exhaust gas mass flow rate
- Engine-out (EO) exhaust emissions:
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM)

The exhaust temperature determines the specific enthalpy.

$$h_{exh} = C_{p_{exh}} T_{exh}$$

The exhaust mass flow rate is the sum of the intake port air mass flow and the fuel mass flow.

$$\dot{m}_{exh} = \dot{m}_{intake} + \dot{m}_{fuel}$$

To calculate the exhaust emissions, the block multiplies the emission mass fraction by the exhaust mass flow rate. To determine the emission mass fractions, the block uses lookup tables that are functions of the engine torque and speed.

$$y_{exh,i} = f_{i\_frac}(T_{brake}, N)$$

$$\dot{m}_{exh,i} = \dot{m}_{exh} y_{exh,i}$$

The fraction of air and fuel entering the intake port, injected fuel, and stoichiometric AFR determine the air mass fraction that exits the exhaust.

$$y_{exh,air} = \max \left[ y_{in,air} - \frac{\dot{m}_{fuel} + y_{in,fuel} \dot{m}_{intake}}{\dot{m}_{fuel} + \dot{m}_{intake}} AFR_s \right]$$

If the engine is operating at the stoichiometric or fuel rich AFR, no air exits the exhaust. Unburned hydrocarbons and burned gas comprise the remainder of the exhaust gas. This equation determines the exhaust burned gas mass fraction.

$$y_{exh,b} = \max[(1 - y_{exh,air} - y_{exh,HC}), 0]$$

The equations use these variables.

$T_{exh}$	Engine exhaust temperature
$h_{exh}$	Exhaust manifold inlet-specific enthalpy
$C_{P_{exh}}$	Exhaust gas specific heat
$\dot{m}_{intk}$	Intake port air mass flow rate
$\dot{m}_{fuel}$	Fuel mass flow rate
$\dot{m}_{exh}$	Exhaust mass flow rate
$y_{in,fuel}$	Intake fuel mass fraction
$y_{exh,i}$	Exhaust mass fraction for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NO}_x, \text{air}, \text{burned gas}, \text{and PM}$
$\dot{m}_{exh,i}$	Exhaust mass flow rate for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NO}_x, \text{air}, \text{burned gas}, \text{and PM}$
$T_{brake}$	Engine brake torque
$N$	Engine speed
$y_{exh,air}$	Exhaust air mass fraction
$y_{exh,b}$	Exhaust air burned mass fraction

## Ports

### Input

#### **FuelMass** – Fuel injector pulse-width

vector

Fuel mass per injection,  $m_{fuel,inj}$  in mg/injection.

#### **Soi** – Start of fuel injection timing

vector

Fuel injection timing, *SOI*, in degrees crank angle after top dead center (degATDC). First vector value, *Soi(1)*, is main injection timing.

### **Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

### **EngSpd — Engine speed**

scalar

Engine speed, *N*, in rpm.

### **Ect — Engine cooling temperature**

scalar

Engine cooling temperature,  $T_{coolant}$  in K.

### **Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

### **Intk — Intake port pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the upstream:

- *Prs* — Pressure, in Pa
- *Temp* — Temperature, in K
- *Enth* — Specific enthalpy, in J/kg
- *MassFrac* — Intake port mass fractions, dimensionless. Exhaust gas recirculation (EGR) mass flow at the intake port is burned gas.

Specifically, a bus with these mass fractions:

- *O2MassFrac* — Oxygen
- *N2MassFrac* — Nitrogen
- *UnbrndFuelMassFrac* — Unburned fuel
- *CO2MassFrac* — Carbon dioxide
- *H2OMassFrac* — Water
- *COMassFrac* — Carbon monoxide

- `NOMassFrac` — Nitric oxide
- `N02MassFrac` — Nitrogen dioxide
- `N0xMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

**Exh — Exhaust port pressure, temperature, enthalpy, mass fractions**  
two-way connector port

Bus containing the exhaust:

- `Prs` — Pressure, in Pa
- `Temp` — Temperature, in K
- `Enth` — Specific enthalpy, in J/kg
- `MassFrac` — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- `O2MassFrac` — Oxygen
- `N2MassFrac` — Nitrogen
- `UnbrndFuelMassFrac` — Unburned fuel
- `C02MassFrac` — Carbon dioxide
- `H20MassFrac` — Water
- `COMassFrac` — Carbon monoxide
- `NOMassFrac` — Nitric oxide
- `N02MassFrac` — Nitrogen dioxide
- `N0xMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
IntkGasMassFlw	Air mass flow entering and exiting the engine from the intake ports to the exhaust ports.	$\dot{m}_{intk}$	kg/s
IntkAirMassFlw	Total engine air mass flow at intake ports, including EGR flow.	$\dot{m}_{port}$	kg/s
NrmlzdAirChrg	Engine load (that is, normalized cylinder air mass) at arbitrary cam phaser angles, corrected for final steady-state cam phase angles	$L$	N/A
Afr	Air fuel ratio at engine exhaust port.	$AFR$	N/A
FuelMassFlw	Fuel flow into engine	$\dot{m}_{fuel}$	kg/s
ExhManGasTemp	Exhaust gas temperature at exhaust manifold inlet	$T_{exh}$	K
EngTrq	Engine brake torque	$T_{brake}$	N.m
EngSpd	Engine speed	$N$	rpm

Signal	Description	Variable	Units
CrkAng	Engine crankshaft absolute angle	$\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ where $Cps$ is crankshaft revolutions per power stroke	degrees crank angle
EgrPct	EGR percent	$EGR_{pct}$	N/A
EoAir	EO air mass flow rate	$\dot{m}_{exh}$	kg/s
EoBrndGas	EO burned gas mass flow rate	$y_{exh,b}$	kg/s
EoHC	EO hydrocarbon emission mass flow rate	$y_{exh,HC}$	kg/s
EoCO	EO carbon monoxide emission mass flow rate	$y_{exh,CO}$	kg/s
EoNOx	EO nitric oxide and nitrogen dioxide emissions mass flow rate	$y_{exh,NOx}$	kg/s
EoCO2	EO carbon dioxide emission mass flow rate	$y_{exh,CO2}$	kg/s
EoPm	EO particulate matter emission mass flow rate	$y_{exh,PM}$	kg/s

### EngTrq – Engine brake torque

scalar

Engine brake torque,  $T_{brake}$ , in N.m.

### Intk – Intake port mass flow rate, heat flow rate, temperature, mass fraction

two-way connector port

Bus containing:

- `MassFlwRate` — Intake port mass flow rate, in kg/s
- `HeatFlwRate` — Intake port heat flow rate, in J/s
- `ExhManGasTemp` — Intake port temperature, in K
- `MassFrac` — Intake port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- `O2MassFrac` — Oxygen
- `N2MassFrac` — Nitrogen
- `UnbrndFuelMassFrac` — Unburned fuel
- `CO2MassFrac` — Carbon dioxide
- `H2OMassFrac` — Water
- `COMassFrac` — Carbon monoxide
- `NOMassFrac` — Nitric oxide
- `N02MassFrac` — Nitrogen dioxide
- `N0xMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

### **Exh — Exhaust port mass flow rate, heat flow rate, temperature, mass fraction** two-way connector port

Bus containing:

- `MassFlwRate` — Exhaust port mass flow rate, in kg/s
- `HeatFlwRate` — Exhaust heat flow rate, in J/s
- `ExhManGasTemp` — Exhaust port temperature, in K
- `MassFrac` — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- `O2MassFrac` — Oxygen
- `N2MassFrac` — Nitrogen
- `UnbrndFuelMassFrac` — Unburned fuel

- C02MassFrac — Carbon dioxide
- H20MassFrac — Water
- C0MassFrac — Carbon monoxide
- N0MassFrac — Nitric oxide
- N02MassFrac — Nitrogen dioxide
- N0xMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

#### Torque model — Select torque model

Torque Structure (default) | Simple Torque Lookup

To calculate the engine torque, you can configure the CI controller to use either of these torque models.

Brake Torque Model	Description
“CI Engine Torque Structure Model”	Model accounts for the reduction in engine torque as these engine conditions vary from nominal: <ul style="list-style-type: none"> <li>• Fuel injection timing</li> <li>• Intake manifold gas temperature and pressure</li> <li>• Unburned cylinder air mass</li> </ul>
“CI Engine Simple Torque Model”	For the simple engine torque calculation, the CI engine uses a torque lookup table map that is a function of engine speed and injected fuel mass.

### Dependencies

The table summarizes the parameter dependencies.

Port Configuration	Enables Parameters
Torque Structure	<p><b>Inner torque table, f_tq_inr</b></p> <p><b>Friction torque table, f_tq_fric</b></p> <p><b>Engine temperature modifier on friction torque, f_fric_temp_mod</b></p> <p><b>Engine temperature modifier breakpoints, f_fric_temp_bpt</b></p> <p><b>Pumping torque table, f_tq_pump</b></p> <p><b>Inner torque fuel mass per injection breakpoints, f_tq_inr_f_bpt</b></p> <p><b>Inner torque speed breakpoints, f_tq_inr_n_bpt</b></p> <p><b>Main start of injection timing modifier on torque, f_tq_mainsoi_mod</b></p> <p><b>Main start of injection timing modifier breakpoints, f_tq_mainsoi_bpt</b></p> <p><b>Intake manifold gas temperature modifier on torque, f_tq_mat_mod</b></p> <p><b>Intake manifold gas temperature modifier breakpoints, f_tq_mat_bpt</b></p> <p><b>Intake manifold gas pressure modifier on torque, f_tq_map_mod</b></p> <p><b>Intake manifold gas pressure modifier breakpoints, f_tq_map_bpt</b></p> <p><b>Unburned air mass per cylinder modifier on torque, f_tq_apc_mod</b></p> <p><b>Unburned air mass per cylinder modifier breakpoints, f_tq_apc_bpt</b></p>

Port Configuration	Enables Parameters
Simple Torque Lookup	<b>Torque table, <math>f_{tq\_nl}</math></b> <b>Torque table load breakpoints, <math>f_{tq\_nl\_l\_bpt}</math></b> <b>Torque table speed breakpoints, <math>f_{tq\_nl\_n\_bpt}</math></b>

**Air****Number of cylinders, NCyl – Engine cylinders**

scalar

Number of engine cylinders,  $N_{cyl}$ .**Crank revolutions per power stroke, Cps – Revolutions per stroke**

scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.**Total displaced volume, Vd – Volume**

scalar

Displaced volume,  $V_d$ , in  $m^3$ .**Ideal gas constant air, Rair – Constant**

scalar

Ideal gas constant,  $R_{air}$ , in  $J/(kg \cdot K)$ .**Air standard pressure, Pstd – Pressure**

scalar

Standard air pressure,  $P_{std}$ , in Pa.**Air standard temperature, Tstd – Temperature**

scalar

Standard air temperature,  $T_{std}$ , in K.

**Speed-density volumetric efficiency,  $f_{\eta_v}$  — Lookup table**

array

The volumetric efficiency lookup table is a function of the intake manifold absolute pressure at intake valve closing (IVC) and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

**Speed-density intake manifold pressure breakpoints,  $f_{\eta_v\_prs\_bpt}$  — Breakpoints**

array

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

**Speed-density engine speed breakpoints,  $f_{\eta_v\_n\_bpt}$  — Breakpoints**

array

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

## Torque

### Torque table, `f_tq_nf` – Lookup table

array

For the simple torque lookup table model, the CI engine uses a lookup table as a function of engine speed and injected fuel mass,  $T_{brake} = f_{Tnf}(F, N)$ , where:

- $Tq = T_{brake}$  is engine brake torque after accounting for engine mechanical and pumping friction effects, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table fuel mass per injection breakpoints, `f_tq_nf_f_bpt` – Breakpoints

vector

Torque table fuel mass per injection breakpoints, in mg per injection.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table speed breakpoints, $f_{tq\_nf\_n\_bpt}$ — Breakpoints vector

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Inner torque table, $f_{tq\_inr}$ — Lookup table array

The inner torque lookup table,  $f_{Tq_{inr}}$ , is a function of engine speed and injected fuel mass,  $Tq_{inr} = f_{Tq_{inr}}(F, N)$ , where:

- $Tq_{inr}$  is inner torque based on gross indicated mean effective pressure, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

**Friction torque table,  $f_{Tq\_fric}$  – Lookup table**

array

The friction torque lookup table,  $f_{Tq\_fric}$ , is a function of engine speed and injected fuel mass,  $T_{fric} = f_{Tq\_fric}(F, N)$ , where:

- $T_{fric}$  is friction torque offset to inner torque, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Engine temperature modifier on friction torque,  $f_{fric\_temp\_mod}$  – Lookup table**

vector

Engine temperature modifier on friction torque,  $f_{fric\_temp}$ , dimensionless.

**Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

**Engine temperature modifier breakpoints,  $f_{fric\_temp\_bpt}$  – Breakpoints**

vector

Engine temperature modifier breakpoints, in K.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Pumping torque table, $f_{Tq\_pump}$ — Lookup table

array

The pumping torque lookup table,  $f_{T_{pump}}$ , is a function of engine speed and injected fuel mass,  $T_{pump} = f_{T_{pump}}(F, N)$ , where:

- $T_{pump}$  is pumping torque, in N.m.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Inner torque fuel mass per injection breakpoints, $f_{Tq\_inr\_f\_bpt}$ — Breakpoints

vector

Inner torque fuel mass per injection breakpoints, in mg per injection.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Inner torque speed breakpoints, $f_{tq\_inr\_n\_bpt}$ – Breakpoints vector

Inner torque speed breakpoints.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Main start of injection timing modifier on torque, $f_{tq\_mainsoi\_mod}$ – Lookup table array

The main start-of-injection (MAINSOI) torque modifier lookup table is a function of MAINSOI and engine speed  $Tmod_{mainsoi} = f_{mainsoi}(MAINSOI, N)$ , where:

- $Tmod_{mainsoi}$  is the torque modifier due to MAINSOI torque loss.
- $MAINSOI$  is the main start-of-injection timing, in degrees crank angle after top dead center (degATDC).
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Main start of injection timing modifier breakpoints, $f_{tq\_mainsoi\_bpt}$ – Breakpoints vector

Main start of injection timing modifier breakpoints, in degrees crank angle after top dead center (degATDC).

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas temperature modifier on torque, $f_{tq\_mat\_mod}$ — Lookup table array

The intake manifold gas temperature (MAT) torque modifier lookup table is a function of MAT and engine speed,  $Tmod_{mat} = f_{mat}(MAT, N)$ , where:

- $Tmod_{mat}$  is the torque modifier due to MAT torque loss.
- $MAT$  is the measured intake manifold gas pressure, in C.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas temperature modifier breakpoints, $f_{tq\_mat\_bpt}$ — Breakpoints vector

Intake manifold gas temperature modifier breakpoints, in °C.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas pressure modifier on torque, $f_{tq\_map\_mod}$ — Lookup table

array

The intake manifold absolute pressure (MAP) torque modifier lookup table is a function of

MAP and engine speed,  $Tmod_{map} = f_{map}(MAP, N)$ , where:

- $Tmod_{map}$  is the torque modifier due to MAP torque loss.
- $MAP$  is the measured intake manifold absolute pressure, in kPa.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Intake manifold gas pressure modifier breakpoints, $f_{tq\_map\_bpt}$ — Breakpoints

vector

Intake manifold gas pressure modifier breakpoints, in kPa.

### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Unburned air mass per cylinder modifier on torque, $f_{tq\_apc\_mod}$ — Lookup table

array

The unburned air per cylinder (APC) torque modifier lookup table is a function of APC and engine speed,  $T_{mod\_apc} = f_{apc}(APC, N)$ , where:

- $T_{mod\_apc}$  is the torque modifier due to APC torque loss.
- $APC$  is the unburned air per cylinder, in mg.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

### Unburned air mass per cylinder modifier breakpoints, $f_{tq\_apc\_bpt}$ — Breakpoints

vector

Unburned air mass per cylinder modifier breakpoints, in mg.

#### Dependencies

To enable this parameter, for **Torque model**, select Torque Structure.

#### Exhaust

### Exhaust temperature table, $f_{t\_exh}$ — Lookup table

array

The lookup table for the exhaust temperature is a function of injected fuel mass and engine speed

$$T_{exh} = f_{T_{exh}}(F, N)$$

where:

- $T_{exh}$  is exhaust temperature, in K.
- $F$  is injected fuel mass, in mg per injection.
- $N$  is engine speed, in rpm.

**Fuel mass per injection breakpoints, `f_t_exh_f_bpt` – Breakpoints**  
array

Engine load breakpoints used for exhaust temperature lookup table, in mg.

**Speed breakpoints, `f_t_exh_n_bpt` – Breakpoints**  
array

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

**Exhaust gas specific heat at constant pressure, `cp_exh` – Specific heat**  
scalar

Exhaust gas-specific heat,  $C_{p_{exh}}$ , in J/(kg\*K).

**CO2 mass fraction table, f\_CO2\_frac — Carbon dioxide (CO<sub>2</sub>) emission lookup table**

array

The CI Core Engine CO<sub>2</sub> emission mass fraction lookup table is a function of engine torque and engine speed,  $CO_2\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *CO<sub>2</sub> Mass Fraction* is the CO<sub>2</sub> emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

**Dependencies**

To enable this parameter, on the **Exhaust** tab, select **CO<sub>2</sub>**.

**CO mass fraction table, f\_CO\_frac — Carbon monoxide (CO) emission lookup table**

array

The CI Core Engine CO emission mass fraction lookup table is a function of engine torque and engine speed,  $CO\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *CO Mass Fraction* is the CO emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO**.

### HC mass fraction table, f\_HC\_frac – Hydrocarbon (HC) emission lookup table

array

The CI Core Engine HC emission mass fraction lookup table is a function of engine torque and engine speed,  $HC\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *HC Mass Fraction* is the HC emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **HC**.

### NOx mass fraction table, `f_NOx_frac` — Nitric oxide and nitrogen dioxide (NOx) emission lookup table

array

The CI Core Engine NOx emission mass fraction lookup table is a function of engine torque and engine speed,  $NOx\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *NOx Mass Fraction* is the NOx emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **NOx**.

### PM mass fraction table, `f_PM_frac` – Particulate matter (PM) emission lookup table

array

The CI Core Engine PM emission mass fraction lookup table is a function of engine torque and engine speed where:

- *PM* is the PM emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **PM**.

### Engine speed breakpoints, `f_exhfrac_n_bpt` – Breakpoints

vector

Engine speed breakpoints used for the emission mass fractions lookup tables, in rpm.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO2**, **CO**, **NOx**, **HC**, or **PM**.

### Engine torque breakpoints, `f_exhfrac_trq_bpt` — Breakpoints vector

Engine torque breakpoints used for the emission mass fractions lookup tables, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO2**, **CO**, **NOx**, **HC**, or **PM**.

### Fuel

### Stoichiometric air-fuel ratio, `afr_stoich` — Air-fuel ratio scalar

Air-fuel ratio, *AFR* .

# Compressor

Compressor for boosted engines

**Library:** Propulsion / Combustion Engine Components / Boost

## Description

The Compressor block simulates engine boost by using the drive shaft energy to increase the intake manifold pressure. The block is a component of supercharger and turbocharger models. The block uses two-way ports to connect to the inlet and outlet control volumes and the drive shaft. The control volumes provide the pressure, temperature, and specific enthalpy for the compressor to calculate the mass and energy flow rates. To calculate the torque and flow rates, the drive shaft provides the speed to the compressor. Typically, compressor manufacturers provide the mass flow rate and efficiency tables as a function of corrected speed and pressure ratio. You can specify the lookup tables to calculate the mass flow rate and efficiency. The block does not support reverse mass flow.

The mass flows from the inlet control volume to the outlet control volume.

## Thermodynamics

The block uses these equations to model the thermodynamics.

Calculation	Equations
Forward mass flow	$\dot{m}_{comp} > 0$ $p_{01} = p_{inlet}$ $p_{02} = p_{outlet}$ $T_{01} = T_{inlet}$ $h_{01} = h_{inlet}$

Calculation	Equations
First law of thermodynamics	$\dot{W}_{comp} = \dot{m}_{comp} c_p (T_{01} - T_{02})$
Isentropic efficiency	$\eta_{comp} = \frac{h_{02s} - h_{01}}{h_{02} - h_{01}} = \frac{T_{02s} - T_{01}}{T_{02} - T_{01}}$
Isentropic outlet temperature, assuming ideal gas and constant specific heats	$T_{02s} = T_{01} \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma-1}{\gamma}}$
Specific heat ratio	$\gamma = \frac{c_p}{c_p - R}$
Outlet temperature	$T_{02} = T_{01} + \frac{T_{01}}{\eta_{comb}} \left\{ \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma-1}{\gamma}} - 1 \right\}$
Heat flows	$q_{inlet} = \dot{m}_{comp} h_{01}$ $q_{outlet} = \dot{m}_{comp} h_{02} = \dot{m}_{comp} c_p T_{02}$
Corrected mass flow rate	$\dot{m}_{corr} = \dot{m}_{comp} \frac{\sqrt{T_{01} / T_{ref}}}{p_{01} / p_{ref}}$
Corrected speed	$\omega_{corr} = \frac{\omega}{\sqrt{T_{01} / T_{ref}}}$
Pressure ratio	$p_r = \frac{p_{01}}{p_{02}}$

The equations use these variables.

$p_{inlet}$  ,  $p_{01}$  Inlet control volume total pressure

$T_{inlet}, T_{01}$	Inlet control volume total temperature
$h_{inlet}, h_{01}$	Inlet control volume total specific enthalpy
$P_{outlet}, P_{02}$	Outlet control volume total pressure
$T_{outlet}$	Outlet control volume total temperature
$h_{outlet}$	Outlet control volume total specific enthalpy
$\dot{W}_{comp}$	Drive shaft power
$T_{02}$	Outlet total temperature
$h_{02}$	Outlet total specific enthalpy
$\dot{m}_{comp}$	Mass flow rate through compressor
$q_{inlet}$	Inlet heat flow rate
$q_{outlet}$	Outlet heat flow rate
$\eta_{comp}$	Compressor isentropic efficiency
$T_{02s}$	Isentropic outlet total temperature
$h_{02s}$	Isentropic outlet total specific enthalpy
$R$	Ideal gas constant
$c_p$	Specific heat at constant pressure
$\gamma$	Specific heat ratio
$\dot{m}_{corr}$	Corrected mass flow rate
$\omega$	Drive shaft speed
$\omega_{corr}$	Corrected drive shaft speed

$T_{ref}$	Lookup table reference temperature
$P_{ref}$	Lookup table reference pressure
$\tau_{comp}$	Compressor drive shaft torque
$p_r$	Pressure ratio
$\eta_{comb,tbl}$	Compressor efficiency 2-D lookup table
$\dot{m}_{corr,tbl}$	Corrected mass flow rate 2-D lookup table
$\omega_{corr,bpts1}$	Corrected speed breakpoints
$p_{r,bpts2}$	Pressure ratio breakpoints

## Ports

### Input

#### **Ds — Drive shaft speed**

two-way connector port

ShftSpd — Signal containing the drive shaft angular speed,  $\omega$ , in rad/s.

#### **A — Inlet pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the inlet control volume:

- InPrs — Pressure,  $p_{inlet}$ , in Pa
- InTemp — Temperature,  $T_{inlet}$ , in K
- InEnth — Specific enthalpy,  $h_{inlet}$ , in J/kg

**B — Outlet pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the outlet control volume:

- OutPrs — Pressure,  $p_{outlet}$ , in Pa
- OutTemp — Temperature,  $T_{outlet}$ , in K
- OutEnth — Specific enthalpy,  $h_{outlet}$ , in J/kg

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
CmprsOutletTemp	Temperature exiting the compressor	$T_{02}$	K
DriveshftPwr	Drive shaft power	$\dot{W}_{comp}$	W
DriveshftTrq	Drive shaft torque	$\tau_{comp}$	N.m
CmprsMassFlw	Mass flow rate through compressor	$\dot{m}_{comp}$	kg/s
PrsRatio	Pressure ratio	$p_r$	N/A
DriveshftCorrSpd	Corrected drive shaft speed	$\omega_{corr}$	rad/s
CmprsEff	Compressor isentropic efficiency	$\eta_{comp}$	N/A
CorrMassFlw	Corrected mass flow rate	$\dot{m}_{corr}$	kg/s

**Ds — Drive shaft torque**

two-way connector port

Trq — Signal containing the drive shaft torque,  $\tau_{comp}$ , in N.m.

**A — Inlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Mass flow rate through inlet,  $\dot{m}_{comp}$ , in kg/s
- HeatFlwRate — Inlet heat flow rate,  $q_{inlet}$ , in J/s
- Temp — Inlet temperature, in K
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**B — Outlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Outlet mass flow rate,  $\dot{m}_{comp}$ , in kg/s

- HeatFlwRate — Outlet heat flow rate,  $q_{outlet}$ , in J/s
- Temp — Outlet temperature, in K
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Performance Tables

**Corrected mass flow rate table, `mdot_corr_tbl` — 2-D lookup table**  
array

Corrected mass flow rate 2-D lookup table,  $\dot{m}_{corr,tbl}$ , in kg/s.

**Efficiency table, `eta_comp_tbl` — 2-D lookup table**  
array

Efficiency 2-D lookup table,  $\eta_{comb,tbl}$ .

**Corrected speed breakpoints, w\_corr\_bpts1 – Breakpoints**

array

Corrected drive shaft speed breakpoints,  $\omega_{corr,bpts1}$ , in rad/s.**Pressure ratio breakpoints, Pr\_bpts2 – Breakpoints**

array

Pressure ratio breakpoints,  $p_{r,bpts2}$ .**Reference temperature, T\_ref – Lookup table**

array

Lookup table reference temperature,  $T_{ref}$ , in K.**Reference pressure, P\_ref – Lookup table**

array

Lookup table reference pressure,  $P_{ref}$ , in Pa.**Gas Properties****Ideal gas constant, R – Constant**

scalar

Ideal gas constant,  $R$ , in J/(kg\*K).**Specific heat at constant pressure, cp – Specific heat**

scalar

Specific heat at constant pressure,  $c_p$ , in J/(kg\*K).**References**

# Control Volume System

Constant volume open thermodynamic system with heat transfer

**Library:** Propulsion / Combustion Engine Components /  
Fundamental Flow

## Description

The Control Volume System block models a constant volume open thermodynamic system with heat transfer. The block uses the conservation of mass and energy, assuming an ideal gas, to determine the pressure and temperature. The block implements an automotive-specific Constant Volume Pneumatic Chamber block that includes thermal effects related to the under hood of passenger vehicles. You can specify heat transfer models:

- Constant
- External input
- External wall convection

You can use the Control Volume System block to represent engine components that contain volume, including pipes and manifolds.

## Thermodynamics

The Control Volume System block implements a constant volume chamber containing an ideal gas. To determine the rate changes in temperature and pressure, the block uses the continuity equation and the first law of thermodynamics.

$$\frac{dT_{vol}}{dt} = \frac{RT_{vol}}{c_v V_{ch} P_{vol}} \left( \sum (q_i - T_{vol} c_v \dot{m}_i) - Q_{wall} \right)$$

$$\frac{dP_{vol}}{dt} = \frac{P_{vol}}{T_{vol}} \frac{dT_{vol}}{dt} + \frac{RT_{vol}}{V_{ch}} \sum \dot{m}_i$$

The block uses this equation for the volume-specific enthalpy.

$$h_{vol} = c_p T_{vol}$$

The equations use these variables.

$\dot{m}_i$	Mass flow rate at port
$q_i$	Heat flow rate at port
$V_{ch}$	Chamber volume
$P_{vol}$	Absolute pressure in the chamber
$R$	Ideal gas constant
$c_v$	Specific heat at constant volume
$T_{vol}$	Absolute gas temperature
$Q_{wall}$	Wall heat transfer rate
$h_{vol}$	Volume-specific enthalpy
$c_p$	Specific heat capacity

### Mass Fractions

The Control Volume Source block is part of a flow network. Blocks in the network determine the mass fractions that the block will track during simulation. The block can track these mass fractions:

- O2 — Oxygen
- N2 — Nitrogen
- UnburnedFuel — Unburned fuel
- CO2 — Carbon dioxide
- H2O — Water
- CO — Carbon monoxide
- NO — Nitric oxide
- NO2 — Nitrogen dioxide
- PM — Particulate matter
- Air — Air
- BurnedGas — Burned gas

Using the conservation of mass for each gas constituent, this equation determines the rate change:

$$\frac{dy_{vol,j}}{dt} = \frac{RT_{vol}}{P_{vol}V_{ch}} \left( \sum \dot{m}_i y_{i,j} + y_{vol,j} \sum \dot{m}_i \right)$$

The equations use these variables.

$V_{ch}$	Chamber volume
$P_{vol}$	Absolute pressure in the chamber
$R$	Ideal gas constant
$T_{vol}$	Absolute gas temperature
$y_{i,j}$	I-th port mass fraction for $j = O_2, N_2, \text{ unburned fuel, } CO_2, H_2O, CO, NO, NO_2, \text{ PM, air, and burned gas}$
$y_{vol,j}$	Control volume mass fraction for $j = O_2, N_2, \text{ unburned fuel, } CO_2, H_2O, CO, NO, NO_2, \text{ PM, air, and burned gas}$
$\dot{m}_i$	Mass flow rate for $i = O_2, N_2, \text{ unburned fuel, } CO_2, H_2O, CO, NO, NO_2, \text{ PM, air, and burned gas}$

## External Wall Convection Heat Transfer Model

To calculate the heat transfer, you can configure the Control Volume Source block to calculate the heat transfer across the wall of the control volume.

The block implements these equations to calculate the heat transfer,  $Q_1$ , from the internal control volume gas to the internal wall depth,  $D_{int\_cond}$ .

$$Q_1 = Q_{1,conv} = Q_{1,cond}$$

$$Q_{1,conv} = h_{int}(x_{int}) \cdot A_{int\_conv} \cdot (T_{int\_gas} - T_{w\_int})$$

$$Q_{1,cond} = k_{int} \cdot \frac{A_{int\_cond}}{D_{int\_cond}} \cdot (T_{w\_int} - T_{mass})$$

The block implements these equations to calculate the heat transfer,  $Q_2$ , from the external wall depth,  $D_{ext\_cond}$  to the external gas.

$$Q_2 = Q_{2,conv} = h_{ext}(x_{ext}) \cdot A_{ext\_conv} \cdot (T_{w\_ext} - T_{ext\_gas})$$

$$Q_{2,cond} = k_{ext} \cdot \frac{A_{ext\_cond}}{D_{ext\_cond}} \cdot (T_{mass} - T_{w\_ext})$$

This equation expresses the heat stored in the thermal mass.

$$\frac{dT_{mass}}{dt} = \frac{Q_1 - Q_2}{c_{p_{wall}} m_{wall}}$$

The block determines the interior convection heat transfer coefficient using a lookup table that is a function of the average mass flow rate.

$$\dot{m}_{int\_gas} = \frac{1}{2} \sum |\dot{m}_i|$$

The equations use these variables.

$Q_1$	Heat flow from the internal gas to a specified wall depth
$Q_{1,conv}$	Heat flow convection from the internal gas to the internal wall
$Q_{1,cond}$	Conduction heat transfer rate
$Q_2$	Heat transfer rate
$Q_{2,conv}$	Convection heat transfer
$Q_{2,cond}$	Heat flow conduction from the external middle portion of the wall to the external wall
$Q_{mass}$	Heat stored in thermal mass

$h_{int}$	Internal convection heat transfer coefficient
$x_{int}$	Internal mass flow rate breakpoints
$A_{int\_conv}$	Internal flow convection area
$T_{int\_gas}$	Temperature of the gas inside the chamber
$T_{w\_int}$	Temperature of the inside wall of the chamber
$k_{int}$	Internal wall thermal conductivity
$A_{int\_cond}$	Internal conduction area
$D_{int\_cond}$	Internal wall thickness
$h_{ext}$	External convection heat transfer coefficient
$x_{ext}$	External velocity breakpoints
$A_{ext\_conv}$	External convection area
$T_{ext\_gas}$	External gas temperature
$T_{w\_ext}$	Temperature of the external wall of the chamber
$k_{ext}$	External wall thermal conductivity
$A_{ext\_cond}$	External conduction area
$D_{ext\_cond}$	External wall thickness
$T_{mass}$	Temperature of the thermal mass
$c_{p\_wall}$	Wall heat capacity
$m_{wall}$	Thermal mass
$Flw_{spd}$	External flow velocity
$\dot{m}_{int\_gas}$	Average internal mass flow rate

## Ports

### Input

#### **C — Inlet mass flow rate, heat flow rate, mass fractions**

two-way connector port

Bus containing:

- **MassFlw** — Mass flow rate through inlet, in kg/s
- **HeatFlw** — Inlet heat flow rate, in J/s
- **MassFrac** — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- **O2MassFrac** — Oxygen
- **N2MassFrac** — Nitrogen
- **UnbrndFuelMassFrac** — Unburned fuel
- **C02MassFrac** — Carbon dioxide
- **H20MassFrac** — Water
- **COMassFrac** — Carbon monoxide
- **NOMassFrac** — Nitric oxide
- **N02MassFrac** — Nitrogen dioxide
- **N0xMassFrac** — Nitric oxide and nitrogen dioxide
- **PmMassFrac** — Particulate matter
- **AirMassFrac** — Air
- **BrndGasMassFrac** — Burned gas

### **Dependencies**

To create input ports, specify the **Number of inlet ports** parameter.

### **HeatTrnsfrRate — Heat transfer**

scalar

External heat transfer input to control volume,  $q_{he}$ , in Kg/s.

### **Dependencies**

To create this port, select `External` input for the **Heat transfer model** parameter.

### **ExtnlFlwVel — External flow velocity**

scalar

External flow velocity,  $Flw_{spd}$ , in m/s.

**Dependencies**

To create this port, select External wall convection for the **Heat transfer model** parameter.

**ExtnlTemp — Ambient temperature, K**

scalar

**Dependencies**

To create this port, select External wall convection for the **Heat transfer model** parameter.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Units	
Vol	Prs	Volume pressure	Pa	
	Temp	Volume temperature	K	
	Enth	Volume specific enthalpy	J/kg	
	Species	O2MassFrac	Oxygen mass fraction	NA
		N2MassFrac	Nitrogen mass fraction	NA
		UnbrndFuelMassFrac	Unburned gas mass fraction	NA
		CO2MassFrac	Carbon dioxide mass fraction	NA
		H2OMassFrac	Water mass fraction	NA
COMassFrac		Carbon monoxide mass fraction	NA	
NOMassFrac		Nitric oxide mass fraction	NA	

Signal		Description	Units	
		N02MassFrac	Nitrogen dioxide mass fraction	NA
		N0xMassFrac	Nitric oxide and nitrogen dioxide mass fraction	NA
		PmMassFrac	Particulate matter mass fraction	NA
		AirMassFrac	Air mass fraction	NA
		BrndGasMassFrac	Burned gas mass fraction	NA
HeatTrnsfr	HeatTrnsfrRate		Wall heat transfer rate	J/s
	MassFlw		Average internal mass flow rate	kg/s
	IntrnTemp		Temperature of gas inside chamber	K

**C — Outlet pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the outlet control volume:

- Prs — Chamber pressure, in Pa
- Temp — Gas temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- C02MassFrac — Carbon dioxide
- H20MassFrac — Water

- COWMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**Dependencies**

To create outlet ports, specify the **Number of outlet ports** parameter.

## Parameters

**Block Options****Number of inlet ports — Number of ports**

1 (default) | 0 | 2 | 3 | 4

Number of inlet ports.

**Dependencies**

To create inlet ports, specify the number.

**Number of outlet ports — Number of ports**

1 (default) | 0 | 2 | 3 | 4

Number of outlet ports.

**Dependencies**

To create outlet ports, specify the number.

**Heat transfer model — Select model**

Constant (default) | External input | External wall convection

**Dependencies**

Selecting Constant or External wall convection enables the **Heat Transfer** parameters.

### **Image type — Icon color**

Cold (default) | Hot

Select color for block icon:

- Cold for blue
- Hot for red

### **General**

#### **Chamber volume, $V_{ch}$ — Volume**

scalar

Chamber volume,  $V_{ch}$ , in  $m^3$ .

#### **Initial chamber pressure, $P_{init}$ — Pressure**

scalar

Initial chamber pressure,  $P_{vol}$ , in Pa.

#### **Initial chamber temperature, $T_{init}$ — Temperature**

scalar

Initial chamber temperature,  $T_{vol}$ , in K.

#### **Ideal gas constant, $R$ — Ideal gas constant**

scalar

Ideal gas constant,  $R$ , in  $J/(kg \cdot K)$ .

#### **Specific heat capacity, $c_p$ — Specific heat**

scalar

Specific heat capacity,  $c_p$ , in  $J/(kg \cdot K)$ .

### **Heat Transfer**

#### **Heat transfer rate, $q_{he}$ — Rate**

scalar

Constant heat transfer rate,  $q_{he}$ , in  $J/s$ .

**Dependencies**

To enable this parameter, select Constant for the **Heat transfer model** parameter.

**External convection heat transfer coefficient, ext\_tbl – Manifold external air**

vector

External convection heat transfer coefficient,  $h_{ext}$ , in  $W/(m^2K)$ .

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External velocity breakpoints, ext\_bpts – Manifold external air**

linspace(0,180,4) (default)

External velocity breakpoints,  $x_{ext}$ , in m/s.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External convection area, Aext\_conv – Manifold external air**

scalar

External convection area,  $A_{ext\_conv}$ , in  $m^2$ .

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Thermal mass, m\_wall – Manifold wall general**

scalar

Thermal mass,  $m_{wall}$ , in kg.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Wall heat capacity, cp\_wall — Manifold wall general**

scalar

Wall heat capacity,  $c_{p\_wall}$ , in J/(kg\*K).

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Initial mass temperature, Tmass — Manifold wall general**

scalar

Initial mass temperature,  $T_{mass}$ , in K.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External wall thickness, Dext\_cond — Manifold wall external**

scalar

External wall thickness,  $D_{ext\_cond}$ , in m.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External conduction area, Aext\_cond — Manifold wall external**

scalar

External conduction area,  $A_{ext\_cond}$ , in m<sup>2</sup>.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**External wall thermal conductivity, kint — Manifold wall external**

scalar

External wall thermal conductivity,  $k_{ext}$ , in W/(m\*K).

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Internal wall thickness,  $D_{int\_cond}$  – Manifold wall internal scalar**

Internal wall thickness,  $D_{int\_cond}$ , in m.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Internal conduction area,  $A_{int\_cond}$  – Manifold wall internal scalar**

Internal conduction area,  $A_{int\_cond}$ , in  $m^2$ .

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Internal wall thermal conductivity,  $k_{int}$  – Manifold wall internal scalar**

Internal wall thermal conductivity,  $k_{int}$ , in  $W/(m*K)$ .

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Internal convection heat transfer coefficient,  $int\_tbl$  – Manifold internal air vector**

Internal convection heat transfer coefficient,  $h_{int}$ , in  $W/(m^2K)$ .

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Internal mass flow rate breakpoints, `int_bpts` — Manifold internal air vector**

Internal velocity breakpoints,  $x_{int}$  in kg/s.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

**Internal flow convection area, `Aint_conv` — Manifold internal air scalar**

Internal convection area,  $A_{int\_conv}$  in m<sup>2</sup>.

**Dependencies**

To enable this parameter, select External wall convection for the **Heat transfer model** parameter.

# Interior PMSM

Three-phase interior permanent magnet synchronous motor with sinusoidal back electromotive force

**Library:** Propulsion / Electric Motors

## Description

The Interior PMSM block implements a three-phase interior permanent magnet synchronous motor (PMSM) with sinusoidal back electromotive force. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

## Motor Construction

This figure shows the motor construction with a single pole pair on the rotor.

The rotor magnetic field due to the permanent magnets creates a sinusoidal rate of change of flux with rotor angle.

For the axes convention, the  $a$ -phase and permanent magnet fluxes are aligned when rotor angle  $\theta_r$  is zero.

### Three-Phase Sinusoidal Model Electrical System

The block implements these equations, expressed in the rotor flux reference frame (dq frame). All quantities in the rotor reference frame are referred to the stator.

$$\omega_e = P\omega_m$$

$$\frac{d}{dt}i_d = \frac{1}{L_d}v_d - \frac{R}{L_d}i_d + \frac{L_q}{L_d}P\omega_m i_q$$

$$\frac{d}{dt}i_q = \frac{1}{L_q}v_q - \frac{R}{L_q}i_q - \frac{L_d}{L_q}P\omega_m i_d - \frac{\lambda_{pm}P\omega_m}{L_q}$$

$$T_e = 1.5P[\lambda_{pm}i_q + (L_d - L_q)i_d i_q]$$

The  $L_q$  and  $L_d$  inductances represent the relation between the phase inductance and the rotor position due to the saliency of the rotor.

The equations use these variables.

$L_q, L_d$	q- and d-axis inductances
$R$	Resistance of the stator windings
$i_q, i_d$	q- and d-axis currents
$v_q, v_d$	q- and d-axis voltages
$\omega_m$	Angular mechanical velocity of the rotor
$\omega_e$	Angular electrical velocity of the rotor
$\lambda_{pm}$	Permanent magnet flux linkage
$P$	Number of pole pairs
$T_e$	Electromagnetic torque
$\Theta_e$	Electrical angle

## Mechanical System

The rotor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of rotor and load
$F$	Combined viscous friction of rotor and load
$\theta_m$	Rotor mechanical angular position
$T_m$	Rotor shaft torque
$T_e$	Electromagnetic torque
$T_f$	Rotor shaft static friction torque
$\omega_m$	Angular mechanical velocity of the rotor

## Ports

### Input

#### LdTrq — Rotor shaft torque

scalar

Rotor shaft input torque,  $T_m$ , in N.m.

#### Dependencies

To create this port, select Torque for the **Port Configuration** parameter.

#### Spd — Rotor shaft speed

scalar

Angular velocity of the rotor,  $\omega_m$ , in rad/s.

**Dependencies**

To create this port, select Speed for the **Port Configuration** parameter.

**PhaseVolt — Stator terminal voltages**

vector

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Dependencies**

To create this port, select Speed or Torque for the **Port Configuration** parameter.

**Output**

**Info — Bus signal**

bus

The bus signal contains these block calculations.

Signal	Description	Variable	Units
IaStator	Stator phase current A	$i_a$	A
IbStator	Stator phase current B	$i_b$	A
IcStator	Stator phase current C	$i_c$	A
IdSync	Direct axis current	$i_d$	A
IqSync	Quadrature axis current	$i_q$	A
VdSync	Direct axis voltage	$v_d$	V
VqSync	Quadrature axis voltage	$v_q$	V
MtrSpd	Angular mechanical velocity of the rotor	$\omega_m$	rad/s
MtrPos	Rotor mechanical angular position	$\theta_m$	rad
MtrTrq	Electromagnetic torque	$T_e$	N.m

## Parameters

### Port Configuration — Select port configuration

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Ports
Torque	LdTrq PhaseVolt Info
Speed	Spd PhaseVolt Info

### Stator phase resistance, $R_s$ — Resistance

scalar

Stator phase resistance,  $R_s$ , in ohm.

### D and Q axis inductances, $L_{dq}$ — Inductance

vector

D and Q axis inductances,  $L_d, L_q$ , in H.

### Permanent magnet flux, $\lambda_{pm}$ — Flux

scalar

Permanent magnet flux linkage,  $\lambda_{pm}$ , in Wb.

### Number of pole pairs, $P$ — Pole pairs

scalar

Motor pole pairs,  $P$ .

### Initial dq current, $idq0$ — Current

vector

Initial q- and d-axis currents,  $i_q$ ,  $i_d$ , in A.

**Initial mechanical position, theta\_init — Angle**  
scalar

Initial rotor angular position,  $\theta_{m0}$ , in rad.

**Initial mechanical speed, omega\_init — Speed**  
scalar

Initial angular velocity of the rotor,  $\omega_{m0}$ , in rad/s.

### Dependencies

To enable this parameter, select the Torque configuration parameter.

**Physical inertia, viscous damping, and static friction, mechanical — Inertia, damping, friction**  
vector

Mechanical properties of the rotor:

- Inertia,  $J$ , in  $\text{kgm}^2$
- Viscous damping,  $F$ , in  $\text{N.m}/(\text{rad/s})$
- Static friction,  $T_f$ , in  $\text{N.m}$

### Dependencies

To enable this parameter, select the Torque configuration parameter.

## Interior PM Controller

Torque-based, field-oriented controller for an internal permanent magnet synchronous motor

**Library:** Propulsion / Electric Motor Controllers

### Description

The Interior PM Controller block implements a torque-based, field-oriented controller for an internal permanent magnet synchronous motor (PMSM) with an optional outer-loop speed controller. The internal torque control implements strategies for achieving maximum torque per ampere (MTPA) and weakening the magnetic flux. You can specify either the speed or torque control type.

The Interior PM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations that use these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	d-axis current
$i_d^*$	d-axis current command
$i_q$	q-axis current
$i_q^*$	q-axis current command
$v_d$	d-axis voltage
$v_d^*$	d-axis voltage command
$v_q$	q-axis voltage
$v_q^*$	q-axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

## Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the Interior PM Controller block.

The state filter is a low-pass filter that generates the acceleration command based on the speed command. On the **Speed Controller** tab:

- To make the speed-command lag time negligible, specify a **Bandwidth of the state filter** parameter.
- To calculate a **Speed time constant, Ksf** gain based on the state filter bandwidth, select **Calculate Speed Regulator Gains**.

The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$$

The equations use these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. The feedback torque calculation also requires gains for speed regulator.

On the **Speed Controller** tab, select **Calculate Speed Regulator Gains** to calculate:

- **Proportional gain,  $b_a$**
- **Angular gain,  $K_{sa}$**
- **Rotational gain,  $K_{isa}$**

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value on the **Motor Parameters** tab.

The gains for the state feedback are calculated using these equations.

Calculation	Equations
Discrete forms of characteristic equation	$z^3 + \frac{(-3J_p + T_s b_a + T_s^2 K_{sa} + T_s^3 K_{isa})}{J_p} z^2 + \frac{(3J_p - 2T_s b_a - T_s^2 K_{sa})}{J_p} z + \frac{-J_p + T_s b_a}{J_p}$ $(z - p_1)(z - p_2)(z - p_3) = z^3 + (p_1 + p_2 + p_3)z^2 + (p_1 p_2 + p_2 p_3 + p_1 p_3)z^2 - p_1 p_2 p_3$
Speed regulator proportional gain	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$
Speed regulator integral gain	$K_{sa} = \frac{J_p (p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$
Speed regulator double integral gain	$K_{isa} = \frac{-J_p (p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain

$K_{isa}$	Speed regulator double integral gain
$J_p$	Motor inertia
$T_{sm}$	Motion controller sample time

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

Selecting **Calculate Speed Regulator Gains** on the **Speed Controller** tab updates the inertia, viscous damping, and static friction with the **Physical inertia, viscous damping, static friction** parameter values on the **Motor Parameters** tab.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

where:

$J_p$	Motor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor speed

### Torque Determination

The block uses a maximum torque per ampere (MTPA) trajectory to calculate the base speed and the current commands. The available bus voltage determines the base speed. The direct (d) and quadrature (q) permanent magnet (PM) determines the induced voltage.

Calculation	Equations
Electrical base speed transition into field weakening	$\omega_{base} = \frac{v_{max}}{\sqrt{(L_q i_q)^2 + (L_d i_d + \lambda_{pm})^2}}$
d-axis voltage	$v_d = -\omega_e L_q i_{q_{max}}$
q-axis voltage	$v_q = \omega_e (L_d i_{d_{max}} + \lambda_{pm})$
Maximum phase current	$i_{max}^2 = i_{d_{max}}^2 + i_{q_{max}}^2$
Maximum line to neutral voltage	$v_{max} = \frac{v_{bus}}{\sqrt{3}}$
d-axis phase current MTPA table	$I_m = \frac{2T_{max}}{3P\lambda_{pm}}$
q-axis phase current MTPA table	$i_{d\_mtpa} = \frac{\lambda_{pm}}{4\left(\frac{I_q - I_d}{2}\right)} - \sqrt{\frac{\lambda_{pm}^2}{16(L_q - L_d)^2} + \frac{I_m^2}{2}}$ $i_{q\_mtpa} = \sqrt{I_m^2 - (i_{mtpa})^2}$
Torque MTPA breakpoints	$T_{mtpa} = \frac{3}{2}P(\lambda_{pm}i_q + (L_d - L_q)i_d i_q)$

Calculation	Equations
Field weakening, using the speed-based voltage limits	$(L_q i_q)^2 + (L_d i_d + \lambda_{pm})^2 \leq \frac{v_{max}^2}{\omega_e^2}$ $i_q = \sqrt{i_{max}^2 - i_d^2}$ $(L_d^2 - L_q^2) i_d^2 + 2\lambda_{pm} L_d i_d + \lambda_{pm}^2 + L_q^2 i_{max}^2 - \frac{v_{max}^2}{\omega_e^2} = 0$ $i_{dfw} = \frac{-\lambda_{pm} L_d + \sqrt{(\lambda_{pm} L_d)^2 - (L_d^2 - L_q^2) \left( \lambda_{pm}^2 + L_q^2 i_{max}^2 - \frac{v_{max}^2}{\omega_e^2} \right)}}{(L_d^2 - L_q^2)}$ $T_{fw} = \frac{3}{2} P (\lambda_{pm} i_{qfw} + (L_d - L_q) i_{dfw} i_{qfw})$

Calculation	Equations
Current command	<p>If <math> \omega_e  \leq \omega_{base}</math></p> $i_{dref} = i_{d_{mpa}}(T_{ref})$ <p>Else</p> $i_{qref} = i_{q_{mpa}}(T_{ref})$ $i_{dfw} = \max(i_{dfw}, -i_{max})$ $i_{qfw} = \sqrt{i_{mq}^2 - i_d^2}$ <p>If <math>T_{fw} &lt; T_{ref}</math></p> $i_{dref} = i_{d_{fw}}$ <p>Else <math>i_{qref} = i_{q_{fw}}</math></p> $i_{dref} = i_{d_{fw}}$ $i_{qref} = \frac{T_{ref}}{\frac{3}{2}P(\lambda_{pm} + (L_d - L_q)i_{dfw})}$ <p>End</p>

The equations use these variables.

$i_{max}$	Maximum phase current
$i_d$	d-axis current
$i_q$	q-axis current
$i_{d_{max}}$	Maximum d-axis phase current
$i_{q_{max}}$	Maximum q-axis phase current
$i_{d_{mpa}}$	d-axis phase current MTPA table
$i_{q_{mpa}}$	q-axis phase current MTPA table
$I_m$	Estimated maximum current
$i_{dfw}$	d-axis field weakening current

$i_{qfw}$	q-axis field weakening current
$\omega_e$	Rotor electrical speed
$\lambda_{pm}$	Permanent magnet flux linkage
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$v_{max}$	Maximum line to neutral voltage
$v_{bus}$	DC bus voltage
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$P$	Motor pole pairs
$T_{fw}$	Field weakening torque
$T_{mtpa}$	Torque MTPA breakpoints

## Current Regulators

The block regulates the current with an anti-windup feature. Classic proportional-integrator (PI) current regulators do not consider the d-axis and q-axis coupling or the back-electromagnetic force (EMF) coupling. As a result, transient performance deteriorates. To account for the coupling, the block implements the complex vector current regulator (CVCR) in the scalar format of the rotor reference frame. The CVCR decouples:

- d-axis and q-axis current cross-coupling
- Back-EMF cross-coupling

The current frequency response is a first-order system, with a bandwidth of  $EV_{current}$ .

The block implements these equations.

Calculation	Equations
Motor voltage, in the rotor reference frame	$L_d \frac{di_d}{dt} = v_d - R_s i_d + p\omega_m L_q i_q$ $L_d \frac{di_q}{dt} = v_q - R_s i_q - p\omega_m L_d i_d - p\omega_m \lambda_{pm}$

Calculation	Equations
Current regulator gains	$\omega_b = 2\pi EV_{current}$ $K_{p\_d} = L_d \omega_b$ $K_{p\_q} = L_q \omega_b$
Transfer functions	$K_i = R_s \omega_b$ $\frac{i_d}{i_{dref}} = \frac{\omega_b}{s + \omega_b}$ $\frac{i_q}{i_{qref}} = \frac{\omega_b}{s + \omega_b}$

The equations use these variables.

$EV_{current}$	Current regulator bandwidth
$i_d$	d-axis current
$i_q$	q-axis current
$K_{p\_d}$	Current regulator d-axis gain
$K_{p\_q}$	Current regulator q-axis gain
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$R_s$	Stator phase winding resistance
$\omega_m$	Rotor speed
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$\lambda_{pm}$	Permanent magnet flux linkage
$P$	Motor pole pairs

## Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos \theta_e + x_\beta \sin \theta_e$ $x_q = -x_\alpha \sin \theta_e + x_\beta \cos \theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos \theta_e - x_q \sin \theta_e$ $x_\beta = x_d \sin \theta_e + x_q \cos \theta_e$

The transforms use these variables.

$\omega_m$	Rotor speed
$P$	Motor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

## Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge. The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$MtrTrq_{est} = 1.5P[\lambda i_q + (L_d - L_q)i_d i_q]$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $
Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_q$	q-axis winding inductance
$L_d$	d-axis winding inductance
$i_q$	q-axis current

$i_d$	d-axis current
$\lambda$	Permanent magnet flux linkage
$P$	Motor pole pairs

## Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use **Tabulated loss data** instead of **Tabulated efficiency data**:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

#### **SpdReq — Rotor speed command**

scalar

Rotor speed command,  $\omega_m^*$ , in rad/s.

#### **Dependencies**

To create this port, select Speed Control for the **Control Type** parameter.

#### **TrqCmd — Torque command**

scalar

Torque command,  $T^*$ , in N.m.

#### **Dependencies**

To create this port, select Torque Control for the **Control Type** parameter.

#### **BusVolt — DC bus voltage**

scalar

DC bus voltage,  $v_{bus}$ , in V.

#### **PhaseCurrA — Current**

scalar

Stator current phase a,  $i_a$ , in A.

#### **PhaseCurrB — Current**

scalar

Stator current phase b,  $i_b$ , in A.

#### **SpdFdbk — Rotor speed**

scalar

Rotor speed,  $\omega_m$ , in rad/s.

**PosFdbk — Rotor electrical angle**

scalar

Rotor electrical angle,  $\theta_m$ , in rad.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N.m

**BusCurr — Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.

**PhaseVolt — Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Parameters**

**Block Options**

**Control Type — Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

### Motor Parameters

#### Stator resistance, $R_s$ – Resistance

scalar

Stator phase winding resistance,  $R_s$ , in ohm.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Stator resistance, $R_s$	D and Q axis integral gain, $K_i$	Current Controller

#### D-axis inductance, $L_d$ – Inductance

scalar

D-axis winding inductance,  $L_d$ , in H.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
D-axis inductance, $L_d$	Torque Breakpoints, $T_{mtpa}$ D-axis table data, $id_{mtpa}$ Q-axis table data, $iq_{mtpa}$ D, q, and max current limits, $idq\_limits$	Id and Iq Calculation

**Q-axis inductance, Lq — Inductance**

scalar

Q-axis winding inductance,  $L_q$ , in H.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Q-axis inductance, Lq	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	Id and Iq Calculation

**Permanent magnet flux, lambda\_pm — Flux**

scalar

Permanent magnet flux,  $\lambda_{pm}$ , in Wb.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Permanent magnet flux, lambda_pm	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	Id and Iq Calculation

**Number of pole pairs, PolePairs – Poles**  
scalar

Motor pole pairs,  $P$ .

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Number of pole pairs, PolePairs	Torque Breakpoints, T_mtpa D-axis table data, id_mtpa Q-axis table data, iq_mtpa D, Q, and max current limits, idq_limits	Id and Iq Calculation

**Physical inertia, viscous damping, static friction, Mechanical – Inertia, damping, friction**  
vector

Mechanical properties of the motor:

- Motor inertia,  $F_v$ , in  $\text{kgm}^2$
- Viscous friction torque constant,  $F_v$ , in  $\text{N.m}/(\text{rad/s})$
- Static friction torque constant,  $F_s$ , in  $\text{N.m}$

**Dependencies**

To enable this parameter, set the **Control Type** parameter to Speed Control.

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value that is on the **Motor Parameters** tab.

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Physical inertia, viscous damping, static friction, Mechanical	Proportional gain, ba  Angular gain, Ksa  Rotational gain, Kisa  Inertia compensation, Jcomp  Viscous damping compensation, Fv  Static friction, Fs	Speed Controller

**Id and Iq Calculation**

**Maximum torque, T\_max — Torque**

scalar

Maximum torque, in N.m.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Maximum torque, T_max	Torque Breakpoints, T_mtpa  D-axis table data, id_mtpa  Q-axis table data, iq_mtpa  D, Q, and max current limits, idq_limits	Id and Iq Calculation

**MTPA table breakpoints, bp — Number of breakpoints**

scalar

### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>MTPA table breakpoints, pb</b>	<b>Torque Breakpoints, T_mtpa</b>  <b>D-axis table data, id_mtpa</b>  <b>Q-axis table data, iq_mtpa</b>  <b>D, Q, and max current limits, idq_limits</b>	<b>Id and Iq Calculation</b>

### Calculate MTPA Table Data – Derive parameters

button

Click to derive parameters.

### Dependencies

On the **Id and Iq Calculation** tab, when you select **Calculate MPTA Table data**, the block calculates derived parameters. The table summarizes the derived parameter dependencies on other block parameters.

Derived Parameter on Id and Iq Calculation tab		Depends On	
		Parameter	Tab
<b>Torque Breakpoints, T_mtpa</b>	$T_{mtpa} = \frac{3}{2}P \left( \lambda_{pm}i_q + (L_d - L_q)i_d i_q \right)$	<b>Maximum torque, T_max</b>  <b>MTPA table breakpoints, pb</b>	<b>Id and Iq Calculation</b>

Derived Parameter on Id and Iq Calculation tab		Depends On	
		Parameter	Tab
D-axis table data, id_mtpa	$I_m = \frac{2T_{max}}{3P\lambda_{pm}}$ $i_{d\_mtpa} = \frac{\lambda_{pm}}{4(L_q - L_d)} - \sqrt{\frac{\lambda_{pm}^2}{16(L_q - L_d)} + \frac{I_m^2}{4}}$	Permanent magnet flux, lambda_pm	Motor Parameters
		D-axis inductance, Ld	
Q-axis table data, iq_mtpa	$i_{q\_mtpa} = \sqrt{I_m^2 - (i_{mtpa})^2}$	Q-axis inductance, Lq	
D, Q, and max current limits, idq_limits		Number of pole pairs, PolePairs	

The equations use these variables.

- $i_{max}$  Maximum phase current
- $i_d$  d-axis current
- $i_q$  q-axis current
- $i_{d\_max}$  Maximum d-axis phase current
- $i_{q\_max}$  Maximum q-axis phase current
- $i_{d\_mtpa}$  d-axis phase current MTPA table
- $i_{q\_mtpa}$  q-axis phase current MTPA table
- $\lambda_{pm}$  Permanent magnet flux linkage
- $L_d$  d-axis winding inductance
- $L_q$  q-axis winding inductance
- $P$  Motor pole pairs
- $T_{mtpa}$  Torque MTPA breakpoints
- $I_m$  Estimated maximum current

**Torque Breakpoints, T\_mtpa — Derived vector**

Derived torque breakpoints, in N.m.

### Dependencies

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Torque Breakpoints, T_mtpa	Maximum torque, T_max MTPA table breakpoints, pb	Id and Iq Calculation

Number of pole pairs, PolePairs		

### Current Controller

**Bandwidth of the current regulator, EV\_current – Bandwidth**  
scalar

Derived current regulator bandwidth, in Hz.

### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Bandwidth of the current regulator, EV_current</b>	<b>D-axis proportional gain, Kp_d</b> <b>Q-axis proportional gain, Kp_q</b> <b>D and Q axis proportional gain, Ki</b>	<b>Current Controller</b>

**Sample time for the torque control, Tst** — Time scalar

Derived torque control sample time, in s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Sample time for the torque control, Tst</b>	<b>Speed time constant, Ksf</b>	<b>Speed Controller</b>

**Calculate Current Regulator Gains** — Derive parameters button

Click to derive parameters.

**Dependencies**

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameter dependencies on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d  Q-axis proportional gain, Kp_q  D and Q axis integral gain, Ki	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters

**D-axis proportional gain, Kp\_d – Derived scalar**

Derived d-axis proportional gain, in V/A.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d	Bandwidth of the current regulator, EV_current	Current Controller

**Q-axis proportional gain, Kp\_q – Derived scalar**

Derived q-axis proportional gain, in V/A.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Q-axis proportional gain, Kp_q	Bandwidth of the current regulator, EV_current	Current Controller

**D and Q axis integral gain, Ki** — Derived scalar

Derived d- and q- axis integral gains, in V/A\*s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D and Q axis integral gain, Ki	Stator resistance, Rs	Motor Parameters

**Speed Controller**

**Bandwidth of the motion controller, EV\_motion** — Bandwidth vector

Motion controller bandwidth, in Hz. Set the first element of the vector to the desired cutoff frequency. Set the second and third elements of the vector to the higher-order cut off frequencies. You can set the value of the next element to 1/5 the value of the previous element. For example, if the desired cutoff frequency is 20 Hz, specify [20 4 0.8].

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the motion controller, EV_motion	Proportional gain, ba Angular gain, Ksa Rotational gain, Kisa	Speed Controller

**Bandwidth of the state filter, EV\_sf – Bandwidth**  
scalar

State filter bandwidth, in Hz.

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the state filter, EV_sf	Speed time constant, Ksf	Speed Controller

**Sample time for the motion control, Tsm – Time**  
scalar

Sample time for the motion controller, in s.

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Sample time for the motion control, Tsm	Proportional gain, ba Angular gain, Ksa Rotational gain, Kisa	Speed Controller

**Calculate Speed Regulator Gains – Derive parameters**  
button

Click to derive parameters.

**Dependencies**

On the **Speed Controller** tab, when you select **Calculate Speed Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
<b>Proportional gain, ba</b>	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$	<b>Sample time for the motion control, Tsm</b>  <b>Bandwidth of the motion controller, EV_motion</b>  <b>Bandwidth of the state filter, EV_sf</b>	<b>Speed Controller</b>
<b>Angular gain, Ksa</b>	$K_{sa} = \frac{J_p (p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p p_1 p_2 p_3}{T_{sm}^2}$	<b>Sample time for the torque control, Tst</b>	<b>Current Controller</b>
<b>Rotational gain, Kisa</b>	$K_{isa} = \frac{-J_p (p_1 + p_2 + p_3) + 3J_p}{T_{sm}^3}$	<b>Physical inertia, viscous damping, static friction, Mechanical</b>	<b>Motor Parameters</b>

scalar

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Viscous damping compensation, Fv	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Static friction, Fs — Derived**  
scalar

Derived static friction, in N.m/(rad/s).

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Static friction, Fs	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Electrical Losses**

**Parameterize losses by — Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

### Overall inverter efficiency, $eff$ – Constant

scalar

Overall inverter efficiency,  $Eff$ , in %.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### Vector of speeds ( $w$ ) for tabulated loss, $w\_loss\_bp$ – Breakpoints

1-by-M matrix

Speed breakpoints for lookup table when calculating losses, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of torques (T) for tabulated loss, T\_loss\_bp — Breakpoints**

1-by-N matrix

Torque breakpoints for lookup table when calculating losses, in N.m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Corresponding losses, losses\_table — Table**

M-by-N matrix

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of speeds (w) for tabulated efficiency, w\_eff\_bp — Breakpoints**

1-by-M matrix

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Vector of torques (T) for tabulated efficiency, T\_eff\_bp — Breakpoints**

1-by-N matrix

Torque breakpoints for lookup table when calculating efficiency, in N.m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

## Corresponding efficiency, efficiency\_table – Table

M-by-N matrix

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

# Flow Boundary

Flow boundary for ambient temperature and pressure

**Library:** Propulsion / Combustion Engine Components /  
Fundamental Flow

## Description

The Flow Boundary block implements a flow boundary that typically represents ambient temperature and pressure. Engine models require flow boundaries at the intake inlet and exhaust outlet. In dynamic engine models, flow-modifying components (for example, flow restriction, turbines, and compressors) connect to control volumes and flow boundaries.

You can specify these block configurations:

- Constant pressure and temperature
- Externally input pressure and temperature

The Flow Boundary block outputs pressure, temperature, and specific enthalpy:

$$h = c_p T$$

The block models the mass fractions as dry air, resulting in these mass fractions:

- $y_{N_2} = 0.767$
- $y_{O_2} = .233$

The equation uses these variables.

$T$	Temperature
$h$	Specific enthalpy
$c_p$	Specific heat at constant pressure
$y_{N_2}$	Nitrogen mass fraction
$y_{O_2}$	Oxygen mass fraction

## Ports

### Input

#### Prs — Pressure

scalar

External input pressure,  $P$ , in Pa.

#### Dependencies

To create this port, select External input for the **Pressure and temperature source** parameter.

#### Temp — Temperature

scalar

External input temperature,  $T$ , in K.

#### Dependencies

To create this port, select External input for the **Pressure and temperature source** parameter.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
BndryPrs	Boundary pressure	Pa
BndryTemp	Boundary temperature	K
BndryEnth	Boundary specific enthalpy	J/kg

#### C — Boundary pressure, temperature, enthalpy, mass fractions

two-way connector port

Bus containing the flow boundary:

- Prs — Pressure,  $P$ , in Pa
- Temp — Temperature,  $T$ , in K
- Enth — Specific enthalpy,  $h$ , in J/kg
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

#### Pressure and temperature source — Select source

External input (default) | Constant

Pressure and temperature source.

### Dependencies

The table summarizes the parameter and port dependencies.

Value	Enables Parameters	Creates Ports
Constant	<b>Pressure, Pcnst</b> <b>Temperature, Tcnst</b>	None
External input	None	Prs Temp

**Image type — Icon color**

Cold (default) | Hot

Select color for block icon:

- Cold for blue
- Hot for red

**Pressure, Pcnst — Constant**

scalar

Constant pressure,  $P$ , in Pa.

**Dependencies**

To enable this parameter, select Constant for the **Pressure and temperature source** parameter.

**Temperature, Tcnst — Constant**

scalar

Constant temperature,  $T$ , in K.

**Dependencies**

To enable this parameter, select Constant for the **Pressure and temperature source** parameter.

**Specific heat at constant pressure, cp — Constant, J/(kg(K))**

scalar

Specific heat at constant pressure, in J/(kg\*K).

## Flow Restriction

Isentropic ideal gas flow through an orifice

**Library:** Propulsion / Combustion Engine Components /  
Fundamental Flow

## Description

The Flow Restriction block models isentropic ideal gas flow through an orifice. The block uses the conservation of mass and energy to determine the mass flow rate. The flow velocity is limited by choked flow.

You can specify these orifice area models:

- Constant
- External input
- Throttle body geometry

## Equations

The Flow Restriction block implements these equations.

Calculation	Equations
Standard Orifice	$\dot{m}_{orf} = \Gamma \cdot \Psi (P_{ratio})$ $P_{ratio} = \frac{P_{downstr}}{P_{upstr}}$ $\Gamma = \frac{A_{eff} \cdot P_{upstr}}{\sqrt{R \cdot T_{upstr}}}$ $P_{cr} = \left( \frac{2}{\gamma + 1} \right)^{\frac{\gamma}{\gamma - 1}}$ $\Psi = \begin{cases} \sqrt{\gamma \left( \frac{2}{\gamma + 1} \right)^{\frac{\gamma + 1}{\gamma - 1}}} & P_{ratio} < P_{cr} \\ \sqrt{\frac{2\gamma}{\gamma - 1} \left( P_{ratio}^{\frac{2}{\gamma}} - P_{ratio}^{\frac{\gamma + 1}{\gamma}} \right)} & P_{cr} \leq P_{ratio} \leq P_{lim} \end{cases}$
Constituent Mass Flow Rates	$\dot{m}_i = \dot{m}_{orf} y_{upstr,i}$
Constant Orifice Area	$A_{eff} = \frac{P_{ratio} - 1}{P_{lim} - 1} \sqrt{\frac{2\gamma}{\gamma - 1} \left( P_{lim}^{\frac{2}{\gamma}} - P_{lim}^{\frac{\gamma + 1}{\gamma}} \right)} \gamma C_{d_{inst}}$ $P_{lim} < P_{ratio}$
External Input Orifice Area	$A_{eff} = A_{orf\_ext} \cdot C_{d_{ext}}$

Calculation	Equations
Throttle Body Geometry	$\theta_{thr} = P_{ct_{thr}} \cdot \frac{90}{100}$ $A_{eff\_thr} = \frac{\pi}{4} D_{thr}^2 C_{d\_thr} (\theta_{thr})$

The equations use these variables.

$A_{eff}$ , $A_{eff\_thr}$	Effective orifice cross-sectional area
$A_{orf\_cnst}$ ,	Orifice area
$A_{orf\_ext}$	
$Cd_{cnst}$ , $Cd_{ext}$	Discharge coefficient
$R$	Ideal gas constant
$P_{cr}$	Critical pressure at which choked flow occurs
$\gamma$	Ratio of specific heats
$\Gamma$	Flow function based on pressure ratio
$P_{ratio}$	Pressure ratio
$P_{upstr}$	Upstream orifice pressure
$P_{downstr}$	Downstream orifice pressure
$P_{lim}$	Pressure ratio limit to avoid singularities as the pressure ratio approaches 1
$y_{upstr,i}$	Upstream species mass fraction for $i = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$
$\dot{m}_i$	Mass flow rate for $i = O_2, N_2, \text{unburned fuel}, CO_2, H_2O, CO, NO, NO_2, PM, \text{air}, \text{and burned gas}$
$\theta_{thr}$	Throttle angle

$Pct_{thr}$	Percentage of throttle body that is open
$C_{d\_thr}$	Throttle discharge coefficient
$D_{thr}$	Throttle body diameter at opening

## Ports

### Input

#### **A — Inlet orifice pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing orifice:

- $Prs$  — Pressure, in Pa
- $Temp$  — Temperature, in K
- $Enth$  — Specific enthalpy, in J/kg
- $MassFrac$  — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- $O2MassFrac$  — Oxygen
- $N2MassFrac$  — Nitrogen
- $UnbrndFuelMassFrac$  — Unburned fuel
- $CO2MassFrac$  — Carbon dioxide
- $H2OMassFrac$  — Water
- $COMassFrac$  — Carbon monoxide
- $NOMassFrac$  — Nitric oxide
- $N02MassFrac$  — Nitrogen dioxide
- $N0xMassFrac$  — Nitric oxide and nitrogen dioxide
- $PmMassFrac$  — Particulate matter
- $AirMassFrac$  — Air
- $BrndGasMassFrac$  — Burned gas

## **B — Outlet orifice pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing orifice:

- Prs — Pressure, in Pa
- Temp — Temperature, in K
- Enth — Specific enthalpy, in J/kg
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **Area — Orifice area**

scalar

External area input for orifice area,  $A_{orf\_ext}$ , in  $m^2$ .

#### **Dependencies**

To create this port, select External input for the **Orifice area model** parameter.

### **ThrPct — Throttle body percent open**

scalar

Percentage of throttle body that is open,  $Pct_{thr}$ .

### Dependencies

To create this port, select Throttle body geometry for the **Orifice area model** parameter.

## Output

### A — Inlet mass flow rate, heat flow rate, temperature

two-way connector port

Bus containing:

- MassFlw — Mass flow rate through inlet, in kg/s
- HeatFlw — Inlet heat flow rate, in J/s
- Temp — Inlet temperature, in K
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### B — Outlet mass flow rate, heat flow rate, temperature

two-way connector port

Bus containing:

- **MassFlw** — Outlet mass flow rate, in kg/s
- **HeatFlw** — Outlet heat flow rate, in J/s
- **Temp** — Outlet temperature, in K
- **MassFrac** — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- **O2MassFrac** — Oxygen
- **N2MassFrac** — Nitrogen
- **UnbrndFuelMassFrac** — Unburned fuel
- **CO2MassFrac** — Carbon dioxide
- **H2OMassFrac** — Water
- **COMassFrac** — Carbon monoxide
- **NOMassFrac** — Nitric oxide
- **NO2MassFrac** — Nitrogen dioxide
- **NOxMassFrac** — Nitric oxide and nitrogen dioxide
- **PmMassFrac** — Particulate matter
- **AirMassFrac** — Air
- **BrndGasMassFrac** — Burned gas

**Info — Bus signal**

bus

Bus signal containing these block calculations.

## Parameters

### Block Options

#### Orifice area model — Select model

Constant (default) | External input | Throttle body geometry

Orifice area model.

### Dependencies

The orifice area model enables the parameters on the **Area Parameters** tab.

#### Image type — Icon color

Cold (default) | Hot

Block icon color:

- Cold for blue.
- Hot for red.

### General

#### Ratio of specific heats, gamma — Ratio

scalar

Ratio of specific heats,  $\gamma$ .

#### Ideal gas constant, R — Constant

scalar

Ideal gas constant,  $R$ , in J/(kg\*K).

#### Pressure ratio linearize limit, Plim — Limit

scalar

Pressure ratio limit to avoid singularities as the pressure ratio approaches 1,  $P_{lim}$ .

**Area****Constant area value, Aorf\_cnst — Area**

scalar

Constant area value,  $A_{orf\_cnst}$ , in  $m^2$ .**Dependencies**To enable this parameter, select Constant for the **Orifice area model** parameter.**Discharge coefficient, Cd\_cnst — Coefficient**

scalar

Discharge coefficient for constant area,  $Cd_{cnst}$ .**Dependencies**To enable this parameter, select Constant for the **Orifice area model** parameter.**Discharge coefficient, Cd\_ext — Coefficient**

scalar

Discharge coefficient for external area input,  $Cd_{ext}$ .**Dependencies**To enable this parameter, select External input for the **Orifice area model** parameter.**Throttle diameter, Dthr — Diameter**

scalar

Throttle body diameter at opening,  $D_{thr}$ , in mm.**Dependencies**To enable this parameter, select Throttle body geometry for the **Orifice area model** parameter.**Discharge coefficient table, ThrCd — Coefficient**

array

Discharge coefficient table,  $C_{d\_thr}$ .

### **Dependencies**

To enable this parameter, select `Throttle body geometry` for the **Orifice area model** parameter.

### **Angle breakpoints, ThrAngBpts — Angle**

array

Angle breakpoints,  $Thr_{ang\_bpts}$ , in deg.

### **Dependencies**

To enable this parameter, select `Throttle body geometry` for the **Orifice area model** parameter.

## Flux-Based PMSM

Flux-based permanent magnet synchronous motor

**Library:** Propulsion / Electric Motors

### Description

The Flux-Based PMSM block implements a flux-based three-phase permanent magnet synchronous motor (PMSM) with a tabular-based electromotive force. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

Flux-based motor models take into account magnetic saturation and iron losses. To calculate the magnetic saturation and iron loss, the Flux-Based PMSM block uses the inverse of the flux linkages. To obtain the block parameters, you can use finite-element analysis (FEA) or measure phase voltages using a dynamometer.

### Three-Phase Sinusoidal Model Electrical System

The block implements equations that are expressed in a stationary rotor reference ( $dq$ ) frame. The  $d$ -axis aligns with the  $a$ -axis. All quantities in the rotor reference frame are referred to the stator.

The block uses these equations.

Calculation	Equation
$q$ - and $d$ -axis voltage	$v_d = \frac{d\psi_d}{dt} + R_s i_d - \omega_e \psi_q$
$q$ - and $d$ -axis current	$v_q = \frac{d\psi_q}{dt} + R_s i_q + \omega_e \psi_d$
Electromechanical torque	$i_d = f(\psi_d, \psi_q)$ $i_q = g(\psi_d, \psi_q)$

The equations use these variables.

$$T_e = 1.5P[\psi_d i_q - \psi_q i_d]$$

$\omega_m$

Rotor mechanical speed

$\omega_e$	Rotor electrical speed
$\Theta_{da}$	dq stator electrical angle with respect to the rotor a-axis
$R_s, R_r$	Resistance of the stator and rotor windings, respectively
$i_q, i_d$	$q$ - and $d$ -axis current, respectively
$v_q, v_d$	$q$ - and $d$ -axis voltage, respectively
$\Psi_q, \Psi_d$	$q$ - and $d$ -axis magnet flux, respectively
$P$	Number of pole pairs
$T_e$	Electromagnetic torque

## Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos \theta_e + x_\beta \sin \theta_e$ $x_q = -x_\alpha \sin \theta_e + x_\beta \cos \theta_e$

Transform	Description	Equations
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{1}{2}x_d \cos \theta_e - \frac{\sqrt{3}}{2}x_q \sin \theta_e$ $x_\beta = x_d \sin \theta_e + x_q \cos \theta_e$

The transforms use these variables.

- $\omega_m$  Rotor mechanical speed
- $P$  Motor pole pairs
- $\omega_e$  Rotor electrical speed
- $\theta_e$  Rotor electrical angle
- $x$  Phase current or voltage

## Mechanical System

The rotor angular velocity is given by:

$$\frac{d}{dt} \omega_m = \frac{1}{J} (T_e - T_f - F \omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

- $J$  Combined inertia of rotor and load
- $F$  Combined viscous friction of rotor and load
- $\theta_m$  Rotor mechanical angular position
- $T_m$  Rotor shaft torque

$T_e$	Electromagnetic torque
$T_f$	Combined rotor and load friction torque
$\omega_m$	Rotor mechanical speed

## Ports

### Input

#### LdTrq — Rotor shaft torque

scalar

Rotor shaft input torque,  $T_m$ , in N.m.

#### Dependencies

To create this port, select Torque for the **Port Configuration** parameter.

#### Spd — Rotor shaft speed

scalar

Angular velocity of the rotor,  $\omega_m$ , in rad/s.

#### Dependencies

To create this port, select Speed for the **Port Configuration** parameter.

#### PhaseVolt — Stator terminal voltages

vector

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

#### Dependencies

To create this port, select Speed or Torque for the **Port Configuration** parameter.

### Output

#### Info — Bus signal

bus

The bus signal contains these block calculations.

Signal	Description	Variable	Units
IaStator	Stator phase current A	$i_a$	A
IbStator	Stator phase current B	$i_b$	A
IcStator	Stator phase current C	$i_c$	A
IdSync	$d$ -axis current	$i_d$	A
IqSync	$q$ axis current	$i_q$	A
VdSync	$d$ -axis voltage	$v_d$	V
VqSync	$q$ -axis axis voltage	$v_q$	V
MtrSpd	Angular mechanical velocity of the rotor	$\omega_m$	rad/s
MtrPos	Rotor mechanical angular position	$\theta_m$	rad
MtrTrq	Electromagnetic torque	$T_e$	N.m

## Parameters

### Port Configuration — Select port configuration

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Ports
Torque	LdTrq PhaseVlt Info
Speed	Spd PhaseVlt Info

**Stator phase resistance, Rs – Resistance**

scalar

Stator phase resistance,  $R_s$ , in ohm.**Vector of d-axis flux, flux\_d – Flux**

vector

 $d$ -axis flux,  $\Psi_d$ , in Wb.**Vector of q-axis flux, flux\_q – Flux**

vector

 $q$ -axis flux,  $\Psi_q$ , in Wb.**Corresponding d-axis current, id – Current**

vector

 $d$ -axis current,  $i_d$ , in A.**Corresponding q-axis current, iq – Current**

vector

 $q$ -axis current,  $i_q$ , in A.**Number of pole pairs, P – Pole pairs**

scalar

Motor pole pairs,  $P$ .**Initial flux, fluxdq0 – Flux**

vector

Initial  $d$ - and  $q$ -axis flux,  $\Psi_{q0}$  and  $\Psi_{d0}$ , in Wb.**Initial mechanical position, theta\_init – Angle**

scalar

Initial rotor angular position,  $\theta_{m0}$ , in rad.**Initial mechanical speed, omega\_init – Speed**

scalar

Initial angular velocity of the rotor,  $\omega_{m0}$ , in rad/s.

### Dependencies

To enable this parameter, select the Torque configuration parameter.

### Physical inertia, viscous damping, and static friction, mechanical — Inertia, damping, friction vector

Mechanical properties of the rotor:

- Inertia,  $J$ , in  $\text{kgm}^2$
- Viscous damping,  $F$ , in  $\text{N.m}/(\text{rad/s})$
- Static friction,  $T_f$ , in  $\text{N.m}$

### Dependencies

To enable this parameter, select the Torque configuration parameter.

## Flux-Based PM Controller

Controller for a flux-based permanent magnet synchronous motor

**Library:** Propulsion / Electric Motor Controllers

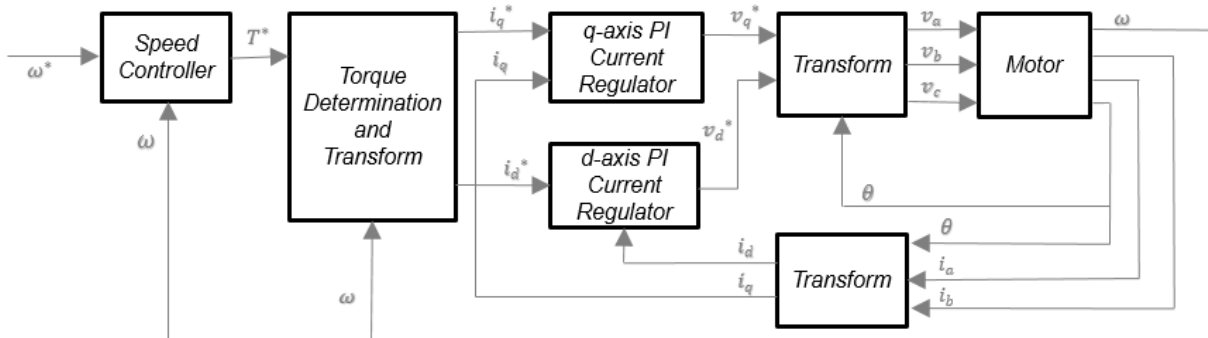

### Description

The Flux Based PM Controller block implements a flux-based, field-oriented controller for an interior permanent magnet synchronous motor (PMSM) with an optional outer-loop speed controller. The internal torque control implements strategies for achieving maximum torque per ampere (MTPA) and weakening the magnetic flux. You can specify either the speed or torque control type.

The Flux Based PM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations using these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	$d$ -axis current
$i_d^*$	$d$ -axis current command
$i_q$	$q$ -axis current
$i_q^*$	$q$ -axis current command
$v_d$	$d$ -axis voltage
$v_d^*$	$d$ -axis voltage command
$v_q$	$q$ -axis voltage
$v_q^*$	$q$ -axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

## Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the Flux Based PM Controller block.

The state filter is a low-pass filter that generates the acceleration command based on the speed command. The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$$

The equations use these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. To filter the speed, the block uses a proportional integral (PI) controller.

$$T_{cmd} = Kp_{\omega} (\omega_m^* - \omega_m) + Ki_{\omega} \frac{zT_{sm}}{z-1} (\omega_m^* - \omega_m)$$

The equations use these variables.

$\omega_m$	Rotor speed
$\omega_m^*$	Rotor speed command
$T_{cmd}$	Torque command
$Kp_\omega$	Speed regulator proportional gain
$Ki_\omega$	Speed regulator integral gain
$T_{sm}$	Speed regulator sample rate

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

where:

$J_p$	Rotor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor speed

The block uses lookup tables to determine the  $d$ -axis and  $q$ -axis current commands. The lookup tables are functions of mechanical speed and torque. To determine the lookup tables, you can use an external finite element analysis (FEA) models or dynamometer test results.

$$i_{dref} = f(|\omega_m|, |T_{ref}|)$$

$$i_{qref} = \text{sign}(T_{ref}) * f(|\omega_m|, |T_{ref}|)$$

The equations use these variables.

$\omega_m$	Rotor speed
$T_{ref}$	Torque command
$i_{dref}, i_{qref}$	$d$ - and $q$ -axis reference current, respectively

The block uses these equations to calculate the voltage in the motor reference frame.

$$v_d = \frac{d\psi_d}{dt} + R_s i_d - \omega_e \psi_q$$

$$v_q = \frac{d\psi_q}{dt} + R_s i_q + \omega_e \psi_d$$

$$\frac{d\psi_d}{dt} + R_s i_d = Kp_d (i_d^* - i_d) + Ki_d \frac{zT_{st}}{z-1} (i_d^* - i_d)$$

$$\frac{d\psi_q}{dt} + R_s i_q = Kp_q (i_q^* - i_q) + Ki_q \frac{zT_{st}}{z-1} (i_q^* - i_q)$$

$$v_d = Kp_i (i_d^* - i_d) + Ki_d \frac{zT_{st}}{z-1} (i_d^* - i_d) + \omega_e \psi_q$$

$$v_q = Kp_i (i_q^* - i_q) + Ki_q \frac{zT_{st}}{z-1} (i_q^* - i_q) - \omega_e \psi_d$$

$$\psi_q = f(i_d, i_q)$$

$$\psi_d = f(i_d, i_q)$$

The equations use these variables.

$\omega_m$	Rotor mechanical speed
$\omega_e$	Rotor electrical speed
$R_s, R_r$	Resistance of the stator and rotor windings, respectively
$i_q, i_d$	$q$ - and $d$ -axis current, respectively
$v_q, v_d$	$q$ - and $d$ -axis voltage, respectively

$\Psi_q, \Psi_d$	$q$ - and $d$ -axis magnet flux, respectively
$T_{st}$	Current regulator sample rate
$Ki_d, Ki_q$	$d$ - and $q$ - axis integral gain, respectively
$Kp_d, Kp_q$	$d$ - and $q$ - axis proportional gain, respectively

## Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos \theta_e + x_\beta \sin \theta_e$ $x_q = -x_\alpha \sin \theta_e + x_\beta \cos \theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$ $x_c = -\frac{1}{2}x_\alpha - \frac{\sqrt{3}}{2}x_\beta$

Transform	Description	Equations
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos \theta_e - x_q \sin \theta_e$ $x_\beta = x_d \sin \theta_e + x_q \cos \theta_e$

The transforms use these variables.

$\omega_m$	Rotor speed
$P$	Rotor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

## Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge.

The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$T_e = 1.5P[\psi_d i_q - \psi_q i_d]$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $

Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$
-------------------------------------	--

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_q, L_d$	$q$ - and $d$ -axis winding inductance, respectively
$\Psi_q, \Psi_d$	$q$ - and $d$ -axis magnet flux, respectively
$i_q, i_d$	$q$ - and $d$ -axis current, respectively
$\lambda$	Permanent magnet flux linkage
$P$	Rotor pole pairs

## Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses** by, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.

Setting	Block Implementation
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use `Tabulated loss data` instead of `Tabulated efficiency data`:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

#### **SpdReq — Rotor speed command**

scalar

Rotor speed command,  $\omega_m^*$ , in rad/s.

#### **Dependencies**

To create this port, select `Speed Control` for the **Control Type** parameter.

#### **TrqCmd — Torque command**

scalar

Torque command,  $T^*$ , in N.m.

**Dependencies**

To create this port, select Torque Control for the **Control Type** parameter.

**BusVolt — DC bus voltage**

scalar

DC bus voltage,  $v_{bus}$ , in V.

**PhaseCurrA — Current**

scalar

Stator current phase a,  $i_a$ , in A.

**PhaseCurrB — Current**

scalar

Stator current phase b,  $i_b$ , in A.

**SpdFdbk — Rotor speed**

scalar

Rotor speed,  $\omega_m$ , in rad/s.

**PosFdbk — Rotor electrical angle**

scalar

Rotor electrical angle,  $\theta_m$ , in rad.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W

Signal	Description	Units
MtrTrqEst	Estimated motor torque	N.m

**BusCurr — Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.

**PhaseVolt — Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

## Parameters

**Block Options**

**Control Type — Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

**Motor Parameters**

**Number of pole pairs, PolePairs — Poles**

scalar

Motor pole pairs,  $P$ .

**Vector of d-axis current breakpoints, id\_index — Current**

vector

$d$ -axis current,  $i_{d\_index}$ , in A.

**Vector of q-axis current breakpoints,  $i_{q\_index}$  – current**  
vector

$q$ -axis current,  $i_{q\_index}$ , in A.

**Corresponding d-axis flux,  $\lambda_{d\_}$  – Flux**  
vector

$d$ -axis flux,  $\lambda_d$ , in Wb.

**Corresponding q-axis flux,  $\lambda_{q\_}$  – Flux**  
vector

$q$ -axis flux,  $\lambda_q$ , in Wb.

**Current Controller**

**Sample time for the torque control,  $T_{st}$  – Time**  
scalar

Torque control sample time,  $T_{st}$ , in s.

**D-axis proportional gain,  $K_{p\_d}$  – Gain**  
scalar

$d$ -axis proportional gain,  $K_{p_d}$ , in V/A.

**Q-axis proportional gain,  $K_{p\_q}$  – Gain**  
scalar

$q$ -axis proportional gain,  $K_{p_q}$ , in V/A.

**D-axis integral gain,  $K_{i\_d}$  – Gain**  
scalar

$d$ -axis integral gain,  $K_{i_d}$ , in V/A\*s.

**Q-axis integral gain,  $K_{i\_q}$  – Gain**  
scalar

$q$ - axis integral gain,  $K_{i_q}$ , in V/A\*s.

**Vector of speed breakpoints,  $w_{pb}$  – Breakpoints**  
vector

Speed breakpoints,  $\omega_{bp}$ , in rad/s.

**Vector of torque breakpoints, tpb — Breakpoints**

vector

Torque breakpoints,  $T_{bp}$ , in N·m.

**Corresponding d-axis current reference, id\_ref — Current**

vector

d-axis reference current,  $i_{dref}$ , in A.

**Corresponding q-axis current reference, iq\_ref — Current**

vector

q-axis reference current,  $i_{qref}$ , in A.

**Speed Controller**

**Sample time for the motion control, Tsm — Time**

scalar

Sample time for the motion controller,  $T_{sm}$ , in s.

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Speed time constant, Ksf — Time**

scalar

Speed regulator time constant,  $K_{sf}$ , in 1/s.

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Proportional gain, Kp\_w — Gain**

scalar

Proportional gain,  $Kp_{\omega}$ , in N.m/(rad/s).

**Dependencies**

To enable this parameter, for the **Control Type** parameter, select Speed Control.

**Integral gain,  $Ki_w$  – Gain**

scalar

Integral gain,  $Ki_w$  N·m/rad.**Dependencies**To enable this parameter, for the **Control Type** parameter, select Speed Control.**Inertia compensation,  $Jcomp$  – Inertia**

scalar

Inertia compensation, in  $kg\cdot m^2$ .**Dependencies**To enable this parameter, for the **Control Type** parameter, select Speed Control.**Static friction,  $Fs$  – Friction**

scalar

Static friction, in N.m.

**Dependencies**To enable this parameter, for the **Control Type** parameter, select Speed Control.**Viscous damping compensation,  $Fv$  – Dampint**

scalar

Viscous damping compensation, in N.m/(rad/s).

**Dependencies**To enable this parameter, for the **Control Type** parameter, select Speed Control.**Electrical Losses****Parameterize losses by – Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

**Overall inverter efficiency,  $eff$  – Constant**

scalar

Overall inverter efficiency,  $Eff$ , in %.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of speeds ( $w$ ) for tabulated loss,  $w\_loss\_bp$  – Breakpoints**

1-by-M matrix

Speed breakpoints for lookup table when calculating losses, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of torques (T) for tabulated loss, T\_loss\_bp – Breakpoints**

1-by-N matrix

Torque breakpoints for lookup table when calculating losses, in N.m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Corresponding losses, losses\_table – Table**

M-by-N matrix

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of speeds (w) for tabulated efficiency, w\_eff\_bp – Breakpoints**

1-by-M matrix

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Vector of torques (T) for tabulated efficiency, T\_eff\_bp – Breakpoints**

1-by-N matrix

Torque breakpoints for lookup table when calculating efficiency, in N.m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

### Corresponding efficiency, efficiency\_table — Table

M-by-N matrix

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

# Heat Exchanger

Intercooler or exhaust gas recirculation (EGR) cooler

**Library:** Propulsion / Combustion Engine Components /  
Fundamental Flow

## Description

The Heat Exchanger block models a heat exchanger, for example, an intercooler or exhaust gas recirculation (EGR) cooler. The inlet (port C) connects to an engine flow component (flow restriction, compressor, turbine, or engine block). The outlet (port B) connects to a volume (control volume or environment). Based on the upstream temperature, heat exchanger effectiveness, and cooling medium temperature, the block determines the heat transfer rate and downstream temperature.

For the heat exchanger effectiveness and cooling medium temperature, you can specify either a constant value or an external input. For example, if you specify a heat exchanger effectiveness that is:

- Equal to 1, the downstream temperature is equal to the cooling medium temperature.
- Equal to 0, there is no heat transfer to the cooling medium. The downstream temperature is equal to the upstream temperature.

The block assumes no pressure drop. To model pressure losses, use a Flow Restriction block.

## Equations

The Heat Exchanger block implements equations that use these variables.

$T_{upstr}$	Upstream temperature
$T_{dnstr}$	Downstream temperature
$T_{cool}$	Cooling medium temperature

$T_{cool, const}$	Constant cooling medium temperature
$T_{cool, input}$	External input cooling medium temperature
$\varepsilon$	Heat exchanger effectiveness
$\varepsilon_{const}$	Constant heat exchanger effectiveness
$\varepsilon_{input}$	Input heat exchanger effectiveness
$c_p$	Specific heat at constant pressure
$q_{ht}$	Heat exchanger heat transfer rate
$P_{flw, in}$	Pressure at inlet
$P_{vol, out}$	Pressure at outlet
$T_{vol, out}$	Temperature at outlet
$h_{vol, out}$	Specific enthalpy at outlet
$q_{in}$	Heat flow rate at inlet
$q_{out}$	Heat flow rate at outlet
$\dot{m}$	Heat exchanger mass flow rate
$T_{flw, in}$	Temperature at inlet
$T_{in}$	Heat exchanger inlet temperature
$T_{out}$	Heat exchanger outlet temperature
$h_{in}$	Inlet specific enthalpy

Heat exchanger effectiveness measures the effectiveness of heat transfer from the incoming hot fluid to the cooling medium:

$$\varepsilon = \frac{T_{upstr} - T_{dnstr}}{T_{upstr} - T_{cool}}$$

In an ideal heat exchanger, the downstream temperature equals the cooling temperature. The effectiveness is equal to 1.

$$\begin{aligned} T_{dnstr} &= T_{cool} \\ \varepsilon &= 1 \end{aligned}$$

The Heat Exchanger block uses the effectiveness to determine the downstream temperature and heat transfer rate.

$$\begin{aligned} T_{dnstr} &= T_{upstr} - \varepsilon (T_{upstr} - T_{cool}) \\ q_{ht} &= \dot{m} c_p (T_{upstr} - T_{dnstr}) \end{aligned}$$

Since the block assumes no pressure drop,  $P_{flw,in} = P_{vol,out}$ .

The flow component connection to the heat exchanger inlet determines the direction of the mass flow. Based on the mass flow rate direction, these temperature and heat flow equations apply.

Fluid Flow	Mass Flow Rate	Temperatures and Heat Flow
Forward — From engine flow component to outlet volume	$\dot{m} \geq 0$	$\begin{aligned} T_{upstr} &= T_{flw,in} \\ T_{in} &= T_{upstr} \\ T_{out} &= T_{dnstr} \\ q_{out} &= \dot{m} c_p T_{dnstr} \end{aligned}$

Fluid Flow	Mass Flow Rate	Temperatures and Heat Flow
Reverse — From outlet volume to engine flow component	$\dot{m} < 0$	$T_{upstr} = T_{vol,out}$ $T_{in} = T_{dnstr}$ $T_{out} = T_{vol,out}$ $h_{in} = c_p T_{dnstr}$ $q_{out} = \dot{m} h_{vol,out}$

## Ports

### Input

#### C — Inlet mass flow rate, heat flow rate, temperature, mass fractions

two-way connector port

Bus containing the heat exchanger:

- MassFlwRate — Mass flow rate at inlet,  $\dot{m}$ , in kg/s
- HeatFlwRate — Heat flow rate at inlet,  $q_{in}$ , in J/s
- Temp — Temperature at inlet,  $T_{flw,in}$ , in K
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide

- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **B — Outlet volume pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the heat exchanger:

- Prs — Pressure at outlet,  $p_{vol,out}$ , in Pa
- Temp — Temperature at outlet,  $T_{vol,out}$ , in K
- Enth — Specific enthalpy at outlet,  $h_{vol,out}$ , in J/kg
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **Effct — Heat exchanger effectiveness**

scalar

Heat exchanger effectiveness,  $\epsilon_{input}$ .

**Dependencies**

To create this port, select External input for the **Effectiveness model** parameter.

**CoolTemp — Cooling medium temperature**

scalar

Cooling medium temperature,  $T_{cool,input}$ .

**Dependencies**

To create this port, select External input for the **Cooling medium temperature input** parameter.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
InletTemp	Heat exchanger inlet temperature	K
OutletTemp	Heat exchanger outlet temperature	K
HeatTrnsfrRate	Heat exchanger heat transfer rate	J/s

**C — Inlet flow pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the heat exchanger:

- Prs — Pressure at inlet,  $p_{flw,in}$ , in Pa
- Temp — Temperature at inlet,  $T_{in}$ , in K
- Enth — Specific enthalpy at inlet,  $h_{in}$ , in J/kg
- MassFrac — Inlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

### **B — Outlet volume mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing the heat exchanger:

- MassFlwRate — Mass flow rate at outlet,  $\dot{m}$ , in kg/s
- HeatFlwRate — Heat flow rate at outlet,  $q_{out}$ , in J/s
- Temp — Temperature at outlet,  $T_{out}$ , in K
- MassFrac — Outlet mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide

- `N02MassFrac` — Nitrogen dioxide
- `N0xMassFrac` — Nitric oxide and nitrogen dioxide
- `PmMassFrac` — Particulate matter
- `AirMassFrac` — Air
- `BrndGasMassFrac` — Burned gas

## Parameters

### Block Options

#### Effectiveness model — Model type for heat effectiveness

`Constant` (default) | `External input`

Type of model to calculate the heat exchanger effectiveness.

#### Dependencies

- Selecting `External input` creates the `Effct` port.
- Selecting `Constant` enables the **Heat exchanger effectiveness, `ep_cnst`** parameter.

#### Cooling medium temperature input — Specify type

`Constant` (default) | `External input`

Cooling medium temperature input.

#### Dependencies

- Selecting `External input` creates the `CoolTemp` port.
- Selecting `Constant` enables the **Cooling medium temperature, `T_cool_cnst`** parameter.

#### Image type — Icon color

`Intercooler` (default) | `EGR cooler`

Block icon color:

- `Intercooler` for blue, to indicate an intercooler
- `EGR cooler` for red, to indicate exhaust-gas-recirculation (EGR) cooling

**Heat exchanger effectiveness, ep\_cnst – Effectiveness**

scalar

Constant heat exchanger effectiveness,  $\epsilon_{cnst}$ .**Dependencies**To enable this parameter, select Constant for the **Effectiveness model** parameter.**Cooling medium temperature, T\_cool\_cnst – Temperature**

scalar

Constant cooling medium temperature,  $T_{cool,cnst}$ , in K.**Dependencies**To enable this parameter, select Constant for the **Cooling medium temperature input** parameter.**Specific heat at constant pressure, cp – Specific heat**

scalar

Specific heat at constant pressure,  $c_p$ , in J/(kg\*K).**References**

## Mapped Motor

Mapped motor and drive electronics operating in torque-control mode

**Library:** Propulsion / Electric Motors

## Description

The Mapped Motor block implements a mapped motor and drive electronics operating in torque-control mode. The output torque tracks the torque reference demand and includes a motor-response and drive-response time constant. Use the block for fast system-level simulations when you do not know detailed motor parameters, for example, for motor power and torque tradeoff studies. The block assumes that the speed fluctuations due to mechanical load do not affect the motor torque tracking.

You can specify:

- Port configuration — Input torque or speed
- Electrical torque range — Torque speed envelope or maximum motor power and torque
- Electrical loss — Single operating point, measured efficiency, or measured loss

## Electrical Torque

To specify the range of torque and speed that the block allows, on the **Electrical Torque** tab, for **Parametrized by**, select one of these options.

Setting	Block Implementation
Tabulated torque-speed envelope	Range specified as a set of speed data points and corresponding maximum torque values.
Maximum torque and power	Range specified with maximum torque and maximum power.

For either method, the block implements an envelope similar to this.

## Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	<p>Sum of these terms, measured at a single measurement point:</p> <ul style="list-style-type: none"> <li>• Fixed losses independent of torque and speed, <math>P_0</math>. Use <math>P_0</math> to account for fixed converter losses.</li> <li>• A torque-dependent electrical loss <math>k\tau^2</math>, where <math>k</math> is a constant and <math>\tau</math> is the torque. Represents ohmic losses in the copper windings.</li> <li>• A speed-dependent electrical loss <math>k_w\omega^2</math>, where <math>k_w</math> is a constant and <math>\omega</math> is the speed. Represents iron losses due to eddy currents.</li> </ul>
Tabulated loss data	Loss lookup table that is a function of motor speeds and load torques.

Setting	Block Implementation
Tabulated efficiency data	<p>Efficiency lookup table that is a function of motor speeds and load torques:</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use `Tabulated loss data` instead of `Tabulated efficiency data`:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Battery Current

The block calculates the battery current using the mechanical power, power loss, and battery voltage. Positive current indicates battery discharge. Negative current indicates battery charge.

$$BattAmp = \frac{MechPwr + PwrLoss}{BattVolt}$$

The equation uses these variables.

*BattVolt* Battery voltage

*MechPwr* Mechanical power

*PwrLoss* Power loss

*BattCurr* Battery current

## Ports

### Input

#### **BattVolt — Battery voltage**

scalar

Battery voltage,  $BattVolt$ , in V.

#### **TrqCmd — Commanded motor torque**

scalar

Commanded motor torque,  $Trq_{cmd}$ , in N·m.

#### **Dependencies**

To create this input port, for the **Port configuration**, select Torque.

#### **MtrSpd — Motor output shaft speed**

scalar

Motor shaft speed,  $Mtr_{spd}$ , in rad/s.

#### **Dependencies**

To create this input port, for the **Port configuration**, select Speed.

### Output

#### **Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
MechPwr	Mechanical power	W
PwrLoss	Internal inverter and motor power loss	W

#### **BattCurr — Battery current**

scalar

Battery current draw or demand,  $I_{batt}$ , in A.

**MtrTrq — Motor torque**

scalar

Motor output shaft torque,  $Mtr_{trq}$ , in N·m.

**MtrSpd — Motor shaft speed**

scalar

Motor shaft speed,  $Mtr_{spd}$ , in rad/s.

**Dependencies**

To create this output port, for the **Port configuration**, select Torque.

## Parameters

**Block Options**

**Port configuration — Select port configuration**

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Ports
Torque	Outpost MtrSpd
Speed	Input MtrSpd

**Electrical Torque**

**Parameterized by — Select type**

Tabulated torque-speed envelope (default) | Maximum torque and power

Setting	Block Implementation
Tabulated torque-speed envelope	Range specified as a set of speed data points and corresponding maximum torque values.
Maximum torque and power	Range specified with maximum torque and maximum power.

For either method, the block implements an envelope similar to this.

### Vector of rotational speeds, $w\_t$ — Rotational speeds

vector

Rotational speeds for permissible steady-state operation, in rad/s. To avoid poor performance due to an infinite slope in the torque-speed curve, specify a vector of rotational speeds that does not contain duplicate consecutive values.

#### Dependencies

To create this parameter, for the **Parameterized by** parameter, select Tabulated torque-speed envelope.

### Vector of maximum torque values, $T\_t$ — Torque

vector

Maximum torque values for permissible steady state, in N·m.

#### Dependencies

To create this parameter, for the **Parameterized by** parameter, select Tabulated torque-speed envelope.

### Maximum torque, $torque\_max$ — Torque

scalar

The maximum permissible motor torque, in N·m.

**Dependencies**

To create this parameter, for the **Parameterized by** parameter, select Maximum torque and power.

**Maximum power, power\_max — Power**

scalar

The maximum permissible motor power, in W.

**Dependencies**

To create this parameter, for the **Parameterized by** parameter, select Maximum torque and power.

**Torque control time constant, Tc — Time constant**

scalar

Time constant with which the motor driver tracks a torque demand, in s.

**Electrical Losses**

**Parameterize losses by — Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	<p>Sum of these terms, measured at a single measurement point:</p> <ul style="list-style-type: none"> <li>• Fixed losses independent of torque and speed, <math>P_0</math>. Use <math>P_0</math> to account for fixed converter losses.</li> <li>• A torque-dependent electrical loss <math>k\tau^2</math>, where <math>k</math> is a constant and <math>\tau</math> is the torque. Represents ohmic losses in the copper windings.</li> <li>• A speed-dependent electrical loss <math>k_w\omega^2</math>, where <math>k_w</math> is a constant and <math>\omega</math> is the speed. Represents iron losses due to eddy currents.</li> </ul>
Tabulated loss data	Loss lookup table that is a function of motor speeds and load torques.

Setting	Block Implementation
Tabulated efficiency data	<p>Efficiency lookup table that is a function of motor speeds and load torques:</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

### Motor and drive overall efficiency, $\text{eff}$ – Efficiency scalar

The block defines overall efficiency as:

$$\eta = 100 \frac{\tau_0 \omega_0}{\tau_0 \omega_0 + P_0 + k\tau_0^2 + k_w \omega_0^2}$$

The equation uses these variables.

$\tau_0$	Torque at which efficiency is measured
$\omega_0$	Speed at which efficiency is measured
$P_0$	Fixed losses independent of torque or speed
$k\tau_0^2$	Torque-dependent electrical losses

$k_w\omega^2$  Speed-dependent iron losses

At initialization, the block solves the efficiency equation for  $k$ . The block neglects losses associated with the rotor damping.

### **Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Single efficiency measurement.

**Speed at which efficiency is measured,  $w_{\text{eff}}$  — Speed**  
scalar

Speed at which efficiency is measured, in rad/s.

### **Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Single efficiency measurement.

**Torque at which efficiency is measured,  $T_{\text{eff}}$  — Torque**  
scalar

Torque at which efficiency is measured, in N·m.

### **Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Single efficiency measurement.

**Iron losses,  $P_{\text{iron}}$  — Power**  
scalar

Iron losses at the speed and torque at which efficiency is defined, in W.

### **Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Single efficiency measurement.

**Fixed losses independent of torque and speed,  $P_{\text{base}}$  — Power**  
scalar

Fixed electrical loss associated with the driver when the motor current and torque are zero, in W.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Single efficiency measurement.

**Vector of speeds (w) for tabulated losses, w\_eff\_bp – Breakpoints**

[1 x m] vector

Speed breakpoints for lookup table when calculating losses, in rad/s. Array dimensions are 1 by the number of speed breakpoints, m.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated loss data or Tabulated efficiency data

**Vector of torques (T) for tabulated losses, T\_eff\_bp – Breakpoints**

[1 x n] vector

Torque breakpoints for lookup table when calculating losses, in N·m. Array dimensions are 1 by the number of torque breakpoints, n.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated loss data or Tabulated efficiency data

**Corresponding losses, losses\_table – Table**

[m x n] array

Array of values for electrical losses as a function of speed and torque, in W. Each value specifies the losses for a specific combination of speed and torque. The [m×n] array dimensions must match the speed, m, and torque, n, breakpoint vector dimensions.

**Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated loss data.

**Corresponding efficiency, efficiency\_table – Table**

[m x n] array

Array of efficiency as a function of speed and torque, in %. Each value specifies the losses for a specific combination of speed and torque. The [mxn] array dimensions must match the speed, m, and torque, n, breakpoint vector dimensions.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

### **Dependencies**

To create this parameter, for the **Parameterize losses by** parameter, select Tabulated efficiency data.

### **Mechanical**

#### **Rotational inertia, J — Inertia**

scalar

Rotor resistance to change in motor motion, in kg\*m<sup>2</sup>. The value can be zero.

### **Dependencies**

To create this parameter, for the **Port configuration** parameter, select Torque.

#### **Rotor damping, b — Damping**

scalar

Rotor damping, in N·m/(rad/s). The value can be zero.

### **Dependencies**

To create this parameter, for the **Port configuration** parameter, select Torque.

#### **Initial rotor speed, omega\_o — Speed**

scalar

Rotor speed at the start of the simulation, in rad/s.

### **Dependencies**

To create this parameter, for the **Port configuration** parameter, select Torque.

## Induction Motor

Three-phase induction motor

**Library:** Propulsion / Electric Motors

## Description

The Induction Motor block implements a three-phase induction motor. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

### Three-Phase Sinusoidal Model Electrical System

The block implements equations that are expressed in a stationary rotor reference (qd) frame. The d-axis aligns with the a-axis. All quantities in the rotor reference frame are referred to the stator.

The block uses these equations to calculate the electrical speed ( $\omega_{em}$ ) and slip speed ( $\omega_{slip}$ ).

$$\omega_{em} = P \omega_m$$

$$\omega_{slip} = \omega_{syn} - \omega_{em}$$

To calculate the dq rotor electrical speed with respect to the rotor A-axis ( $dA$ ), the block uses the difference between the stator a-axis ( $da$ ) speed and slip speed:

$$\omega_{dA} = \omega_{da} - \omega_{em}$$

To simplify the equations for the flux, voltage, and current transformations, the block uses a stationary reference frame:

$$\omega_{da} = 0$$

$$\omega_{dA} = -\omega_{em}$$

Calculation	Equation
Flux	$\frac{d}{dt} \begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \end{bmatrix} = \begin{bmatrix} v_{sd} \\ v_{sq} \end{bmatrix} - R_s \begin{bmatrix} i_{sd} \\ i_{sq} \end{bmatrix} - \omega_{da} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \end{bmatrix}$ $\frac{d}{dt} \begin{bmatrix} \lambda_{rd} \\ \lambda_{rq} \end{bmatrix} = \begin{bmatrix} v_{rd} \\ v_{rq} \end{bmatrix} - R_r \begin{bmatrix} i_{rd} \\ i_{rq} \end{bmatrix} - \omega_{dA} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} \lambda_{rd} \\ \lambda_{rq} \end{bmatrix}$ $\begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \\ \lambda_{rd} \\ \lambda_{rq} \end{bmatrix} = \begin{bmatrix} L_s & 0 & L_m & 0 \\ 0 & L_s & 0 & L_m \\ L_m & 0 & L_r & 0 \\ 0 & L_m & 0 & L_r \end{bmatrix} \begin{bmatrix} i_{sd} \\ i_{sq} \\ i_{rd} \\ i_{rq} \end{bmatrix}$
Current	$\begin{bmatrix} i_{sd} \\ i_{sq} \\ i_{rd} \\ i_{rq} \end{bmatrix} = \left( \frac{1}{L_m^2 - L_r L_s} \right) \begin{bmatrix} -L_r & 0 & L_m & 0 \\ 0 & -L_r & 0 & L_m \\ L_m & 0 & -L_s & 0 \\ 0 & L_m & 0 & -L_s \end{bmatrix} \begin{bmatrix} \lambda_{sd} \\ \lambda_{sq} \\ \lambda_{rd} \\ \lambda_{rq} \end{bmatrix}$
Inductance	$L_s = L_{ls} + L_m$ $L_r = L_{lr} + L_m$
Electromagnetic torque	$T_e = PL_m (i_{sq} i_{rd} - i_{sd} i_{rq})$
Power invariant dq transformation to ensure that the dq and three phase powers are equal	$\begin{bmatrix} v_{sd} \\ v_{sq} \end{bmatrix} = \sqrt{\frac{2}{3}} \begin{bmatrix} \cos(\theta_{da}) & \cos(\theta_{da} - \frac{2\pi}{3}) & \cos(\theta_{da} + \frac{2\pi}{3}) \\ -\sin(\theta_{da}) & -\sin(\theta_{da} - \frac{2\pi}{3}) & -\sin(\theta_{da} + \frac{2\pi}{3}) \end{bmatrix} \begin{bmatrix} v_a \\ v_b \\ v_c \end{bmatrix}$ $\begin{bmatrix} i_a \\ i_b \\ i_c \end{bmatrix} = \sqrt{\frac{2}{3}} \begin{bmatrix} \cos(\theta_{da}) & -\sin(\theta_{da}) \\ \cos(\theta_{da} - \frac{2\pi}{3}) & -\sin(\theta_{da} - \frac{2\pi}{3}) \\ \cos(\theta_{da} + \frac{2\pi}{3}) & -\sin(\theta_{da} + \frac{2\pi}{3}) \end{bmatrix} \begin{bmatrix} i_{sd} \\ i_{sq} \end{bmatrix}$

The equations use these variables.

$\omega_m$	Angular velocity of the rotor
$\omega_{em}$	Electrical rotor speed
$\omega_{slip}$	Electrical rotor slip speed
$\omega_{syn}$	Synchronous rotor speed
$\omega_{da}$	dq stator electrical speed with respect to the rotor a-axis
$\omega_{dA}$	dq stator electrical speed with respect to the rotor A-axis
$\Theta_{da}$	dq stator electrical angle with respect to the rotor a-axis
$\Theta_{dA}$	dq stator electrical angle with respect to the rotor A-axis
$L_q, L_d$	q- and d-axis inductances
$L_s$	Stator inductance
$L_r$	Rotor inductance
$L_m$	Magnetizing inductance
$L_{ls}$	Stator leakage inductance
$L_{lr}$	Rotor leakage inductance
$v_{sq}, v_{sd}$	Stator q- and d-axis voltages
$i_{sq}, i_{sd}$	Stator q- and d-axis currents
$\lambda_{sq}, \lambda_{sd}$	Stator q- and d-axis flux
$i_{rq}, i_{rd}$	Rotor q- and d-axis currents
$\lambda_{rq}, \lambda_{rd}$	Rotor q- and d-axis flux
$v_a, v_b, v_c$	Stator voltage phases a, b, c
$i_a, i_b, i_c$	Stator currents phases a, b, c
$R_s$	Resistance of the stator windings
$R_r$	Resistance of the rotor windings
$P$	Number of pole pairs
$T_e$	Electromagnetic torque

## Mechanical System

The rotor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$
$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of rotor and load
$F$	Combined viscous friction of rotor and load
$\theta_m$	Rotor mechanical angular position
$T_m$	Rotor shaft torque
$T_e$	Electromagnetic torque
$T_f$	Rotor shaft static friction torque
$\omega_m$	Angular mechanical velocity of the rotor

## Ports

### Input

#### LdTrq — Rotor shaft torque

scalar

Rotor shaft input torque,  $T_m$ , in N.m.

#### Dependencies

To create this port, select Torque for the **Port configuration** parameter.

#### Spd — Rotor shaft speed

scalar

Angular velocity of the rotor,  $\omega_m$ , in rad/s.

#### Dependencies

To create this port, select Speed for the **Port configuration** parameter.

**PhaseVolt — Stator terminal voltages**

vector

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
IaStator	Stator phase current A	$i_a$	A
IbStator	Stator phase current B	$i_b$	A
IcStator	Stator phase current C	$i_c$	A
IdSta	Direct axis current	$i_{sd}$	A
IqSta	Quadrature axis current	$i_{sq}$	A
VdSta	Direct axis voltage	$v_{sd}$	V
VqSta	Quadrature axis voltage	$v_{sq}$	V
MtrSpd	Angular velocity of the rotor	$\omega_m$	rad/s
MtrPos	Rotor angular position	$\theta_m$	rad
MtrTrq	Electromagnetic torque	$T_e$	N.m

**Parameters****Configuration****Port configuration — Select port configuration**

Torque (default) | Speed

This table summarizes the port configurations.

<b>Port Configuration</b>	<b>Creates Ports</b>
Torque	PhaseV Info LdTrq
Speed	PhaseV Info Spd

**Stator resistance and leakage inductance, Zs – Resistance and inductance**

vector

Stator resistance,  $R_s$ , in ohms and leakage inductance,  $L_{ls}$ , in H.

**Rotor resistance and leakage inductance, Zr – Resistance and inductance**

vector

Rotor resistance,  $R_r$ , in ohms and leakage inductance,  $L_{lr}$ , in H.

**Magnetizing inductance, Lm – Inductance**

scalar

Magnetizing inductance,  $L_m$ , in H.

**Number of pole pairs, P – Pole pairs**

scalar

Motor pole pairs,  $P$ .

**Initial mechanical position, theta\_init – Angular position**

scalar

Initial rotor angular position,  $\theta_{m0}$ , in rad.

**Initial mechanical speed, omega\_init – Angular speed**

scalar

Initial angular velocity of the rotor,  $\omega_{m0}$ , in rad/s.

### Dependencies

To enable this parameter, select Torque for the **Port configuration**.

### Physical inertia, viscous damping, static friction, mechanical — Inertia, damping, friction vector

Mechanical properties of the rotor:

- Inertia,  $J$ , in  $\text{kgm}^2$
- Viscous damping,  $F$ , in  $\text{N.m}/(\text{rad/s})$
- Static friction,  $T_f$ , in  $\text{N.m}$

### Dependencies

To enable this parameter, select Torque for the **Port configuration**.

## IM Controller

Internal torque-based, field-oriented controller for an induction motor with an optional outer-loop speed controller

**Library:** Propulsion / Electric Motor Controllers

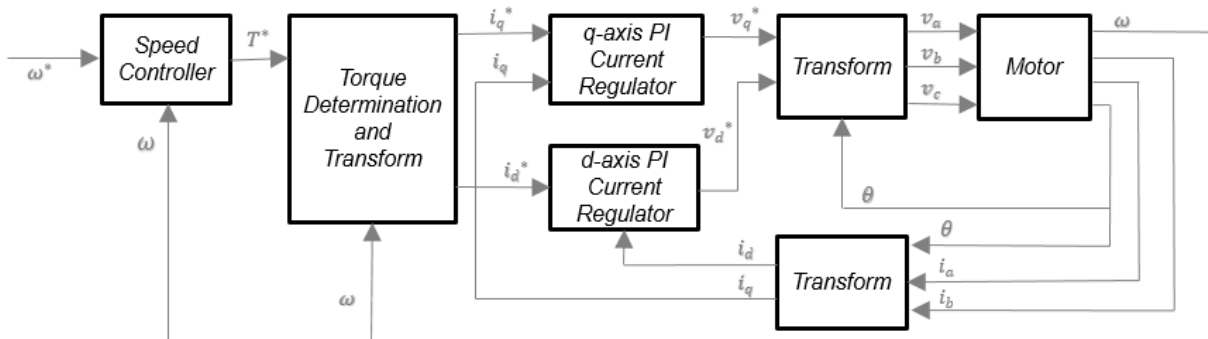

## Description

The IM Controller block implements an internal torque-based, field-oriented controller for an induction motor (IM) with an optional outer-loop speed controller. The torque control implements a strategy to control the motor flux. You can specify either speed or torque control.

The IM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations that use these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	d-axis current
$i_d^*$	d-axis current command
$i_q$	q-axis current
$i_q^*$	q-axis current command
$v_d$	d-axis voltage
$v_d^*$	d-axis voltage command
$v_q$	q-axis voltage
$v_q^*$	q-axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

## Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the IM Controller block.

The state filter is a low-pass filter that generates the acceleration command based on the speed command. On the **Speed Controller** tab:

- To make the speed-command lag time negligible, specify a **Bandwidth of the state filter** parameter.
- To calculate a **Speed time constant, Ksf** gain based on the state filter bandwidth, select **Calculate Speed Regulator Gains**.

The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$$

The equation uses these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. The feedback torque calculation also requires gains for speed regulator.

On the **Speed Controller** tab, select **Calculate Speed Regulator Gains** to compute:

- **Proportional gain,  $b_a$**
- **Angular gain,  $K_{sa}$**
- **Rotational gain,  $K_{isa}$**

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value on the **Motor Parameter** tab.

The gains for the state feedback are calculated using these equations.

Calculation	Equations
Discrete forms of characteristic equation	$z^3 + \frac{(-3J_p + T_s b_a + T_s^2 K_{sa} + T_s^3 K_{isa})}{J_p} z^2 + \frac{(3J_p - 2T_s b_a - T_s^2 K_{sa})}{J_p} z + \frac{-J_p + T_s b_a}{J_p}$ $(z - p_1)(z - p_2)(z - p_3) = z^3 + (p_1 + p_2 + p_3)z^2 + (p_1 p_2 + p_2 p_3 + p_1 p_3)z^2 - p_1 p_2 p_3$
Speed regulator proportional gain	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$
Speed regulator integral gain	$K_{sa} = \frac{J_p (p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$
Speed regulator double integral gain	$K_{isa} = \frac{-J_p (p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$

The equations use these variables.

$P$	Motor pole pairs
$b_a$	Speed regulator proportional gain
$K_{sa}$	Speed regulator integral gain

$K_{isa}$	Speed regulator double integral gain
$J_p$	Motor inertia
$T_{sm}$	Motion controller sample time

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

Selecting **Calculate Speed Regulator Gains** on the **Speed Controller** tab updates the inertia, viscous damping, and static friction with the **Physical inertia, viscous damping, static friction** parameter values on the **Motor Parameter** tab.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

The equation uses these variables.

$J_p$	Motor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor mechanical speed

### Torque Determination

The block uses a quadrature current to determine the base speed and the current commands. The motor ratings determine the rated electrical speed.

Calculation	Equations
Current commands	$i_{qref} = \frac{T_{cmd}}{i_{sq\_0} \cdot P \cdot \left( \frac{L_m^2}{L_r} \right)}$ <p>If <math> \omega_e  \leq \omega_{rated}</math></p> $i_{dref} = i_{sd\_0}$ <p>Else</p> $i_{dref} = \frac{i_{sd\_0}}{ \omega_e }$ <p>End</p>
Inductance	$L_r = L_{lr} + L_m$ $L_s = L_{ls} + L_m$

The equations use these variables.

$i_{dref}$	d-axis reference current
$i_{qref}$	q-axis reference current
$i_{sd\_0}$	d-axis rated current
$i_{sq\_0}$	q-axis rated current
$\omega_e$	Rotor electrical speed
$\omega_{rated}$	Rated electrical speed
$L_{lr}$	Rotor leaking inductance
$L_r$	Rotor winding inductance
$L_{ls}$	Stator leaking inductance
$L_s$	Stator winding inductance
$L_m$	Motor magnetizing inductance
$P$	Motor pole pairs
$T_{cmd}$	Commanded motor maximum torque

## Current Regulators

The block regulates the current with an anti-windup feature. Classic proportional-integrator (PI) current regulators do not consider the d-axis and q-axis coupling or the back-electromagnetic force (EMF) coupling. As a result, transient performance deteriorates. To account for the coupling, the block implements the complex vector current regulator (CVCR) in the scalar format of the rotor reference frame. The CVCR decouples:

- d-axis and q-axis current cross-coupling
- Back-EMF cross-coupling

The current frequency response is a first-order system, with a bandwidth of  $EV_{current}$ .

The block implements these equations.

Calculation	Equations
Motor voltage, in the stator reference frame	$\sigma = 1 - \frac{L_m^2}{L_s L_r}$ $v_{sd} = R_s i_{sd} + \sigma L_s \frac{di_{sd}}{dt} + \frac{L_m}{L_r} \frac{d\lambda_{rd}}{dt} - P \omega_m \sigma L_s i_{sq}$
Current regulator gains	$v_{sq} = R_s i_{sq} + \sigma L_s \frac{di_{sq}}{dt} + \omega_d \frac{L_m}{L_r} \frac{d\lambda_{rd}}{dt} + P \omega_m \sigma L_s i_{sd}$ $\omega_b = 2\pi EV_{current}$ $K_p = \sigma L_d \omega_b$
Transfer functions	$K_i = R_s \omega_b$ $\frac{i_d}{i_{dref}} = \frac{\omega_b}{s + \omega_b}$ $\frac{i_q}{i_{qref}} = \frac{\omega_b}{s + \omega_b}$

The equations use these variables.

$EV_{current}$	Current regulator bandwidth
$i_d$	d-axis current
$i_q$	q-axis current
$i_{sq}$	Stator q-axis current
$i_{sd}$	Stator d-axis current
$v_{sd}$	Stator d-axis voltage
$v_{sq}$	Stator q-axis voltage
$K_p$	Current regulator d-axis gain
$K_i$	Current regulator integrator gain
$L_s$	Stator winding inductance
$L_m$	Motor magnetizing inductance
$L_r$	Rotor winding inductance
$R_s$	Stator phase winding resistance
$\lambda_{rd}$	Rotor d-axis magnetic flux
$\sigma$	Leakage factor
$p$	Motor pole pairs

## Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos \theta_e + x_\beta \sin \theta_e$ $x_q = -x_\alpha \sin \theta_e + x_\beta \cos \theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{1}{2}x_d \cos \theta_e - \frac{\sqrt{3}}{2}x_q \sin \theta_e$ $x_\beta = x_d \sin \theta_e + x_q \cos \theta_e$

The transforms use these variables.

$\omega_m$	Rotor mechanical speed
$P$	Motor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

## Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge. The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$MtrTrq_{est} = P \lambda_{rd} i_{sq} \frac{L_m}{L_r}$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $
Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_r$	Rotor winding inductance
$L_m$	Motor magnetizing inductance
$\lambda_{rd}$	Rotor d-axis magnetic flux
$i_{sq}$	q-axis current
$P$	Motor pole pairs

## Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use **Tabulated loss data** instead of **Tabulated efficiency data**:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

**SpdReq — Rotor mechanical speed command**  
 scalar

Rotor mechanical speed command,  $\omega_m^*$ , in rad/s.

**Dependencies**

To create this port, select Speed Control for the **Control Type** parameter.

**TrqCmd — Torque command**

scalar

Torque command,  $T^*$ , in N.m.

**Dependencies**

To create this port, select Torque Control for the **Control Type** parameter.

**BusVolt — DC bus voltage**

scalar

DC bus voltage  $v_{bus}$ , in V.

**PhaseCurrA — Current**

scalar

Stator current phase a,  $i_a$ , in A.

**PhaseCurrB — Current**

scalar

Stator current phase b,  $i_b$ , in A.

**SpdFdbk — Rotor mechanical speed**

scalar

Rotor mechanical speed,  $\omega_m$ , in rad/s.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N.m

**BusCurr — Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.

**PhaseVolt — Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

## Parameters

**Block Options**

**Control Type — Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

**Motor**

**Stator resistance, Rs — Resistance**

scalar

Stator phase winding resistance,  $R_s$ , in ohm.

### Dependencies

## Electrical Losses

### Parameterize losses by – Select type

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

### **Overall inverter efficiency, $eff$ — Constant** scalar

Overall inverter efficiency,  $Eff$ , in %.

#### **Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### **Vector of speeds ( $w$ ) for tabulated loss, $w\_loss\_bp$ — Breakpoints** 1-by-M matrix

Speed breakpoints for lookup table when calculating losses, in rad/s.

#### **Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### **Vector of torques ( $T$ ) for tabulated loss, $T\_loss\_bp$ — Breakpoints** 1-by-N matrix

Torque breakpoints for lookup table when calculating losses, in N.m.

#### **Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### **Corresponding losses, $losses\_table$ — Table** M-by-N matrix

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

#### **Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### **Vector of speeds ( $w$ ) for tabulated efficiency, $w\_eff\_bp$ — Breakpoints** 1-by-M matrix

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

### Vector of torques (T) for tabulated efficiency, `T_eff_bp` – Breakpoints

1-by-N matrix

Torque breakpoints for lookup table when calculating efficiency, in N.m.

### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

### Corresponding efficiency, `efficiency_table` – Table

M-by-N matrix

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

Flux-Based PM Controller | Induction Motor | Interior PM Controller | Surface Mount PM Controller

**Introduced in R2017a**

# Surface Mount PMSM

Three-phase exterior permanent magnet synchronous motor with sinusoidal back electromotive force

**Library:** Propulsion / Electric Motors

## Description

The Surface Mount PMSM block implements a three-phase exterior permanent magnet synchronous motor (PMSM) with sinusoidal back electromotive force. The block uses the three-phase input voltages to regulate the individual phase currents, allowing control of the motor torque or speed.

## Motor Construction

This figure shows the motor construction with a single pole pair on the rotor.

The rotor magnetic field due to the permanent magnets creates a sinusoidal rate of change of flux with rotor angle.

For the axes convention, the  $a$ -phase and permanent magnet fluxes are aligned when rotor angle  $\theta_r$  is zero.

### Three-Phase Sinusoidal Model Electrical System

The block implements these equations, expressed in the rotor flux reference frame (dq frame). All quantities in the rotor reference frame are referred to the stator.

$$\omega_e = P\omega_m$$

$$\frac{d}{dt}i_d = \frac{1}{L_d}v_d - \frac{R}{L_d}i_d + \frac{L_q}{L_d}P\omega_m i_q$$

$$\frac{d}{dt}i_q = \frac{1}{L_q}v_q - \frac{R}{L_q}i_q - \frac{L_d}{L_q}P\omega_m i_d - \frac{\lambda_{pm}P\omega_m}{L_q}$$

$$T_e = 1.5P[\lambda_{pm}i_q + (L_d - L_q)i_d i_q]$$

The  $L_q$  and  $L_d$  inductances represent the relation between the phase inductance and the rotor position due to the saliency of the rotor magnets. For the surface mount PMSM,

$$L_d = L_q.$$

The equations use these variables.

$L_q, L_d$	q- and d-axis inductances
$R$	Resistance of the stator windings
$i_q, i_d$	q- and d-axis currents
$v_q, v_d$	q- and d-axis voltages
$\omega_m$	Angular mechanical velocity of the rotor
$\omega_e$	Angular electrical velocity of the rotor
$\lambda_{pm}$	Permanent magnet flux linkage
$P$	Number of pole pairs
$T_e$	Electromagnetic torque
$\theta_e$	Electrical angle

## Mechanical System

The rotor angular velocity is given by:

$$\frac{d}{dt}\omega_m = \frac{1}{J}(T_e - T_f - F\omega_m - T_m)$$

$$\frac{d\theta_m}{dt} = \omega_m$$

The equations use these variables.

$J$	Combined inertia of rotor and load
$F$	Combined viscous friction of rotor and load
$\theta_m$	Rotor mechanical angular position
$T_m$	Rotor shaft torque
$T_e$	Electromagnetic torque
$T_f$	Rotor shaft static friction torque
$\omega_m$	Angular mechanical velocity of the rotor

## Ports

### Input

#### LdTrq — Rotor shaft torque

scalar

Rotor shaft input torque,  $T_m$ , in N.m.

#### Dependencies

To create this port, select Torque for the **Port Configuration** parameter.

#### Spd — Rotor shaft speed

scalar

Angular velocity of the rotor,  $\omega_m$ , in rad/s.

### Dependencies

To create this port, select Speed for the **Port Configuration** parameter.

### PhaseVolt — Stator terminal voltages

vector

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
IaStator	Stator phase current A	$i_a$	A
IbStator	Stator phase current B	$i_b$	A
IcStator	Stator phase current C	$i_c$	A
IdSync	Direct axis current	$i_d$	A
IqSync	Quadrature axis current	$i_q$	A
VdSync	Direct axis voltage	$v_d$	V
VqSync	Quadrature axis voltage	$v_q$	V
MtrSpd	Angular mechanical velocity of the rotor	$\omega_m$	rad/s
MtrPos	Rotor mechanical angular position	$\theta_m$	rad
MtrTrq	Electromagnetic torque	$T_e$	N.m

### Parameters

#### Port Configuration — Select port configuration

Torque (default) | Speed

This table summarizes the port configurations.

Port Configuration	Creates Ports
Torque	PhaseV <sub>olt</sub> Info LdTrq
Speed	PhaseV <sub>olt</sub> Info Spd

**Stator phase resistance,  $R_s$  – Resistance**

scalar

Stator phase resistance,  $R_s$ , in ohm.**Armature inductance,  $L_{dq}$  – Inductance**

vector

Armature inductance,  $L_d, L_q$ , in H.**Permanent magnet flux,  $\lambda_{pm}$  – Flux**

scalar

Permanent magnet flux linkage,  $\lambda_{pm}$ , in Wb.**Number of pole pairs,  $P$  – Pole pairs**

Flux-Based PMSM | Induction Motor | Interior PMSM | Mapped Motor | Surface Mount PM Controller

**Introduced in R2017a**

# Surface Mount PM Controller

Torque-based, field-oriented controller for a surface mount permanent magnet synchronous motor

**Library:** Propulsion / Electric Motor Controllers

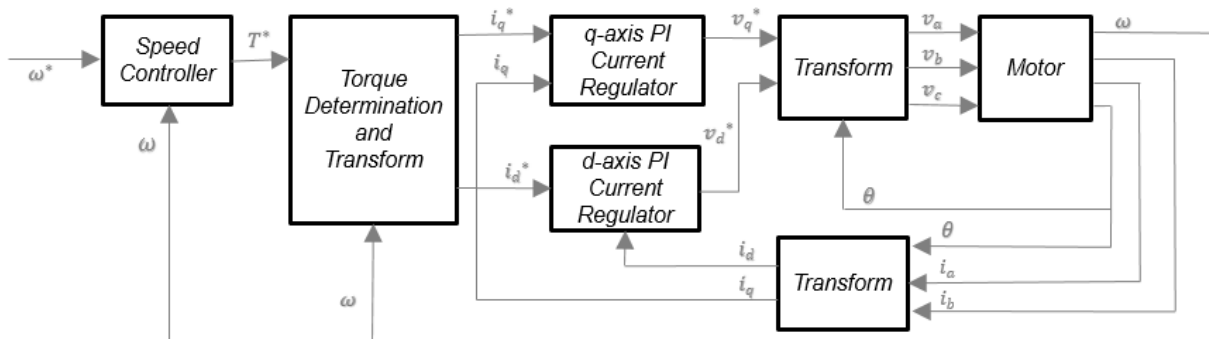

## Description

The Surface Mount PM Controller block implements a torque-based, field-oriented controller for a surface mount permanent magnet synchronous motor (PMSM) with an optional outer-loop speed controller. The torque control utilizes quadrature current and does not weaken the magnetic flux. You can specify either speed or torque control.

The Surface Mount PM Controller implements equations for speed control, torque determination, regulators, transforms, and motors.

The figure illustrates the information flow in the block.

The block implements equations that use these variables.

$\omega$	Rotor speed
$\omega^*$	Rotor speed command
$T^*$	Torque command
$i_d$	d-axis current
$i_d^*$	d-axis current command
$i_q$	q-axis current
$i_q^*$	q-axis current command
$v_d$	d-axis voltage
$v_d^*$	d-axis voltage command
$v_q$	q-axis voltage
$v_q^*$	q-axis voltage command
$v_a, v_b, v_c$	Stator phase a, b, c voltages
$i_a, i_b, i_c$	Stator phase a, b, c currents

### Speed Controller

To implement the speed controller, select the **Control Type** parameter `Speed Control`. If you select the **Control Type** parameter `Torque Control`, the block does not implement the speed controller.

The speed controller determines the torque command by implementing a state filter, and calculating the feedforward and feedback commands. If you do not implement the speed controller, input a torque command to the Surface Mount PM Controller block.

The state filter is a low-pass filter that generates the acceleration command based on the speed command. On the **Speed Controller** tab:

- To make the speed-command lag time negligible, specify a **Bandwidth of the state filter** parameter.
- To calculate a **Speed time constant, Ksf** gain based on the state filter bandwidth, select **Calculate Speed Regulator Gains**.

The discrete form of characteristic equation is given by:

$$z + K_{sf}T_{sm} - 1$$

The filter calculates the gain using this equation.

$$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$$

The equations use these variables.

$EV_{sf}$	Bandwidth of the speed command filter
$T_{sm}$	Motion controller sample time
$K_{sf}$	Speed regulator time constant

To generate the state feedback torque, the block uses the filtered speed error signal from the state filter. The feedback torque calculation also requires gains for speed regulator.

On the **Speed Controller** tab, select **Calculate Speed Regulator Gains** to calculate:

- **Proportional gain,  $b_a$**
- **Angular gain,  $K_{sa}$**
- **Rotational gain,  $K_{isa}$**

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value on the **Motor Parameters** tab.

The gains for the state feedback are calculated using these equations.

Calculation	Equations
Discrete forms of characteristic equation	$z^3 + \frac{(-3J_p + T_s b_a + T_s^2 K_{sa} + T_s^3 K_{isa})}{J_p} z^2 + \frac{(3J_p - 2T_s b_a - T_s^2 K_{sa})}{J_p} z + \frac{-J_p + T_s b_a}{J_p}$ $(z - p_1)(z - p_2)(z - p_3) = z^3 + (p_1 + p_2 + p_3)z^2 + (p_1 p_2 + p_2 p_3 + p_1 p_3)z^2 - p_1 p_2 p_3$
Speed regulator proportional gain	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$
Speed regulator integral gain	$K_{sa} = \frac{J_p (p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p + 2b_a T_{sm}}{T_{sm}^2}$
Speed regulator double integral gain	$K_{isa} = \frac{-J_p (p_1 + p_2 + p_3) + 3J_p - b_a T_{sm} - K_{sa} T_{sm}^2}{T_{sm}^3}$

The equations use these variables.

- $P$  Motor pole pairs  
 $b_a$  Speed regulator proportional gain  
 $K_{sa}$  Speed regulator integral gain

$K_{isa}$	Speed regulator double integral gain
$J_p$	Motor inertia
$T_{sm}$	Motion controller sample time

To generate the state feedforward torque, the block uses the filtered speed and acceleration from the state filter. Also, the feedforward torque calculation uses the inertia, viscous damping, and static friction. To achieve zero tracking error, the torque command is the sum of the feedforward and feedback torque commands.

Selecting **Calculate Speed Regulator Gains** on the **Speed Controller** tab updates the inertia, viscous damping, and static friction with the **Physical inertia, viscous damping, static friction** parameter values on the **Motor Parameters** tab.

The feedforward torque command uses this equation.

$$T_{cmd\_ff} = J_p \dot{\omega}_m + F_v \omega_m + F_s \frac{\omega_m}{|\omega_m|}$$

The equation uses these variables.

$J_p$	Motor inertia
$T_{cmd\_ff}$	Torque command feedforward
$F_s$	Static friction torque constant
$F_v$	Viscous friction torque constant
$F_s$	Static friction torque constant
$\omega_m$	Rotor speed

## Torque Determination

The block uses a quadrature current to determine the base speed and the current commands. The available bus voltage determines the base speed. The direct (d) and quadrature (q) permanent magnet (PM) determines the induced voltage.

Calculation	Equations
Motor maximum torque	$T_{max} = \frac{3}{2} P (\lambda_{pm} i_q + (L_d - L_q) i_d i_q)$
Maximum q-axis phase current	$i_{q\_max} = \frac{T_{cmd}}{\frac{3}{2} P \lambda_{pm}}$
Electrical base speed	$\omega_{base} = \frac{v_{max}}{\sqrt{(L_q i_q)^2 + (\lambda_{pm})^2}}$
d-axis voltage	$v_d = -\omega_e L_q i_{q\_max}$
q-axis voltage	$v_q = \omega_e \lambda_{pm}$
Maximum phase current	$i_{max} =  i_{q\_max} $
Maximum voltage	$v_{max} = \frac{v_{bus}}{\sqrt{3}}$

Calculation	Equations
Current command	$i_{dref} = 0$ $i_{q\_tmp} = \min(i_{q\_max}, \frac{T_{cmd}}{\frac{3}{2}P\lambda_{pm}})$ If $ \omega_e  \leq \omega_{base}$ $i_{qref} = i_{q\_tmp}$ Else $i_{qfw} = \text{sqrt}(\min(0, \frac{1}{L_q} \left( \left( \frac{v_{max}}{\omega_e} \right)^2 - (\lambda_{pm})^2 \right))$ If $i_{q\_tmp} < i_{qfw}$ $i_{qref} = i_{q\_tmp}$ Else $i_{qref} = i_{qfw}$ End           End

The equations use these variables.

$i_{max}$	Maximum phase current
$i_d$	d-axis current
$i_q$	q-axis current
$i_{dref}$	d-axis reference current
$i_{qref}$	q-axis reference current
$i_{q\_max}$	Maximum q-axis phase current
$\omega_e$	Rotor electrical speed
$\lambda_{pm}$	Permanent magnet flux linkage
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$v_{max}$	Maximum line to neutral voltage

$v_{bus}$	DC bus voltage
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$P$	Motor pole pairs
$T_{max}$	Motor maximum torque
$T_{cmd}$	Commanded motor maximum torque

## Current Regulators

The block regulates the current with an anti-windup feature. Classic proportional-integrator (PI) current regulators do not consider the d-axis and q-axis coupling or the back-electromagnetic force (EMF) coupling. As a result, transient performance deteriorates. To account for the coupling, the block implements the complex vector current regulator (CVCR) in the scalar format of the rotor reference frame. The CVCR decouples:

- d-axis and q-axis current cross-coupling
- back-EMF cross-coupling

The current frequency response is a first-order system, with a bandwidth of  $EV_{current}$ .

The block implements these equations.

Calculation	Equations
Motor voltage, in the rotor reference frame	$L_d \frac{di_d}{dt} = v_d - R_s i_d + p \omega_m L_q i_q$
Current regulator gains	$L_d \frac{di_q}{dt} = v_q - R_s i_q - p \omega_m L_d i_d - p \omega_m \lambda_{pm}$ $\omega_b = 2\pi EV_{current}$ $K_{p\_d} = L_d \omega_b$ $K_{p\_q} = L_q \omega_b$ $K_i = R_s \omega_b$

Calculation	Equations
Transfer functions	$\frac{i_d}{i_{dref}} = \frac{\omega_b}{s + \omega_b}$ $\frac{i_q}{i_{qref}} = \frac{\omega_b}{s + \omega_b}$

The equations use these variables.

$EV_{current}$	Current regulator bandwidth
$i_d$	d-axis current
$i_q$	q-axis current
$K_{p\_d}$	Current regulator d-axis gain
$K_{p\_q}$	Current regulator q-axis gain
$K_i$	Current regulator integrator gain
$L_d$	d-axis winding inductance
$L_q$	q-axis winding inductance
$R_s$	Stator phase winding resistance
$\omega_m$	Rotor speed
$v_d$	d-axis voltage
$v_q$	q-axis voltage
$\lambda_{pm}$	Permanent magnet flux linkage
$P$	Motor pole pairs

## Transforms

To calculate the voltages and currents in balanced three-phase ( $a, b$ ) quantities, quadrature two-phase ( $\alpha, \beta$ ) quantities, and rotating ( $d, q$ ) reference frames, the block uses the Clarke and Park Transforms.

In the transform equations.

$$\omega_e = P\omega_m$$

$$\frac{d\theta_e}{dt} = \omega_e$$

Transform	Description	Equations
Clarke	Converts balanced three-phase quantities ( $a, b$ ) into balanced two-phase quadrature quantities ( $\alpha, \beta$ ).	$x_\alpha = \frac{2}{3}x_a - \frac{1}{3}x_b - \frac{1}{3}x_c$ $x_\beta = \frac{\sqrt{3}}{2}x_b - \frac{\sqrt{3}}{2}x_c$
Park	Converts balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ) into an orthogonal rotating reference frame ( $d, q$ ).	$x_d = x_\alpha \cos \theta_e + x_\beta \sin \theta_e$ $x_q = -x_\alpha \sin \theta_e + x_\beta \cos \theta_e$
Inverse Clarke	Converts balanced two-phase quadrature quantities ( $\alpha, \beta$ ) into balanced three-phase quantities ( $a, b$ ).	$x_a = x_\alpha$ $x_b = -\frac{1}{2}x_\alpha + \frac{\sqrt{3}}{2}x_\beta$
Inverse Park	Converts an orthogonal rotating reference frame ( $d, q$ ) into balanced two-phase orthogonal stationary quantities ( $\alpha, \beta$ ).	$x_\alpha = x_d \cos \theta_e - x_q \sin \theta_e$ $x_\beta = x_d \sin \theta_e + x_q \cos \theta_e$

The transforms use these variables.

$\omega_m$	Rotor speed
$P$	Motor pole pairs
$\omega_e$	Rotor electrical speed
$\theta_e$	Rotor electrical angle
$x$	Phase current or voltage

## Motor

The block uses the phase currents and phase voltages to estimate the DC bus current. Positive current indicates battery discharge. Negative current indicates battery charge. The block uses these equations.

Load power	$Ld_{Pwr} = v_a i_a + v_b i_b + v_c i_c$
Source power	$Src_{Pwr} = Ld_{Pwr} + Pwr_{Loss}$
DC bus current	$i_{bus} = \frac{Src_{Pwr}}{v_{bus}}$
Estimated rotor torque	$MtrTrq_{est} = 1.5P[\lambda i_q + (L_d - L_q)i_d i_q]$
Power loss for single efficiency source to load	$Pwr_{Loss} = \frac{100 - Eff}{Eff} \cdot Ld_{Pwr}$
Power loss for single efficiency load to source	$Pwr_{Loss} = \frac{100 - Eff}{100} \cdot  Ld_{Pwr} $
Power loss for tabulated efficiency	$Pwr_{Loss} = f(\omega_m, MtrTrq_{est})$

The equations use these variables.

$v_a, v_b, v_c$	Stator phase a, b, c voltages
$v_{bus}$	Estimated DC bus voltage
$i_a, i_b, i_c$	Stator phase a, b, c currents
$i_{bus}$	Estimated DC bus current
$Eff$	Overall inverter efficiency
$\omega_m$	Rotor mechanical speed
$L_q$	q-axis winding inductance
$L_d$	d-axis winding inductance
$i_q$	q-axis current

$i_d$	d-axis current
$\lambda$	Permanent magnet flux linkage
$P$	Motor pole pairs

## Electrical Losses

To specify the electrical losses, on the **Electrical Losses** tab, for **Parameterize losses by**, select one of these options.

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use **Tabulated loss data** instead of **Tabulated efficiency data**:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

## Ports

### Input

#### **SpdReq — Rotor speed command**

scalar

Rotor speed command,  $\omega_m^*$ , in rad/s.

#### **Dependencies**

To create this port, select Speed Control for the **Control Type** parameter.

#### **TrqCmd — Torque command**

scalar

Torque command,  $T^*$ , in N.m.

#### **Dependencies**

To create this port, select Torque Control for the **Control Type** parameter.

#### **BusVolt — DC bus voltage**

scalar

DC bus voltage  $v_{bus}$ , in V.

#### **PhaseCurrA — Current**

scalar

Stator current phase a,  $i_a$ , in A.

#### **PhaseCurrB — Current**

scalar

Stator current phase b,  $i_b$ , in A.

#### **SpdFdbk — Rotor speed**

scalar

Rotor speed,  $\omega_m$ , in rad/s.

**PosFdbk — Rotor electrical angle**

scalar

Rotor electrical angle,  $\theta_m$ , in rad.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Units
SrcPwr	Source power	W
LdPwr	Load power	W
PwrLoss	Power loss	W
MtrTrqEst	Estimated motor torque	N.m

**BusCurr — Bus current**

scalar

Estimated DC bus current,  $i_{bus}$ , in A.

**PhaseVolt — Stator terminal voltages**

array

Stator terminal voltages,  $V_a$ ,  $V_b$ , and  $V_c$ , in V.

**Parameters**

**Configuration**

**Control Type — Select control**

Speed Control (default) | Torque Control

If you select Torque Control, the block does not implement the speed controller.

This table summarizes the port configurations.

Port Configuration	Creates Ports
Speed Control	SpdReq
Torque Control	TrqCmd

### Motor Parameters

#### Stator resistance, $R_s$ – Resistance

scalar

Stator phase winding resistance,  $R_s$ , in ohm.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Stator resistance, $R_s$	D and Q axis integral gain, $K_i$	Current Controller

#### DQ axis inductance, $L_{dq}$ – Inductance

scalar

D-axis winding inductance,  $L_{dq}$ , in H.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
DQ axis inductance, $L_{dq}$	D-axis proportional gain, $K_{p\_d}$ Q-axis proportional gain, $K_{p\_q}$ D and Q axis integral gain, $K_i$	Current Controller

**Permanent magnet flux,  $\lambda_{pm}$  — Flux**

scalar

Permanent magnet flux,  $\lambda_{pm}$ , in Wb.

**Number of pole pairs, PolePairs — Poles**

scalar

Motor pole pairs,  $P$ .

**Physical inertia, viscous damping, static friction, Mechanical — Inertia, damping, friction**

vector

Mechanical properties of the motor:

- Motor inertia,  $F_v$ , in  $\text{kgm}^2$
- Viscous friction torque constant,  $F_v$ , in  $\text{N.m}/(\text{rad/s})$
- Static friction torque constant,  $F_s$ , in  $\text{N.m}$

**Dependencies**

To enable this parameter, set the **Control Type** parameter to Speed Control.

For the gain calculations, the block uses the inertia from the **Physical inertia, viscous damping, static friction** parameter value that is on the **Motor Parameters** tab.

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
Physical inertia, viscous damping, static friction, Mechanical	Proportional gain, ba Angular gain, Ksa Rotational gain, Kisa Inertia compensation, Jcomp Viscous damping compensation, Fv Static friction, Fs	Speed Controller

#### Id and Iq Calculation

#### Maximum torque, T\_max – Torque

scalar

Maximum torque, in N.m.

#### Current Controller

#### Bandwidth of the current regulator, EV\_current – Bandwidth

scalar

Current regulator bandwidth, in Hz.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Bandwidth of the current regulator, EV_current</b>	<b>D-axis proportional gain, Kp_d</b>  <b>Q-axis proportional gain, Kp_q</b>  <b>D and q axis proportional gain, Ki</b>	<b>Current Controller</b>

**Sample time for the torque control, Tst** — Time scalar

Torque control sample time, in s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Used to Derive	
	Parameter	Tab
<b>Sample time for the torque control, Tst</b>	<b>Speed time constant, Ksf</b>	<b>Speed Controller</b>

**Calculate Current Regulator Gains — Derive parameters** button

Click to derive parameters.

**Dependencies**

On the **Current Controller** tab, when you select **Calculate Current Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Current Controller tab	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d  Q-axis proportional gain, Kp_q  D and Q axis integral gain, Ki	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters
	DQ-axis inductance, Ldq	

#### D-axis proportional gain, Kp\_d – Derived scalar

Derived d-axis proportional gain, in V/A.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D-axis proportional gain, Kp_d	Bandwidth of the current regulator, EV_current	Current Controller
	DQ-axis inductance, Ldq	Motor Parameters

#### Q-axis proportional gain, Kp\_q – Derived scalar

Derived q-axis proportional gain, in V/A.

#### Dependencies

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
Q-axis proportional gain, $K_p_q$	Bandwidth of the current regulator, EV_current	Current Controller
	DQ-axis inductance, Ldq	Motor Parameters

**D and Q axis integral gain,  $K_i$  — Derived scalar**

Derived axis integral gain, in V/A\*s.

**Dependencies**

This table summarizes the parameter dependencies.

Parameter	Dependency	
	Parameter	Tab
D and Q axis integral gain, $K_i$	Bandwidth of the current regulator, EV_current	Current Controller
	Stator resistance, Rs	Motor Parameters
	DQ-axis inductance, Ldq	

**Speed Controller**

**Bandwidth of the motion controller, EV\_motion — Bandwidth vector**

Motion controller bandwidth, in Hz. Set the first element of the vector to the desired cutoff frequency. Set the second and third elements of the vector to the higher-order cut off frequencies. You can set the value of the next element to 1/5 the value of the previous element. For example, if the desired cutoff frequency is 20 Hz, specify [20 4 0.8].

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the motion controller, EV_motion	Proportional gain, ba Angular gain, Ksa Rotational gain, Kisa	Speed Controller

**Bandwidth of the state filter, EV\_sf – Bandwidth**  
scalar

State filter bandwidth, in Hz.

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Bandwidth of the state filter, EV_sf	Speed time constant, Ksf	Speed Controller

**Sample time for the motion control, Tsm – Time**  
scalar

Sample time for the motion controller, in s.

**Dependencies**

The parameter is enabled when the **Control Type** parameter is set to Speed Control.

Parameter	Used to Derive	
	Parameter	Tab
Sample time for the motion control, Tsm	Proportional gain, ba Angular gain, Ksa Rotational gain, Kisa	Speed Controller

**Calculate Speed Regulator Gains – Derive parameters**  
button

Click to derive parameters.

**Dependencies**

On the **Speed Controller** tab, when you select **Calculate Speed Regulator Gains**, the block calculates derived parameters. The table summarizes the derived parameters that depend on other block parameters.

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
<b>Proportional gain, ba</b>	$b_a = \frac{J_p - J_p p_1 p_2 p_3}{T_{sm}}$	<p>Sample time for the motion control, Tsm</p> <p>Bandwidth of the motion controller, EV_motion</p> <p>Bandwidth of the state filter, EV_sf</p>	<b>Speed Controller</b>
<b>Angular gain, Ksa</b>	$K_{sa} = \frac{J_p (p_1 p_2 + p_2 p_3 + p_3 p_1) - 3J_p p_1 p_2 p_3}{T_{sm}^2}$	<p>Sample time for the torque control, Tst</p>	<b>Current Controller</b>
<b>Rotational gain, Kisa</b>	$K_{isa} = \frac{-J_p (p_1 + p_2 + p_3) + 3J_p}{T_{sm}^3}$	<p>Physical inertia, viscous damping, static friction, Mechanical</p>	<b>Motor Parameters</b>
<b>Speed time constant, Ksf</b>	$K_{sf} = \frac{1 - \exp(-T_{sm} 2\pi EV_{sf})}{T_{sm}}$		
<b>Inertia compensation, Jcomp</b>	$J_{comp} = J_p$	<p>Physical inertia, viscous damping, static friction, Mechanical</p>	<b>Motor Parameters</b>

Derived Parameter on Speed Controller tab		Depends On	
		Parameter	Tab
Viscous damping compensation, $F_v$	$F_v$		
Static friction, $F_s$	$F_s$		

The equations use these variables.

$P$	Motor pole pairs

Static friction, Fs	Physical inertia, viscous damping, static friction, Mechanical	Motor Parameters

**Electrical Losses**

**Parameterize losses by — Select type**

Single efficiency measurement (default) | Tabulated loss data | Tabulated efficiency data

Setting	Block Implementation
Single efficiency measurement	Electrical loss calculated using a constant value for inverter efficiency.
Tabulated loss data	Electrical loss calculated as a function of motor speeds and load torques.
Tabulated efficiency data	<p>Electrical loss calculated using inverter efficiency that is a function of motor speeds and load torques.</p> <ul style="list-style-type: none"> <li>• Converts the efficiency values you provide into losses and uses the tabulated losses for simulation.</li> <li>• Ignores efficiency values you provide for zero speed or zero torque. Losses are assumed zero when either torque or speed is zero.</li> <li>• Uses linear interpolation to determine losses. Provide tabulated data for low speeds and low torques, as required, to get the desired level of accuracy for lower power conditions.</li> <li>• Does not extrapolate loss values for speed and torque magnitudes that exceed the range of the table.</li> </ul>

For best practice, use Tabulated loss data instead of Tabulated efficiency data:

- Efficiency becomes ill defined for zero speed or zero torque.
- You can account for fixed losses that are still present for zero speed or torque.

### Overall inverter efficiency, $eff$ – Constant

scalar

Overall inverter efficiency,  $Eff$ , in %.

#### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

### Vector of speeds ( $w$ ) for tabulated loss, $w\_loss\_bp$ – Breakpoints

1-by-M matrix

Speed breakpoints for lookup table when calculating losses, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of torques (T) for tabulated loss, T\_loss\_bp — Breakpoints**

1-by-N matrix

Torque breakpoints for lookup table when calculating losses, in N.m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Corresponding losses, losses\_table — Table**

M-by-N matrix

Array of values for electrical losses as a function of M speeds and N torques, in W. Each value specifies the losses for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated loss data.

**Vector of speeds (w) for tabulated efficiency, w\_eff\_bp — Breakpoints**

1-by-M matrix

Speed breakpoints for lookup table when calculating efficiency, in rad/s.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

**Vector of torques (T) for tabulated efficiency, T\_eff\_bp — Breakpoints**

1-by-N matrix

Torque breakpoints for lookup table when calculating efficiency, in N.m.

**Dependencies**

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

## Corresponding efficiency, `efficiency_table` – Table

M-by-N matrix

Array of efficiency as a function of M speeds and N torque, in %. Each value specifies the efficiency for a specific combination of speed and torque. The matrix size must match the dimensions defined by the speed and torque vectors.

The block ignores efficiency values for zero speed or zero torque. Losses are zero when either torque or speed is zero. The block uses linear interpolation.

To get the desired level of accuracy for lower power conditions, you can provide tabulated data for low speeds and low torques.

### Dependencies

To enable this parameter, for **Parameterize losses by**, select Tabulated efficiency data.

- The Controller subsystem — Determines the commands based on the commanded torque, measured engine speed, and estimated cylinder air mass.
- The Estimator subsystem — Determines the estimated air mass flow, torque, and exhaust gas temperature from intake manifold gas pressure, intake manifold gas temperature, engine speed, and cam phaser positions.

The figure illustrates the signal flow.

The figure uses these variables.

$N$	Engine speed
$MAP$	Cycle average intake manifold pressure
$IAT$	Intake air temperature
$T_{in,EGR}$	Temperature at EGR valve inlet
$MAT$	Cycle average intake manifold gas absolute temperature

$\varphi_{ICP}$ ,	Intake cam phaser angle and intake cam phaser angle command, respectively
$\varphi_{ICPCMD}$	
$\varphi_{ECP}$ ,	Exhaust cam phaser angle and exhaust cam phaser angle command, respectively
$\varphi_{ECPCMD}$	
$EGRap$ , $EGRap_{cmd}$	EGR valve area percent and EGR valve area percent command, respectively
$\Delta P_{EGR}$	Pressure difference at EGR valve inlet and outlet
$WAP_{cmd}$	Turbocharger wastegate area percent command
SA	Spark advance
$Pw_{inj}$	Fuel injector pulse-width
$TPP_{cmd}$	Throttle position percent command

The Model-Based Calibration Toolbox was used to develop the tables that are available with the Powertrain Blockset.

## Controller

The block determines the commanded engine load (that is, normalized cylinder air mass) from a lookup table that is a function of commanded torque and measured engine speed.

$$L_{cmd} = f_{Lcmd}(T_{cmd}, N)$$

To achieve the commanded load, the controller sets the throttle position percent and turbocharger wastegate area percent using feed forward lookup tables. The lookup tables are functions of the commanded load and measured engine speed.

$$TAP_{cmd} = f_{TAPcmd}(L_{cmd}, N)$$

$$TPP_{cmd} = f_{TPPcmd}(TAP_{cmd})$$

$$WAP_{cmd} = f_{WAPcmd}(L_{cmd}, N)$$

To determine the cam phaser angle commands, the block uses lookup tables that are functions of estimated engine load and measured engine speed.

$$\varphi_{ICPCMD} = f_{ICPCMD}(L_{est}, N)$$

$$\varphi_{ECPCMD} = f_{ECPCMD}(L_{est}, N)$$

The block calculates the desired engine load using this equation.

$$L_{est} = \frac{Cps R_{air} T_{std} \dot{m}_{air,est}}{P_{std} V_d N}$$

The equations use these variables.

$L_{est}$	Estimated engine load
$L_{cmd}$	Commanded engine load
$N$	Engine speed
$T_{cmd}$	Commanded engine torque
$TAP_{cmd}$	Throttle area percent command
$TPP_{cmd}$	Throttle position percent command
$WAP_{cmd}$	Turbocharger wastegate area percent command
$Cps$	Crankshaft revolutions per power stroke
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$R_{air}$	Ideal gas constant for air and burned gas mixture
$V_d$	Displaced volume
$\dot{m}_{air,est}$	Estimated engine air mass flow

The controller subsystem uses these lookup tables for the air calculations.

- The throttle area percent command lookup table,  $f_{TAP_{cmd}}$ , is a function of commanded load and engine speed

$$TAP_{cmd} = f_{TAP_{cmd}}(L_{cmd}, N)$$

where:

- $TAP_{cmd}$  is throttle area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

- To account for the non-linearity of the throttle position to throttle area, the throttle position percent lookup table linearizes the open-loop air mass flow control.

The throttle position percent command lookup table,  $f_{TPP_{cmd}}$ , is a function of the throttle area percentage command

$$TPP_{cmd} = f_{TPP_{cmd}}(TAP_{cmd})$$

where:

- $TPP_{cmd}$  is throttle position percentage command, in percent.
- $TAP_{cmd}$  is throttle area percentage command, in percent.

- The wastegate area percent command lookup table,  $f_{WAPcmd}$ , is a function of the commanded engine load and engine speed

$$WAP_{cmd} = f_{WAPcmd}(L_{cmd}, N)$$

where:

- $WAP_{cmd}$  is wastegate area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

- The commanded engine load lookup table,  $f_{Lcmd}$ , is a function of the commanded torque and engine speed

$$L_{cmd} = f_{Lcmd}(T_{cmd}, N)$$

where:

- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $T_{cmd}$  is commanded torque, in N.m.
- $N$  is engine speed, in rpm.

- The intake cam phaser angle command lookup table,  $f_{ICPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ICPCMD} = f_{ICPCMD}(L_{est}, N)$$

where:

- $\varphi_{ICPCMD}$  is commanded intake cam phaser angle, in degrees crank advance.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

- The exhaust cam phaser angle command lookup table,  $f_{ECPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ECPCMD} = f_{ECPCMD}(L_{est}, N)$$

where:

- $\varphi_{ECPCMD}$  is commanded exhaust cam phaser angle, in degrees crank retard.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

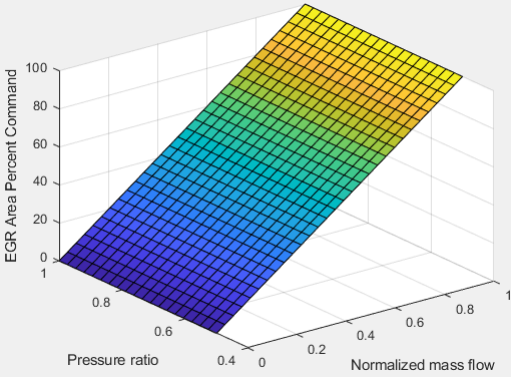

EGR is typically expressed as a percent of total intake port flow.

$$EGR_{pct} = 100 \frac{\dot{m}_{EGR}}{\dot{m}_{EGR} + \dot{m}_{air}}$$

To calculate the EGR area percent command, the block uses equations and a lookup table.

Equations	$\dot{m}_{EGRstd,cmd} = \dot{m}_{EGR,cmd} \frac{P_{std}}{P_{in,EGR}} \sqrt{\frac{T_{in,EGR}}{T_{std}}}$ $\dot{m}_{EGRstd,max} = f_{EGRstd,max} \left( \frac{P_{out,EGR}}{P_{in,EGR}} \right)$ $\dot{m}_{EGR,cmd} = EGR_{pct,cmd} \dot{m}_{intk,est}$
-----------	--

<p>Lookup table</p>	<p>The EGR area percent command, <math>EGRap_{cmd}</math>, lookup table is a function of the normalized mass flow and pressure ratio</p> $EGRap_{cmd} = f_{EGRap,cmd} \left( \frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}, \frac{P_{out,EGR}}{P_{in,EGR}} \right)$ <p>where:</p> <ul style="list-style-type: none"> <li>• <math>EGRap_{cmd}</math> is commanded EGR area percent, dimensionless.</li> <li>• <math>\frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}</math> is the normalized mass flow, dimensionless.</li> <li>• <math>\frac{P_{out,EGR}}{P_{in,EGR}}</math> is the pressure ratio, dimensionless.</li> </ul> 
---------------------	--

The equations and table use these variables.

- $EGRap$ ,  $EGRap_{cmd}$  EGR valve area percent and EGR valve area percent command, respectively
- $EGR_{pct,cmd}$  EGR percent command
- $\dot{m}_{EGRstd,cmd}$  Commanded standard mass flow

$\dot{m}_{EGRstd,max}$	Maximum standard mass flow
$\dot{m}_{EGR,cmd}$	Commanded mass flow
$\dot{m}_{intk,est}$	Estimated intake port mass flow
$T_{std}, P_{std}$	Standard temperature and pressure
$T_{in,EGR}$	Temperature at EGR valve inlet
$P_{out,EGR},$ $P_{in,EGR}$	Pressure at EGR valve inlet and outlet, respectively

The air-fuel ratio (AFR) impacts three-way-catalyst (TWC) conversion efficiency, torque production, and combustion temperature. The engine controller manages AFR by

commanding injector pulse-width from a desired relative AFR. The relative AFR,  $\lambda_{cmd}$ , is the ratio between the commanded AFR and the stoichiometric AFR of the fuel.

$$\lambda_{cmd} = \frac{AFR_{cmd}}{AFR_{stoich}}$$

$$AFR_{cmd} = \frac{\dot{m}_{air,est}}{\dot{m}_{fuel,cmd}}$$

The commanded lambda,  $\lambda_{cmd}$ , lookup table is a function of estimated engine load and measured engine speed

$$\lambda_{cmd} = f_{\lambda_{cmd}}(L_{est}, N)$$

where:

- $\lambda_{cmd}$  is commanded relative AFR, dimensionless.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

The block calculates the estimated fuel mass flow rate using the commanded lambda,  $\lambda_{cmd}$ , stoichiometric AFR, and estimated air mass flow rate.

$$\dot{m}_{fuel,cmd} = \frac{\dot{m}_{air,est}}{AFR_{cmd}} = \frac{\dot{m}_{air,est}}{\lambda_{cmd} AFR_{stoich}}$$

The block assumes that the battery voltage and fuel pressure are at nominal settings where pulse-width correction is not necessary. The commanded fuel injector pulse-width is proportional to the fuel mass per injection. The fuel mass per injection is calculated from the commanded fuel mass flow rate, engine speed, and the number of cylinders.

$$Pw_{inj} = \begin{cases} \frac{\dot{m}_{fuel,cmd} Cps \left( \frac{60s}{min} \right) \left( \frac{1000mg}{g} \right) \left( \frac{1000g}{kg} \right)}{NS_{inj} N_{cyl}} & \text{when } Trq_{cmd} > 0 \\ 0 & \text{when } Trq_{cmd} \leq 0 \end{cases}$$

The equations use these variables.

$\lambda_{cmd}$	Lambda command, relative AFR
$L_{est}$	Estimated engine load, based on normalized cylinder air mass
$N$	Engine speed
$Trq_{cmd}$	Commanded engine torque
$AFR_{stoich}$	Stoichiometric fuel AFR

$AFR_{cmd}$	Commanded AFR
$\dot{m}_{air,est}$	Estimated engine air mass flow
$\dot{m}_{fuel,cmd}$	Commanded fuel mass flow
$N_{cyl}$	Number of engine cylinders
$S_{inj}$	Fuel injector slope
$Pw_{inj}$	Fuel injector pulse-width
$f_{\lambda cmd}$	Relative AFR lookup table

Spark advance is the crank angle before top dead center (BTDC) of the power stroke when the spark is delivered. The spark advance has an impact on engine efficiency, torque, exhaust temperature, knock, and emissions.

The spark advance lookup table is a function of estimated load and engine speed.

$$SA = f_{SA}(L_{est}, N)$$

where:

- $SA$  is spark advance, in crank advance degrees.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

The equations use these variables.

$L_{est}$	Estimated engine load, based on normalized cylinder air mass
$N$	Engine speed
$f_{SA}$	Lookup table for spark advance
$N$	Spark advance

When the commanded torque is below a threshold value, the idle speed controller regulates the engine speed.

If	Idle Speed Controller
$Trq_{cmd,input} < Trq_{idlecmd,enable}$	Enabled
$Trq_{idlecmd,enable} \leq Trq_{cmd,input}$	Not enabled

The idle speed controller uses a discrete PI controller to regulate the target idle speed by commanding a torque.

The PI controller uses this transfer function:

$$C_{idle}(z) = K_{p,idle} + K_{i,idle} \frac{t_s}{z-1}$$

The idle speed commanded torque must be less than the maximum commanded torque:

$$0 \leq Trq_{idlecmd} \leq Trq_{idlecmd,max}$$

Idle speed control is active under these conditions. If the commanded input torque drops below the threshold for enabling the idle speed controller ( $Trq_{cmd,input} < Trq_{idlecmd,enable}$ ), the commanded engine torque is given by:

$$Trq_{cmd} = \max(Trq_{cmd,input}, Trq_{idlecmd}).$$

The equations use these variables.

$Trq_{cmd}$	Commanded engine torque
$Trq_{cmd,input}$	Input commanded engine torque

$Trq_{idlecmd,enable}$	Threshold for enabling idle speed controller
$Trq_{idlecmd}$	Idle speed controller commanded torque
$Trq_{idlecmd,max}$	Maximum commanded torque
$N_{idle}$	Base idle speed
$K_{p,idle}$	Idle speed controller proportional gain
$K_{i,idle}$	Idle speed controller integral gain

## Estimator

The estimator subsystem determines the estimated air mass flow, torque, EGR mass flow, and exhaust temperature based on sensor feedback and calibration parameters.

$\dot{m}_{air,est}$	Estimated engine air mass flow
$Trq_{est}$	Estimated engine torque
$T_{exh,est}$	Estimated engine exhaust temperature
$\dot{m}_{EGR,est}$	Estimated low-pressure EGR mass flow

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
“SI Engine Speed-Density Air Mass Flow Model”	Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.

Air Mass Flow Model	Description
<p>“SI Engine Dual-Independent Cam Phaser Air Mass Flow Model”</p>	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

To determine the estimated air mass flow, the block uses the intake air mass fraction. The EGR mass fraction at the intake port lags the mass fraction near the EGR valve outlet. To model the lag, the block uses a first order system with a time constant.

$$y_{intk,EGR,est} = \frac{\dot{m}_{EGR,est}}{\dot{m}_{intk,est}} \frac{t_s z}{\tau_{EGR} z + t_s - \tau_{EGR}}$$

The remainder of the gas is air.

$$y_{intk,air,est} = 1 - y_{intk,EGR,est}$$

The equations use these variables.

$y_{intk,EGR,est}$	Estimated intake manifold EGR mass fraction
$y_{intk,air,est}$	Estimated intake manifold air mass fraction
$\dot{m}_{EGR,est}$	Estimated low-pressure EGR mass flow
$\dot{m}_{intk,est}$	Estimated intake port mass flow
$\tau_{EGR}$	EGR time constant

To calculate the brake torque, configure the SI engine to use either of these torque models.

Brake Torque Model	Description
“SI Engine Torque Structure Model”	For the structured brake torque calculation, the SI engine uses tables for the inner torque, friction torque, optimal spark, spark efficiency, and lambda efficiency.
“SI Engine Simple Torque Model”	For the simple brake torque calculation, the SI engine block uses a torque lookup table map that is a function of engine speed and load.

The controller estimates low-pressure mass flow, EGR valve inlet pressure, and EGR valve outlet pressure using an algorithm developed by F. Liu and J. Pfeiffer. The estimator requires measured EGR valve differential pressure, EGR valve area percent, intake air temperature, and EGR valve inlet temperature.

To estimate the EGR valve commands, the block uses:

- Equations

$$\dot{m}_{air,std} = \dot{m}_{air,est} \frac{P_{std}}{P_{amb}} \sqrt{\frac{IAT}{T_{std}}}$$

$$P_{in,EGR} = P_{out,EGR} + \Delta P_{EGR}$$

$$\dot{m}_{EGR,est} = \dot{m}_{EGR,std} \frac{P_{in,EGR}}{P_{std}} \sqrt{\frac{T_{std}}{T_{in,EGR}}}$$

- Tables
- The EGR valve standard mass flow lookup table is a function of EGR valve area percent and the pressure ratio

$$\dot{m}_{EGR,std} = f_{EGR,std} \left( EGRap, \frac{P_{out,EGR}}{P_{in,EGR}} \right)$$

where:

- $\dot{m}_{EGR,std}$  is EGR valve standard mass flow, dimensionless.
- $EGRap$  is EGR valve flow area percent, in percent.
- $\frac{P_{out,EGR}}{P_{in,EGR}}$  is the pressure ratio, dimensionless.

- The pressure ratio is a function of the standard mass flow

$$\frac{P_{out,EGR}}{P_{amb}} = f_{intk_{sys,pr}}(\dot{m}_{air,std})$$

where:

- $\dot{m}_{air,std}$  is standard mass flow, in g/s.
- $\frac{P_{out,EGR}}{P_{amb}}$  is pressure ratio, dimensionless.

The equations use these variables.

$EGR_{ap}$	EGR valve area percent command
$IAT$	Intake air temperature
$\dot{m}_{air,std}$ , $\dot{m}_{EGR,std}$	Standard air and EGR valve mass flow, respectively
$\dot{m}_{air,est}$ , $\dot{m}_{EGR,est}$	Estimated air and EGR valve mass flow, respectively
$T_{std}$ , $P_{std}$	Standard temperature and pressure
$T_{amb}$ , $P_{amb}$	Ambient temperature and pressure

$\Delta P_{EGR}$	Pressure difference at EGR valve inlet and outlet
$T_{in,EGR}, T_{out,EGR}$	Temperature at EGR valve inlet and outlet, respectively
$P_{in,EGR}, P_{out,EGR}$	Pressure at EGR valve inlet and outlet, respectively

The exhaust temperature lookup table,  $f_{T_{exh}}$ , is a function of engine load and engine speed

$$T_{exh} = f_{T_{exh}}(L, N)$$

where:

- $T_{exh}$  is engine exhaust temperature, in K.
- $L$  is normalized cylinder air mass or engine load, dimensionless.
- $N$  is engine speed, in rpm.

## Ports

### Input

**TrqCmd — Commanded engine torque**  
scalar

Commanded engine torque,  $Trq_{cmd,input}$ , in N.m.

**EngSpd — Measured engine speed**

scalar

Measured engine speed,  $N$ , in rpm.

**AmbPrs — Measured absolute ambient pressure**

scalar

Measured ambient pressure,  $P_{Amb}$ , in Pa.

**Map — Measured intake manifold absolute pressure**

scalar

Measured intake manifold absolute pressure  $MAP$ , in Pa.

**Mat — Measured intake manifold absolute temperature**

scalar

Measured intake manifold absolute temperature,  $MAT$ , in K.

**IntkCamPhase — Intake cam phaser angle**

scalar

Intake cam phaser angle,  $\phi_{ICP}$ , in degCrkAdv, or degrees crank advance.

**ExhCamPhase — Exhaust cam phaser angle**

scalar

Exhaust cam phaser angle,  $\phi_{ECP}$ , in degCrkRet, or degrees crank retard.

**Iat — Intake air temperature**

scalar

Intake air temperature,  $IAT$ , in K.

**Ect — Engine cooling temperature**

scalar

Engine cooling temperature,  $T_{coolant}$ , in K.

**EgrVlvInTemp — EGR valve inlet temperature**

scalar

EGR valve inlet temperature,  $T_{in,EGR}$ , in K.

**EgrVlvAreaPct — EGR valve area percent**

scalar

EGR valve area percent,  $EGRap$ , in %.

**EgrVlvDeltaPrs — EGR valve delta pressure**

scalar

EGR valve delta pressure,  $\Delta P_{EGR}$ , in Pa.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
TrqCmd	Engine torque	$Trq_{cmd}$	N.m
LdCmd	Commanded load	$L_{cmd}$	N/A
ThrPosCmd	Throttle area percent command	$TAP_{cmd}$	%
WgAreaPctCmd	Wastegate area percent command	$WAP_{cmd}$	%
InjPw	Fuel injector pulse-width	$Pw_{inj}$	ms
SpkAdv	Spark advance	$SA$	degBTDC
IntkCamPhaseCmd	Intake cam phaser angle command	$\varphi_{ICPCMD}$	degCrkAdv
ExhCamPhaseCmd	Exhaust cam phaser angle command	$\varphi_{ECPCMD}$	degCrkRet

Signal	Description	Variable	Units
EgrVlvAreaPctCmd	Exhaust cam phaser angle command	$EGR\alpha_{cmd}$	%

## Controls

### Air

#### Engine commanded load table, $f_{lcmd}$ — Lookup table

array

The commanded engine load lookup table,  $f_{Lcmd}$ , is a function of the commanded torque and engine speed

$$L_{cmd} = f_{Lcmd}(T_{cmd}, N)$$

where:

- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $T_{cmd}$  is commanded torque, in N.m.
- $N$  is engine speed, in rpm.

**Torque command breakpoints,  $f\_lcmd\_tq\_bpt$  — Breakpoints**  
array

Torque command breakpoints, in N.m.

**Speed breakpoints,  $f\_lcmd\_n\_bpt$  — Breakpoints**  
array

Speed breakpoints, in rpm.

**Throttle area percent,  $f\_tap$  — Lookup table, %**  
array

The throttle area percent command lookup table,  $f_{TAPcmd}$ , is a function of commanded load and engine speed

$$TAP_{cmd} = f_{TAPcmd}(L_{cmd}, N)$$

where:

- $TAP_{cmd}$  is throttle area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Throttle area percent load breakpoints,  $f\_tap\_ld\_bpt$  — Breakpoints**  
array

Throttle area percent load breakpoints, dimensionless.

**Throttle area percent speed breakpoints,  $f_{tap\_n\_bpt}$  — Breakpoints**  
array

Throttle area percent speed breakpoints, in rpm.

**Throttle area percent to position percent table,  $f_{tpp}$  — Lookup table**  
array

The throttle position percent command lookup table,  $f_{TPPcmd}$ , is a function of the throttle area percentage command

$$TPP_{cmd} = f_{TPPcmd}(TAP_{cmd})$$

where:

- $TPP_{cmd}$  is throttle position percentage command, in percent.
- $TAP_{cmd}$  is throttle area percentage command, in percent.

**Throttle area percent to position percent area breakpoints,  $f_{tpp\_tap\_bpt}$  — Breakpoints**  
array

Throttle area percent to position percent area breakpoints, dimensionless.

**Wastegate area percent,  $f_{wap}$  — Lookup table, %**  
array

The wastegate area percent command lookup table,  $f_{WAP_{cmd}}$ , is a function of the commanded engine load and engine speed

$$WAP_{cmd} = f_{WAP_{cmd}}(L_{cmd}, N)$$

where:

- $WAP_{cmd}$  is wastegate area percentage command, in percent.
- $L_{cmd}=L$  is commanded engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f_{wap\_ld\_bpt}$  — Breakpoints**  
array

Load breakpoints, dimensionless.

**Speed breakpoints,  $f_{wap\_n\_bpt}$  — Breakpoints, rpm**  
array

Speed breakpoints, in rpm.

**Intake cam phaser angle,  $f_{icp}$  — Lookup table**  
array

The intake cam phaser angle command lookup table,  $f_{ICPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ICPCMD} = f_{ICPCMD}(L_{est}, N)$$

where:

- $\varphi_{ICPCMD}$  is commanded intake cam phaser angle, in degrees crank advance.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

### Exhaust cam phaser angle, f\_ecp — Lookup table

array

The exhaust cam phaser angle command lookup table,  $f_{ECPCMD}$ , is a function of the engine load and engine speed

$$\varphi_{ECPCMD} = f_{ECPCMD}(L_{est}, N)$$

where:

- $\varphi_{ECPCMD}$  is commanded exhaust cam phaser angle, in degrees crank retard.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f_{cp\_ld\_bpt}$  – Breakpoints**  
array

Load breakpoints, dimensionless.

**Speed breakpoints,  $f_{cp\_n\_bpt}$  – Breakpoints**  
array

Speed breakpoints, in rpm.

**Commanded EGR percent,  $f_{egrpct\_cmd}$  – Lookup table**  
array

The EGR percent command,  $EGR_{pct,cmd}$ , lookup table is a function of estimated engine load and engine speed

$$EGR_{pct,cmd} = f_{EGRpct,cmd}(L_{est}, N)$$

where:

- $EGR_{pct,cmd}$  is commanded EGR percent, dimensionless.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f\_egrpct\_ld\_bpt$  — Breakpoints**  
vector

Engine load breakpoints,  $L$ , dimensionless.

**Speed breakpoints,  $f\_egrpct\_n\_bpt$  — Breakpoints**  
vector

Engine speed breakpoints,  $N$ , in rpm.

**EGR valve area percent,  $f\_egr\_areapct\_cmd$  — Lookup table**  
array

The EGR area percent command,  $EGRap_{cmd}$ , lookup table is a function of the normalized mass flow and pressure ratio

$$EGRap_{cmd} = f_{EGRap,cmd} \left( \frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}, \frac{P_{out,EGR}}{P_{in,EGR}} \right)$$

where:

- $EGRap_{cmd}$  is commanded EGR area percent, dimensionless.
- $\frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}$  is the normalized mass flow, dimensionless.
- $\frac{P_{out,EGR}}{P_{in,EGR}}$  is the pressure ratio, dimensionless.

**Open EGR valve standard flow,  $f\_egr\_max\_stdflow$  – Breakpoints**  
vector

Maximum standard EGR valve mass flow breakpoints,  $\dot{m}_{EGRstd,max}$ , in N.m.

**Normalized EGR valve standard flow breakpoints,  $f\_egr\_areapct\_nrmlzdflow\_bpt$  – Breakpoints**  
vector

Normalized mass flow breakpoints,  $\frac{\dot{m}_{EGRstd,cmd}}{\dot{m}_{EGRstd,max}}$ , dimensionless.

**EGR valve pressure ratio breakpoints,  $f\_egr\_areapct\_pr\_bpt$  – Breakpoints**  
vector

Pressure ratio breakpoints,  $\frac{P_{out,EGR}}{P_{in,EGR}}$ , dimensionless.

**Fuel**

**Injector slope,  $S_{inj}$  – Slope**  
scalar

Fuel injector slope,  $S_{inj}$ , in mg/ms.

**Stoichiometric air-fuel ratio, afr\_stoich** — Ratio  
scalar

Stoichiometric air-fuel ratio,  $AFR_{stoich}$ .

**Relative air-fuel ratio lambda, f\_lam** — Air-fuel-ratio (AFR) lookup table  
array

The commanded lambda,  $\lambda_{cmd}$ , lookup table is a function of estimated engine load and measured engine speed

$$\lambda_{cmd} = f_{\lambda_{cmd}}(L_{est}, N)$$

where:

- $\lambda_{cmd}$  is commanded relative AFR, dimensionless.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints, f\_lam\_ld\_bpt** — Breakpoints  
array

Load breakpoints, dimensionless.

**Speed breakpoints, f\_lam\_n\_bpt** — Breakpoints  
array

Speed breakpoints, in rpm.

## Spark

### Spark advance table, `f_sa` – Lookup table

array

The spark advance lookup table is a function of estimated load and engine speed.

$$SA = f_{SA}(L_{est}, N)$$

where:

- $SA$  is spark advance, in crank advance degrees.
- $L_{est}=L$  is estimated engine load, dimensionless.
- $N$  is engine speed, in rpm.

### Load breakpoints, `f_sa_ld_bpt` – Breakpoints

array

Load breakpoints, dimensionless.

### Speed breakpoints, `f_sa_n_bpt` – Breakpoints

array

Speed breakpoints, in rpm.

### Idle Speed

### Target idle speed, `N_idle` – Speed

scalar

Target idle speed,  $N_{idle}$ , in rpm.

**Enable torque command limit, Trq\_idlecmd\_enable — Torque**  
scalar

Torque to enable the idle speed controller,  $Trq_{idlecmd,enable}$ , in N.m.

**Maximum torque command, Trq\_idlecmd\_max — Torque**  
scalar

Maximum idle controller commanded torque,  $Trq_{idlecmd,max}$ , in N.m.

**Proportional gain, Kp\_idle — PI Controller**  
scalar

Proportional gain for idle speed control,  $K_{p,idle}$ , in N.m/rpm.

**Integral gain, Ki\_idle — PI Controller**  
scalar

Integral gain for idle speed control,  $K_{i,idle}$ , in N.m/(rpm\*s).

## Estimation

### Air

**Number of cylinders, NCyl — Engine cylinders**  
scalar

Number of engine cylinders,  $N_{cyl}$ .

**Crank revolutions per power stroke, Cps — Revolutions per stroke**  
scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.

**Total displaced volume, Vd — Volume**  
scalar

Displaced volume,  $V_d$ , in  $m^3$ .

**Ideal gas constant air,  $R_{air}$  – Constant**

scalar

Ideal gas constant,  $R_{air}$ , in J/(kg\*K).**Air standard pressure,  $P_{std}$  – Pressure**

scalar

Standard air pressure,  $P_{std}$ , in Pa.**Air standard temperature,  $T_{std}$  – Temperature**

scalar

Standard air temperature,  $T_{std}$ , in K.**Speed-density volumetric efficiency,  $f_{nv}$  – Lookup table**

array

The engine volumetric efficiency lookup table,  $f_{\eta_v}$ , is a function of intake manifold absolute pressure and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Simple Speed-Density.

### Speed-density intake manifold pressure breakpoints, `f_nv_prs_bpt` — Breakpoints

array

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Simple Speed-Density.

### Speed-density engine speed breakpoints, `f_nv_n_bpt` — Breakpoints

array

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Simple Speed-Density.

### Cylinder volume at intake valve close table, $f_{v_{ivc}}$ – 2-D lookup table array

The cylinder volume at intake valve close table (IVC),  $f_{v_{ivc}}$  is a function of the intake cam phaser angle

$$V_{IVC} = f_{v_{ivc}}(\varphi_{ICP})$$

where:

- $V_{IVC}$  is cylinder volume at IVC, in L.
- $\varphi_{ICP}$  is intake cam phaser angle, in crank advance degrees.

#### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

#### Engine speed breakpoints, $f_{tm\_corr\_n\_bpt}$ – Breakpoints array

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Cylinder volume intake cam phase breakpoints, `f_vivc_icp_bpt` — Breakpoints

array

Cylinder volume at intake valve close table breakpoints.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Cylinder trapped mass correction factor, `f_tm_corr` — Lookup table

array

The trapped mass correction factor table,  $f_{TM_{corr}}$ , is a function of the normalized density and engine speed

$$TM_{corr} = f_{TM_{corr}}(\rho_{norm}, N)$$

where:

- $TM_{corr}$ , is trapped mass correction multiplier, dimensionless.
- $\rho_{norm}$  is normalized density, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Normalized density breakpoints, `f_tm_corr_nd_bpt` — Breakpoints

array

Normalized density breakpoints.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Intake mass flow, `f_mdot_intk` — Lookup table

array

The phaser intake mass flow model lookup table is a function of exhaust cam phaser angles and trapped air mass flow

$$\dot{m}_{intkideal} = f_{intkideal}(\varphi_{ECP}, TM_{flow})$$

where:

- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.
- $\varphi_{ECP}$  is exhaust cam phaser angle, in degrees crank retard.
- $TM_{flow}$  is flow rate equivalent to corrected trapped mass at the current engine speed, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Exhaust cam phase breakpoints, `f_mdott_air_ecp_bpt` — Breakpoints array

Exhaust cam phaser breakpoints for air mass flow lookup table.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Trapped mass flow breakpoints, `f_mdott_trpd_bpt` — Breakpoints array

Trapped mass flow breakpoints for air mass flow lookup table.

## Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

## Air mass flow correction factor, $f_{\text{mdot\_air\_corr}}$ — Lookup table

array

The intake air mass flow correction lookup table,  $f_{\text{aircorr}}$ , is a function of ideal load and engine speed

$$\dot{m}_{\text{air}} = \dot{m}_{\text{intkideal}} f_{\text{aircorr}}(L_{\text{ideal}}, N)$$

where:

- $L_{\text{ideal}}$  is engine load (normalized cylinder air mass) at arbitrary cam phaser angles, uncorrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.
- $\dot{m}_{\text{air}}$  is engine intake air mass flow final correction at steady-state cam phaser angles, in g/s.
- $\dot{m}_{\text{intkideal}}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Engine load breakpoints for air mass flow correction, **f\_mdotairstd\_corr\_ld\_bpt** — Breakpoints

array

Engine load breakpoints for air mass flow final correction.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### Engine speed breakpoints for air mass flow correction, **f\_mdotairstd\_n\_bpt** — Breakpoints

vector

Engine speed breakpoints for air mass flow final correction.

### Dependencies

To enable this parameter, for the **Air mass flow estimation model** parameter, select Dual Variable Cam Phasing.

### EGR flow time constant, **tau\_egr** — Constant

scalar

EGR flow time constant,  $\tau_{EGR}$ , in s.

### Intake system pressure ratio table, **f\_intksys\_stdflow\_pr** — Table

array

The pressure ratio is a function of the standard mass flow

$$\frac{P_{out,EGR}}{P_{amb}} = f_{intksys,pr}(\dot{m}_{air,std})$$

where:

- $\dot{m}_{air,std}$  is standard mass flow, in g/s.
- $\frac{P_{out,EGR}}{P_{amb}}$  is pressure ratio, dimensionless.

**Standard mass flow rate breakpoints for intake pressure ratio, f\_intksys\_stdflow\_bpt – Breakpoints**  
vector

Standard mass flow,  $\dot{m}_{air,std}$ , in g/s.

**EGR valve standard mass flow rate, f\_egr\_stdflow – Table**  
array

The EGR valve standard mass flow lookup table is a function of EGR valve area percent and the pressure ratio

$$\dot{m}_{EGR,std} = f_{EGR,std} \left( EGR_{ap}, \frac{P_{out,EGR}}{P_{in,EGR}} \right)$$

where:

- $\dot{m}_{EGR,std}$  is EGR valve standard mass flow, dimensionless.

- $EGR_{ap}$  is EGR valve flow area percent, in percent.
- $\frac{P_{out,EGR}}{P_{in,EGR}}$  is the pressure ratio, dimensionless.

**EGR valve standard flow pressure ratio breakpoints, f\_egr\_stdflow\_pr\_bpt — Breakpoints**  
vector

EGR valve standard flow pressure ratio,  $\frac{P_{out,EGR}}{P_{in,EGR}}$ , dimensionless.

**EGR valve standard flow area percent breakpoints, f\_egr\_stdflow\_egrap\_bpt — Breakpoints**  
vector

EGR valve flow area percent,  $EGR_{ap}$ , in percent.

**Torque**

**Torque table, f\_tq\_n1 — Lookup table**  
array

For the simple torque lookup table model, the SI engine uses a lookup table map that is a function of engine speed and load,  $T_{brake} = f_{TnL}(L, N)$ , where:

- $T_{brake}$  is engine brake torque after accounting for spark advance, AFR, and friction effects, in N.m.

- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table load breakpoints, $f_{tq\_nl\_l\_bpt}$ — Breakpoints array

Engine load breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table speed breakpoints, $f_{tq\_nl\_n\_bpt}$ — Breakpoints array

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Inner torque table, `f_tq_inr` — Lookup table

array

The inner torque lookup table,  $f_{Tq_{inr}}$ , is a function of engine speed and engine load,

$Tq_{inr} = f_{Tq_{inr}}(L, N)$ , where:

- $Tq_{inr}$  is inner torque based on gross indicated mean effective pressure, in N.m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for the **Torque model** parameter, select **Torque Structure**.

### Friction torque table, `f_tq_fric` — Lookup table

array

The friction torque lookup table,  $f_{Tf_{fric}}$ , is a function of engine speed and engine load,

$Tf_{fric} = f_{Tf_{fric}}(L, N)$ , where:

- $Tf_{fric}$  is friction torque offset to inner torque, in N.m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.

- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Engine temperature modifier on friction torque, $f_{fric\_temp\_mod}$ — Lookup table vector

Engine temperature modifier on friction torque,  $f_{fric\_temp}$ , dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Engine temperature modifier breakpoints, $f_{fric\_temp\_bpt}$ — Breakpoints vector

Engine temperature modifier breakpoints, in K.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Pumping torque table, $f_{tq\_pump}$ — Lookup table array

The pumping torque lookup table,  $f_{T_{pump}}$ , is a function of engine speed and injected fuel mass,  $T_{pump} = f_{T_{pump}}(L, N)$ , where:

- $T_{pump}$  is pumping torque, in N.m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Optimal spark table, $f_{SAopt}$ — Lookup table

array

The optimal spark lookup table,  $f_{SAopt}$ , is a function of engine speed and engine load,

$SA_{opt} = f_{SAopt}(L, N)$ , where:

- $SA_{opt}$  is optimal spark advance timing for maximum inner torque at stoichiometric air-fuel ratio (AFR), in deg.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque load breakpoints, $f_{tq\_inr\_l\_bpt}$ — Breakpoints array

Inner torque load breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque speed breakpoints, $f_{tq\_inr\_n\_bpt}$ — Breakpoints array

Inner torque speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Spark efficiency table, $f_{m\_sa}$ — Lookup table array

The spark efficiency lookup table,  $f_{Msa}$ , is a function of the spark retard from optimal

$$M_{sa} = f_{Msa}(\Delta SA)$$

$$\Delta SA = SA_{opt} - SA$$

where:

- $M_{sa}$  is the spark retard efficiency multiplier, dimensionless.
- $\Delta SA$  is the spark retard timing distance from optimal spark advance, in deg.

#### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

#### Spark retard from optimal, **f\_del\_sa\_bpt** — Breakpoints scalar

Spark retard from optimal inner torque timing breakpoints, in deg.

#### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

#### Lambda efficiency, **f\_m\_lam** — Lookup table array

The lambda efficiency lookup table,  $f_{M\lambda}$ , is a function of lambda,  $M_\lambda = f_{M\lambda}(\lambda)$ , where:

- $M_\lambda$  is the lambda multiplier on inner torque to account for the air-fuel ratio (AFR) effect, dimensionless.
- $\lambda$  is lambda, AFR normalized to stoichiometric fuel AFR, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Lambda breakpoints, $f\_m\_lam\_bpt$ – Breakpoints

array

Lambda effect on inner torque lambda breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Exhaust

### Exhaust temperature table, $f\_t\_exh$ – Lookup table

array

The exhaust temperature lookup table,  $f_{T_{exh}}$ , is a function of engine load and engine speed

$$T_{exh} = f_{T_{exh}}(L, N)$$

where:

- $T_{exh}$  is engine exhaust temperature, in K.
- $L$  is normalized cylinder air mass or engine load, dimensionless.
- $N$  is engine speed, in rpm.

**Load breakpoints,  $f\_t\_exh\_l\_bpt$  — Breakpoints**  
array

Engine load breakpoints used for exhaust temperature lookup table.

**Speed breakpoints,  $f\_t\_exh\_n\_bpt$  — Breakpoints**  
array

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

## SI Core Engine

Spark-ignition engine from intake to exhaust port

**Library:** Propulsion / Combustion Engine Components / Core Engine

### Description

The SI Core Engine block implements a spark-ignition (SI) engine from intake to exhaust port. You can use the block in larger vehicle models, hardware-in-the-loop (HIL) engine control design, or vehicle-level fuel economy and performance simulations.

The SI Core Engine block calculates:

- Brake torque
- Fuel flow
- Port gas mass flow, including exhaust gas recirculation (EGR)
- Air-fuel ratio (AFR)
- Exhaust temperature and exhaust mass flow rate
- Engine-out (EO) exhaust emissions
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM)

## Air Mass Flow

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
"SI Engine Speed-Density Air Mass Flow Model"	<p>Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.</p>
"SI Engine Dual-Independent Cam Phaser Air Mass Flow Model"	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

## Brake Torque

To calculate the brake torque, configure the SI engine to use either of these torque models.

Brake Torque Model	Description
“SI Engine Torque Structure Model”	For the structured brake torque calculation, the SI engine uses tables for the inner torque, friction torque, optimal spark, spark efficiency, and lambda efficiency.
“SI Engine Simple Torque Model”	For the simple brake torque calculation, the SI engine block uses a torque lookup table map that is a function of engine speed and load.

## Fuel Flow

To calculate the fuel flow, the SI Core Engine block uses fuel injector characteristics and fuel injector pulse-width.

$$\dot{m}_{fuel} = \frac{NS_{inj}Pw_{inj}N_{cyl}}{Cps \left( \frac{60s}{min} \right) \left( \frac{1000mg}{g} \right)}$$

The equation uses these variables.

$\dot{m}_{fuel}$	Engine fuel mass flow, g/s
$\omega$	Engine rotational speed, rad/s
$Cps$	Crankshaft revolutions per power stroke, rev/stroke
$S_{inj}$	Fuel injector slope, mg/ms
$Pw_{inj}$	Fuel injector pulse-width, ms
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed, rpm

## Air-Fuel Ratio

To calculate the air-fuel (AFR) ratio, the CI Core Engine and SI Core Engine blocks implement this equation.

$$AFR = \frac{\dot{m}_{air}}{\dot{m}_{fuel}}$$

To calculate the exhaust gas recirculation (EGR), the blocks implement this equation. The calculation expresses the EGR as a percent of the total intake port flow.

$$EGR_{pct} = 100 \frac{\dot{m}_{intk,b}}{\dot{m}_{intk}} = 100 y_{intk,b}$$

The equations use these variables.

$AFR$	Air-fuel ratio
$\dot{m}_{intk}$	Engine air mass flow
$\dot{m}_{fuel}$	Fuel mass flow
$y_{intk,b}$	Intake burned mass fraction
$EGR_{pct}$	EGR percent
$\dot{m}_{intk,b}$	Recirculated burned gas mass flow rate

## Exhaust

The block calculates the:

- Exhaust gas temperature
- Exhaust gas-specific enthalpy
- Exhaust gas mass flow rate
- Engine-out (EO) exhaust emissions:
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NOx)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM)

The exhaust temperature determines the specific enthalpy.

$$h_{exh} = C_{p_{exh}} T_{exh}$$

The exhaust mass flow rate is the sum of the intake port air mass flow and the fuel mass flow.

$$\dot{m}_{exh} = \dot{m}_{intake} + \dot{m}_{fuel}$$

To calculate the exhaust emissions, the block multiplies the emission mass fraction by the exhaust mass flow rate. To determine the emission mass fractions, the block uses lookup tables that are functions of the engine torque and speed.

$$y_{exh,i} = f_{i\_frac}(T_{brake}, N)$$

$$\dot{m}_{exh,i} = \dot{m}_{exh} y_{exh,i}$$

The fraction of air and fuel entering the intake port, injected fuel, and stoichiometric AFR determine the air mass fraction that exits the exhaust.

$$y_{exh,air} = \max \left[ y_{in,air} - \frac{\dot{m}_{fuel} + y_{in,fuel} \dot{m}_{intake}}{\dot{m}_{fuel} + \dot{m}_{intake}} AFR_s \right]$$

If the engine is operating at the stoichiometric or fuel rich AFR, no air exits the exhaust. Unburned hydrocarbons and burned gas comprise the remainder of the exhaust gas. This equation determines the exhaust burned gas mass fraction.

$$y_{exh,b} = \max \left[ (1 - y_{exh,air} - y_{exh,HC}), 0 \right]$$

The equations use these variables.

$T_{exh}$	Engine exhaust temperature
$h_{exh}$	Exhaust manifold inlet-specific enthalpy
$C_{p_{exh}}$	Exhaust gas specific heat

$\dot{m}_{intk}$	Intake port air mass flow rate
$\dot{m}_{fuel}$	Fuel mass flow rate
$\dot{m}_{exh}$	Exhaust mass flow rate
$y_{in,fuel}$	Intake fuel mass fraction
$y_{exh,i}$	Exhaust mass fraction for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NO}_x, \text{air}, \text{burned gas}, \text{and PM}$
$\dot{m}_{exh,i}$	Exhaust mass flow rate for $i = \text{CO}_2, \text{CO}, \text{HC}, \text{NO}_x, \text{air}, \text{burned gas}, \text{and PM}$
$T_{brake}$	Engine brake torque
$N$	Engine speed
$y_{exh,air}$	Exhaust air mass fraction
$y_{exh,b}$	Exhaust air burned mass fraction

## Ports

### Input

#### **InjPw — Fuel injector pulse-width**

scalar

Fuel injector pulse-width,  $Pw_{inj}$ , in ms.

#### **SpkAdv — Spark advance**

scalar

Spark advance,  $SA$ , in degrees crank angle before top dead center (degBTDC).

#### **Dependencies**

To create this port, for the **Torque model** parameter, select Torque Structure.

#### **ICP — Intake cam phase angle command**

scalar

Intake cam phase angle command,  $\phi_{ICPCMD}$ , in degCrkAdv, or degrees crank advance.

### **Dependencies**

To create this port, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### **ECP — Exhaust cam phase angle command**

scalar

Exhaust cam phase angle command,  $\phi_{EPCMD}$ , in degCrkRet, or degrees crank retard.

### **Dependencies**

To create this port, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### **AmbPrs — Ambient pressure**

scalar

Ambient pressure,  $P_{Amb}$ , in Pa.

### **Dependencies**

To create this port, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### **EngSpd — Engine speed**

scalar

Engine speed,  $N$ , in rpm.

### **Ect — Engine cooling temperature**

scalar

Engine cooling temperature,  $T_{coolant}$ , in K.

### **Dependencies**

To enable this parameter, for **Torque model**, select Torque Structure.

### **Intk — Intake port pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the upstream:

- $Prs$  — Pressure, in Pa
- $Temp$  — Temperature, in K
- $Enth$  — Specific enthalpy, in J/kg
- $MassFrac$  — Intake port mass fractions, dimensionless. EGR mass flow at the intake port is burned gas.

Specifically, a bus with these mass fractions:

- $O2MassFrac$  — Oxygen
- $N2MassFrac$  — Nitrogen
- $UnbrndFuelMassFrac$  — Unburned fuel
- $CO2MassFrac$  — Carbon dioxide
- $H2OMassFrac$  — Water
- $COMassFrac$  — Carbon monoxide
- $NOMassFrac$  — Nitric oxide
- $NO2MassFrac$  — Nitrogen dioxide
- $NOxMassFrac$  — Nitric oxide and nitrogen dioxide
- $PmMassFrac$  — Particulate matter
- $AirMassFrac$  — Air
- $BrndGasMassFrac$  — Burned gas

**Exh — Exhaust port pressure, temperature, enthalpy, mass fractions**  
two-way connector port

Bus containing the exhaust:

- $Prs$  — Pressure, in Pa
- $Temp$  — Temperature, in K
- $Enth$  — Specific enthalpy, in J/kg
- $MassFrac$  — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- $O2MassFrac$  — Oxygen

- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
IntkGasMassFlw	Engine intake air mass flow.	$\dot{m}_{air}$	kg/s
IntkAirMassFlw	Engine intake port mass flow.	$\dot{m}_{intk}$	kg/s
NrmlzdAirChrg	Engine load (that is, normalized cylinder air mass) corrected for final steady-state cam phase angles	$L$	N/A
Afr	Air-fuel ratio at engine exhaust port	$AFR$	N/A
FuelMassFlw	Fuel flow into engine	$\dot{m}_{fuel}$	kg/s

Signal	Description	Variable	Units
ExhManGasTemp	Exhaust gas temperature at exhaust manifold inlet	$T_{exh}$	K
EngTrq	Engine brake torque	$T_{brake}$	N.m
EngSpd	Engine speed	$N$	rpm
IntkCamPhase	Intake cam phaser angle	$\varphi_{ICP}$ i	degrees crank advance
ExhCamPhase	Exhaust cam phaser angle	$\varphi_{ECP}$	degrees crank retard
CrkAng	Engine crankshaft absolute angle	$\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ where $Cps$ is crankshaft revolutions per power stroke	degrees crank angle
EgrPct	EGR percent	$EGR_{pct}$	N/A
EoAir	EO air mass flow rate	$\dot{m}_{exh}$	kg/s
EoBrndGas	EO burned gas mass flow rate	$y_{exh,b}$	kg/s
EoHC	EO hydrocarbon emission mass flow rate	$y_{exh,HC}$	kg/s
EoCO	EO carbon monoxide emission mass flow rate	$y_{exh,CO}$	kg/s
EoNOx	EO nitric oxide and nitrogen dioxide emissions mass flow rate	$y_{exh,NOx}$	kg/s
EoCO2	EO carbon dioxide emission mass flow rate	$y_{exh,CO2}$	kg/s
EoPm	EO particulate matter emission mass flow rate	$y_{exh,PM}$	kg/s

**EngTrq — Engine brake torque**

scalar

Engine brake torque,  $T_{brake}$ , in N.m.

**Intk — Intake port mass flow rate, heat flow rate, temperature, mass fraction**

two-way connector port

Bus containing:

- MassFlwRate — Intake port mass flow rate, in kg/s
- HeatFlwRate — Intake port heat flow rate, in J/s
- Temp — Intake port temperature, in K
- MassFrac — Intake port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

**Exh — Exhaust port mass flow rate, heat flow rate, temperature, mass fraction**

two-way connector port

Bus containing:

- MassFlwRate — Exhaust port mass flow rate, in kg/s

- HeatFlwRate — Exhaust heat flow rate, in J/s
- Temp — Exhaust temperature, in K
- MassFrac — Exhaust port mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

#### Air mass flow model — Select air mass flow model

Dual-Independent Variable Cam Phasing (default) | Simple Speed-Density

To calculate engine air mass flow, configure the SI engine to use either of these air mass flow models.

Air Mass Flow Model	Description
"SI Engine Speed-Density Air Mass Flow Model"	Uses the speed-density equation to calculate the engine air mass flow, relating the engine air mass flow to the intake manifold pressure and engine speed. Consider using this air mass flow model in engines with fixed valvetrain designs.

<b>Air Mass Flow Model</b>	<b>Description</b>
<p>“SI Engine Dual-Independent Cam Phaser Air Mass Flow Model”</p>	<p>To calculate the engine air mass flow, the dual-independent cam phaser model uses:</p> <ul style="list-style-type: none"> <li>• Empirical calibration parameters developed from engine mapping measurements</li> <li>• Desktop calibration parameters derived from engine computer-aided design (CAD) data</li> </ul> <p>In contrast to typical embedded air mass flow calculations based on direct air mass flow measurement with an air mass flow (MAF) sensor, this air mass flow model offers:</p> <ul style="list-style-type: none"> <li>• Elimination of MAF sensors in dual cam-phased valvetrain applications</li> <li>• Reasonable accuracy with changes in altitude</li> <li>• Semiphysical modeling approach</li> <li>• Bounded behavior</li> <li>• Suitable execution time for electronic control unit (ECU) implementation</li> <li>• Systematic development of a relatively small number of calibration parameters</li> </ul>

**Dependencies**

The table summarizes the parameter dependencies.

<b>Air Mass Flow Model</b>	<b>Enables Parameters</b>

### Torque model — Select torque model

Torque Structure (default) | Simple Torque Lookup

To calculate the brake torque, configure the SI engine to use either of these torque models.

<b>Brake Torque Model</b>	<b>Description</b>
"SI Engine Torque Structure Model"	For the structured brake torque calculation, the SI engine uses tables for the inner torque, friction torque, optimal spark, spark efficiency, and lambda efficiency.
"SI Engine Simple Torque Model"	For the simple brake torque calculation, the SI engine block uses a torque lookup table map that is a function of engine speed and load.

**Dependencies**

The table summarizes the parameter dependencies.

<b>Torque Model</b>	<b>Enables Parameters</b>

**Air****Number of cylinders, NCyl – Engine cylinders**

scalar

Number of engine cylinders,  $N_{cyl}$ .**Crank revolutions per power stroke, Cps – Revolutions per stroke**

scalar

Crankshaft revolutions per power stroke,  $Cps$ , in rev/stroke.**Total displaced volume, Vd – Volume**

scalar

Displaced volume,  $V_d$ , in  $m^3$ .**Ideal gas constant air, Rair – Constant**

scalar

Ideal gas constant,  $R_{air}$ , in  $J/(kg \cdot K)$ .**Air standard pressure, Pstd – Pressure**

scalar

Standard air pressure,  $P_{std}$ , in Pa.**Air standard temperature, Tstd – Temperature**

scalar

Standard air temperature,  $T_{std}$ , in K.

### Speed-density volumetric efficiency, $f_{\eta_v}$ — Lookup table

array

The engine volumetric efficiency lookup table,  $f_{\eta_v}$ , is a function of intake manifold absolute pressure and engine speed

$$\eta_v = f_{\eta_v}(MAP, N)$$

where:

- $\eta_v$  is engine volumetric efficiency, dimensionless.
- $MAP$  is intake manifold absolute pressure, in KPa.
- $N$  is engine speed, in rpm.

#### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Simple Speed-Density.

### Speed-density intake manifold pressure breakpoints, $f_{\eta_v\_prs\_bpt}$ — Breakpoints

array

Intake manifold pressure breakpoints for speed-density volumetric efficiency lookup table, in KPa.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Simple Speed-Density.

**Speed-density engine speed breakpoints,  $f_{nv\_n\_bpt}$  – Breakpoints**  
array

Engine speed breakpoints for speed-density volumetric efficiency lookup table, in rpm.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Simple Speed-Density.

**Cylinder volume at intake valve close table,  $f_{vivc}$  – 2-D lookup table**  
array

The cylinder volume at intake valve close table (IVC),  $f_{vivc}$  is a function of the intake cam phaser angle

$$V_{IVC} = f_{vivc}(\phi_{ICP})$$

where:

- $V_{IVC}$  is cylinder volume at IVC, in L.
- $\phi_{ICP}$  is intake cam phaser angle, in crank advance degrees.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

**Cylinder volume intake cam phase breakpoints, f\_vivc\_icp\_bpt — Breakpoints**

array

Cylinder volume intake cam phase breakpoints, in L.

**Dependencies**

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

**Cylinder trapped mass correction factor, f\_tm\_corr — Lookup table**

array

The trapped mass correction factor table,  $f_{TM_{corr}}$ , is a function of the normalized density and engine speed

$$TM_{corr} = f_{TM_{corr}}(\rho_{norm}, N)$$

where:

- $TM_{corr}$ , is trapped mass correction multiplier, dimensionless.
- $\rho_{norm}$  is normalized density, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

### Normalized density breakpoints, `f_tm_corr_nd_bpt` – Breakpoints array

Normalized density breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

### Engine speed breakpoints, `f_tm_corr_n_bpt` – Breakpoints array

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Air mass flow, $f_{\dot{m}_{air}}$ — Lookup table

array

The phaser intake mass flow model lookup table is a function of exhaust cam phaser angles and trapped air mass flow

$$\dot{m}_{intkideal} = \dot{f}_{intkideal}(\varphi_{ECP}, TM_{flow})$$

where:

- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.
- $\varphi_{ECP}$  is exhaust cam phaser angle, in degrees crank retard.
- $TM_{flow}$  is flow rate equivalent to corrected trapped mass at the current engine speed, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Exhaust cam phase breakpoints, $f\_mdot\_air\_ecp\_bpt$ — Breakpoints array

Exhaust cam phaser breakpoints for air mass flow lookup table, in degrees crank retard.

#### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Trapped mass flow breakpoints, $f\_mdot\_trpd\_bpt$ — Breakpoints array

Trapped mass flow breakpoints for air mass flow lookup table, in g/s.

#### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual - Independent Variable Cam Phasing.

### Air mass flow correction factor, $f\_mdot\_air\_corr$ — Lookup table array

The intake air mass flow correction lookup table,  $f_{aircorr}$ , is a function of ideal load and engine speed

$$\dot{m}_{air} = \dot{m}_{intkideal} f_{aircorr}(L_{ideal}, N)$$

where:

- $L_{ideal}$  is engine load (normalized cylinder air mass) at arbitrary cam phaser angles, uncorrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.
- $\dot{m}_{air}$  is engine intake air mass flow final correction at steady-state cam phaser angles, in g/s.
- $\dot{m}_{intkideal}$  is engine intake port mass flow at arbitrary cam phaser angles, in g/s.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

### Engine load breakpoints for air mass flow correction, **f\_mdott\_air\_corr\_ld\_bpt** — Breakpoints

array

Engine load breakpoints for air mass flow final correction, dimensionless.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

### Engine speed breakpoints for air mass flow correction, **f\_mdott\_air\_n\_bpt** — Breakpoints

array

Engine speed breakpoints for air mass flow final correction, in rpm.

### Dependencies

To enable this parameter, for the **Air mass flow model** parameter, select Dual-Independent Variable Cam Phasing.

## Torque

### Torque table, `f_tq_nl` – Lookup table

array

For the simple torque lookup table model, the SI engine uses a lookup table map that is a function of engine speed and load,  $T_{brake} = f_{TnL}(L, N)$ , where:

- $T_{brake}$  is engine brake torque after accounting for spark advance, AFR, and friction effects, in N.m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table load breakpoints, `f_tq_nl_l_bpt` – Breakpoints

array

Engine load breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Torque table speed breakpoints, $f_{tq\_nl\_n\_bpt}$ — Breakpoints

array

Engine speed breakpoints, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Simple Torque Lookup.

### Inner torque table, $f_{tq\_inr}$ — Lookup table

array

The inner torque lookup table,  $f_{Tq_{inr}}$ , is a function of engine speed and engine load,

$Tq_{inr} = f_{Tq_{inr}}(L, N)$ , where:

- $Tq_{inr}$  is inner torque based on gross indicated mean effective pressure, in N.m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Friction torque table, `f_tq_fric` – Lookup table

array

The friction torque lookup table,  $f_{T_{fric}}$ , is a function of engine speed and engine load,

$T_{fric} = f_{T_{fric}}(L, N)$ , where:

- $T_{fric}$  is friction torque offset to inner torque, in N.m.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Engine temperature modifier on friction torque, `f_fric_temp_mod` – Lookup table

vector

Engine temperature modifier on friction torque,  $f_{fric,temp}$ , dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Engine temperature modifier breakpoints,  $f_{\text{fric\_temp\_bpt}}$  — Breakpoints**

vector

Engine temperature modifier breakpoints, in K.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Pumping torque table,  $f_{\text{tq\_pump}}$  — Lookup table**

array

The pumping torque lookup table,  $f_{T_{\text{pump}}}$ , is a function of engine speed and injected fuel mass,  $T_{\text{pump}} = f_{T_{\text{pump}}}(L, N)$ , where:

- $T_{\text{pump}}$  is pumping torque, in N.m.
- $L$  is engine load, as a normalized cylinder air mass, dimensionless.
- $N$  is engine speed, in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Optimal spark table,  $f_{\text{sa\_opt}}$  — Lookup table**

array

The optimal spark lookup table,  $f_{SA_{\text{opt}}}$ , is a function of engine speed and engine load,

$SA_{\text{opt}} = f_{SA_{\text{opt}}}(L, N)$ , where:

- $SA_{opt}$  is optimal spark advance timing for maximum inner torque at stoichiometric air-fuel ratio (AFR), in deg.
- $L$  is engine load at arbitrary cam phaser angles, corrected for final steady-state cam phaser angles, dimensionless.
- $N$  is engine speed, in rpm.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque load breakpoints, $f_{tq\_inr\_l\_bpt}$ – Breakpoints

array

Inner torque load breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Inner torque speed breakpoints, $f_{tq\_inr\_n\_bpt}$ – Breakpoints

array

Inner torque speed breakpoints, in rpm.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Spark efficiency table, f\_m\_sa — Lookup table**

array

The spark efficiency lookup table,  $f_{M_{sa}}$ , is a function of the spark retard from optimal

$$M_{sa} = f_{M_{sa}}(\Delta SA)$$

$$\Delta SA = SA_{opt} - SA$$

where:

- $M_{sa}$  is the spark retard efficiency multiplier, dimensionless.
- $\Delta SA$  is the spark retard timing distance from optimal spark advance, in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Spark retard from optimal,  $f\_del\_sa\_bpt$  – Breakpoints**

scalar

Spark retard from optimal inner torque timing breakpoints, in deg.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Lambda efficiency,  $f\_m\_lam$  – Lookup table**

array

The lambda efficiency lookup table,  $f_{M\lambda}$ , is a function of lambda,  $M_\lambda = f_{M\lambda}(\lambda)$ , where:

- $M_\lambda$  is the lambda multiplier on inner torque to account for the air-fuel ratio (AFR) effect, dimensionless.
- $\lambda$  is lambda, AFR normalized to stoichiometric fuel AFR, dimensionless.

**Dependencies**

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

**Lambda breakpoints,  $f\_m\_lam\_bpt$  – Breakpoints**

array

Lambda effect on inner torque lambda breakpoints, dimensionless.

### Dependencies

To enable this parameter, for the **Torque model** parameter, select Torque Structure.

### Exhaust

#### Exhaust temperature table, $f_{T_{exh}}$ — Lookup table

array

The exhaust temperature lookup table,  $f_{T_{exh}}$ , is a function of engine load and engine speed

$$T_{exh} = f_{T_{exh}}(L, N)$$

where:

- $T_{exh}$  is engine exhaust temperature, in K.
- $L$  is normalized cylinder air mass or engine load, dimensionless.
- $N$  is engine speed, in rpm.

#### Load breakpoints, $f_{T_{exh\_l\_bpt}}$ — Breakpoints

array

Engine load breakpoints used for exhaust temperature lookup table, dimensionless.

**Speed breakpoints,  $f\_t\_exh\_n\_bpt$  – Breakpoints**

array

Engine speed breakpoints used for exhaust temperature lookup table, in rpm.

**Exhaust gas specific heat at constant pressure,  $cp\_exh$  – Specific heat**

scalar

Exhaust gas-specific heat,  $Cp_{exh}$ , in J/(kg\*K).

**CO<sub>2</sub> mass fraction table,  $f\_CO2\_frac$  – Carbon dioxide (CO<sub>2</sub>) emission lookup table**

array

The SI Core Engine CO<sub>2</sub> emission mass fraction lookup table is a function of engine torque and engine speed,  $CO_2\ Mass\ Fraction = f(Speed, Torque)$ , where:

- $CO_2\ Mass\ Fraction$  is the CO<sub>2</sub> emission mass fraction, dimensionless.
- $Speed$  is engine speed, in rpm.
- $Torque$  is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO2**.

### CO mass fraction table, $f_{CO\_frac}$ — Carbon monoxide (CO) emission lookup table

array

The SI Core Engine CO emission mass fraction lookup table is a function of engine torque and engine speed,  $CO\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *CO Mass Fraction* is the CO emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO**.

### HC mass fraction table, $f_{HC\_frac}$ — Hydrocarbon (HC) emission lookup table

array

The SI Core Engine HC emission mass fraction lookup table is a function of engine torque and engine speed,  $HC\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *HC Mass Fraction* is the HC emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **HC**.

### NOx mass fraction table, $f_{NOx\_frac}$ — Nitric oxide and nitrogen dioxide (NOx) emission lookup table

array

The SI Core Engine NOx emission mass fraction lookup table is a function of engine torque and engine speed,  $NOx\ Mass\ Fraction = f(Speed, Torque)$ , where:

- *NOx Mass Fraction* is the NOx emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **NOx**.

### PM mass fraction table, **f\_PM\_frac** — Particulate matter (PM) emission lookup table

array

The SI Core Engine PM emission mass fraction lookup table is a function of engine torque and engine speed where:

- *PM* is the PM emission mass fraction, dimensionless.
- *Speed* is engine speed, in rpm.
- *Torque* is engine torque, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **PM**.

### Engine speed breakpoints, **f\_exhfrac\_n\_bpt** — Breakpoints

vector

Engine speed breakpoints used for the emission mass fractions lookup tables, in rpm.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO2**, **CO**, **NOx**, **HC**, or **PM**.

### Engine torque breakpoints, `f_exhfrac_trq_bpt` — Breakpoints

vector

Engine torque breakpoints used for the emission mass fractions lookup tables, in N.m.

### Dependencies

To enable this parameter, on the **Exhaust** tab, select **CO2**, **CO**, **NOx**, **HC**, or **PM**.

### Fuel

### Injector slope, `Sinj` — Slope

scalar

Fuel injector slope,  $S_{inj}$ , mg/ms.

### Stoichiometric air-fuel ratio, `afr_stoich` — Air-fuel ratio

scalar

Air-fuel ratio,  $AFR$ .

## Topics

“SI Core Engine Air Mass Flow and Torque Production”

“Engine Calibration Maps”

**Introduced in R2017a**

# Turbine

Turbine for boosted engines

**Library:** Propulsion / Combustion Engine Components / Boost

## Description

The Turbine block uses the conservation of mass and energy to calculate mass and heat flow rates for turbines with either fixed or variable geometry. You can configure the block with a wastegate valve to bypass the turbine. The block uses two-way ports to connect to the inlet and outlet control volumes and the drive shaft. You can specify the lookup tables to calculate the mass flow rate and turbine efficiency. Typically, turbine manufacturers provide the mass flow rate and efficiency tables as a function of corrected speed and pressure ratio. The block does not support reverse mass flow.

The mass flows from the inlet control volume to outlet control volume.

The Turbine block implements equations to model the performance, wastegate flow, and combined flow.

## Thermodynamics

The block uses these equations to model the thermodynamics.

Calculation	Equations
Forward mass flow	$\dot{m}_{turb} > 0$ $p_{01} = p_{inlet}$ $p_{02} = p_{outlet}$ $T_{01} = T_{inlet}$ $h_{01} = h_{inlet}$
First law of thermodynamics	$\dot{W}_{turb} = \dot{m}_{turb} c_p (T_{01} - T_{02})$
Isentropic efficiency	$\eta_{turb} = \frac{h_{01} - h_{02}}{h_{01} - h_{02s}} = \frac{T_{01} - T_{02}}{T_{01} - T_{02s}}$
Isentropic outlet temperature, assuming ideal gas, and constant specific heats	$T_{02s} = T_{01} \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma-1}{\gamma}}$
Specific heat ratio	$\gamma = \frac{c_p}{c_p - R}$
Outlet temperature	$T_{02} = T_{01} + \eta_{turb} T_{01} \left\{ 1 - \left( \frac{p_{02}}{p_{01}} \right)^{\frac{\gamma-1}{\gamma}} \right\}$
Heat flows	$q_{in,turb} = \dot{m}_{turb} c_p T_{01}$ $q_{out,turb} = \dot{m}_{turb} c_p T_{02}$
Drive shaft torque	$\tau_{turb} = \frac{\dot{W}_{turb}}{\omega}$

The equations use these variables.

$P_{inlet}$ , $P_{01}$	Inlet control volume total pressure
$T_{inlet}$ , $T_{01}$	Inlet control volume total temperature
$h_{inlet}$ , $h_{01}$	Inlet control volume total specific enthalpy
$P_{outlet}$ , $P_{02}$	Outlet control volume total pressure
$T_{outlet}$	Outlet control volume total temperature
$h_{outlet}$	Outlet control volume total specific enthalpy
$\dot{W}_{turb}$	Drive shaft power
$T_{02}$	Temperature exiting the turbine
$h_{02}$	Outlet total specific enthalpy
$\dot{m}_{turb}$	Turbine mass flow rate
$q_{in,turb}$	Turbine inlet heat flow rate
$q_{out,turb}$	Turbine outlet heat flow rate
$\eta_{turb}$	Turbine isentropic efficiency
$T_{02s}$	Isentropic outlet total temperature
$h_{02s}$	Isentropic outlet total specific enthalpy
$R$	Ideal gas constant
$c_p$	Specific heat at constant pressure
$\gamma$	Specific heat ratio
$\tau_{turb}$	Drive shaft torque

$\dot{W}_{turb}$  Drive shaft power

## Performance Lookup Tables

The block implements lookup tables based on these equations.

Calculation	Equation	
Corrected mass flow rate	$\dot{m}_{corr} = \dot{m}_{turb} \frac{\sqrt{T_{01} / T_{ref}}}{p_{01} / p_{ref}}$	
Corrected speed	$\omega_{corr} = \frac{\omega}{\sqrt{T_{01} / T_{ref}}}$	
Pressure expansion ratio	$p_r = \frac{p_{01}}{p_{02}}$	
Efficiency lookup table	Fixed geometry (2-D table)	$\eta_{turbfx,tbl} = f(\omega_{corr}, p_r)$
	Variable geometry (3-D table)	$\eta_{turbvr,tbl} = f(\omega_{corr}, p_r, L_{rack})$
Corrected mass flow lookup table	Fixed geometry (2-D table)	$\dot{m}_{corrfx,tbl} = f(\omega_{corr}, p_r)$
	Variable geometry (3-D table)	$\dot{m}_{corrvr,tbl} = f(\omega_{corr}, p_r, L_{rack})$

The equations use these variables.

$p_{01}$  Inlet control volume total pressure  
 $p_r$  Pressure expansion ratio  
 $p_{02}$  Outlet control volume total pressure  
 $P_{ref}$  Lookup table reference pressure

$T_{01}$	Inlet control volume total temperature
$T_{ref}$	Lookup table reference temperature
$\dot{m}_{turb}$	Turbine mass flow rate
$\omega$	Drive shaft speed
$\omega_{corr}$	Corrected drive shaft speed
$L_{rack}$	Variable geometry turbine rack position
$\eta_{turbfx,tbl}$	Efficiency 2-D lookup table for fixed geometry
$\dot{m}_{corrfx,tbl}$	Corrected mass flow rate 2-D lookup table for fixed geometry
$\eta_{turbvr,tbl}$	Efficiency 3-D lookup table for variable geometry
$\dot{m}_{corrvr,tbl}$	Corrected mass flow rate 3-D lookup table for variable geometry

## Wastegate

To calculate the wastegate heat and mass flow rates, the Turbine block uses a Flow Restriction block. The Flow Restriction block uses the wastegate flow area.

$$A_{wg} = A_{wgpctcmd} \frac{A_{wgopen}}{100}$$

The equation uses these variables.

$A_{wgpctcmd}$	Wastegate valve area percent command
$A_{wg}$	Wastegate valve area
$A_{wgopen}$	Wastegate valve area when fully open

## Combined Flow

To represent flow through the wastegate valve and turbine, the block uses these equations.

Calculation	Equations
Blocks not configured with a wastegate valve	$\dot{m}_{wg} = q_{wg} = 0$
Total mass flow rate	$\dot{m}_{total} = \dot{m}_{turb} + \dot{m}_{wg}$
Total heat flow rate	$q_{inlet} = q_{in,turb} + q_{wg}$
	$q_{outlet} = q_{out,turb} + q_{wg}$
Combined temperature exiting the wastegate valve and turbine	$T_{outflow} = \begin{cases} \frac{q_{outlet}}{\dot{m}_{total}c_p} & \dot{m}_{total} > \dot{m}_{thresh} \\ \frac{T_{02} + T_{outflow,wg}}{2} & else \end{cases}$

The equations use these variables.

$\dot{m}_{total}$	Total mass flow rate through the wastegate valve and turbine
$\dot{m}_{turb}$	Turbine mass flow rate
$\dot{m}_{wg}$	Mass flow rate through the wastegate valve
$q_{inlet}$	Total inlet heat flow rate
$q_{outlet}$	Total outlet heat flow rate
$q_{in,turb}$	Turbine inlet heat flow rate
$q_{out,turb}$	Turbine outlet heat flow rate

$q_{wg}$	Wastegate valve heat flow rate
$T_{02}$	Temperature exiting the turbine
$T_{outflw}$	Total temperature exiting the block
$T_{outflw,wg}$	Temperature exiting the wastegate valve
$\dot{m}_{thresh}$	Mass flow rate threshold to prevent dividing by zero
$c_p$	Specific heat at constant pressure

## Ports

### Input

#### **Ds — Drive shaft speed**

two-way connector port

ShaftSpd — Signal containing the drive shaft angular speed,  $\omega$ , in rad/s.

#### **A — Inlet pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the inlet control volume:

- InPrs — Pressure,  $p_{inlet}$ , in Pa
- InTemp — Temperature,  $T_{inlet}$ , in K
- InEnth — Specific enthalpy,  $h_{inlet}$ , in J/kg

#### **B — Outlet pressure, temperature, enthalpy, mass fractions**

two-way connector port

Bus containing the outlet control volume:

- OutPrs — Pressure,  $p_{outlet}$ , in Pa
- OutTemp — Temperature,  $T_{outlet}$ , in K
- OutEnth — Specific enthalpy,  $h_{outlet}$ , in J/kg

### RackPos — Rack position

scalar

Variable geometry turbine rack position,  $L_{rack}$ .

### Dependencies

To create this port, select **Variable geometry** for the **Turbine type** parameter.

### WgAreaPct — Wastegate area percent

scalar

Wastegate valve area percent,  $A_{wgpcmd}$ .

### Dependencies

To create this port, select **Include wastegate**.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
TurbOutletTemp	Temperature exiting the turbine	$T_{02}$	K
DriveshftPwr	Drive shaft power	$\dot{W}_{turb}$	W
DriveshftTrq	Drive shaft torque	$\tau_{turb}$	N.m

Signal	Description	Variable	Units
TurbMassFlw	Turbine mass flow rate	$\dot{m}_{turb}$	kg/s
PrsRatio	Pressure ratio	$p_r$	N/A
DriveshftCorrSpd	Corrected drive shaft speed	$\omega_{corr}$	rad/s
TurbEff	Turbine isentropic efficiency	$\eta_{turb}$	N/A
CorrMassFlw	Corrected mass flow rate	$\dot{m}_{corr}$	kg/s
WgArea	Wastegate valve area	$A_{wg}$	m <sup>2</sup>
WgMassFlw	Mass flow rate through the wastegate valve	$\dot{m}_{wg}$	kg/s
WgOutletTemp	Temperature exiting the wastegate valve	$T_{outflow, wg}$	K

**Ds — Drive shaft torque**

two-way connector port

Trq — Signal containing the drive shaft torque,  $\tau_{turb}$ , in N.m.

**A — Inlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Total mass flow rate through wastegate valve and turbine,  $-\dot{m}_{total}$ , in kg/s
- HeatFlwRate — Total inlet heat flow rate,  $-q_{inlet}$ , in J/s
- Temp — Total inlet temperature,  $T_{inlet}$ , in K
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide
- NOMassFrac — Nitric oxide
- NO2MassFrac — Nitrogen dioxide
- NOxMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## **B — Outlet mass flow rate, heat flow rate, temperature, mass fractions**

two-way connector port

Bus containing:

- MassFlwRate — Turbine mass flow rate through wastegate valve and turbine,  $\dot{m}_{turb}$ , in kg/s
- HeatFlwRate — Total outlet heat flow rate,  $q_{outlet}$ , in J/s
- Temp — Total outlet temperature,  $T_{outflow}$ , in K
- MassFrac — Mass fractions, dimensionless.

Specifically, a bus with these mass fractions:

- O2MassFrac — Oxygen
- N2MassFrac — Nitrogen
- UnbrndFuelMassFrac — Unburned fuel
- CO2MassFrac — Carbon dioxide
- H2OMassFrac — Water
- COMassFrac — Carbon monoxide

- N0MassFrac — Nitric oxide
- N02MassFrac — Nitrogen dioxide
- N0xMassFrac — Nitric oxide and nitrogen dioxide
- PmMassFrac — Particulate matter
- AirMassFrac — Air
- BrndGasMassFrac — Burned gas

## Parameters

### Block Options

#### Turbine type — Select turbine type

Fixed geometry (default) | Variable geometry

Turbine type.

### Dependencies

The table summarizes the parameter and port dependencies.

Value	Enables Parameters	Creates Ports
Fixed geometry	<p>Corrected mass flow rate table, <b>mdot_corrfx_tbl</b></p> <p>Efficiency table, <b>eta_turbfx_tbl</b></p> <p>Corrected speed breakpoints, <b>w_corrfx_bpts1</b></p> <p>Pressure ratio breakpoints, <b>Pr_fx_bpts2</b></p>	None

Value	Enables Parameters	Creates Ports
Variable geometry	<p>Corrected mass flow rate table, <b>mdot_corrvr_tbl</b></p> <p>Efficiency table, <b>eta_turbvr_tbl</b></p> <p>Corrected speed breakpoints, <b>w_corrvr_bpts2</b></p> <p>Pressure ratio breakpoints, <b>Pr_vr_bpts2</b></p> <p>Rack breakpoints, <b>L_rack_bpts3</b></p>	RP

### Include wastegate — Select

on (default) | off | off

#### Dependencies

Selecting the **Include wastegate** parameter enables:

- **Wastegate flow area, A\_wgopen**
- **Pressure ratio linearize limit, Plim\_wg**

#### Performance Tables

**Corrected mass flow rate table, mdot\_corrfx\_tbl — 2-D lookup table**  
array

Corrected mass flow rate 2-D lookup table for fixed geometry,  $\dot{m}_{corrfx,tbl}$ , in kg/s.

#### Dependencies

To enable this parameter, select **Fixed geometry** for the **Turbine type** parameter.

**Efficiency table, eta\_turbfx\_tb — 2-D lookup table**  
array

Efficiency 2-D lookup table for fixed geometry,  $\eta_{turbfx,tbl}$ .

**Dependencies**

To enable this parameter, select `Fixed geometry` for the **Turbine type** parameter.

**Corrected speed breakpoints, `w_corrfx_bpts1` — Fixed geometry**

array

Corrected drive shaft speed breakpoints for fixed geometry,  $\omega_{corrfx,bpts1}$ , in rad/s.

**Dependencies**

To enable this parameter, select `Fixed geometry` for the **Turbine type** parameter.

**Pressure ratio breakpoints, `Pr_fx_bpts2` — Fixed geometry**

array

Pressure ratio breakpoints for fixed geometry,  $Pr_{fx,bpts2}$ .

**Dependencies**

To enable this parameter, select `Fixed geometry` for the **Turbine type** parameter.

**Corrected mass flow rate table, `mdot_corrvr_tbl` — 3-D lookup table**

array

Corrected mass flow rate 3-D lookup table for variable geometry,  $\dot{m}_{corrvr,tbl}$ , in kg/s.

**Dependencies**

To enable this parameter, select `Variable geometry` for the **Turbine type** parameter.

**Efficiency table, `eta_turbvr_tbl` — 3-D lookup table**

array

Efficiency 3-D lookup table for variable geometry,  $\eta_{turbvr,tbl}$ .

**Dependencies**

To enable this parameter, select `Variable geometry` for the **Turbine type** parameter.

**Corrected speed breakpoints, `w_corrvr_bpts2` — Variable geometry**

array

Corrected drive shaft speed breakpoints for variable geometry,  $\omega_{corr, vr, bpts1}$ , in rad/s.

**Dependencies**

To enable this parameter, select **Variable geometry** for the **Turbine type** parameter.

**Pressure ratio breakpoints, Pr\_vr\_bpts2 – Variable geometry**

array

Pressure ratio breakpoints for variable geometry.

**Dependencies**

To enable this parameter, select **Variable geometry** for the **Turbine type** parameter.

**Rack breakpoints, L\_rack\_bpts3 – Variable geometry**

array

Rack position breakpoints for variable geometry,  $L_{rack, bpts3}$ .

**Dependencies**

To enable this parameter, select **Variable geometry** for the **Turbine type** parameter.

**Reference temperature, T\_ref – Temperature**

scalar

Performance map reference temperature,  $T_{ref}$ , in K.

**Reference pressure, P\_ref – Pressure**

scalar

Performance map reference pressure,  $P_{ref}$ , in Pa.

**Wastegate**

**Wastegate flow area, A\_wgopen – Area**

scalar

Area of fully opened wastegate valve,  $A_{wgopen}$ , in m<sup>2</sup>.

### Dependencies

To enable **Wastegate flow area, A\_wgopen**, select the **Include wastegate** parameter.

### Pressure ratio linearize limit, Plim\_wg — Area, m<sup>2</sup>

scalar

### Dependencies

Flow restriction linearization limit,  $p_{lim,wg}$ .

To enable **Pressure ratio linearize limit, Plim\_wg**, select the **Include wastegate** parameter.

### Properties

### Ideal gas constant, R — Constant

array

Ideal gas constant  $R$ , in J/(kg\*K).

### Specific heat at constant pressure, cp — Specific heat

scalar

Specific heat at constant pressure,  $c_p$ , in J/(kg\*K).

# Mapped Core Engine

Steady-state core engine model using lookup tables

**Library:** Propulsion / Combustion Engine Components / Core Engine

## Description

The Mapped Core Engine block implements a steady-state core engine model using power, air mass flow, fuel flow, exhaust temperature, efficiency, and emission performance lookup tables. You can use the block for:

- Hardware-in-the-loop (HIL) engine control design.
- Vehicle-level fuel economy and performance simulations.

The block enables you to specify lookup tables for these engine characteristics. The lookup tables are functions of engine load,  $L$ , and engine speed  $N$ .

- Power
- Air
- Fuel
- Temperature
- Efficiency
- Emissions
  - Hydrocarbon (HC)
  - Carbon monoxide (CO)
  - Nitric oxide and nitrogen dioxide (NO<sub>x</sub>)
  - Carbon dioxide (CO<sub>2</sub>)
  - Particulate matter (PM) emissions

To bound the Mapped Core Engine block output, the block does not extrapolate the lookup table data.

## Ports

### Input

#### <TrqCmd> — Engine load

TrqCmd (default)

Engine load,  $L$ . Examples of engine load include:

- Commanded torque
- Commanded indicated mean effective pressure (IMEP) in the engine cylinder
- Normalized cylinder air mass
- Injected fuel mass

#### Dependencies

To specify an engine load port name, on the **Configuration** tab, enter a name in the **Load input port name** parameter field.

#### <EngSpd> — Engine speed

EngSpd (default)

Engine speed,  $N$ .

#### Dependencies

To specify an engine load port name, on the **Configuration** tab, enter a name in the **Speed input port name** parameter field.

### Output

#### <EngTrq> — Power

EngTrq (default)

Engine power,  $T_{brake}$ .

**Dependencies**

- To create this port, on the **Configuration** tab, select **Power**.
- To specify the port name, on the **Power** tab, enter a name in the **Power output port name** parameter field.

**<IntkAirMassFlw> – Air mass flow**

IntkAirMassFlw (default)

Engine air mass flow,  $\dot{m}_{intk}$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **Air**.
- To specify the port name, on the **Air** tab, enter a name in the **Air output port name** parameter field.

**<FuelMassFlw> – Fuel flow**

FuelMassFlw (default)

Engine fuel flow,  $\dot{m}_{fuel}$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **Fuel**.
- To specify the port name, on the **Fuel** tab, enter a name in the **Fuel output port name** parameter field.

**<ExhManGasTemp> – Exhaust temperature**

ExhManGasTemp (default)

Engine exhaust temperature,  $T_{exh}$ .**Dependencies**

- To create this port, on the **Configuration** tab, select **Temperature**.
- To specify the port name, on the **Temperature** tab, enter a name in the **Temperature output port name** parameter field.

**<Bsfc> – Efficiency**

Bsfc (default)

Brake-specific fuel consumption (BSFC), *Eff*.

**Dependencies**

- To create this port, on the **Configuration** tab, select **Efficiency**.
- To specify the port name, on the **Efficiency** tab, enter a name in the **Efficiency output port name** parameter field.

**<EoHC> — Hydrocarbon emissions**

EoHC (default)

Hydrocarbon emissions, *HC*.

**Dependencies**

- To create this port, on the **Configuration** tab, select **HC**.
- To specify the port name, on the **HC** tab, enter a name in the **HC output port name** parameter field.

**<EoCO> — Carbon monoxide emissions**

EoCO (default)

Carbon monoxide emissions, *CO*.

**Dependencies**

- To create this port, on the **Configuration** tab, select **CO**.
- To specify the port name, on the **CO** tab, enter a name in the **CO output port name** parameter field.

**<EoNOx> — Nitric oxide and nitrogen dioxide emissions**

EoNOx (default)

Nitric oxide and nitrogen dioxide emissions, *NOx*.

**Dependencies**

- To create this port, on the **Configuration** tab, select **NOx**.
- To specify the port name, on the **NOx** tab, enter a name in the **NOx output port name** parameter field.

**<EoCO2> — Carbon dioxide emissions**

EoCO2 (default)

Carbon dioxide emissions, *CO2*.

#### **Dependencies**

- To create this port, on the **Configuration** tab, select **CO2**.
- To specify the port name, on the **CO2** tab, enter a name in the **CO2 output port name** parameter field.

#### **<EoPm> – Particulate matter emissions**

EoPm (default)

Particulate matter emissions, *PM*.

#### **Dependencies**

- To create this port, on the **Configuration** tab, select **PM**.
- To specify the port name, on the **PM** tab, enter a name in the **PM output port name** parameter field.

## **Parameters**

### **Configuration**

#### **Engine Type – Type of engine image**

Compression-ignition (CI) (default) | Spark-ignition (SI)

Type of mapped internal combustion engine image to use in the block.

#### **Load input port name – Name**

TrqCmd (default)

Engine load input port name.

#### **Breakpoints for load input – Breakpoints**

vector

Breakpoints for engine load input.

#### **Speed input port name – Name**

EngSpd (default)

Speed input port name.

**Breakpoints for speed input — Breakpoints**

vector

Breakpoints for engine speed input.

**Output — Create output ports**

power on (default)

Create the output ports.

**Dependencies**

The table summarizes the output ports that are created for each **Output** parameter selection.

<b>Output Selection</b>	<b>Creates Port</b>	<b>Creates Tab</b>
<b>Power</b>	<i>EngTrq</i>	<b>Power</b>
<b>Air</b>	<i>IntkAirMassFlw</i>	<b>Air</b>
<b>Fuel</b>	<i>FuelMassFlw</i>	<b>Fuel</b>
<b>Temperature</b>	<i>ExhManGasTemp</i>	<b>Temperature</b>
<b>Efficiency</b>	<i>Bsfc</i>	<b>Efficiency</b>
<b>HC</b>	<i>EoHC</i>	<b>HC</b>
<b>CO</b>	<i>EoCO</i>	<b>CO</b>
<b>NOx</b>	<i>EoNOx</i>	<b>NOx</b>
<b>CO2</b>	<i>EoCO2</i>	<b>CO2</b>
<b>PM</b>	<i>EoPm</i>	<b>PM</b>

**Power**

**Power output port name — Power**

BrkTrq (default)

Power output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **Power**.

**Power table — Power**

array

Power table.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Power**.

### **Air**

#### **Air output port name — Air**

AirFlw (default)

Air mass flow output port name.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Air**.

#### **Air table — Air**

array

Air mass flow table.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Air**.

### **Fuel**

#### **Fuel output port name — Fuel**

FuelFlw (default)

Fuel output port name.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Fuel**.

#### **Fuel table — Fuel**

array

Fuel table.

### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Fuel**.

### **Temperature**

#### **Temperature output port name — Temperature**

Texh (default)

Temperature output port name.

#### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Temperature**.

#### **Temperature table — Temperature**

array

Temperature table.

#### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Temperature**.

### **Efficiency**

#### **Efficiency output port name — Efficiency**

BSFC (default)

Efficiency output port name.

#### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Efficiency**.

#### **Efficiency table — Efficiency**

array

Efficiency table.

#### **Dependencies**

To create this parameter, on the **Configuration** tab, select **Efficiency**.

### **HC**

#### **HC output port name — Hydrocarbon**

E0 HC (default)

Hydrocarbon output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **HC**.

**HC table — Hydrocarbon**

array

Hydrocarbon table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **HC**.

**CO****CO output port name — Carbon dioxide**

E0 CO (default)

Carbon monoxide output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO**.

**CO table — Carbon dioxide**

array

Carbon dioxide table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO**.

**NOx****NOx output port name — Nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>***

E0 NOx (default)

NOx output port name. NOx is nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>*.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **NOx**.

**NOx table — Nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>***

array

NOx emissions table. NOx is nitric oxide *NO* and nitrogen dioxide *NO<sub>2</sub>*.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **NOx**.

**CO2**

**CO2 output port name — Carbon dioxide**

E0 CO2 (default)

Carbon dioxide output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO2**.

**CO2 table — Carbon dioxide**

array

Carbon dioxide table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **CO2**.

**PM**

**PM output port name — Particulate matter**

E0 PM (default)

Particulate matter output port name.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **PM**.

**PM table — Particulate matter**

array

Particulate matter table.

**Dependencies**

To create this parameter, on the **Configuration** tab, select **PM**.

CI Core Engine | SI Core Engine

**Introduced in R2017a**

## Mapped CI Engine

Compression-ignition engine model using lookup tables

**Library:** Propulsion / Combustion Engines

### Description

The Mapped CI Engine block implements a mapped compression-ignition (CI) engine model using power, air mass flow, fuel flow, exhaust temperature, efficiency, and emission performance lookup tables. You can use the block for:

- Hardware-in-the-loop (HIL) engine control design
- Vehicle-level fuel economy and performance simulations

The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of either injected fuel mass,  $F$ , or engine torque,  $T$ , and engine speed,  $N$ .

Input Command Setting	Lookup Tables
Fuel mass	$f(F,N)$
Torque	$f(T,N)$

The block enables you to specify lookup tables for these engine characteristics:

- Power
- Air
- Fuel
- Temperature
- Efficiency
- Hydrocarbon (HC) emissions
- Carbon monoxide (CO) emissions

- Nitric oxide and nitrogen dioxide (NOx) emissions
- Carbon dioxide (CO<sub>2</sub>) emissions
- Particulate matter (PM) emissions

To bound the Mapped CI Engine block output, the block does not extrapolate the lookup table data.

## Cylinder Air Mass

The block calculates the normalized cylinder air mass using these equations.

$$M_{Nom} = \frac{P_{std} V_d}{N_{cyl} R_{air} T_{std}}$$

$$L = \frac{\left(\frac{60s}{min}\right) C_{ps} \cdot \dot{m}_{air}}{\left(\frac{1000g}{Kg}\right) N_{cyl} \cdot N \cdot M_{Nom}}$$

The equations use these variables.

$L$	Normalized cylinder air mass
$M_{Nom}$	Nominal engine cylinder air mass at standard temperature and pressure, piston at bottom dead center (BDC) maximum volume, in kg
$C_{ps}$	Crankshaft revolutions per power stroke, rev/stroke
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$R_{air}$	Ideal gas constant for air and burned gas mixture
$V_d$	Displaced volume
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed

$\dot{m}_{inth}$  Engine air mass flow, in g/s

## Turbocharger Lag

To model turbocharger lag, select **Include turbocharger lag effect**. Turbocharger lag limits the maximum fuel mass per injection. To model the maximum fuel mass per injection, the block uses a first-order system with a time constant. At low torque, the engine does not require boost to provide sufficient air flow. When the requested fuel mass requires boost, the block uses a time constant to determine the maximum fuel mass per injection. The block uses these equations for the specified **Input command** setting.

Calculation	Input command Parameter Setting	
	Fuel mass	Torque
Dynamic torque	$\frac{dF_{max}}{dt} = \frac{1}{\tau_{eng}} (F_{cmd} - F_{max})$	$\frac{dT_{max}}{dt} = \frac{1}{\tau_{eng}} (T_{cmd} - T_{max})$
Fuel mass per injection or torque - with turbocharger lag	$F = \begin{cases} F_{cmd} & \text{when } F_{cmd} < F_{max} \\ F_{max} & \text{when } F_{cmd} \geq F_{max} \end{cases}$	$T_{target} = \begin{cases} T_{cmd} & \text{when } T_{cmd} < T_{max} \\ T_{max} & \text{when } T_{cmd} \geq T_{max} \end{cases}$
Fuel mass per injection or torque - without turbocharger lag	$F = F_{cmd} = F_{max}$	$T_{target} = T_{cmd} = T_{max}$
Boost time constant	$\tau_{bst} = \begin{cases} \tau_{bst, rising} & \text{when } F_{cmd} > F_{max} \\ \tau_{bst, falling} & \text{when } F_{cmd} \leq F_{max} \end{cases}$	$\tau_{bst} = \begin{cases} \tau_{bst, rising} & \text{when } T_{cmd} > T_{max} \\ \tau_{bst, falling} & \text{when } T_{cmd} \leq T_{max} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{nat} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$	

The equations use these variables.

$T_{brake}$  Brake torque

$F$	Fuel mass per injection
$F_{cmd}, F_{max}$	Commanded and maximum fuel mass per injection, respectively
$T_{target}, T_{cmd}, T_{max}$	Target, commanded, and maximum torque, respectively
$\tau_{bst}$	Boost time constant
$\tau_{bst,rising}, \tau_{bst,falling}$	Boost rising and falling time constant, respectively
$\tau_{eng}$	Final time constant
$\tau_{nat}$	Time constant below the boost torque speed line
$f_{bst}(N)$	Boost torque/speed line
$N$	Engine speed

## Ports

### Input

#### FuelMassCmd — Injected fuel mass command

scalar

Injected fuel mass command,  $F$ , in mg/inj.

#### Dependencies

To create this port, for **Input command**, select Fuel mass.

#### TrqCmd — Torque command

scalar

Torque command,  $T$ , in N·m.

#### Dependencies

To create this port, for **Input command**, select Torque.

#### EngSpd — Engine speed

scalar

Engine speed,  $N$ , in rpm.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
IntkGasMassFlw	Engine air mass flow output	kg/s
NrmlzdAirChrg	Normalized engine cylinder air mass	N/A
Afr	Air-fuel ratio (AFR)	N/A
FuelMassFlw	Engine fuel flow output	kg/s
ExhManGasTemp	Engine exhaust gas temperature	K
EngTrq	Engine torque output	N·m
EngSpd	Engine speed	rpm
CrkAng	Engine crankshaft absolute angle  $\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ where $Cps$ is crankshaft revolutions per power stroke.	degrees crank angle
Bsfc	Engine brake-specific fuel consumption (BSFC)	g/kWh
EoHC	Engine out hydrocarbon emission mass flow	kg/s
EoCO	Engine out carbon monoxide emission mass flow rate	kg/s
EoNOx	Engine out nitric oxide and nitrogen dioxide emissions mass flow	kg/s
EoCO2	Engine out carbon dioxide emission mass flow	kg/s

Signal	Description	Units
EoPM	Engine out particulate matter emission mass flow	kg/s

### EngTrq — Power

scalar

Engine power,  $T_{brake}$ , in N·m.

## Parameters

### Block Options

#### Input command — Table functions

Fuel mass (default) | Torque

The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of either injected fuel mass,  $F$ , or engine torque,  $T$ , and engine speed,  $N$ .

Input Command Setting	Lookup Tables
Fuel mass	$f(F,N)$
Torque	$f(T,N)$

### Dependencies

- Selecting Fuel mass enables **Breakpoints for commanded fuel mass input, f\_tbrake\_f\_bpt.**
- Selecting Torque enables **Breakpoints for commanded torque input, f\_tbrake\_t\_bpt.**

#### Include turbocharger lag effect — Increase time constant

off (default)

To model turbocharger lag, select **Include turbocharger lag effect**. Turbocharger lag limits the maximum fuel mass per injection. To model the maximum fuel mass per injection, the block uses a first-order system with a time constant. At low torque, the engine does not require boost to provide sufficient air flow. When the requested fuel mass requires boost, the block uses a time constant to determine the maximum fuel mass per injection. The block uses these equations for the specified **Input command** setting.

Calculation	Input command Parameter Setting	
	Fuel mass	Torque
Dynamic torque	$\frac{dF_{max}}{dt} = \frac{1}{\tau_{eng}} (F_{cmd} - F_{max})$	$\frac{dT_{max}}{dt} = \frac{1}{\tau_{eng}} (T_{cmd} - T_{max})$
Fuel mass per injection or torque - with turbocharger lag	$F = \begin{cases} F_{cmd} & \text{when } F_{cmd} < F_{max} \\ F_{max} & \text{when } F_{cmd} \geq F_{max} \end{cases}$	$T_{target} = \begin{cases} T_{cmd} & \text{when } T_{cmd} < T_{max} \\ T_{max} & \text{when } T_{cmd} \geq T_{max} \end{cases}$
Fuel mass per injection or torque - without turbocharger lag	$F = F_{cmd} = F_{max}$	$T_{target} = T_{cmd} = T_{max}$
Boost time constant	$\tau_{bst} = \begin{cases} \tau_{bst,rising} & \text{when } F_{cmd} > F_{max} \\ \tau_{bst,falling} & \text{when } F_{cmd} \leq F_{max} \end{cases}$	$\tau_{bst} = \begin{cases} \tau_{bst,rising} & \text{when } T_{cmd} > T_{max} \\ \tau_{bst,falling} & \text{when } T_{cmd} \leq T_{max} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{nat} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$	

The equations use these variables.

- $T_{brake}$  Brake torque
- $F$  Fuel mass per injection
- $F_{cmd}, F_{max}$  Commanded and maximum fuel mass per injection, respectively
- $T_{target}, T_{cmd}, T_{max}$  Target, commanded, and maximum torque, respectively
- $\tau_{bst}$  Boost time constant
- $\tau_{bst,rising}, \tau_{bst,falling}$  Boost rising and falling time constant, respectively
- $\tau_{eng}$  Final time constant
- $\tau_{nat}$  Time constant below the boost torque speed line
- $f_{bst}(N)$  Boost torque/speed line
- $N$  Engine speed

**Dependencies**

Selecting **Include turbocharger lag effect** enables these parameters:

- **Boost torque line, f\_tbrake\_bst**
- **Time constant below boost line, tau\_nat**
- **Rising maximum fuel mass boost time constant, tau\_bst\_rising**
- **Falling maximum fuel mass boost time constant, tau\_bst\_falling**

**Configuration**

**Breakpoints for commanded fuel mass input, f\_tbrake\_f\_bpt – Breakpoints**

vector

Breakpoints, in mg/inj.

**Dependencies**

Setting **Input command** to Fuel mass enables this parameter.

**Breakpoints for commanded torque input, f\_tbrake\_t\_bpt – Breakpoints**

vector

Breakpoints, in N·m.

**Dependencies**

Setting **Input command** to Torque enables this parameter.

**Breakpoints for engine speed input, f\_tbrake\_n\_bpt – Breakpoints**

vector

Breakpoints, in rpm.

**Number of cylinders, NCyl – Number**

scalar

Number of cylinders.

**Crank revolutions per power stroke, Cps – Crank revolutions**

scalar

Crank revolutions per power stroke.

**Total displaced volume, Vd — Volume**

scalar

Volume displaced by engine, in  $m^3$ .

**Ideal gas constant air, Rair — Constant**

scalar

Ideal gas constant of air and residual gas entering the engine intake port, in  $J/(kg \cdot K)$ .

**Air standard pressure, Pstd — Pressure**

scalar

Standard air pressure, in Pa.

**Air standard temperature, Tstd — Temperature**

scalar

Standard air temperature, in K.

**Boost torque line, f\_tbrake\_bst — Boost lag**

vector

Boost torque line,  $f_{bst}(N)$ , in  $N \cdot m$ .

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Time constant below boost line — Time constant below**

scalar

Time constant below boost line,  $\tau_{nat}$ , in s.

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Rising maximum fuel mass boost time constant, tau\_bst\_rising — Rising time constant**

scalar

Rising maximum fuel mass boost time constant,  $\tau_{bst,rising}$ , in s.

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Falling maximum fuel mass boost time constant, tau\_bst\_falling — Falling time constant**

scalar

Falling maximum fuel mass boost time constant,  $\tau_{bst,falling}$ , in s.

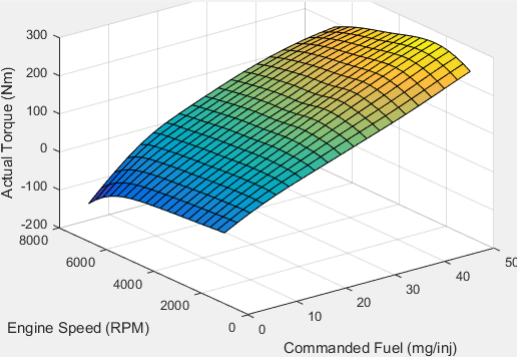

**Dependencies**

To enable this parameter, select **Include turbocharger lag effect**.

**Power****Brake torque map, f\_tbrake — Torque table**

array

**Dependencies**

Input Command Setting	Description
Fuel mass	<p>The engine brake torque lookup table is a function of commanded fuel mass and engine speed, <math>T_{brake} = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{brake}</math> is engine torque, in N·m.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine brake torque lookup table is a function of target torque and engine speed, <math>T_{brake} = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{brake}</math> is engine torque, in N·m.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

button

Click to plot table.

**Temperature**

**Exhaust temperature map, f\_texh – Lookup table**

array

**Dependencies**

Input Command Setting	Description
Fuel mass	<p>The engine exhaust temperature table is a function of commanded fuel mass and engine speed, <math>T_{exh} = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{exh}</math> is exhaust temperature, in K.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine exhaust temperature table is a function of target torque and engine speed, <math>T_{exh} = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>T_{exh}</math> is exhaust temperature, in K.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Plot exhaust temperature map – Plot table**

button

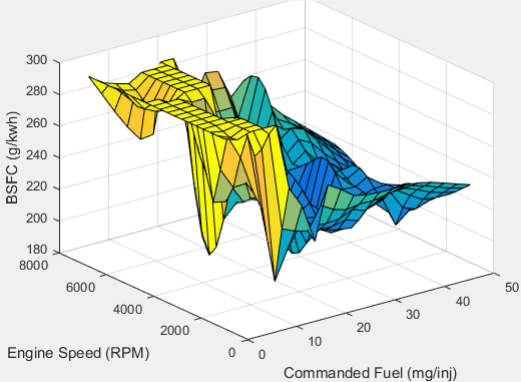

Click to plot table.

**Efficiency**

**BSFC map, f\_eff — Lookup table**

array

**Dependencies**

Input Command Setting	Description
Fuel mass	<p>The brake-specific fuel consumption (BSFC) efficiency is a function of commanded fuel mass and engine speed, <math>BSFC = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>BSFC</math> is BSFC, in g/kWh.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The brake-specific fuel consumption (BSFC) efficiency is a function of target torque and engine speed, <math>BSFC = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>BSFC</math> is BSFC, in g/kWh.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Plot BSFC map — Plot table**

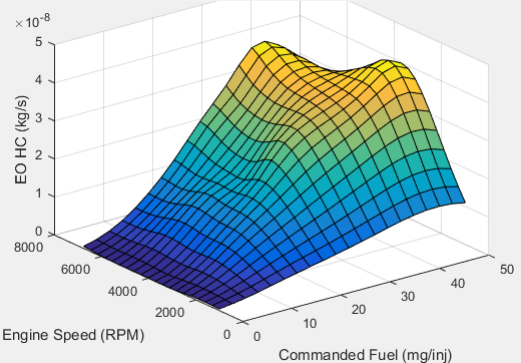

button

Click to plot table.

**HC****EO HC map, f\_hc — Lookup table**

array

**Dependencies**

Input Command Setting	Description
Fuel mass	<p>The engine-out hydrocarbon emissions are a function of commanded fuel mass and engine speed, <math>EO\ HC = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ HC</math> is engine-out hydrocarbon emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 
Torque	<p>The engine-out hydrocarbon emissions are a function of target torque and engine speed, <math>EO\ HC = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ HC</math> is engine-out hydrocarbon emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

**Plot EO HC map — Plot table**

button

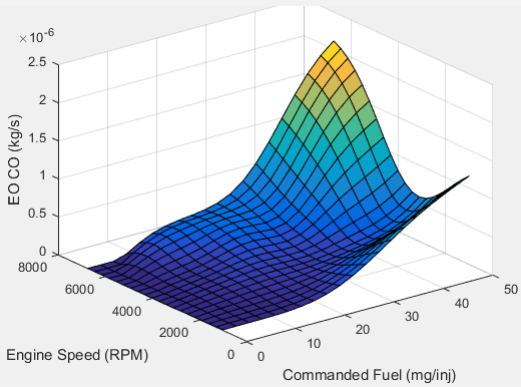

Click to plot table.

**CO**

**EO CO map, f\_co — Lookup table**

array

**Dependencies**

Input Command Setting	Description
Fuel mass	<p>The engine-out carbon monoxide emissions are a function of commanded fuel mass and engine speed, <math>EO\ CO = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ CO</math> is engine-out carbon monoxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul> 

Input Command Setting	Description
Torque	<p>The engine-out carbon monoxide emissions are a function of target torque and engine speed, <math>EO\ CO = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"><li>• <math>EO\ CO</math> is engine-out carbon monoxide emissions, in kg/s.</li><li>• <math>T_{target}</math> is target torque, in N·m.</li><li>• <math>N</math> is engine speed, in rpm.</li></ul>

**Plot E0 CO map – Plot table**

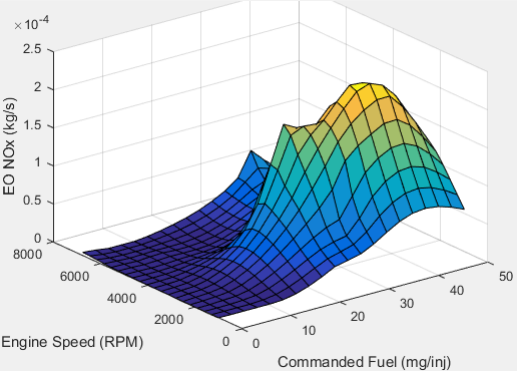

button

Click to plot table.

**NOx****E0 NOx map, f\_nox – Lookup table**

array

**Dependencies**

Input Command Setting	Description
Fuel mass	<p>The engine-out nitric oxide and nitrogen dioxide emissions are a function of commanded fuel mass and engine speed, <math>EO\ NO_x = f(F, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ NO_x</math> is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.</li> <li>• <math>F</math> is commanded fuel mass, in mg per injection.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>  <p>The figure is a 3D surface plot showing the relationship between Engine Speed (RPM) on the x-axis, Commanded Fuel (mg/inj) on the y-axis, and EO NOx emissions (kg/s) on the z-axis. The x-axis ranges from 0 to 6000 RPM, the y-axis from 0 to 50 mg/inj, and the z-axis from 0 to 2.5 x 10^-4 kg/s. The surface shows a peak in emissions at approximately 2000 RPM and 20 mg/inj, with values decreasing as engine speed increases beyond 4000 RPM or as fuel mass increases beyond 30 mg/inj.</p>
Torque	<p>The engine-out nitric oxide and nitrogen dioxide emissions are a function of target torque and engine speed, <math>EO\ NO_x = f(T_{target}, N)</math>, where:</p> <ul style="list-style-type: none"> <li>• <math>EO\ NO_x</math> is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.</li> <li>• <math>T_{target}</math> is target torque, in N·m.</li> <li>• <math>N</math> is engine speed, in rpm.</li> </ul>

# Mapped SI Engine

Spark-ignition engine model using lookup tables

**Library:** Propulsion / Combustion Engines

## Description

The Mapped SI Engine block implements a mapped spark-ignition (SI) engine model using power, air mass flow, fuel flow, exhaust temperature, efficiency, and emission performance lookup tables. You can use the block for:

- Hardware-in-the-loop (HIL) engine control design
- Vehicle-level fuel economy and performance simulations

The block enables you to specify lookup tables for these engine characteristics. The lookup tables, developed with the Model-Based Calibration Toolbox, are functions of commanded torque,  $T_{cmd}$ , brake torque,  $T_{brake}$ , and engine speed,  $N$ .

- Power —  $f(T_{cmd}, N)$
- Air —  $f(T_{brake}, N)$
- Fuel —  $f(T_{brake}, N)$
- Temperature —  $f(T_{brake}, N)$
- Efficiency —  $f(T_{brake}, N)$
- Hydrocarbon (HC) emissions —  $f(T_{brake}, N)$
- Carbon monoxide (CO) emissions —  $f(T_{brake}, N)$
- Nitric oxide and nitrogen dioxide (NOx) emissions —  $f(T_{brake}, N)$
- Carbon dioxide (CO<sub>2</sub>) emissions —  $f(T_{brake}, N)$
- Particulate matter (PM) emissions —  $f(T_{brake}, N)$

To bound the Mapped SI Engine block output, the block does not extrapolate the lookup table data.

## Cylinder Air Mass

The block calculates the normalized cylinder air mass using these equations.

$$M_{Nom} = \frac{P_{std} V_d}{N_{cyl} R_{air} T_{std}}$$

$$L = \frac{\left(\frac{60s}{min}\right) C_{ps} \cdot \dot{m}_{air}}{\left(\frac{1000g}{Kg}\right) N_{cyl} \cdot N \cdot M_{Nom}}$$

The equations use these variables.

$L$	Normalized cylinder air mass
$M_{Nom}$	Nominal engine cylinder air mass at standard temperature and pressure, piston at bottom dead center (BDC) maximum volume, in kg
$C_{ps}$	Crankshaft revolutions per power stroke, rev/stroke
$P_{std}$	Standard pressure
$T_{std}$	Standard temperature
$R_{air}$	Ideal gas constant for air and burned gas mixture
$V_d$	Displaced volume
$N_{cyl}$	Number of engine cylinders
$N$	Engine speed
$\dot{m}_{inth}$	Engine air mass flow, in g/s

## Turbocharger Lag

To model turbocharger lag, select **Include turbocharger lag effect**. During throttle control, the time constant models the manifold filling and emptying dynamics. When the torque request requires a turbocharger boost, the block uses a larger time constant to represent the turbocharger lag. The block uses these equations.

Dynamic torque	$\frac{dT_{brake}}{dt} = \frac{1}{\tau_{eng}}(T_{stdy} - T_{brake})$
Boost time constant	$\tau_{bst} = \begin{cases} \tau_{bst,rising} & \text{when } T_{stdy} > T_{brake} \\ \tau_{bst,falling} & \text{when } T_{stdy} \leq T_{brake} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{thr} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$

The equations use these variables.

$T_{brake}$	Brake torque
$T_{stdy}$	Steady-state target torque
$\tau_{bst}$	Boost time constant
$\tau_{bst,rising}$ , $\tau_{bst,falling}$	Boost rising and falling time constant, respectively
$\tau_{eng}$	Final time constant
$\tau_{thr}$	Time constant during throttle control
$f_{bst}(N)$	Boost torque speed line
$N$	Engine speed

## Ports

### Input

#### **TrqCmd — Commanded torque**

scalar

Torque,  $T_{cmd}$ , in N·m.

#### **EngSpd — Engine speed**

scalar

Engine speed,  $N$ , in rpm.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Units
IntkGassMassFlw	Engine air mass flow output	kg/s
NrmlzdAirChrg	Normalized engine cylinder air mass	N/A
Afr	Air-fuel ratio (AFR)	N/A
FuelMassFlw	Engine fuel flow output	kg/s
ExhManGasTemp	Engine exhaust gas temperature	K
EngTrq	Engine torque output	N·m
EngSpd	Engine speed	rpm
CrkAng	Engine crankshaft absolute angle  $\int_0^{(360)Cps} EngSpd \frac{180}{30} d\theta$ where $Cps$ is crankshaft revolutions per power stroke.	degrees crank angle
Bsfc	Engine brake-specific fuel consumption (BSFC)	g/kWh
EoHC	Engine out hydrocarbon emission mass flow	kg/s
EoCO	Engine out carbon monoxide emission mass flow rate	kg/s
EoNOx	Engine out nitric oxide and nitrogen dioxide emissions mass flow	kg/s
EoCO2	Engine out carbon dioxide emission mass flow	kg/s

Signal	Description	Units
EoPM	Engine out particulate matter emission mass flow	kg/s

### EngTrq — Engine brake torque

scalar

Engine brake torque,  $T_{brake}$ , in N·m.

## Parameters

### Block Options

#### Include turbocharger lag effect — Increase time constant

off (default)

To model turbocharger lag, select **Include turbocharger lag effect**. During throttle control, the time constant models the manifold filling and emptying dynamics. When the torque request requires a turbocharger boost, the block uses a larger time constant to represent the turbocharger lag. The block uses these equations.

Dynamic torque	$\frac{dT_{brake}}{dt} = \frac{1}{\tau_{eng}} (T_{stdy} - T_{brake})$
Boost time constant	$\tau_{bst} = \begin{cases} \tau_{bst, rising} & \text{when } T_{stdy} > T_{brake} \\ \tau_{bst, falling} & \text{when } T_{stdy} \leq T_{brake} \end{cases}$
Final time constant	$\tau_{eng} = \begin{cases} \tau_{thr} & \text{when } T_{brake} < f_{bst}(N) \\ \tau_{bst} & \text{when } T_{brake} \geq f_{bst}(N) \end{cases}$

The equations use these variables.

$T_{brake}$	Brake torque
$T_{stdy}$	Steady-state target torque

$\tau_{bst}$	Boost time constant
$\tau_{bst,rising},$ $\tau_{bst,falling}$	Boost rising and falling time constant, respectively
$\tau_{eng}$	Final time constant
$\tau_{thr}$	Time constant during throttle control
$f_{bst}(N)$	Boost torque speed line
$N$	Engine speed

### Dependencies

Selecting **Include turbocharger lag effect** enables these parameters:

- **Boost torque line, `f_tbrake_bst`**
- **Time constant below boost line, `tau_thr`**
- **Rising torque boost time constant, `tau_bst_rising`**
- **Falling torque boost time constant, `tau_bst_falling`**

### Configuration

**Breakpoints for commanded torque, `f_tbrake_t_bpt` — Breakpoints**  
vector

Breakpoints, in N·m.

**Breakpoints for engine speed input, `f_tbrake_n_bpt` — Breakpoints**  
vector

Breakpoints, in rpm.

**Number of cylinders, `NCyl` — Number**  
scalar

Number of cylinders.

**Crank revolutions per power stroke, `Cps` — Crank revolutions**  
scalar

Crank revolutions per power stroke.

**Total displaced volume, Vd – Volume**

scalar

Volume displaced by engine, in  $\text{m}^3$ .**Ideal gas constant air, Rair – Constant**

scalar

Ideal gas constant of air and residual gas entering the engine intake port, in  $\text{J}/(\text{kg}\cdot\text{K})$ .**Air standard pressure, Pstd – Pressure**

scalar

Standard air pressure, in Pa.

**Air standard temperature, Tstd – Temperature**

scalar

Standard air temperature, in K.

**Boost torque line, f\_tbrake\_bst – Boost lag**

vector

Boost torque line,  $f_{bst}(N)$ , in  $\text{N}\cdot\text{m}$ .**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Time constant below boost line – Time constant below**

scalar

Time constant below boost line,  $\tau_{thr}$ , in s.**Dependencies**To enable this parameter, select **Include turbocharger lag effect**.**Rising torque boost time constant, tau\_bst\_rising – Rising time constant**

scalar

Rising torque boost time constant,  $\tau_{bst,rising}$ , in s.

### Dependencies

To enable this parameter, select **Include turbocharger lag effect**.

### Falling torque boost time constant, `tau_bst_falling` — Falling time constant

scalar

Falling torque boost time constant,  $\tau_{bst,falling}$ , in s.

### Dependencies

To enable this parameter, select **Include turbocharger lag effect**.

### Power

### Brake torque map, `f_tbrake` — Torque table

array

The engine torque lookup table is a function of commanded engine torque and engine speed,  $T = f(T_{cmd}, N)$ , where:

- $T$  is engine torque, in N·m.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Plot brake torque map — Plot table

button

Click to plot table.

**Air****Air mass flow map,  $f\_air$  – Lookup table**

array

The engine air mass flow lookup table is a function of commanded engine torque and engine speed,  $\dot{m}_{intk} = f(T_{cmd}, N)$ , where:

- $\dot{m}_{intk}$  is engine air mass flow, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Plot air mass map – Plot table**

button

Click to plot table.

**Fuel****Fuel flow map,  $f\_fuel$  – Lookup table**

array

The engine fuel mass flow lookup table is a function of commanded engine torque and engine speed,  $MassFlow = f(T_{cmd}, N)$ , where:

- $MassFlow$  is engine fuel mass flow, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.

- $N$  is engine speed, in rpm.

### Plot fuel flow map — Plot table button

Click to plot table.

### Temperature

### Exhaust temperature map, $f\_texh$ — Lookup table array

The engine exhaust temperature lookup table is a function of commanded engine torque and engine speed,  $T_{exh} = f(T_{cmd}, N)$ , where:

- $T_{exh}$  is exhaust temperature, in K.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Plot exhaust temperature map – Plot table button

Click to plot table.

### Efficiency

### BSFC map, $f_{eff}$ – Lookup table array

The brake-specific fuel consumption (BSFC) efficiency is a function of commanded engine torque and engine speed,  $BSFC = f(T_{cmd}, N)$ , where:

- $BSFC$  is BSFC, in g/kWh.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Plot BSFC map — Plot table

button

Click to plot table.

### HC

#### EO HC map, $f_{hc}$ — Lookup table

array

The engine-out hydrocarbon emissions are a function of commanded engine torque and engine speed,  $EO\ HC = f(T_{cmd}, N)$ , where:

- $EO\ HC$  is engine-out hydrocarbon emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Plot EO HC map — Plot table

button

Click to plot table.

### CO

#### EO CO map, $f_{co}$ — Lookup table

array

The engine-out carbon monoxide emissions are a function of commanded engine torque and engine speed,  $EO\ CO = f(T_{cmd}, N)$ , where:

- $EO\ CO$  is engine-out carbon monoxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Plot EO CO map — Plot table

button

Click to plot table.

### NOx

### EO NOx map, $f_{nox}$ — Lookup table

array

The engine-out nitric oxide and nitrogen dioxide emissions are a function of commanded engine torque and engine speed,  $EO\ NOx = f(T_{cmd}, N)$ , where:

- $EO\ NOx$  is engine-out nitric oxide and nitrogen dioxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

### Plot EO NOx map — Plot table button

Click to plot table.

### CO2

### EO CO2 map, f\_co2 — Lookup table array

The engine-out carbon dioxide emissions are a function of commanded engine torque and engine speed,  $EO\ CO_2 = f(T_{cmd}, N)$ , where:

- $EO\ CO_2$  is engine-out carbon dioxide emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

**Plot CO2 map — Plot table**

button

Click to plot table.

**PM****E0 PM map, f\_pm — Lookup table**

array

The engine-out particulate matter emissions are a function of commanded engine torque and engine speed, where:

- $EO\ PM$  is engine-out PM emissions, in kg/s.
- $T_{cmd}$  is commanded engine torque, in N·m.
- $N$  is engine speed, in rpm.

## Drive Cycle Source

Standard or specified longitudinal drive cycle

**Library:** Vehicle Scenario Builder

## Description

The Drive Cycle Source block generates a standard or user-specified longitudinal drive cycle. The block output is the specified vehicle longitudinal speed, which you can use to:

- Predict the engine torque and fuel consumption that a vehicle requires to achieve desired speed and acceleration for a given gear shift reference.
- Produce realistic velocity and shift references for closed loop acceleration and braking commands for vehicle control and plant models.
- Study, tune, and optimize vehicle control, system performance, and system robustness over multiple drive cycles.

For the drive cycles, you can use:

- Drive cycles from predefined sources. By default, the block includes the FTP–75 drive cycle. To install additional drive cycles from a support package, see “Install Drive Cycle Data”. The support package has drive cycles that include the gear shift schedules, for example JC08 and CUEDC.
- Workspace variables.
- .mat, .xls, .xlsx, or .txt files.
- Wide open throttle (WOT) parameters, including initial and nominal reference speed, deceleration start time, and final reference speed.

To achieve the goals listed in the table, use the specified Drive Cycle Source block parameter options.

Goal	Action
Repeat the drive cycle if the simulation run time exceeds the drive cycle length.	Select <b>Repeat cyclically</b> .
Output the acceleration, as calculated by Savitzky-Golay differentiation.	Select <b>Output acceleration</b> .
Specify a sample period for discrete applications.	Specify a <b>Output sample period (0 for continuous), dt</b> parameter.
Update the simulation run time so that it equals the length of the drive cycle.	Click <b>Update simulation time</b> . If a model configuration reference exists, the block does not enable this option.
Plot the drive cycle in a MATLAB® figure.	Click <b>Plot drive cycle</b> .
Specify the drive cycle using a workspace variable.	Click <b>Specify variable</b> . The block: <ul style="list-style-type: none"> <li>• Sets the <b>Drive cycle source</b> parameter to <b>Workspace variable</b>.</li> <li>• Enables the <b>From workspace</b> parameter.</li> </ul> Specify the workspace variable so that it contains time, velocity, and, optionally, the gear shift schedule.
Specify the drive cycle using a file.	Click <b>Select file</b> . The block: <ul style="list-style-type: none"> <li>• Sets the <b>Drive cycle source</b> parameter to <b>.mat, .xls, .xlsx or .txt file</b>.</li> <li>• Enables the <b>Drive cycle source file</b> parameter.</li> </ul> Specify a file that contains time, velocity, and, optionally, the gear shift schedule.

Goal	Action
Output drive cycle gear.	Specify a drive cycle that contains a gear shift schedule. You can use: <ul style="list-style-type: none"> <li>• A support package to install standard drive cycles that include the gear shift schedules, for example JC08 and CUEDC.</li> <li>• Workspace variables.</li> <li>• .mat, .xls, .xlsx, or .txt files.</li> </ul> Click <b>Output gear shift data</b> .
Install additional drive cycles from a support package.	Click <b>Install additional drive cycles</b> . The block enables the parameter if you can install additional drive cycles from a support package.

## Ports

### Output

#### Speed — Vehicle reference speed

scalar

Vehicle reference speed, in units that you specify. To specify the units, use the **Output velocity units** parameter.

#### Acceleration — Vehicle reference acceleration

scalar

To calculate the acceleration, the block implements Savitzky-Golay differentiation using a second-order polynomial with a three-sample point filter.

#### Dependencies

To create the output acceleration port, select **Output acceleration**. Selecting **Output acceleration** enables the **Output acceleration units** parameter.

#### Gear — Vehicle gear

scalar

## Dependencies

To create this port:

- 1 Specify a drive cycle that contains a gear shift schedule. You can use:
  - A support package to install standard drive cycles that include the gear shift schedules, for example JC08 and CUEDC.
  - Workspace variables.
  - .mat, .xls, .xlsx, or .txt files.
- 2 Select **Output gear shift** data.

## Parameters

### Drive Cycle

#### Drive cycle source — Select the drive cycle source

FTP75 (default) | Wide Open Throttle (WOT) | Workspace variable  
|.mat, .xls, .xlsx or .txt file

- **FTP75** — Load the FTP75 drive cycle from a .mat file into a 1-D Lookup Table block. The FTP75 represents a city drive cycle that you can use to determine tailpipe emissions and fuel economy of passenger cars. To install additional drive cycles from a support package, see “Install Drive Cycle Data”.
- **Wide Open Throttle (WOT)** — Use WOT parameters to specify a drive cycle for performance testing.
- **Workspace variable** — Specify time, speed, and, optionally, gear data as a structure, 2-D array, or time series object.
- **.mat, .xls, .xlsx or .txt file** — Specify a file that contains time, speed and, optionally, gear data in column format.

Once you have installed additional cycles, you can use `set_param` to set the drive cycle. For example, to use drive cycle US06:

```
set_param([gcs '/Drive Cycle Source'], 'cycleVar', 'US06')
```

### Dependencies

The table summarizes the parameter dependencies.

Drive Cycle Source	Enables Parameter
Wide Open Throttle (WOT)	Start time, <code>t_wot1</code>
	Initial reference speed, <code>xdot_woto</code>
	Nominal reference speed, <code>xdot_wot1</code>
	Time to start deceleration, <code>wot2</code>
	Final reference speed, <code>xdot_wot2</code>
	WOT simulation time, <code>t_wotend</code>
	Source velocity units
Workspace variable	From workspace
	Source velocity units
	Output gear shift data, if drive cycle includes gear shift schedule
.mat, .xls, .xlsx or .txt file	Drive cycle source file
	Source velocity units
	Output gear shift data, if drive cycle includes gear shift schedule

**From workspace — Workspace variable**

Monotonically increasing time, velocity, and, optionally, gear data, specified by a structure, 2-D array, or time series object. Enter units for velocity in the **Source velocity units** parameter field.

A valid point must exist for each corresponding time value. You cannot specify `inf`, empty, or `NaN`.

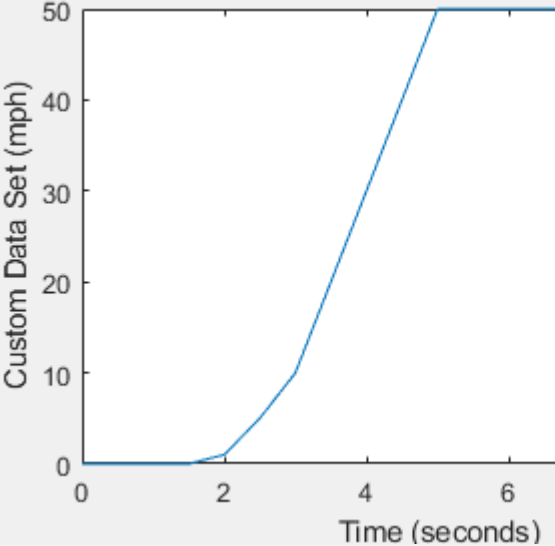

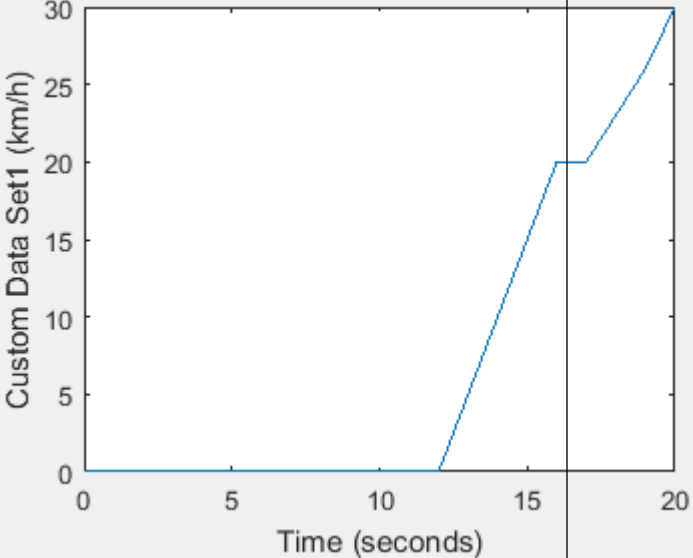

File containing monotonically increasing time, velocity, and, optionally, gear in column or comma-separated format. The block ignores units in the file. Enter units for velocity in the **Source velocity units** parameter field.

File	Source Velocity Unit	Drive Cycle Plot																																																				
<p>An .xls or .xlsx file with time in column A, velocity in column B, and gear in column C. The block:</p> <ul style="list-style-type: none"> <li>• Ignores the units in the file.</li> <li>• Converts the gear information to integers: <ul style="list-style-type: none"> <li>• N to 0</li> <li>• D to 2</li> </ul> </li> </ul>	mph

File	Source Velocity Unit	Drive Cycle Plot
<p>A .txt with time in column 1 and velocity in column 2. The block ignores the header and units information.</p> <pre data-bbox="249 552 402 1142"> Time  Speed s      km/h 0      0 1      0 2      0 3      0 4      0 5      0 6      0 7      0 8      0 9      0 10     0 11     0 12     0 13     5 14     10 15     15 16     20 17     20 18     23 19     26 20     30                     </pre>	<p>km/h</p>	

If you provide the gear schedule using **P, R, N, D, L, OD**, the block maps the gears to integers.

Gear	Integer
P	80
R	-1
N	0
L	1
D	2

<b>Gear</b>	<b>Integer</b>
OD	Next integer after highest specified gear.

For example, the block converts the gear schedule P P N L D 3 4 5 6 5 4 5 6 7 OD 7 to 80 80 0 1 2 3 4 5 6 5 4 5 6 7 8 7.

### **Dependencies**

To enable this parameter, select `.mat`, `.xls`, `.xlsx` or `.txt` file from **Drive cycle source**.

### **Repeat cyclically – Repeat drive cycle**

off (default)

Repeat the drive cycle if the simulation run time exceeds the length of the drive cycle.

### **Output acceleration – Output the acceleration**

off (default)

To calculate the acceleration, the block implements Savitzky-Golay differentiation using a second-order polynomial with a three-sample point filter.

### **Dependencies**

To create the output acceleration port, select **Output acceleration**. Selecting **Output acceleration** enables the **Output acceleration units** parameter.

### **Output gear shift data – Output the gear**

off (default)

### **Dependencies**

- Specify a drive cycle that contains a gear shift schedule. You can use:
  - A support package to install standard drive cycles that include the gear shift schedules, for example JC08 and CUEDC.
  - Workspace variables.
  - `.mat`, `.xls`, `.xlsx`, or `.txt` files.
- Clicking this parameter creates input port **Gear**.

### WOT

#### Start time, $t_{\text{wot1}}$ — Drive cycle start time

scalar

Drive cycle start time, in s. For example, this plot shows a drive cycle with a start time of 10 s.

#### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

#### Initial reference speed, $x_{\text{dot\_woto}}$ — Speed

scalar

Initial reference speed, in units that you specify with the **Source velocity units** parameter. For example, this plot shows a drive cycle with an initial reference speed of 4 m/s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### Nominal reference speed, `xdot_wot1` — Speed scalar

Nominal reference speed, in units that you specify with the **Source velocity units** parameter. For example, this plot shows a drive cycle with a nominal reference speed of 30 m/s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### Time to start deceleration, wot2 — Time scalar

Time to start vehicle deceleration, in s. For example, this plot shows a drive cycle with vehicle deceleration starting at 25 s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### Final reference speed, `xdot_wot2` — Speed scalar

Final reference speed, in units that you specify with the **Source velocity units** parameter. For example, this plot shows a drive cycle with a final reference speed of 2 m/s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### WOT simulation time, `t_wotend` — Time scalar

Drive cycle WOT simulation time, in s. For example, this plot shows a drive cycle with a simulation time of 50 s.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT).

### Units and Sample Period

#### Source velocity units – Specify velocity units

m/s (default)

Input velocity units.

### Dependencies

To enable this parameter, select the **Drive cycle source** parameter Wide Open Throttle (WOT), Workspace variable, or .mat, .xls, .xlsx or .txt file.

#### Output velocity units – Specify velocity units

m/s (default)

Output velocity units.

#### Output acceleration units – Specify acceleration units

m/s<sup>2</sup> (default)

Specify the output acceleration units.

**Dependencies**

To enable this parameter, select **Output acceleration**.

**Output sample period (0) for continuous — Sample rate**

scalar

Sample rate. Set to 0 for continuous sample period. For a discrete period, specify a non-zero rate.

**See Also**

Longitudinal Driver

**Topics**

“Time Series Objects” (MATLAB)

**Introduced in R2017a**

# Longitudinal Driver

Longitudinal speed-tracking controller

**Library:** Vehicle Scenario Builder

## Description

The Longitudinal Driver block implements a longitudinal speed-tracking controller. Based on reference and feedback velocities, the block generates normalized acceleration and braking commands that can vary from 0 through 1. You can use the block to model the dynamic response of a driver or to generate the commands necessary to track a longitudinal drive cycle.

## Longitudinal Speed-Tracking Controller

The Longitudinal Driver block implements a Proportional-Integral (PI) controller with tracking anti-windup and feed-forward gains. You can specify parameters to account for road grade loads and feedback error filtering.

The block uses these equations to calculate the speed control output:

$$y = \frac{K_{ff}}{v_{nom}} + \frac{K_p e_{ref}}{v_{nom}} + \left( \frac{K_i}{v_{nom}} + K_{aw} e_{out} \right) \int e_{ref} dt + K_g \theta$$

where:

$$e_{ref} = v_{ref} - v$$

$$e_{out} = y_{sat} - y$$

$$y_{sat} = \begin{cases} -1 & y < -1 \\ y & -1 \leq y \leq 1 \\ 1 & 1 < y \end{cases}$$

The velocity error low-pass filter uses this transfer function:

$$H(s) = \frac{1}{\tau_{err}s + 1} \quad \text{for } \tau_{err} > 0$$

To calculate the acceleration and braking commands, the block uses these equations.

$$y_{acc} = \begin{cases} 0 & y_{sat} < 0 \\ y_{sat} & 0 \leq y_{sat} \leq 1 \\ 1 & 1 < y_{sat} \end{cases}$$

$$y_{dec} = \begin{cases} 0 & y_{sat} > 0 \\ -y_{sat} & -1 \leq y_{sat} \leq 0 \\ 1 & y_{sat} < -1 \end{cases}$$

The equations use these variables.

$v_{nom}$	Nominal vehicle speed
$K_p$	Proportional gain
$K_i$	Integral gain
$K_{aw}$	Anti-windup gain
$K_{ff}$	Velocity feed-forward gain
$K_g$	Grade feed-forward gain
$\theta$	Grade angle
$\tau_{err}$	Error filter time constant
$y$	Nominal control output magnitude
$y_{sat}$	Saturated control output magnitude
$e_{ref}$	Velocity error
$e_{out}$	Difference between saturated and nominal control outputs
$y_{acc}$	Acceleration signal
$y_{dec}$	Braking signal
$v$	Velocity feedback signal

$v_{ref}$  Reference velocity signal

## Ports

### Input

#### VelRef — Reference vehicle velocity

scalar

Reference velocity,  $v_{ref}$ , in m/s.

#### VelFdbk — Forward vehicle velocity

scalar

Forward vehicle velocity, in m/s.

#### Grade — Road grade angle

scalar

Road grade angle,  $\theta$ , in deg.

### Output

#### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Variable	Description
Accel	$y_{acc}$	Commanded vehicle acceleration, normalized from 0 through 1
Decel	$y_{dec}$	Commanded vehicle deceleration, normalized from 0 through 1
Err	$e_{ref}$	Difference in reference vehicle speed and vehicle speed

Signal	Variable	Description
ErrSqrSum	$\int_0^t e_{ref}^2 dt$	Integrated square of error
ErrMax	$\max(e_{ref}(t))$	Maximum error during simulation
ErrMin	$\min(e_{ref}(t))$	Minimum error during simulation

**AccelCmd — Commanded vehicle acceleration**

scalar

Commanded vehicle acceleration,  $y_{acc}$ , normalized from 0 through 1.

**DecelCmd — Commanded vehicle deceleration**

scalar

Commanded vehicle deceleration,  $y_{dec}$ , normalized from 0 through 1.

## Parameters

**Longitudinal Tracking**

**Nominal speed, vnom — Nominal vehicle speed**

scalar

Nominal vehicle speed,  $v_{nom}$ , in m/s. The block uses the nominal speed to normalize the controller gains.

**Proportional gain, Kp — Gain**

scalar

Proportional gain,  $K_p$ .

**Integral gain, Ki — Gain**

scalar

Proportional gain,  $K_i$ .

**Anti-windup, Kaw – Gain**

scalar

Anti-windup gain,  $K_{aw}$ .**Velocity feed-forward, Kff – Gain**

scalar

Velocity feed-forward gain,  $K_{ff}$ .**Grade feed-forward, Kg – Gain**

scalar

Grade feed-forward gain,  $K_g$ .**Error filter time constant, tauerr – Filter**

scalar

Error filter time constant,  $\tau_{err}$ , in s. To disable the filter, enter 0.**See Also**

Drive Cycle Source | Vehicle Body Total Road Load

**Introduced in R2017a**

# **Transmission Blocks – Alphabetical List**

---

# Automated Manual Transmission

Ideal automated manual transmission

**Library:** Transmission / Transmission Systems

## Description

The Automated Manual Transmission block implements an ideal automated transmission (AMT). An AMT is a manual transmission with additional actuators and an electronic control unit (ECU) to regulate clutch and gear selection based on commands from a controller. The number of gears is specified via an integer vector with corresponding gear ratios, inertias, viscous damping, and efficiency factors. The clutch and synchronization engagement rates are linear and adjustable.

Use the block for:

- Power and torque capacity sizing
- Determining gear ratio impact on fuel economy and performance

To determine the rotational drive shaft speed and reaction torque, the Automated Manual Transmission block calculates:

- Clutch lock-up and clutch friction
- Locked rotational dynamics
- Unlocked rotational dynamics

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.

Setting	Block Implementation
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

## Clutch Control

The AMT delivers drive shaft torque continuously by controlling the pressure signals from the clutch. If you select **Control type** parameter `Ideal integrated controller`, the block generates idealized clutch pressure signals. To use your own clutch control signals, select **Control type** parameter `External control`.

## Clutch Lock-Up and Clutch Friction

Based on the clutch lock-up condition, the block implements one of these friction models.

If	Clutch Condition	Friction Model
$\omega_i \neq N\omega_d$ or $T_S <  T_f - Nw_i b_i $	Unlocked	$T_f = T_k$ where, $T_k = F_c R_{eff} \mu_k \tanh \left[ 4 \left( \frac{w_i}{N} - w_d \right) \right]$
$\omega_i = N\omega_d$ and $T_S \geq  T_f - Nb_i \omega_i $	Locked	$T_f = T_s$ $T_s = F_c R_{eff} \mu_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$

The equations use these variables.

$\omega_t$	Output drive shaft speed
$\omega_i$	Input drive shaft speed
$\omega_d$	Drive shaft speed
$b_i$	Viscous damping
$F_c$	Applied clutch force
$N$	Engaged gear
	Frictional torque
$T_f$	
	Kinetic frictional torque
$T_k$	
	Static frictional torque
$T_s$	
	Effective clutch radius
$R_{eff}$	
	Annular disk outer radius
$R_o$	
	Annular disk inner radius
$R_i$	
$\mu_s$	Coefficient of static friction
$\mu_k$	Coefficient of kinetic friction

## Locked Rotational Dynamics

To model the rotational dynamics when the clutch is locked, the block implements these equations.

$$\dot{\omega}_d J_N = \eta_N T_d - \frac{\omega_i}{N} b_N + N T_i$$

$$\omega_i = N \omega_d$$

The block determines the input torque,  $T_i$ , through differentiation.

The equations use these variables.

$\omega_i$	Input drive shaft speed
$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$\eta_N$	Engaged gear efficiency
$T_d$	Drive shaft torque
$T_i$	Applied input torque

## Unlocked Rotational Dynamics

To model the rotational dynamics when the clutch is unlocked, the block implements this equation.

$$\dot{\omega}_d J_N = N T_f - \omega_d b_N + T_d$$

where:

$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$T_d$	Drive shaft torque
$T_i$	Applied input torque

## Ports

### Input

**Gear — Gear number to engage**

scalar

Integer value of gear number to engage.

### **ClutchCmd — Clutch command**

scalar

Clutch pressure command.

#### **Dependencies**

To create this port, select **Control type** parameter External control.

### **EngTrq — Applied input torque**

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N.m.

### **DiffTrq — Applied load torque**

scalar

Applied load torque,  $T_d$ , typically from the differential or driveshaft, in N.m.

### **Temp — Oil temperature**

scalar

Oil temperature, in K. To determine the efficiency, the block uses a 4D lookup table that is a function of:

- Gear
- Input torque
- Input speed
- Oil temperature

#### **Dependencies**

To create this port, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

## **Output**

### **Info — Bus signal**

bus

Bus signal contains these block calculations.

Signal		Description	Variable	Units
Eng	EngTrq	Input applied torque	$T_i$	N.m
	EngSpd	Input drive shaft speed	$\omega_i$	rad/s
Diff	DiffTrq	Output drive shaft torque	$T_t$	N.m
	DiffSpd	Output drive shaft speed	$\omega_t$	rad/s
Cltch	CltchForce	Applied clutch force	$F_c$	N
	CltchLocked	Clutch lock status, Boolean: <ul style="list-style-type: none"> <li>Locked — 0</li> <li>Unlocked — 1</li> </ul>	N/A	N/A
Trans	TransSpdRatio	Speed ratio at time $t$	$\phi(t)$	N/A
	TransEta	Ratio of output power to input power	$\eta$	N/A
	TransGearCmd	Commanded gear	$N_{cmd}$	N/A
	TransGear	Engaged gear	$N$	N/A

**EngSpd — Angular speed**

scalar

Applied drive shaft angular speed input,  $\omega_i$ , in rad/s.**DiffSpd — Angular speed**

scalar

Drive shaft angular speed output,  $\omega_d$ , in rad/s.**Parameters****Control type — Specify control type**

Ideal integrated controller (default) | External control

The AMT delivers drive shaft torque continuously by controlling the pressure signals from the clutch. If you select **Control type** parameter Ideal integrated controller, the

block generates idealized clutch pressure signals. To use your own clutch control signals, select **Control type** parameter External control.

**Dependencies**

This table summarizes the port configurations.

Control Mode	Creates Ports
External control	CltchCmd

**Efficiency factors — Specify efficiency calculation**

Gear only (default) | Gear, input torque, input speed, and temperature

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

**Dependencies**

Setting Parameter To	Enables
Gear only	<b>Efficiency vector, eta</b>
Gear, input torque, input speed, and temperature	<b>Efficiency torque breakpoints, Trq_bpts</b> <b>Efficiency speed breakpoints, omega_bpts</b> <b>Efficiency temperature breakpoints, Temp_bpts</b> <b>Efficiency lookup table, eta_tbl</b>

**Transmission****Input shaft inertia,  $J_{in}$  – Inertia**

scalar

Input shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .**Input shaft damping,  $b_{in}$  – Damping**

scalar

Input shaft damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .**Initial input velocity,  $\omega_{gain\_o}$  – Angular velocity**

scalar

Angular velocity, in  $\text{rad}/\text{s}$ .**Gear number vector,  $G$  – Specify number of transmission speeds**

vector

Vector of integer gear commands used to specify the number of transmission speeds. Neutral gear is 0. For example, you can set these parameter values.

To Specify	Set Gear number, $G$ To
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]
Three transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency torque breakpoints,  $\text{Trq\_bpts}$  – Breakpoints**

vector

Torque breakpoints for efficiency table, in  $\text{N}\cdot\text{m}$ .

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency speed breakpoints, omega\_bpts — Breakpoints**

vector

Speed breakpoints for efficiency table, rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Breakpoints**

vector

Temperature breakpoints for efficiency table, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Gear ratio vector, N — Ratio of input speed to output speed**

vector

Vector of gear ratios (that is, input speed to output speed) with indices corresponding to the ratios specified in **Gear number, G**. For neutral, set the gear ratio to 1. For example, you can set these parameter values.

To Specify Gear Ratios For	Set Gear number, G To	Set Gear ratio, N To
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]	[1, 4.47, 2.47, 1.47, 1]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]	[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

### Transmission inertia vector, $J_{out}$ – Gear rotational inertia vector

Vector of gear rotational inertias, with indices corresponding to the inertias specified in **Gear number, G**, in  $\text{kg}\cdot\text{m}^2$ . For example, you can set these parameter values.

To Specify Inertia For	Set Gear number, G To	Set Inertia, J To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.01, 2.28, 2.04, 0.32, 0.028]
Inertia for five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[2.28, 0.01, 2.28, 2.04, 0.32, 0.028, 0.01]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

### Transmission damping vector, $b_{out}$ – Gear viscous damping coefficient vector

Vector of gear viscous damping coefficients, with indices corresponding to the coefficients specified in **Gear number, G**, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ . For example, you can set these parameter values.

To Specify Damping For	Set Gear number, G To	Set Damping, b To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.001, 0.003, 0.0025, 0.002, 0.001]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.003, 0.001, 0.003, 0.0025, 0.002, 0.001, 0.001]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

### Efficiency vector, $\eta$ – Gear efficiency vector

Vector of gear mechanical efficiency, with indices corresponding to the efficiencies specified in **Gear number, G**. For example, you can set these parameter values.

To Specify Efficiency For	Set Gear number, G To	Set Efficiency, eta To
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.9, 0.9, 0.9, 0.9, 0.95]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Transmission damping vector**, and **Efficiency vector** parameters must be equal.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear only.

**Efficiency lookup table, eta\_tbl — Gear efficiency**  
array

Table of gear mechanical efficiency,  $\eta_N$  as a function of gear, input torque, input speed, and temperature.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Initial output velocity, omega\_o — Transmission**  
scalar

Transmission initial output rotational velocity,  $\omega_{to}$ , in rad/s. If you select **Clutch initially locked**, the block ignores the **Initial output velocity, omega\_o** parameter value.

**Initial gear, G\_o — Engaged gear**  
scalar

Initial gear to engage,  $G_o$ .

**Clutch and Synchronizer****Clutch pressure time constant,  $t_{auc}$  – Time**

scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

**Synchronization time,  $t_s$  – Time**

scalar

Time required for gear selection and synchronization,  $t_s$ , in s.

**Clutch time,  $t_c$  – Time**

scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

**Dependencies**

To create this parameter, select **Control type** parameter Ideal integrated controller.

**Effective clutch radius,  $R$  – Radius**

scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force, in m. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

**Clutch force gain,  $K_c$  – Force**

scalar

Open loop lock-up clutch gain,  $K_c$ , in N.

**Clutch static friction coefficient, mus — Coefficient**

scalar

Dimensionless clutch disc coefficient of static friction,  $\mu_s$ .

**Clutch kinematic friction coefficient, muk — Coefficient**

scalar

Dimensionless clutch disc coefficient of kinetic friction,  $\mu_k$ .

**Clutch initially locked — Select to initially lock clutch**

off (default)

Select to lock clutch initially.

**Dependencies**

To create this parameter, select **Control type** parameter Ideal integrated controller.

**Synchronizer initially locked — Select to initially lock synchronizer**

off (default)

Select to initially lock synchronizer.

AMT Controller | Continuously Variable Transmission | Dual Clutch Transmission | Ideal Fixed Gear Transmission

**Introduced in R2017a**

# AMT Controller

Automated manual transmission controller with clutch open, close, and synchronization timing

**Library:** Transmission / Transmission Controllers

## Description

The AMT Controller block implements an automated manual transmission (AMT) controller. You can specify the clutch open, close, and synchronization timing parameters. The block determines the clutch commands using integrator-based timers and latching logic that is based on the specified timing parameters and gear request.

## Ports

### Inputs

**GearReq — Gear number to engage**

scalar

Gear number request,  $G_{req}$ .

### Output

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable
GearReq	Gear number request	$G_{req}$
GearEngd	Nominal gear commanded by the controller	$G_o$
Clutch	Clutch pressure command for gears, between 0 and 1	NA

**GearEffct — Effective gear for shifting**

scalar

Effective gear for shifting. The block uses this signal for the smooth application of inertial, efficiency, gear ratio, and damping parameters.

**Clutch — Command for clutch pressure**

scalar

Clutch pressure command, between 0 and 1.

## Parameters

**Initial gear, G\_o — Engaged gear**

scalar

Initial gear to engage,  $G_o$ .

**Clutch actuation time, tc — Time**

scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

**Synchronizer time, ts — Time**

scalar

Time required for gear selection and synchronization,  $t_s$ , in s.

**Sample period, dt — Time**

scalar

Sample period,  $dt$ , in s.

**Clutch initially locked – Select to initially lock clutch**

off (default)

Selecting this parameter initially locks the clutch.

**Synchronizer initially locked – Select to initially lock synchronizer**

off (default)

Selecting this parameter initially locks the synchronizer.

# Continuously Variable Transmission

Push belt continuously variable transmission with independent radii control

**Library:** Transmission / Transmission Systems

## Description

The Continuously Variable Transmission block implements a push belt continuously variable transmission (CVT) with independent radii control. Use the block for control system design, powertrain matching, and fuel economy studies. You can configure the block for internal or external control:

- Internal — Input direction and pulley ratio requests
- External — Input direction and pulley displacement requests

The table summarizes the pulley kinematic, speed reduction, and dynamic calculations made by the Continuously Variable Transmission block.

Calculation	Pulley Kinematics	Reverse and Final Speed Reduction	Dynamics
Final angular speed ratio	✓	✓	✓
Belt torque applied to the secondary and primary pulleys			✓
Torque applied to the secondary and primary pulleys		✓	
Angular velocity of secondary and primary pulleys	✓	✓	✓

Calculation	Pulley Kinematics	Reverse and Final Speed Reduction	Dynamics
Belt and pulley geometry	✓		
Belt linear speed			✓
Wrap angle on secondary and primary pulley	✓		
Primary and secondary pulley radii	✓		

The figure shows the CVT variator with two configurations. In the first configuration, which illustrates speed reduction, the variator is set to decrease the primary pulley radius and increase the secondary pulley radius. In the second configuration, which illustrates overdrive, the variator is set to increase the primary pulley radius and decrease the secondary pulley radius.

## Pulley Kinematics

Using the physical dimensions of the system, the block calculates the primary and secondary variator positions that meet the pulley ratio request.

The figure and equations summarize the geometric dependencies.

$$C_{dist} = r_{p_{max}} + r_{gap} + r_{s_{max}}$$

$$L_0 = f(r_{p_{max}}, r_{s_{max}}, r_{p_{min}}, r_{s_{min}}, C_{dist})$$

$$ratio_{command} = f(ratio_{request}, ratio_{max}, ratio_{min})$$

$$r_{pri} = f(r_0, ratio_{command}, C_{dist})$$

$$r_{sec} = f(r_0, ratio_{command}, C_{dist})$$

$$x_{pri} = f(r_0, r_{pri}, \theta_{wedge})$$

$$x_{sec} = f(r_0, r_{sec}, \theta_{wedge})$$

The equations use these variables.

$ratio_{request}$	Pulley gear ratio request
$ratio_{command}$	Pulley gear ratio command, based on request and physical limitations
$r_{gap}$	Gap distance between variator pulleys
$C_{dist}$	Distance between variator pulley centers
$rp_{max}$	Maximum variator primary pulley radius
$rs_{max}$	Maximum variator secondary pulley radius
$rp_{min}$	Minimum variator primary pulley radius
$rs_{min}$	Minimum variator secondary pulley radius
$r_o$	Initial pulley radii with gear ratio of 1
$L_o$	Initial belt length, resulting from variator specification
$x_{pri}$	Variator primary pulley displacement, resulting from controller request
$x_{sec}$	Variator secondary pulley displacement, resulting from controller request
$r_{pri}$	Variator primary pulley radius, resulting from controller request
$r_{sec}$	Variator secondary pulley radius, resulting from controller request
$\Theta_{wedge}$	Variator wedge angle
$\Phi$	Angle of belt to pulley contact point
$L$	Belt length, resulting from variator position

## Reverse and Final Speed Reduction

The CVT input shaft connects to a planetary gear set that drives the primary pulley. The shift direction determines the input gear inertia, efficiency, and gear ratio. The shift direction is the filtered commanded direction:

$$\frac{Dir_{shift}}{Dir}(s) = \frac{1}{\tau_s s + 1}$$

For forward motion ( $Dir_{shift} = 1$ ):

$$N_i = 1$$

$$\eta_i = \eta_{fwd}$$

$$J_i = J_{fwd}$$

For reverse motion ( $Dir_{shift} = -1$ ):

$$N_i = -N_{rev}$$

$$\eta_i = \eta_{rev}$$

$$J_i = J_{rev}$$

The gear ratio and efficiency determine the input drive shaft speed and torque applied to the primary pulley:

$$T_{app\_pri} = \eta_i N_i T_i$$

The block reduces the secondary pulley speed and applied torque using a fixed gear ratio.

$$T_{app\_sec} = \frac{T_o}{\eta_o N_o}$$

$$\omega_o = \frac{\omega_{sec}}{N_o}$$

The final gear ratio, without slip, is given by:

$$N_{final} = \frac{\omega_i}{\omega_o} = N_i N_o \frac{r_{sec}}{r_{pri}}$$

The equations use these variables.

$N_i$	Input planetary gear ratio
$Dir$	CVT direction command
$Dir_{shift}$	Direction used to determine planetary inertia, efficiency, and ratio
$\tau_s$	Direction shift time constant
$\eta_{fwd}, \eta_{rev}$	Forward and reverse gear efficiency, respectively
$J_{fwd}, J_{rev}$	Forward and reverse gear inertia, respectively
$N_{rev}$	Reverse gear ratio
$T_{app\_pri}, T_{app\_sec}$	Torque applied to primary and secondary pulleys, respectively

$T_i$	Input drive shaft torque
$\omega_i, \omega_o$	Input and output drive shaft speed, respectively
$\omega_{pri}, \omega_{sec}$	Primary and secondary pulley speed, respectively
$N_{final}$	Total no-slip gear ratio

## Dynamics

The maximum torque that the CVT can transmit depends on the friction between the pulleys and belt. According to *Prediction of Friction Drive Limit of Metal V-Belt*, the torque friction is defined as:

$$T_{fric}(r_p, \mu) = \frac{2\mu F_{ax} r_p}{\cos(\theta_{wedge})}$$

Without macro slip, the tangential acceleration of the pulley is assumed to be equal to the belt acceleration. Once the torque reaches the static friction limit, the belt begins to slip, and the pulley and belt acceleration are independent. During slip, the torque transmitted by the belt is a function of the kinetic friction factor. During the transition from slip to non-slip conditions, the belt and tangential pulley velocities are equal.

The block implements these equations for four different slip conditions.

Condition	Equations
Belt slips on both secondary and primary pulleys	$(J_{pri} + J_i)\dot{\omega}_{pri} = T_{app\_pri} - T_{BoP\_pri} - b_{pri}\omega_{pri}$ $J_{sec}\dot{\omega}_{sec} = T_{app\_sec} - T_{BoP\_sec} - b_{sec}\omega_{sec}$ $m_b\dot{v}_b = \frac{T_{BoP\_pri}}{r_{pri}} + \frac{T_{BoP\_sec}}{r_{sec}} - b_b v_b$ $r_{pri}\omega_{pri} \neq v_b$ $r_{sec}\omega_{sec} \neq v_b$

Condition	Equations
Belt slips on only the primary pulley	$(J_{pri} + J_i)\dot{\omega}_{pri} = T_{app\_pri} - T_{BoP\_pri} - b_{pri}\omega_{pri}$ $\left(m_b + \frac{J_{sec}}{r_{sec}^2}\right)\dot{v}_b = \frac{T_{BoP\_pri}}{r_{pri}} + \frac{T_{BoP\_sec}}{r_{sec}} - \left(b_b + \frac{b_{sec}}{r_{sec}^2}\right)v_b$ $\omega_{sec} = \frac{v_b}{r_{sec}}$ $r_{pri}\omega_{pri} \neq v_b$ $T_{BoP\_pri} = \text{sgn}(r_{pri}\omega_{pri} - v_b)T_{fric}(r_{pri}, \mu_{kin})$ $ T_{BoP\_sec}  < T_{fric}(r_{sec}, \mu_{static})$
Belt slips on only the secondary pulley	$\left(m_b + \frac{J_{pri} + J_i}{r_{pri}^2}\right)\dot{v}_b = \frac{T_{app\_pri}}{r_{pri}} + \frac{T_{BoP\_sec}}{r_{sec}} - \left(b_b + \frac{b_{pri}}{r_{pri}^2}\right)v_b$ $J_{sec}\dot{\omega}_b = T_{app\_sec} + T_{BoP\_sec} - b_{sec}\omega_{sec}$ $\omega_{pri} = \frac{v_b}{r_{pri}}$ $r_{sec}\omega_{sec} \neq v_b$ $T_{BoP\_sec} = \text{sgn}(r_{sec}\omega_{sec} - v_b)T_{fric}(r_{sec}, \mu_{kin})$ $ T_{BoP\_pri}  < T_{fric}(r_{pri}, \mu_{static})$
Belt does not slip	$\left(m_b + \frac{J_{sec}}{r_{sec}^2} + \frac{J_{pri} + J_i}{r_{pri}^2}\right)\dot{v}_b = \frac{T_{app\_pri}}{r_{pri}} + \frac{T_{app\_sec}}{r_{sec}} - \left(b_b + \frac{b_{sec}}{r_{sec}^2} + \frac{b_{pri}}{r_{pri}^2}\right)v_b$ $\omega_{pri} = \frac{v_b}{r_{pri}}$ $\omega_{sec} = \frac{v_b}{r_{sec}}$ $ T_{BoP\_pri}  < T_{fric}(r_{pri}, \mu_{static})$ $ T_{BoP\_sec}  < T_{fric}(r_{sec}, \mu_{static})$

Condition	Equations
Slip direction	$PriSlipDir = \begin{cases} 0 & r_{pri}\omega_{pri} = v_b \\ 1 & r_{pri}\omega_{pri} > v_b \\ -1 & r_{pri}\omega_{pri} < v_b \end{cases}$ $SecSlipDir = \begin{cases} 0 & r_{sec}\omega_{sec} = v_b \\ 1 & r_{sec}\omega_{sec} > v_b \\ -1 & r_{sec}\omega_{sec} < v_b \end{cases}$

The equations use these variables.

$T_{BoP\_pri}, T_{BoP\_sec}$	Belt torque acting on the primary and secondary pulleys, respectively
$T_{app\_pri}, T_{app\_sec}$	Torque applied to primary and secondary pulleys, respectively
$J_{pri}, J_{sec}$	Primary and secondary pulley rotational inertias, respectively
$b_{pri}, b_{sec}$	Primary and secondary pulley rotational viscous damping, respectively
$F_{ax}$	Pulley clamp force
$\mu$	Coefficient of friction
$\mu_{kin}, \mu_{static}$	Coefficient of kinetic and static friction
$v_b, a_b$	Linear speed and acceleration of the belt, respectively
$m_b$	Total belt mass
$r_{pri}, r_{sec}$	Radii of the primary and secondary pulleys, respectively
$\Phi_{wrap}$	Wrap angle of belt to pulley contact point
$\Phi_{wrap\_pri}, \Phi_{wrap\_sec}$	Primary and secondary pulley wrap angles, respectively

## Ports

### Inputs

#### Dir – Direction request

scalar

Direction request,  $Dir_{req}$ , controlling the direction. The block filters the request to determine the direction, forward or reverse.  $Dir$  equals 1 for forward motion.  $Dir$  equals -1 for reverse.

$$Dir = \begin{cases} 1 & \text{when } Dir_{req} \geq 0 \\ -1 & \text{when } Dir_{req} < 0 \end{cases}$$

### **PllyRatioReq — Pulley ratio request**

scalar

CVT pulley ratio request,  $ratio_{request}$ .

#### **Dependencies**

To create this port, for the **Control mode** parameter, select `Ideal` integrated controller.

### **PriDisp — Primary pulley displacement**

scalar

Variator primary pulley displacement,  $x_{pri}$ , in m.

#### **Dependencies**

To create this port, for the **Control mode** parameter, select `External` control.

### **SecDisp — Secondary pulley displacement**

scalar

Variator secondary pulley displacement,  $x_{sec}$ , in m.

#### **Dependencies**

To create this port, for the **Control mode** parameter, select `External` control.

### **EngTrq — Input drive shaft torque**

scalar

External torque applied to the input drive shaft,  $T_i$ , in N.m.

### **DiffTrq — Output drive shaft torque**

scalar

External torque applied to the output drive shaft,  $T_o$ , in N.m.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal	Description	Variable	Units
EngTrq	Input shaft torque	$T_i$	N.m
DiffTrq	Output shaft torque	$T_o$	N.m
EngSpd	Input shaft speed	$\omega_i$	rad/s
DiffSpd	Output shaft speed	$\omega_o$	rad/s
PriRadius	Primary pulley radius	$r_{pri}$	m
PriPhi	Primary pulley wrap angle	$\Phi_{pri}$	rad
SecRadius	Secondary pulley radius	$r_{sec}$	m
SecPhi	Secondary pulley wrap angle	$\Phi_{sec}$	rad
BltLngthDelta	Change in belt length	$\Delta L$	m
BltLngth	Belt length	$L$	m
BltLngthInit	Initial belt length	$L_o$	m
BltOnPriTrq	Belt torque acting on the primary pulley	$T_{BoP\_pri}$	N.m
BltOnSecTrq	Belt torque acting on the secondary pulley	$T_{BoP\_sec}$	N.m
BltVel	Linear speed of the belt	$v_b$	m/s
PriAngVel	Primary pulley speed	$\omega_{pri}$	rad/s
SecAngVel	Secondary pulley speed	$\omega_{sec}$	rad/s
PriSlipDir	Primary pulley slip direction indicator	$PriSlipDir$	N/A
SecSlipDir	Secondary pulley slip direction indicator	$SecSlipDir$	N/A

Signal	Description	Variable	Units
TransSpdRatio	Total no-slip gear ratio	$N_{final}$	N/A

**EngSpd — Input drive shaft speed**

scalar

Input drive shaft angular speed,  $\omega_i$ , in rad/sec.

**DiffSpd — Output drive shaft speed**

scalar

Output drive shaft angular speed,  $\omega_o$ , in rad/sec.

## Parameters

**Control mode — External or internal**

Ideal integrated controller (default) | External control

Specify the control method, either internal or external.

**Dependencies**

This table summarizes the port and input model configurations.

Control Mode	Creates Ports
Ideal integrated controller	PllyRatioReq
External control	PriDisp
	SecDisp

**Kinematics**

**Maximum variator primary pulley radius, rp\_max — Radius**

scalar

Maximum variator primary pulley radius,  $rp_{max}$ , in m.

**Maximum variator secondary pulley radius, rs\_max — Radius**

scalar

Maximum variator secondary pulley radius,  $rs_{max}$ , in m.

**Minimum variator primary pulley radius,  $rp_{min}$  – Radius**  
scalar

Minimum variator primary pulley radius,  $rp_{min}$ , in m.

**Minimum variator secondary pulley radius,  $rs_{min}$  – Radius**  
scalar

Minimum variator secondary pulley radius,  $rs_{min}$ , in m.

**Gap distance between variator pulleys,  $rgap$  – Specify crown wheel connection**  
scalar

The gap between the secondary and primary pulleys,  $r_{gap}$ , in m. The figure shows the pulley geometry.

**Variator wedge angle,  $\theta_{wedge}$  – Specify crown wheel connection**  
scalar

Variator wedge angle,  $\theta_{wedge}$ , in deg.

**Dynamics**

**Primary pulley inertia,  $J_{pri}$  — Inertia**  
scalar

Primary pulley inertia,  $J_{pri}$ , in  $\text{kg}\cdot\text{m}^2$ .

**Secondary pulley inertia,  $J_{sec}$  — Inertia**  
scalar

Secondary pulley inertia,  $J_{sec}$ , in  $\text{kg}\cdot\text{m}^2$ .

**Primary pulley damping coefficient,  $b_{pri}$  — Damping**  
scalar

Primary pulley damping coefficient,  $b_{pri}$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Secondary pulley damping coefficient,  $b_{sec}$  — Damping**  
scalar

Secondary pulley damping coefficient,  $b_{sec}$ , in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

**Belt damping coefficient,  $b_b$  — Damping**  
scalar

Belt damping coefficient,  $b_b$ , in  $\text{kg}/\text{s}$ .

**Static friction coefficient, mu\_static – Friction**

scalar

Static friction coefficient between the belt and primary pulley,  $\mu_{static}$ , dimensionless.**Kinetic friction coefficient, mu\_kin – Friction**

scalar

Kinetic friction coefficient between the belt and primary pulley,  $\mu_{kin}$ , dimensionless.**Belt mass, m\_b – Mass**

scalar

Belt mass,  $m_b$ , in kg.**Pulley clamp force, F\_ax – Pulley clamp force**

scalar

Pulley clamp force,  $F_{ax}$ , in N.**Reverse and Output Ratio****Forward inertia, J\_fwd – Inertia**

scalar

Forward inertia,  $J_{fwd}$ , in  $\text{kg}\cdot\text{m}^2$ .**Reverse inertia, J\_rev – Inertia**

scalar

Reverse inertia,  $J_{rev}$ , in  $\text{kg}\cdot\text{m}^2$ .**Forward efficiency, eta\_fwd – Efficiency**

scalar

Forward efficiency,  $\eta_{fwd}$ , dimensionless.**Reverse efficiency, eta\_rev – Efficiency**

scalar

Reverse efficiency,  $\eta_{rev}$ , dimensionless.**Reverse gear ratio, N\_rev – Ratio**

scalar

Reverse gear ratio,  $N_{rev}$ , dimensionless.

**Shift time constant, tau\_s — Constant**

scalar

Shift time constant,  $\tau_s$ , in s.

**Output gear ratio, N\_o — Ratio**

scalar

Output gear ratio,  $N_o$ , dimensionless.

**Output gear efficiency, eta\_o — Efficiency**

scalar

Output gear efficiency,  $\eta_o$ , dimensionless.

# CVT Controller

Continuously variable transmission controller

**Library:** Transmission / Transmission Controllers

## Description

The CVT Controller block implements a push belt continuously variable transmission (CVT) controller. The block uses standard pulley and geometric equations to calculate the kinematic setpoints for the CVT variator. You can use the block to control a CVT.

## Pulley Kinematics

Using the physical dimensions of the system, the block calculates the primary and secondary variator positions that meet the pulley ratio request.

The figure and equations summarize the geometric dependencies.

$$C_{dist} = rp_{max} + r_{gap} + r_{sec\_max}$$

$$L_0 = f(rp_{max}, rs_{max}, rp_{min}, rs_{min}, C_{dist})$$

$$ratio_{command} = f(ratio_{request}, ratio_{max}, ratio_{min})$$

$$r_{pri} = f(r_0, ratio_{command}, C_{dist})$$

$$r_{sec} = f(r_0, ratio_{command}, C_{dist})$$

$$x_{pri} = f(r_0, r_{pri}, \theta_{wedge})$$

$$x_{sec} = f(r_0, r_{sec}, \theta_{wedge})$$

The equations use these variables.

- $ratio_{request}$  Pulley gear ratio request
- $ratio_{command}$  Pulley gear ratio command, based on request and physical limitations
- $r_{gap}$  Gap distance between variator pulleys
- $C_{dist}$  Distance between variator pulley centers
- $rp_{max}$  Maximum variator primary pulley radius

$rS_{max}$	Maximum variator secondary pulley radius
$rP_{min}$	Minimum variator primary pulley radius
$rS_{min}$	Minimum variator secondary pulley radius
$r_o$	Initial pulley radii with gear ratio of 1
$L_o$	Initial belt length, resulting from variator specification
$x_{pri}$	Variator primary pulley displacement, resulting from controller request
$x_{sec}$	Variator secondary pulley displacement, resulting from controller request
$r_{pri}$	Variator primary pulley radius, resulting from controller request
$r_{sec}$	Variator secondary pulley radius, resulting from controller request
$\Theta_{wedge}$	Variator wedge angle
$\Phi$	Angle of belt to pulley contact point
$L$	Belt length, resulting from variator position

## Dual Clutch Transmission

Dual clutch transmission that applies torque to the drive shaft

**Library:** Transmission / Transmission Systems

### Description

The Dual Clutch Transmission block implements a dual clutch transmission (DCT). In a DCT, two clutches apply mechanical torque to the drive shaft. Odd gears engage one clutch, while even gears engage the secondary clutch. The number of gears is specified via an integer vector with corresponding gear ratios, inertias, viscous damping, and efficiency factors. The clutch and synchronization engagement rates are linear and adjustable. You can provide external clutch signals or configure the block to generate idealized internal clutch signals. The block implements the transmission model with minimal parameterization or computational cost.

Use the block to model a simplified automated manual transmission (AMT) for:

- Power and torque capacity sizing
- Determining gear ratio impact on fuel economy and performance

To determine the rotational drive shaft speed and reaction torque, the Dual Clutch Transmission block calculates:

- Clutch lock-up and clutch friction
- Locked rotational dynamics
- Unlocked rotational dynamics

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

## Clutch Control

The DCT delivers drive shaft torque continuously by controlling the pressure signals from both clutches. If you select **Control mode** parameter `Ideal integrated controller`, the block generates idealized clutch pressure signals. The block uses the maximum pressure from each clutch to approximate the single-clutch commands that result in equivalent drive shaft torque. To use your own clutch control signals, select **Control mode** parameter `External control`.

## Clutch Lock-Up and Clutch Friction

Based on the clutch lock-up condition, the block implements one of these friction models.

If	Clutch Condition	Friction Model
$\omega_i \neq N\omega_d$ or $T_S <  T_f - Nw_i b_i $	Unlocked	$T_f = T_k$ where, $T_k = F_c R_{eff} \mu_k \tanh \left[ 4 \left( \frac{w_i}{N} - w_d \right) \right]$

$$T_s = F_c R_{eff} \mu_s$$

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

If	Clutch Condition	Friction Model
$\omega_i = N \omega_t$ and	Locked	$T_f = T_s$

$T_s \geq |T_f - Nb_i \omega_i|$   
 The equations use these variables.

- $\omega_t$  Output drive shaft speed
- $\omega_i$  Input drive shaft speed
- $\omega_d$  Drive shaft speed
- $b_i$  Viscous damping
- $F_c$  Applied clutch force
- $N$  Engaged gear
- Frictional torque
- $T_f$  Kinetic frictional torque
- $T_k$  Static frictional torque
- $T_s$  Effective clutch radius
- $R_{eff}$  Annular disk outer radius
- $R_o$  Annular disk inner radius
- $R_i$  Coefficient of static friction
- $\mu_s$  Coefficient of kinetic friction
- $\mu_k$

### Locked Rotational Dynamics

To model the rotational dynamics when the clutch is locked, the block implements these equations.

$$\dot{\omega}_d J_N = \eta_N T_d - \frac{\omega_i}{N} b_N + N T_i$$

$$\omega_i = N \omega_d$$

The block determines the input torque,  $T_i$ , through differentiation.

The equations use these variables.

$\omega_i$	Input drive shaft speed
$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$\eta_N$	Engaged gear efficiency
$T_d$	Drive shaft torque
$T_i$	Applied input torque

## Unlocked Rotational Dynamics

To model the rotational dynamics when the clutch is unlocked, the block implements this equation.

$$\dot{\omega}_d J_N = N T_f - \omega_d b_N + T_d$$

where:

$\omega_d$	Drive shaft speed
$N$	Engaged gear
$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear inertia
$T_d$	Drive shaft torque
$T_i$	Applied input torque

## Ports

### Inputs

**Gear — Gear number to engage**

scalar

Integer value of gear number to engage.

**ClutchACmd — Command for odd-numbered gears**

scalar

Clutch pressure command for odd-numbered gears, between 0 and 1.

**Dependencies**

To create this port, select **Control mode** parameter External control.

**ClutchBCmd — Command for even-numbered gears**

scalar

Clutch pressure command for even-numbered gears, between 0 and 1.

**Dependencies**

To create this port, select **Control mode** parameter External control.

**EngTrq — Applied torque**

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N.m.

**DiffTrq — Applied torque**

scalar

Applied load torque,  $T_d$ , typically from the drive shaft, in N.m.

**Temp — Oil temperature**

scalar

Oil temperature, in K. To determine the efficiency, the block uses a 4D lookup table that is a function of:

- Gear
- Input torque
- Input speed
- Oil temperature

### Dependencies

To create this port, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

## Output

### Info — Bus signal

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units
Eng	EngTrq	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper	$T_i$	N.m
	EngSpd	Applied drive shaft angular speed input	$\omega_i$	rad/s
Diff	DiffTrq	Applied load torque, typically from the differential	$T_d$	N.m
	DiffSpd	Drive shaft angular speed output	$\omega_d$	rad/s
Cltch	CltchForce	Applied clutch force	$F_c$	N
	CltchLocked	Clutch state	NA	NA
Trans	TransSpdRatio	Input to output speed ratio at time t	$\Phi(t)$	NA
	TransEta	Ratio of output power to input power	$\eta_N$	NA

Signal		Description	Variable	Units
	TransGearCmd	Commanded gear	$N_{cmd}$	NA
	TransGear	Engaged gear	$N$	NA

**EngSpd — Angular speed**

scalar

Drive shaft angular speed,  $\omega_d$ , in rad/s.

**DiffSpd — Angular speed**

scalar

Drive shaft angular speed,  $\omega_d$ , in rad/s.

## Parameters

**Control mode — Specify control mode**

External control (default) | Ideal integrated controller

The DCT delivers drive shaft torque continuously by controlling the pressure signals from both clutches. If you select **Control mode** parameter *Ideal integrated controller*, the block generates idealized clutch pressure signals. The block uses the maximum pressure from each clutch to approximate the single-clutch commands that result in equivalent drive shaft torque. To use your own clutch control signals, select **Control mode** parameter *External control*.

**Dependencies**

This table summarizes the port configurations.

Control Mode	Creates Ports
External control	CltchACmd
	CltchBCmd

**Efficiency factors — Specify efficiency calculation**

Gear only (default) | Gear, input torque, input speed, and temperature

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

#### Dependencies

Setting Parameter To	Enables
Gear only	<b>Efficiency vector, eta</b>
Gear, input torque, input speed, and temperature	<b>Efficiency torque breakpoints, Trq_bpts</b> <b>Efficiency speed breakpoints, omega_bpts</b> <b>Efficiency temperature breakpoints, Temp_bpts</b> <b>Efficiency lookup table, eta_tbl</b>

#### Transmission

##### **Input shaft inertia, Jin – Inertia**

scalar

Input shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

##### **Input shaft damping, bin – Damping**

scalar

Input shaft damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

##### **Initial input velocity, omegain\_o – Angular velocity**

scalar

Angular velocity, in rad/s.

**Efficiency torque breakpoints, Trq\_bpts — Breakpoints**

vector

Torque breakpoints for efficiency table, in N·m.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency speed breakpoints, omega\_bpts — Breakpoints**

vector

Speed breakpoints for efficiency table, in rad/s.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Breakpoints**

vector

Temperature breakpoints for efficiency table, in K.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Gear number vector, G — Specify number of transmission speeds**

vector

Vector of integers used to specify the number of transmission speeds. Neutral gear is 0. For example, you can set these parameter values.

To Specify	Set Gear number, G to
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]

To Specify	Set Gear number, G to
Three transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

### **Gear ratio vector, N – Ratio of input speed to output speed** vector

Vector of gear ratios (that is, input speed to output speed) with indices corresponding to the ratios specified in **Gear number, G**. For neutral, set the gear ratio to 1. For example, you can set these parameter values.

To Specify Gear Ratios for	Set Gear number, G to	Set Gear ratio, N to
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]	[1, 4.47, 2.47, 1.47, 1]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]	[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

### **Transmission inertia vector, Jout – Gear rotational inertia** vector

Vector of gear rotational inertias, with indices corresponding to the inertias specified in **Gear number, G**, in  $\text{kg}\cdot\text{m}^2$ . For example, you can set these parameter values.

To Specify Inertia for	Set Gear number, G to	Set Inertia, J to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.01, 2.28, 2.04, 0.32, 0.028]

To Specify Inertia for	Set Gear number, G to	Set Inertia, J to
Inertia for five gears, including reverse and neutral	[- 1, 0, 1, 2, 3, 4, 5]	[2.28, 0.01, 2.28, 2.04, 0.32, 0.028, 0.01]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Damping vector, b<sub>out</sub> — Gear viscous damping coefficient vector**

Vector of gear viscous damping coefficients, with indices corresponding to the coefficients specified in **Gear number, G**, in N.m\*s/rad. For example, you can set these parameter values.

To Specify Damping for	Set Gear number, G to	Set Damping, b to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.001, 0.003, 0.0025, 0.002, 0.001]
Five gears, including reverse and neutral	[- 1, 0, 1, 2, 3, 4, 5]	[0.003, 0.001, 0.003, 0.0025, 0.002, 0.001, 0.001]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency vector, eta — Gear efficiency vector**

Vector of gear mechanical efficiency, with indices corresponding to the efficiencies specified in **Gear number, G**. For example, you can set these parameter values.

To Specify Efficiency for	Set Gear number, G to	Set Efficiency, eta to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.9, 0.9, 0.9, 0.9, 0.95]
Five gears, including reverse and neutral	[- 1, 0, 1, 2, 3, 4, 5]	[0.9, 0.9, 0.9, 0.9, 0.9, 0.95, 0.95]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Transmission inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### **Dependencies**

To enable this parameter, set **Efficiency factors** to Gear only.

#### **Efficiency lookup table, eta\_tbl – Gear efficiency**

array

Table of gear mechanical efficiency,  $\eta_N$  as a function of gear, input torque, input speed, and temperature.

#### **Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

#### **Initial output velocity, omegaout\_o – Transmission**

scalar

Transmission initial output rotational velocity,  $\omega_{to}$ , in rad/s. If you select **Clutch initially locked**, the block ignores the **Initial output velocity, omega\_o** parameter value.

#### **Initial gear, G\_o – Engaged gear**

scalar

Initial gear to engage,  $G_o$ .

#### **Clutch and Synchronizer**

#### **Clutch pressure time constant, tauc – Time**

scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

#### **Synchronization time, ts – Time**

scalar

Time required for gear selection and synchronization,  $t_s$ , in s.

#### **Clutch time, tc – Time**

scalar

Time required to engage clutch,  $t_c$ , in s.

**Dependencies**

To create this parameter, select **Control mode** parameter Ideal integrated controller.

**Effective clutch radius, R — Radius**

scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force, in m. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

**Clutch force gain, K\_c — Force**

scalar

Open loop lock-up clutch gain,  $K_c$ , in N.

**Clutch static friction coefficient, mus — Coefficient**

scalar

Dimensionless clutch disc coefficient of static friction,  $\mu_s$ .

**Clutch kinematic friction coefficient, muk — Coefficient**

scalar

Dimensionless clutch disc coefficient of kinetic friction,  $\mu_k$ .

**Clutch initially locked — Select to initially lock clutch**

off (default)

Selecting this parameter initially locks the clutch.

**Dependencies**

To create this parameter, select **Control mode** parameter Ideal integrated controller.

**Synchronizer initially locked – Select to initially lock synchronizer**  
off (default)

Selecting this parameter initially locks the synchronizer.

# DCT Controller

Dual clutch transmission controller

**Library:** Transmission / Transmission Controllers

## Description

The DCT Controller block implements a dual clutch transmission (DCT) controller. You can specify the clutch open, close, and synchronization timing parameters. The block determines the clutch commands using integrator-based timers and latching logic that is based on the specified timing parameters and gear request.

## Ports

### Inputs

**GearReq — Gear number to engage**

scalar

Gear number request,  $G_{req}$ .

### Output

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal	Description	Variable
GearReq	Gear number request	$G_{req}$

Signal	Description	Variable
GearEngd	Nominal gear commanded by the controller	$G_o$
GearEffct	Effective gear	NA
ClutchACmd	Clutch pressure command for odd-numbered gears, between 0 and 1	NA
ClutchBCmd	Clutch pressure command for even-numbered gears, between 0 and 1	NA

### **NomGear — Nominal gear for shifting**

scalar

Nominal gear for shifting. The Dual Clutch Transmission block uses this signal for the smooth application of inertial, efficiency, gear ratio, and damping parameters.

### **ClutchACmd — Command for odd-numbered gears**

scalar

Clutch pressure command for odd-numbered gears, between 0 and 1.

### **ClutchBCmd — Command for even-numbered gears**

scalar

Clutch pressure command for even-numbered gears, between 0 and 1.

## **Parameters**

### **Initial gear, G\_o — Engaged gear**

scalar

Initial gear to engage,  $G_o$ .

### **Clutch actuation time, t\_c — Time**

scalar

Time required to engage and disengage the clutch during shift events,  $t_c$ , in s.

### **Synchronizer time, t\_s — Time**

scalar

Time required for gear selection and synchronization,  $t_s$ , in s.

**Sample period, dt — Time**

scalar

Sample period,  $dt$ , in s.

**Clutch initially locked — Select to initially lock clutch**

off (default)

Selecting this parameter initially locks the clutch.

**Synchronizer initially locked — Select to initially lock synchronizer**

off (default)

Selecting this parameter initially locks the synchronizer.

# Ideal Fixed Gear Transmission

Ideal fixed gear transmission without clutch or synchronization

**Library:** Transmission / Transmission Systems

## Description

The Ideal Fixed Gear Transmission implements an idealized fixed-gear transmission without a clutch or synchronization. Use the block to model the overall gear ratio and power loss when you do not need a detailed transmission model, for example, in component-sizing, fuel economy, and emission studies. The block implements a transmission model with minimal parameterization or computational cost.

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

The block uses this equation to determine the transmission dynamics:

$$\dot{\omega}_i \frac{J_N}{N} = \eta_N \left( \frac{T_o}{N} + T_i \right) - \frac{\omega_i}{N^2} b_N$$

$$\omega_i = N \omega_o$$

The block filters the gear command signal:

$$\frac{G}{G_{cmd}}(s) = \frac{1}{\tau_s s + 1}$$

The equations use these variables.

$b_N$	Engaged gear viscous damping
$J_N$	Engaged gear rotational inertia
$\eta_N$	Engaged gear efficiency
$G$	Engaged gear number
$G_{cmd}$	Gear number to engage
$N$	Engaged gear ratio
$T_i$	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper
$T_o$	Applied load torque, typically from the differential or drive shaft
$\omega_o$	Output drive shaft angular speed
$\omega_i, \dot{\omega}_i$	Applied drive shaft angular speed and acceleration
$\tau_s$	Shift time constant

## Ports

### Inputs

#### **Gear — Gear number to engage**

scalar

Integer value of gear number to engage,  $G_{cmd}$ .

#### **EngTrq — Applied input torque**

scalar

Applied input torque,  $T_i$ , typically from the engine crankshaft or dual mass flywheel damper, in N·m.

**DiffTrq — Applied load torque**

scalar

Applied load torque,  $T_o$ , typically from the differential, in N·m.

**Temp — Oil temperature**

scalar

Oil temperature, in K. To determine the efficiency, the block uses a 4D lookup table that is a function of:

- Gear
- Input torque
- Input speed
- Oil temperature

**Dependencies**

To create this port, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Output****Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Variable	Units
Eng	EngTrq	Applied input torque, typically from the engine crankshaft or dual mass flywheel damper	$T_i$	N·m
	EngSpd	Applied drive shaft angular speed input	$\omega_i$	rad/s
Diff	DiffTrq	Applied load torque, typically from the differential	$T_o$	N·m
	DiffSpd	Drive shaft angular speed output	$\omega_o$	rad/s

Signal		Description	Variable	Units
Trans	TransSpd Ratio	Input to output speed ratio at time $t$	$\Phi(t)$	N/A
	TransEta	Ratio of output power to input power	$\eta_N$	N/A
	TransGearCmd	Commanded gear	$N_{cmd}$	N/A
	TransGear	Engaged gear	$N$	N/A

**EngSpd — Angular speed**

scalar

Applied drive shaft angular speed input,  $\omega_i$ , in rad/s.

**DiffSpd — Angular speed**

scalar

Drive shaft angular speed output,  $\omega_o$ , in rad/s.

## Parameters

**Efficiency factors — Specify efficiency calculation**

Gear only (default) | Gear, input torque, input speed, and temperature

To specify the block efficiency calculation, for **Efficiency factors**, select either of these options.

Setting	Block Implementation
Gear only	Efficiency determined from a 1D lookup table that is a function of the gear.

Setting	Block Implementation
Gear, input torque, input speed, and temperature	Efficiency determined from a 4D lookup table that is a function of: <ul style="list-style-type: none"> <li>• Gear</li> <li>• Input torque</li> <li>• Input speed</li> <li>• Oil temperature</li> </ul>

### Dependencies

Setting Parameter To	Enables
Gear only	<b>Efficiency vector, eta</b>
Gear, input torque, input speed, and temperature	<b>Efficiency torque breakpoints, Trq_bpts</b> <b>Efficiency speed breakpoints, omega_bpts</b> <b>Efficiency temperature breakpoints, Temp_bpts</b> <b>Efficiency lookup table, eta_tbl</b>

### Gear property interpolation method – Interpolation

Nearest (default) | Linear | Flat | Cubic spline

Method that the block uses to switch the gear ratio during gear shifting.

### Transmission

#### Gear number vector, **G** – Specify number of transmission speeds

vector

Vector of integer gear commands used to specify the number of transmission speeds. Neutral gear is 0. For example, you can set these parameter values.

To Specify	Set Gear number, <b>G</b> to
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]

To Specify	Set Gear number, G to
Three transmission speeds, including neutral and reverse	[- 1, 0, 1, 2, 3]
Five transmission speeds, including neutral and reverse	[- 1, 0, 1, 2, 3, 4, 5]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency torque breakpoints, Trq\_bpts — Breakpoints**  
vector

Torque breakpoints for efficiency table.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency speed breakpoints, omega\_bpts — Breakpoints**  
vector

Speed breakpoints for efficiency table.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Efficiency temperature breakpoints, Temp\_bpts — Breakpoints**  
vector

Temperature breakpoints for efficiency table.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Gear ratio vector, N — Ratio of input speed to output speed**  
vector

Vector of gear ratios (that is, input speed to output speed) with indices corresponding to the ratios specified in **Gear number, G**. For neutral, set the gear ratio to 1. For example, you can set these parameter values.

To Specify Gear Ratios for	Set Gear number, G to	Set Gear ratio, N to
Four transmission speeds, including neutral	[0, 1, 2, 3, 4]	[1, 4.47, 2.47, 1.47, 1]
Five transmission speeds, including neutral and reverse	[-1, 0, 1, 2, 3, 4, 5]	[-4.47, 1, 4.47, 2.47, 1.47, 1, 0.8]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### **Inertia vector, Jout – Gear rotational inertia vector**

Vector of gear rotational inertias,  $J_N$ , with indices corresponding to the inertias specified in **Gear number, G**, in  $\text{kg}\cdot\text{m}^2$ . For example, you can set these parameter values.

To Specify Inertia for	Set Gear number, G to	Set Inertia, J to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.01, 2.28, 2.04, 0.32, 0.028]
Inertia for five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[2.28, 0.01, 2.28, 2.04, 0.32, 0.028, 0.01]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

#### **Damping vector, bout – Gear viscous damping coefficient vector**

Vector of gear viscous damping coefficients,  $b_N$ , with indices corresponding to the coefficients specified in **Gear number, G**, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ . For example, you can set these parameter values.

To Specify Damping for	Set Gear number, G to	Set Damping, b to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.001, 0.003, 0.0025, 0.002, 0.001]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.003, 0.001, 0.003, 0.0025, 0.002, 0.001, 0.001]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Efficiency vector, eta — Gear efficiency vector**

Vector of gear mechanical efficiency,  $\eta_N$ , with indices corresponding to the efficiencies specified in **Gear number**, **G**. For example, you can set these parameter values.

To Specify Efficiency for	Set Gear number, G to	Set Efficiency, eta to
Four gears, including neutral	[0, 1, 2, 3, 4]	[0.9, 0.9, 0.9, 0.9, 0.95]
Five gears, including reverse and neutral	[-1, 0, 1, 2, 3, 4, 5]	[0.9, 0.9, 0.9, 0.9, 0.95, 0.95]

Vector dimensions for the **Gear number vector**, **Gear ratio vector**, **Inertia vector**, **Damping vector**, and **Efficiency vector** parameters must be equal.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear only.

**Efficiency lookup table, eta\_tbl — Gear efficiency array**

Table of gear mechanical efficiency,  $\eta_N$  as a function of gear, input torque, input speed, and temperature.

**Dependencies**

To enable this parameter, set **Efficiency factors** to Gear, input torque, input speed, and temperature.

**Initial output velocity, omega\_o – Transmission**

scalar

Transmission initial output rotational velocity,  $\omega_{to}$ , in rad/s. If you select **Clutch initially locked**, the block ignores the **Initial output velocity, omega\_o** parameter value.

**Shift time constant, tau\_s – Time**

scalar

Shift time constant,  $\tau_s$ , in s.

**See Also**

## Torque Converter

Three-part torque converter consisting of an impeller, turbine, and stator

**Library:** Transmission / Torque Converters

## Description

The Torque Converter block implements a three-part torque converter consisting of an impeller, turbine, and stator with an optional clutch lock-up capability. The block can simulate driving (power flowing from impeller to turbine) and coasting (power flowing from turbine to impeller).

You can specify torque converter characteristics:

- Speed ratio — Ratio of turbine angular speed to impeller angular speed
- Torque ratio — Ratio of turbine torque to impeller torque
- Capacity factor parameterization — Function of input speed or input torque

Optional clutch lock-up configurations include:

- No lock-up — Model fluid-coupling only
- Lock-up — Model automatic clutch engagement
- External lock-up — Model clutch pressure as input from an external signal

## Equations

The block implements equations that use these variables.

$T_f$	Frictional torque
$T_k$	Kinetic frictional torque
$T_s$	Static frictional torque
$T_i$	Applied input torque
$T_p$	Impeller reaction torque
$T_{ext}$	Externally applied turbine torque
$\psi(\phi)$	Torque conversion capacity factor
$\zeta(\phi)$	Torque ratio
$\omega_i$	Impeller rotational shaft speed

$\omega_t$	Turbine rotational shaft speed
$J_i$	Impeller rotational inertia
$J_t$	Turbine rotational inertia
$b_i$	Impeller rotational viscous damping
$b_t$	Turbine rotational viscous damping
$R_{eff}$	Effective clutch radius
$R_o$	Annular disk outer radius
$R_i$	Annular disk inner radius

Based on the clutch lock-up condition, the block implements these friction models.

If	Clutch Condition	Friction Model
$\omega_i \neq \omega_t$ or $T_S < \left  \frac{J_t}{(J_i + J_t)} [T_i + T_f - \omega_t(b_t + b_i)] \right $	Unlocked	$T_f = T_k$ where: $T_k = F_c R_{eff} m_k \tanh [4(\omega_i - \omega_t)]$
$\omega_i = \omega_t$ and $T_S \geq \left  \frac{J_t}{(J_i + J_t)} [T_i + T_f - \omega_t(b_t + b_i) + \omega_t b_t] \right $	Locked	$T_{fs} = F_c R_{eff} m_s$ $R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$

To model the rotational dynamics if the clutch is locked, the block implements equations.

$$\dot{\omega}(J_i + J_t) = T_i - \omega(b_i + b_t) + T_{ext}$$

$$\omega = \omega_i = \omega_t$$

The rotational velocity represents both the impeller and turbine rotational velocities.

To model the rotational dynamics if the clutch is unlocked, the block implements equations.

$$\dot{\omega}_i J_i = T_i - \omega_i b_i - T_f - T_p$$

$$\dot{\omega}_t J_t = T_{ext} - \omega_t b_t + T_f + T_t$$

$$T_p = \omega_i^2 \psi(\phi)$$

$$T_t = T_p \zeta(\phi)$$

To approximate the torque multiplication lag between the impeller and turbine, you can specify the parameter **Fluid torque response time constant (set to 0 to disable), tauc [s]**.

## Ports

### Inputs

#### ImpTrq — Applied impeller torque

scalar

Applied input torque, typically from the engine crankshaft or dual mass flywheel, in N.m.

#### TurbTrq — Applied turbine torque

scalar

Applied turbine torque, typically from the transmission, in N.m.

#### Clutch Force — Applied clutch force

scalar

Applied clutch force, typically from a hydraulic actuator, in N.

**Dependencies**

To create this port, select External lock-up input for the **Lock-up clutch configuration** parameter.

**Output**

**Info — Bus signal**

bus

Bus signal containing these block calculations.

Signal		Description	Units
Imp	ImpTrq	Applied input torque	N.m
	ImpSpd	Impeller rotational shaft speed	rad/s
Turb	TurbTrq	Applied turbine torque	N.m
	TurbSpd	Turbine rotational shaft speed	rad/s
Cltch	CltchForce	Applied clutch force	N
	CltchLocked	Clutch locked or unlocked state	N/A
TrqConv	TrqConvSpdRatio	Turbine to impeller speed ratio	N/A
	TrqConvEta	Torque conversion efficiency	N/A

**ImpSpd — Impeller speed**

scalar

Impeller rotational shaft speed,  $\omega_i$ , in rad/s.

**TrbSpd — Turbine speed**

scalar

Turbine rotational shaft speed,  $\omega_t$ , in rad/s.

## Parameters

### Configuration

#### Lock-up clutch configuration – Select lock-up clutch configuration

Lock-up (default) | No lock-up | External lock-up input

To Model	Select
Fluid-coupling only	No lock-up
Automatic clutch engagement	Lock-up
Clutch pressure as input from an external signal	External lock-up input

### Dependencies

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

### Torque Converter

#### Impeller shaft inertia, $J_i$ – Inertia

scalar

Impeller shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

#### Impeller shaft viscous damping, $b_i$ – Viscous damping coefficient

scalar

Impeller shaft viscous damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

#### Turbine shaft inertia, $J_t$ – Inertia

scalar

Turbine shaft inertia, in  $\text{kg}\cdot\text{m}^2$ .

#### Turbine shaft viscous damping, $b_t$ – Viscous damping coefficient

scalar

Turbine shaft viscous damping, in  $\text{N}\cdot\text{m}\cdot\text{s}/\text{rad}$ .

#### Initial impeller shaft velocity, $\omega_{\text{gaio}}$ – Angular velocity

scalar

Initial impeller shaft velocity, in rad/s.

**Initial turbine shaft velocity,  $\omega_{t0}$  — Angular velocity**  
scalar

Initial turbine shaft velocity, in rad/s.

**Speed ratio vector,  $\phi$  — Ratio**  
vector

Vector of turbine speed to impeller speed ratios. Breakpoints for the capacity and torque multiplication vectors.

**Capacity factor parameterization — Select factor ratio type**

Input speed /  $\sqrt{\text{input torque}}$  (default) | Absorbed torque / input speed<sup>2</sup>

To Set Factor Ratio to	Select
Impeller angular velocity to square root impeller torque	Input speed / $\sqrt{\text{input torque}}$
Impeller absorbed torque to square of impeller angular velocity	Absorbed torque / input speed <sup>2</sup>

**Capacity vector,  $\psi$  — Vector**  
vector

Capacity factor parameterization Setting	Capacity Vector Units
Input speed / $\sqrt{\text{input torque}}$	(rad/s)/(N.m) <sup>0.5</sup>
Absorbed torque / input speed <sup>2</sup>	N.m/(rad/s) <sup>2</sup>

**Torque ratio vector,  $\zeta$  — Vector**  
vector

Vector of turbine torque to impeller speed ratios.

**Fluid torque response time constant (set to 0 to disable), tauTC – Time constant**

scalar

To account for the delay in torque calculations due to changing input torque, specify the fluid torque transfer time constant, in s.

**Interpolation method – Select interpolation method**

Linear (default) | Flat | Nearest

Interpolates the torque ratio and capacity factor functions between the discrete relative velocity values.

**Clutch**

**Clutch force equivalent net radius, Reff – Effective radius**

scalar

The effective radius,  $R_{eff}$ , used with the applied clutch friction force to determine the friction force, in m. The effective radius is defined as:

$$R_{eff} = \frac{2(R_o^3 - R_i^3)}{3(R_o^2 - R_i^2)}$$

The equation uses these variables.

$R_o$  Annular disk outer radius

$R_i$  Annular disk inner radius

**Dependencies**

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

**Static friction coefficient, mus – Coefficient**

scalar

Dimensionless clutch disc coefficient of static friction.

**Dependencies**

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

**Kinetic friction coefficient, muk — Coefficient**

scalar

Dimensionless clutch disc coefficient of kinetic friction.

To enable the **Clutch** parameters, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

**Initially lock clutch — Select to initially lock clutch**

off (default)

**Dependencies**

To enable this parameter, select Lock-up or External lock-up input for the **Lock-up clutch configuration** parameter.

**Lock-up speed ratio threshold, philu — Threshold**

scalar

Set speed ratio threshold that engages clutch lock-up.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Minimum lock-up engagement speed, omegalmin — Angular velocity**

scalar

Set the minimum impeller speed that engages clutch lock-up, in rad/s.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Lock-up disengagement speed, omegau — Angular velocity**

scalar

Set the minimum impeller speed that disengages clutch lock-up, in rad/s.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Lock-up clutch force gain, Kclutch — Gain**

scalar

Open loop clutch lock-up force gain, in N.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

**Lock-up clutch time constant, tau<sub>lu</sub> — Time constant**

scalar

Open loop clutch lock-up time constant, in s.

**Dependencies**

To enable this parameter, select Lock-up for the **Lock-up clutch configuration** parameter.

# Functions

---

## mdf

Access information contained in MDF file

### Syntax

```
mdfObj = mdf(mdfFileName)
```

### Description

`mdfObj = mdf(mdfFileName)` identifies a measurement data format (MDF) file and returns an MDF file object, which you can use to access information and data contained in the file. You can specify a full or partial path to the file.

---

**Note** This function is supported only on 64-bit Windows® operating systems.

---

### Examples

#### Create MDF File Object for Specified MDF File

Create an MDF object for a given file, and view the object display.

```
mdfObj = mdf('MDFFile.mf4')
```

MDF with properties:

#### File Details

```
      Name: 'MDFFile.mf4'  
      Path: 'c:\temp\MDFFile.mf4'  
      Author: 'HOK'  
      Department: 'Research'  
      Project: 'MDF'  
      Subject: 'CAN bus'  
      Comment: 'This file contains CAN messages'  
      Version: '4.10'
```

```

        DataSize: 32100
    InitialTimestamp: 2016-02-27 12:09:02

    Creator Details
        ProgramIdentifier: 'mmddff.04'
        Creator: [1x1 struct]

    File Contents
        Attachment: [1x1 struct]
        ChannelNames: {6x1 cell}
        ChannelGroup: [1x6 struct]

```

## Input Arguments

### **mdfFileName** — MDF file name

char vector | string

MDF file name, specified as a character vector or string, including the necessary full or relative path.

Example: 'MDFFile.mf4'

Data Types: char | string

## Output Arguments

### **mdfObj** — MDF file

MDF file object

MDF file, returned as an MDF file object. The object provides access to the MDF file information contained in the following properties.

Property	Description
Name	Name of the MDF file, including extension
Path	Full path to the MDF file, including file name
Author	Author who originated the MDF file
Department	Department that originated the MDF file
Project	Project that originated the MDF file

<b>Property</b>	<b>Description</b>
Subject	Subject matter in the MDF file
Comment	Open comment field from the MDF file
Version	MDF standard version of the file
DataSize	Total size of the data in the MDF file, in bytes
InitialTimestamp	Time when file data acquisition began in UTC or local time
ProgramIdentifier	Originating program of the MDF file
Creator	Structure containing details about creator of the MDF file, with these fields: VendorName, ToolName, ToolVersion, UserName, and Comment
Attachment	Structure of information about attachments contained within the MDF file, with these fields: Name, Path, Comment, Type, MIMETYPE, Size, EmbeddedSize, and MD5Checksum
ChannelNames	Cell array of the channel names in each channel group
ChannelGroup	Structure of information about channel groups contained within the MDF file, with these fields: AcquisitionName, Comment, NumSamples, DataSize, Sorted, and Channel

## See Also

### Functions

read | saveAttachment

**Introduced in R2016b**

---

## read

Read channel data from MDF file

### Syntax

```
data = read(mdfObj)
data = read(mdfObj,chanGroupIndex,chanName)
data = read(mdfObj,chanGroupIndex,chanName,startPosition)
data = read(mdfObj,chanGroupIndex,chanName,startPosition,
endPosition)
data = read(mdfObj,chanGroupIndex,chanName,startPosition,
endPosition,'OutputFormat',fmtType)
[data,time] = read(mdfObj,chanGroupIndex,chanName,startPosition,
endPosition,'OutputFormat','Vector')
```

### Description

`data = read(mdfObj)` reads all data for all channels from the MDF file identified by the MDF file object `mdfObj`, and assigns the output to `data`. If the file data is one channel group, the output is a timetable; multiple channel groups are returned as a cell array of timetables, where the cell array index corresponds to the channel group number.

---

**Note** This function is supported only on 64-bit Windows operating systems.

---

`data = read(mdfObj,chanGroupIndex,chanName)` reads all data for the specified channel from the MDF file identified by the MDF file object `mdfObj`.

`data = read(mdfObj,chanGroupIndex,chanName,startPosition)` reads data from the position specified by `startPosition`.

`data = read(mdfObj,chanGroupIndex,chanName,startPosition, endPosition)` reads data for the range specified from `startPosition` to `endPosition`.

`data = read(mdfObj, chanGroupIndex, chanName, startPosition, endPosition, 'OutputFormat', fmtType)` returns data with the specified output format.

`[data, time] = read(mdfObj, chanGroupIndex, chanName, startPosition, endPosition, 'OutputFormat', 'Vector')` returns two vectors of channel data and corresponding timestamps.

## Examples

### Read All Data from MDF File

Read all available data from the MDF file.

```
mdfObj = mdf('MDFFile.mf4');  
data = read(mdfObj);
```

### Read All Data from Multiple Channels

Read all available data from the MDF file for specified channels.

```
mdfObj = mdf('MDFFile.mf4');  
data = read(mdfObj, 1, {'Channel1', 'Channel2'});
```

### Read Range of Data from Specified Index Values

Read a range of data from the MDF file using indexing for `startPosition` and `endPosition` to specify the data range.

```
mdfObj = mdf('MDFFile.mf4');  
data = read(mdfObj, 1, {'Channel1', 'Channel2'}, 1, 10);
```

### Read Range of Data from Specified Time Values

Read a range of data from the MDF file using time values for `startPosition` and `endPosition` to specify the data range.

```
mdfObj = mdf('MDFFile.mf4');  
data = read(mdfObj,1,{'Channel1','Channel2'},seconds(5.5),seconds(7.3));
```

### Read All Data in Vector Format

Read all available data from the MDF file, returning data and time vectors.

```
mdfObj = mdf('MDFFile.mf4');  
[data,time] = read(mdfObj,1,'Channel1','OutputFormat','Vector');
```

### Read All Data in Time Series Format

Read all available data from the MDF file, returning time series data.

```
mdfObj = mdf('MDFFile.mf4');  
data = read(mdfObj,1,'Channel1','OutputFormat','TimeSeries');
```

## Input Arguments

### **mdfObj** — MDF file

MDF file object

MDF file, specified as an MDF file object.

Example: `mdf('MDFFile.mf4')`

### **chanGroupIndex** — Index of the channel group

numeric value

Index of channel group, specified as a numeric value that identifies the channel group from which to read.

Example: 1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

### **chanName** — Name of channel

char vector | string

Name of channel, specified as a character vector, string, or array. `chanName` identifies the name of a channel in the channel group. Use a cell array of character vectors or array of string to identify multiple channels.

Example: 'Channel1'

Data Types: `char` | `string` | `cell`

### **startPosition** — First position of channel data

numeric value | duration

First position of channel data, specified as a numeric value or duration. The `startPosition` option specifies the first position from which to read channel data. Provide a numeric value to specify an index position; use a duration to specify a time position. If only `startPosition` is provided without the `endPosition` option, the data value at that location is returned. When used with `endPosition` to specify a range, the function returns data from the `startPosition` (inclusive) to the `endPosition` (noninclusive).

Example: 1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | duration

### **endPosition** — Last position of channel data range

numeric value | duration

Last position of channel data range, specified as a numeric value or duration. The `endPosition` option specifies the last position for reading a range of channel data. Provide both the `startPosition` and `endPosition` to specify retrieval of a range of data. The function returns up to but not including `endPosition` when reading a range. Provide a numeric value to specify an index position; use a duration to specify a time position.

Example: 1000

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | duration

### **fmtType** — Format for output data

'T timetable' (default) | 'Vector' | 'TimeSeries'

Format for output data, specified as a character vector or string. This option formats the output according to the following table.

OutputFormat	Description
'Timetable'	Return a timetable from one or more channels into one output variable. This is the only format allowed when reading from multiple channels at the same time. (Default.)  Note: The timetable format includes columns for the MDF channels. Because the column titles must be valid MATLAB identifiers, they might not be exactly the same as those values in the MDF object ChannelNames property. The column headers are derived from the property using the function <code>matlab.lang.makeValidName</code> . The original channel names are available in the VariableDescriptions property of the <code>timetable</code> object.
'Vector'	Return a vector of numeric data values, and optionally a vector of time values from one channel. Use one output variable to return only data, or two output variables to return both data and time vectors.
'TimeSeries'	Return a time series of data from one channel.

Example: 'Vector'

Data Types: char | string

## Output Arguments

### **data** — Channel data

timetable (default) | double | time series | cell array

Channel data, returned as vector of doubles, a time series, a timetable, or cell array of timetables, according to the 'OutputFormat' option setting and the number of channel groups.

### **time** — Channel data times

double

Channel data times, returned as a vector of double elements. The time vector is returned only when the 'OutputFormat' is set to 'Vector'.

# saveAttachment

Save attachment from MDF file

## Syntax

```
saveAttachment(mdfObj,AttachmentName)
saveAttachment(mdfObj,AttachmentName,DestFile)
```

## Description

`saveAttachment(mdfObj,AttachmentName)` saves the specified attachment from the MDF file to the current MATLAB working folder. The attachment is saved with its existing name.

---

**Note** This function is supported only on 64-bit Windows operating systems.

---

`saveAttachment(mdfObj,AttachmentName,DestFile)` saves the specified attachment from the MDF file to the given destination. You can specify relative or absolute paths to place the attachment in a specific folder.

## Examples

### Save Attachment with Original Name

Save an MDF file attachment with its original name in the current folder.

```
mdfObj = mdf('MDFFile.mf4');
saveAttachment(mdfObj,'AttachmentName.ext')
```

### Save Attachment with New Name

Save an MDF file attachment with a new name in the current folder.

```
mdfObj = mdf('MDFFile.mf4');  
saveAttachment(mdfObj, 'AttachmentName.ext', 'MyFile.ext')
```

### Save Attachment in Parent Folder

Save an MDF file attachment in a folder specified with a relative path name, in this case in the parent of the current folder.

```
mdfObj = mdf('MDFFile.mf4');  
saveAttachment(mdfObj, 'AttachmentName.ext', '..\MyFile.ext')
```

### Save Attachment in Specified Folder

This example saves an MDF file attachment using an absolute path name.

```
mdfObj = mdf('MDFFile.mf4');  
saveAttachment(mdfObj, 'AttachmentName.ext', 'C:\MyDir\MyFile.ext')
```

## Input Arguments

### **mdfObj** — MDF file

MDF file object

MDF file, specified as an MDF file object.

Example: `mdf('MDFFile.mf4')`

### **AttachmentName** — MDF file attachment name

char vector | string

MDF file attachment name, specified as a character vector or string. The name of the attachment is available in the Name field of the MDF file object Attachment property.

Example: `'file1.dbc'`

Data Types: char | string

**DestFile – Destination file name for the saved attachment**

existing attachment name (default) | char vector | string

Destination file name for the saved attachment, specified as a character vector or string. The specified destination can include an absolute or relative path, otherwise the attachment is saved in the current folder.

Example: 'MyFile.ext'

Data Types: char | string

**See Also****Functions**

**Introduced in R2016b**

## mdfDatastore

Datastore for collection of MDF files

### Syntax

```
mdfds = mdfDatastore(location)
mdfds = mdfDatastore(__, 'Name1', Value1, 'Name2', Value2, ...)
```

### Description

`mdfds = mdfDatastore(location)` creates an `MDFDatastore` based on an MDF file or a collection of files in the folder specified by `location`. All files in the folder with extensions `.mdf`, `.dat`, or `.mf4` are included.

`mdfds = mdfDatastore(__, 'Name1', Value1, 'Name2', Value2, ...)` specifies function options and properties of `mdfds` using optional name-value pairs.

### Examples

#### Create an MDF Datastore

Create an MDF datastore from the sample file `CANape.MF4`, and read it into a timetable.

```
mdfds = mdfDatastore(fullfile(matlabroot, 'examples', 'vnt', 'CANape.MF4'));
while hasdata(mdfds)
    m = read(mdfds);
end
```

### Input Arguments

#### **location** — Location of MDF datastore files

character vector | cell array

Location of MDF datastore files, specified as a character vector or cell array of character vectors, identifying either files or folders. The path can be relative or absolute, and can contain the wildcard character \*. If `location` specifies a folder, the datastore includes by default all files in that folder with extensions `.mdf`, `.dat`, or `.mf4`.

Example: `'CANape.MF4'`

Data Types: `char` | `cell`

## Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (`' '`). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'SelectedChannelNames', 'Counter_B4'`

### IncludeSubfolders — Include files in subfolders

`false` (default) | `true`

Include files in subfolders, specified as a logical. Specify `true` to include files in each folder and recursively in subfolders.

Example: `true`

Data Types: `logical`

### FileExtensions — Custom extensions for filenames to include in MDF datastore

`{'.mdf', '.dat', '.mf4'}` (default) | `char` | `cell`

Custom extensions for filenames to include in the MDF datastore, specified as a character vector or cell array of character vectors. By default, the extensions supported include `.mdf`, `.dat`, and `.mf4`. If your files have custom or nonstandard extensions, use this Name-Value setting to include files with those extensions.

Example: `{'.myformat1', '.myformat2'}`

Data Types: `char` | `cell`

### ReadSize — Size of data returned by read

`'file'` (default) | `numeric` | `duration`

Size of data returned by `read`, specified as `'file'`, a numeric value, or a duration. A character vector value of `'file'` causes the entire file to be read; a numeric double

value specifies the number of records to read; and a duration value specifies a time range to read.

If you subsequently change the ReadSize property value type, the datastore resets.

Example: 50

Data Types: double | char | duration

### **SelectedChannelNames — Names of channels to read**

char | string | cell

Names of channels to read, specified as a character vector, string, or cell array.

Example: 'Counter\_B4'

Data Types: char | string | cell

### **SelectedChannelGroupNumber — Channel group to read**

numeric scalar

Channel group to read, specified as a numeric scalar value.

Example: 1

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

## **Output Arguments**

### **mdfds — MDF datastore**

MDFDatastore object

MDF datastore returned as an MDFDatastore object, with the following methods and properties.

<b>Method</b>	<b>Purpose</b>
preview	Read eight rows from start of datastore (first file), from the selected channel group number and selected channel names
read	Read subset of data from datastore

Method	Purpose
readall	Read all data from datastore
hasdata	True if more data available in datastore
reset	Reset datastore to start of data
partition	Part of original datastore
numpartitions	Estimate for number of partitions to use

Property	Purpose
Files	Files included in datastore
ReadSize	Size of data returned by read
ChannelGroups	All channel groups present in first MDF file (read-only)
Channels	All channels present in first MDF file (read-only)
SelectedChannelGroupNumber	Channel group currently selected
SelectedChannelNames	Channels currently selected

## See Also

### Functions

hasdata | numpartitions | partition | preview | read | readall | reset

### Introduced in R2017b

## hasdata (MDFDatastore)

Determine if data is available to read from MDF datastore

### Syntax

```
tf = hasdata(mdfds)
```

### Description

`tf = hasdata(mdfds)` returns logical 1 (`true`) if there is data available to read from the MDF datastore specified by `mdfds`. Otherwise, it returns logical 0 (`false`).

### Examples

#### Check MDF Datastore for Readable Data

Use `hasdata` in a loop to control read iterations.

```
mdfds = mdfDatastore(fullfile(matlabroot, 'examples', 'vnt', 'CANape.MF4'));  
while hasdata(mdfds)  
    m = read(mdfds);  
end
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

## Output Arguments

**tf** — Indicator of data to read

1 | 0

Indicator of data to read, returned as a logical 1 (true) or false (0).

## See Also

### Functions

mdfDatastore | read | readall | reset

**Introduced in R2017b**

## numpartitions (MDFDatastore)

Number of partitions for MDF datastore

### Syntax

```
N = numpartitions(mdfds)
N = numpartitions(mdfds,pool)
```

### Description

`N = numpartitions(mdfds)` returns the recommended number of partitions for the MDF datastore `mdfds`. Use the result as an input to the `partition` function.

`N = numpartitions(mdfds,pool)` returns a reasonable number of partitions to parallelize `mdfds` over the parallel pool, `pool`, based on the number of files in the datastore and the number of workers in the pool.

### Examples

#### Find Recommended Number of Partitions for MDF Datastore

Determine the number of partitions you should use for your MDF datastore.

```
mdfds = mdfDatastore(fullfile(matlabroot,'examples','vnt','CANape.MF4'));
N = numpartitions(mdfds);
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

**pool — Parallel pool**

parallel pool object

Parallel pool specified as a parallel pool object.

Example: `gcp`

## Output Arguments

**N — Number of partitions**

double

Number of partitions, returned as a double. This number is the calculated recommendation for the number of partitions for your MDF datastore. Use this when partitioning your datastore with the `partition` function.

## partition (MDFDatastore)

Partition MDF datastore

### Syntax

```
subds = partition(mdfds,N,index)
subds = partition(mdfds,'Files',index)
subds = partition(mdfds,'Files',filename)
```

### Description

`subds = partition(mdfds,N,index)` partitions the MDF datastore `mdfds` into the number of parts specified by `N`, and returns the partition corresponding to the index `index`.

`subds = partition(mdfds,'Files',index)` partitions the MDF datastore by files and returns the partition corresponding to the file of index `index` in the `Files` property.

`subds = partition(mdfds,'Files',filename)` partitions the datastore by files and returns the partition corresponding to the specified `filename`.

### Examples

#### Partition an MDF Datastore into Default Parts

Partition an MDF datastore from the sample file `CANape.MF4`, and return the first part.

```
mdfds = mdfDatastore(fullfile(matlabroot,'examples','vnt','CANape.MF4'));
N = numpartitions(mdfds);
subds1 = partition(mdfds,N,1);
```

## Partition an MDF Datastore by Its Files

Partition an MDF datastore according to its files, and return partitions by index and file name.

```
cd c:\temp
mdfds = mdfDatastore({'CANape1.MF4', 'CANape2.MF4', 'CANape3.MF4'});
mdfds.Files

ans =
    3x1 cell array
    'c:\temp\CANape1.MF4'
    'c:\temp\CANape2.MF4'
    'c:\temp\CANape3.MF4'

subds2 = partition(mdfds, 'files', 2);
subds3 = partition(mdfds, 'files', 'c:\temp\CANape3.MF4');
```

## Input Arguments

### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

### **N** — Number of partitions

positive integer

Number of partitions, specified as a double of positive integer value. Use the `numpartitions` function for the recommended number or partitions.

Example: `numpartitions(mdfds)`

Data Types: double

### **index** — Index

positive integer

Index, specified as a double of positive integer value. When using the 'files' partition scheme, this value corresponds to the index of the MDF datastore object `Files` property.

Example: 1

Data Types: double

### **filename — File name**

character vector

File name, specified as a character vector. The argument can specify a relative or absolute path.

Example: 'CANape.MF4'

Data Types: char

## Output Arguments

### **subds — MDF datastore partition**

MDF datastore object

MDF datastore partition, returned as an MDF datastore object. This output datastore is of the same type as the input datastore `mdfds`.

# preview (MDFDatastore)

Subset of data from MDF datastore

## Syntax

```
data = preview(mdfds)
```

## Description

`data = preview(mdfds)` returns a subset of data from MDF datastore `mdfds` without changing the current position in the datastore.

## Examples

### Examine Preview of MDF Datastore

```
mdfds = mdfDatastore(fullfile(matlabroot,'examples','vnt','CANape.MF4'));  
data = preview(mdfds)
```

```
data2 =
```

```
10×74 timetable
```

Time	Counter_B4	Counter_B5	Counter_B6	Counter_B7	PWM
0.00082554 sec	0	0	1	0	100
0.010826 sec	0	0	1	0	100
0.020826 sec	0	0	1	0	100
0.030826 sec	0	0	1	0	100
0.040826 sec	0	0	1	0	100
0.050826 sec	0	0	1	0	100

0.060826 sec	0	0	1	0	100
0.070826 sec	0	0	1	0	100

## Input Arguments

### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

## Output Arguments

### **data** — Subset of data

timetable

Subset of data, returned as a timetable of MDF records.

### **Functions**

`hasdata` | `mdfDatastore` | `read`

### **Introduced in R2017b**

# read (MDFDatastore)

Read data in MDF datastore

## Syntax

```
data = read(mdfds)
[data,info] = read(mdfds)
```

## Description

`data = read(mdfds)` returns data from the MDF datastore `mdfds` into the timetable `data`.

The `read` function returns a subset of data from the datastore. The size of the subset is determined by the `ReadSize` property of the datastore object. On the first call, `read` starts reading from the beginning of the datastore, and subsequent calls continue reading from the endpoint of the previous call. Use `reset` to read from the beginning again.

`[data,info] = read(mdfds)` also returns to the output argument `info` information, including metadata, about the extracted data.

## Examples

### Read Datastore by Files

Read data from an MDF datastore one file at a time.

```
mdfds = mdfDatastore({'CANape1.MF4','CANape2.MF4','CANape3.MF4'});
mdfds.ReadSize = 'file';
data = read(mdfds);
```

Read the second file and view information about the data.

```
[data2,info2] = read(mdfds);
info2
```

```
struct with fields:
    Filename: 'CANape2.MF4'
    FileSize: 57592
    MDFFileProperties: [1x1 struct]
```

## Input Arguments

### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

## Output Arguments

### **data** — Output data

timetable

Output data, returned as a timetable of MDF records.

### **info** — Information about data

structure array

Information about data, returned as a structure array with the following fields:

```
Filename
FileSize
MDFFileProperties
```

## See Also

### **Functions**

`hasdata` | `mdfDatastore` | `preview` | `readall` | `reset`

### **Introduced in R2017b**

## readall (MDFDatastore)

Read all data in MDF datastore

### Syntax

```
data = readall(mdfds)
```

### Description

`data = readall(mdfds)` reads all the data in the datastore specified by `mdfds` and returns it to timetable `data`.

After the `readall` function returns all the data, it resets `mdfds` to point to the beginning of the datastore.

If all the data in the datastore does not fit in memory, then `readall` returns an error.

### Examples

#### Read All Data in Datastore

Read all the data from a multiple file MDF datastore into a timetable.

```
mdfds = mdfDatastore({'CANape1.MF4', 'CANape2.MF4', 'CANape3.MF4'});  
data = readall(mdfds);
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`

## Output Arguments

### **data** — Output data

timetable

Output data, returned as a timetable of MDF records.

## See Also

**Introduced in R2017b**

## reset (MDFDatastore)

Reset MDF datastore to initial state

### Syntax

```
reset(mdfds)
```

### Description

`reset(mdfds)` resets the MDF datastore specified by `mdfds` to its initial read state, where no data has been read from it. Resetting allows you to reread from the same datastore.

### Examples

#### Reset MDF Datastore

Reset an MDF datastore so that you can read from it again.

```
mdfds = mdfDatastore(fullfile(matlabroot,'examples','vnt','CANape.MF4'));  
data = read(mdfds);  
reset(mdfds);  
data = read(mdfds);
```

### Input Arguments

#### **mdfds** — MDF datastore

MDF datastore object

MDF datastore, specified as an MDF datastore object.

Example: `mdfds = mdfDatastore('CANape.MF4')`
