Functions — Alphabetical List

actionCallback

Class: Advisor.authoring.CustomCheck

Package: Advisor.authoring

Register action callback for model configuration check

Syntax

Advisor.authoring.CustomCheck.actionCallback(task)

Description

Advisor.authoring.CustomCheck.actionCallback(task) is used as the action callback function when registering custom checks that use an XML data file to specify check behavior.

Examples

This `sl_customization.m` file registers the action callback for configuration parameter checks with fix actions.

```
function defineModelAdvisorChecks

    rec = ModelAdvisor.Check('com.mathworks.Check1');
    rec.Title = 'Test: Check1';
    rec.setCallbackFcn(@(system)(Advisor.authoring.CustomCheck.checkCallback(system)), ...
        'None', 'Style0ne');
    rec.TitleTips = 'Example check for check authoring infrastructure.';

    % --- data file input parameters
    rec.setInputParametersLayoutGrid([1 1]);
    inputParam1 = ModelAdvisor.InputParameter;
    inputParam1.Name = 'Data File';
    inputParam1.Value = 'Check1.xml';
    inputParam1.Type = 'String';
    inputParam1.Description = 'Name or full path of XML data file.';
    inputParam1.setRowSpan([1 1]);
    inputParam1.setColSpan([1 1]);
    rec.setInputParameters({inputParam1});
```

```
% -- set fix operation
act = ModelAdvisor.Action;
act.setCallbackFcn(@(task)(Advisor.authoring.CustomCheck.actionCallback(task)));
act.Name = 'Modify Settings';
act.Description = 'Modify model configuration settings.';
rec.setAction(act);

mdladvRoot = ModelAdvisor.Root;
mdladvRoot.register(rec);
end
```

Topics

“Create Check for Model Configuration Parameters”

addCheck

Class: ModelAdvisor.FactoryGroup

Package: ModelAdvisor

Add check to folder

Syntax

```
addCheck(fg_obj, check_ID)
```

Description

`addCheck(fg_obj, check_ID)` adds checks, identified by `check_ID`, to the folder specified by `fg_obj`, which is an instantiation of the `ModelAdvisor.FactoryGroup` class.

Examples

Add three checks to `rec`:

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
.
.
.
addCheck(rec, 'com.mathworks.sample.Check1');
addCheck(rec, 'com.mathworks.sample.Check2');
addCheck(rec, 'com.mathworks.sample.Check3');
```

addGroup

Class: ModelAdvisor.Group

Package: ModelAdvisor

Add subfolder to folder

Syntax

```
addGroup(group_obj, child_obj)
```

Description

`addGroup(group_obj, child_obj)` adds a new subfolder, identified by `child_obj`, to the folder specified by `group_obj`, which is an instantiation of the `ModelAdvisor.Group` class.

Examples

Add three checks to rec:

```
group_obj = ModelAdvisor.Group('com.mathworks.sample.group');  
.  
.  
.  
addGroup(group_obj, 'com.mathworks.sample.subgroup1');  
addGroup(group_obj, 'com.mathworks.sample.subgroup2');  
addGroup(group_obj, 'com.mathworks.sample.subgroup3');
```

To add `ModelAdvisor.Task` objects to a group using `addGroup`:

```
mdladvRoot = ModelAdvisor.Root();  
  
% MAT1, MAT2, and MAT3 are registered ModelAdvisor.Task objects  
% Create the group 'My Group'  
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');  
MAG.DisplayName='My Group';
```

```
% Add the first task to the 'My Group' folder
MAG.addTask(MAT1);

% Create a subfolder 'Folder1'
MAGSUB1 = ModelAdvisor.Group('com.mathworks.sample.Folder1');
MAGSUB1.DisplayName='Folder1';

% Add the second task to Folder1
MAGSUB1.addTask(MAT2);

% Create a subfolder 'Folder2'
MAGSUB2 = ModelAdvisor.Group('com.mathworks.sample.Folder2');
MAGSUB2.DisplayName='Folder2';

% Add the third task to Folder2
MAGSUB2.addTask(MAT3);

% Register the two subfolders. This must be done before calling addGroup
mdladvRoot.register(MAGSUB1);
mdladvRoot.register(MAGSUB2);

% Invoke addGroup to place the subfolders under 'My Group'
MAG.addGroup(MAGSUB1);
MAG.addGroup(MAGSUB2);

mdladvRoot.publish(MAG); % publish under Root
```

addItem

Class: ModelAdvisor.List

Package: ModelAdvisor

Add item to list

Syntax

`addItem(element)`

Description

`addItem(element)` adds items to the list created by the `ModelAdvisor.List` constructor.

Input Arguments

<i>element</i>	Specifies an element to be added to a list in one of the following: <ul style="list-style-type: none">• Element• Cell array of elements. When you add a cell array to a list, they form different rows in the list.• Character vector
----------------	---

Examples

```
subList = ModelAdvisor.List();
setType(subList, 'numbered')
addItem(subList, ModelAdvisor.Text('Sub entry 1', {'pass', 'bold'}));
addItem(subList, ModelAdvisor.Text('Sub entry 2', {'pass', 'bold'}));
```

See Also

“Model Advisor Customization”

Topics

“Create Model Advisor Checks”

addItem

Class: ModelAdvisor.Paragraph

Package: ModelAdvisor

Add item to paragraph

Syntax

```
addItem(text, element)
```

Description

addItem(text, element) adds an element to text. element is one of the following:

- Character vector
- Element
- Cell array of elements

Examples

Add two lines of text:

```
result = ModelAdvisor.Paragraph;  
addItem(result, [resultText1 ModelAdvisor.LineBreak resultText2]);
```

Topics

“Create Model Advisor Checks”

addProcedure

Class: ModelAdvisor.Group

Package: ModelAdvisor

Add procedure to folder

Syntax

```
addProcedure(group_obj, procedure_obj)
```

Description

`addProcedure(group_obj, procedure_obj)` adds a procedure, specified by `procedure_obj`, to the folder `group_obj`. `group_obj` is an instantiation of the `ModelAdvisor.Group` class.

Examples

Add three procedures to MAG.

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');  
  
MAP1=ModelAdvisor.Procedure('com.mathworks.sample.procedure1');  
MAP2=ModelAdvisor.Procedure('com.mathworks.sample.procedure2');  
MAP3=ModelAdvisor.Procedure('com.mathworks.sample.procedure3');  
  
addProcedure(MAG, MAP1);  
addProcedure(MAG, MAP2);  
addProcedure(MAG, MAP3);
```

addProcedure

Class: ModelAdvisor.Procedure

Package: ModelAdvisor

Add subprocedure to procedure

Syntax

```
addProcedure(procedure1_obj, procedure2_obj)
```

Description

`addProcedure(procedure1_obj, procedure2_obj)` adds a procedure, specified by `procedure2_obj`, to the procedure `procedure1_obj`. `procedure2_obj` and `procedure1_obj` are instantiations of the `ModelAdvisor.Procedure` class.

Examples

Add three procedures to MAP.

```
MAP = ModelAdvisor.Procedure('com.mathworks.sample.ProcedureSample');  
  
MAP1=ModelAdvisor.Procedure('com.mathworks.sample.procedure1');  
MAP2=ModelAdvisor.Procedure('com.mathworks.sample.procedure2');  
MAP3=ModelAdvisor.Procedure('com.mathworks.sample.procedure3');  
  
addProcedure(MAP, MAP1);  
addProcedure(MAP, MAP2);  
addProcedure(MAP, MAP3);
```

addRow

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add row to table

Syntax

```
addRow(ft_obj, {item1, item2, ..., itemn})
```

Description

`addRow(ft_obj, {item1, item2, ..., itemn})` is an optional method that adds a row to the end of a table in the result. *ft_obj* is a handle to the template object previously created. {*item1*, *item2*, ..., *itemn*} is a cell array of character vectors and objects to add to the table. The order of the items in the array determines which column the item is in. If you do not add data to the table, the Model Advisor does not display the table in the result.

Note Before adding rows to a table, you must specify column titles using the `setColTitle` method.

Examples

Find all of the blocks in the model and create a table of the blocks:

```
% Create FormatTemplate object, specify table format
ft = ModelAdvisor.FormatTemplate('TableTemplate');

% Add information to the table
setTableTitle(ft, {'Blocks in Model'});
setColTitles(ft, {'Index', 'Block Name'});
% Find all the blocks in the system and add them to a table.
allBlocks = find_system(system);
for inx = 2 : length(allBlocks)
    % Add information to the table
```

```
    addRow(ft, {inx-1,allBlocks(inx)});  
end
```

addTask

Class: ModelAdvisor.Group

Package: ModelAdvisor

Add task to folder

Syntax

```
addTask(group_obj, task_obj)
```

Description

`addTask(group_obj, task_obj)` adds a task, specified by `task_obj`, to the folder `group_obj`. `group_obj` is an instantiation of the `ModelAdvisor.Group` class.

Examples

Add three tasks to MAG.

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');  
addTask(MAG, MAT1);  
addTask(MAG, MAT2);  
addTask(MAG, MAT3);
```

addTask

Class: ModelAdvisor.Procedure

Package: ModelAdvisor

Add task to procedure

Syntax

```
addTask(procedure_obj, task_obj)
```

Description

`addTask(procedure_obj, task_obj)` adds a task, specified by `task_obj`, to `procedure_obj`. `procedure_obj` is an instantiation of the `ModelAdvisor.Procedure` class.

Examples

Add three tasks to MAP.

```
MAP = ModelAdvisor.Procedure('com.mathworks.sample.ProcedureSample');
```

```
MAT1=ModelAdvisor.Task('com.mathworks.sample.task1');
```

```
MAT2=ModelAdvisor.Task('com.mathworks.sample.task2');
```

```
MAT3=ModelAdvisor.Task('com.mathworks.sample.task3');
```

```
addTask(MAP, MAT1);
```

```
addTask(MAP, MAT2);
```

```
addTask(MAP, MAT3);
```

Advisor.Application class

Package: Advisor

Run Model Advisor across model hierarchy

Description

Use instances of `Advisor.Application` to run Model Advisor checks across a model hierarchy. You can use `Advisor.Application` to:

- Run checks on referenced models.
- Select model components for Model Advisor analysis.
- Select checks to run during Model Advisor analysis.

Consider using `Advisor.Application` if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

The `Advisor.Application` methods use the following definitions:

- Model component — Model in the system hierarchy. Models that the root model references and that `setAnalysisroot` specifies are model components.
- Check instance — Instantiation of a `ModelAdvisor.Check` object in the Model Advisor configuration. Each check instance has an instance ID. When you change the Model Advisor configuration, the instance ID can change.

Construction

To create an `Advisor.Application` object, use `Advisor.Manager.createApplication`.

Properties

AnalysisRoot — Name of root model in the model hierarchy to analyze

character vector

Name of root model in the model hierarchy to analyze, as specified by the `Advisor.Application.setAnalysisRoot` method. This property is read only.

ID — Unique identifier

character vector

Unique identifier for the `Advisor.Application` object. This property is read only.

UseTempDir — Run analysis in a temporary working folder

false (default) | true

Run analysis in a temporary working folder. Specified by the `Advisor.Manager.createApplication` method. This property is read only.

Data Types: logical

AnalyzeVariants — Run analysis on active and inactive variants

false (default) | true

Run analysis on active and inactive variants based on predefined configurations in the the Variant Manager. For each configuration, produce a Model Advisor report. This property is read/write.

Data Types: logical

Methods

<code>delete</code>	Delete <code>Advisor.Application</code> object
<code>deselectCheckInstances</code>	Clear check instances from Model Advisor analysis
<code>deselectComponents</code>	Clear model components from Model Advisor analysis
<code>generateReport</code>	Generate report for Model Advisor analysis
<code>getCheckInstanceIDs</code>	Obtain check instance IDs
<code>getResults</code>	Access Model Advisor analysis results
<code>loadConfiguration</code>	Load Model Advisor configuration
<code>run</code>	Run Model Advisor analysis on model components
<code>selectCheckInstances</code>	Select check instances to use in Model Advisor analysis
<code>selectComponents</code>	Select model components for Model Advisor analysis
<code>setAnalysisRoot</code>	Specify model hierarchy for Model Advisor analysis

Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects \(MATLAB\)](#).

Examples

Run Model Advisor Checks on Referenced Model

This example shows how to run a check on model `sldemo_mdhref_counter` referenced from `sldemo_mdhref_basic`.

In the Command Window, open model `sldemo_mdhref_basic` and referenced model `sldemo_mdhref_counter`.

```
open_system('sldemo_mdhref_basic');  
open_system('sldemo_mdhref_counter');
```

Save a copy of the models to a work folder, renaming them to `mdhref_basic` and `mdhref_counter`.

```
save_system('sldemo_mdref_basic','mdlref_basic');
save_system('sldemo_mdref_counter','mdlref_counter');
```

In `mdlref_basic`, change model reference from `sldemo_mdref_counter` to `mdlref_counter`. Save `mdlref_basic`.

```
set_param('mdlref_basic/CounterA','modelName','mdlref_counter');
set_param('mdlref_basic/CounterB','modelName','mdlref_counter');
set_param('mdlref_basic/CounterC','modelName','mdlref_counter');
save_system('mdlref_basic');
```

Set root model to `mdlref_basic`.

```
RootModel='mdlref_basic';
```

Create an Application object.

```
app = Advisor.Manager.createApplication();
```

Set root analysis.

```
setAnalysisRoot(app,'Root',RootModel);
```

Clear all check instances from Model Advisor analysis.

```
deselectCheckInstances(app);
```

Select check **Identify unconnected lines, input ports, and output ports** using check instance ID.

```
instanceID = getCheckInstanceIDs(app,'mathworks.design.UnconnectedLinesPorts');
checkinstanceID = instanceID(1);
selectCheckInstances(app,'IDs',checkinstanceID);
```

Run Model Advisor analysis.

```
run(app);
```

Get analysis results.

```
getResults(app);
```

Generate and view the Model Advisor report. The Model Advisor runs the check on both `mdlref_basic` and `mdlref_counter`.

```
report = generateReport(app);
web(report)
```

Close the models.

```
close_system('mdlref_basic');  
close_system('mdlref_counter');
```

Run Model Advisor Checks on a Subsystem

This example shows how to run a check on subsystem CounterA referenced from sldemo_mdlref_basic.

In the Command Window, open model sldemo_mdlref_basic.

```
open_system('sldemo_mdlref_basic');
```

Set root model to sldemo_mdlref_basic.

```
RootModel='sldemo_mdlref_basic';
```

Create an Application object.

```
app = Advisor.Manager.createApplication();
```

Set root analysis to subsystem sldemo_mdlref_basic/CounterA.

```
setAnalysisRoot(app, 'Root', 'sldemo_mdlref_basic/CounterA', 'RootType', 'Subsystem');
```

Clear all check instances from Model Advisor analysis.

```
deselectCheckInstances(app);
```

Select check **Identify unconnected lines, input ports, and output ports** using check instance ID.

```
instanceID = getCheckInstanceIDs(app, 'mathworks.design.UnconnectedLinesPorts');  
checkinstanceID = instanceID(1);  
selectCheckInstances(app, 'IDs', checkinstanceID);
```

Run Model Advisor analysis.

```
run(app);
```

Get analysis results.

```
getResults(app);
```

Generate and view the Model Advisor report. The Model Advisor runs the check on subsystem `sldemo_mdref_basic/CounterA`.

```
report = generateReport(app);  
web(report)
```

Close the model.

```
close_system('sldemo_mdref_basic');
```

[Property Attributes \(MATLAB\)](#)

Introduced in R2015b

Advisor.authoring.generateConfigurationParameterDataFile

Package: Advisor.authoring

Generate XML data file for custom configuration parameter check

Syntax

```
Advisor.authoring.generateConfigurationParameterDataFile(dataFile,  
source)
```

```
Advisor.authoring.generateConfigurationParameterDataFile(dataFile,  
source,Name,Value)
```

Description

`Advisor.authoring.generateConfigurationParameterDataFile(dataFile, source)` generates an XML data file named `dataFile` specifying the configuration parameters for `source`. The data file uses tagging to specify the configuration parameter settings you want. When you create a check for configuration parameters, you use the data file. Each model configuration parameter specified in the data file is a subcheck.

`Advisor.authoring.generateConfigurationParameterDataFile(dataFile, source,Name,Value)` generates an XML data file named `dataFile` specifying the configuration parameters for `source`. It also specifies additional options by one or more optional `Name,Value` arguments. The data file uses tagging to specify the configuration parameter settings you want. When you create a check for configuration parameters, you use the data file. Each model configuration parameter specified in the data file is a subcheck.

Examples

Create data file for configuration parameter check

Create a data file with all the configuration parameters. You use the data file to create a configuration parameter.

```
model = 'vdp';
dataFile = 'myDataFile.xml';
Advisor.authoring.generateConfigurationParameterDataFile( ...
    dataFile, model);
```

Data file `myDataFile.xml` has tagging specifying subcheck information for each configuration parameter. `myDataFile.xml` specifies the configuration parameters settings you want. The following specifies XML tagging for configuration parameter `AbsTol`. If the configuration parameter is set to `1e-6`, the configuration parameter subcheck specified in `myDataFile.xml` passes.

```
<!-- Absolute tolerance: (AbsTol)-->
  <PositiveModelParameterConstraint>
    <parameter>AbsTol</parameter>
    <value>1e-6</value>
  </PositiveModelParameterConstraint>
```

Create data file for Solver pane configuration parameter check with fix action

Create a data file with configuration parameters for the **Solver** pane. You use the data file to create a **Solver** pane configuration parameter check with fix actions.

```
model = 'vdp';
dataFile = 'myDataFile.xml';
Advisor.authoring.generateConfigurationParameterDataFile( ...
    dataFile, model, 'Pane', 'Solver', 'FixValues', true);
```

Data file `myDataFile.xml` has tagging specifying subcheck information for each configuration parameter. `myDataFile.xml` specifies the configuration parameters settings that you want. The following specifies XML tagging for configuration parameter `AbsTol`. If the configuration parameter is set to `1e-6`, the configuration parameter subcheck specified in `myDataFile.xml` passes. If the subcheck does not pass, the check fix action modifies the configuration parameter to `1e-6`.

```
<!-- Absolute tolerance: (AbsTol)-->
  <PositiveModelParameterConstraint>
    <parameter>AbsTol</parameter>
```

```
<value>1e-6</value>  
<fixvalue>1e-6</fixvalue>  
</PositiveModelParameterConstraint>
```

- “Create Check for Model Configuration Parameters”

Input Arguments

dataFile — Name of data file to create

character vector

Name of XML data file to create, specified as a character vector.

Example: 'myDataFile.xml'

source — Name of model or configuration set

character vector | Simulink.ConfigSet

Name of model or Simulink.ConfigSet object used to specify configuration parameters

Example: 'vdp'

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: 'Pane', 'Solver', 'FixValues', true specifies a dataFile with Solver pane configuration parameters and fix tagging.

Pane — Limit the configuration parameters in the dataFile

Solver | Data Import/Export | Optimization | Diagnostics | Hardware Implementation | Model Referencing | Code Generation

Option to limit the configuration parameters in the data file to the pane specified as the comma-separated pair of 'Pane' and one of the following:

- Solver

- Data Import/Export
- Optimization
- Diagnostics
- Hardware Implementation
- Model Referencing
- Code Generation

Example: 'Pane', 'Solver' limits the dataFile to configuration parameters on the Solver pane.

Data Types: char

FixValues – Create fix tagging in the dataFile

false | true

Setting FixValues to true provides the dataFile with fix tagging. When you generate a custom configuration parameter check using a dataFile with fix tagging, each configuration parameter subcheck has a fix action. Specified as the comma-separated pair of 'FixValues' and either true or false.

Example: 'FixValues, true specifies fix tagging in the dataFile.

Data Types: logical

“Data File for Configuration Parameter Check”

Introduced in R2014a

Advisor.authoring.generateBlockConstraintsDataFile

Package: Advisor.authoring

Generate XML data file for custom check for block constraints

Syntax

```
Advisor.authoring.generateBlockConstraintsDataFile(dataFile,  
'constraints',constraintslist)
```

Description

Advisor.authoring.generateBlockConstraintsDataFile(dataFile, 'constraints',constraintslist) generates an XML data file named dataFile. This data file specifies the constraints that a custom check contains. The data file uses tagging to specify the constraint information. When you create a custom check, you use the data file.

Define constraint objects in the base workspace and then pass these objects as inputs to this function. These constraints may be root constraints and prerequisites to root constraints. You can also define a composite constraint. If you specify multiple root constraints and no composite constraint, Simulink implements a composite constraint with a CompositeOperator of and.

Examples

Create Data File for Custom Check for Block Constraints

Create a custom check for this JMAAB 4.0 check: **jc_0632: Default case port in Multiport Switch block**. For Multiport Switch blocks, the check contains a constraint that checks that the **Data port order** parameter setting is Specify indices. If the parameter has this setting, there are constraints that check that the **Data port for**

default case parameter setting is Additional data port and the **Diagnostic for default case** setting is None.

Create three PositiveBlockParameter constraint objects.

```
c1 = Advisor.authoring.PositiveBlockParameterConstraint();
c1.ID = 'ID_A2';
c1.BlockType = 'MultiPortSwitch';
c1.ParameterName = 'DataPortOrder';
c1.SupportedParameterValues = {'Specify indices'};
c1.ValueOperator = 'eq';

c2 = Advisor.authoring.PositiveBlockParameterConstraint();
c2.ID = 'ID_A3';
c2.BlockType = 'MultiPortSwitch';
c2.ParameterName = 'DataPortForDefault';
c2.SupportedParameterValues = {'Additional data port'};
c2.ValueOperator = 'eq';

c3 = Advisor.authoring.PositiveBlockParameterConstraint();
c3.ID = 'ID_A4';
c3.BlockType = 'MultiPortSwitch';
c3.ParameterName = 'DiagnosticForDefault';
c3.SupportedParameterValues = {'None'};
c3.ValueOperator = 'eq';
```

Use the addPreRequisiteConstraintID method to make c1 a prerequisite to checking constraints c2 and c3.

```
c2.addPreRequisiteConstraintID('ID_A2');
c3.addPreRequisiteConstraintID('ID_A2');
```

Create a composite constraint that specifies that if a Multiport Switch block does not meet constraints c2 and c3, the block is in violation of this check.

```
cc = Advisor.authoring.CompositeConstraint();
cc.addConstraintID('ID_A3');
cc.addConstraintID('ID_A4');
cc.CompositeOperator = 'and';
```

Create a data file that contains the constraints.

```
dataFile = 'myDataFile.xml';
Advisor.authoring.generateBlockConstraintsDataFile( ...
    dataFile, 'constraints', {c1,c2,c3,cc});
```

Data file myDataFile.xml has tagging specifying the constraint information for the custom check.

```
<?xml version="1.0" encoding="utf-8"?>
<customcheck>
```

```
<checkdata>
  <PositiveBlockParameterConstraint BlockType="MultiPortSwitch" id="ID_A2">
    <parameter type="string">DataPortOrder</parameter>
    <value>Specify indices</value>
    <operator>eq</operator>
  </PositiveBlockParameterConstraint>
  <PositiveBlockParameterConstraint BlockType="MultiPortSwitch" id="ID_A3">
    <parameter type="string">DataPortForDefault</parameter>
    <value>Additional data port</value>
    <operator>eq</operator>
    <dependson>ID_A2</dependson>
  </PositiveBlockParameterConstraint>
  <PositiveBlockParameterConstraint BlockType="MultiPortSwitch" id="ID_A4">
    <parameter type="string">DiagnosticForDefault</parameter>
    <value>None</value>
    <operator>eq</operator>
    <dependson>ID_A2</dependson>
  </PositiveBlockParameterConstraint>
  <CompositeConstraint>
    <ID>ID_A3</ID>
    <ID>ID_A4</ID>
    <operator>and</operator>
  </CompositeConstraint>
</checkdata>
</customcheck>
```

Note For model configuration parameter constraints, use the `Advisor.authoring.generateBlockConstraintsDataFile` method only when specifying model configuration parameter constraints as prerequisites to block constraints or as part of a composite constraint consisting of both block and model configuration parameter constraints. For all other cases, use the `Advisor_authoring.generateConfigurationParameterDatafile` method.

Input Arguments

dataFile — Name of data file to create

character vector

Name of XML data file to create, specified as a character vector.

Example: 'myDataFile.xml'

constraintslist — cell array of constraint objects

cell array of objects

Use these classes to create constraint objects:

- `Advisor.authoring.PositiveBlockParameterConstraint`
- `Advisor.authoring.NegativeBlockParameterConstraint`
- `Advisor.authoring.PositiveModelParameterConstraint`
- `Advisor.authoring.NegativeModelParameterConstraint`
- `Advisor.authoring.PositiveBlockTypeConstraint`
- `Advisor.authoring.NegativeBlockTypeConstraint`
- `Advisor.authoring.CompositeConstraint`

Example: {c1,c2,c3}

Topics

“Define Checks for Supported or Unsupported Blocks and Parameters”

Introduced in R2018a

Advisor.authoring.createBlockConstraintCheck

Package: Advisor.authoring

Create Model Advisor check for registering block constraints

Syntax

```
check_obj = Advisor.authoring.createBlockConstraintCheck(check_ID)
```

Description

`check_obj = Advisor.authoring.createBlockConstraintCheck(check_ID)` creates a `ModelAdvisor.check` object, `check_obj`, and assigns it a unique identifier, `check_ID`. Specify the block constraints data file as an input parameter to this object. Use the `Advisor.authoring.generateBlockConstraintsDataFile` function to create the block constraints data file.

Examples

Create Model Advisor Checks from Constraint

This code shows how to specify and register a Model Advisor constraint check in the `sl_customization` file. Just below the `%check` comment, the `Advisor.authoring.createBlockConstraintCheck` function creates the `ModelAdvisor.check` object `rec`. The `inputParam1.value` is the name of the data file that contains the block constraints. In this example, that data file is `myDataFile.xml`. For an example of how to create this data file, see `Advisor.authoring.generateBlockConstraintsDataFile`.

```
function sl_customization(cm)
% register custom checks.
cm.addModelAdvisorCheckFcn(@defineModelAdvisorChecks);
```

```

% register items to factory group.
cm.addModelAdvisorTaskFcn(@defineModelAdvisorGroups);

% defineModelAdvisorChecks
function defineModelAdvisorChecks

% check
rec = Advisor.authoring.createBlockConstraintCheck('com.mathworks.sample.Check1');
rec.Title = 'Example: Check block parameter constraints';
rec.setCallbackFcn(@(system)(Advisor.authoring.CustomCheck.checkCallback...
    (system)), 'None', 'Style0ne');
rec.TitleTips = 'Example check block parameter constraints';

% --- data file input parameters
rec.setInputParametersLayoutGrid([1 1]);
inputParam1 = ModelAdvisor.InputParameter;
inputParam1.Name = 'Data File';
inputParam1.Value = 'myDataFile.xml';
inputParam1.Type = 'BlockConstraint';
inputParam1.Description = 'Name or full path of XML data file.';
inputParam1.setRowSpan([1 1]);
inputParam1.setColSpan([1 1]);
rec.setInputParameters({inputParam1});
rec.SupportExclusion = false;
rec.SupportLibrary = true;

mdladvRoot = ModelAdvisor.Root;
mdladvRoot.register(rec);

% defineModelAdvisorGroups
function defineModelAdvisorGroups
mdladvRoot = ModelAdvisor.Root;

% --- sample factory group 1
rec = ModelAdvisor.FactoryGroup('com.mathworks.Test.factoryGroup');
rec.DisplayName='Example: My Group';
rec.addCheck('com.mathworks.sample.Check1');

mdladvRoot.publish(rec);

```

Input Arguments

check_ID — Name of Model Advisor check

character vector

Name of model advisor check, specified as a character vector

Example: 'com.mathworks.sample.Check1'

Output Arguments

check_obj — Model Advisor check object

character vector

New ModelAdvisor.check object with default property values.

Note The ModelAdvisor.Check object that you create using the Advisor.authoring.createBlockConstraintCheck function does not support setting exclusions.

Advisor.authoring.CustomCheck class

Package: Advisor.authoring

Define custom check

Description

Instances of the `Advisor.authoring.CustomCheck` class provide a container for static methods used as callback functions when defining a configuration parameter check. The configuration parameter check is defined in an XML data file.

Methods

<code>actionCallback</code>	Register action callback for model configuration check
<code>checkCallback</code>	Register check callback for model configuration check

Copy Semantics

Handle. To learn how this affects your use of the class, see [Copying Objects \(MATLAB\)](#) in the [MATLAB® Programming Fundamentals](#) documentation.

checkCallback

Class: Advisor.authoring.CustomCheck

Package: Advisor.authoring

Register check callback for model configuration check

Syntax

Advisor.authoring.CustomCheck.checkCallback(system)

Description

Advisor.authoring.CustomCheck.checkCallback(system) is used as the check callback function when registering custom checks that use an XML data file to specify check behavior.

Examples

This `sl_customization.m` file registers a configuration parameter check using `Advisor.authoring.CustomCheck.checkCallback(system)`.

```
function defineModelAdvisorChecks

    rec = ModelAdvisor.Check('com.mathworks.Check1');
    rec.Title = 'Test: Check1';
    rec.setCallbackFcn(@(system)(Advisor.authoring.CustomCheck.checkCallback(system)), ...
        'None', 'Style0ne');
    rec.TitleTips = 'Example check for check authoring infrastructure.';

    % --- data file input parameters
    rec.setInputParametersLayoutGrid([1 1]);
    inputParam1 = ModelAdvisor.InputParameter;
    inputParam1.Name = 'Data File';
    inputParam1.Value = 'Check1.xml';
    inputParam1.Type = 'String';
    inputParam1.Description = 'Name or full path of XML data file.';
    inputParam1.setRowSpan([1 1]);
    inputParam1.setColSpan([1 1]);
    rec.setInputParameters({inputParam1});
```

```
% -- set fix operation
act = ModelAdvisor.Action;
act.setCallbackFcn(@(task)(Advisor.authoring.CustomCheck.actionCallback(task)));
act.Name = 'Modify Settings';
act.Description = 'Modify model configuration settings.';
rec.setAction(act);

mdladvRoot = ModelAdvisor.Root;
mdladvRoot.register(rec);
end
```

createApplication

Class: Advisor.Manager

Package: Advisor

Create Advisor.Application object

Syntax

```
app = Advisor.Manager.createApplication()  
app = Advisor.Manager.createApplication(Name, Value)
```

Description

`app = Advisor.Manager.createApplication()` constructs an Advisor.Application object.

`app = Advisor.Manager.createApplication(Name, Value)` constructs an Advisor.Application object that operates in a temporary working folder.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

Example: 'UseTempDir', true specifies that Advisor.Application object operates in a temporary working folder.

UseTempDir — Create Advisor.Application object that operates in a temporary working folder

false (default) | true

Data Types: logical

Output Arguments

app — Application

Advisor.Application object

Constructed Advisor.Application object.

Advisor.Application | Advisor.Manager.getApplication

Introduced in R2015b

delete

Class: `Advisor.Application`

Package: `Advisor`

Delete `Advisor.Application` object

Syntax

```
delete(app)
```

Description

`delete(app)` deletes the `Application` object when you close the root model specified using `Advisor.Application.setAnalysisRoot`, `Application` objects are implicitly closed.

Examples

```
app = Advisor.Manager.createApplication();  
delete(app)
```

Input Arguments

app — `Advisor.Application` object to destroy

handle

`Advisor.Application` object to destroy, as specified by `Advisor.Manager.createApplication`.

deselectCheckInstances

Class: `Advisor.Application`

Package: `Advisor`

Clear check instances from Model Advisor analysis

Syntax

`deselectCheckInstances(app)`

`deselectCheckInstances(app,Name,Value)`

Description

You can clear check instances from Model Advisor analysis. A check instance is an instantiation of a `ModelAdvisor.Check` object in the Model Advisor configuration. When you change the Model Advisor configuration, the check instance ID might change. To obtain the check instance ID, use the `getCheckInstanceIDs` method.

`deselectCheckInstances(app)` clears all check instances from Model Advisor analysis.

`deselectCheckInstances(app,Name,Value)` clears check instances specified by `Name,Value` pair arguments from Model Advisor analysis.

Input Arguments

app — Application

`Advisor.Application` object

`Advisor.Application` object, created by `Advisor.Manager.createApplication`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

IDs — Checks instance IDs

cell array

Check instances to clear from Model Advisor analysis, as specified by a cell array of IDs

Data Types: cell

Examples

Clear All Check Instances from Model Advisor Analysis

This example shows how to set the root model, create an `Application` object, set root analysis, and clear checks instances from Model Advisor analysis.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Deselect all checks
deselectCheckInstances(app);
```

Clear Check Instance from Model Advisor Analysis Using Instance ID

This example shows how to set the root model, create an `Application` object, set root analysis, and deselect checks instances using instance IDs.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);
```

```
% Deselect "Identify unconnected lines, input ports, and output  
% ports" check using instance ID  
instanceID = getCheckInstanceIDs(app,'mathworks.design.UnconnectedLinesPorts');  
checkinstanceID = instanceID(1);  
deselectCheckInstances(app,'IDs',checkinstanceID);
```

deselectComponents

Class: Advisor.Application

Package: Advisor

Clear model components from Model Advisor analysis

Syntax

```
deselectComponents (app)
```

```
deselectComponents (app, Name, Value)
```

Description

You can clear model components from Model Advisor analysis. A model component is a model in the system hierarchy. Models that the root model references and that `Advisor.Application.setAnalysisRoot` specifies are model components.

`deselectComponents (app)` clears all components from Model Advisor analysis.

`deselectComponents (app, Name, Value)` clears model components specified by `Name, Value` pair arguments from Model Advisor analysis.

Input Arguments

app — Application

`Advisor.Application` object

`Advisor.Application` object, created by `Advisor.Manager.createApplication`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

IDs — Component IDs

cell array

Components to clear from Model Advisor analysis, as specified by a cell array of IDs

Data Types: cell

HierarchicalSelection — Clear component and component children

false (default) | true

Clear components specified by IDs and component children from Model Advisor analysis

Data Types: logical

Examples

Clear All Components from Model Advisor Analysis

This example shows how to set the root model, create an `Application` object, set root analysis, and clear all components from Model Advisor analysis.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';
```

```
% Create an Application object
app = Advisor.Manager.createApplication();
```

```
% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);
```

```
% Deselect all components
deselectComponents(app);
```

Clear Components from Model Advisor Analysis Using IDs

This example shows how to set the root model, create an `Application` object, set root analysis, and clear model components using IDs.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Deselect component using IDs
deselectComponents(app,'IDs',RootModel);
```

See Also

Advisor.Application.selectComponents |
Advisor.Application.setAnalysisRoot |
Advisor.Manager.createApplication

Introduced in R2015b

generateReport

Class: `Advisor.Application`

Package: `Advisor`

Generate report for Model Advisor analysis

Syntax

```
generateReport(app)
generateReport(app,Name,Value)
```

Description

Generate a Model Advisor report for an `Application` object analysis.

`generateReport(app)` generates a Model Advisor report for each component specified by the `Application` object. By default, a report with the name of the analysis root is generated in the current folder.

`generateReport(app,Name,Value)` generates a Model Advisor report for each component specified by the `Application` object. Use the `Name,Value` pairs to specify the location and name of the report.

Input Arguments

app — Application

`Advisor.Application` object

`Advisor.Application` object, created by `Advisor.Manager.createApplication`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

Location — Path to report location

character vector

Name — Report name

character vector

Examples

Generate Report

This example shows how to generate a report with the analysis root name in the current folder.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Run Model Advisor analysis
run(app);

% Generate report
report = generateReport(app);

% Open the report in web browser
web(report);
```

Generate Report with Specified Name and Location

This example shows how to generate a report with a specified name and location.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';
```

```
% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Run Model Advisor analysis
run(app);

% Generate report in my_work directory
mkdir my_work
report = generateReport(app,'Location','my_work','Name','RootModelReport');

%Open the report in web browser
web(report);
```

See Also

Introduced in R2015b

getApplication

Class: Advisor.Manager

Package: Advisor

Return handle to `Advisor.Application` object

Syntax

```
app = getApplication(Name,Value)
```

Description

`app = getApplication(Name,Value)` returns the handle to an `Advisor.Application` object by using the object properties.

Input Arguments

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

Example: 'Id', appID returns handle to an `Advisor.Application` using the object ID.

Id — Advisor.Application object ID

`Advisor.Application` object

Data Types: `function_handle`

Root — Root model name

character vector

Data Types: `char`

RootType — Type of root analysis

'Model' (default) | 'Subsystem'

Data Types: char

Output Arguments

app — Handle to Advisor.Application object

Advisor.Application object

Data Types: function_handle

See Also

Advisor.Application | Advisor.Manager.createApplication

Introduced in R2015b

getCheckInstanceIDs

Class: Advisor.Application

Package: Advisor

Obtain check instance IDs

Syntax

```
CheckInstanceIDs = getCheckInstanceIDs (app)
```

```
CheckInstanceIDs = getCheckInstanceIDs (app, CheckID)
```

Description

Obtain the check instance ID for a check using the check ID. A check instance is an instantiation of a `ModelAdvisor.Check` object in the Model Advisor configuration. When you change the Model Advisor configuration, the check instance ID might change. The check ID is a static identifier that does not change.

`CheckInstanceIDs = getCheckInstanceIDs (app)` returns a cell array of IDs.

`CheckInstanceIDs = getCheckInstanceIDs (app, CheckID)` returns a instance ID for a check.

Input Arguments

app — Application

Advisor.Application object

Advisor.Application object, created by `Advisor.Manager.createApplication`

CheckID — Check ID associated with Model Advisor check

character vector

Check ID associated with Model Advisor check.

Example: `'mathworks.design.UnconnectedLinesPorts'`

Output Arguments

CheckInstanceIDs — Cell array of check instance IDs

cell array

Check instance IDs, returned as a cell array of IDs

Examples

Obtain Check Instance IDs

This example shows how to set the root model, create an `Application` object, set root analysis, and obtain the check instance ID.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Select all check instances
selectCheckInstances(app);

% Obtain check instance IDs
CheckInstanceIDs = getCheckInstanceIDs(app);
```

Obtain Check Instance ID for a Check

This example shows how to set the root model, create an `Application` object, set root analysis, and obtain the check instance ID for check **Identify unconnected lines, input ports**.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';
```

```
% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Select all check instances
selectCheckInstances(app);

% Obtain check instance ID for Model Advisor check "Identify unconnected lines,
%   input ports"
CheckInstanceIDs = getCheckInstanceIDs(app,'mathworks.design.UnconnectedLinesPorts');
```

Alternatives

In the left-hand pane of the Model Advisor window, right-click the check and select **Send Check Instance ID to Workspace**.

Advisor.Manager.createApplication

Introduced in R2015b

getEntry

Class: ModelAdvisor.Table

Package: ModelAdvisor

Get table cell contents

Syntax

```
content = getEntry(table, row, column)
```

Description

`content = getEntry(table, row, column)` gets the contents of the specified cell.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>row</code>	An integer specifying the row
<code>column</code>	An integer specifying the column

Output Arguments

<code>content</code>	An element object or object array specifying the content of the table entry
----------------------	---

Examples

Get the content of the table cell in the third column, third row:

```
table1 = ModelAdvisor.Table(4, 4);  
.
```

```
.  
.content = getEntry(table1, 3, 3);
```

“Model Advisor Customization”

Topics

“Create Model Advisor Checks”

getID

Class: ModelAdvisor.Check

Package: ModelAdvisor

Return check identifier

Syntax

```
id = getID(check_obj)
```

Description

`id = getID(check_obj)` returns the ID of the check `check_obj`. `id` is a unique identifier for the check.

You create this unique identifier when you create the check. This unique identifier is the equivalent of the `ModelAdvisor.Check ID` property.

Topics

“Define Custom Checks”

“Create Model Advisor Checks”

execute

Class: slmetric.Engine

Package: slmetric

Collect metric data

Syntax

```
execute(metric_engine)  
execute(slmetric_obj, MetricIDs)
```

Description

Collect model metric data for the specified metric engine object. The model metric data is based on defined architectural components. The components are these Simulink objects:

- Model
- Subsystem block
- Chart
- MATLAB Function block
- Protected model

`execute(metric_engine)` collects metric data for available model metrics, which can include MathWorks metrics and custom metrics.

`execute(slmetric_obj, MetricIDs)` collects metric data for only the specified metrics, which can be MathWorks metrics or custom metrics.

Input Arguments

metric_engine — Metric engine object

`slmetric.Engine` object

Create a `slmetric.Engine` object.

```
metric_engine = slmetric.Engine();
```

MetricIDs — Metric identifier

character vector | cell array of character vectors

Metric identifier for “Model Metrics” on page 2-387 or custom model metrics that you create. You can specify one or multiple metric identifiers. You can get metric identifiers by calling `slmetric.metric.getAvailableMetrics`.

Example: `'mathworks.metrics.DescriptiveBlockNames'`

Examples

Collect and Access Metric Data for a Model

Collect and access model metric data for the model `sldemo_mdref_basic`.

Create an `slmetric.Engine` object and set the root in the model for analysis.

```
metric_engine = slmetric.Engine();
```

```
% Include referenced models and libraries in the analysis.
```

```
% These properties are on by default.
```

```
metric_engine.AnalyzeModelReferences = 1;
```

```
metric_engine.AnalyzeLibraries = 1;
```

```
setAnalysisRoot(metric_engine, 'Root', 'sldemo_mdref_basic');
```

Collect model metric data

```
execute(metric_engine);
```

Get the model metric data that returns an array of `slmetric.metric.ResultCollection` objects, `res_col`.

```
res_col = getMetrics(metric_engine, 'mathworks.metrics.SimulinkBlockCount');
```

Display the results for the `mathworks.metrics.SimulinkBlockCount` metric.

```
for n=1:length(res_col)
    if res_col(n).Status == 0
        result = res_col(n).Results;
        for m=1:length(result)
```

```

        disp(['MetricID: ', result(m).MetricID]);
        disp([' ComponentPath: ', result(m).ComponentPath]);
        disp([' Value: ', num2str(result(m).Value)]);
        disp([' AggregatedValue: ', num2str(result(m).AggregatedValue)]);
    end
else
    disp(['No results for:', result(n).MetricID]);
end
disp(' ');
end

```

Collect and Access Metric Data for One Metric

Collect and access model metric data for the model `sldemo_mdref_basic`.

Create an `slmetric.Engine` object. Include referenced models and libraries in the analysis and set the root in the model for analysis.

```

metric_engine = slmetric.Engine();
metric_engine.AnalyzeModelReferences = 1;
metric_engine.AnalyzeLibraries = 1;

```

```

setAnalysisRoot(metric_engine, 'Root', 'sldemo_mdref_basic');

```

Collect model metric data

```

execute(metric_engine, 'mathworks.metrics.ExplicitIOCount');

```

Get the model metric data that returns an array of `slmetric.metric.ResultCollection` objects, `res_col`.

```

res_col = getMetrics(metric_engine, 'mathworks.metrics.ExplicitIOCount');

```

Display the results for the `mathworks.metrics.ExplicitIOCount` metric.

```

for n=1:length(res_col)
    if res_col(n).Status == 0
        result = res_col(n).Results;

        for m=1:length(result)
            disp(['MetricID: ', result(m).MetricID]);
            disp([' ComponentPath: ', result(m).ComponentPath]);
            disp([' Value: ', num2str(result(m).Value)]);
            disp([' AggregatedValue: ', num2str(result(m).AggregatedValue)]);
            disp([' Measures: ', num2str(result(m).Measures)]);
            disp([' AggregatedMeasures: ', num2str(result(m).AggregatedMeasures)]);
        end
    else
        disp(['No results for:', result(n).MetricID]);
    end
    disp(' ');
end

```

Here are the results:

```
MetricID: mathworks.metrics.ExplicitIOCount
  ComponentPath: sldemo_mdref_basic
  Value: 3
  AggregatedValue: 4
  Measures: 0 3
  AggregatedMeasures: 3 3
MetricID: mathworks.metrics.ExplicitIOCount
  ComponentPath: sldemo_mdref_basic/More Info
  Value: 0
  AggregatedValue: 0
  Measures: 0 0
  AggregatedMeasures: 0 0
MetricID: mathworks.metrics.ExplicitIOCount
  ComponentPath: sldemo_mdref_counter
  Value: 4
  AggregatedValue: 4
  Measures: 3 1
  AggregatedMeasures: 3 1
```

For the ComponentPath: `sldemo_mdref_basic`, the value is 3 because there are 3 outputs. The three outputs are in the second element of the Measures array. The `slmetric.metric.AggregationMode` is Max, so the AggregatedValue is 4 which is the number of inputs and outputs to `sldemo_mdref_counter`. The AggregatedMeasures array contains the maximum number of inputs and outputs for a component or subcomponent.

getAnalysisRootMetric

Class: slmetric.Engine

Package: slmetric

Get metric data for one metric for analysis root only

Syntax

```
metricResult = getAnalysisRootMetric(metric_engine, MetricID)
```

Description

Get metric data from the metric engine where the root of analysis was set using `setAnalysisRoot`.

`metricResult = getAnalysisRootMetric(metric_engine, MetricID)` get the metric data from `metric_engine`, for a specified metric identifier, `MetricID`, only for the analysis root.

Input Arguments

metric_engine — Collects and accesses metric data

slmetric.Engine object

When you call `execute`, `metric_engine` collects metric data for all available metrics or for the specified `MetricID`. Calling `getMetrics` accesses the collected metric data in `metric_engine`.

MetricID — Metric identifier

character vector

Metric identifier for “Model Metrics” on page 2-387 or custom model metrics, that you create. You can get metric identifiers by calling `slmetric.metric.getAvailableMetrics`.

Example: `'mathworks.metrics.DescriptiveBlockNames'`

Output Arguments

metricResult — Result of metric analysis on the analysis root

`slmetric.metric.Result` object

Outputs the object of the `slmetric.metric.Result` object containing the result data for the requested analysis root and metric.

Examples

Collect and Access Metric Data for the Analysis Root

This example shows how to set the analysis root, collect, and access the metric data for a metric.

```
% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify the model for metric analysis
setAnalysisRoot(metric_engine, 'Root', 'sldemo_fuelsys');

% Collect model metrics for only the analysis root
metricID = 'mathworks.metrics.SimulinkBlockCount';
execute(metric_engine, metricID);

metricResult = getAnalysisRootMetric(metric_engine, metricID);
```

getErrorLog

Class: slmetric.Engine

Package: slmetric

Get error log

Syntax

```
metricLog = getErrorLog(metric_engine)
```

Description

Get a log of errors and warnings that occurred during metric data collection of a specified metric engine object. The log includes errors that occurred during the execution of metric algorithms, model compilation, and metric data validation.

```
metricLog = getErrorLog(metric_engine).
```

Input Arguments

metric_engine — Metric engine object

slmetric.Engine object

Constructed slmetric.Engine object.

Output Arguments

metricLog — Log of metric errors and warnings

string array

The `metricLog` string contains the errors and warnings from metric analysis and is formatted in HTML.

Examples

Get Error Log

This example shows how to create a `slmetric.Engine` object, set the analysis root, generate metrics, and create and display the error log for the model `sldemo_fuelsys`.

```
% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify model for metric analysis
setAnalysisRoot(metric_engine, 'Root', 'sldemo_fuelsys');

% Collect model metrics for only the analysis root
metricID = 'mathworks.metrics.SimulinkBlockCount';
execute(metric_engine, metricID);

metricLog = getErrorLog(metricEngine);
disp(metricLog);
```

Topics

“Collect Model Metrics Programmatically”

“Model Metrics” on page 2-387

Introduced in R2017a

getMetricDistribution

Class: `slmetric.Engine`

Package: `slmetric`

Get metric distribution

Syntax

```
getMetricDistribution(metric_engine, MetricID)
```

Description

`getMetricDistribution(metric_engine, MetricID)` generates distribution for a specific metric, `MetricID`, for the metric data in the `slmetric.Engine` object, `metric_engine`. The distribution is on the metric data from the `Value` property of a `slmetric.metric.Result` object.

Input Arguments

metric_engine — Collects and accesses metric data

`slmetric.Engine` object

When you call `execute`, `metric_engine` collects metric data for all available metrics or for the specified `MetricID`. Calling `getMetrics` accesses the collected metric data in `metric_engine`.

MetricID — Metric identifier

character vector

Metric identifier for a model metric, specified as a character vector.

Example: `'mathworks.metrics.DescriptiveBlockNames'`

Output Arguments

dist — Distribution of the metric data

`slmetric.metric.MetricDistribution` object

Distribution of the metric data contains the following properties:

- `MetricID` is a char array that returns the metric ID specified in the `getMetricDistribution` function call.
- `BinCounts` is an `uint64` array of the number of components corresponding to a bin.
- `BinEdges` is a double array of equally spaced edges of each bin.

Examples

Generate Metric Distribution

To generate the distribution for a specific metric, create a `slmetric.Engine` object, set the analysis root for the `sldemo_fuelsys` model, and create a histogram of the data. The histogram shows the number of components corresponding to a number of blocks.

```
% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify model for metric analysis
setAnalysisRoot(metric_engine, 'Root', 'sldemo_fuelsys');

% Collect model metrics and get distribution
metricID = 'mathworks.metrics.SimulinkBlockCount';
execute(metric_engine, metricID);
dist = getMetricDistribution(metric_engine, metricID);

% View the distribution using a histogram.
histogram('BinEdges',dist.BinEdges,'BinCounts',dist.BinCounts);
```

Topics

“Collect Model Metrics Programmatically”

“Model Metrics” on page 2-387

Introduced in R2017a

getMetrics

Class: slmetric.Engine

Package: slmetric

Access model metric data

Syntax

```
Results = getMetrics(metric_engine)
Results = getMetrics(metric_engine, MetricIDs)
Results = getMetrics(metric_engine, MetricIDs, 'AggregationDepth', ad)
```

Description

Access model metric data from the specified model metric engine. When you call execute, the metric engine collects the metric data. The returned metric data is based on defined architectural components. The components are these Simulink objects:

- Model
- Subsystem block
- Chart
- MATLAB Function block
- Protected model

`Results = getMetrics(metric_engine)` returns metric data for all metrics that the metric engine executed.

`Results = getMetrics(metric_engine, MetricIDs)` returns metric data for the specified metric identifiers.

`Results = getMetrics(metric_engine, MetricIDs, 'AggregationDepth', ad)` returns metric data for the specified metric identifiers and specifying how to aggregate data.

Input Arguments

metric_engine — Collects and accesses metric data

`slmetric.Engine` object

When you call `execute`, `metric_engine` collects metric data for all available MathWorks metrics or for the specified `MetricIDs`. Calling `getMetrics` accesses the collected metric data in `metric_engine`.

MetricIDs — Metric identifier

character vector | cell array of character vectors

Metric identifier for “Model Metrics” on page 2-387 or custom model metrics that you create. You can specify one or multiple metric identifiers. You can get metric identifiers by calling `slmetric.metric.getAvailableMetrics`.

Example: `'mathworks.metrics.DescriptiveBlockNames'`

AggregationDepth — Depth or level in the component hierarchy to which `getMetrics` aggregates the metric data

All (default) | None

Depth or level in the component for which `getMetrics` aggregates the metric data, specified as a name-value pair argument. Values are one of the following:

- **All** — `getMetrics` aggregates the detailed results to the component level. Then, the component level results are used to calculate the aggregated values by traversing the component hierarchy. `getMetrics` returns only the component-level results.
- **None** — Do not aggregate measures and values. If you specify this option, `getMetrics` returns metric values as collected by the metric algorithm. For example, if the metric algorithm returns detailed results, the detailed results are returned without aggregation. `AggregatedValue` and `AggregatedMeasures` properties of the returned `slmetric.metric.Result` objects are empty.

Example: `'AggregationDepth', 'None'`

Data Types: `char`

Output Arguments

Results — Metric data from the metric engine

array of `slmetric.metric.Result` objects

Metric data from the metric engine.

Examples

Collect and Access Metric Data for a Model

Collect and access model metric data for the model `sldemo_mdref_basic`.

Create an `slmetric.Engine` object and set the root in the model for analysis.

```
metric_engine = slmetric.Engine();

% Include referenced models and libraries in the analysis.
% These properties are on by default.
metric_engine.AnalyzeModelReferences = 1;
metric_engine.AnalyzeLibraries = 1;

setAnalysisRoot(metric_engine, 'Root', 'sldemo_mdref_basic');
```

Collect model metric data

```
execute(metric_engine, 'mathworks.metrics.SimulinkBlockCount');
```

Get the model metric data that returns an array of `slmetric.metric.ResultCollection` objects, `res_col`.

```
res_col = getMetrics(metric_engine, 'mathworks.metrics.SimulinkBlockCount');
```

Display the results for the `mathworks.metrics.SimulinkBlockCount` metric.

```
for n=1:length(res_col)
    if res_col(n).Status == 0
        result = res_col(n).Results;

        for m=1:length(result)
            disp(['MetricID: ', result(m).MetricID]);
            disp([' ComponentPath: ', result(m).ComponentPath]);
            disp([' Value: ', num2str(result(m).Value)]);
            disp([' AggregatedValue: ', num2str(result(m).AggregatedValue)]);
        end
    else
        disp(['No results for:', result(n).MetricID]);
    end
end
```

```
    disp(' ');  
end
```

getResults

Class: Advisor.Application

Package: Advisor

Access Model Advisor analysis results

Syntax

```
Results = getResults(app)
```

```
Results = getResults(app,Name,Value)
```

Description

Access Application object analysis results.

`Results = getResults(app)` provides access to Model Advisor analysis results.

`Results = getResults(app,Name,Value)`

Input Arguments

app — Application

Advisor.Application object

Advisor.Application object, created by `Advisor.Manager.createApplication`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

IDs — Component IDs

cell array

Component IDs, as specified as a cell array of IDs

Data Types: cell

Output Arguments

Result — Analysis results

cell array of `ModelAdvisor.SystemResult` objects

Analysis results, returned as a cell array of `ModelAdvisor.SystemResult` objects.

getStatistics

Class: slmetric.Engine

Package: slmetric

Get statistics on metric data

Syntax

```
stats = getStatistics(metric_engine, MetricID)
```

Description

Generate statistics on the Value properties of the `slmetric.metric.Result` objects for the specified metric engine object, `metric_engine`.

`stats = getStatistics(metric_engine, MetricID)` generate statistics for the specified metric identifier.

Input Arguments

metric_engine — Collects and accesses metric data

`slmetric.Engine` object

When you call `execute`, `metric_engine` collects metric data for all available metrics or for the specified `MetricID`. Calling `getMetrics` accesses the collected metric data in `metric_engine`.

MetricID — Metric identifier

character vector

Metric identifier for “Model Metrics” on page 2-387 or custom model metrics that you create. You can get metric identifiers by calling `slmetric.metric.getAvailableMetrics`.

Example: `'mathworks.metrics.DescriptiveBlockNames'`

Output Arguments

stats — Metric statistics

`slmetric.metric.Statistics` object

The `Statistics` object contains the following properties:

- `MinValue` is a double that returns the minimum of the `Value` of the `slmetric.metric.Result` object.
- `MaxValue` is a double that returns the maximum of the `Value` of the `slmetric.metric.Result` object.
- `MeanValue` is a double that returns the mean of the `Value` of the `slmetric.metric.Result` object.
- `StandardDeviation` is a double that returns the standard deviation of the `Value` of the `slmetric.metric.Result` object.

Examples

Collect Statistics

This example shows how to create a `slmetric.Engine` object, set the analysis root, collect the block count metric, and collect statistics for the model `sldemo_fuelsys`.

```
% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify model for metric analysis
setAnalysisRoot(metric_engine, 'Root','sldemo_fuelsys');

% Generate and collect model metrics
metricID = 'mathworks.metrics.SimulinkBlockCount';
execute(metric_engine, metricID);
stats = getStatistics(metric_engine, metricID);
```

loadConfiguration

Class: Advisor.Application

Package: Advisor

Load Model Advisor configuration

Syntax

```
loadConfiguration(app, filename)
```

Description

loadConfiguration(app, filename) loads a Model Advisor configuration MAT-file.

Input Arguments

app — Application

Advisor.Application object

Advisor.Application object, created by Advisor.Manager.createApplication

filename — Name of Model Advisor configuration MAT-file

character vector

Name of Model Advisor configuration MAT-file, specified as a character vector.

Example: 'MyConfiguration.mat'

Data Types: char

Advisor.Manager.createApplication

Introduced in R2015b

mdltransformer

Open Model Transformer

Syntax

```
mdltransformer(model)
```

Description

`mdltransformer(model)` opens the Model Transformer for a model specified by `model`. If the specified model is not open, this command opens it.

Examples

Open Model Transformer for model

Open the Model Transformer for `rtwdemo_reusable_sys_outputs` example model:

```
mdltransformer('rtwdemo_reusable_sys_outputs')
```

- “Transform Model to Variant System”
- “Improve Model Readability by Eliminating Local Data Store Blocks”

Input Arguments

model — Model name

character vector

Model name or handle, specified as a character vector.

Data Types: char

“Improve Model Readability by Eliminating Local Data Store Blocks”

Introduced in R2016b

metricsdashboard

Open Metrics Dashboard

Syntax

```
metricsdashboard(system)
```

Description

`metricsdashboard(system)` opens the Metrics Dashboard for a system specified by `system`. The *system* can be either a model name or a block path to a subsystem. The system cannot be a Configurable Subsystem block.

Examples

Open Metrics Dashboard for system

Open the Metrics Dashboard for vdp example model:

```
metricsdashboard('vdp')
```

Input Arguments

system — System name

character vector

System name, specified as a character vector.

Data Types: char

See Also

Topics

“Collect and Explore Metric Data by Using the Metrics Dashboard”

Introduced in R2017b

slmetric.metric.Metric class

Package: slmetric.metric

Abstract class for creating model metrics

Description

Abstract base class for creating model metrics. To create a model metric, create a MATLAB class that derives from the `slmetric.metric.Metric` class.

Properties

CompileContext — Compile mode

character vector

Compile mode for metric calculation. If your model metric requires model compilation, specify `PostCompile`. If your model metric does not require model compilation, specify `None`.

Example: `'PostCompile'`

Data Types: `char`

ComponentScope — Component scope

array of `Advisor.component.Types` enum values

Model components for which metric is calculated. The metric is calculated for all components that match the type.

Description — Metric description

character vector

Metric description.

Data Types: `char`

ID — Metric ID

character vector

Unique metric identifier.

Data Types: char

Version — Metric version number

integer

Use this property to communicate changes in your metric algorithm to the metric engine.

Data Types: uint32

Name — Name of the metric algorithm

character vector

Specify a name for the custom metric algorithm.

Data Types: char

ResultChecksumCoverage — Reuse metric data

logical

If `true`, results produced by the metric algorithm change only if the model or library source files change. If the source file and the metric `Version` have not changed, metric data is not regenerated. If `false`, each call to `slmetric.Engine.execute` collects new data for this metric and stores it in the metric repository.

Data Types: logical

AggregationMode — How the metric algorithm aggregates the metric data

character array

Specify the operation to aggregate the `slmetric.metric.Result` object properties `Value` and `Measure` across the component hierarchy. The metric algorithm outputs the aggregated values in the `slmetric.metric.Result` object properties `AggregatedValues` and `AggregatedMeasures`. Options are:

- **Sum**: Returns the sum of the `Value` property and the `Value` properties of all its children components across the component hierarchy.
- **Max**: Returns the maximum of the `Value` property and the `Value` properties of all its children components across the component hierarchy.
- **None**: No aggregation of metric values.

Data Types: char

AggregateComponentDetails — Aggregate detailed results to the component level

logical

If `true`, metric results that do not cover the full component scope are aggregated to the component level. Values and measures of the detailed results belonging to a component are summed and a new result is created that spans the complete component.

If `false`, returns the detailed results of the component. Detailed results are not aggregated.

Data Types: `logical`

SupportsResultDetails — Specify whether Details property contains data

logical

Specify whether the `slmetric.metric.Result` object property `Details` contains data. The default value is `false`.

Data Types: `logical`

Methods

`algorithm` Specify logic for metric data analysis

Introduced in R2016a

algorithm

Class: `slmetric.metric.Metric`

Package: `slmetric.metric`

Specify logic for metric data analysis

Syntax

```
Result = algorithm(Metric,Component)
```

Description

Specify logic for metric algorithm analysis. Custom-authored metric algorithms are not called for library links and external MATLAB file components.

`Result = algorithm(Metric,Component)` specifies logic for metric algorithm analysis.

Input Arguments

Metric — New model metric class

`slmetric.metric.Metric` object

Model metric class you are defining for a new metric.

Component — Component for metric analysis

`Advisor.component.Component` object

Instance of `Advisor.component.Component` for metric analysis.

Output Arguments

Result — Algorithm result data

array of `slmetric.metric.Result` objects

Algorithm data, returned as an array of `slmetric.metric.Result` objects.

Examples

Create Metric Algorithm for Nonvirtual Block Count

This example shows how to use the `algorithm` method to create a nonvirtual block count metric.

Using the `createNewMetricClass` function, create a metric class with the name `nonvirtualblockcount`. The function creates the `nonvirtualblockcount.m` file in the current working folder.

```
className = 'nonvirtualblockcount';  
slmetric.metric.createNewMetricClass(className);
```

Open and edit the metric algorithm file `nonvirtualblockcount.m`. The file contains an empty metric algorithm method.

```
edit(className);
```

Copy and paste the following code into the `nonvirtualblockcount.m` file. Save `nonvirtualblockcount.m`. The code provides a metric algorithm for counting the nonvirtual blocks.

```
classdef nonvirtualblockcount < slmetric.metric.Metric  
    % nonvirtualblockcount calculate number of non-virtual blocks per level.  
    % BusCreator, BusSelector and BusAssign are treated as non-virtual.  
    properties  
        VirtualBlockTypes = {'Demux','From','Goto','Ground', ...  
            'GotoTagVisibility','Mux','SignalSpecification', ...  
            'Terminator','Inport'};  
    end  
  
    methods  
        function this = nonvirtualblockcount()  
            this.ID = 'nonvirtualblockcount';  
            this.Version = 1;  
            this.CompileContext = 'None';  
            this.Description = 'Algorithm that counts nonvirtual blocks per level.';  
            this.ComponentScope = [Advisor.component.Types.Model, ...  
                Advisor.component.Types.SubSystem];  
    end  
  
    function res = algorithm(this, component)  
        % create a result object for this component  
        res = slmetric.metric.Result();  
    end  
end
```

```

% set the component and metric ID
res.ComponentID = component.ID;
res.MetricID = this.ID;

% use find_system to get all blocks inside this component
blocks = find_system(getComponentSource(component), ...
    'FollowLinks','on', 'SearchDepth', 1, ...
    'Type', 'Block', ...
    'FollowLinks', 'On');

isNonVirtual = true(size(blocks));

for n=1:length(blocks)
    blockType = get_param(blocks{n}, 'BlockType');

    if any(strcmp(this.VirtualBlockTypes, blockType))
        isNonVirtual(n) = false;
    else
        switch blockType
            case 'SubSystem'
                % Virtual unless the block is conditionally executed
                % or the Treat as atomic unit check box is selected.
                if strcmp(get_param(blocks{n}, 'IsSubSystemVirtual'), ...
                    'on')
                    isNonVirtual(n) = false;
                end
            case 'Outputport'
                % Outputport: Virtual when the block resides within
                % any SubSystem block (conditional or not), and
                % does not reside in the root (top-level) Simulink window.
                if component.Type ~= Advisor.component.Types.Model
                    isNonVirtual(n) = false;
                end
            case 'Selector'
                % Virtual only when Number of input dimensions
                % specifies 1 and Index Option specifies Select
                % all, Index vector (dialog), or Starting index (dialog).
                nod = get_param(blocks{n}, 'NumberOfDimensions');
                ios = get_param(blocks{n}, 'IndexOptionArray');

                ios_settings = {'Assign all', 'Index vector (dialog)', ...
                    'Starting index (dialog)'};

                if nod == 1 && any(strcmp(ios_settings, ios))
                    isNonVirtual(n) = false;
                end
            case 'Trigger'
                % Virtual when the output port is not present.
                if strcmp(get_param(blocks{n}, 'ShowOutputPort'), 'off')
                    isNonVirtual(n) = false;
                end
            case 'Enable'
                % Virtual unless connected directly to an Outputport block.
                isNonVirtual(n) = false;

                if strcmp(get_param(blocks{n}, 'ShowOutputPort'), 'on')
                    pc = get_param(blocks{n}, 'PortConnectivity');

                    if ~isempty(pc.DstBlock) && ...
                        strcmp(get_param(pc.DstBlock, 'BlockType'), ...
                            'Outputport')

```

```
                isNonVirtual(n) = true;
            end
        end
    end
    end
    blocks = blocks(isNonVirtual);
    res.Value = length(blocks);
end
end
end
```

Introduced in R2016a

slmetric.metric.ResultDetail class

Package: slmetric.metric

Details about instances of `slmetric.metric.Result` objects

Description

Details about what the metric engine counts for the `slmetric.metric.Result` object property `Value`.

Construction

Calling the `slmetric.Engine.execute` method creates the `slmetric.metric.Result` objects, which optionally includes the `slmetric.metric.ResultDetail` objects.

Properties

ID — Unique identifier

character vector

Unique identifier for the entity that the result detail instance counts. This property is read/write.

Data Types: char

Name — Name of model entity

character vector

Name of model entity that result detail instance counts. This property is read/write.

Data Types: char

Value — Value of ID property

double

Scalar value generated by metric algorithm for ID. This property is read/write.

Data Types: double

Methods

setGroup	Set the name and identifier for a group of <code>slmetric.metric.ResultDetail</code> objects
getGroupIdentifier	Obtain the identifier for a group of <code>slmetric.metric.ResultDetail</code> objects
getGroupName	Obtain the name for a group of <code>slmetric.metric.ResultDetail</code> objects

Examples

Obtain Clone Group Names and Identifiers

Use the `getGroupName` and `getGroupIdentifier` methods to obtain the name and identifier for a group of clones.

Open the example model.

```
open_system([docroot '\toolbox\simulink\examples\ex_clone_detection.slx']);
```

Save the example model to your current working folder.

Call the `execute` method. Apply the `getMetrics` method for the `mathworks.metric.CloneDetection` metric.

```
metric_engine = slmetric.Engine();  
setAnalysisRoot(metric_engine, 'Root', 'ex_clone_detection', 'RootType', 'Model');  
execute(metric_engine);  
rc = getMetrics(metric_engine, 'mathworks.metrics.CloneDetection');
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetail` object, display the clone group name and identifier.

```
for n=1:length(rc.Results)  
    if rc.Results(n).Value > 0  
        for m=1:length(rc.Results(n).Details)  
            disp(['ComponentPath: ', rc.Results(n).ComponentPath]);  
            disp(['Group Name: ', rc.Results(n).Details(m).getGroupName]);  
            disp(['Group Identifier: ', rc.Results(n).Details(m).getGroupIdentifier]);  
        end  
    end  
end
```

```

        end
    else
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);
    end
    disp(' ');
end
end

```

The results show that the model contains one clone group, CloneGroup1, which contains two clones.

Set Group Names and Group Identifiers for a Custom Model Metric

Use the `setGroup` method to group detailed results. When you create a custom model metric, you apply this method as part of the `algorithm` method.

Using the `createNewMetricClass` function, create a metric class named `DataStoreCount`. This metric counts the number of Data Store Read and Data Store Write blocks and groups them together by the corresponding Data Store Memory block. The `createNewMetricClass` function creates a file, `DataStoreCount.m` in the current working folder. The file contains a constructor and empty metric algorithm method. For this example, make sure that you are working in a writable folder.

```

className = 'DataStoreCount';
slmetric.metric.createNewMetricClass(className);

```

To write the metric algorithm, open the `DataStoreCount.m` file and add the metric to the file. For this example, you can create the metric algorithm by copying this logic into the `DataStoreCount.m` file.

```

classdef DataStoreCount < slmetric.metric.Metric
    % Count the number of Data Store Read and Data Store Write
    % blocks and correlate them across components.

    methods
        function this = DataStoreCount()
            this.ID = 'DataStoreCount';
            this.ComponentScope = [Advisor.component.Types.Model, ...
                Advisor.component.Types.SubSystem];
            this.AggregationMode = slmetric.AggregationMode.Sum;
            this.AggregateComponentDetails = true;
            this.CompileContext = 'None';
            this.Version = 1;
            this.SupportsResultDetails = true;

            %Textual information on the metric algorithm
            this.Name = 'Data store usage';
            this.Description = 'Metric that counts the number of Data Store Read and Write';
                'blocks and groups them by the corresponding Data Store Memory block.';
        end
    end
end

```

```
function res = algorithm(this, component)
% Use find_system to get all blocks inside this component.
dswBlocks = find_system(getPath(component), ...
    'SearchDepth', 1, ...
    'BlockType', 'DataStoreWrite');
dsrBlocks = find_system(getPath(component), ...
    'SearchDepth', 1, ...
    'BlockType', 'DataStoreRead');

% Create a ResultDetail object for each data store read and write block.
% Group ResultDetails by the data store name.
details1 = slmetric.metric.ResultDetail.empty();
for i=1:length(dswBlocks)
    details1(i) = slmetric.metric.ResultDetail(getfullname(dswBlocks{i}),...
        get_param(dswBlocks{i}, 'Name'));
    groupID = get_param(dswBlocks{i}, 'DataStoreName');
    groupName = get_param(dswBlocks{i}, 'DataStoreName');
    details1(i).setGroup(groupID, groupName);
    details1(i).Value = 1;
end

details2 = slmetric.metric.ResultDetail.empty();
for i=1:length(dsrBlocks)
    details2(i) = slmetric.metric.ResultDetail(getfullname(dsrBlocks{i}),...
        get_param(dsrBlocks{i}, 'Name'));
    groupID = get_param(dsrBlocks{i}, 'DataStoreName');
    groupName = get_param(dsrBlocks{i}, 'DataStoreName');
    details2(i).setGroup(groupID, groupName);
    details2(i).Value = 1;
end

res = slmetric.metric.Result();
res.ComponentID = component.ID;
res.MetricID = this.ID;
res.Value = length(dswBlocks)+ length(dsrBlocks);
res.Details = [details1 details2];
end
end
end
```

In the `DataStoreCount` metric class, the `SupportsResultDetail` method is set to true. The metric algorithm contains the logic for the `setGroup` method.

Now that your new model metric is defined in `DataStoreCount.m`, register the new metric.

```
[id_metric,err_msg] = slmetric.metric.registerMetric(className);
```

To collect metric data on models, use instances of `slmetric.Engine`. Using the `getMetrics` method, specify the metric that you want to collect. For this example, specify the data store count metric for the `sldemo_mdhref_dsm` model.

Load the `sldemo_mdhref_dsm` model.

```
model = 'sldemo_mdhref_dsm';
load_system(model);
```

Create a metric engine object and set the analysis root.

```
metric_engine = slmetric.Engine();
setAnalysisRoot(metric_engine, 'Root', model, 'RootType', 'Model');
```

Collect metric data for the Data Store count metric.

```
execute(metric_engine);
rc=getMetrics(metric_engine, id_metric);
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetails` object, display the Data Store group name and identifier.

```
for n=1:length(rc.Results)
    if rc.Results(n).Value > 0
        for m=1:length(rc.Results(n).Details)
            disp(['ComponentPath: ',rc.Results(n).ComponentPath]);
            disp(['Group Name: ',rc.Results(n).Details(m).getGroupName]);
            disp(['Group Identifier: ',rc.Results(n).Details(m).getGroupIdentifier]);
        end
    else
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);
    end
    disp(' ');
end
```

Here are the results.

```
ComponentPath: sldemo_mdhref_dsm
Group Name: ErrorCond
Group Identifier: ErrorCond
```

```
No results for ComponentPath: sldemo_mdhref_dsm/A
```

```
No results for ComponentPath: sldemo_mdhref_dsm/A1
```

```
No results for ComponentPath: sldemo_mdhref_dsm/More Info1
```

```
ComponentPath: sldemo_mdhref_dsm_bot
Group Name: RefSignalVal
Group Identifier: RefSignalVal
```

```
ComponentPath: sldemo_mdhref_dsm_bot2
Group Name: ErrorCond
Group Identifier: ErrorCond
```

```
ComponentPath: sldemo_mdhref_dsm_bot/PositiveSS
Group Name: RefSignalVal
Group Identifier: RefSignalVal
```

```
ComponentPath: sldemo_mdref_dsm_bot/NegativeSS  
Group Name: RefSignalVal  
Group Identifier: RefSignalVal
```

For this example, unregister the data store count metric.

```
slmetric.metric.unregisterMetric(id_metric);
```

Close the model.

```
clear;  
bdclose('all');
```

Introduced in R2017b

setGroup

Class: `slmetric.metric.ResultDetail`

Package: `slmetric.metric`

Set the name and identifier for a group of `slmetric.metric.ResultDetail` objects

Syntax

```
setGroup(groupIdentifier,groupName)
```

Description

For a custom-authored metric, set the identifier and name for a group of `slmetric.metric.ResultDetail` objects. Apply this method from within the part of the metric algorithm that specifies the details for `getMetrics` objects.

`setGroup(groupIdentifier,groupName)` sets the values of the group name and identifier for an `slmetric.metric.ResultDetail` object.

Input Arguments

groupIdentifier — Group identifier

character vector

Specify a value for the identifier for a group of `slmetric.metric.ResultDetail` objects.

groupName — Group name

character vector

Specify a value for the name of a group of `slmetric.metric.ResultDetail` objects.

Examples

Set Group Names and Group Identifiers for a Custom Model Metric

Use the `setGroup` method to group detailed results. When you create a custom model metric, you apply this method as part of the `algorithm` method.

Using the `createNewMetricClass` function, create a metric class named `DataStoreCount`. This metric counts the number of Data Store Read and Data Store Write blocks and groups them together by the corresponding Data Store Memory block. The `createNewMetricClass` function creates a file `DataStoreCount.m` in the current working folder. The file contains a constructor and empty metric algorithm method. For this example, make sure that you are working in a writable folder.

```
className = 'DataStoreCount';  
slmetric.metric.createNewMetricClass(className);
```

To write the metric algorithm, open the `DataStoreCount.m` file and add the metric to the file. For this example, you can create the metric algorithm by copying this logic into the `DataStoreCount.m` file.

```
classdef DataStoreCount < slmetric.metric.Metric  
    % Count the number of Data Store Read and Data Store Write  
    % blocks and correlate them across components.  
  
    methods  
        function this = DataStoreCount()  
            this.ID = 'DataStoreCount';  
            this.ComponentScope = [Advisor.component.Types.Model, ...  
                Advisor.component.Types.SubSystem];  
            this.AggregationMode = slmetric.AggregationMode.Sum;  
            this.AggregateComponentDetails = true;  
            this.CompileContext = 'None';  
            this.Version = 1;  
            this.SupportsResultDetails = true;  
  
            %Textual information on the metric algorithm  
            this.Name = 'Data store usage';  
            this.Description = 'Metric that counts the number of Data Store Read and Write';  
                'blocks and groups them by the corresponding Data Store Memory block.';  
  
        end  
  
        function res = algorithm(this, component)  
            % Use find_system to get all blocks inside this component.  
            dswBlocks = find_system(getPath(component), ...  
                'SearchDepth', 1, ...  
                'BlockType', 'DataStoreWrite');  
            dsrBlocks = find_system(getPath(component), ...  
                'SearchDepth', 1, ...  
                'BlockType', 'DataStoreRead');  
  
            % Create a ResultDetail object for each data store read and write block.  
            % Group ResultDetails by the data store name.  
            details1 = slmetric.metric.ResultDetail.empty();  
            for i=1:length(dswBlocks)  
                details1(i) = slmetric.metric.ResultDetail(getfullname(dswBlocks{i}),...
```

```

        get_param(dswBlocks{i}, 'Name'));
groupID = get_param(dswBlocks{i}, 'DataStoreName');
groupName = get_param(dswBlocks{i}, 'DataStoreName');
details1(i).setGroup(groupID, groupName);
details1(i).Value = 1;
end

details2 = slmetric.metric.ResultDetail.empty();
for i=1:length(dsrBlocks)
    details2(i) = slmetric.metric.ResultDetail(getfullname(dsrBlocks{i}),...
        get_param(dsrBlocks{i}, 'Name'));
    groupID = get_param(dsrBlocks{i}, 'DataStoreName');
    groupName = get_param(dsrBlocks{i}, 'DataStoreName');
    details2(i).setGroup(groupID, groupName);
    details2(i).Value = 1;
end

res = slmetric.metric.Result();
res.ComponentID = component.ID;
res.MetricID = this.ID;
res.Value = length(dswBlocks)+ length(dsrBlocks);
res.Details = [details1 details2];
end
end
end
end
end

```

In the `DataStoreCount` metric class, the `SupportsResultDetail` method is set to true. The metric algorithm contains the logic for the `setGroup` method.

Now that your new model metric is defined in `DataStoreCount.m`, register the new metric.

```
[id_metric,err_msg] = slmetric.metric.registerMetric(className);
```

To collect metric data on models, use instances of `slmetric.Engine`. Using the `getMetrics` method, specify the metric that you want to collect. For this example, specify the data store count metric for the `sldemo_mdhref_dsm` model.

Load the `sldemo_mdhref_dsm` model.

```
model = 'sldemo_mdhref_dsm';
load_system(model);
```

Create a metric engine object and set the analysis root..

```
metric_engine = slmetric.Engine();
setAnalysisRoot(metric_engine, 'Root', model, 'RootType', 'Model');
```

Collect metric data for the Data Store count metric.

```
execute(metric_engine);
rc=getMetrics(metric_engine, id_metric);
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetails` object, display the Data Store group name and identifier.

```
for n=1:length(rc.Results)
    if rc.Results(n).Value > 0
        for m=1:length(rc.Results(n).Details)
            disp(['ComponentPath: ',rc.Results(n).ComponentPath]);
            disp(['Group Name: ',rc.Results(n).Details(m).getGroupName]);
            disp(['Group Identifier: ',rc.Results(n).Details(m).getGroupIdentifier]);
        end
    else
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);
    end
end
disp(' ');
end
```

Here are the results.

```

Introduced in R2017b

getGroupIdentifier

Class: `slmetric.metric.ResultDetail`

Package: `slmetric.metric`

Obtain the identifier for a group of `slmetric.metric.ResultDetail` objects

Syntax

```
groupIdentifier = getGroupIdentifier(mrd)
```

Description

Obtain the identifier for a group of `slmetric.metric.ResultDetail` objects. Calling the `execute` method collects metric data. Calling `getMetrics` accesses the `slmetric.metric.Result` objects, which include the `slmetric.metric.ResultDetail` objects. Apply the `getGroupIdentifier` method to the `slmetric.metric.ResultDetail` object.

`groupIdentifier = getGroupIdentifier(mrd)` obtains the group identifier for the `slmetric.metric.ResultDetail` object `mrd`.

Input Arguments

mrd — `slmetric.metric.ResultDetail` object

character vector

Calling the `slmetric.Engine.execute` method creates the `slmetric.metric.Result` objects, which include the `slmetric.metric.ResultDetail` objects.

Output Arguments

groupIdentifier — Group identifier

character vector

Identifier for a group of `slmetric.metric.ResultDetail` objects.

Examples

Obtain Clone Group Names and Identifiers

Use the `getGroupName` and `getGroupIdentifier` methods to obtain the name and identifier for a group of clones.

Open the example model.

```
open_system([docroot '\toolbox\simulink\examples\ex_clone_detection.slx']);
```

Save the example model to your current working folder.

Call the `execute` method. Apply the `getMetrics` method for `themathworks.metric.CloneDetection` metric.

```
metric_engine = slmetric.Engine();
setAnalysisRoot(metric_engine,'Root','ex_clone_detection','RootType','Model');
execute(metric_engine);
rc = getMetrics(metric_engine,'mathworks.metrics.CloneDetection');
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetail` object, display the clone group name and identifier.

```
for n=1:length(rc.Results)
    if rc.Results(n).Value > 0
        for m=1:length(rc.Results(n).Details)
            disp(['ComponentPath: ',rc.Results(n).ComponentPath]);
            disp(['Group Name: ',rc.Results(n).Details(m).getGroupName]);
            disp(['Group Identifier: ',rc.Results(n).Details(m).getGroupIdentifier]);
        end
    else
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);
    end
    disp(' ');
end
```

The results show that the model contains one clone group, `CloneGroup1`, which contains two clones.

Set Group Names and Group Identifiers for a Custom Model Metric

Use the `setGroup` method to group detailed results. When you create a custom model metric, you apply this method as part of the `algorithm` method.

Using the `createNewMetricClass` function, create a new metric class named `DataStoreCount`. This metric counts the number of Data Store Read and Data Store Write blocks and groups them together by the corresponding Data Store Memory block. The `createNewMetricClass` function creates a file, `DataStoreCount.m` in the current working folder. The file contains a constructor and empty metric algorithm method. For this example, make sure that you are working in a writable folder.

```
className = 'DataStoreCount';
slmetric.metric.createNewMetricClass(className);
```

To write the metric algorithm, open the `DataStoreCount.m` file and add the metric to the file. For this example, you can create the metric algorithm by copying this logic into the `DataStoreCount.m` file.

```
classdef DataStoreCount < slmetric.metric.Metric
    % Count the number of Data Store Read and Data Store Write
    % blocks and correlate them across components.

    methods
        function this = DataStoreCount()
            this.ID = 'DataStoreCount';
            this.ComponentScope = [Advisor.component.Types.Model, ...
                Advisor.component.Types.SubSystem];
            this.AggregationMode = slmetric.AggregationMode.Sum;
            this.AggregateComponentDetails = true;
            this.CompileContext = 'None';
            this.Version = 1;
            this.SupportsResultDetails = true;

            %Textual information on the metric algorithm
            this.Name = 'Data store usage';
            this.Description = 'Metric that counts the number of Data Store Read and Write';
                'blocks and groups them by the corresponding Data Store Memory block.';
        end

        function res = algorithm(this, component)
            % Use find_system to get all blocks inside this component.
            dswBlocks = find_system(getPath(component), ...
                'SearchDepth', 1, ...
                'BlockType', 'DataStoreWrite');
            dsrBlocks = find_system(getPath(component), ...
                'SearchDepth', 1, ...
                'BlockType', 'DataStoreRead');

            % Create a ResultDetail object for each data store read and write block.
```

```

% Group ResultDetails by the data store name.
details1 = slmetric.metric.ResultDetail.empty();
for i=1:length(dswBlocks)
    details1(i) = slmetric.metric.ResultDetail(getfullname(dswBlocks{i}),...
        get_param(dswBlocks{i}, 'Name'));
groupID = get_param(dswBlocks{i}, 'DataStoreName');
groupName = get_param(dswBlocks{i}, 'DataStoreName');
    details1(i).setGroup(groupID, groupName);
    details1(i).Value = 1;
end

details2 = slmetric.metric.ResultDetail.empty();
for i=1:length(dsrBlocks)
    details2(i) = slmetric.metric.ResultDetail(getfullname(dsrBlocks{i}),...
        get_param(dsrBlocks{i}, 'Name'));
groupID = get_param(dsrBlocks{i}, 'DataStoreName');
groupName = get_param(dsrBlocks{i}, 'DataStoreName');
    details2(i).setGroup(groupID, groupName);
    details2(i).Value = 1;
end

res = slmetric.metric.Result();
res.ComponentID = component.ID;
res.MetricID = this.ID;
res.Value = length(dswBlocks)+ length(dsrBlocks);
res.Details = [details1 details2];
end
end
end

```

In the `DataStoreCount` metric class, the `SupportsResultDetail` method is set to true. The metric algorithm contains the logic for the `setGroup` method.

Now that your new model metric is defined in `DataStoreCount.m`, register the new metric in the metric repository.

```
[id_metric,err_msg] = slmetric.metric.registerMetric(className);
```

To collect metric data on models, use instances of `slmetric.Engine`. Using the `getMetrics` method, specify the metric that you want to collect. For this example, specify the data store count metric for the `sldemo_mdref_dsm` model.

Load the `sldemo_mdref_dsm` model.

```
model = 'sldemo_mdref_dsm';
load_system(model);
```

Create a metric engine object and set the analysis root..

```
metric_engine = slmetric.Engine();
setAnalysisRoot(metric_engine, 'Root', model, 'RootType', 'Model');
```

Collect metric data for the Data Store count metric.

```
execute(metric_engine);  
rc=getMetrics(metric_engine, id_metric);
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetails` object, display the Data Store group name and identifier.

```
for n=1:length(rc.Results)  
    if rc.Results(n).Value > 0  
        for m=1:length(rc.Results(n).Details)  
            disp(['ComponentPath: ',rc.Results(n).ComponentPath]);  
            disp(['Group Name: ',rc.Results(n).Details(m).getGroupName]);  
            disp(['Group Identifier: ',rc.Results(n).Details(m).getGroupIdentifier]);  
        end  
    else  
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);  
    end  
    disp(' ');  
end
```

Here are the results.

```

getGroupName

Class: `slmetric.metric.ResultDetail`

Package: `slmetric.metric`

Obtain the name for a group of `slmetric.metric.ResultDetail` objects

Syntax

```
groupName = getGroupName(mrd)
```

Description

Obtain the name of a group of `slmetric.metric.ResultDetail` objects. Calling the `execute` method collects metric data. Calling `getMetrics` accesses the `slmetric.metric.Result` objects which include the `slmetric.metric.ResultDetail` objects. Apply the `getGroupName` method to the `slmetric.metric.ResultDetail` object.

`groupName = getGroupName(mrd)` obtains the name for the `slmetric.metric.ResultDetail` object `mrd`.

Input Arguments

mrd — `slmetric.metric.ResultDetail` object

character vector

Calling the `slmetric.Engine.execute` method creates the `slmetric.metric.Result` objects, which include the `slmetric.metric.ResultDetail` objects.

Output Arguments

groupName — Group name
character vector

Name for a group of `slmetric.metric.ResultDetail` objects

Examples

Obtain Clone Group Names and Identifiers

Use the `getGroupName` and `getGroupIdentifier` methods to obtain the name and identifier for a group of clones.

Open the example model.

```
open_system([docroot '\toolbox\simulink\examples\ex_clone_detection.slx']);
```

Save the example model to your current working folder.

Call the `execute` method. Apply the `getMetrics` method for the `mathworks.metric.CloneDetection` metrics.

```
metric_engine = slmetric.Engine();
setAnalysisRoot(metric_engine,'Root','ex_clone_detection','RootType','Model');
execute(metric_engine);
rc = getMetrics(metric_engine,'mathworks.metrics.CloneDetection');
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetail` object, display the clone group name and identifier.

```
for n=1:length(rc.Results)
    if rc.Results(n).Value > 0
        for m=1:length(rc.Results(n).Details)
            disp(['ComponentPath: ',rc.Results(n).ComponentPath]);
            disp(['Group Name: ',rc.Results(n).Details(m).getGroupName]);
            disp(['Group Identifier: ',rc.Results(n).Details(m).getGroupIdentifier]);
        end
    else
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);
    end
    disp(' ');
end
```

The results show that the model contains one clone group, CloneGroup1, which contains two clones.

Set Group Names and Group Identifiers for a Custom Model Metric

Use the `setGroup` method to group detailed results. When you create a custom model metric, you apply this method as part of the `algorithm` method.

Using the `createNewMetricClass` function, create a metric class named `DataStoreCount`. This metric counts the number of Data Store Read and Data Store Write blocks and groups them together by the corresponding Data Store Memory block. The `createNewMetricClass` function creates a file, `DataStoreCount.m`, in the current working folder. The file contains a constructor and empty metric algorithm method. For this example, make sure that you are working in a writable folder.

```
className = 'DataStoreCount';
slmetric.metric.createNewMetricClass(className);
```

To write the metric algorithm, open the `DataStoreCount.m` file and add the metric to the file. For this example, you can create the metric algorithm by copying this logic into the `DataStoreCount.m` file.

```
classdef DataStoreCount < slmetric.metric.Metric
    % Count the number of Data Store Read and Data Store Write
    % blocks and correlate them across components.

    methods
        function this = DataStoreCount()
            this.ID = 'DataStoreCount';
            this.ComponentScope = [Advisor.component.Types.Model, ...
                Advisor.component.Types.SubSystem];
            this.AggregationMode = slmetric.AggregationMode.Sum;
            this.AggregateComponentDetails = true;
            this.CompileContext = 'None';
            this.Version = 1;
            this.SupportsResultDetails = true;

            %Textual information on the metric algorithm
            this.Name = 'Data store usage';
            this.Description = 'Metric that counts the number of Data Store Read and Write';
                'blocks and groups them by the corresponding Data Store Memory block.';
        end

        function res = algorithm(this, component)
            % Use find_system to get all blocks inside this component.
            dswBlocks = find_system(getPath(component), ...
                'SearchDepth', 1, ...
                'BlockType', 'DataStoreWrite');
            dsrBlocks = find_system(getPath(component), ...
                'SearchDepth', 1, ...
                'BlockType', 'DataStoreRead');

            % Create a ResultDetail object for each data store read and write block.
```

```

% Group ResultDetails by the data store name.
details1 = slmetric.metric.ResultDetail.empty();
for i=1:length(dswBlocks)
    details1(i) = slmetric.metric.ResultDetail(getfullname(dswBlocks{i}),...
        get_param(dswBlocks{i}, 'Name'));
groupID = get_param(dswBlocks{i}, 'DataStoreName');
groupName = get_param(dswBlocks{i}, 'DataStoreName');
    details1(i).setGroup(groupID, groupName);
    details1(i).Value = 1;
end

details2 = slmetric.metric.ResultDetail.empty();
for i=1:length(dsrBlocks)
    details2(i) = slmetric.metric.ResultDetail(getfullname(dsrBlocks{i}),...
        get_param(dsrBlocks{i}, 'Name'));
groupID = get_param(dsrBlocks{i}, 'DataStoreName');
groupName = get_param(dsrBlocks{i}, 'DataStoreName');
    details2(i).setGroup(groupID, groupName);
    details2(i).Value = 1;
end

res = slmetric.metric.Result();
res.ComponentID = component.ID;
res.MetricID = this.ID;
res.Value = length(dswBlocks)+ length(dsrBlocks);
res.Details = [details1 details2];
end
end
end

```

In the `DataStoreCount` metric class, the `SupportsResultDetail` method is set to true. The metric algorithm contains the logic for the `setGroup` method.

Now that your new model metric is defined in `DataStoreCount.m`, register the new metric.

```
[id_metric,err_msg] = slmetric.metric.registerMetric(className);
```

To collect metric data on models, use instances of `slmetric.Engine`. Using the `getMetrics` method, specify the metric that you want to collect. For this example, specify the data store count metric for the `sldemo_mdref_dsm` model.

Load the `sldemo_mdref_dsm` model.

```
model = 'sldemo_mdref_dsm';
load_system(model);
```

Create a metric engine object and set the analysis root.

```
metric_engine = slmetric.Engine();
setAnalysisRoot(metric_engine, 'Root', model, 'RootType', 'Model');
```

Collect metric data for the Data Store count metric.

```
execute(metric_engine);  
rc=getMetrics(metric_engine, id_metric);
```

For each `slmetric.metric.Result` object, display the `ComponentPath`. For each `slmetric.metric.ResultDetails` object, display the Data Store group name and identifier.

```
for n=1:length(rc.Results)  
    if rc.Results(n).Value > 0  
        for m=1:length(rc.Results(n).Details)  
            disp(['ComponentPath: ',rc.Results(n).ComponentPath]);  
            disp(['Group Name: ',rc.Results(n).Details(m).getGroupName]);  
            disp(['Group Identifier: ',rc.Results(n).Details(m).getGroupIdentifier]);  
        end  
    else  
        disp(['No results for ComponentPath: ',rc.Results(n).ComponentPath]);  
    end

Introduced in R2017b

Advisor.component.Component class

Package: Advisor.component

Create component for metric analysis

Description

Model component used for metric analysis. When you define a custom model metric, the component object defines the component for metric analysis.

Construction

`component_obj = Advisor.component.Component` creates a model component object.

Properties

ID — Component ID

character vector

Component identifier. This property is read/write.

Type — Component type

enum

Component type, as specified by `Advisor.component.Types`. This property is read/write.

Name — Component name

character vector

Model component name. This property is read/write.

IsLinked — Specifies if the component is linked to a library

logical

IsLinked is true if the component is linked to a library. Components of type Model, ModelBlock, ProtectedModel cannot be linked. For these properties, the IsLinked is always true.

Methods

getPath Retrieve component path

getPath

Class: Advisor.component.Component

Package: Advisor.component

Retrieve component path

Syntax

```
path = getPath(component)
```

Description

`path = getPath(component)` retrieves the path to the component.

Input Arguments

component — Component

Advisor.component.Component model object

Constructed Advisor.component.Component model object.

Output Arguments

path — Model component path

character vector

Model component path, specified as a character vector.

Advisor.component.Types

Introduced in R2016a

Advisor.component.Types class

Package: Advisor.component

Create enum class specifying component type

Description

Create an enumeration `Advisor.component.Types` class to specify the model component type.

Construction

`enum_comp_type = Advisor.component.Type.Model` creates an enumeration of component type `Model`. The following table lists the component types.

Type	Description
<code>Model</code>	Simulink block diagram.
<code>LibraryBlock</code>	Library linked block.
<code>MFile</code>	MATLAB code file.
<code>ProtectedModel</code>	Protect Simulink block diagram.
<code>SubSystem</code>	Simulink subsystem block.
<code>Chart</code>	Stateflow® chart or Stateflow block.
<code>MATLABFunction</code>	MATLAB function block.

ModelAdvisor.Action class

Package: ModelAdvisor

Add actions to custom checks

Description

Instances of this class define actions you take when the Model Advisor checks do not pass. Users access actions by clicking the **Action** button that you define in the Model Advisor window.

Construction

ModelAdvisor.Action	Add actions to custom checks
---------------------	------------------------------

Methods

setCallbackFcn	Specify action callback function
----------------	----------------------------------

Properties

Description	Message in Action box
Name	Action button label

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

```
% define action (fix) operation
myAction = ModelAdvisor.Action;
myAction.Name='Fix block fonts';
myAction.Description=...
    'Click the button to update all blocks with specified font';
```

“Create Model Advisor Checks”

ModelAdvisor.Action

Class: ModelAdvisor.Action

Package: ModelAdvisor

Add actions to custom checks

Syntax

```
action_obj = ModelAdvisor.Action
```

Description

`action_obj = ModelAdvisor.Action` creates a handle to an action object.

Note

- Include an action definition in a check definition.
 - Each check can contain only one action.
-

Examples

```
% define action (fix) operation  
myAction = ModelAdvisor.Action;
```

“Create Model Advisor Checks”

ModelAdvisor.Check class

Package: ModelAdvisor

Create custom checks

Description

The `ModelAdvisor.Check` class creates a Model Advisor check object. Checks must have an associated `ModelAdvisor.Task` object to be displayed in the Model Advisor tree.

You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution** is displayed in the **By Product > Simulink** folder and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When you use checks in task definitions, the following rules apply:

- If you define the properties of the check in the check definition and the task definition, the task definition takes precedence. The Model Advisor displays the information contained in the task definition. For example, if you define the name of the check in the task definition using the `ModelAdvisor.Task.DisplayName` property and in the check definition using the `ModelAdvisor.Check.Title` property, the Model Advisor displays the information provided in `ModelAdvisor.Task.DisplayName`.
- If you define the properties of the check in the check definition but not the task definition, the task uses the properties from the check. For example, if you define the name of the check in the check definition using the `ModelAdvisor.Check.Title` property, and you register the check using a task definition, the Model Advisor displays the information provided in `ModelAdvisor.Check.Title`.
- If you define the properties of the check in the task definition but not the check definition, the Model Advisor displays the information as long as you register the task with the Model Advisor instead of the check. For example, if you define the name of the check in the task definition using the `ModelAdvisor.Task.DisplayName` property instead of the `ModelAdvisor.Check.Title` property, and you register the check using a task definition, the Model Advisor displays the information provided in `ModelAdvisor.Task.DisplayName`.

Construction

ModelAdvisor.Check Create custom checks

Methods

getID Return check identifier
setAction Specify action for check
setCallbackFcn Specify callback function for check
setInputParameters Specify input parameters for check
setInputParametersLayoutGrid Specify layout grid for input parameters

Properties

CallbackContext Specify when to run check
CallbackHandle Callback function handle for check
CallbackStyle Callback function type
EmitInputParametersToReport Display check input parameters in the Model Advisor report
Enable Indicate whether user can enable or disable check
ID Identifier for check
LicenseName Product license names required to display and run check
ListViewVisible Status of **Explore Result** button
Result Results cell array
SupportExclusion Set to support exclusions
SupportLibrary Set to support library models
Title Name of check
TitleTips Description of check
Value Status of check
Visible Indicate to display or hide check

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
```

“Create Model Advisor Checks”

ModelAdvisor.Check

Class: ModelAdvisor.Check

Package: ModelAdvisor

Create custom checks

Syntax

```
check_obj = ModelAdvisor.Check(check_ID)
```

Description

`check_obj = ModelAdvisor.Check(check_ID)` creates a check object, `check_obj`, and assigns it a unique identifier, `check_ID`. `check_ID` must remain constant. To display checks in the Model Advisor tree, checks must have an associated `ModelAdvisor.Task` or `ModelAdvisor.Root` object.

Note You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution appears** in the **By Product > Simulink folder** and in the **By Task > Model Referencing** folder in the Model Advisor tree.

Examples

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');

Model Advisor object

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

```
% --- sample factory group  
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
```

See Also

“Model Advisor Customization”

Topics

“Create Model Advisor Checks”

ModelAdvisor.FactoryGroup

Class: ModelAdvisor.FactoryGroup

Package: ModelAdvisor

Define subfolder in **By Task** folder

Syntax

```
fg_obj = ModelAdvisor.FactoryGroup(fg_ID)
```

Description

`fg_obj = ModelAdvisor.FactoryGroup(fg_ID)` creates a handle to a factory group object, `fg_obj`, and assigns it a unique identifier, `fg_ID`. `fg_ID` must remain constant.

Examples

```
% --- sample factory group  
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
```

“Create Model Advisor Checks”

ModelAdvisor.FormatTemplate class

Package: ModelAdvisor

Template for formatting Model Advisor analysis results

Description

Use the `ModelAdvisor.FormatTemplate` class to format the result of a check in the analysis result pane of the Model Advisor for a uniform look and feel among the checks you create. There are two formats for the analysis result:

- Table
- List

Construction

`ModelAdvisor.FormatTemplate` Construct template object for formatting Model Advisor analysis results

Methods

<code>addRow</code>	Add row to table
<code>setCheckText</code>	Add description of check to result
<code>setColTitles</code>	Add column titles to table
<code>setInformation</code>	Add description of subcheck to result
<code>setListObj</code>	Add list of hyperlinks to model objects
<code>setRecAction</code>	Add Recommended Action section and text
<code>setRefLink</code>	Add See Also section and links
<code>setSubBar</code>	Add line between subcheck results
<code>setSubResultStatus</code>	Add status to check or subcheck result
<code>setSubResultStatusText</code>	Add text below status in result
<code>setSubTitle</code>	Add title for subcheck in result
<code>setTableInfo</code>	Add data to table
<code>setTableTitle</code>	Add title to table

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

The following code creates two template objects, `ft1` and `ft2`, and uses them to format the result of running the check in a table and a list. The result identifies the blocks in the model. The graphics following the code display the output as it appears in the Model Advisor when the check passes and fails.

```
function sl_customization(cm)

% register custom checks
cm.addModelAdvisorCheckFcn(@defineModelAdvisorChecks);

% register custom factory group
cm.addModelAdvisorTaskFcn(@defineModelAdvisorTasks);
```

```

% -----
% defines Model Advisor Checks
% -----
function defineModelAdvisorChecks

% Define and register a sample check
rec = ModelAdvisor.Check('mathworks.example.SampleStyleOne');
rec.Title = 'Sample check for Model Advisor using the ModelAdvisor.FormatTemplate';
setCallbackFcn(rec, @SampleStyleOneCallback,'None','StyleOne');

mdladvRoot = ModelAdvisor.Root;
mdladvRoot.register(rec);

% -----
% defines Model Advisor Tasks
% -----
function defineModelAdvisorTasks
mdladvRoot = ModelAdvisor.Root;

% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
rec.DisplayName='My Group 1';
rec.Description='Demo Factory Group';
rec.addCheck('mathworks.example.SampleStyleOne');
mdladvRoot.publish(rec); % publish inside By Group list

% -----
% Sample Check With Subchecks Callback Function
% -----
function ResultDescription = SampleStyleOneCallback(system)
mdladvObj = Simulink.ModelAdvisor.getModelAdvisor(system); % get object

% Initialize variables
ResultDescription={};
ResultStatus = false; % Default check status is 'Warning'
mdladvObj.setCheckResultStatus(ResultStatus);

% Create FormatTemplate object for first subcheck, specify table format
ft1 = ModelAdvisor.FormatTemplate('TableTemplate');

% Add information describing the overall check
setCheckText(ft1, ['Find and report all blocks in the model. ...
'(setCheckText method - Description of what the check reviews)']);

% Add information describing the subcheck
setSubTitle(ft1, 'Table of Blocks (setSubTitle method - Title of the subcheck)');
setInformation(ft1, ['Find and report all blocks in a table. ...
'(setInformation method - Description of what the subcheck reviews)']);

% Add See Also section for references to standards
setRefLink(ft1, {'Standard 1 reference (setRefLink method)',
{'Standard 2 reference (setRefLink method)'}]);

```

```
% Add information to the table
setTableTitle(ft1, {'Blocks in the Model (setTableTitle method)'});
setColTitles(ft1, {'Index (setColTitles method)',
    'Block Name (setColTitles method)'});

% Perform the check actions
allBlocks = find_system(system);
if length(find_system(system)) == 1
    % Add status for subcheck
    setSubResultStatus(ft1, 'Warn');
    setSubResultStatusText(ft1, ['The model does not contain blocks. '...
        '(setSubResultStatusText method - Description of result status)']);
    setRecAction(ft1, {'Add blocks to the model. '...
        '(setRecAction method - Description of how to fix the problem)'});
    ResultStatus = false;
else
    % Add status for subcheck
    setSubResultStatus(ft1, 'Pass');
    setSubResultStatusText(ft1, ['The model contains blocks. '...
        '(setSubResultStatusText method - Description of result status)']);
    for inx = 2 : length(allBlocks)
        % Add information to the table
        addRow(ft1, {inx-1,allBlocks(inx)});
    end
    ResultStatus = true;
end

% Pass table template object for subcheck to Model Advisor
ResultDescription{end+1} = ft1;

% Create FormatTemplate object for second subcheck, specify list format
ft2 = ModelAdvisor.FormatTemplate('ListTemplate');

% Add information describing the subcheck
setSubTitle(ft2, 'List of Blocks (setSubTitle method - Title of the subcheck)');
setInformation(ft2, ['Find and report all blocks in a list. '...
    '(setInformation method - Description of what the subcheck reviews)']);

% Add See Also section for references to standards
setRefLink(ft2, {'Standard 1 reference (setRefLink method)',
    {'Standard 2 reference (setRefLink method)'}));

% Last subcheck, suppress line
setSubBar(ft2, false);

% Perform the subcheck actions
if length(find_system(system)) == 1
    % Add status for subcheck
    setSubResultStatus(ft2, 'Warn');
    setSubResultStatusText(ft2, ['The model does not contain blocks. '...
        '(setSubResultStatusText method - Description of result status)']);
    setRecAction(ft2, {'Add blocks to the model. '...
        '(setRecAction method - Description of how to fix the problem)'});
    ResultStatus = false;
end
```

```
else
    % Add status for subcheck
    setSubResultStatus(ft2, 'Pass');
    setSubResultStatusText(ft2, ['The model contains blocks. '...
        '(setSubResultStatusText method - Description of result status)']);
    % Add information to the list
    setListObj(ft2, allBlocks);
end

% Pass list template object for the subcheck to Model Advisor
ResultDescription{end+1} = ft2;
% Set overall check status
mdladvObj.setCheckResultStatus(ResultStatus);
```

The following graphic displays the output as it appears in the Model Advisor when the check passes.

Result:  Passed

Table of Blocks (setSubTitle method - Title of the subcheck)

Find and report all blocks in a table. (setInformation method - Description of what the subcheck reviews)

See Also

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

Passed

The model contains blocks. (setSubResultStatusText method - Description of result status)

Blocks in the Model (setTableTitle method)

Index (setColTitles method)	Block Name (setColTitles method)
1	model/Constant
2	model/Constant1
3	model/Gain
4	model/Product
5	model/Out1

List of Blocks (setSubTitle method - Title of the subcheck)

Find and report all blocks in a list. (setInformation method - Description of what the subcheck reviews)

See Also

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

Passed

The model contains blocks. (setSubResultStatusText method - Description of result status)

- [model](#)
- [model/Constant](#)
- [model/Constant1](#)
- [model/Gain](#)
- [model/Product](#)
- [model/Out1](#)

The following graphic displays the output as it appears in the Model Advisor when the check fails.

Result:  Warning

Find and report all blocks in the model. (setCheckText method - Description of what the check reviews)

Table of Blocks (setSubTitle method - Title of the subcheck)

Find and report all blocks in a table. (setInformation method - Description of what the subcheck reviews)

See Also

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

Warning

The model does not contain blocks. (setSubResultStatusText method - Description of result status)

Recommended Action

Add blocks to the model.

(setRecAction method - Description of how to fix the problem)

List of Blocks (setSubTitle method - Title of the subcheck)

Find and report all blocks in a list. (setInformation method - Description of what the subcheck reviews)

See Also

- Standard 1 reference (setRefLink method)
- Standard 2 reference (setRefLink method)

Warning

The model does not contain blocks. (setSubResultStatusText method - Description of result status)

Recommended Action

Add blocks to the model.

(setRecAction method - Description of how to fix the problem)

Alternatives

Use the Model Advisor Formatting API to format check analysis results. However, use the `ModelAdvisor.FormatTemplate` class for a uniform look and feel among the checks you create.

“Format Check Results”

ModelAdvisor.FormatTemplate

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Construct template object for formatting Model Advisor analysis results

Syntax

```
obj = ModelAdvisor.FormatTemplate('type')
```

Description

obj = ModelAdvisor.FormatTemplate('type') creates a handle, *obj*, to an object of the ModelAdvisor.FormatTemplate class. *type* is a character vector identifying the format type of the template, either list or table. Valid values are ListTemplate and TableTemplate.

You must return the result object to the Model Advisor to display the formatted result in the analysis result pane.

Note Use the ModelAdvisor.FormatTemplate class in check callbacks.

Examples

Create a template object, *ft*, and use it to create a list template:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
```

ModelAdvisor.Group class

Package: ModelAdvisor

Define custom folder

Description

The `ModelAdvisor.Group` class defines a folder that is displayed in the Model Advisor tree. Use folders to consolidate checks by functionality or usage.

Construction

`ModelAdvisor.Group`

Define custom folder

Methods

`addGroup`

Add subfolder to folder

`addProcedure`

Add procedure to folder

`addTask`

Add task to folder

Properties

`Description`

Description of folder

`DisplayName`

Name of folder

`ID`

Identifier for folder

`MAObj`

Model Advisor object

ModelAdvisor.Image

Class: ModelAdvisor.Image

Package: ModelAdvisor

Include image in Model Advisor output

Syntax

```
object = ModelAdvisor.Image
```

Description

`object = ModelAdvisor.Image` creates a handle to an image object, `object`, that the Model Advisor displays in the output. The Model Advisor supports many image formats, including, but not limited to, JPEG, BMP, and GIF.

Examples

```
image_obj = ModelAdvisor.Image;
```

ModelAdvisor.InputParameter class

Package: ModelAdvisor

Add input parameters to custom checks

Description

Instances of the `ModelAdvisor.InputParameter` class specify the input parameters a custom check uses in analyzing the model. Access input parameters in the Model Advisor window.

Construction

`ModelAdvisor.InputParameter` Add input parameters to custom checks

Methods

`setColSpan` Specify number of columns for input parameter
`setRowSpan` Specify rows for input parameter

Properties

Description	Description of input parameter
Entries	Drop-down list entries
Name	Input parameter name
Type	Input parameter type
Value	Value of input parameter

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

ModelAdvisor.InputParameter

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Add input parameters to custom checks

Syntax

```
input_param = ModelAdvisor.InputParameter
```

Description

`input_param = ModelAdvisor.InputParameter` creates a handle to an input parameter object, `input_param`.

Note You must include input parameter definitions in a check definition.

Examples

Note The following example is a fragment of code from the `sl_customization.m` file for the example model, `slvndemo_mdadv`. The example does not execute as shown without the additional content found in the `sl_customization.m` file.

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.setInputParametersLayoutGrid([3 2]);
% define input parameters
inputParam1 = ModelAdvisor.InputParameter;
inputParam1.Name = 'Skip font checks.';
inputParam1.Type = 'Bool';
inputParam1.Value = false;
inputParam1.Description = 'sample tooltip';
inputParam1.setRowSpan([1 1]);
inputParam1.setColSpan([1 1]);
inputParam2 = ModelAdvisor.InputParameter;
inputParam2.Name = 'Standard font size';
```

```
inputParam2.Value='12';
inputParam2.Type='String';
inputParam2.Description='sample tooltip';
inputParam2.setRowSpan([2 2]);
inputParam2.setColSpan([1 1]);
inputParam3 = ModelAdvisor.InputParameter;
inputParam3.Name='Valid font';
inputParam3.Type='Combobox';
inputParam3.Description='sample tooltip';
inputParam3.Entries={'Arial', 'Arial Black'};
inputParam3.setRowSpan([2 2]);
inputParam3.setColSpan([2 2]);
rec.setInputParameters({inputParam1,inputParam2,inputParam3});
```

ModelAdvisor.ListViewParameter class

Package: ModelAdvisor

Add list view parameters to custom checks

Description

The Model Advisor uses list view parameters to populate the Model Advisor Result Explorer. Access the information in list views by clicking **Explore Result** in the Model Advisor window.

Construction

ModelAdvisor.ListViewParameter Add list view parameters to custom checks

Properties

Attributes	Attributes to display in Model Advisor Report Explorer
Data	Objects in Model Advisor Result Explorer
Name	Drop-down list entry

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

Note The following example is a fragment of code from the `sl_customization.m` file for the example model, `slvndemo_mdadv`. The example does not execute as shown without the additional content found in the `sl_customization.m` file.

```
mdladvObj = Simulink.ModelAdvisor.getModelAdvisor(system);
mdladvObj.setCheckResultStatus(true);

% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
myLVParam.Data = get_param(searchResult,'object');
myLVParam.Attributes = {'FontName'}; % name is default property
mdladvObj.setListViewParameters({myLVParam});
```

ModelAdvisor.lookupCheckID

Package: ModelAdvisor

Look up Model Advisor check ID

Syntax

```
NewID = ModelAdvisor.lookupCheckID('OldCheckID')
```

Description

`NewID = ModelAdvisor.lookupCheckID('OldCheckID')` returns the check ID of the check specified by `OldCheckID`. `OldCheckID` is the ID of a check prior to R2010b.

Input Arguments

`OldCheckID`

`OldCheckID` is the ID of a check prior to R2010b.

Output Arguments

`NewID`

Check ID that corresponds to the previous check ID identified by `OldCheckID`.

Examples

Look up the check ID for **By Product > Simulink Check > Modeling Standards > DO-178C/DO-331 Checks > Check safety-related optimization settings** using the previous ID `D0178B:OptionSet`:

```
NewID = ModelAdvisor.LookupCheckID('D0178B:OptionSet');
```

ModelAdvisor.Procedure class

Package: ModelAdvisor

Define custom procedures

Description

The `ModelAdvisor.Procedure` class defines a procedure that is displayed in the Model Advisor tree. Use procedures to organize additional procedures or checks by functionality or usage.

Construction

`ModelAdvisor.Procedure`

Define custom procedures

Properties

Description

Provides information about the procedure. Details about the procedure are displayed in the right pane of the Model Advisor.

Default: '' (empty character vector)

Name

Specifies the name of the procedure that is displayed in the Model Advisor.

Default: '' (empty character vector)

ID

Specifies a permanent, unique identifier for the procedure.

Note

- You must specify this field.
 - The value of ID must remain constant.
 - The Model Advisor generates an error if ID is not unique.
 - Procedure definitions must refer to other procedures by ID.
-

MAObj

Specifies a handle to the current Model Advisor object.

Methods

addProcedure	Add subprocedure to procedure
addTask	Add task to procedure

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

ModelAdvisor.run

Package: ModelAdvisor

Run Model Advisor checks on systems

Syntax

```
SysResultObjArray = ModelAdvisor.run(SysList,CheckIDList,Name,Value)  
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',  
FileName,Name,Value)
```

Description

`SysResultObjArray = ModelAdvisor.run(SysList,CheckIDList,Name,Value)` runs the Model Advisor on the systems provided by `SysList` with additional options specified by one or more optional `Name, Value` pair arguments. `CheckIDList` contains cell array of check IDs to run.

`SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',FileName,Name,Value)` runs the Model Advisor on the systems provided by `SysList`. The list of checks to run is specified using a Model Advisor configuration file, specified by `FileName`.

Input Arguments

SysList

Cell array of systems to run.

CheckIDList

Cell array of check IDs to run. For details on how to find check IDs, see “Find Check IDs”.

`CheckIDList` optionally can include input parameters for specific checks using the following syntax; `{'CheckID', 'InputParam', {'IP', 'IPV'}}`, where `IP` is the input

parameter name and IPV is the corresponding input parameter value. You can specify several input parameter name and value pair arguments in any order as IP1, IPV1, ..., IPN, IPVN.

FileName

Name of the Model Advisor configuration file. For details on creating a configuration file, see “Organize Checks and Folders Using the Model Advisor Configuration Editor”.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1, Value1, . . . , NameN, ValueN`.

DisplayResults

Setting `DisplayResults` to 'Summary' displays a summary of the system results in the Command Window. Setting `DisplayResults` to 'Details' displays the following in the Command Window:

- Which system the Model Advisor is checking while the run is in progress.
- For each system, the pass and fail results of each check.
- A summary of the system results.

Setting `DisplayResults` to 'None' displays no information in the Command Window.

Default: 'Summary'

Force

Setting `Force` to 'On' removes existing `modeladvisor/system` folders. Setting `Force` to 'Off' prompts you before removing existing `modeladvisor/system` folders.

Default: 'Off'

ParallelMode

Setting `ParallelMode` to 'On' runs the Model Advisor in parallel mode if you have a Parallel Computing Toolbox license and a multicore machine. The Parallel Computing

Toolbox does not support 32-bit Windows® machines. Each parallel process runs checks on one model at a time. In parallel mode, load the model data from the model workspace or data dictionary. The Model Advisor in parallel mode does not support model data in the base workspace. For an example, see “Create a Function for Checking Multiple Systems in Parallel”.

Default: 'Off'

TempDir

Setting TempDir to 'On' runs the Model Advisor from a temporary working folder, to avoid concurrency issues when running using a parallel pool. For more information, see “Resolving Data Concurrency Issues” (Simulink). Setting TempDir to 'Off' runs the Model Advisor in the current working folder.

Default: 'Off'

ShowExclusions

Setting ShowExclusions to 'On' lists Model Advisor check exclusions in the report. Setting ShowExclusions to 'Off' does not list Model Advisor check exclusion in the report.

Default: 'On'

Output Arguments

SysResultObjArray

Cell array of ModelAdvisor.SystemResult objects, one for each model specified in SysList. Each ModelAdvisor.SystemResult object contains an array of CheckResultObj objects. Save SysResultObjArray to review results at a later time without having to rerun the Model Advisor (see “Save and Load Process for Objects” (MATLAB)).

CheckResultObj

Array of ModelAdvisor.CheckResult objects, one for each check that runs.

Examples

Runs the Model Advisor checks **Check model diagnostic parameters** and **Check for fully defined interface** on the `sldemo_auto_climatecontrol/Heater Control` and `sldemo_auto_climatecontrol/AC Control` subsystems:

```
% Create list of checks and models to run.
CheckIDList = {'mathworks.maab.jc_0021',...
              'mathworks.iec61508.RootLevelInports'};
SysList={'sldemo_auto_climatecontrol/Heater Control',...
        'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,CheckIDList);
```

Runs the Model Advisor configuration file `slvndemo_mdldv_config.mat` on the `sldemo_auto_climatecontrol/Heater Control` and `sldemo_auto_climatecontrol/AC Control` subsystems:

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
        'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);
```

Tips

- If you have a Parallel Computing Toolbox™ license and a multicore machine, Model Advisor can run on multiple systems in parallel. You can run the Model Advisor in parallel mode by using `ModelAdvisor.run` with `'ParallelMode'` set to `'On'`. By default, `'ParallelMode'` is set to `'Off'`. When you use `ModelAdvisor.run` with `'ParallelMode'` set to `'On'`, MATLAB automatically creates a parallel pool.

Alternatives

- Use the Model Advisor GUI to run each system, one at a time.
- Create a script or function using the `Simulink.ModelAdvisor` class to run each system, one at a time.

ModelAdvisor.summaryReport

Package: ModelAdvisor

Open Model Advisor Command-Line Summary report

Syntax

```
ModelAdvisor.summaryReport(SysResultObjArray)
```

Description

`ModelAdvisor.summaryReport(SysResultObjArray)` opens the Model Advisor Command-Line Summary report in a web browser. `SysResultObjArray` is a cell array of `ModelAdvisor.SystemResult` objects returned by `ModelAdvisor.run`.

Input Arguments

`SysResultObjArray`

Cell array of `ModelAdvisor.SystemResult` objects returned by `ModelAdvisor.run`.

Examples

Opens the Model Advisor Command-Line Summary report after running the Model Advisor:

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
        'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);
```

```
% Open the Model Advisor Command-Line Summary report.  
ModelAdvisor.summaryReport(SysResultObjArray)
```

ModelAdvisor.Table class

Package: ModelAdvisor

Create table

Description

Instances of the `ModelAdvisor.Table` class create and format a table. Specify the number of rows and columns in a table, excluding the table title and table heading row.

Construction

ModelAdvisor.Table

Create table

Methods

getEntry	Get table cell contents
setColHeading	Specify table column title
setColHeadingAlign	Specify column title alignment
setColHeadingValign	Specify column title vertical alignment
setColWidth	Specify column widths
setEntries	Set contents of table
setEntry	Add cell to table
setEntryAlign	Specify table cell alignment
setEntryValign	Specify table cell vertical alignment
setHeading	Specify table title
setHeadingAlign	Specify table title alignment
setRowHeading	Specify table row title
setRowHeadingAlign	Specify table row title alignment
setRowHeadingValign	Specify table row title vertical alignment

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

ModelAdvisor.Table

Class: ModelAdvisor.Table

Package: ModelAdvisor

Create table

Syntax

```
table = ModelAdvisor.Table(row, column)
```

Description

`table = ModelAdvisor.Table(row, column)` creates a table object (`table`). The Model Advisor displays the table object containing the number of rows (`row`) and columns (`column`) that you specify.

Examples

Create two table objects

Create two table objects, `table1` and `table2`. The Model Advisor displays `table1` in the results as a table with one row and one column. The Model Advisor display `table2` in the results as a table with two rows and three columns.

```
table1 = ModelAdvisor.Table(1,1);  
table2 = ModelAdvisor.Table(2,3);
```

Create table with five rows and five columns

Create a table with five rows and five columns containing randomly generated numbers.

Use the following MATLAB code in a callback function. The Model Advisor displays `table1` in the results.

	Column 1	Column 2	Column 3	Column 4	Column 5
Row 1	81472.3686	9754.0405	15761.3082	14188.6339	65574.0699
Row 2	90579.1937	27849.8219	97059.2782	42176.1283	3571.1679
Row 3	12698.6816	54688.1519	Example Text	91573.5525	84912.9306
Row 4	91337.5856	95750.6835	48537.5649	79220.733	93399.3248
Row 5	63235.9246	96488.8535	80028.0469	95949.2426	67873.5155

ModelAdvisor.Task class

Package: ModelAdvisor

Define custom tasks

Description

The `ModelAdvisor.Task` class is a wrapper for a check so that you can access the check with the Model Advisor.

You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution** is displayed in the **By Product > Simulink** folder and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When adding checks as tasks, the Model Advisor uses the task properties instead of the check properties, except for `Visible` and `LicenseName`.

Construction

`ModelAdvisor.Task`

Define custom tasks

Methods

`setCheck`

Specify check used in task

Properties

Description	Description of task
DisplayName	Name of task
Enable	Indicate if user can enable and disable task
ID	Identifier for task
LicenseName	Product license names required to display and run task
MAObj	Model Advisor object
Value	Status of task
Visible	Indicate to display or hide task

Copy Semantics

Handle. To learn how this affects your use of the class, see Copying Objects (MATLAB) in the MATLAB Programming Fundamentals documentation.

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');  
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
```

Topics

“Create Model Advisor Checks”

ModelAdvisor.Task

Class: ModelAdvisor.Task

Package: ModelAdvisor

Define custom tasks

Syntax

```
task_obj = ModelAdvisor.Task(task_ID)
```

Description

`task_obj = ModelAdvisor.Task(task_ID)` creates a task object, `task_obj`, with a unique identifier, `task_ID`. `task_ID` must remain constant. If you do not specify `task_ID`, the Model Advisor assigns a random `task_ID` to the task object.

You can use one `ModelAdvisor.Check` object in multiple `ModelAdvisor.Task` objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution appears** in the **By Product > Simulink folder** and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When adding checks as tasks, the Model Advisor uses the task properties instead of the check properties, except for `Visible` and `LicenseName`.

Examples

In the following example, you create three task objects, `MAT1`, `MAT2`, and `MAT3`.

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');  
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
```

ModelAdvisor.Text class

Package: ModelAdvisor

Create Model Advisor text output

Description

Instances of `ModelAdvisor.Text` class create formatted text for the Model Advisor output.

Construction

`ModelAdvisor.Text`

Create Model Advisor text output

Methods

`setBold`

Specify bold text

`setColor`

Specify text color

`setHyperlink`

Specify hyperlinked text

`setItalic`

Italicize text

`setRetainSpaceReturn`

Retain spacing and returns in text

`setSubscript`

Specify subscripted text

`setSuperscript`

Specify superscripted text

`setUnderlined`

Underline text

Copy Semantics

Handle. To learn how this affects your use of the class, see [Copying Objects \(MATLAB\)](#) in the MATLAB Programming Fundamentals documentation.

Examples

```
t1 = ModelAdvisor.Text('This is some text');
```

Topics

“Create Model Advisor Checks”

“Format Check Results”

ModelAdvisor.Text

Class: ModelAdvisor.Text

Package: ModelAdvisor

Create Model Advisor text output

Syntax

```
text = ModelAdvisor.Text(content, {attribute})
```

Description

`text = ModelAdvisor.Text(content, {attribute})` creates a text object for the Model Advisor output.

Input Arguments

content Optional character vector specifying the content of the text object. If *content* is empty, empty text is output.

- attribute* Optional cell array of character vectors specifying the formatting of the content. If no attribute is specified, the output text has default coloring with no formatting. Possible formatting options include:
- 'normal' (default) — Text is default color and style.
 - 'bold' — Text is bold.
 - 'italic' — Text is italicized.
 - 'underline' — Text is underlined.
 - 'pass' — Text is green.
 - 'warn' — Text is yellow.
 - 'fail' — Text is red.
 - 'keyword' — Text is blue.
 - 'subscript' — Text is subscripted.
 - 'superscript' — Text is superscripted.

Output Arguments

text	The text object you create
------	----------------------------

Examples

```
text = ModelAdvisor.Text('Sub entry 1', {'pass','bold'})
```

publish

Class: ModelAdvisor.Root

Package: ModelAdvisor

Publish object in Model Advisor root

Syntax

```
publish(root_obj, check_obj, location)
publish(root_obj, group_obj)
publish(root_obj, procedure_obj)
publish(root_obj, fg_obj)
```

Description

`publish(root_obj, check_obj, location)` specifies where the Model Advisor places the check in the Model Advisor tree. `location` is either one of the subfolders in the **By Product** folder, or the name of a new subfolder to put in the **By Product** folder. Use a pipe-delimited character vector to indicate multiple subfolders. For example, to add a check to the **Simulink Check > Modeling Standards** folder, use the following: `'Simulink Check|Modeling Standards'`.

If the **By Product** is not displayed in the Model Advisor window, select **Show By Product Folder** from the **Settings > Preferences** dialog box.

`publish(root_obj, group_obj)` specifies the `ModelAdvisor.Group` object to publish as a folder in the **Model Advisor Task Manager** folder.

`publish(root_obj, procedure_obj)` specifies the `ModelAdvisor.Procedure` object to publish.

`publish(root_obj, fg_obj)` specifies the `ModelAdvisor.FactoryGroup` object to publish as a subfolder in the **By Task** folder.

Examples

```
% publish check into By Product > Demo group.  
mdladvRoot.publish(rec, 'Demo');
```

refresh_customizations

Class: Advisor.Manager

Package: Advisor

Refresh Model Advisor check information cache

Syntax

```
Advisor.Manager.refresh_customizations()
```

Description

`Advisor.Manager.refresh_customizations()` refreshes the Model Advisor check information cache.

Alternatives

To refresh the cache from Model Advisor, select **Settings > Preferences**. Click **Update check information cache**, then click **OK**. To see updates, close and reopen model, then start Model Advisor.

register

Class: ModelAdvisor.Root

Package: ModelAdvisor

Register object in Model Advisor root

Syntax

```
register(MAobj, obj)
```

Description

`register(MAobj, obj)` registers the object, *obj*, in the root object *MAobj*.

In the Model Advisor memory, the `register` method registers the following types of objects:

- `ModelAdvisor.Check`
- `ModelAdvisor.FactoryGroup`
- `ModelAdvisor.Group`
- `ModelAdvisor.Procedure`
- `ModelAdvisor.Task`

The `register` method places objects in the Model Advisor memory that you use in other functions. The `register` method does not place objects in the Model Advisor tree.

Examples

```
mdladvRoot = ModelAdvisor.Root;  
  
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.DisplayName='Example task with input parameter and auto-fix ability';  
MAT1.setCheck('com.mathworks.sample.Check1');  
mdladvRoot.register(MAT1);
```

```
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');
MAT2.DisplayName='Example task 2';
MAT2.setCheck('com.mathworks.sample.Check2');
mdladvRoot.register(MAT2);

MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');
MAT3.DisplayName='Example task 3';
MAT3.setCheck('com.mathworks.sample.Check3');
mdladvRoot.register(MAT3)
```

run

Class: Advisor.Application

Package: Advisor

Run Model Advisor analysis on model components

Syntax

```
run(app)
```

Description

run(app) runs a Model Advisor analysis, as specified by the Application object.

Examples

This example shows how to create an Application object, set root analysis to RootModel, and run a Model Advisor analysis.

```
% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app, 'Root', RootModel);

% Run Model Advisor analysis
run(app);
```

Input Arguments

app — Application

Advisor.Application object

Advisor.Application object, created by Advisor.Manager.createApplication

See Also

Advisor.Application.setAnalysisRoot |
Advisor.Manager.createApplication

Introduced in R2015b

selectCheckInstances

Class: Advisor.Application

Package: Advisor

Select check instances to use in Model Advisor analysis

Syntax

```
selectCheckInstances(app)
selectCheckInstances(app,Name,Value)
```

Description

You can select check instances to use in a Model Advisor analysis. A check instance is an instantiation of a `ModelAdvisor.Check` object in the Model Advisor configuration. When you change the Model Advisor configuration, the check instance ID might change. To obtain the check instance ID, use the `getCheckInstanceIDs` method.

`selectCheckInstances(app)` selects all check instances to use for Model Advisor analysis.

`selectCheckInstances(app,Name,Value)` selects check instances specified by `Name,Value` pair arguments to use for Model Advisor analysis.

Input Arguments

app — Application

Advisor.Application object

Advisor.Application object, created by `Advisor.Manager.createApplication`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, ..., NameN, ValueN.

IDs — Check instance IDs

cell array

Select check instances to use in Model Advisor analysis, as specified as a cell array of IDs

Data Types: cell

Examples

Select All Check Instances to Use in Model Advisor Analysis

This example shows how to set the root model, create an `Application` object, set root analysis, and select all check instances for Model Advisor analysis.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app, 'Root', RootModel);

% Select all checks
selectCheckInstances(app);
```

Select Check Instance for Model Advisor Analysis Using Instance ID

This example shows how to set the root model, create an `Application` object, set root analysis, and select a check using instance ID.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app, 'Root', RootModel);
```

```
% Select "Identify unconnected lines, input ports, and output  
% ports" check using check instance ID  
instanceID = getCheckInstanceIDs(app,'mathworks.design.UnconnectedLinesPorts');  
checkinstanceID = instanceID(1);  
selectCheckInstances(app,'IDs',checkinstanceID);
```

selectComponents

Class: `Advisor.Application`

Package: `Advisor`

Select model components for Model Advisor analysis

Syntax

```
selectComponents(app)
selectComponents(app,Name,Value)
```

Description

You can select model components for Model Advisor analysis. A model component is a model in the system hierarchy. Models that the root model references and that `Advisor.Application.setAnalysisRoot` specifies are model components. By default, all components are selected.

`selectComponents(app)` includes all components for Model Advisor analysis.

`selectComponents(app,Name,Value)` includes model components specified by `Name,Value` pair arguments for Model Advisor analysis.

Input Arguments

app — Application

`Advisor.Application` object

`Advisor.Application` object, created by `Advisor.Manager.createApplication`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as Name1,Value1,...,NameN,ValueN.

IDs — Component IDs

cell array

Components to select for Model Advisor analysis, as specified by a cell array of IDs

Data Types: cell

HierarchicalSelection — Select component and component children

false (default) | true

Select components specified by IDs and component children from Model Advisor analysis.

Data Types: logical

Examples

Include All Components in Model Advisor Analysis

This example shows how to set the root model, create an `Application` object, set root analysis, and include model components in Model Advisor analysis.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';
```

```
% Create an Application object
app = Advisor.Manager.createApplication();
```

```
% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);
```

```
% Select all components
selectComponents(app);
```

Select Components for Model Advisor Analysis Using IDs

This example shows how to set the root model, create an `Application` object, set root analysis, and include model components using IDs.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app,'Root',RootModel);

% Select component using IDs
selectComponents(app,'IDs',RootModel);
```

Introduced in R2015b

setAction

Class: ModelAdvisor.Check

Package: ModelAdvisor

Specify action for check

Syntax

```
setAction(check_obj, action_obj)
```

Description

`setAction(check_obj, action_obj)` returns the action object `action_obj` to use in the check `check_obj`. The `setAction` method identifies the action you want to use in a check.

Topics

“Create Model Advisor Checks”

setAlign

Class: ModelAdvisor.Paragraph

Package: ModelAdvisor

Specify paragraph alignment

Syntax

```
setAlign(paragraph, alignment)
```

Description

setAlign(paragraph, alignment) specifies the alignment of text. Possible values are:

- 'left' (default)
- 'right'
- 'center'

Examples

```
report_paragraph = ModelAdvisor.Paragraph;  
setAlign(report_paragraph, 'center');
```

setAnalysisRoot

Class: Advisor.Application

Package: Advisor

Specify model hierarchy for Model Advisor analysis

Syntax

```
setAnalysisRoot(app, 'Root', root)
setAnalysisRoot(app, 'Root', root, Name, Value)
```

Description

Specify the model hierarchy for an Application object analysis.

`setAnalysisRoot(app, 'Root', root)` specifies the analysis root.

`setAnalysisRoot(app, 'Root', root, Name, Value)` specifies the analysis root using Name, Value options.

Input Arguments

app — Application

Advisor.Application object

Advisor.Application object, created by Advisor.Manager.createApplication

'Root', root — Name, Value argument specifying model or subsystem path

character vector

Comma-separated Name, Value argument specifying model or subsystem path

Name-Value Pair Arguments

Specify optional comma-separated pairs of Name, Value arguments. Name is the argument name and Value is the corresponding value. Name must appear inside single

quotes (' '). You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

RootType — Analysis root

Model (default) | Subsystem

Examples

Specify Root Model as Analysis Root

This example shows how to set the root model, create an `Application` object, and set the root analysis.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app, 'Root', RootModel);
```

Specify Subsystem as Analysis Root

This example shows how to set the root model, create an `Application` object, and specify a subsystem as the analysis root.

```
% Set root model to sldemo_mdref_basic model
RootModel='sldemo_mdref_basic';

% Create an Application object
app = Advisor.Manager.createApplication();

% Set the Application object root analysis
setAnalysisRoot(app, 'Root', 'sldemo_mdref_basic/CounterA', 'RootType', 'Subsystem');
```

See Also

`Advisor.Manager.createApplication`

Introduced in R2015b

setAnalysisRoot

Class: slmetric.Engine

Package: slmetric

Specify model or subsystem for metric analysis

Syntax

```
setAnalysisRoot(metric_engine, 'Root', root)
setAnalysisRoot(metric_engine, 'Root', root, Name, Value)
```

Description

Specify the model or subsystem for `slmetric.Engine` metric object analysis.

`setAnalysisRoot(metric_engine, 'Root', root)` specifies the metric analysis root.

`setAnalysisRoot(metric_engine, 'Root', root, Name, Value)` specifies the metric analysis root by using `Name, Value` pairs.

Input Arguments

metric_engine — Collects and accesses metric data

`slmetric.Engine` object

When you call `execute`, `metric_engine` collects metric data for all MathWorks metrics or for the specified `MetricIDs`. Calling `getMetrics` accesses the collected metric data in `metric_engine`.

'Root' — Name, Value argument specifying model or subsystem path

character vector

Comma-separated `Name, Value` argument specifying model or subsystem path.

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes (' '). You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

RootType — Type of model component for metric analysis

Model (default) | Subsystem

Examples

Specify Model for Metric Analysis

This example shows how to set the root model, create an `slmetric.Engine` object, and specify the model for metric analysis.

```
% Set root model to vdp model
RootModel='vdp';

% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify model for metric analysis
setAnalysisRoot(metric_engine,'Root',RootModel);
```

Specify Subsystem for Metric Analysis

This example shows how to set the root model, create an `slmetric.Engine` object, and specify a subsystem for metric analysis.

```
% Set subsystem to CounterA
Subsys ='sf_car/Engine';

% Create an slmetric.Engine object
metric_engine = slmetric.Engine();
```

```
% Set a subsystem for metric analysis  
setAnalysisRoot(metric_engine, 'Root', Subsys, 'RootType', 'Subsystem');
```

setBold

Class: ModelAdvisor.Text

Package: ModelAdvisor

Specify bold text

Syntax

```
setBold(text, mode)
```

Description

`setBold(text, mode)` specifies whether text should be formatted in bold font.

Input Arguments

<code>text</code>	Instantiation of the ModelAdvisor.Text class
<code>mode</code>	A Boolean value indicating bold formatting of text: <ul style="list-style-type: none">• <code>true</code> — Format the text in bold font.• <code>false</code> — Do not format the text in bold font.

Examples

```
t1 = ModelAdvisor.Text('This is some text');  
setBold(t1, 'true');
```

setCallbackFcn

Class: ModelAdvisor.Action

Package: ModelAdvisor

Specify action callback function

Syntax

```
setCallbackFcn(action_obj, @handle)
```

Description

setCallbackFcn(action_obj, @handle) specifies the handle to the callback function, handle, to use with the action object, action_obj.

Examples

Note The following example is a fragment of code from the `sl_customization.m` file for the example model, `slvndemo_mdldv`. The example does not execute as shown without the additional content found in the `sl_customization.m` file.

```
rec = ModelAdvisor.Check('mathworks.example.optimizationSettings');  
% Define an automatic fix action for this check  
modifyAction = ModelAdvisor.Action;  
modifyAction.setCallbackFcn(@modifyOptimizationSetting);  
modifyAction.Name = 'Modify Settings';  
modifyAction.Description = ['Modify model configuration optimization' ...  
    ' settings that can impact safety'];  
modifyAction.Enable = true;  
rec.setAction(modifyAction);
```

setCallbackFcn

Class: ModelAdvisor.Check

Package: ModelAdvisor

Specify callback function for check

Syntax

```
setCallbackFcn(check_obj, @handle, context, style)
```

Description

`setCallbackFcn(check_obj, @handle, context, style)` specifies the callback function to use with the check, `check_obj`.

Input Arguments

<code>check_obj</code>	Instantiation of the <code>ModelAdvisor.Check</code> class
<code>handle</code>	Handle to a check callback function
<code>context</code>	Context for checking the model or subsystem: <ul style="list-style-type: none">• 'None' — No special requirements.• 'PostCompile' — The model must be compiled.
<code>style</code>	Type of callback function: <ul style="list-style-type: none">• 'StyleOne' — Simple check callback function, for formatting results using template• 'StyleTwo' — Detailed check callback function• 'StyleThree' — Check callback functions with hyperlinked results

Examples

```
% --- sample check 1
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.Title = 'Check Simulink block font';
rec.TitleTips = 'Example style three callback';
rec.setCallbackFcn(@SampleStyleThreeCallback,'None','StyleThree');
```

“Create Model Advisor Checks”

setCheck

Class: ModelAdvisor.Task

Package: ModelAdvisor

Specify check used in task

Syntax

```
setCheck(task, check_ID)
```

Description

setCheck(task, check_ID) specifies the check to use in the task.

You can use one ModelAdvisor.Check object in multiple ModelAdvisor.Task objects, allowing you to place the same check in multiple locations in the Model Advisor tree. For example, **Check for implicit signal resolution** appears in the **By Product > Simulink folder** and in the **By Task > Model Referencing** folder in the Model Advisor tree.

When adding checks as tasks, the Model Advisor uses the task properties instead of the check properties, except for Visible and LicenseName.

Input Arguments

task	Instantiation of the ModelAdvisor.Task class
check_ID	A unique identifier for the check to use in the task

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
setCheck(MAT1, 'com.mathworks.sample.Check1');
```

setCheckedText

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add description of check to result

Syntax

```
setCheckedText(ft_obj, text)
```

Description

`setCheckedText(ft_obj, text)` is an optional method that adds text or a model advisor template object as the first item in the report. Use this method to add information describing the overall check.

Input Arguments

ft_obj

A handle to a template object.

text

A character vector or a handle to a formatting object.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

text appears as the first line in the analysis result.

Examples

Create a list object, `ft`, and add a line of text to the result:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');  
setCheckText(ft, ['Identify unconnected lines, input ports,...  
    'and output ports in the model']);
```

setColHeading

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table column title

Syntax

```
setColHeading(table, column, heading)
```

Description

`setColHeading(table, column, heading)` specifies that the column header of column is set to heading.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>column</code>	An integer specifying the column number
<code>heading</code>	A character vector, element object, or object array specifying the table column title

Examples

```
table1 = ModelAdvisor.Table(2, 3);  
setColHeading(table1, 1, 'Header 1');  
setColHeading(table1, 2, 'Header 2');  
setColHeading(table1, 3, 'Header 3');
```

setColHeadingAlign

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify column title alignment

Syntax

```
setColHeadingAlign(table, column, alignment)
```

Description

`setColHeadingAlign(table, column, alignment)` specifies the alignment of the column heading.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>column</code>	An integer specifying the column number
<code><i>alignment</i></code>	Alignment of the column heading. <i>alignment</i> can have one of the following values: <ul style="list-style-type: none">• left (default)• right• center

Examples

```
table1 = ModelAdvisor.Table(2, 3);  
setColHeading(table1, 1, 'Header 1');  
setColHeadingAlign(table1, 1, 'center');  
setColHeading(table1, 2, 'Header 2');
```

```
setColHeadingAlign(table1, 2, 'center');  
setColHeading(table1, 3, 'Header 3');  
setColHeadingAlign(table1, 3, 'center');
```

setColHeadingValign

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify column title vertical alignment

Syntax

```
setColHeadingValign(table, column, alignment)
```

Description

`setColHeadingValign(table, column, alignment)` specifies the vertical alignment of the column heading.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>column</code>	An integer specifying the column number
<code>alignment</code>	Vertical alignment of the column heading. <code>alignment</code> can have one of the following values: <ul style="list-style-type: none">• top (default)• middle• bottom

Examples

```
table1 = ModelAdvisor.Table(2, 3);  
setColHeading(table1, 1, 'Header 1');  
setColHeadingValign(table1, 1, 'middle');  
setColHeading(table1, 2, 'Header 2');
```

```
setColHeadingValign(table1, 2, 'middle');  
setColHeading(table1, 3, 'Header 3');  
setColHeadingValign(table1, 3, 'middle');
```

setColor

Class: ModelAdvisor.Text

Package: ModelAdvisor

Specify text color

Syntax

```
setColor(text, color)
```

Description

`setColor(text, color)` sets the text color to *color*.

Input Arguments

<i>text</i>	Instantiation of the ModelAdvisor.Text class
<i>color</i>	Color of the text, specified as one of the following formatting options: <ul style="list-style-type: none">• 'normal' (default) — Text is default color.• 'pass' — Text is green.• 'warn' — Text is yellow.• 'fail' — Text is red.• 'keyword' — Text is blue.

Examples

```
t1 = ModelAdvisor.Text('This is a warning');  
setColor(t1, 'warn');
```

setColSpan

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Specify number of columns for input parameter

Syntax

```
setColSpan(input_param, [start_col end_col])
```

Description

setColSpan(input_param, [start_col end_col]) specifies the number of columns that the parameter occupies. Use the `setColSpan` method to specify where you want an input parameter located in the layout grid when there are multiple input parameters.

Input Arguments

input_param	Instantiation of the ModelAdvisor.InputParameter class
start_col	A positive integer representing the first column that the input parameter occupies in the layout grid
end_col	A positive integer representing the last column that the input parameter occupies in the layout grid

Examples

```
inputParam2 = ModelAdvisor.InputParameter;  
inputParam2.Name = 'Standard font size';  
inputParam2.Value='12';  
inputParam2.Type='String';  
inputParam2.Description='sample tooltip';
```

```
inputParam2.setRowSpan([2 2]);  
inputParam2.setColSpan([1 1]);
```

setColTitles

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add column titles to table

Syntax

```
setColTitles(ft_obj, {col_title_1, col_title_2, ...})
```

Description

`setColTitles(ft_obj, {col_title_1, col_title_2, ...})` is method you must use when you create a template object that is a table type. Use it to specify the titles of the columns in the table.

Note Before adding data to a table, you must specify column titles.

Input Arguments

ft_obj

A handle to a template object.

col_title_N

A cell of character vectors or handles to formatting objects, specifying the column titles.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

The order of the `col_title_N` inputs determines which column the title is in. If you do not add data to the table, the Model Advisor does not display the table in the result.

Examples

Create a table object, `ft`, and specify two column titles:

```
ft = ModelAdvisor.FormatTemplate('TableTemplate');  
setColTitles(ft, {'Index', 'Block Name'});
```

setColWidth

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify column widths

Syntax

```
setColWidth(table, column, width)
```

Description

`setColWidth(table, column, width)` specifies the column.

The `setColWidth` method specifies the table column widths relative to the entire table width. If column widths are [1 2 3], the second column is twice the width of the first column, and the third column is three times the width of the first column. Unspecified columns have a default width of 1. For example:

```
setColWidth(1, 1);  
setColWidth(3, 2);
```

specifies [1 1 2] column widths.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>column</code>	An integer specifying column number
<code>width</code>	An integer or array of integers specifying the column widths, relative to the entire table width

Examples

```
table1 = ModelAdvisor.Table(2, 3)
setColWidth(table1, 1, 1);
setColWidth(table1, 3, 2);
```

See Also

“Model Advisor Customization”

setEntries

Class: ModelAdvisor.Table

Package: ModelAdvisor

Set contents of table

Syntax

```
setEntries(content)
```

Description

setEntries(content) sets content of the table.

Input Arguments

content	A 2-D cell array containing the contents of the table. Each item of the cell array must be either a character vector or an instance of ModelAdvisor.Element. The size of the cell array must be equal to the size of the table specified in the ModelAdvisor.Table constructor.
---------	---

Examples

```
table = ModelAdvisor.Table(4,3);
contents = cell(4,3); % 4 by 3 table
for k=1:4
    for m=1:3
        contents{k,m} = ['Contents for row-' num2str(k) ' column-' num2str(m)];
    end
end
table.setEntries(contents);
```

setEntry

Class: ModelAdvisor.Table

Package: ModelAdvisor

Add cell to table

Syntax

```
setEntry(table, row, column, string)
setEntry(table, row, column, content)
```

Description

setEntry(table, row, column, string) adds a character vector to a cell in a table.

setEntry(table, row, column, content) adds an object specified by content to a cell in a table.

Input Arguments

table	Instantiation of the ModelAdvisor.Table class
row	An integer specifying the row
column	An integer specifying the column
string	A character vector representing the contents of the entry
content	An element object or object array specifying the content of the table entries

Examples

Create two tables and insert table2 into the first cell of table1:

```
table1 = ModelAdvisor.Table(1, 1);  
table2 = ModelAdvisor.Table(2, 3);  
.  
.  
.  
setEntry(table1, 1, 1, table2);
```

setEntryAlign

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table cell alignment

Syntax

```
setEntryAlign(table, row, column, alignment)
```

Description

`setEntryAlign(table, row, column, alignment)` specifies the cell alignment of the designated cell.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>row</code>	An integer specifying row number
<code>column</code>	An integer specifying column number
<code><i>alignment</i></code>	Cell alignment, specified as one of the following: <ul style="list-style-type: none">• 'left' (default)• 'right'• 'center'

Examples

```
table1 = ModelAdvisor.Table(2,3);  
setHeading(table1, 'New Table');
```

.

```
.  
.  
setEntry(table1, 1, 1, 'First Entry');  
setEntryAlign(table1, 1, 1, 'center');
```

setEntryValign

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table cell vertical alignment

Syntax

```
setEntryValign(table, row, column, alignment)
```

Description

`setEntryValign(table, row, column, alignment)` specifies the cell alignment of the designated cell.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>row</code>	An integer specifying row number
<code>column</code>	An integer specifying column number
<code>alignment</code>	Cell vertical alignment, specified as one of the following: <ul style="list-style-type: none">• 'top' (default)• 'middle'• 'bottom'

Examples

```
table1 = ModelAdvisor.Table(2,3);  
setHeading(table1, 'New Table');
```

.

```
.  
.br/>setEntry(table1, 1, 1, 'First Entry');  
setEntryValign(table1, 1, 1, 'middle');
```

setHeading

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table title

Syntax

```
setHeading(table, title)
```

Description

setHeading(table, title) specifies the table title.

Input Arguments

table	Instantiation of the ModelAdvisor.Table class
title	A character vector, element object, or object array that specifies the table title

Examples

```
table1 = ModelAdvisor.Table(2, 3);  
setHeading(table1, 'New Table');
```

setHyperlink

Class: ModelAdvisor.Image

Package: ModelAdvisor

Specify hyperlink location

Syntax

```
setHyperlink(image, url)
```

Description

`setHyperlink(image, url)` specifies the target location of the hyperlink associated with `image`.

Input Arguments

<code>image</code>	Instantiation of the <code>ModelAdvisor.Image</code> class
<code>url</code>	The target URL

Examples

```
matlab_logo=ModelAdvisor.Image;  
setHyperlink(matlab_logo, 'https://www.mathworks.com');
```

setHyperlink

Class: ModelAdvisor.Text

Package: ModelAdvisor

Specify hyperlinked text

Syntax

```
setHyperlink(text, url)
```

Description

setHyperlink(text, url) creates a hyperlink from the text to the specified URL.

Input Arguments

text	Instantiation of the ModelAdvisor.Text class
url	The target location of the URL

Examples

```
t1 = ModelAdvisor.Text('MathWorks home page');  
setHyperlink(t1, 'https://www.mathworks.com');
```

Topics

“Create Model Advisor Checks”

setInformation

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add description of subcheck to result

Syntax

```
setInformation(ft_obj, text)
```

Description

`setInformation(ft_obj, text)` is an optional method that adds text as the first item after the subcheck title. Use this method to add information describing the subcheck.

Input Arguments

ft_obj

A handle to a template object.

text

A character vector or a handle to a formatting object, that describes the subcheck.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

The Model Advisor displays *text* after the title of the subcheck.

Examples

Create a list object, `ft`, and specify a subcheck title and description:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setSubTitle(ft, ['Check for constructs in the model '...
  'that are not supported when generating code']);
setInformation(ft, ['Identify blocks that should not '...
  'be used for code generation.']);
```

setInputParameters

Class: ModelAdvisor.Check

Package: ModelAdvisor

Specify input parameters for check

Syntax

```
setInputParameters(check_obj, params)
```

Description

`setInputParameters(check_obj, params)` specifies `ModelAdvisor.InputParameter` objects (`params`) to be used as input parameters to a check (`check_obj`).

Input Arguments

<code>check_obj</code>	Instantiation of the <code>ModelAdvisor.Check</code> class
<code>params</code>	A cell array of <code>ModelAdvisor.InputParameters</code> objects

Examples

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');  
inputParam1 = ModelAdvisor.InputParameter;  
inputParam2 = ModelAdvisor.InputParameter;  
inputParam3 = ModelAdvisor.InputParameter;  
setInputParameters(rec, {inputParam1,inputParam2,inputParam3});
```

setInputParametersLayoutGrid

Class: ModelAdvisor.Check

Package: ModelAdvisor

Specify layout grid for input parameters

Syntax

```
setInputParametersLayoutGrid(check_obj, [row col])
```

Description

`setInputParametersLayoutGrid(check_obj, [row col])` specifies the layout grid for input parameters in the Model Advisor. Use the `setInputParametersLayoutGrid` method when there are multiple input parameters.

Input Arguments

<code>check_obj</code>	Instantiation of the <code>ModelAdvisor.Check</code> class
<code>row</code>	Number of rows in the layout grid
<code>col</code>	Number of columns in the layout grid

Examples

```
% --- sample check 1
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.Title = 'Check Simulink block font';
rec.TitleTips = 'Example style three callback';
rec.setCallbackFcn(@SampleStyleThreeCallback, 'None', 'StyleThree');
rec.setInputParametersLayoutGrid([3 2]);
```

setItalic

Class: ModelAdvisor.Text

Package: ModelAdvisor

Italicize text

Syntax

```
setItalic(text, mode)
```

Description

`setItalic(text, mode)` specifies whether text should be italicized.

Input Arguments

<code>text</code>	Instantiation of the <code>ModelAdvisor.Text</code> class
<code>mode</code>	A Boolean value indicating italic formatting of text: <ul style="list-style-type: none">• <code>true</code> — Italicize the text.• <code>false</code> — Do not italicize the text.

Examples

```
t1 = ModelAdvisor.Text('This is some text');  
setItalic(t1, 'true');
```

“Create Model Advisor Checks”

setListObj

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add list of hyperlinks to model objects

Syntax

```
setListObj(ft_obj, {model_obj})
```

Description

`setListObj(ft_obj, {model_obj})` is an optional method that generates a bulleted list of hyperlinks to model objects. *ft_obj* is a handle to a list template object. *model_obj* is a cell array of handles or full paths to blocks, or model objects that the Model Advisor displays as a bulleted list of hyperlinks in the report.

Examples

Create a list object, `ft`, and add a list of the blocks found in the model:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');  
  
% Find all the blocks in the system  
allBlocks = find_system(system);  
  
% Add the blocks to a list  
setListObj(ft, allBlocks);
```

See Also

Topics

“Create Model Advisor Checks”

“Format Check Results”

setRecAction

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add Recommended Action section and text

Syntax

```
setRecAction(ft_obj, {text})
```

Description

setRecAction(*ft_obj*, {*text*}) is an optional method that adds a Recommended Action section to the report. Use this method to describe how to fix the check.

Input Arguments

ft_obj

A handle to a template object.

text

A cell array of character vectors or handles to formatting objects, that describes the recommended action to fix the issues reported by the check.

Valid formatting objects are: ModelAdvisor.Image, ModelAdvisor.LineBreak, ModelAdvisor.List, ModelAdvisor.Paragraph, ModelAdvisor.Table, and ModelAdvisor.Text.

The Model Advisor displays the recommended action as a separate section below the list or table in the report.

Examples

Create a list object, ft, find Gain blocks in the model, and recommend changing them:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
% Find all Gain blocks
gainBlocks = find_system(gcs, 'BlockType','Gain');

% Find Gain blocks
for idx = 1:length(gainBlocks)
    gainObj = get_param(gainBlocks(idx), 'Object');

    setRecAction(ft, {'If you are using these blocks '...
                    'as buffers, you should replace them with '...
                    'Signal Conversion blocks'});
end
```

setRefLink

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add See Also section and links

Syntax

```
setRefLink(ft_obj, {'standard'})  
setRefLink(ft_obj, {'url', 'standard'})
```

Description

`setRefLink(ft_obj, {'standard'})` is an optional method that adds a See Also section above the table or list in the result. Use this method to add references to standards. *ft_obj* is a handle to a template object. *standard* is a cell array of character vectors that you want to display in the result. If you include more than one cell, the Model Advisor displays the character vectors in a bulleted list.

`setRefLink(ft_obj, {'url', 'standard'})` generates a list of links in the See Also section. *url* indicates the location to link to. You must provide the full link including the protocol. For example, `https:\\www.mathworks.com` is a valid link, while `www.mathworks.com` is not a valid link. You can create a link to a protocol that is valid URL, such as a web site address, a full path to a file, or a relative path to a file.

Note `setRefLink` expects a cell array of cell arrays for the second input.

Examples

Create a list object, *ft*, and add a related standard:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');  
setRefLink(ft, {'IEC 61508-3, Table A.3 (3) 'Language subset'});
```

Create a list object, *ft*, and add a list of related standards:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setRefLink(ft, {
    {'IEC 61508-3, Table A.3 (2) ''Strongly typed programming language''},...
    {'IEC 61508-3, Table A.3 (3) ''Language subset''}});
```

setRetainSpaceReturn

Class: ModelAdvisor.Text

Package: ModelAdvisor

Retain spacing and returns in text

Syntax

```
setRetainSpaceReturn(text, mode)
```

Description

`setRetainSpaceReturn(text, mode)` specifies whether the text must retain the spaces and carriage returns.

Input Arguments

<code>text</code>	Instantiation of the <code>ModelAdvisor.Text</code> class
<code>mode</code>	A Boolean value indicating whether to preserve spaces and carriage returns in the text: <ul style="list-style-type: none">• <code>true</code> (default) — Preserve spaces and carriage returns.• <code>false</code> — Do not preserve spaces and carriage returns.

Examples

```
t1 = ModelAdvisor.Text('MathWorks home page');  
setRetainSpaceReturn(t1, 'true');
```

setRowHeading

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table row title

Syntax

```
setRowHeading(table, row, heading)
```

Description

`setRowHeading(table, row, heading)` specifies a title for the designated table row.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>row</code>	An integer specifying row number
<code>heading</code>	A character vector, element object, or object array specifying the table row title

Examples

```
table1 = ModelAdvisor.Table(2,3);  
setRowHeading(table1, 1, 'Row 1 Title');  
setRowHeading(table1, 2, 'Row 2 Title');
```

setRowHeadingAlign

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table row title alignment

Syntax

```
setRowHeadingAlign(table, row, alignment)
```

Description

`setRowHeadingAlign(table, row, alignment)` specifies the alignment for the designated table row.

Input Arguments

<i>table</i>	Instantiation of the ModelAdvisor.Table class
<i>row</i>	An integer specifying row number.
<i>alignment</i>	Cell alignment, specified as one of the following: <ul style="list-style-type: none">• 'left' (default)• 'right'• 'center'

Examples

```
table1 = ModelAdvisor.Table(2, 3);  
setRowHeading(table1, 1, 'Row 1 Title');  
setRowHeadingAlign(table1, 1, 'center');  
setRowHeading(table1, 2, 'Row 2 Title');  
setRowHeadingAlign(table1, 2, 'center');
```

setRowHeadingValign

Class: ModelAdvisor.Table

Package: ModelAdvisor

Specify table row title vertical alignment

Syntax

```
setRowHeadingValign(table, row, alignment)
```

Description

`setRowHeadingValign(table, row, alignment)` specifies the vertical alignment for the designated table row.

Input Arguments

<code>table</code>	Instantiation of the <code>ModelAdvisor.Table</code> class
<code>row</code>	An integer specifying row number.
<code>alignment</code>	Cell vertical alignment, specified as one of the following: <ul style="list-style-type: none">• 'top' (default)• 'middle'• 'bottom'

Examples

```
table1 = ModelAdvisor.Table(2, 3);  
setRowHeading(table1, 1, 'Row 1 Title');  
setRowHeadingValign(table1, 1, 'middle');  
setRowHeading(table1, 2, 'Row 2 Title');  
setRowHeadingValign(table1, 2, 'middle');
```

setRowSpan

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Specify rows for input parameter

Syntax

```
setRowSpan(input_param, [start_row end_row])
```

Description

`setRowSpan(input_param, [start_row end_row])` specifies the number of rows that the parameter occupies. Specify where you want an input parameter located in the layout grid when there are multiple input parameters.

Input Arguments

<code>input_param</code>	The input parameter object
<code>start_row</code>	A positive integer representing the first row that the input parameter occupies in the layout grid
<code>end_row</code>	A positive integer representing the last row that the input parameter occupies in the layout grid

Examples

```
inputParam2 = ModelAdvisor.InputParameter;  
inputParam2.Name = 'Standard font size';  
inputParam2.Value='12';  
inputParam2.Type='String';  
inputParam2.Description='sample tooltip';
```

```
inputParam2.setRowSpan([2 2]);  
inputParam2.setColSpan([1 1]);
```

setSubBar

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add line between subcheck results

Syntax

```
setSubBar(ft_obj, value)
```

Description

`setSubBar(ft_obj, value)` is an optional method that adds lines between results for subchecks. *ft_obj* is a handle to a template object. *value* is a boolean value that specifies when the Model Advisor includes a line between subchecks in the check results. By default, the value is `true`, and the Model Advisor displays the bar. The Model Advisor does not display the bar when you set the value to `false`.

Examples

Create a list object, `ft`, turn off the subbar:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');  
setSubBar(ft, false);
```

See Also

setSubResultStatus

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add status to check or subcheck result

Syntax

```
setSubResultStatus(ft_obj, 'status')
```

Description

`setSubResultStatus(ft_obj, 'status')` is an optional method that displays the status in the result. Use this method to display the status of the check or subcheck in the result. *ft_obj* is a handle to a template object. *status* is a character vector identifying the status of the check:

Pass

Warn

Fail

Examples

Create a list object, `ft`, and add a passing status:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');  
setSubResultStatus(ft, 'Pass');
```

“Format Check Results”

setSubResultStatusText

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add text below status in result

Syntax

```
setSubResultStatusText(ft_obj, message)
```

Description

`setSubResultStatusText(ft_obj, message)` is an optional method that displays text below the status in the result. Use this method to describe the status.

Input Arguments

ft_obj

A handle to a template object.

message

A character vector or a handle to a formatting object that the Model Advisor displays below the status in the report.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

Examples

Create a list object, `ft`, add a passing status and a description of why the check passed:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');
setSubResultStatus(ft, 'Pass');
setSubResultStatusText(ft, ['Constructs that are not supported when '...
    'generating code were not found in the model or subsystem']);
```

Topics

“Model Advisor Customization”

“Format Check Results”

setSubscript

Class: ModelAdvisor.Text

Package: ModelAdvisor

Specify subscripted text

Syntax

```
setSubscript(text, mode)
```

Description

`setSubscript(text, mode)` indicates whether to make text subscript.

Input Arguments

<code>text</code>	Instantiation of the <code>ModelAdvisor.Text</code> class
<code>mode</code>	A Boolean value indicating subscripted formatting of text: <ul style="list-style-type: none">• <code>true</code> — Make the text subscript.• <code>false</code> — Do not make the text subscript.

Examples

```
t1 = ModelAdvisor.Text('This is some text');  
setSubscript(t1, 'true');
```

Topics

“Create Model Advisor Checks”

setSuperscript

Class: ModelAdvisor.Text

Package: ModelAdvisor

Specify superscripted text

Syntax

```
setSuperscript(text, mode)
```

Description

`setSuperscript(text, mode)` indicates whether to make text superscript.

Input Arguments

<code>text</code>	Instantiation of the <code>ModelAdvisor.Text</code> class
<code>mode</code>	A Boolean value indicating superscripted formatting of text: <ul style="list-style-type: none">• <code>true</code> — Make the text superscript.• <code>false</code> — Do not make the text superscript.

Examples

```
t1 = ModelAdvisor.Text('This is some text');  
setSuperscript(t1, 'true');
```

Topics

“Create Model Advisor Checks”

setSubTitle

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add title for subcheck in result

Syntax

```
setSubTitle(ft_obj, title)
```

Description

`setSubTitle(ft_obj, title)` is an optional method that adds a subcheck result title. Use this method when you create subchecks to distinguish between them in the result.

Input Arguments

ft_obj

A handle to a template object.

title

A character vector or a handle to a formatting object specifying the title of the subcheck.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

Examples

Create a list object, `ft`, and add a subcheck title:

```
ft = ModelAdvisor.FormatTemplate('ListTemplate');  
setSubTitle(ft, ['Check for constructs in the model '...  
    'that are not supported when generating code']);
```

“Create Model Advisor Checks”

“Format Check Results”

setTableInfo

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add data to table

Syntax

```
setTableInfo(ft_obj, {data})
```

Description

`setTableInfo(ft_obj, {data})` is an optional method that creates a table. *ft_obj* is a handle to a table template object. *data* is a cell array of character vectors or objects specifying the information in the body of the table. The Model Advisor creates hyperlinks to objects. If you do not add data to the table, the Model Advisor does not display the table in the result.

Note Before creating a table, you must specify column titles using the `setColTitle` method.

Examples

Create a table object, `ft`, add column titles, and add data to the table:

```
ft = ModelAdvisor.FormatTemplate('TableTemplate');  
setColTitle(ft, {'Index', 'Block Name'});  
setTableInfo(ft, {'1', 'Gain'});
```

setTableTitle

Class: ModelAdvisor.FormatTemplate

Package: ModelAdvisor

Add title to table

Syntax

```
setTableTitle(ft_obj, title)
```

Description

`setTableTitle(ft_obj, title)` is an optional method that adds a title to a table.

Input Arguments

ft_obj

A handle to a template object.

title

A character vector or a handle to a formatting object specifying the title of the table.

Valid formatting objects are: `ModelAdvisor.Image`, `ModelAdvisor.LineBreak`, `ModelAdvisor.List`, `ModelAdvisor.Paragraph`, `ModelAdvisor.Table`, and `ModelAdvisor.Text`.

The title appears above the table. If you do not add data to the table, the Model Advisor does not display the table and title in the result.

Examples

Create a table object, `ft`, and add a table title:

```
ft = ModelAdvisor.FormatTemplate('TableTemplate');  
setTableTitle(ft, 'Table of fonts and styles used in model');
```

setType

Class: ModelAdvisor.List

Package: ModelAdvisor

Specify list type

Syntax

```
setType(list_obj, listType)
```

Description

`setType(list_obj, listType)` specifies the type of list the `ModelAdvisor.List` constructor creates.

Input Arguments

<code>list_obj</code>	Instantiation of the <code>ModelAdvisor.List</code> class
<code>listType</code>	Specifies the list type: <ul style="list-style-type: none">• numbered• bulleted

Examples

```
subList = ModelAdvisor.List();
subList.setType('numbered')
subList.addItem(ModelAdvisor.Text('Sub entry 1', {'pass','bold'}));
subList.addItem(ModelAdvisor.Text('Sub entry 2', {'pass','bold'}));
```

setUnderlined

Class: ModelAdvisor.Text

Package: ModelAdvisor

Underline text

Syntax

```
setUnderlined(text, mode)
```

Description

`setUnderlined(text, mode)` indicates whether to underline text.

Input Arguments

<code>text</code>	Instantiation of the <code>ModelAdvisor.Text</code> class
<code>mode</code>	A Boolean value indicating underlined formatting of text: <ul style="list-style-type: none">• <code>true</code> — Underline the text.• <code>false</code> — Do not underline the text.

Examples

```
t1 = ModelAdvisor.Text('This is some text');  
setUnderlined(t1, 'true');
```

slmetric.Engine class

Package: slmetric

Collect metric data on models or model components

Description

Use a `slmetric.Engine` object to collect metric data on models by calling `execute`. Use `getMetrics` to access the metric data and return an array of `slmetric.metric.ResultCollection` objects. This metric data is persistent in the simulation cache folder. Future instantiations of the `slmetric.Engine` object for the same model can access the cached metric data without regenerating the metric data.

Construction

`metric_engine = slmetric.Engine()` creates a metric engine object.

Properties

AnalysisRoot — Name of root model or subsystem on which to collect metric data

character vector

Name of root model or subsystem on which to collect metric data, as specified by the `slmetric.Engine.setAnalysisRoot` method. This property is read-only.

AnalyzeLibraries — Collect metric data on library linked subsystems in the model

1 (default)

Specify if the metric engine analyzes library-linked subsystems in the root model, including libraries inside referenced models under the root. Metric analysis does not include linked blocks to Simulink built-in libraries. Set this parameter to `false` or `0` to not include libraries in the metric analysis.

Data Types: logical

AnalyzeModelReferences — Collect metric data on all referenced models under the root model

1 (default)

Specify if the metric engine analyzes referenced models in your root model. Set this parameter to `false` or `0` to not include referenced models in the metric analysis.

Data Types: logical

Methods

<code>execute</code>	Collect metric data
<code>getAnalysisRootMetric</code>	Get metric data for one metric for analysis root only
<code>getErrorLog</code>	Get error log
<code>getMetricDistribution</code>	Get metric distribution
<code>getMetrics</code>	Access model metric data
<code>getStatistics</code>	Get statistics on metric data
<code>setAnalysisRoot</code>	Specify model or subsystem for metric analysis
<code>exportMetrics</code>	Export model metrics

Examples

Collect and Access Metric Data for One Metric

Collect and access model metric data for the model `sldemo_mdhref_basic`.

Create an `slmetric.Engine` object and set the root in the model for analysis.

```
metric_engine = slmetric.Engine();

% Include referenced models and libraries in the analysis,
%     these properties are on by default
metric_engine.AnalyzeModelReferences = 1;
metric_engine.AnalyzeLibraries = 1;
```

```
setAnalysisRoot(metric_engine, 'Root', 'sldemo_mdhref_basic');
```

Collect model metric data

```
execute(metric_engine, 'mathworks.metrics.ExplicitIOCount');
```

Get the model metric data that returns an array of `slmetric.metric.ResultCollection` objects, `res_col`.

```
res_col = getMetrics(metric_engine, 'mathworks.metrics.ExplicitIOCount');
```

Display the results for the `mathworks.metrics.ExplicitIOCount` metric.

```
for n=1:length(res_col)
    if res_col(n).Status == 0
        result = res_col(n).Results;

        for m=1:length(result)
            disp(['MetricID: ', result(m).MetricID]);
            disp([' ComponentPath: ', result(m).ComponentPath]);
            disp([' Value: ', num2str(result(m).Value)]);
            disp([' AggregatedValue: ', num2str(result(m).AggregatedValue)]);
            disp([' Measures: ', num2str(result(m).Measures)]);
            disp([' AggregatedMeasures: ', num2str(result(m).AggregatedMeasures)]);
        end
    else
        disp(['No results for:', result(n).MetricID]);
    end
    disp(' ');
end
```

Here are the results:

```
MetricID: mathworks.metrics.ExplicitIOCount
ComponentPath: sldemo_mdhref_basic
Value: 3
AggregatedValue: 4
Measures: 0 3
AggregatedMeasures: 3 3
MetricID: mathworks.metrics.ExplicitIOCount
ComponentPath: sldemo_mdhref_basic/More Info
Value: 0
AggregatedValue: 0
Measures: 0 0
AggregatedMeasures: 0 0
MetricID: mathworks.metrics.ExplicitIOCount
ComponentPath: sldemo_mdhref_counter
Value: 4
AggregatedValue: 4
```

```
Measures: 3 1  
AggregatedMeasures: 3 1
```

For the ComponentPath: `sldemo_mdref_basic`, the value is 3 because there are 3 outputs. The three outputs are in the second element of the `Measures` array. The `slmetric.metric.AggregationMode` is `Max`, so the `AggregatedValue` is 4 which is the number of inputs and outputs to `sldemo_mdref_counter`. The `AggregatedMeasures` array contains the maximum number of inputs and outputs for a component or subcomponent.

slmetric.metric.getAvailableMetrics

Package: slmetric.metric

Obtain available metrics

Syntax

```
IDs = slmetric.metric.getAvailableMetrics()  
[IDs,props] = slmetric.metric.getAvailableMetrics()
```

Description

IDs = slmetric.metric.getAvailableMetrics() get metric identifiers for available metrics in the metric engine.

[IDs,props] = slmetric.metric.getAvailableMetrics() get metric identifiers and properties.

Examples

Obtain Available Metric IDs for Model

This example shows how to obtain the available model metric IDs.

```
ID = slmetric.metric.getAvailableMetrics()  
  
ID =  
  
    'mathworks.metrics.CyclomaticComplexity'  
    'mathworks.metrics.DescriptiveBlockNames'  
    'mathworks.metrics.IOCount'  
    'mathworks.metrics.LayerSeparation'  
    'mathworks.metrics.LibraryLinkCount'  
    'mathworks.metrics.MatlabCodeAnalyzerWarnings'  
    'mathworks.metrics.MatlabLOCCount'
```

```
'mathworks.metrics.ModelAdvisorCheckCompliance.misra_c'
'mathworks.metrics.ModelAdvisorCheckCompliance.do178'
'mathworks.metrics.ModelAdvisorCheckCompliance.IS026262'
'mathworks.metrics.ModelAdvisorCheckCompliance.maab'
'mathworks.metrics.ModelAdvisorCheckIssues.misra_c'
'mathworks.metrics.ModelAdvisorCheckIssues.do178'
'mathworks.metrics.ModelAdvisorCheckIssues.IS026262'
'mathworks.metrics.ModelAdvisorCheckIssues.maab'
'mathworks.metrics.SimulinkBlockCount'
'mathworks.metrics.StateflowChartObjectCount'
'mathworks.metrics.StateflowLOCCount'
'mathworks.metrics.SubSystemCount'
'mathworks.metrics.SubSystemDepth'
```

Obtain Available Metric IDs and Metric Properties

This example shows how to obtain the available model metric properties.

```
[ID,PROPS]=slmetric.metric.getAvailableMetrics()
```

ID =

```
'mathworks.metrics.CyclomaticComplexity'
'mathworks.metrics.DescriptiveBlockNames'
'mathworks.metrics.IOCount'

```

```
PROPS =  
  
1x20 struct array with fields:  
  
    Name  
    Description  
    IsBuiltIn  
    Version
```

Output Arguments

IDs — Metric identifiers

cell array of character vectors

Metric identifiers in the metric engine.

props — Metric properties

structure array

Metric properties, returned as a structure array with the following fields:

Name	Name of the metric algorithm.
Description	Description of the metric algorithm.
IsBuiltIn	Boolean indicating if the metric is included with Simulink Check.
Version	Metric algorithm version.

Data Types: struct

See Also

`slmetric.Engine` | `slmetric.metric.Result` | `slmetric.metric.ResultCollection`

Introduced in R2016a

slmetric.metric.Result class

Package: slmetric.metric

Metric data for specified model component and metric algorithm

Description

Instances of `slmetric.metric.Result` contain the metric data for a specified model component and metric algorithm.

Construction

`metric_result = slmetric.metric.Result` creates a handle to a metric results object.

Properties

ID — Numeric identifier

integer

Unique numeric identifier for the metric result object. This property is read-only.

Data Types: uint64

ComponentID — Component ID

character vector

Unique identifier of the component object for which the metric is calculated. Use `ComponentID` to trace the generated result object to the analyzed component. Set the `ComponentID` or `ComponentPath` properties by using the `slmetric.metric.Metric.algorithm` method.

This property is read/write.

Data Types: char

ComponentPath — Component path

character vector

Component path for which metric is calculated. Use `ComponentPath` as an alternative to setting the `ComponentID` property. The metric engine converts the `ComponentPath` to a `ComponentID`. Set the `ComponentID` or `ComponentPath` properties by using the `slmetric.metric.Metric.algorithm` method.

This property is read/write.

Data Types: `char`

MetricID — Metric identifier

character vector

Metric identifier for “Model Metrics” on page 2-387 or custom model metrics that you create. You can get metric identifiers by calling `slmetric.metric.getAvailableMetrics`.

This property is read/write.

Data Types: `char`

Value — Metric value

double (default)

Metric scalar value, generated by the algorithm for the metric specified by `MetricID` and the component specified by `ComponentID`.

If the algorithm does not specify a metric scalar value, the default value is `NaN`. For example, suppose you collect metric data for a model that contains a Stateflow Chart. For the `StateflowChartObjectCount` metric, the `Value` property of the model `slmetric.metric.Result` object is `NaN` because the model itself cannot have Stateflow objects. The `AggregatedValue` property of the model `slmetric.metric.Result` object contains the total number of Stateflow objects in the chart.

This property is read/write.

Data Types: `double`

AggregatedValue — Aggregated metric value

double (default)

Metric value aggregated across the model hierarchy. The metric engine implicitly aggregates the metric values based on the `AggregationMode`. Do not set this property. If the metric scalar value is NaN for all components, the `AggregatedValue` is zero.

This property is read-only.

Data Types: double

Measures — Metric measures

double array

Metric measures, optionally specified by the metric algorithm. Metric measures contain detailed information about the metric value. For example, for a metric that counts the number of blocks per subsystem, you can specify measures that contain the number of virtual and nonvirtual blocks. The metric value is the sum of the virtual and nonvirtual block count.

Set the property by using the `slmetric.metric.Metric.algorithm` method. This property is read/write.

Data Types: double

AggregatedMeasures — Aggregated metric measures

double array

Metric measures value aggregated across the model hierarchy. The metric engine implicitly aggregates the metric measure values based on the `AggregationMode`. Do not set this property.

This property is read-only.

Data Types: double

Details — Metric result details

array of `slmetric.metric.ResultDetail` objects

Details about what the metric engine counts for the `Value` property

This property is read/write.

UserData — User data

character vector

User data optionally provided by the metric algorithm.

This property is read/write.

Data Types: char

Examples

Collect and Access Metric Data for One Metric

Collect and access model metric data for the model `sldemo_mdref_basic`.

Create an `slmetric.Engine` object and set the root in the model for analysis.

```
metric_engine = slmetric.Engine();

% Include referenced models and libraries in the analysis,
%     these properties are on by default
metric_engine.AnalyzeModelReferences = 1;
metric_engine.AnalyzeLibraries = 1;

setAnalysisRoot(metric_engine, 'Root', 'sldemo_mdref_basic');
```

Collect model metric data

```
execute(metric_engine, 'mathworks.metrics.ExplicitIOCount');
```

Get the model metric data that returns an array of `slmetric.metric.ResultCollection` objects, `res_col`.

```
res_col = getMetrics(metric_engine, 'mathworks.metrics.ExplicitIOCount');
```

Display the results for the `mathworks.metrics.ExplicitIOCount` metric.

```
for n=1:length(res_col)
    if res_col(n).Status == 0
        result = res_col(n).Results;

        for m=1:length(result)
            disp(['MetricID: ', result(m).MetricID]);
            disp([' ComponentPath: ', result(m).ComponentPath]);
            disp([' Value: ', num2str(result(m).Value)]);
            disp([' AggregatedValue: ', num2str(result(m).AggregatedValue)]);
            disp([' Measures: ', num2str(result(m).Measures)]);
            disp([' AggregatedMeasures: ', num2str(result(m).AggregatedMeasures)]);
        end
    else
        disp(['No results for:', result(n).MetricID]);
    end
end
```

```

    disp(' ');
end

```

Here are the results:

```

MetricID: mathworks.metrics.ExplicitIOCount
  ComponentPath: sldemo_mdref_basic
  Value: 3
  AggregatedValue: 4
  Measures: 0 3
  AggregatedMeasures: 3 3
MetricID: mathworks.metrics.ExplicitIOCount
  ComponentPath: sldemo_mdref_basic/More Info
  Value: 0
  AggregatedValue: 0
  Measures: 0 0
  AggregatedMeasures: 0 0
MetricID: mathworks.metrics.ExplicitIOCount
  ComponentPath: sldemo_mdref_counter
  Value: 4
  AggregatedValue: 4
  Measures: 3 1
  AggregatedMeasures: 3 1

```

For the ComponentPath: `sldemo_mdref_basic`, the value is 3 because there are 3 outputs. The three outputs are in the second element of the Measures array. The `slmetric.metric.AggregationMode` is Max, so the AggregatedValue is 4 which is the number of inputs and outputs to `sldemo_mdref_counter`. The AggregatedMeasures array contains the maximum number of inputs and outputs for a component or subcomponent.

Topics

“Collect Model Metrics Programmatically”
 “Model Metrics” on page 2-387

Introduced in R2016a

slmetric.metric.ResultCollection class

Package: slmetric.metric

Metric data for specified model metric

Description

Instances of `slmetric.metric.ResultCollection` contain the metric data for a specific model metric.

Construction

`metricRC = slmetric.metric.ResultCollection` creates a handle to a metric result collection object.

Properties

MetricID — Metric identifier

character vector

Metric identifier for a MathWorks metric or a custom metric. You can get metric identifiers by calling `slmetric.metric.getAvailableMetrics`.

Status — Unique identifier

integer

Status code of metric execution. This property is read-only.

Integer	Status
1	No result. Metric algorithm is not applicable to the analyzed system. Components analyzed by the metric not found, or metric with compile requirement cannot be executed on library model.
0	Result collected.

Integer	Status
-1	No result. Error executing metric.
-2	No result available from previous run.
-3	No result. Compilation error.
-4	Empty result. Missing prerequisite.

Outdated – Determine if metric data is current

logical

If `true`, the metric data is out-of-date because the model or source files have changed. This property is read-only.

Results – Metric data collected for executing one or more metrics

array of `slmetric.metric.Result` objects

Metric data collected when you call the `execute` method for one or more metrics. This property is read-only.

Examples

Collect and Access Metric Data for One Metric

Collect and access model metric data for the model `sldemo_mdhref_basic`.

Create an `slmetric.Engine` object and set the root in the model for analysis.

```
metric_engine = slmetric.Engine();

% Include referenced models and libraries in the analysis,
%     these properties are on by default
metric_engine.AnalyzeModelReferences = 1;
metric_engine.AnalyzeLibraries = 1;

setAnalysisRoot(metric_engine, 'Root', 'sldemo_mdhref_basic');

Collect model metric data

execute(metric_engine, 'mathworks.metrics.ExplicitIOCount');
```

Get the model metric data that returns an array of `slmetric.metric.ResultCollection` objects, `res_col`.

```
res_col = getMetrics(metric_engine, 'mathworks.metrics.ExplicitIOCount');
```

Display the results for the `mathworks.metrics.ExplicitIOCount` metric.

```
for n=1:length(res_col)
    if res_col(n).Status == 0
        result = res_col(n).Results;

        for m=1:length(result)
            disp(['MetricID: ', result(m).MetricID]);
            disp([' ComponentPath: ', result(m).ComponentPath]);
            disp([' Value: ', num2str(result(m).Value)]);
            disp([' AggregatedValue: ', num2str(result(m).AggregatedValue)]);
            disp([' Measures: ', num2str(result(m).Measures)]);
            disp([' AggregatedMeasures: ', num2str(result(m).AggregatedMeasures)]);
        end
    else
        disp(['No results for:', result(n).MetricID]);
    end
end
disp(' ');
end
```

Here are the results:

```
MetricID: mathworks.metrics.ExplicitIOCount
ComponentPath: sldemo_mdref_basic
Value: 3
AggregatedValue: 4
Measures: 0 3
AggregatedMeasures: 3 3
MetricID: mathworks.metrics.ExplicitIOCount
ComponentPath: sldemo_mdref_basic/More Info
Value: 0
AggregatedValue: 0
Measures: 0 0
AggregatedMeasures: 0 0
MetricID: mathworks.metrics.ExplicitIOCount
ComponentPath: sldemo_mdref_counter
Value: 4
AggregatedValue: 4
Measures: 3 1
AggregatedMeasures: 3 1
```

For the `ComponentPath: sldemo_mdref_basic`, the value is 3 because there are 3 outputs. The three outputs are in the second element of the `Measures` array. The `slmetric.metric.AggregationMode` is `Max`, so the `AggregatedValue` is 4 which is the number of inputs and outputs to `sldemo_mdref_counter`. The

AggregatedMeasures array contains the maximum number of inputs and outputs for a component or subcomponent.

slmetric.metric.getAvailableMetrics

Introduced in R2016a

Attributes property

Class: ModelAdvisor.ListViewParameter

Package: ModelAdvisor

Attributes to display in Model Advisor Report Explorer

Values

Cell array

Default: {} (empty cell array)

Description

The `Attributes` property specifies the attributes to display in the center pane of the Model Advisor Results Explorer.

Examples

```
% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
myLVParam.Data = get_param(searchResult,'object');
myLVParam.Attributes = {'FontName'}; % name is default property
```

CallbackContext property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Specify when to run check

Values

'PostCompile'

'None' (default)

Description

The CallbackContext property specifies the context for checking the model or subsystem.

'None'	No special requirements for the model before checking.
'Postcompile'	The model must be compiled.

CallbackHandle property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Callback function handle for check

Values

Function handle.

An empty handle [] is the default.

Description

The `CallbackHandle` property specifies the handle to the check callback function.

CallbackStyle property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Callback function type

Values

'StyleOne' (default)

'StyleTwo'

'StyleThree'

Description

The CallbackStyle property specifies the type of the callback function.

'StyleOne'	Simple check callback function
'StyleTwo'	Detailed check callback function
'StyleThree'	Check callback function with hyperlinked results

EmitInputParametersToReport property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Display check input parameters in the Model Advisor report

Values

'true' (default)

'false'

Description

The EmitInputParametersToReport property specifies the display of check input parameters in the Model Advisor report.

'true'	Display check input parameters in the Model Advisor report
'false'	Do not display check input parameters in the Model Advisor report

Data property

Class: ModelAdvisor.ListViewParameter

Package: ModelAdvisor

Objects in Model Advisor Result Explorer

Values

Array of Simulink objects

Default: [] (empty array)

Description

The Data property specifies the objects displayed in the Model Advisor Result Explorer.

Examples

```
% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
myLVParam.Data = get_param(searchResult,'object');
```

Description property

Class: ModelAdvisor.Action

Package: ModelAdvisor

Message in **Action** box

Values

Character vector

Default: ' ' (empty character vector)

Description

The Description property specifies the message displayed in the Action box.

Examples

```
% define action (fix) operation
myAction = ModelAdvisor.Action;
%Specify a callback function for the action
myAction.setCallbackFcn(@sampleActionCB);
myAction.Name='Fix block fonts';
myAction.Description=...
    'Click the button to update all blocks with specified font';
```

Description property

Class: ModelAdvisor.FactoryGroup

Package: ModelAdvisor

Description of folder

Values

Character vector

Default: '' (empty character vector)

Description

The `Description` property provides information about the folder. Details about the folder are displayed in the right pane of the Model Advisor.

Examples

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
rec.Description='Sample Factory Group';
```

Description property

Class: ModelAdvisor.Group

Package: ModelAdvisor

Description of folder

Values

Character vector

Default: '' (empty character vector)

Description

The `Description` property provides information about the folder. Details about the folder are displayed in the right pane of the Model Advisor.

Examples

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');  
MAG.Description='This is my group';
```

Description property

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Description of input parameter

Values

Character vector.

Default: '' (empty character vector)

Description

The `Description` property specifies a description of the input parameter. Details about the check are displayed in the right pane of the Model Advisor.

Examples

```
% define input parameters
inputParam2 = ModelAdvisor.InputParameter;
inputParam2.Name = 'Standard font size';
inputParam2.Value='12';
inputParam2.Type='String';
inputParam2.Description='sample tooltip';
```

Description property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Description of task

Values

Character vector

Default: '' (empty character vector)

Description

The `Description` property is a description of the task that the Model Advisor displays in the **Analysis** box.

When adding checks as tasks, the Model Advisor uses the task `Description` property instead of the check `TitleTips` property.

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.DisplayName='Example task 1';  
MAT1.Description='This is the first example task.'
```

```
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');  
MAT2.DisplayName='Example task 2';  
MAT2.Description='This is the second example task.'
```

```
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');  
MAT3.DisplayName='Example task 3';  
MAT3.Description='This is the third example task.'
```

DisplayName property

Class: ModelAdvisor.FactoryGroup

Package: ModelAdvisor

Name of folder

Values

Character vector

Default: ' ' (empty character vector)

Description

The `DisplayName` specifies the name of the folder that is displayed in the Model Advisor.

Examples

```
% --- sample factory group
rec = ModelAdvisor.FactoryGroup('com.mathworks.sample.factorygroup');
rec.DisplayName='Sample Factory Group';
```

DisplayName property

Class: ModelAdvisor.Group

Package: ModelAdvisor

Name of folder

Values

Character vector

Default: ' ' (empty character vector)

Description

The `DisplayName` specifies the name of the folder that is displayed in the Model Advisor.

Examples

```
MAG = ModelAdvisor.Group('com.mathworks.sample.GroupSample');  
MAG.DisplayName='My Group';
```

DisplayName property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Name of task

Values

Character vector

Default: '' (empty character vector)

Description

The `DisplayName` property specifies the name of the task. The Model Advisor displays each custom task in the tree using the name of the task. Therefore, you should specify a unique name for each task. When you specify the same name for multiple tasks, the Model Advisor generates a warning.

When adding checks as tasks, the Model Advisor uses the task `DisplayName` property instead of the check `Title` property.

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.DisplayName='Example task with input parameter and auto-fix ability';
```

```
MAT2 = ModelAdvisor.Task('com.mathworks.sample.TaskSample2');  
MAT2.DisplayName='Example task 2';
```

```
MAT3 = ModelAdvisor.Task('com.mathworks.sample.TaskSample3');  
MAT3.DisplayName='Example task 3';
```

Enable property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Indicate whether user can enable or disable check

Values

true (default)

false

Description

The Enable property specifies whether the user can enable or disable the check.

true	Display the check box control
------	-------------------------------

false	Hide the check box control
-------	----------------------------

Enable property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Indicate if user can enable and disable task

Values

true (default)

false

Description

The Enable property specifies whether the user can enable or disable a task.

true (default)

Display the check box control for task

false

Hide the check box control for task

When adding checks as tasks, the Model Advisor uses the task Enable property instead of the check Enable property.

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.Enable = false;
```

Entries property

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Drop-down list entries

Values

Depends on the value of the Type property.

Description

The Entries property is valid only when the Type property is one of the following:

- Enum
- ComboBox
- PushButton

Examples

```
inputParam3 = ModelAdvisor.InputParameter;  
inputParam3.Name='Valid font';  
inputParam3.Type='Combobox';  
inputParam3.Description='sample tooltip';  
inputParam3.Entries={'Arial', 'Arial Black'};
```

ID property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Identifier for check

Values

Character vector

Default: '' (empty character vector)

Description

The ID property specifies a permanent, unique identifier for the check. Note the following about the ID property:

- You must specify this property.
- The value of ID must remain constant.
- The Model Advisor generates an error if ID is not unique.
- Tasks and factory group definitions must refer to checks by ID.

ID property

Class: ModelAdvisor.FactoryGroup

Package: ModelAdvisor

Identifier for folder

Values

Character vector

Description

The ID property specifies a permanent, unique identifier for the folder.

Note

- You must specify this field.
 - The value of **ID** must remain constant.
 - The Model Advisor generates an error if **ID** is not unique.
 - Group definitions must refer to other groups by **ID**.
-

ID property

Class: ModelAdvisor.Group

Package: ModelAdvisor

Identifier for folder

Values

Character vector

Description

The ID property specifies a permanent, unique identifier for the folder.

Note

- You must specify this field.
 - The value of **ID** must remain constant.
 - The Model Advisor generates an error if **ID** is not unique.
 - Group definitions must refer to other groups by **ID**.
-

ID property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Identifier for task

Values

Character vector

Default: '' (empty character vector)

Description

The ID property specifies a permanent, unique identifier for the task.

Note

- The Model Advisor automatically assigns a unique identifier to ID if you do not specify it.
 - The value of ID must remain constant.
 - The Model Advisor generates an error if ID is not unique.
 - Group definitions must refer to tasks using ID.
-

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.ID='Task_ID_1234';
```

LicenseName property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Product license names required to display and run check

Values

Cell array of product license names

{ }(empty cell array) (default)

Description

The `LicenseName` property specifies a cell array of names for product licenses required to display and run the check.

When the Model Advisor starts, it tests whether the product license exists. If you do not meet the license requirements, the Model Advisor does not display the check.

The Model Advisor performs a checkout of the product licenses when you run the custom check. If you do not have the product licenses available, you see an error message that the required license is not available.

Tip To find the text for license strings, type `help license` at the MATLAB command line.

LicenseName property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Product license names required to display and run task

Values

Cell array of product license names

Default: {} (empty cell array)

Description

The `LicenseName` property specifies a cell array of names for product licenses required to display and run the check.

When the Model Advisor starts, it tests whether the product license exists. If you do not meet the license requirements, the Model Advisor does not display the check.

The Model Advisor performs a checkout of the product licenses when you run the custom check. If you do not have the product licenses available, you see an error message that the required license is not available.

If you specify `ModelAdvisor.Check.LicenseName`, the Model Advisor displays the check when the union of both properties is true.

Tip To find the text for license strings, type `help license` at the MATLAB command line.

ListViewVisible property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Status of **Explore Result** button

Values

false (default)

true

Description

The `ListViewVisible` property is a Boolean value that sets the status of the **Explore Result** button.

true	Display the Explore Result button.
false	Hide the Explore Result button.

Examples

```
% add 'Explore Result' button  
rec.ListViewVisible = true;
```

MAObj property

Class: ModelAdvisor.FactoryGroup

Package: ModelAdvisor

Model Advisor object

Values

Handle to a `Simulink.ModelAdvisor` object

Description

The `MAObj` property specifies a handle to the current Model Advisor object.

MAObj property

Class: ModelAdvisor.Group

Package: ModelAdvisor

Model Advisor object

Values

Handle to Simulink.ModelAdvisor object

Description

The MAObj property specifies a handle to the current Model Advisor object.

MAObj property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Model Advisor object

Values

Handle to a `Simulink.ModelAdvisor` object

Description

The `MAObj` property specifies the current Model Advisor object.

When adding checks as tasks, the Model Advisor uses the task `MAObj` property instead of the check `MAObj` property.

Name property

Class: ModelAdvisor.Action

Package: ModelAdvisor

Action button label

Values

Character vector

Default: '' (empty character vector)

Description

The Name property specifies the label for the action button. This property is required.

Examples

```
% define action (fix) operation
myAction = ModelAdvisor.Action;
%Specify a callback function for the action
myAction.setCallbackFcn(@sampleActionCB);
myAction.Name='Fix block fonts';
```

Name property

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Input parameter name

Values

Character vector.

Default: '' (empty character vector)

Description

The Name property specifies the name of the input parameter in the custom check.

Examples

```
inputParam2 = ModelAdvisor.InputParameter;  
inputParam2.Name = 'Standard font size';  
inputParam2.Value='12';  
inputParam2.Type='String';  
inputParam2.Description='sample tooltip';
```

Name property

Class: ModelAdvisor.ListViewParameter

Package: ModelAdvisor

Drop-down list entry

Values

Character vector

Default: '' (empty character vector)

Description

The Name property specifies an entry in the **Show** drop-down list in the Model Advisor Result Explorer.

Examples

```
% define list view parameters
myLVParam = ModelAdvisor.ListViewParameter;
myLVParam.Name = 'Invalid font blocks'; % the name appeared at pull down filter
```

Result property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Results cell array

Values

Cell array

Default: {} (empty cell array)

Description

The `Result` property specifies the cell array for storing the results that are returned by the callback function specified in `CallbackHandle`.

Tip To set the icon associated with the check, use the `Simulink.ModelAdvisor.setCheckResultStatus` and `setCheckErrorSeverity` methods.

SupportExclusion property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Set to support exclusions

Values

Boolean value specifying that the check supports exclusions.

true The check supports exclusions.

false (default). The check does not support exclusions.

Description

The SupportExclusion property specifies whether the check supports exclusions.

'true'	Check supports exclusions.
'false'	Check does not support exclusions.

Examples

```
% specify that a check supports exclusions
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.SupportExclusion = true;
```

SupportLibrary property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Set to support library models

Values

Boolean value specifying that the check supports library models.

true. The check supports library models.

false (default). The check does not support library models.

Description

The SupportLibrary property specifies whether the check supports library models.

'true'	Check supports library models.
'false'	Check does not support library models.

Examples

```
% specify that a check supports library models
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');
rec.SupportLibrary = true;
```

Title property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Name of check

Values

Character vector

Default: '' (empty character vector)

Description

The `Title` property specifies the name of the check in the Model Advisor. The Model Advisor displays each custom check in the tree using the title of the check. Therefore, you should specify a unique title for each check. When you specify the same title for multiple checks, the Model Advisor generates a warning.

Examples

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');  
rec.Title = 'Check Simulink block font';
```

TitleTips property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Description of check

Values

Character vector

Default: '' (empty character vector)

Description

The `TitleTips` property specifies a description of the check. Details about the check are displayed in the right pane of the Model Advisor.

Examples

```
rec = ModelAdvisor.Check('com.mathworks.sample.Check1');  
rec.Title = 'Check Simulink block font';  
rec.TitleTips = 'Example style three callback';
```

Type property

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Input parameter type

Values

character vector

Default: ''

Description

The Type property specifies the type of input parameter.

Use the Type property with the Value and Entries properties to define input parameters.

Valid values are listed in the following table.

Type	Data Type	Default Value	Description
Bool	Boolean	false	A check box
ComboBox	Cell array	First entry in the list	A drop-down menu <ul style="list-style-type: none">• Use Entries to define the entries in the list.• Use Value to indicate a specific entry in the menu or to enter a value not in the list.

Type	Data Type	Default Value	Description
Enum	Cell array	First entry in the list	A drop-down menu <ul style="list-style-type: none">• Use <code>Entries</code> to define the entries in the list.• Use <code>Value</code> to indicate a specific entry in the list.
PushButton	N/A	N/A	A button When you click the button, the callback function specified by <code>Entries</code> is called.
String	Character vector	' '	A text box

Examples

```
% define input parameters
inputParam1 = ModelAdvisor.InputParameter;
inputParam1.Name = 'Skip font checks.';
inputParam1.Type = 'Bool';
inputParam1.Value = false;
```

validate

Class: Advisor.authoring.DataFile

Package: Advisor.authoring

Validate XML data file used for model configuration check

Syntax

```
msg = Advisor.authoring.DataFile.validate(dataFile)
```

Description

`msg = Advisor.authoring.DataFile.validate(dataFile)` validates the syntax of the XML data file used for model configuration checks.

Input Arguments

`dataFile` XML data file name (character vector)

Examples

```
dataFile = 'myDataFile.xml';  
msg = Advisor.authoring.DataFile.validate(dataFile);  
  
if isempty(msg)  
    disp('Data file passed the XSD schema validation.');
```

```
else  
    disp(msg);  
end
```

Topics

“Create Check for Model Configuration Parameters”

Advisor.authoring.CompositeConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint that checks for multiple constraints

Description

Instances of `Advisor.authoring.CompositeConstraint` class contain multiple constraints. Depending on the instance definition, the Model Advisor reports a violation if a model does not meet one or all of the constraints.

Construction

`cc = Advisor.authoring.CompositeConstraint` creates an instance of this class

Properties

ConstraintID — IDs of constraints

character vector | cell array of character vectors

IDs of constraints that compose an `Advisor.authoring.CompositeConstraint` object. This property is read-only. Use the `addConstraintID` method to create a `CompositeConstraint`.

CompositeOperator — Operator for specifying whether the Model Advisor reports a violation

character vector

Use `and` operator to specify that the Model Advisor reports a violation if a model does not meet all of the check constraints. Use `or` operator to specify that the Model Advisor reports a violation if a model does not meet at least one of the check constraints. This property is read/write.

Methods

`addConstraintID` Add constraint to composite constraint

Examples

Specify a Composite Constraint

These commands specify a composite constraint for Multi-Port Switch blocks.

Create three `PositiveBlockParameter` constraint objects.

```
c1 = Advisor.authoring.PositiveBlockParameterConstraint();
c1.ID = 'ID_A2';
c1.BlockType = 'MultiPortSwitch';
c1.ParameterName = 'DataPortOrder';
c1.SupportedParameterValues = {'Specify indices'};
c1.ValueOperator = 'eq';

c2 = Advisor.authoring.PositiveBlockParameterConstraint();
c2.ID = 'ID_A3';
c2.BlockType = 'MultiPortSwitch';
c2.ParameterName = 'DataPortForDefault';
c2.SupportedParameterValues = {'Additional data port'};
c2.ValueOperator = 'eq';

c3 = Advisor.authoring.PositiveBlockParameterConstraint();
c3.ID = 'ID_A4';
c3.BlockType = 'MultiPortSwitch';
c3.ParameterName = 'DiagnosticForDefault';
c3.SupportedParameterValues = {'None'};
c3.ValueOperator = 'eq';
```

Use the `addPreRequisiteConstraintID` method to make `c1` a prerequisite to checking constraints `c2` and `c3`.

```
c2.addPreRequisiteConstraintID('ID_A2');
c3.addPreRequisiteConstraintID('ID_A2');
```

Create a composite constraint that specifies that if a Rate Transition block does not meet both constraints `c2` and `c3`, the block is in violation of this check.

```
CC = Advisor.authoring.CompositeConstraint();
CC.addConstraintID('ID_A3');
```

```
CC.addConstraintID('ID_A4');  
CC.CompositeOperator = 'and';
```

Topics

“Define Checks for Supported or Unsupported Blocks and Parameters”

Introduced in R2018a

Advisor.authoring.PositiveBlockTypeConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint to check for supported block types

Description

Instances of `Advisor.authoring.PositiveBlockTypeConstraint` class define the only blocks that a model can contain.

Construction

`constraint = Advisor.authoring.PositiveBlockTypeConstraint` creates an instance of this class.

Properties

ID — Unique identifier

character vector

Unique identifier for the positive block type constraint. This property is read/write.

SupportedBlockTypes — Supported block types

structure of character vectors

Structure consisting of these fields:

- 'BlockType'
- 'MaskType'

List of supported block types. For more information on the **MaskType** field, see “Mask Editor Overview” (Simulink) and “Mask Parameters” (Simulink). This property is read/write.

PreRequisiteConstraintIDs — IDs of prerequisite constraints

cell array of character vectors

IDs of constraints that you specify as prerequisites by using the `addPreRequisiteConstraintID` method. If a prerequisite is not satisfied, the Model Advisor does not check the constraint that has the prerequisite. This property is read-only.

Examples

Specify Supported Block Types

These commands specify that a model contain only Inport, Outport, and Gain blocks and Constant blocks that have a specified mask:

```
c1=Advisor.authoring.PositiveBlockTypeConstraint;  
c1.ID='ID_1';  
s1=struct('BlockType','Inport','MaskType','');  
s2=struct('BlockType','Outport','MaskType','');  
s3=struct('BlockType','Gain','MaskType','');  
s4=struct('BlockType','Constant','MaskType','Stateflow');  
c1.SupportedBlockTypes={s1;s2;s3;s4};
```

Advisor.authoring.NegativeModelParameterConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint to check for unsupported model parameter values

Description

Instances of `Advisor.authoring.NegativeModelParameterConstraint` class define unsupported values for specified model parameters.

Construction

`constraint = Advisor.authoring.NegativeModelParameterConstraint` creates an instance of this class.

Properties

ID — Unique identifier

character vector

Unique identifier for the negative model parameter constraint. This property is read/write.

ParameterName — Name of model parameter

character vector

Model parameter for which you are specifying a constraint. This property is read/write.

UnsupportedParameterValues — Unsupported model parameter values

cell array of character vectors | cell array of structs | cell array of array of character vectors

List of unsupported values for the model parameter specified by the `ParameterName` field. This property is read/write.

PreRequisiteConstraintIDs — IDs of prerequisite constraints

cell array of character vectors

IDs of constraints that you specify as prerequisites by using the `addPreRequisiteConstraintID` method. If a prerequisite is not satisfied, the Model Advisor does not check the constraint that has the prerequisite. This property is read-only.

Examples

Specify Unsupported Model Parameter Value

These commands specify that the **MaxType** parameter does not support a value of zero:

```
c1=Advisor.authoring.NegativeModelParameterConstraint;  
c1.ID='ID_1';  
c1.ParameterName='MaxStep';  
c1.UnsupportedParameterValues={'0'};
```

Topics

“Define Checks for Supported or Unsupported Blocks and Parameters”

Introduced in R2018a

Advisor.authoring.PositiveModelParameterConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint to check for supported model parameter values

Description

Instances of `Advisor.authoring.PositiveModelParameterConstraint` class define supported values for specified model parameters.

Construction

`constraint = Advisor.authoring.PositiveModelParameterConstraint` creates an instance of this class.

Properties

ID — Unique identifier

character vector

Unique identifier for the positive model parameter constraint. This property is read/write.

ParameterName — Name of model parameter

character vector

Model parameter for which you are specifying a constraint. This property is read/write.

SupportedParameterValues — Supported model parameter values

cell array of character vectors | cell array of structs | cell array of array of character vectors

List of supported values for the model parameter specified by the `ParameterName` field. This property is read/write.

PreRequisiteConstraintIDs — IDs of prerequisite constraints

cell array of character vectors

IDs of constraints that you specify as prerequisites by using the `addPreRequisiteConstraintID` method. If a prerequisite is not satisfied, the Model Advisor does not check the constraint that has the prerequisite. This property is read-only.

Examples

Specify Supported Model Parameter Values

These commands specify that the Solver **Type** model parameter must have a value of `Variable-step`:

```
c1=Advisor.authoring.PositiveModelParameterConstraint;
c1.ID='ID_1';
c1.ParameterName='SolverType';
c1.SupportedParameterValues={'Variable-step'};
```

These commands specify that the **Stop time** model parameter must have a value of `10` or `15`:

```
c1=Advisor.authoring.PositiveModelParameterConstraint;
c1.ID='ID_1';
c1.ParameterName='StopTime';
c1.SupportedParameterValues={'10','15'};
```

For the **ReplacementTypes** model parameter (Embedded Coder Users), these commands specify two sets of supported values for the double and single data types:

```
c1 = Advisor.authoring.PositiveModelParameterConstraint();
c1.ID='ID_2';
c1.ParameterName = 'ReplacementTypes';
s1 = struct('double', 'a', 'single', 'b');
s2 = struct('double', 'c', 'single', 'b');
c1.SupportedParameterValues = {s1, s2};
```

Topics

“Define Checks for Supported or Unsupported Blocks and Parameters”

Introduced in R2018a

Advisor.authoring.NegativeBlockParameterConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint to check for unsupported block parameter values

Description

Instances of `Advisor.authoring.NegativeBlockParameterConstraint` class define unsupported values for specified block parameters.

Construction

`constraint = Advisor.authoring.NegativeBlockParameterConstraint` creates an instance of this class.

Properties

ID — Unique identifier

character vector

Unique identifier for the negative block constraint. This property is read/write.

BlockType — Block type

character vector

Block that contains the parameter for which you are specifying a constraint. For a list of block types, see “Block-Specific Parameters” (Simulink). This property is read/write.

ParameterName — Name of block parameter

character vector

Block parameter for which you are specifying a constraint. For a list of block parameters, see “Block-Specific Parameters” (Simulink). This property is read/write.

UnsupportedParameterValues — Unsupported block parameter values

cell array of character vectors | cell array of structs | cell array of array of character vectors

List of unsupported values for the block parameter specified by the `BlockType` and `ParameterName` fields. This property is read/write.

ValueOperator — Operator for specifying unsupported parameter values

character vector

To specify one or more unsupported values, use these operators:

- 'eq'
- 'or'
- 'lt'
- 'gt'
- 'ge'
- 'le'
- 'range'
- 'regex'

This property is read/write. For more information on the regex operator, see `regexp`.

PreRequisiteConstraintIDs — IDs of prerequisite constraints

cell array of character vectors

IDs of constraints that you specify as prerequisites by using the `addPreRequisiteConstraintID` method. If a prerequisite is not satisfied, the Model Advisor does not check the constraint that has the prerequisite. This property is read/write.

Examples

Specify Unsupported Block Parameter Values

For a Constant block, these commands specify that one or four values are unsupported for the **Value** parameter:

```
c1=Advisor.authoring.NegativeBlockParameterConstraint;  
c1.ID='ID_1';  
c1.BlockType='Constant';  
c1.ParameterName='Value';  
c1.UnsupportedParameterValues={'1','4'};  
c1.ValueOperator='or';
```

“Define Checks for Supported or Unsupported Blocks and Parameters”

Introduced in R2018a

Advisor.authoring.PositiveBlockParameterConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint to check for supported block parameter values

Description

Instances of `Advisor.authoring.PositiveBlockParameterConstraint` class define supported values for a specified block parameter.

Construction

`constraint = Advisor.authoring.PositiveBlockParameterConstraint` creates an instance of this class.

Properties

ID — Unique identifier

character vector

Unique identifier for the positive block parameter constraint. This property is read/write.

BlockType — Block type

character vector

Block that contains the parameter for which you are specifying a constraint. For a list of block types, see “Block-Specific Parameters” (Simulink). This property is read/write.

ParameterName — Name of block parameter

character vector

Block parameter for which you are specifying a constraint. For a list of block parameters, see “Block-Specific Parameters” (Simulink). This property is read/write.

SupportedParameterValues — Supported block parameter values

cell array of character vectors | cell array of structs | cell array of array of character vectors

List of supported values for the block parameter specified by the `BlockType` and `ParameterName` fields. This property is read/write.

ValueOperator — Operator for specifying supported parameter values

character vector

Use these operators to specify one or more supported values:

- 'eq'
- 'or'
- 'lt'
- 'gt'
- 'ge'
- 'le'
- 'range'
- 'regex'

This property is read/write. For more information on the regex operator, see `regexp`.

PreRequisiteConstraintIDs — IDs of prerequisite constraints

cell array of character vectors

IDs of constraints that you specify as prerequisites by using the `addPreRequisiteConstraintID` method. If a prerequisite is not satisfied, the Model Advisor does not check the constraint that has the prerequisite. This property is read-only.

Example

Specify Supported Block Parameter Values

For a Constant block, these commands specify that the **Value** parameter must have values of 2 and 5.

```
c1=Advisor.authoring.PositiveBlockParameterConstraint;  
c1.ID='ID_1';
```

```
c1.BlockType='Constant';  
c1.ParameterName='Value';  
c1.SupportedParameterValues={'[2,5]'};  
c1.ValueOperator='eq';
```

For a Constant block, these commands specify that the **Value** parameter must have a value between 1 and 4.

```
c1=Advisor.authoring.PositiveBlockParameterConstraint;  
c1.ID='ID_1';  
c1.BlockType='Constant';  
c1.ParameterName='Value';  
c1.SupportedParameterValues={'1','4'};  
c1.ValueOperator='range';
```

AddPrerequisiteConstraintID

Class: Advisor.authoring.PositiveBlockParameterConstraint,
Advisor.authoring.NegativeBlockParameterConstraint,
Advisor.authoring.PositiveModelParameterConstraint,
Advisor.authoring.NegativeModelParameterConstraint,
Advisor.authoring.PositiveBlockTypeConstraint,
Advisor.authoring.NegativeBlockTypeConstraint

Package: Advisor.authoring

Check a prerequisite constraint object before the actual constraint object

Syntax

```
addPreRequisiteConstraintID(ID_1)
```

Description

Specify a constraint as a prerequisite to a constraint object. The Model Advisor checks the prerequisite constraint before checking the actual constraint object.

`addPreRequisiteConstraintID(ID_1)` specifies a prerequisite constraint ID `ID_1` that the Model Advisor checks before checking the actual constraint object.

Input Arguments

ID_1 — ID of constraint object

character vector

To create constraint objects that you can specify as prerequisite constraints, use these classes:

- `Advisor.authoring.PositiveBlockParameterConstraint`
- `Advisor.authoring.NegativeBlockParameterConstraint`

- `Advisor.authoring.PositiveModelParameterConstraint`
- `Advisor.authoring.NegativeModelParameterConstraint`
- `Advisor.authoring.PositiveBlockTypeConstraint`
- `Advisor.authoring.NegativeBlockTypeConstraint`

Examples

Specify a Prerequisite Constraint

Specify a constraint on a Gain block. Specify this constraint as a prerequisite for a constraint on a Constant block.

Use the `PositiveBlockParameterConstraint` class to create a constraint on the **Gain** parameter of a Gain block.

```
c1=Advisor.authoring.PositiveBlockParameterConstraint;  
c1.ID='ID_1';  
c1.BlockType='Gain';  
c1.ParameterName='Gain';  
c1.SupportedParameterValues={'0','5'};  
c1.ValueOperator='range';
```

Use the `NegativeBlockParameterConstraint` class to create a negative constraint on the **Value** parameter of a Constant block.

```
c2=Advisor.authoring.NegativeBlockParameterConstraint;  
c2.ID='ID_2';  
c2.BlockType='Constant';  
c2.ParameterName='Value';  
c2.UnsupportedParameterValues={'5'};  
c2.ValueOperator='lt';
```

Use the `AddPreRequisiteConstraintID` method to specify the Gain block constraint as a prerequisite to the Constant block constraint.

```
c2.addPreRequisiteConstraintID('ID_1');
```

The Model Advisor does not check the Constant block constraint unless the **Gain** parameter has a value between 0 and 5.

PositiveBlockTypeConstraint | PositiveModelParameterConstraint

Topics

“Define Checks for Supported or Unsupported Blocks and Parameters”

Introduced in R2018a

addConstraintID

Class: Advisor.authoring.CompositeConstraint

Package: Advisor.authoring

Add constraint to composite constraint

Syntax

```
addConstraintID(ID_1)
```

Description

Specify a constraint ID to add to a composite constraint.

`addConstraintID(ID_1)` specifies a constraint ID `ID_1` that the Model Advisor checks as part of a `CompositeConstraint` object.

Input Arguments

ID_1 — ID of constraint object

character vector

To create root constraint objects that you can specify as part of a composite constraint, use these classes:

- `Advisor.authoring.PositiveBlockParameterConstraint`
- `Advisor.authoring.NegativeBlockParameterConstraint`
- `Advisor.authoring.PositiveBlockTypeConstraint`
- `Advisor.authoring.NegativeBlockTypeConstraint`

Examples

Specify a Composite Constraint

These commands specify a composite constraint for Multi-Port Switch blocks:

Create three PositiveBlockParameter constraint objects.

```
c1 = Advisor.authoring.PositiveBlockParameterConstraint();
c1.ID = 'ID_A1';
c1.BlockType = 'MultiPortSwitch';
c1.ParameterName = 'DataPortOrder';
c1.SupportedParameterValues = {'Specify indices'};
c1.ValueOperator = 'eq';

c2 = Advisor.authoring.PositiveBlockParameterConstraint();
c2.ID = 'ID_A2';
c2.BlockType = 'MultiPortSwitch';
c2.ParameterName = 'DataPortForDefault';
c2.SupportedParameterValues = {'Additional data port'};
c2.ValueOperator = 'eq';

c3 = Advisor.authoring.PositiveBlockParameterConstraint();
c3.ID = 'ID_A3';
c3.BlockType = 'MultiPortSwitch';
c3.ParameterName = 'DiagnosticForDefault';
c3.SupportedParameterValues = {'None'};
c3.ValueOperator = 'eq';
```

Use the addPreRequisiteConstraintID method to make c1 a prerequisite to checking constraints c2 and c3.

```
c2.addPreRequisiteConstraintID('ID_1');
c3.addPreRequisiteConstraintID('ID_2');
```

Create a composite constraint that specifies that if a Rate Transition block does not meet both constraints c2 and c3, the block is in violation of this check.

```
CC = Advisor.authoring.CompositeConstraint();
CC.addConstraintID('ID_A2');
CC.addConstraintID('ID_A3');
CC.CompositeOperator = 'and';
```

Advisor.authoring.NegativeBlockTypeConstraint class

Package: Advisor.authoring

Create a Model Advisor constraint to check for unsupported blocks

Description

Instances of `Advisor.authoring.NegativeBlockTypeConstraint` class define blocks that a model must not contain.

Construction

`constraint = Advisor.authoring.NegativeBlockTypeConstraint` creates an instance of this class.

Properties

ID — Unique identifier

character vector

Unique identifier for the block type constraint. This property is read/write.

UnsupportedBlockTypes — Unsupported block types

structure of character vectors

Structure consisting of these fields:

- 'BlockType'
- 'MaskType'

List of unsupported block types. This property is read/write. For more information on the **MaskType** field, see “Mask Editor Overview” (Simulink) and “Mask Parameters” (Simulink).

PreRequisiteConstraintIDs — IDs of prerequisite constraints

cell array of character vectors

IDs of constraints that you specify as prerequisites by using the `addPreRequisiteConstraintID` method. If a prerequisite is not satisfied, the Model Advisor does not check the constraint that has the prerequisite. This property is read-only.

Examples

Specify Unsupported Block Types

These commands specify that a model cannot contain Rate Transition and Integrator blocks and Constant blocks with a specified mask:

```
c1=Advisor.authoring.NegativeBlockTypeConstraint;  
c1.ID='ID_1';  
s1=struct('BlockType','Integrator','MaskType','');  
s2=struct('BlockType','RateTransition','MaskType','');  
s3=struct('BlockType','Constant','MaskType','Stateflow');  
c1.UnsupportedBlockTypes={s1;s2};
```

Introduced in R2018a

Value property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Status of check

Values

'true' (default)

'false'

Description

The Value property specifies the initial status of the check. When you use the Value property to specify the initial status of the check, you enable or disable **Run This Check** in the Model Advisor window.

If you want to specify the initial status of a check in the **By Product** folder, before starting Model Advisor, make sure `ModelAdvisor.Preferences.DeselectByProduct` is `false`.

'true'	Check is enabled
'false'	Check is disabled

Examples

```
% hide all checks that do not belong to Demo group
if ~(strcmp(checkCellArray{i}.Group, 'Demo'))
    checkCellArray{i}.Visible = false;
    checkCellArray{i}.Value = false;
end
```

See Also

`ModelAdvisor.Preferences`

Value property

Class: ModelAdvisor.InputParameter

Package: ModelAdvisor

Value of input parameter

Values

Depends on the Type property.

Description

The Value property specifies the initial value of the input parameter. This property is valid only when the Type property is one of the following:

- 'Bool'
- 'String'
- 'Enum'
- 'ComboBox'

Examples

```
% define input parameters
inputParam1 = ModelAdvisor.InputParameter;
inputParam1.Name = 'Skip font checks.';
inputParam1.Type = 'Bool';
inputParam1.Value = false;
```

Value property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Status of task

Values

'true' (default) — Initial status of task is enabled

'false' — Initial status of task is disabled

Description

The Value property indicates the initial status of a task—whether it is enabled or disabled.

When adding checks as tasks, the Model Advisor uses the task Value property instead of the check Value property.

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.Value = 'false';
```

view

View Model Advisor run results for checks

Syntax

```
view(CheckResultObj)
```

Description

`view(CheckResultObj)` opens a web browser and displays the results of the check specified by `CheckResultObj`. `CheckResultObj` is a `ModelAdvisor.CheckResult` object returned by `ModelAdvisor.run`.

Input Arguments

CheckResultObj

`ModelAdvisor.CheckResult` object which is a part of a `ModelAdvisor.SystemResult` object returned by `ModelAdvisor.run`.

Examples

View the Model Advisor run results for the first check in the `slvndemo_mdldv_config` configuration file:

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
         'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% View the 'Identify unconnected...' check result.
view(SysResultObjArray{1}.CheckResultObjs(1))
```

viewReport

View Model Advisor run results for systems

Syntax

```
viewReport(SysResultObjArray)
viewReport(SysResultObjArray, 'MA')
viewReport(SysResultObjArray, 'Cmd')
```

Description

`viewReport(SysResultObjArray)` opens the Model Advisor Report for the system specified by `SysResultObjArray`. `SysResultObjArray` is a `ModelAdvisor.SystemResult` object returned by `ModelAdvisor.run`.

`viewReport(SysResultObjArray, 'MA')` opens the Model Advisor and displays the results of the run for the system specified by `SysResultObjArray`.

`viewReport(SysResultObjArray, 'Cmd')` displays the Model Advisor run summary in the Command Window for the systems specified by `SysResultObjArray`.

Input Arguments

`SysResultObjArray`

`ModelAdvisor.SystemResult` object returned by `ModelAdvisor.run`.

Default:

Examples

Open the Model Advisor report for `sldemo_auto_climatecontrol/Heater Control`.

```
% Identify Model Advisor configuration file.
% Create list of models to run.
```

```
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
        'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% Open the Model Advisor report.
viewReport(SysResultObjArray{1})
```

Open Model Advisor and display results for sldemo_auto_climatecontrol/Heater Control.

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
        'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% Open the Model Advisor and display results.
viewReport(SysResultObjArray{1}, 'MA')
```

Display results in the Command Window for sldemo_auto_climatecontrol/Heater Control.

```
% Identify Model Advisor configuration file.
% Create list of models to run.
fileName = 'slvndemo_mdldv_config.mat';
SysList={'sldemo_auto_climatecontrol/Heater Control',...
        'sldemo_auto_climatecontrol/AC Control'};

% Run the Model Advisor.
SysResultObjArray = ModelAdvisor.run(SysList,'Configuration',fileName);

% Display results in the Command Window.
viewReport(SysResultObjArray{1}, 'Cmd')
```

Alternatives

Visible property

Class: ModelAdvisor.Check

Package: ModelAdvisor

Indicate to display or hide check

Values

'true' (default)

'false'

Description

The Visible property specifies whether the Model Advisor displays the check.

'true' Display the check

'false' Hide the check

Examples

```
% hide all checks that do not belong to Demo group
if ~(strcmp(checkCellArray{i}.Group, 'Demo'))
    checkCellArray{i}.Visible = false;
    checkCellArray{i}.Value = false;
end
```

Visible property

Class: ModelAdvisor.Task

Package: ModelAdvisor

Indicate to display or hide task

Values

'true' (default) — Display task in the Model Advisor

'false' — Hide task

Description

The `Visible` property specifies whether the Model Advisor displays the task.

Caution When adding checks as tasks, you cannot specify both the task and check `Visible` properties, you must specify one or the other. If you specify both properties, the Model Advisor generates an error when the check `Visible` property is `false`.

Examples

```
MAT1 = ModelAdvisor.Task('com.mathworks.sample.TaskSample1');  
MAT1.Visible = 'false';
```

slmetric.metric.registerMetric

Package: slmetric.metric

Register a custom model metric with the model metric repository

Syntax

```
[MetricID,err_msg] = slmetric.metric.registerMetric(classname)
```

Description

[MetricID,err_msg] = slmetric.metric.registerMetric(classname) register a custom model metric with the model metric repository. The new metric class must be on the MATLAB search path and derived from slmetric.metric.Metric.

Examples

Register a Custom Model Metric with the Model Metric Repository

This example shows how to register a custom model metric.

Create a new metric class, derived from slmetric.metric.Metric, called my_metric.

```
slmetric.metric.createNewMetricClass('my_metric')
```

Finish the custom model metric implementation and testing.

Register the new custom metric in the model metric repository.

```
[MetricID, err_msg] = slmetric.metric.registerMetric('my_metric');
```

Input Arguments

classname — Metric class name

character vector

New metric class name.

Data Types: char

Output Arguments

MetricID — Metric ID

character vector

Unique metric identifier.

Data Types: char

err_msg — Error message

character vector

If you cannot register a new class, the function returns an error message.

Data Types: char

Introduced in R2016a

slmetric.metric.unregisterMetric

Package: slmetric.metric

Unregister a custom model metric from the model metric repository

Syntax

```
slmetric.metric.unregisterMetric(MetricID)
```

Description

`slmetric.metric.unregisterMetric(MetricID)` unregister a custom model metric from the model metric repository.

Input Arguments

MetricID — Unique metric identifier

character vector

Metric identifier for a custom model metric that you created.

See Also

`slmetric.metric.Metric` | `slmetric.metric.createNewMetricClass` | `slmetric.metric.refresh` | `slmetric.metric.registerMetric`

Introduced in R2016a

slmetric.metric.refresh

Package: slmetric.metric

Update available model metrics

Syntax

```
slmetric.metric.refresh()
```

Description

`slmetric.metric.refresh()` updates available metrics after manual updates to the metric registration file.

See Also

```
slmetric.metric.Metric | slmetric.metric.createNewMetricClass |  
slmetric.metric.registerMetric | slmetric.metric.unregisterMetric
```

Introduced in R2016a

slmetric.metric.createNewMetricClass

Package: slmetric.metric

Create new metric class for a custom model metric

Syntax

```
slmetric.metric.createNewMetricClass(class_name)
```

Description

`slmetric.metric.createNewMetricClass(class_name)` creates a `slmetric.metric.Metric` class in the current working folder. The new metric class is used to define a custom model metric and supports the following `Advisor.component.Types`:

- Model
- SubSystem
- ModelBlock
- Chart
- MATLABFunction

Examples

Create a Custom Model Metric Class

This example shows how to create a new metric class `my_metric`.

Call the function and provide a name for the new metric class:

```
slmetric.metric.createNewMetricClass('my_metric')
```

The function creates a `my_metric.m` file in the current working folder.

```
slmetric.metric.createNewMetricClass('my_metric')
```

The file contains the class definition for `my_metric`, which includes the constructor and an empty metric algorithm method.

```
classdef my_metric < slmetric.metric.Metric
    % my_metric Summary of this metric class goes here
    % Detailed explanation goes here
    properties
    end

    methods
        function this = my_metric()
            this.ID = 'my_metric';
            this.Description = '';
            this.ComponentScope = [Advisor.component.Types.Model, ...
                Advisor.component.Types.SubSystem];
            this.AggregationMode = slmetric.AggregationMode.Sum;
            this.AggregateComponentDetails = true;
            this.CompileContext = 'None';
            this.Version = 1;
        end

        function res = algorithm(this, component)
            res = slmetric.metric.Result();
            res.ComponentID = component.ID;
            res.MetricID = this.ID;
            res.Value = 0;
        end
    end
end
```

Write your custom metric algorithm in `algorithm`.

When your custom metric class is working and tested, register your metric using `slmetric.metric.registerMetric`.

Input Arguments

class_name — Name of the new metric class

character vector

Name of the new metric class you are creating for a custom metric.

Data Types: char

See Also

Advisor.component.Types | slmetric.metric.Metric |
slmetric.metric.registerMetric | slmetric.metric.unregisterMetric

Introduced in R2016a

exportMetrics

Class: slmetric.Engine

Package: slmetric

Export model metrics

Syntax

```
exportMetrics(metric_engine,filename)
exportMetrics(metric_engine,filename,filelocation)
```

Description

Export model metric data to an XML file.

`exportMetrics(metric_engine,filename)` exports an XML filename containing metric data to your current folder.

`exportMetrics(metric_engine,filename,filelocation)` exports an XML filename containing metric data to filelocation.

Input Arguments

metric_engine — Collects and accesses metric data

slmetric.Engine object

When you call `execute`, `metric_engine` collects metric data for available metrics or for the specified `MetricIDs`. Calling `getMetrics` accesses the collected metric data in `metric_engine`.

filename — XML file name

character vector

Name of XML file.

Example: 'MyMetrics.xml'

filelocation — File path

character vector

Path to XML file

Example: 'C:/mywork'

Examples

Export Metrics to Current Folder

This example shows how to export metrics for model vdp to XML file MyMetrics.xml in your current folder.

```
% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify model for metric analysis
setAnalysisRoot(metric_engine, 'Root', 'vdp', 'RootType', 'Model');

% Generate and collect model metrics
execute(metric_engine);
rc = getMetrics(metric_engine);

% Export metrics to XML file myMetrics.xml
exportMetrics(metric_engine, 'MyMetrics.xml');
```

Export Metrics to Specified Location

This example shows how to export metrics for model vdp to XML file MyMetrics.xml in a specified folder, C:/work.

```
% Create an slmetric.Engine object
metric_engine = slmetric.Engine();

% Specify model for metric analysis
setAnalysisRoot(metric_engine, 'Root', 'vdp', 'RootType', 'Model');
```

```
% Collect model metrics
execute(metric_engine);
rc = getMetrics(metric_engine);

% Export metrics to XML file myMetrics.xml
exportMetrics(metric_engine, 'MyMetrics.xml', 'C:/work');
```

clonedetection

Open Identify Modeling Clones tool

Syntax

```
clonedetection(model)
```

Description

`clonedetection(model)` opens the Identifying Modeling Clones tool for a model specified by `model`. If the specified model is not open, this command opens it.

Examples

Open Identify Modeling Clones tool for a model

Open the Identify Modeling Clones tool for `rtwdemo_preprocessor_subsys` example model:

```
clonedetection('rtwdemo_preprocessor_subsys')
```

Input Arguments

model — Model name

character vector

Model name or handle, specified as a character vector.

Data Types: `char`

DO-178C/DO-331 Checks

DO-178C/DO-331 checks facilitate designing and troubleshooting models from which code is generated for applications that must meet safety or mission-critical requirements.

The Model Advisor performs a checkout of the Simulink Check license when you run the DO-178C/DO-331 checks.

These checks are qualified by the DO Qualification Kit for use in projects involving the DO-178 standard and related standards.

See Also

- “Simulink Checks” (Simulink)
- “Simulink Coder Checks” (Simulink Coder)
- Radio Technical Commission for Aeronautics (RTCA) for information on the DO-178C Software Considerations in Airborne Systems and Equipment Certification and related standards

Check model object names

Check ID: `mathworks.do178.hisl_0032`

Check model object names.

Description

This check verifies that the following model object names comply with your own modeling guidelines or the high-integrity modeling guidelines. The check also verifies that the model object does not use a reserved name.

- Blocks
- Signals
- Parameters

- Busses
- Stateflow objects

Reserved names:

- MATLAB keywords
- Reserved keywords for C, C++, and code generation. For complete list, see “Reserved Keywords” (Simulink Coder)
- int8, uint8
- int16, uint16
- int32, uint32
- inf, Inf
- NaN, nan
- eps
- intmin, intmax
- realmin, realmax
- pi
- infinity
- Nil

Note For some cases, the Model Advisor reports an issue in multiple subchecks of this check.

Available with Simulink Check.

Input Parameters

To specify the naming standard and model object names that the check flags, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check model object names**. In the **Input Parameters** pane, for each of the model objects, select one of the following:

- MAAB to use the MAAB naming standard. When you select MAAB, the check uses the regular expression $(\^{.}{32, }$) | ([^a-zA-Z_0-9]) | (^d) | (^) | (^_) | (^_) | (_$)$ to verify that names:
 - Use these characters: a-z, A-Z, 0-9, and the underscore (_).
 - Do not start with a number.
 - Do not use underscores at the beginning or end of a string.
 - Do not use more than one consecutive underscore.
 - Use strings that are less than 32 characters.
 - Custom to use your own naming standard. When you select Custom, you can enter your own **Regular expression for prohibited <model object> names**. For example, if you want to allow more than one consecutive underscore, enter $(\^{.}{32, }$) | ([^a-zA-Z_0-9]) | (^d) | (^) | (^_) | (_$)$
 - None if you do not want the check to verify the model object name
- 2 Click **Apply**.
 - 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The model object names do not comply with the naming standard specified in the input parameters.	Update the model object names to comply with your own guidelines or the high-integrity guidelines.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check safety-related optimization settings

Check ID: `mathworks.do178.OptionSet`

Check model configuration for optimization settings that can impact safety.

Description

This check verifies that model optimization configuration parameters are set optimally for generating code for a safety-related application. Although highly optimized code is desirable for most real-time systems, some optimizations can have undesirable side effects that impact safety.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Block reduction optimization is selected. This optimization can remove blocks from generated code, resulting in requirements without associated code and violations for traceability requirements. (See DO-331, Section MB.6.3.4.e—Source code is traceable to low-level requirements.)	In the Configuration Parameter dialog box, clear Block reduction (Simulink) or set parameter <code>BlockReduction</code> to <code>off</code> .

Condition	Recommended Action
<p>Implementation of logic signals as Boolean data is cleared. Strong data typing is recommended for safety-related code. (See DO-331, Section MB.6.3.1.e—High-level requirements conform to standards, DO-331, Section MB.6.3.2.e—Low-level requirements conform to standards, and MISRA C:2012, Rule 10.1.)</p>	<p>In the Configuration Parameter dialog box, select Implement logic signals as boolean data (vs. double) (Simulink) or set the parameter <code>BooleanDataType</code> to on.</p>
<p>The model includes blocks that depend on elapsed or absolute time and is configured to minimize the amount of memory allocated for the timers. Such a configuration limits the number of days the application can execute before a timer overflow occurs. Many aerospace products are powered on continuously and timers should not assume a limited lifespan. (See DO-331, Section MB.6.3.1.g—Algorithms are accurate and DO-331, Section MB.6.3.2.g—Algorithms are accurate.)</p>	<p>In the Configuration Parameter dialog box, set Application lifespan (days) (Simulink) on the Math and Data Types pane in the Configuration Parameters dialog box or set the parameter <code>LifeSpan</code> to <code>inf</code>.</p>
<p>The optimization that suppresses the generation of initialization code for root-level inports and outports that are set to zero is selected. For safety-related code, you should explicitly initialize all variables. (See DO-331, Section MB.6.3.3.b—Software architecture is consistent.)</p>	<p>If you have an Embedded Coder® license and are using an ERT-based system target file, clear Configuration Parameter Remove root level I/O zero initialization (Simulink Coder) or set the parameter <code>ZeroExternalMemoryAtStartup</code> to on. Alternatively, integrate external, handwritten code that initializes all I/O variables to zero explicitly.</p>
<p>The optimization that suppresses the generation of initialization code for internal work structures, such as block states and block outputs that are set to zero, is selected. For safety-related code, you should explicitly initialize every variable. (See DO-331, Section MB.6.3.3.b—Software architecture is consistent.)</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter Remove internal data zero initialization (Simulink Coder) or set the parameter <code>ZeroInternalMemoryAtStartup</code> to on. Alternatively, integrate external, handwritten code that initializes every state variable to zero explicitly.</p>

Condition	Recommended Action
<p>The optimization that suppresses generation of code resulting from floating-point to integer conversions that wrap out-of-range values is cleared. You must avoid overflows for safety-related code. When this optimization is off and your model includes blocks that disable the Saturate on overflow parameter, the code generator wraps out-of-range values for those blocks. This can result in unreachable and, therefore, untestable code. (See DO-331, Section MB.6.3.1.g—Algorithms are accurate and DO-331, Section MB.6.3.2.g—Algorithms are accurate.)</p>	<p>If you have a Simulink Coder™ license, select Configuration Parameter Remove code from floating-point to integer conversions that wraps out-of-range values (Simulink Coder) or set the parameter <code>EfficientFloat2IntCast</code> to on.</p>
<p>The optimization that suppresses generation of code that guards against division by zero for fixed-point data is selected. You must avoid division-by-zero exceptions in safety-related code. (See DO-331, Section MB.6.3.1.g—Algorithms are accurate, DO-331, Section MB.6.3.2.g—Algorithms are accurate, and MISRA C:2012, Dir 4.1.)</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter Remove code that protects against division arithmetic exceptions (Simulink Coder) or set the parameter <code>NoFixptDivByZeroProtection</code> to off.</p>
<p>The optimization that uses the specified minimum and maximum values for signals and parameters to optimize the generated code is selected. This might result in requirements without traceable code. (See DO-331 Section MB.6.3.4.e - Source code is traceable to low-level requirements.)</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter Optimize using the specified minimum and maximum values (Simulink Coder).</p>

Action Results

Clicking **Modify Settings** configures model optimization settings that can impact safety.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related solver settings for tasking and sample-time

Check ID: `mathworks.do178.hisl_0042`

Check solver settings in the model configuration that apply to periodic sample time constraints and might impact safety.

Description

This check verifies that model configuration parameters are set optimally to ensure that the model operates at a specific set of prioritized periodic sample times for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Configuration parameter Automatically handle rate transition for data transfer is selected.	Clear Automatically handle rate transition for data transfer in the Configuration Parameters dialog box or set parameter <code>AutoInsertRateTranBlk</code> to off.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Section MB.6.3.4.e Source code is traceable to low-level requirements
- hisl_0042: Configuration Parameters > Solver > Tasking and sample time options

Check safety-related diagnostic settings for solvers

Check ID: `mathworks.do178.SolverDiagnosticsSet`

Check model configuration for diagnostic settings that apply to solvers and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to solvers are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic for detecting automatic breakage of algebraic loops is set to none or warning. The breaking of algebraic loops can affect the predictability of the order of block execution. For safety-related applications, a model developer needs to know when such breaks occur. (See DO-331, Section MB.6.3.3.e - Software architecture conforms to standards.)</p>	<p>Set Algebraic loop (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter AlgebraicLoopMsg to error. Consider breaking such loops explicitly with Unit Delay blocks so that the execution order is predictable. At a minimum, verify that the results of loops breaking automatically are acceptable.</p>
<p>The diagnostic for detecting automatic breakage of algebraic loops for Model blocks, atomic subsystems, and enabled subsystems is set to none or warning. The breaking of algebraic loops can affect the predictability of the order of block execution. For safety-related applications, a model developer needs to know when such breaks occur. (See DO-331, Section MB.6.3.3.e - Software architecture conforms to standards.)</p>	<p>Set Minimize algebraic loop (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter ArtificialAlgebraicLoopMsg to error. Consider breaking such loops explicitly with Unit Delay blocks so that the execution order is predictable. At a minimum, verify that the results of loops breaking automatically are acceptable.</p>
<p>The diagnostic for detecting potential conflict in block execution order is set to none or warning. For safety-related applications, block execution order must be predictable. A model developer needs to know when conflicting block priorities exist. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Block priority violation (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter BlockPriorityViolationMsg to error.</p>

Condition	Recommended Action
<p>The diagnostic for detecting whether a model contains an S-function that has not been specified explicitly to inherit sample time is set to none or warning. These settings can result in unpredictable behavior. A model developer needs to know when such an S-function exists in a model so it can be modified to produce predictable behavior. (See DO-331, Section MB.6.3.3.e - Software architecture conforms to standards.)</p>	<p>Set Unspecified inheritability of sample time (Simulink) in the Configuration Parameters dialog box or set parameter <code>UnknownTsInhSupMsg</code> to error.</p>
<p>The diagnostic for detecting whether the Simulink software automatically modifies the solver, step size, or simulation stop time is set to none or warning. Such changes can affect the operation of generated code. For safety-related applications, it is better to detect such changes so a model developer can explicitly set the parameters to known values. (See DO-331, Section MB.6.3.3.e - Software architecture conforms to standards.)</p>	<p>Set Automatic solver parameter selection (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>SolverPrmCheckMsg</code> to error.</p>
<p>The diagnostic for detecting when a name is used for more than one state in the model is set to none. State names within a model should be unique. For safety-related applications, it is better to detect name clashes so a model developer can fix them. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set State name clash (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>StateNameClashWarn</code> to warning.</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- “hisl_0043: Configuration Parameters > Diagnostics > Solver” (Simulink)
- “Model Configuration Parameters: Diagnostics” (Simulink)

Check safety-related diagnostic settings for sample time

Check ID: `mathworks.do178.SampleTimeDiagnosticsSet`

Check model configuration for diagnostic settings that apply to sample time and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to sample times are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic for detecting when a source block, such as a Sine Wave block, inherits a sample time (specified as -1) is set to none or warning. The use of inherited sample times for a source block can result in unpredictable execution rates for the source block and blocks connected to it. For safety-related applications, source blocks should have explicit sample times to prevent incorrect execution sequencing. (See DO-331, Section MB.6.3.3.e - Software architecture conforms to standards.)</p>	<p>Set Source block specifies -1 sample time (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>InheritedTsInSrcMsg</code> to error.</p>

Condition	Recommended Action
<p>The diagnostic for detecting invalid rate transitions between two blocks operating in multitasking mode is set to none or warning. Such rate transitions should not be used for embedded real-time code. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Multitask rate transition (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>MultiTaskRateTransMsg</code> to error.</p>
<p>The diagnostic for detecting subsystems that can cause data corruption or nondeterministic behavior is set to none or warning. This diagnostic detects whether conditionally executed multirate subsystems (enabled, triggered, or function-call subsystems) operate in multitasking mode. Such subsystems can corrupt data and behave unpredictably in real-time environments that allow preemption. (See DO-331, Section MB. 6.3.3.b - Software architecture is consistent.)</p>	<p>Set Multitask conditionally executed subsystem (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>MultiTaskCondExecSysMsg</code> to error.</p>
<p>The diagnostic for checking sample time consistency between a Signal Specification block and the connected destination block is set to none or warning. An over-specified sample time can result in an unpredictable execution rate. (See DO-331, Section MB. 6.3.3.e - Software architecture conforms to standards.)</p>	<p>Set Enforce sample times specified by Signal Specification blocks (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>SigSpecEnsureSampleTimeMsg</code> to error.</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to sample time and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- “Model Configuration Parameters: Sample Time Diagnostics” (Simulink)
- “View Diagnostics” (Simulink)

Check safety-related diagnostic settings for signal data

Check ID: `mathworks.do178.DataValiditySignalsDiagnosticsSet`

Check model configuration for diagnostic settings that apply to signal data and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to signal data are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic that specifies how the Simulink software resolves signals associated with <code>Simulink.Signal</code> objects is set to <code>Explicit and implicit</code> or <code>Explicit and warn implicit</code>. For safety-related applications, model developers should be required to define signal resolution explicitly. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Signal resolution (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>SignalResolutionControl</code> to <code>Explicit only</code>. This provides predictable operation by requiring users to define each signal and block setting that must resolve to <code>Simulink.Signal</code> objects in the workspace.</p> <p>Alternatively, to disable the use of <code>Simulink.Signal</code> objects, set the configuration parameter to <code>None</code>.</p>

Condition	Recommended Action
<p>The Product block diagnostic that detects a singular matrix while inverting one of its inputs in matrix multiplication mode is set to none or warning. Division by a singular matrix can result in numeric exceptions when executing generated code. This is not acceptable in safety-related systems. (See DO-331, Section MB.6.3.1.g - Algorithms are accurate, DO-331, Section MB.6.3.2.g - Algorithms are accurate, and MISRA C:2012, Dir 4.1.)</p>	<p>Set Division by singular matrix (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>CheckMatrixSingularityMsg</code> to error.</p>
<p>The diagnostic that detects when the Simulink software cannot infer the data type of a signal during data type propagation is set to none or warning. For safety-related applications, model developers must verify the data types of signals. (See DO-331, Section MB.6.3.1.e - High-level requirements conform to standards, and DO-331, Section MB.6.3.2.e - Low-level requirements conform to standards.)</p>	<p>Set Underspecified data types (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>UnderSpecifiedDataTypeMsg</code> to error.</p>
<p>The diagnostic that detects whether the value of a signal is too large to be represented by the signal data type is set to none or warning. Undetected numeric overflows can result in unexpected application behavior. (See DO-331, Section MB.6.3.1.g - Algorithms are accurate, DO-331, Section MB.6.3.2.g - Algorithms are accurate, and MISRA C:2012, Dir 4.1.)</p>	<p>Set Wrap on overflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>IntegerOverflowMsg</code> to error.</p>
<p>The diagnostic that detects whether the value of a signal is too large to be represented by the signal data type, resulting in a saturation, is set to none or warning. Undetected numeric overflows can result in unexpected application behavior. (See DO-331, Section MB.6.3.1.g - Algorithms are accurate, DO-331, Section MB.6.3.2.g - Algorithms are accurate, and MISRA C:2012, Dir 4.1.)</p>	<p>Set Saturate on overflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>IntegerSaturationMsg</code> to error.</p>

Condition	Recommended Action
<p>The diagnostic that detects when the value of a block output signal is Inf or NaN at the current time step is set to none or warning. When this type of block output signal condition occurs, numeric exceptions can result, and numeric exceptions are not acceptable in safety-related applications. (See DO-331, Section MB.6.3.1.g - Algorithms are accurate, DO-331, Section MB.6.3.2.g - Algorithms are accurate, and MISRA C:2012, Dir 4.1.)</p>	<p>Set Inf or NaN block output (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>SignalInfNanChecking</code> to error.</p>
<p>The diagnostic that detects Simulink object names that begin with <code>rt</code> is set to none or warning. This diagnostic prevents name clashes with generated signal names that have an <code>rt</code> prefix. (See DO-331, Section MB.6.3.1.e - High-level requirements conform to standards, and DO-331, Section MB.6.3.2.e - Low-level requirements conform to standards.)</p>	<p>Set "rt" prefix for identifiers (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>RTPrefix</code> to error.</p>
<p>The diagnostic that detects simulation range checking is set to none or warning. This diagnostic detects when signals exceed their specified ranges during simulation. Simulink compares the signal values that a block outputs with the specified range and the block data type. (See DO-331, Section MB.6.3.1.g - Algorithms are accurate, DO-331, Section MB.6.3.2.g - Algorithms are accurate, and MISRA C:2012, Dir 4.1.)</p>	<p>Set Simulation range checking (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>SignalRangeChecking</code> to error.</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to signal data and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for parameters

Check ID: `mathworks.do178.DataValidityParamDiagnosticsSet`

Check model configuration for diagnostic settings that apply to parameters and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to parameters are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects when a parameter downcast occurs is set to none or warning. A downcast to a lower signal range can result in numeric overflows of parameters, resulting in unexpected behavior.	Set Detect downcast (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>ParameterDowncastMsg</code> to error.
The diagnostic that detects when a parameter underflow occurs is set to none or warning. When the data type of a parameter does not have enough resolution, the parameter value is zero instead of the specified value. This can lead to incorrect operation of generated code.	Set Detect underflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>ParameterUnderflowMsg</code> to error.

Condition	Recommended Action
The diagnostic that detects when a parameter overflow occurs is set to none or warning . Numeric overflows can result in unexpected application behavior and should be detected and fixed in safety-related applications.	Set Detect overflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>ParameterOverflowMsg</code> to error.
The diagnostic that detects when a parameter loses precision is set to none or warning . Not detecting such errors can result in a parameter being set to an incorrect value in the generated code.	Set Detect precision loss (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>ParameterPrecisionLossMsg</code> to error.
The diagnostic that detects when an expression with tunable variables is reduced to its numerical equivalent is set to none or warning . This can result in a tunable parameter unexpectedly not being tunable in generated code.	Set Detect loss of tunability (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>ParameterTunabilityLossMsg</code> to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to parameters and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for data used for debugging

Check ID: `mathworks.do178.DataValidityDebugDiagnosticsSet`

Check model configuration for diagnostic settings that apply to data used for debugging and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to debugging are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that enables model verification blocks is set to <code>Use local settings</code> or <code>Enable all</code> . Such blocks should be disabled because they are assertion blocks, which are for verification only. Model developers should not use assertions in embedded code.	In the Configuration Parameters dialog box, set Model Verification block enabling (Simulink) or set parameter <code>AssertControl</code> to <code>Disable All</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to data used for debugging and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for data store memory

Check ID: `mathworks.do178.DataStoreMemoryDiagnosticsSet`

Check model configuration for diagnostic settings that apply to data store memory and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to data store memory are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether the model attempts to read data from a data store in which it has not stored data in the current time step is set to a value other than Enable all as errors . Reading data before it is written can result in use of stale data or data that is not initialized.	Set Detect read before write (Simulink) in the Configuration Parameters dialog box or set the parameter <code>ReadBeforeWriteMsg</code> to Enable all as errors .
The diagnostic that detects whether the model attempts to store data in a data store, after previously reading data from it in the current time step, is set to a value other than Enable all as errors . Writing data after it is read can result in use of stale or incorrect data.	Set Detect write after read (Simulink) in the Configuration Parameters dialog box or set the parameter <code>WriteAfterReadMsg</code> to Enable all as errors .

Condition	Recommended Action
The diagnostic that detects whether the model attempts to store data in a data store twice in succession in the current time step is set to a value other than Enable all as errors . Writing data twice in one time step can result in unpredictable data.	Set Detect write after write (Simulink) in the Configuration Parameters dialog box or set the parameter <code>WriteAfterWriteMsg</code> to Enable all as errors .
The diagnostic that detects when one task reads data from a Data Store Memory block to which another task writes data is set to none or warning . Reading or writing data in different tasks in multitask mode can result in corrupted or unpredictable data.	Set Multitask data store (Simulink) in the Configuration Parameters dialog box or set the parameter <code>MultiTaskDSMMsg</code> to error .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to data store memory and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

Check safety-related diagnostic settings for type conversions

Check ID: `mathworks.do178.TypeConversionDiagnosticsSet`

Check model configuration for diagnostic settings that apply to type conversions and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to type conversions are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects Data Type Conversion blocks when the type conversion is set to none. The Simulink software might remove unnecessary Data Type Conversion blocks from generated code, which might result in requirements without corresponding code. The removal of these blocks needs to be identified so model developers can explicitly remove the unnecessary blocks .	Set the Unnecessary type conversions (Simulink) Configuration Parameter or <code>UnnecessaryDatatypeConvMsg</code> parameter to warning.
The diagnostic that detects vector-to-matrix or matrix-to-vector conversions at block inputs is set to none or warning. When the Simulink software automatically converts between vector and matrix dimensions, unintended operations or unpredictable behavior can occur.	Set the Vector/matrix block input conversion (Simulink) Configuration Parameter or <code>VectorMatrixConversionMsg</code> parameter to error
The diagnostic that detects when a 32-bit integer value is converted to a floating-point value is set to none. This type of conversion can result in a loss of precision due to truncation of the least significant bits for large integer values.	Set the 32-bit integer to single precision float conversion (Simulink) Configuration Parameter or <code>Int32ToFloatConvMsg</code> parameter to warning.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to type conversions and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for signal connectivity

Check ID: `mathworks.do178.ConnectivitySignalsDiagnosticsSet`

Check model configuration for diagnostic settings that apply to signal connectivity and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to signal connectivity are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects virtual signals that have a common source signal but different labels is set to none or warning . This diagnostic pertains to virtual signals only and has no effect on generated code. However, signal label mismatches can lead to confusion during model reviews.	Set Signal label mismatch (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>SignalLabelMismatchMsg</code> to error .
The diagnostic that detects when the model contains a block with an unconnected input signal is set to none or warning . This must be detected because code is not generated for unconnected block inputs.	Set Unconnected block input ports (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>UnconnectedInputMsg</code> to error .
The diagnostic that detects when the model contains a block with an unconnected output signal is set to none or warning . This must be detected because dead code can result from unconnected block output signals.	Set Unconnected block output ports (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>UnconnectedOutputMsg</code> to error .
The diagnostic that detects unconnected signal lines and unmatched Goto or From blocks is set to none or warning . This error must be detected because code is not generated for unconnected lines.	Set Unconnected line (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>UnconnectedLineMsg</code> to error .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to signal connectivity and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for bus connectivity

Check ID: `mathworks.do178.ConnectivityBussesDiagnosticsSet`

Check model configuration for diagnostic settings that apply to bus connectivity and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to bus connectivity are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a Model block's root Outputport block is connected to a bus but does not specify a bus object is set to none or warning . For a bus signal to cross a model boundary, the signal must be defined as a bus object for compatibility with higher level models that use a model as a reference model.	Set Unspecified bus object at root Outputport block (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>RootOutputportRequireBusObject</code> to error .

Condition	Recommended Action
The diagnostic that detects whether the name of a bus element matches the name specified by the corresponding bus object is set to none or warning . This diagnostic prevents the use of incompatible buses in a bus-capable block such that the output names are inconsistent.	Set Element name mismatch (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>BusObjectLabelMismatch</code> to error .
The diagnostic that detects when some blocks treat a signal as a mux/vector, while other blocks treat the signal as a bus, is set to none or warning . When the Simulink software automatically converts a muxed signal to a bus, it is possible for an unintended operation or unpredictable behavior to occur.	Set Bus signal treated as vector (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box to error , or the parameter <code>StrictBusMsg</code> to <code>ErrorOnBusTreatedAsVector</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to bus connectivity and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings that apply to function-call connectivity

Check ID: `mathworks.do178.FcnCallDiagnosticsSet`

Check model configuration for diagnostic settings that apply to function-call connectivity and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to function-call connectivity are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects incorrect use of a function-call subsystem is set to none or warning. If this condition is undetected, incorrect code might be generated.	Set Invalid function-call connection (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>InvalidFcnCallConnMsg</code> to error.
The diagnostic that specifies whether the Simulink software has to compute inputs of a function-call subsystem directly or indirectly while executing the subsystem is set to Use local settings or Disable all. This diagnostic detects unpredictable data coupling between a function-call subsystem and the inputs of the subsystem in the generated code.	Set Context-dependent inputs (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>FcnCallInpInsideContextMsg</code> to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to function-call connectivity and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Section MB.6.3.3.b - Software architecture is consistent

Check safety-related diagnostic settings for compatibility

Check ID: `mathworks.do178.CompatibilityDiagnosticsSet`

Check model configuration for diagnostic settings that affect compatibility and that might impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to compatibility are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects when a block has not been upgraded to use features of the current release is set to <code>none</code> or <code>warning</code> . An S-function written for an earlier version might not be compatible with the current version and generated code could operate incorrectly.	Set S-function upgrades needed (Simulink) on the Diagnostics > Compatibility pane in the Configuration Parameters dialog box or set the parameter <code>SFcnCompatibilityMsg</code> to <code>error</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that affect compatibility and that might impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Section MB.6.3.3.b - Software architecture is consistent

Check safety-related diagnostic settings for model initialization

Check ID: `mathworks.do178.InitDiagnosticsSet`

In the model configuration, check diagnostic settings that affect model initialization and might impact safety.

Description

This check verifies that model diagnostic configuration parameters for initialization are optimally set to generate code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic, ensuring compatibility with previous releases of Simulink. The “Check undefined subsystem initial output” (Simulink) diagnostic is cleared. This diagnostic specifies whether Simulink displays a warning if the model contains a conditionally executed subsystem, in which a block with a specified initial condition drives an Output block with an undefined initial condition. A conditionally executed subsystem could have an output that is not initialized. If undetected, this condition can produce behavior that is nondeterministic.</p>	<p>Do one of the following:</p> <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Simplified. • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Classic and select Check undefined subsystem initial output (Simulink). • Set the parameter <code>CheckSSInitialOutputMsg</code> to on.
<p>In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic, ensuring compatibility with previous releases of Simulink. This diagnostic detects potential initial output differences from earlier releases. A conditionally executed subsystem could have an output that is not initialized. If undetected, this condition can produce behavior that is nondeterministic.</p>	<p>Do one of the following:</p> <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Simplified. • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Classic. • Set the parameter <code>CheckExecutionContextPreStartOutputMsg</code> to on.

Condition	Recommended Action
<p>In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic, ensuring compatibility with previous releases of Simulink. The “Check runtime output of execution context” (Simulink) diagnostic is cleared. This diagnostic detects potential output differences from earlier releases. A conditionally executed subsystem could have an output that is not initialized and feeds into a block with a tunable parameter. If undetected, this condition can cause the behavior of the downstream block to be nondeterministic.</p>	<p>Do one of the following:</p> <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Simplified. • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Classic and select Check runtime output of execution context (Simulink). • Set the parameter <code>CheckExecutionContextRuntimeOutputMsg</code> to on.

Action Results

To configure the diagnostic settings that affect model initialization and might impact safety, click **Modify Settings**.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Section MB.6.3.3.b – Software architecture is consistent
- “View Diagnostics” (Simulink)

Check safety-related diagnostic settings for model referencing

Check ID: mathworks.do178.MdlrefDiagnosticsSet

Check model configuration for diagnostic settings that apply to model referencing and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to model referencing are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic that detects a mismatch between the version of the model that creates or refreshes a Model block and the current version of the referenced model is set to error or warning. The detection occurs during load and update operations. When you get the latest version of the referenced model from the software configuration management system, rather than an older version that was used in a previous simulation, if this diagnostic is set to error, the simulation is aborted. If the diagnostic is set to warning, a warning message is issued. To resolve the issue, the user must resave the model being simulated, which may not be the desired action. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Model block version mismatch (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceVersionMismatchMessage</code> to none.</p>

Condition	Recommended Action
<p>The diagnostic that detects port and parameter mismatches during model loading and updating is set to none or warning. If undetected, such mismatches can lead to incorrect simulation results because the parent and referenced models have different interfaces. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Port and parameter mismatch (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceIOMismatchMessage</code> to error.</p>
<p>The diagnostic that detects invalid internal connections to the current model's root-level Inport and Outport blocks is set to none or warning. When this condition is detected, the Simulink software might automatically insert hidden blocks into the model to fix the condition. The hidden blocks can result in generated code without traceable requirements. Setting the diagnostic to error forces model developers to fix the referenced models manually. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Invalid root Inport/Outport block connection (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceIOMessage</code> to error.</p>
<p>The diagnostic that detects whether To Workspace or Scope blocks are logging data in a referenced model is set to none or warning. Data logging is not supported for To Workspace and Scope blocks in referenced models. (See DO-331, Section MB.6.3.1.d - High-level requirements are verifiable and DO-331, Section MB.6.3.2.d - Low-level requirements are verifiable.)</p>	<p>Set Unsupported data logging (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceDataLoggingMessage</code> to error. To log data, remove the blocks and log the referenced model signals. For more information, see "Logging Referenced Model Signals" (Simulink).</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to model referencing and that can impact safety.

Capabilities and Limitations

- Does not run on library models.

- Does not allow exclusions of blocks or charts.

See Also

- “View Diagnostics” (Simulink)
- “Model Configuration Parameters: Model Referencing Diagnostics” (Simulink)
- Radio Technical Commission for Aeronautics (RTCA) for information on the DO-178C Software Considerations in Airborne Systems and Equipment Certification and related standards

- “hisl_0310: Configuration Parameters > Diagnostics > Model Referencing” (Simulink)

Check safety-related model referencing settings

Check ID: `mathworks.do178.MdlrefOptSet`

Check model configuration for model referencing settings that can impact safety.

Description

This check verifies that model configuration parameters for model referencing are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The referenced model is configured such that its target is rebuilt whenever you update, simulate, or generate code for the model, or if the Simulink software detects changes in known dependencies. These configuration settings can result in unnecessary regeneration of the code, resulting in changing only the date of the file and slowing down the build process when using model references. (See DO-331, Section MB.6.3.1.b - High-level requirements are accurate and consistent and DO-331, Section MB.6.3.2.b - Low-level requirements are accurate and consistent.)</p>	<p>Set Rebuild (Simulink) on the Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>UpdateModelReferenceTargets</code> to <code>Never</code> or <code>If any changes detected</code>.</p>
<p>The diagnostic that detects whether a target needs to be rebuilt is set to <code>None</code> or <code>Warn if targets require rebuild</code>. For safety-related applications, an error should alert model developers that the parent and referenced models are inconsistent. This diagnostic parameter is available only if Rebuild is set to <code>Never</code>. (See DO-331, Section MB.6.3.1.b - High-level requirements are accurate and consistent and DO-331, Section MB.6.3.2.b - Low-level requirements are accurate and consistent.)</p>	<p>Set Never rebuild diagnostic (Simulink) on the Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>CheckModelReferenceTargetMessage</code> to <code>error</code>.</p>
<p>The ability to pass scalar root input by value is off. This capability should be off because scalar values can change during a time step and result in unpredictable data. (See DO-331, Section MB.6.3.3.b - Software architecture is consistent.)</p>	<p>Set Pass fixed-size scalar root inputs by value for Real-Time Workshop (Simulink) on the Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferencePassRootInputsByReference</code> to <code>off</code>.</p>

Condition	Recommended Action
The model is configured to minimize algebraic loop occurrences. This configuration is incompatible with the recommended setting of Single output/update function for embedded systems code. (See DO-331, Section MB.6.3.3.b – Software architecture is consistent.)	In the Configuration Parameters dialog box, set Minimize algebraic loop occurrences (Simulink) or set parameter <code>ModelReferenceMinAlgLoopOccurrences</code> to off.

Action Results

Clicking **Modify Settings** configures model referencing settings that can impact safety.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- “hisl_0037: Configuration Parameters > Model Referencing” (Simulink)

- Radio Technical Commission for Aeronautics (RTCA) for information on the DO-178C Software Considerations in Airborne Systems and Equipment Certification and related standards

Check safety-related code generation settings

Check ID: `mathworks.do178.CodeSet`

Check model configuration for code generation settings that can impact safety.

Description

This check verifies that model configuration parameters for code generation are set optimally for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The option to include comments in the generated code is cleared. Comments provide good traceability between the code and the model. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)	Select Include comments (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>GenerateComments</code> to on.
The option to include comments that describe the code for blocks is cleared. Comments provide good traceability between the code and the model. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)	Select Simulink block comments (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>SimulinkBlockComments</code> to on.
The option to include comments that describe the code for blocks eliminated from a model is cleared. Comments provide good traceability between the code and the model. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)	Select Show eliminated blocks (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>ShowEliminatedStatement</code> to on.
The option to include the names of parameter variables and source blocks as comments in the model parameter structure declaration in <code>model_prm.h</code> is cleared. Comments provide good traceability between the code and the model. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)	Select Verbose comments for SimulinkGlobal storage class (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>ForceParamTrailComments</code> to on.
The option to include requirement descriptions assigned to Simulink blocks as comments is cleared. Comments provide good traceability between the code and the model. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)	Select Requirements in block comments (Simulink Coder) on the Code Generation > Custom comments pane in the Configuration Parameters dialog box or set the parameter <code>ReqsInCode</code> to on.

Condition	Recommended Action
<p>The option to generate nonfinite data and operations is selected. Support for nonfinite numbers is inappropriate for real-time embedded systems. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear Support: non-finite numbers (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SupportNonFinite</code> to off.</p>
<p>The option to generate and maintain integer counters for absolute and elapsed time is selected. Support for absolute time is inappropriate for real-time safety-related systems. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear Support: absolute time (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SupportAbsoluteTime</code> to off.</p>
<p>The option to generate code for blocks that use continuous time is selected. Support for continuous time is inappropriate for real-time safety-related systems. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear Support: continuous time (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SupportContinuousTime</code> to off.</p>
<p>The option to generate code for noninlined S-functions is selected. This option requires support of nonfinite numbers, which is inappropriate for real-time safety-related systems. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear Support: non-inlined S-functions (Simulink Coder) in the Configuration Parameters dialog box or set the parameter <code>SupportNonInlinedSFcns</code> to off.</p>

Condition	Recommended Action
<p>The option to generate model function calls compatible with the main program module of the pre-R2012a GRT target is selected. This option is inappropriate for real-time safety-related systems. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear Classic call call interface (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>GRTInterface</code> to off.</p>
<p>The option to generate the <i>model_update</i> function is cleared. Having a single call to the output and update functions simplifies the interface to the real-time operating system (RTOS) and simplifies verification of the generated code. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Select Single output/update function (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>CombineOutputUpdateFcns</code> to on.</p>
<p>The option to generate the <i>model_terminate</i> function is selected. This function deallocates dynamic memory, which is unsuitable for real-time safety-related systems. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear Terminate function (Simulink Coder) on the Code Generation pane in the Configuration Parameters dialog box or set the parameter <code>IncludeMdlTerminateFcn</code> to off.</p>
<p>The option to log or monitor error status is cleared. If you do not select this option, the Simulink Coder product generates extra code that might not be reachable for testing. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Select Remove error status field in real-time model data structure (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SuppressErrorStatus</code> to on.</p>

Condition	Recommended Action
<p>MAT-file logging is selected. This option adds extra code for logging test points to a MAT-file, which is not supported by embedded targets. Use this option only in test harnesses. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer and DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer.)</p>	<p>Clear MAT-file logging (Simulink Coder) in the Configuration Parameters dialog box or set the parameter <code>MatFileLogging</code> to off.</p>
<p>The option that specifies the style for parenthesis usage is set to <code>Minimum (Rely on C/C++ operators precedence)</code> or to <code>Nominal (Optimize for readability)</code>. For safety-related applications, explicitly specify precedence with parentheses. (See DO-331, Section MB.6.3.1.c - High-level requirements are compatible with target computer, DO-331, Section MB.6.3.2.c - Low-level requirements are compatible with target computer, and MISRA C:2012, Rule 12.1.)</p>	<p>Set parameter <code>ParenthesesLevel</code> to <code>Maximum (Specify precedence with parentheses)</code>.</p>
<p>The option that specifies whether to preserve operand order is cleared. This option increases the traceability of the generated code. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)</p>	<p>Set parameter <code>PreserveExpressionOrder</code> to on.</p>
<p>The option that specifies whether to preserve empty primary condition expressions in <code>if</code> statements is cleared. This option increases the traceability of the generated code. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)</p>	<p>Set parameter <code>PreserveIfCondition</code> to on.</p>

Condition	Recommended Action
The minimum number of characters specified for generating name mangling strings is less than four. You can use this option to minimize the likelihood that parameter and signal names will change during code generation when the model changes. Use of this option assists with minimizing code differences between file versions, decreasing the effort to perform code reviews. (See DO-331, Section MB.6.3.4.e - Source code is traceable to low-level requirements.)	Set Minimum mangle length (Simulink Coder) on the Code Generation > Symbols pane in the Configuration Parameters dialog box or the parameter MangleLength to a value of 4 or greater.

Action Results

Clicking **Modify Settings** configures model code generation settings that can impact safety.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related optimization settings for Loop unrolling threshold

Check ID: `mathworks.do178.hisl_0051`

Check optimization settings in the model configuration that apply to Loop unrolling threshold and might impact safety.

Description

This check verifies that the model optimization configuration parameters pertaining to the minimum signal or parameter width for which a `for` loop is generated is set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The optimization setting to specify the minimum signal or parameter width for which a <code>for</code> loop is generated is set to a value less than 2.	In the Configuration Parameters dialog box, set Loop unrolling threshold or set the parameter <code>RollThreshold</code> to a value equal to or greater than 2.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes content in masked subsystems that have no workspace and no dialog boxes.

See Also

Check safety-related diagnostic settings for saving

Check ID: `mathworks.do178.SavingDiagnosticsSet`

Check model configuration for diagnostic settings that apply to saving model files

Description

This check verifies that model configuration parameters are set optimally for saving a model for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a model contains disabled library links before the model is saved is set to <code>none</code> or <code>warning</code> . If this condition is undetected, incorrect code might be generated.	Set Block diagram contains disabled library links (Simulink) in the Configuration Parameters dialog box or set parameter <code>SaveWithDisabledLinkMsg</code> to <code>error</code> .
The diagnostic that detects whether a model contains library links that are using parameters not in a mask before the model is saved is set to <code>none</code> or <code>warning</code> . If this condition is undetected, incorrect code might be generated.	Set Block diagram contains parameterized library links (Simulink) in the Configuration Parameters dialog box or set parameter <code>SaveWithParameterizedLinkMsg</code> to <code>error</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to saving a model file.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for Merge blocks

Check ID: `mathworks.do178.hisl_0303`

Check model configuration for diagnostic settings that apply to Merge blocks

Description

This check verifies that model configuration parameters are set optimally for Merge blocks for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a model contains Merge blocks with more than one driving block executing at the same time step is set to <code>none</code> or <code>warning</code> and in the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to <code>Classic</code> .	In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” (Simulink) or set parameter <code>MergeDetectMultiDrivingBlocksExec</code> to <code>error</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331 MB.6.3.2 (b) Accuracy and Consistency

Check safety-related diagnostic settings for Stateflow

Check ID: `mathworks.do178.hisl_0311`

Check safety-related diagnostic settings for Stateflow

Description

This check verifies that model configuration parameters are set optimally for Stateflow for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a chart configuration leads to unwanted backtracking during simulation is set to none or warning.	In the Configuration Parameters dialog box, set “Unexpected backtracking” (Simulink) or set the parameter SFUnexpectedBacktrackingDiag to error.

Condition	Recommended Action
The diagnostic that detects whether a chart configuration has blocks that connect to chart input ports do not initialize their outputs during initialization is set to none or warning.	In the Configuration Parameters dialog box, set “Invalid input data access in chart initialization” (Simulink) or set the parameter SFInvalidInputDataAccessInChartInitDiag to error.
The diagnostic that detects whether a chart has an unconditional default transition to a state or a junction is set to none or warning.	In the Configuration Parameters dialog box, set “No unconditional default transitions” (Simulink) or set the parameter SFNoUnconditionalDefaultTransitionDiag to error.
The diagnostic that detects whether a chart contains a transition that loops outside of the parent state or junction is set to none or warning.	In the Configuration Parameters dialog box, set “Transition outside natural parent” (Simulink) or set the parameter SFTransitionOutsideNaturalParentDiag to error.
The diagnostic that detects whether a chart constructs on a valid execution path is set to none or warning.	In the Configuration Parameters dialog box, set “Unreachable execution path” (Simulink) or set the parameter SFUnreachableExecutionPathDiag to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check for model elements that do not link to requirements

Check ID: `mathworks.do178.RequirementInfo`

Check whether Simulink model elements link to a requirements document.

Description

This check verifies whether model objects link to a document containing engineering requirements for traceability.

Available with Simulink Check.

This check requires a Simulink Requirements license.

Results and Recommended Actions

Condition	Recommended Action
Blocks do not link to a requirements document.	Link to requirements document. See .

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.
- Does not allow the exclusion of Stateflow elements.

Tip

Run this check from the top model or subsystem that you want to check.

Check state machine type of Stateflow charts

Check ID: `mathworks.do178.hisf_0001`

Identify whether Stateflow charts are all Mealy or all Moore charts.

Description

Compares the state machine type of all Stateflow charts to the type that you specify in the input parameters.

Available with Simulink Check.

This check requires a Stateflow license.

Input Parameters

Mealy or Moore

Check whether charts use the same state machine type, and are all Mealy or all Moore charts.

Mealy

Check whether all charts are Mealy charts.

Moore

Check whether all charts are Moore charts.

Results and Recommended Actions

Condition	Recommended Action
The input parameter is set to Mealy or More and charts in the model use either of the following: <ul style="list-style-type: none"> • Classic state machine types. • Multiple state machine types. 	For each chart, in the Chart Properties dialog box, specify State Machine Type to either Mealy or Moore . Use the same state machine type for all charts in the model.
The input parameter is set to Mealy and charts in the model use other state machine types.	For each chart, in the Chart Properties dialog box, specify State Machine Type to Mealy .
The input parameter is set to Moore and charts in the model use other state machine types.	For each chart, in the Chart Properties dialog box, specify State Machine Type to Moore .

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check Stateflow charts for ordering of states and transitions

Check ID: mathworks.do178.hisf_0002

Identify Stateflow charts that have **User specified state/transition execution order** cleared.

Description

Identify Stateflow charts that have **User specified state/transition execution order** cleared, and therefore do not use explicit ordering of parallel states and transitions.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Stateflow charts have User specified state/transition execution order cleared.	<p>For the specified charts, in the Chart Properties dialog box, select User specified state/transition execution order.</p> <p>To display the transition testing order, select Display > Chart > Transition Execution Order.</p>

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Action Results

Clicking **Modify** selects **User specified state/transition execution order** for the specified charts.

See Also

Check Stateflow debugging options

Check ID: mathworks.do178.hisf_0011

Check the Stateflow debugging settings.

Description

Verify the following debugging settings.

- **Wrap on overflow**
- **Simulation range checking**
- **Detect Cycles**

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
<p>Any of the following:</p> <ul style="list-style-type: none"> • Wrap on overflow is not set to error. • Simulation range checking is not set to error. • Detect Cycles is cleared. 	<p>In the Configuration Parameters dialog box, set:</p> <ul style="list-style-type: none"> • Wrap on overflow to error. • Simulation range checking to error. <p>In the model window, select:</p> <ul style="list-style-type: none"> • Simulation > Debug > MATLAB & Stateflow Error Checking Options > Detect Cycles.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Allows exclusions of blocks and charts.

Action Results

Clicking **Modify** selects the specified debugging options.

Check Stateflow charts for transition paths that cross parallel state boundaries

Check ID: mathworks.do178.hisf_0013

Identify transition paths that cross parallel state boundaries in Stateflow charts.

Description

Identify transition paths that cross parallel state boundaries in Stateflow charts. Using such transition paths creates diagrams that consist of transition executions, which are difficult to understand.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow charts have transition paths that cross parallel state boundaries.	Modify the Stateflow charts so that transitions do not cross parallel state boundaries. For more information see, "Design Considerations for Defining Transitions Between States" (Stateflow).

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Allows exclusions of blocks and charts.
- Analyzes content in all masked subsystems.

See Also

- DO-331, Section MB.6.3.1.b High-level requirements are accurate and consistent

Check Stateflow charts for strong data typing

Check ID: `mathworks.do178.hisf_0015`

Identify variables and parameters in expressions with different data types in Stateflow objects.

Description

To facilitate strong data typing, this check identifies the variables and parameters in expressions with different data types in Stateflow states and transitions.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow objects have variables and parameters in expressions with different data types.	Explicitly cast variables and parameters in expressions to the same data types. For more information see, <code>cast</code> .

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Allows exclusions of blocks and charts.
- Analyzes content in all masked subsystems.
- Does not analyze the type of literals in expressions in Stateflow objects. Explicitly casts types of literals to the intended data type.

- Does not flag expressions with true and false keywords. For more information, see “Reserved Keywords for Code Generation” (Embedded Coder).

Check usage of lookup table blocks

Check ID: `mathworks.do178.LUTRangeCheckCode`

Check for lookup table blocks that do not generate out-of-range checking code.

Description

This check verifies that the following blocks generate code to protect against inputs that fall outside the range of valid breakpoint values:

- 1-D Lookup Table
- 2-D Lookup Table
- n-D Lookup Table
- Prelookup

This check also verifies that Interpolation Using Prelookup blocks generate code to protect against inputs that fall outside the range of valid index values.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The lookup table block does not generate out-of-range checking code.	<p>Change the setting on the block dialog box so that out-of-range checking code is generated.</p> <ul style="list-style-type: none"> • For the 1-D Lookup Table, 2-D Lookup Table, n-D Lookup Table, and Prelookup blocks, clear the check box for Remove protection against out-of-range input in generated code. • For the Interpolation Using Prelookup block, clear the check box for Remove protection against out-of-range index in generated code.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Action Results

Clicking **Modify** verifies that lookup table blocks are set to generate out-of-range checking code.

Check MATLAB Code Analyzer messages

Check ID: mathworks.do178.himl_0004

Check MATLAB Functions for `%#codegen` directive, MATLAB Code Analyzer messages, and justification message IDs.

Description

Verifies `%#codegen` directive, MATLAB Code Analyzer messages, and justification message IDs for:

- MATLAB code in MATLAB Function blocks
- MATLAB functions defined in Stateflow charts
- Called MATLAB functions

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>For MATLAB code in MATLAB Function blocks, either of the following:</p> <ul style="list-style-type: none"> • Code lines are not justified with a <code> %#ok</code> comment. • Codes lines justified with <code> %#ok</code> do not specify a message id. 	<ul style="list-style-type: none"> • Implement MATLAB Code Analyzer recommendations. • Justify not following MATLAB Code Analyzer recommendations with a <code> %#ok</code> comment. • Specify justified code lines with a message id. For example, <code> %#ok<NOPRT></code>.
<p>For MATLAB functions defined in Stateflow charts, either of the following:</p> <ul style="list-style-type: none"> • Code lines are not justified with a <code> %#ok</code> comment. • Codes lines justified with <code> %#ok</code> do not specify a message id. 	<ul style="list-style-type: none"> • Implement MATLAB Code Analyzer recommendations. • Justify not following MATLAB Code Analyzer recommendations with a <code> %#ok</code> comment. • Specify justified code lines with a message id. For example, <code> %#ok<NOPRT></code>.

Condition	Recommended Action
<p>For called MATLAB functions:</p> <ul style="list-style-type: none"> Code does not have the <code>codegen</code> directive. Code lines are not justified with a <code>ok</code> comment. Codes lines justified with <code>ok</code> do not specify a message id. 	<ul style="list-style-type: none"> Insert <code>codegen</code> directive in the MATLAB code. Implement MATLAB Code Analyzer recommendations. Justify not following MATLAB Code Analyzer recommendations with a <code>ok</code> comment. Specify justified code lines with a message id. For example, <code>ok<NOPRT></code>.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Sections MB.6.3.1.b and MB.6.3.2.b - Accuracy and consistency

Check MATLAB code for global variables

Check ID: `mathworks.do178.himl_0005`

Check for global variables in MATLAB code.

Description

Verifies that global variables are not used in any of the following:

- MATLAB code in MATLAB Function blocks

- MATLAB functions defined in Stateflow charts
- Called MATLAB functions

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Global variables are used in one or more of the following: <ul style="list-style-type: none"> • MATLAB code in MATLAB Function blocks • MATLAB functions defined in Stateflow charts • Called MATLAB functions 	Replace global variables with signal lines, function arguments, or persistent data.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Sections MB.6.3.3.b 'Consistency'
- "himl_0005: Usage of global variables in MATLAB functions" (Simulink)

Check for inconsistent vector indexing methods

Check ID: mathworks.do178.hisl_0021

Identify blocks with inconsistent indexing method.

Description

Using inconsistent block indexing methods can result in modeling errors. You should use a consistent vector indexing method for all blocks. This check identifies blocks with

inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains blocks with inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified.	Modify the model to use a single consistent indexing method.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- DO-331, Section MB.6.3.2.b - Low-level requirements are accurate and consistent
- “hisl_0021: Consistent vector indexing method” (Simulink)

Check for MATLAB Function interfaces with inherited properties

Check ID: `mathworks.do178.himl_0002`

Identify MATLAB Functions that have inputs, outputs or parameters with inherited complexity or data type properties.

Description

The check identifies MATLAB Functions with inherited complexity or data type properties. A results table provides links to MATLAB Functions that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Functions have inherited interfaces.	<p>Explicitly define complexity and data type properties for inports, outports, and parameters of MATLAB Functions identified in the results.</p> <p>If applicable, using the “MATLAB Function Block Editor” (Simulink), make the following modifications in the “Ports and Data Manager” (Simulink):</p> <ul style="list-style-type: none"> • Change Complexity from Inherited to On or Off. • Change Type from Inherit: Same as Simulink to an explicit type.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- DO-331, Section MB.6.3.2.b - Low-level requirements are accurate and consistent
- “himl_0002: Strong data typing at MATLAB function boundaries” (Simulink)

Check MATLAB Function metrics

Check ID: mathworks.do178.himl_0003

Display complexity and code metrics for MATLAB Functions. Report metric violations.

Description

This check provides complexity and code metrics for MATLAB Functions. The check additionally reports metric violations. A results table provides links to MATLAB Functions that violate the complexity input parameters.

Available with Simulink Check.

Input Parameters

Maximum effective lines of code per function

Provide the maximum effective lines of code per function. Effective lines do not include empty lines, comment lines, or lines with a function end keyword.

Minimum density of comments

Provide minimum density of comments. Density is ratio of comment lines to total lines of code.

Maximum cyclomatic complexity per function

Provide maximum cyclomatic complexity per function. Cyclomatic complexity is the number of linearly independent paths through the source code.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Function violates the complexity input parameters.	For the MATLAB Function: <ul style="list-style-type: none">• If effective lines of code is too high, further divide the MATLAB Function.• If comment density is too low, add comment lines.• If cyclomatic complexity per function is too high, further divide the MATLAB Function.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.

- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- DO-331, Sections MB.6.3.1.e - High-level requirements conform to standards
- DO-331, Sections MB.6.3.2.e - Low-level requirements conform to standards

Check for blocks not recommended for C/C++ production code deployment

Check ID: `mathworks.do178.PCGSupport`

Identify blocks not supported by code generation or not recommended for C/C++ production code deployment.

Description

This check partially identifies model constructs that are not recommended for C/C++ production code generation as identified in the Simulink Block Support (Simulink Coder) tables for Simulink Coder and Embedded Coder. If you are using blocks with support notes for code generation, review the information and follow the given advice.

Available with Simulink Check and Embedded Coder.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains blocks that should not be used for production code deployment.	Consider replacing the blocks listed in the results. Click an element from the list of questionable items to locate condition.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

- Allows exclusions of blocks and charts.

See Also

- DO-331, Section MB.6.3.2.b - Low-level requirements are accurate and consistent
- “hisl_0020: Blocks not recommended for MISRA C:2012 compliance” (Simulink)
- “Blocks and Products Supported for C Code Generation” (Simulink Coder)

Check for variant blocks with 'Generate preprocessor conditionals' active

Check ID: `mathworks.do178.VariantBlock`

Check variant block parameters for settings that might result in code that does not trace to requirements.

Description

This check verifies that variant block parameters for code generation are set to trace to requirements.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The option to generate preprocessor conditionals is selected in one or more variant blocks in the model.	In order to simplify the tracing of code to requirements, consider clearing the option to generate preprocessor conditionals in variant blocks.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

- DO-331, Section MB.6.3.2.b 'Low-level requirements are accurate and consistent'
- "hisl_0023: Verification of model and subsystem variants" (Simulink)

Check Stateflow charts for uniquely defined data objects**Check ID:** mathworks.do178.hisl_0061

Identify Stateflow charts that include data objects that are not uniquely defined.

Description

This check searches your model for local data in Stateflow charts that is not uniquely defined.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow chart contains a data object identifier defined in two or more scopes.	For the identified chart, do one of the following: <ul style="list-style-type: none"> • Create a unique data object identifier within each of the scopes. • Create a unique data object identifier within the chart, at the parent level.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

Check usage of Math Operations blocks

Check ID: `mathworks.do178.MathOperationsBlocksUsage`

Identify usage of Math Operation blocks that might impact safety.

Description

This check inspects the usage of the following blocks:

- Abs
- Gain
- Math Function
 - Natural logarithm
 - Common (base 10) logarithm
 - Remainder after division
 - Reciprocal
- Assignment

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The model or subsystem contains an Absolute Value block that is operating on one of the following:</p> <ul style="list-style-type: none"> • A boolean or an unsigned input data type. This condition results in unreachable simulation pathways through the model and might result in unreachable code • A signed integer value with the Saturate on integer overflow check box not selected. For signed data types, the absolute value of the most negative value is problematic because it is not representable by the data type. This condition results in an overflow in the generated code. 	<p>If the identified Absolute Value block is operating on a boolean or unsigned data type, do one of the following:</p> <ul style="list-style-type: none"> • Change the input of the Absolute Value block to a signed input type. • Remove the Absolute Value block from the model. <p>If the identified Absolute Value block is operating on a signed data type, in the Block Parameters > Signal Attributes dialog box, select Saturate on integer overflow.</p>
<p>The model or subsystem contains Gain blocks with a of value 1 or an identity matrix.</p>	<p>If you are using Gain blocks as buffers, consider replacing them with Signal Conversion blocks.</p>
<p>The model or subsystem contains Math Function - Natural logarithm (log) blocks that might result in non-finite output signals. Non-finite signals are not supported in real-time embedded systems.</p>	<p>When using the Math Function block with a log function, protect the input to the block from being less than or equal to zero. Otherwise, the output can produce a NaN or -Inf and result in a run-time error in the generated code.</p>
<p>The model or subsystem contains Math Function - Common (base 10) (base 10 logarithm) blocks that might result in non-finite output signals. Non-finite signals are not supported in real-time embedded systems.</p>	<p>When using the Math Function block with a log10 function, protect the input to the block from being less than or equal to zero. Otherwise, the output can produce a NaN or -Inf and result in a run-time error in the generated code.</p>

Condition	Recommended Action
The model or subsystem contains Math Function - Remainder after division (<code>rem</code>) blocks that might result in non-finite output signals. Non-finite signals are not supported in real-time embedded systems.	When using the Math Function block with a <code>rem</code> function, protect the second input to the block from being equal to zero. Otherwise the output can produce a <code>Inf</code> or <code>-Inf</code> and result in a run-time error in the generated code.
The model or subsystem contains Math Function - Reciprocal (<code>reciprocal</code>) blocks that might result in non-finite output signals. Non-finite signals are not supported in real-time embedded systems.	When using the Math Function block with a <code>reciprocal</code> function, protect the input to the block from being equal to zero. Otherwise the output can produce a <code>Inf</code> or <code>-Inf</code> and result in a run-time error in the generated code.
The model or subsystem might contain Assignment blocks with incomplete array initialization that do not have block parameter Action if any output element is not assigned set to Error or Warning .	Set block parameter Action if any output element is not assigned to one of the recommended values: <ul style="list-style-type: none"> • Error, if Assignment block is not in an Iterator subsystem. • Warning, if Assignment block is in an Iterator subsystem.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Signal Routing blocks

Check ID: mathworks.do178.SignalRoutingBlockUsage

Identify usage of Signal Routing blocks that might impact safety.

Description

This check identifies model or subsystem Switch blocks that might generate code with inequality operations ($\sim=$) in expressions that contain a floating-point variable or constant.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains a Switch block that might generate code with inequality operations ($\sim=$) in expressions where at least one side of the expression contains a floating-point variable or constant. The Switch block might cause floating-point inequality comparisons in the generated code.	For the identified block, do one of the following: <ul style="list-style-type: none"> • For the control input block, change the Data type parameter setting. • Change the Switch block Criteria for passing first input parameter setting. This might change the algorithm.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Logic and Bit Operations blocks

Check ID: `mathworks.do178.LogicBlockUsage`

Identify usage of Logical Operator and Bit Operations blocks that might impact safety.

Description

This check inspects the usage of:

- Blocks that compute relational operators, including Relational Operator, Compare To Constant, Compare To Zero, Detect Change, and If blocks
- Logical Operator blocks

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains a block computing a relational operator that is operating on different data types. The condition can lead to unpredictable results in the generated code.	For the identified blocks, use common data types as inputs. You can use Data Type Conversion blocks to change input data types.
The model or subsystem contains a block computing a relational operator that does not have Boolean output. The condition can lead to unpredictable results in the generated code.	For the specified blocks, on the Block Parameters > Signal Attributes pane, set the Output data type to boolean.

Condition	Recommended Action
<p>The model or subsystem contains a block computing a relational operator that uses the == or ~= operator to compare floating-point signals. The use of these operators on floating-point signals is unreliable and unpredictable because of floating-point precision issues. These operators can lead to unpredictable results in the generated code.</p>	<p>For the identified block, do one of the following:</p> <ul style="list-style-type: none"> • Change the signal data type. • Rework the model to eliminate using == or ~= operators on floating-point signals.
<p>The model or subsystem contains a Logical Operator block that has inputs or outputs that are not Boolean inputs or outputs. The block might result in floating-point equality or inequality comparisons in the generated code.</p>	<ul style="list-style-type: none"> • Modify the Logical Operator block so that all inputs and outputs are Boolean. On the Block Parameters > Signal Attributes pane, consider selecting Require all inputs to have the same data type and setting Output data type to boolean. • In the Configuration Parameters dialog box, consider selecting the Implement logic signals as boolean data (vs. double).

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Ports and Subsystems blocks

Check ID: `mathworks.do178.PortsSubsystemsUsage`

Identify usage of Ports and Subsystems blocks that might impact safety.

Description

This check inspects the usage of these blocks:

- For Iterator
- While Iterator
- If
- Switch Case

The check does not flag Switch Case blocks that do not use integer data types or enumeration values for inputs. To comply with “hisl_0011: Usage of Switch Case blocks and Action Subsystem blocks” (Simulink) - C, use an integer data type or an enumeration value for the inputs to Switch Case blocks.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The model or subsystem contains a For Iterator block that has variable iterations. This condition can lead to unpredictable execution times or infinite loops in the generated code.</p>	<p>For the identified For Iterator blocks, do one of the following:</p> <ul style="list-style-type: none"> • Set the Iteration limit source parameter to <code>internal</code>. • If the Iteration limit source parameter must be <code>external</code>, use a Constant, Probe, or Width block as the source. • Clear the Set next i (iteration variable) externally check box. • Consider selecting the Show iteration variable check box and observe the iteration value during simulation.
<p>The model or subsystem contains a While Iterator block that has unlimited iterations. This condition can lead to infinite loops in the generated code.</p>	<p>For the identified While Iterator blocks:</p> <ul style="list-style-type: none"> • Set the Maximum number of iterations (-1 for unlimited) parameter to a positive integer value. • Consider selecting the Show iteration number port check box and observe the iteration value during simulation.
<p>The model or subsystem contains an If block with an If expression or Elseif expressions that might cause floating-point equality or inequality comparisons in generated code.</p>	<p>Modify the expressions in the If block to avoid floating-point equality or inequality comparisons in generated code.</p>
<p>The model or subsystem contains an If block using Elseif expressions without an Else condition.</p>	<p>In the If block Block Parameters dialog box, select Show else condition. Connect the resulting Else output port to an If Action Subsystem block.</p>
<p>The model or subsystem contains an If block with output ports that do not connect to If Action Subsystem blocks.</p>	<p>Verify that output ports of the If block connect to If Action Subsystem blocks.</p>

Condition	Recommended Action
The model or subsystem contains an Switch Case block without a default case.	In the Switch Case block Block Parameters dialog box, select Show default case . Connect the resulting default output port to a Switch Case Action Subsystem block.
The model or subsystem contains a Switch Case block with an output port that does not connect to a Switch Case Action Subsystem block.	Verify that output ports of the Switch Case blocks connect to Switch Case Action Subsystem blocks.
<p>The model or subsystem contains one of the following time-dependent blocks in a For Iterator or While Iterator subsystem:</p> <ul style="list-style-type: none"> • Discrete Filter • Discrete FIR Filter • Discrete State-Space • Discrete Transfer Fcn • Discrete Zero-Pole • Transfer Fcn First Order • Transfer Fcn Lead or Lag • Transfer Fcn Real Zero • Discrete Derivative • Discrete Transfer Fcn (with initial outputs) • Discrete Transfer Fcn (with initial states) • Discrete Zero-Pole (with initial outputs) • Discrete Zero-Pole (with initial states) 	In the model or subsystem, consider removing the time-dependent blocks.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

- Allows exclusions of blocks and charts.

Display model version information

Check ID: `mathworks.do178.MdlChecksum`

Display model version information in your report.

Description

This check displays the following information for the current model:

- Version number
- Author
- Date
- Model checksum

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Could not retrieve model version and checksum information.	This summary is provided for your information. No action is required.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check for root Inports with missing properties

Check ID: `mathworks.iec61508.RootLevelInports`

Identify root model Inport blocks with missing or inherited sample times, data types or port dimensions.

Description

Using root model Inport blocks that do not have defined sample time, data types or port dimensions can lead to undesired simulation results. Simulink back-propagates dimensions, sample times, and data types from downstream blocks unless you explicitly assign these values. You can specify Inport block properties with block parameters or Simulink signal objects that explicitly resolve to the connected signal lines. When you run the check, a results table provides links to Inport blocks and signal objects that do not pass, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Missing port dimension — Model contains Inport blocks with inherited port dimensions.	For the listed Inport blocks and Simulink signal objects, specify port dimensions.
Missing signal data type — Model contains Inport blocks with inherited data types.	For the listed Inport blocks and Simulink signal objects, specify data types.
Missing port sample time — Model contains Inport blocks with inherited sample times.	For the listed Inport blocks and Simulink signal objects, specify sample times. The sample times for root Inports with bus type must match the sample times specified at the leaf elements of the bus object.
Implicit resolution to a Simulink signal object — Model contains Inport block signal names that implicitly resolve to a Simulink signal object in the base workspace, model workspace, or Simulink data dictionary.	For the listed Simulink signal objects, in the property dialog, select signal property Signal name must resolve to Simulink signal object.

Capabilities and Limitations

- Does not run on library models.
- Allows exclusions of blocks and charts.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to Ensure sample time independent
- For export-function models, *inherited sample time* is not flagged.

Check for root Inports with missing range definitions

Check ID: `mathworks.iec61508.InportRange`

Identify root level Inport blocks with missing or erroneous minimum or maximum range values.

Description

The check identifies root level Inport blocks with missing or erroneous minimum or maximum range values. You can specify Inport block minimum and maximum values with block parameters or Simulink signal objects that explicitly resolve to the connected signal lines. A results table provides links to Inport blocks and signal objects that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Missing range — Model contains Inport blocks with numeric data types that have missing range parameters (minimum and/or maximum).	For the listed Inport blocks and Simulink signal objects, specify scalar minimum and maximum parameters.
Missing range(s) for bus object — Bus objects defining the Inport blocks have leaf elements with missing ranges.	For the listed leaf elements, to specify the model interface range, provide scalar minimum and maximum parameters .
Range specified will be ignored — Minimum or maximum values at Inports or Simulink signal objects are not supported for bus data types. The values are ignored during range checking.	To enable range checking, specify minimum and maximum signal values on the leaf elements of the bus objects defining the data type.

Condition	Recommended Action
<p>No data type specified — Model contains Inport blocks or Simulink signal objects with inherited data types.</p>	<p>Specify one of the supported data types:</p> <ul style="list-style-type: none"> • Enum • Simulink.AliasType • Simulink.Bus • Simulink.NumericType • build-in
<p>Implicit resolution to a Simulink signal object — Model contains Inport block signal names that implicitly resolve to a Simulink signal object in the base workspace, model workspace, or Simulink data dictionary.</p>	<p>For the listed Simulink signal objects, in the property dialog, select signal property Signal name must resolve to Simulink signal object.</p>

Capabilities and Limitations

- Does not run on library models.
- Allows exclusions of blocks and charts.

Check for root Outports with missing range definitions

Check ID: `mathworks.iec61508.OutportRange`

Identify root level Outport blocks with missing or erroneous minimum or maximum range values.

Description

The check identifies root level Outport blocks with missing or erroneous minimum or maximum range values. You can specify Outport block minimum and maximum values with block parameters or Simulink signal objects that explicitly resolve to the connected

signal lines. A results table provides links to Outport blocks that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>Missing range — Model contains Outport blocks with numeric data types that have missing range parameters (minimum and/or maximum).</p>	<p>For the listed Outport blocks and Simulink signal objects, specify scalar minimum and maximum parameters.</p>
<p>Missing range(s) for bus object — Bus objects defining the Outport blocks have leaf elements with missing ranges.</p>	<p>For the listed leaf elements, to specify the model interface range, provide scalar minimum and maximum parameters.</p>
<p>Range specified at Outport will be ignored — Minimum or maximum values at Outports or Simulink signal objects are not supported for bus data types. The values are ignored during range checking.</p>	<p>To enable range checking, specify minimum and maximum signal values on the leaf elements of the bus objects defining the data type.</p>
<p>No bus data type specified — Model contains Outport block or Simulink signal objects with inherited bus data types.</p>	<p>For the Outport blocks and Simulink signal objects, specify one of the supported data types:</p> <ul style="list-style-type: none"> • Enum • Simulink.AliasType • Simulink.Bus • Simulink.NumericType • build-in
<p>Implicit resolution to a Simulink signal object — Model contains Outport block signal names that implicitly resolve to a Simulink signal object in the base workspace, model workspace, or Simulink data dictionary.</p>	<p>For the listed Simulink signal objects, in the property dialog, select signal property Signal name must resolve to Simulink signal object.</p>

Capabilities and Limitations

- Does not run on library models.
- Allows exclusions of blocks and charts.

Check usage of Stateflow constructs

Check ID: `mathworks.iec61508.StateflowProperUsage`

Identify usage of Stateflow constructs that might impact safety.

Description

This check identifies instances of Stateflow software being used in a way that can impact an application's safety, including:

- Use of strong data typing
- Port name mismatches
- Scope of data objects and events
- Formatting of state action statements
- Ordering of states and transitions
- Unreachable code
- Indeterminate execution time

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>A Stateflow chart is not configured for strong data typing on boundaries between a Simulink model and the Stateflow chart. See hisf_0009: Strong data typing (Simulink and Stateflow boundary).</p>	<p>In the Chart properties dialog box, select Use Strong Data Typing with Simulink I/O for the Stateflow chart. When you select this check box, the Stateflow chart accepts input signals of any data type that Simulink models support, provided that the type of the input signal matches the type of the corresponding Stateflow input data object.</p>
<p>Signals have names that differ from those of their corresponding Stateflow ports. See hisf_0016: Stateflow port names .</p>	<ul style="list-style-type: none"> • Check whether the ports are connected and, if not, fix the connections. • Change the names of the signals or the Stateflow ports so that the names match.
<p>Local data is not defined in the Stateflow hierarchy at the chart level or below. See hisf_0017: Stateflow data object scoping</p>	<p>Define local data at the chart level or below.</p>
<p>A new line is missing from a state action after:</p> <ul style="list-style-type: none"> • An entry (en), during (du), or exit (ex) statement • The semicolon (;) at the end of an assignment statement 	<p>Add missing new lines.</p>
<p>Stateflow charts have User specified state/transition execution order cleared. See hisf_0002: User-specified state/transition execution order.</p>	<p>For the specified charts, in the Chart Properties dialog box, select User specified state/transition execution order.</p>

Condition	Recommended Action
<p>Any of the following:</p> <ul style="list-style-type: none"> • Wrap on overflow is not set to error. • Simulation range checking is not set to error. • Detect Cycles is cleared. <p>See hisf_0011: Stateflow debugging settings.</p>	<p>In the Configuration Parameters dialog box, set:</p> <ul style="list-style-type: none"> • Diagnostics > Data Validity > Wrap on overflow to error. • Diagnostics > Data Validity > Simulation range checking to error. <p>In the model window, select:</p> <ul style="list-style-type: none"> • Simulation > Debug > MATLAB & Stateflow Error Checking Options > Detect Cycles.
<p>The Stateflow chart contains a data object identifier defined in two or more scopes. See hisl_0061: Unique identifiers for clarity.</p>	<p>For the identified chart, do one of the following:</p> <ul style="list-style-type: none"> • Create a unique data object identifier within each of the scopes. • Create a unique data object identifier within the chart, at the parent level.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts. Exclusions will not work for library linked charts.

Check safety-related solver settings for simulation time

Check ID: `mathworks.iec61508.hisl_0040`

Check solver settings in the model configuration that apply to simulation time and might impact safety.

Description

This check verifies that the model solver configuration parameters pertaining to simulation time are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The solver setting to specify the start time for the simulation or generated code is set to a value other than 0.0.	In the Configuration Parameters dialog box, set “Start time” (Simulink) or set the parameter <code>StartTime</code> to 0.0.

Condition	Recommended Action
The solver setting to specify the stop time for the simulation or generated code is set to a negative value or a positive value greater than the value of “Application lifespan (days)” (Simulink). By default, “Application lifespan (days)” (Simulink) is auto. If you do not change this setting, any positive value for “Stop time” (Simulink) is valid.	In the Configuration Parameters dialog box, , set “Stop time” (Simulink) or set the parameter StopTime to a positive value that is less than the value of “Application lifespan (days)” (Simulink).

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes content in masked subsystems that have no workspace and no dialog boxes.

See Also

Check safety-related solver settings for solver options

Check ID: mathworks.iec61508.hisl_0041

Check solver settings in the model configuration that apply to solvers and might impact safety.

Description

This check verifies that the model solver configuration parameters pertaining to solvers are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The solver setting to specify the type of solver to simulate model is set to <code>Variable-step</code> .	In the Configuration Parameters dialog box, set "Type" (Simulink) or set the parameter <code>SolverType</code> to <code>Fixed-step</code> .
The solver setting to specify the solver to compute the states of the model during simulation or code generation is set to a value other than <code>Discrete(no continuous states)</code> .	In the Configuration Parameters dialog box, set "Solver" (Simulink) to <code>discrete(no continuous states)</code> or set the parameter <code>Solver</code> to <code>FixedStepDiscrete</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes content in masked subsystems that have no workspace and no dialog boxes.

Check usage of shift operations for Stateflow data

Check ID: `mathworks.do178.hisf_0064`

Identify usage of shift operations for Stateflow data that might impact safety.

Description

This check inspects the shift operations that have shift operand values greater than the bit-width of the input or output type or a shift operand that has a negative value.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Right-shift operations are greater than the bit-width of the input type.	Explicitly modify the value of the bit-shift operations to be less than the shift operand.
Left-shift operations are greater than the bit-width of the output type.	Explicitly modify the value of the bit-shift operations to be less than the shift operand.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Does not support the shift operation that has the shift size defined as a Simulink signal or a variable.
- Does not support the shift operations that consist of shift size decided at run time.

See Also

Check assignment operations in Stateflow Charts

Check ID: `mathworks.do178.hisf_0065`

Identify assignment operations in Stateflow objects.

Description

This check identifies the assignment operations in Stateflow objects that cast integer and fixed-point calculations to wider data types than the input data types.

This check identifies only the assignments with arithmetic operations.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow object consists of assignment operations that cast integer and fixed-point calculations to wider data types than the input data types.	Explicitly replace assignment operator (=) to := operator in Stateflow objects.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

Check Stateflow charts for unary operators

Check ID: mathworks.do178.hisf_0211

Identify unary operators in Stateflow charts.

Description

This check identifies the unary minus operators on unsigned data types in Stateflow charts.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow chart consists of a unary minus operator on unsigned data types.	Explicitly modify the unary operator on unsigned data types. For more information, see “Unary Operations” (Stateflow).

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Does not flag expressions with bitwise and arithmetic operators. For example, - (u1/u2) is not flagged.

Check for blocks not recommended for MISRA C:2012

Check ID: `mathworks.misra.BlkSupport`

Identify blocks that are not supported or recommended for MISRA C:2012 compliant code generation.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Lookup Table blocks using cubic spline interpolation or extrapolation methods were found in the model or subsystem.	Consider other interpolation and extrapolation methods for the Lookup Table blocks.
Deprecated Lookup Table blocks were found in the model or subsystem. The deprecated Lookup Table blocks are Lookup and Lookup2D.	Consider replacing the deprecated Lookup Table blocks.
S-Function Builder blocks were found in the model or subsystem.	Consider replacing the S-Function Builder blocks with blocks recommended for production.
From Workspace blocks were found in the model or subsystem.	Consider replacing the From Workspace blocks with blocks recommended for production.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Check configuration parameters for MISRA C:2012

Check ID: `mathworks.misra.CodeGenSettings`

Identify configuration parameters that might impact MISRA C:2012 compliant code generation.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Use division for fixed-point net slope computation is not set to On or Use division for reciprocals of integers only.	Set configuration parameter Use division for fixed-point net slope computation to On or Use division for reciprocals of integers only.
Bitfield declarator type specifier is set to uchar_T when any these parameters are selected: <ul style="list-style-type: none"> • Pack Boolean data into bitfields • Use bitsets for storing state configuration • Use bitsets for storing Boolean data 	Set configuration parameter Bitfield declarator type specifier to uint_T.
Model Verification block enabling is set to Use local settings or Enable All.	Set configuration parameter Model Verification block enabling to Disable All.
Wrap on overflow is set to None	Set configuration parameter Wrap on overflow to warning or error.
Inf or NaN block output is set to None	Set configuration parameter Inf or NaN block output to warning or error.
Signed integer division rounds to is not set to Zero or Floor.	Set configuration parameter Signed integer division rounds to to Zero or Floor.

Condition	Recommended Action
Dynamic memory allocation in MATLAB Function blocks is selected.	Clear configuration parameter Dynamic memory allocation in MATLAB Function blocks .
System target file is set to a GRT-based target.	Set configuration parameter System target file to an ERT-based target.
Maximum identifier length	Set the configuration parameter value to the implementation dependent limit. The default is 31.
System-generated identifiers is set to Classic.	Set configuration parameter System-generated identifiers to Shortened.
Code replacement library is not set to None or AUTOSAR 4.0.	Set configuration parameter Code replacement library to None or AUTOSAR 4.0
Shared code placement is set to Auto.	Set configuration parameter Shared code placement to Shared location
Support: non-finite numbers is selected.	Clear configuration parameter Support: non-finite numbers
Support: complex numbers is selected.	Clear configuration parameter Support: complex numbers (ERT-based target only)
Support: continuous time is selected.	Clear configuration parameter Support: continuous time (ERT-based target only)
MAT-file logging is selected.	Clear configuration parameter MAT-file logging
Generate shared constants is selected.	Clear configuration parameter Generate shared constants .
Standard math library does not indicate the correct C programming language.	Set configuration parameter Standard math library to C89/C90 (ANSI) or C99 (ISO) depending on toolchain
Support non-inlined S-functions is selected.	Clear configuration parameter Support non-inlined S-functions (ERT-based target only)

Condition	Recommended Action
Use dynamic memory allocation for model initialization is selected when Code Interface Packaging is set to Reusable Function.	Clear configuration parameter Use dynamic memory allocation for model initialization . Select only when configuration parameter Code Interface Packaging is set to Reusable Function.
Parenthesis level is not set to Maximum (Specify precedence with parentheses).	Set configuration parameter Parentheses level to Maximum (Specify precedence with parentheses).
Replace multiplications by powers of two with signed bitwise shifts is selected.	Clear configuration parameter Replace multiplications by powers of two with signed bitwise shifts .
Casting Modes is not set to Standards Compliant.	Set configuration parameter Casting Modes to Standards Compliant.
Allow right shifts on signed integers is selected.	Clear configuration parameter Allow right shifts on signed integers .
Preserve static keyword in function declarations is cleared when File packaging format is set to Compact or CompactWithDataFile.	Select configuration parameter Preserve static keyword in function declarations (ERT-based target only).

Action Results

Clicking **Modify All** changes the parameter values to the recommended values.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

This check does not review referenced models.

IEC 61508, IEC 62304, ISO 26262, and EN 50128 Checks

IEC 61508, IEC 62304, ISO 26262, and EN 50128 checks facilitate designing and troubleshooting models, subsystems, and the corresponding generated code for applications to comply with IEC 61508-3, IEC 62304, ISO 26262-6, or EN 50128.

The Model Advisor performs a checkout of the Simulink Check license when you run the IEC 61508, IEC 62304, ISO 26262, or EN 50128 checks.

These checks are certified by the IEC Certification Kit for use in development processes that must comply with IEC 61508, ISO 26262, EN 50128, or derivative standards.

Tips

If your model uses model referencing, run the IEC 61508, IEC 62304, ISO 26262, or EN 50128 checks on all referenced models before running them on the top-level model.

 - “ISO 26262 Standard” (Embedded Coder)
 - “EN 50128 Standard” (Embedded Coder)

Check model object names

Check ID: `mathworks.iec61508.hisl_0032`

Check model object names.

Description

This check verifies that the following model object names comply with your own modeling guidelines or the high-integrity modeling guidelines. The check also verifies that the model object does not use a reserved name.

- Blocks
- Signals
- Parameters
- Busses
- Stateflow objects

Reserved names:

- MATLAB keywords
- Reserved keywords for C, C++, and code generation. For complete list, see “Reserved Keywords” (Simulink Coder).
- `int8`, `uint8`
- `int16`, `uint16`
- `int32`, `uint32`
- `inf`, `Inf`
- `NaN`, `nan`
- `eps`
- `intmin`, `intmax`
- `realmin`, `realmax`
- `pi`
- `infinity`
- `Nil`

Note For some cases, the Model Advisor reports an issue in multiple subchecks of this check.

Available with Simulink Check.

Input Parameters

To specify the naming standard and model object names that the check flags, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check model object names**. In the **Input Parameters** pane, for each of the model objects, select one of the following:
 - **MAAB** to use the MAAB naming standard. When you select MAAB, the check uses the regular expression $(^.{32,}$)|([\^a-zA-Z_0-9])|(\^d)|(\^)|(\^_) |(_)|(_$)$ to verify that names:
 - Use these characters: a-z, A-Z, 0-9, and the underscore (_).
 - Do not start with a number.
 - Do not use underscores at the beginning or end of a string.
 - Do not use more than one consecutive underscore.
 - Use strings that are less than 32 characters.
 - **Custom** to use your own naming standard. When you select Custom, you can enter your own **Regular expression for prohibited <model object> names**. For example, if you want to allow more than one consecutive underscore, enter $(^.{32,}$)|([\^a-zA-Z_0-9])|(\^d)|(\^)|(\^_) |(_)|(_$)$
 - **None** if you do not want the check to verify the model object name
- 2 Click **Apply**.
- 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The model object names do not comply with the naming standard specified in the input parameters.	Update the model object names to comply with your own or the high-integrity guidelines.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check safety-related optimization settings

Check ID: `mathworks.do178.OptionSet`

Check model configuration for optimization settings that can impact safety.

Description

This check verifies that model optimization configuration parameters are set optimally for generating code for a safety-related application. Although highly optimized code is desirable for most real-time systems, some optimizations can have undesirable side effects that impact safety.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>Block reduction optimization is selected. This optimization can remove blocks from generated code, resulting in requirements without associated code and violations for traceability requirements.</p> <p>See IEC 61508-3, Clauses 7.4.7.2, 7.4.8.3, and 7.7.2.8 which require to demonstrate that no unintended functionality has been introduced</p>	<p>Clear Configuration Parameter Block reduction (Simulink) or set parameter BlockReduction to off.</p>
<p>Implementation of logic signals as Boolean data is cleared. Strong data typing is recommended for safety-related code.</p> <p>See: IEC 61508-3, Table A.3 (2) 'Strongly typed programming language' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1c) 'Enforcement of strong typing' EN 50128, Table A.4 (8) 'Strongly Typed Programming Language'</p>	<p>Select Configuration Parameter Implement logic signals as boolean data (vs. double) (Simulink) or set the parameter BooleanDataType to on.</p>

Condition	Recommended Action
<p>The model includes blocks that depend on elapsed or absolute time and is configured to minimize the amount of memory allocated for the timers. Such a configuration limits the number of days the application can execute before a timer overflow occurs. Many aerospace products are powered on continuously and timers should not assume a limited lifespan.</p> <p>See: IEC 61508-3, Table A.4 (3) 'Defensive Programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>Set Configuration Parameter Application lifespan (days) (Simulink) or set the parameter <code>LifeSpan</code> to <code>inf</code>.</p>
<p>The optimization that suppresses the generation of initialization code for root-level inports and outports that are set to zero is selected. For safety-related code, you should explicitly initialize all variables.</p> <p>See: IEC 61508-3, Table A.4 (3) 'Defensive Programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter Remove root level I/O zero initialization (Simulink Coder) or set the parameter <code>ZeroExternalMemoryAtStartup</code> to <code>on</code>. Alternatively, integrate external, handwritten code that initializes all I/O variables to zero explicitly.</p>

Condition	Recommended Action
<p>The optimization that suppresses the generation of initialization code for internal work structures, such as block states and block outputs that are set to zero, is selected. For safety-related code, you should explicitly initialize every variable.</p> <p>See: IEC 61508-3, Table A.4 (3) 'Defensive Programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter Remove internal data zero initialization (Simulink Coder) or set the parameter <code>ZeroInternalMemoryAtStartup</code> to on. Alternatively, integrate external, handwritten code that initializes every state variable to zero explicitly.</p>
<p>The optimization that suppresses generation of code resulting from floating-point to integer conversions that wrap out-of-range values is cleared. You must avoid overflows for safety-related code. When this optimization is off and your model includes blocks that disable the Saturate on overflow parameter, the code generator wraps out-of-range values for those blocks. This can result in unreachable and, therefore, untestable code.</p> <p>See: IEC 61508-3, Table A.4 (3) 'Defensive Programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>If you have a Simulink Coder license, select Configuration Parameter Remove code from floating-point to integer conversions that wraps out-of-range values (Simulink Coder) or set the parameter <code>EfficientFloat2IntCast</code> to on.</p>

Condition	Recommended Action
<p>The optimization that suppresses generation of code that guards against division by zero for fixed-point data is selected. You must avoid division-by-zero exceptions in safety-related code.</p> <p>See: IEC 61508-3, Table A.4 (3) 'Defensive Programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter Remove code that protects against division arithmetic exceptions (Simulink Coder) or set the parameter NoFixptDivByZeroProtection to off.</p>
<p>The optimization that uses the specified minimum and maximum values for signals and parameters to optimize the generated code is selected. This might result in requirements without traceable code.</p> <p>See: IEC 61508-3, Table A.4 (3) 'Defensive Programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>If you have an Embedded Coder license and are using an ERT-based system target file, clear Configuration Parameter "Optimize using the specified minimum and maximum values" (Simulink Coder).</p>

Action Results

Clicking **Modify Settings** configures model optimization settings that can impact safety.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Display model metrics and complexity report

Check ID: `mathworks.iec61508.MdlMetricsInfo`

Display number of elements and name, level, and depth of subsystems for the model or subsystem.

Description

The IEC 61508, ISO 26262, and EN 50128 standards recommend the usage of size and complexity metrics to assess the software under development. This check provides metrics information for the model. The provided information can be used to inspect whether the size or complexity of the model or subsystem exceeds given limits. The check displays:

- A block count for each Simulink block type contained in the given model, including library linked blocks.
- A count of Stateflow constructs in the given model (if applicable).
- Name, level, and depth of the subsystems contained in the given model (if applicable).
- The maximum subsystem depth of the given model.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
N/A	This summary is provided for your information. No action is required.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

Check for unconnected objects

Check ID: `mathworks.iec61508.Unconnected0bjects`

Identify unconnected lines, input ports, and output ports in the model.

Description

Unconnected objects are likely to cause problems propagating signal attributes such as data, type, sample time, and dimensions.

Ports connected to Ground or Terminator blocks pass this check.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
There are unconnected lines, input ports, or output ports in the model or subsystem.	<ul style="list-style-type: none"> • Double-click an element in the list of unconnected items to locate the item in the model diagram. • Connect the objects identified in the results.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

- “Signal Basics” (Simulink)

Check for root Inports with missing properties

Check ID: `mathworks.iec61508.RootLevelInports`

Identify root model Inport blocks with missing or inherited sample times, data types or port dimensions.

Description

Using root model Inport blocks that do not have defined sample time, data types or port dimensions can lead to undesired simulation results. Simulink back-propagates dimensions, sample times, and data types from downstream blocks unless you explicitly assign these values. You can specify Inport block properties with block parameters or Simulink signal objects that explicitly resolve to the connected signal lines. When you run the check, a results table provides links to Inport blocks and signal objects that do not pass, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Missing port dimension — Model contains Inport blocks with inherited port dimensions.	For the listed Inport blocks and Simulink signal objects, specify port dimensions.
Missing signal data type — Model contains Inport blocks with inherited data types.	For the listed Inport blocks and Simulink signal objects, specify data types.
Missing port sample time — Model contains Inport blocks with inherited sample times.	For the listed Inport blocks and Simulink signal objects, specify sample times. The sample times for root Inports with bus type must match the sample times specified at the leaf elements of the bus object.

Condition	Recommended Action
Implicit resolution to a Simulink signal object — Model contains Inport block signal names that implicitly resolve to a Simulink signal object in the base workspace, model workspace, or Simulink data dictionary.	For the listed Simulink signal objects, in the property dialog, select signal property Signal name must resolve to Simulink signal object.

Capabilities and Limitations

- Does not run on library models.
- Allows exclusions of blocks and charts.

Tips

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to Ensure sample time independent
- For export-function models, *inherited sample time* is not flagged.

Check for MATLAB Function interfaces with inherited properties

Check ID: mathworks.iec61508.himl_0002

Identify MATLAB Functions that have inputs, outputs or parameters with inherited complexity or data type properties.

Description

The check identifies MATLAB Functions with inherited complexity or data type properties. A results table provides links to MATLAB Functions that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>MATLAB Functions have inherited interfaces.</p>	<p>Explicitly define complexity and data type properties for inports, outports, and parameters of MATLAB Functions identified in the results.</p> <p>If applicable, using the “MATLAB Function Block Editor” (Simulink), make the following modifications in the “Ports and Data Manager” (Simulink):</p> <ul style="list-style-type: none"> • Change Complexity from Inherited to On or Off. • Change Type from Inherit: Same as Simulink to an explicit type.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

Check MATLAB Function metrics

Check ID: `mathworks.iec61508.himl_0003`

Display complexity and code metrics for MATLAB Functions. Report metric violations.

Description

The IEC 61508, ISO 26262, and EN 50128 standards recommend the usage of size and complexity metrics to assess the software under development. This check provides complexity and code metrics for MATLAB Functions. The check additionally reports metric violations.

A results table provides links to MATLAB Functions that violate the complexity input parameters.

Available with Simulink Check.

Input Parameters

Maximum effective lines of code per function

Provide the maximum effective lines of code per function. Effective lines do not include empty lines, comment lines, or lines with a function end keyword.

Minimum density of comments

Provide minimum density of comments. Density is ratio of comment lines to total lines of code.

Maximum cyclomatic complexity per function

Provide maximum cyclomatic complexity per function. Cyclomatic complexity is the number of linearly independent paths through the source code.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Function violates the complexity input parameters.	For the MATLAB Function: <ul style="list-style-type: none"> • If effective lines of code is too high, further divide the MATLAB Function. • If comment density is too low, add comment lines. • If cyclomatic complexity per function is too high, further divide the MATLAB Function.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check for root Inports with missing range definitions

Check ID: `mathworks.iec61508.InportRange`

Identify root level Inport blocks with missing or erroneous minimum or maximum range values.

Description

The check identifies root level Inport blocks with missing or erroneous minimum or maximum range values. You can specify Inport block minimum and maximum values with

block parameters or Simulink signal objects that explicitly resolve to the connected signal lines. A results table provides links to Inport blocks and signal objects that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Missing range — Model contains Inport blocks with numeric data types that have missing range parameters (minimum and/or maximum).	For the listed Inport blocks and Simulink signal objects, specify scalar minimum and maximum parameters.
Missing range(s) for bus object — Bus objects defining the Inport blocks have leaf elements with missing ranges.	For the listed leaf elements, to specify the model interface range, provide scalar minimum and maximum parameters.
Range specified will be ignored — Minimum or maximum values at Inports or Simulink signal objects are not supported for bus data types. The values are ignored during range checking.	To enable range checking, specify minimum and maximum signal values on the leaf elements of the bus objects defining the data type.
No data type specified — Model contains Inport blocks or Simulink signal objects with inherited data types.	Specify one of the supported data types: <ul style="list-style-type: none"> • Enum • Simulink.AliasType • Simulink.Bus • Simulink.NumericType • build-in
Implicit resolution to a Simulink signal object — Model contains Inport block signal names that implicitly resolve to a Simulink signal object in the base workspace, model workspace, or Simulink data dictionary.	For the listed Simulink signal objects, in the property dialog, select signal property Signal name must resolve to Simulink signal object.

Capabilities and Limitations

- Does not run on library models.
- Allows exclusions of blocks and charts.

Check for root Outports with missing range definitions

Check ID: `mathworks.iec61508.OutportRange`

Identify root level Outport blocks with missing or erroneous minimum or maximum range values.

Description

The check identifies root level Outport blocks with missing or erroneous minimum or maximum range values. You can specify Outport block minimum and maximum values with block parameters or Simulink signal objects that explicitly resolve to the connected signal lines. A results table provides links to Outport blocks that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Missing range — Model contains Outport blocks with numeric data types that have missing range parameters (minimum and/or maximum).	For the listed Outport blocks and Simulink signal objects, specify scalar minimum and maximum parameters.

Condition	Recommended Action
Missing range(s) for bus object — Bus objects defining the Outport blocks have leaf elements with missing ranges.	For the listed leaf elements, to specify the model interface range, provide scalar minimum and maximum parameters.
Range specified at Outport will be ignored — Minimum or maximum values at Outports or Simulink signal objects are not supported for bus data types. The values are ignored during range checking.	To enable range checking, specify minimum and maximum signal values on the leaf elements of the bus objects defining the data type.
No bus data type specified — Model contains Outport block or Simulink signal objects with inherited bus data types.	For the Outport blocks and Simulink signal objects, specify one of the supported data types: <ul style="list-style-type: none"> • Enum • Simulink.AliasType • Simulink.Bus • Simulink.NumericType • build-in
Implicit resolution to a Simulink signal object — Model contains Outport block signal names that implicitly resolve to a Simulink signal object in the base workspace, model workspace, or Simulink data dictionary.	For the listed Simulink signal objects, in the property dialog, select signal property Signal name must resolve to Simulink signal object.

Capabilities and Limitations

Check for blocks not recommended for C/C++ production code deployment

Check ID: `mathworks.iec61508.PCGSupport`

Identify blocks not supported by code generation or not recommended for C/C++ production code deployment.

Description

This check partially identifies model constructs that are not recommended for C/C++ production code generation as identified in the Simulink Block Support (Simulink Coder) tables for Simulink Coder and Embedded Coder. If you are using blocks with support notes for code generation, review the information and follow the given advice.

Available with Simulink Check and Embedded Coder.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains blocks that should not be used for production code deployment.	Consider replacing the blocks listed in the results. Click an element from the list of questionable items to locate condition.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- IEC 61508-3, Table A.3 (3) - Language subset

Check for variant blocks with 'Generate preprocessor conditionals' active

Check ID: `mathworks.do178.VariantBlock`

Check variant block parameters for settings that might result in code that does not trace to requirements.

Description

This check verifies that variant block parameters for code generation are set to trace to requirements.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The option to generate preprocessor conditionals is selected in one or more variant blocks in the model.	In order to simplify the tracing of code to requirements, consider clearing the option to generate preprocessor conditionals in variant blocks.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

Check Stateflow charts for uniquely defined data objects

Check ID: mathworks.do178.hisl_0061

Identify Stateflow charts that include data objects that are not uniquely defined.

Description

This check searches your model for local data in Stateflow charts that is not uniquely defined.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow chart contains a data object identifier defined in two or more scopes.	For the identified chart, do one of the following: <ul style="list-style-type: none"> • Create a unique data object identifier within each of the scopes. • Create a unique data object identifier within the chart, at the parent level.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

Check usage of Stateflow constructs

Check ID: `mathworks.iec61508.StateflowProperUsage`

Identify usage of Stateflow constructs that might impact safety.

Description

This check identifies instances of Stateflow software being used in a way that can impact an application's safety, including:

- Use of strong data typing
- Port name mismatches
- Scope of data objects and events
- Formatting of state action statements
- Ordering of states and transitions
- Unreachable code
- Indeterminate execution time

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>A Stateflow chart is not configured for strong data typing on boundaries between a Simulink model and the Stateflow chart. See:</p> <ul style="list-style-type: none"> • hisf_0009: Strong data typing (Simulink and Stateflow boundary) • IEC 61508-3, Table A.3 (2) - Strongly typed programming language • IEC 62304, 5.5.3 - Software Unit acceptance criteria • ISO 26262-6, Table 1 (1c) - Enforcement of strong typing • EN 50128, Table A.4 (8) - Strongly Typed Programming Language 	<p>In the Chart properties dialog box, select Use Strong Data Typing with Simulink I/O for the Stateflow chart. When you select this check box, the Stateflow chart accepts input signals of any data type that Simulink models support, provided that the type of the input signal matches the type of the corresponding Stateflow input data object.</p>

Check state machine type of Stateflow charts

Check ID: `mathworks.iec61508.hisf_0001`

Identify whether Stateflow charts are all Mealy or all Moore charts.

Description

Compares the state machine type of all Stateflow charts to the type that you specify in the input parameters.

Available with Simulink Check.

This check requires a Stateflow license.

Input Parameters

Mealy or Moore

Check whether charts use the same state machine type, and are all Mealy or all Moore charts.

Mealy

Check whether all charts are Mealy charts.

Moore

Check whether all charts are Moore charts.

Results and Recommended Actions

Condition	Recommended Action
The input parameter is set to Mealy or Moore and charts in the model use either of the following: <ul style="list-style-type: none"> • Classic state machine types. • Multiple state machine types. 	For each chart, in the Chart Properties dialog box, specify State Machine Type to either Mealy or Moore . Use the same state machine type for all charts in the model.
The input parameter is set to Mealy and charts in the model use other state machine types.	For each chart, in the Chart Properties dialog box, specify State Machine Type to Mealy .
The input parameter is set to Moore and charts in the model use other state machine types.	For each chart, in the Chart Properties dialog box, specify State Machine Type to Moore .

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check Stateflow charts for ordering of states and transitions

Check ID: mathworks.do178.hisf_0002

Identify Stateflow charts that have **User specified state/transition execution order** cleared.

Description

Identify Stateflow charts that have **User specified state/transition execution order** cleared, and therefore do not use explicit ordering of parallel states and transitions.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Stateflow charts have User specified state/transition execution order cleared.	<p>For the specified charts, in the Chart Properties dialog box, select User specified state/transition execution order.</p> <p>To display the transition testing order, select Display > Chart > Transition Execution Order.</p>

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Action Results

Clicking **Modify** selects **User specified state/transition execution order** for the specified charts.

Check Stateflow debugging options

Check ID: `mathworks.do178.hisf_0011`

Check the Stateflow debugging settings.

Description

Verify the following debugging settings.

- **Wrap on overflow**
- **Simulation range checking**
- **Detect Cycles**

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
<p>Any of the following:</p> <ul style="list-style-type: none"> • Wrap on overflow is not set to error. • Simulation range checking is not set to error. • Detect Cycles is cleared. 	<p>In the Configuration Parameters dialog box, set:</p> <ul style="list-style-type: none"> • Wrap on overflow to error. • Simulation range checking to error. <p>In the model window, select:</p> <ul style="list-style-type: none"> • Simulation > Debug > MATLAB & Stateflow Error Checking Options > Detect Cycles.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Allows exclusions of blocks and charts.

Action Results

Clicking **Modify** selects the specified debugging options.

Check Stateflow charts for transition paths that cross parallel state boundaries

Check ID: mathworks.iec61508.hisf_0013

Identify transition paths that cross parallel state boundaries in Stateflow charts.

Description

Identify transition paths that cross parallel state boundaries in Stateflow charts. Using such transition paths creates diagrams that consist of transition executions, which are difficult to understand.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow charts have transition paths that cross parallel state boundaries.	Modify the Stateflow chart so that transitions do not cross parallel state boundaries. For more information see, "Design Considerations for Defining Transitions Between States" (Stateflow).

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Allows exclusions of blocks and charts.
- Analyzes content in all masked subsystems.

See Also

Check Stateflow charts for strong data typing

Check ID: `mathworks.iec61508.hisf_0015`

Identify variables and parameters in expressions with different data types in Stateflow objects.

Description

To facilitate strong data typing, this check identifies the variables and parameters in expressions with different data types in Stateflow states and transitions.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow objects have variables and parameters in expressions with different data types.	Explicitly cast variables and parameters in expressions to the same data types. For more information see, <code>cast</code> .

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Allows exclusions of blocks and charts.
- Analyzes content in all masked subsystems.
- Does not analyze the type of literals in expressions in Stateflow objects. Explicitly casts types of literals to the intended data type.

- Does not flag expressions with true and false keywords. For more information, see “Reserved Keywords for Code Generation” (Embedded Coder).

Check usage of lookup table blocks

Check ID: `mathworks.do178.LUTRangeCheckCode`

Check for lookup table blocks that do not generate out-of-range checking code.

Description

This check verifies that the following blocks generate code to protect against inputs that fall outside the range of valid breakpoint values:

- 1-D Lookup Table
- 2-D Lookup Table
- n-D Lookup Table
- Prelookup

This check also verifies that Interpolation Using Prelookup blocks generate code to protect against inputs that fall outside the range of valid index values.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The lookup table block does not generate out-of-range checking code.</p>	<p>Change the setting on the block dialog box so that out-of-range checking code is generated.</p> <ul style="list-style-type: none"> • For the 1-D Lookup Table, 2-D Lookup Table, n-D Lookup Table, and Prelookup blocks, clear the check box for Remove protection against out-of-range input in generated code. • For the Interpolation Using Prelookup block, clear the check box for Remove protection against out-of-range index in generated code.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Action Results

Clicking **Modify** verifies that lookup table blocks are set to generate out-of-range checking code.

Check for model elements that do not link to requirements

Check ID: `mathworks.iec61508.RequirementInfo`

Check whether Simulink model elements link to a requirements document.

Description

This check verifies whether model objects link to a document containing engineering requirements for traceability.

This check verifies whether model objects link to a document containing engineering requirements for traceability.

Available with Simulink Check.

This check requires a Simulink Requirements license.

Results and Recommended Actions

Condition	Recommended Action
Blocks do not link to a requirements document.	Link to requirements document. See .

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.
- Does not allow the exclusion of Stateflow elements.

Tip

Run this check from the top model or subsystem that you want to check.

Check for inconsistent vector indexing methods

Check ID: `mathworks.iec61508.hisl_0021`

Identify blocks with inconsistent indexing method.

Description

Using inconsistent block indexing methods can result in modeling errors. You should use a consistent vector indexing method for all blocks. This check identifies blocks with inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains blocks with inconsistent indexing methods. The indexing methods are zero-based, one-based or user-specified.	Modify the model to use a single consistent indexing method.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Check safety-related solver settings for simulation time

Check ID: `mathworks.iec61508.SimulationTimeOptions`

Check solver settings in the model configuration that apply to simulation time and might impact safety.

Description

This check verifies that the model solver configuration parameters pertaining to simulation time are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The solver setting to specify the start time for the simulation or generated code is set to a value other than 0.0.	In the Configuration Parameters dialog box,, set “Start time” (Simulink) or set the parameter StartTime to 0.0.
The solver setting to specify the stop time for the simulation or generated code is set to a negative value or a positive value greater than the value of “Application lifespan (days)” (Simulink). By default, “Application lifespan (days)” (Simulink) is auto. If you do not change this setting, any positive value for “Stop time” (Simulink) is valid.	In the Configuration Parameters dialog box, set “Stop time” (Simulink) or set the parameter StopTime to a positive value that is less than the value of “Application lifespan (days)” (Simulink).

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes content in masked subsystems that have no workspace and no dialog boxes.

Check safety-related solver settings for solver options

Check ID: `mathworks.iec61508.hisl_0041`

Check solver settings in the model configuration that apply to solvers and might impact safety.

Description

This check verifies that the model solver configuration parameters pertaining to solvers are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The solver setting to specify the type of solver to simulate model is set to <code>Variable-step</code> .	In the Configuration Parameters dialog box, set “Type” (Simulink) or set the parameter <code>SolverType</code> to <code>Fixed-step</code> .
The solver setting to specify the solver to compute the states of the model during simulation or code generation is set to a value other than <code>Discrete(no continuous states)</code> .	In the Configuration Parameters dialog box, set “Solver” (Simulink) to <code>discrete(no continuous states)</code> or set the parameter <code>Solver</code> to <code>FixedStepDiscrete</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

- Analyzes content in masked subsystems that have no workspace and no dialog boxes.

Check safety-related solver settings for tasking and sample-time

Check ID: `mathworks.iec61508.hisl_0042`

Check solver settings in the model configuration that apply to periodic sample time constraints and might impact safety.

Description

This check verifies that model configuration parameters are set optimally to ensure that the model operates at a specific set of prioritized periodic sample times for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Configuration parameter Automatically handle rate transition for data transfer is selected.	Clear Automatically handle rate transition for data transfer in the Configuration Parameters dialog box or set parameter <code>AutoInsertRateTranBlk</code> to off.

Capabilities and Limitations

- Does not run on library models.

- Does not allow exclusions of blocks or charts.

See Also

Check safety-related diagnostic settings for solvers

Check ID: `mathworks.do178.SolverDiagnosticsSet`

Check model configuration for diagnostic settings that apply to solvers and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to solvers are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic for detecting automatic breakage of algebraic loops is set to none or warning . The breaking of algebraic loops can affect the predictability of the order of block execution. For safety-related applications, a model developer needs to know when such breaks occur.	Set Algebraic loop (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>AlgebraicLoopMsg</code> to <code>error</code> . Consider breaking such loops explicitly with Unit Delay blocks so that the execution order is predictable. At a minimum, verify that the results of loops breaking automatically are acceptable.

Condition	Recommended Action
<p>The diagnostic for detecting automatic breakage of algebraic loops for Model blocks, atomic subsystems, and enabled subsystems is set to none or warning. The breaking of algebraic loops can affect the predictability of the order of block execution. For safety-related applications, a model developer needs to know when such breaks occur.</p>	<p>Set Minimize algebraic loop (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>ArtificialAlgebraicLoopMsg</code> to error. Consider breaking such loops explicitly with Unit Delay blocks so that the execution order is predictable. At a minimum, verify that the results of loops breaking automatically are acceptable.</p>
<p>The diagnostic for detecting potential conflict in block execution order is set to none or warning. For safety-related applications, block execution order must be predictable. A model developer needs to know when conflicting block priorities exist.</p>	<p>Set Block priority violation (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>BlockPriorityViolationMsg</code> to error.</p>
<p>The diagnostic for detecting whether a model contains an S-function that has not been specified explicitly to inherit sample time is set to none or warning. These settings can result in unpredictable behavior. A model developer needs to know when such an S-function exists in a model so it can be modified to produce predictable behavior.</p>	<p>Set Unspecified inheritability of sample time (Simulink) in the Configuration Parameters dialog box or set the parameter <code>UnknownTsInhSupMsg</code> to error.</p>
<p>The diagnostic for detecting whether the Simulink software automatically modifies the solver, step size, or simulation stop time is set to none or warning. Such changes can affect the operation of generated code. For safety-related applications, it is better to detect such changes so a model developer can explicitly set the parameters to known values.</p>	<p>Set Automatic solver parameter selection (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>SolverPrmCheckMsg</code> to error.</p>
<p>The diagnostic for detecting when a name is used for more than one state in the model is set to none. State names within a model should be unique. For safety-related applications, it is better to detect name clashes so a model developer can fix them.</p>	<p>Set State name clash (Simulink) on the Diagnostics > Solver pane in the Configuration Parameters dialog box or set the parameter <code>StateNameClashWarn</code> to warning.</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for sample time

Check ID: `mathworks.do178.SampleTimeDiagnosticsSet`

Check model configuration for diagnostic settings that apply to sample time and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to sample times are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic for detecting when a source block, such as a Sine Wave block, inherits a sample time (specified as -1) is set to none or warning. The use of inherited sample times for a source block can result in unpredictable execution rates for the source block and blocks connected to it. For safety-related applications, source blocks should have explicit sample times to prevent incorrect execution sequencing.</p>	<p>Set Source block specifies -1 sample time (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>InheritedTsInSrcMsg</code> to error.</p>
<p>The diagnostic for detecting invalid rate transitions between two blocks operating in multitasking mode is set to none or warning. Such rate transitions should not be used for embedded real-time code.</p>	<p>Set Multitask rate transition (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>MultiTaskRateTransMsg</code> to error.</p>
<p>The diagnostic for detecting subsystems that can cause data corruption or nondeterministic behavior is set to none or warning. This diagnostic detects whether conditionally executed multirate subsystems (enabled, triggered, or function-call subsystems) operate in multitasking mode. Such subsystems can corrupt data and behave unpredictably in real-time environments that allow preemption.</p>	<p>Set Multitask conditionally executed subsystem (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>MultiTaskCondExecSysMsg</code> to error.</p>
<p>The diagnostic for checking sample time consistency between a Signal Specification block and the connected destination block is set to none or warning. An over-specified sample time can result in an unpredictable execution rate.</p>	<p>Set Enforce sample times specified by Signal Specification blocks (Simulink) on the Diagnostics > Sample Time pane in the Configuration Parameters dialog box or set the parameter <code>SigSpecEnsureSampleTimeMsg</code> to error.</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to sample time and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for signal data

Check ID: `mathworks.do178.DataValiditySignalsDiagnosticsSet`

Check model configuration for diagnostic settings that apply to signal data and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to signal data are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic that specifies how the Simulink software resolves signals associated with <code>Simulink.Signal</code> objects is set to <code>Explicit and implicit</code> or <code>Explicit and warn implicit</code>. For safety-related applications, model developers should be required to define signal resolution explicitly.</p>	<p>Set Signal resolution (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>SignalResolutionControl</code> to <code>Explicit only</code>. This provides predictable operation by requiring users to define each signal and block setting that must resolve to <code>Simulink.Signal</code> objects in the workspace.</p> <p>Alternatively, to disable the use of <code>Simulink.Signal</code> objects, set the configuration parameter to <code>None</code>.</p>
<p>The Product block diagnostic that detects a singular matrix while inverting one of its inputs in matrix multiplication mode is set to <code>none</code> or <code>warning</code>. Division by a singular matrix can result in numeric exceptions when executing generated code. This is not acceptable in safety-related systems.</p>	<p>Set Division by singular matrix (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>CheckMatrixSingularityMsg</code> to <code>error</code>.</p>
<p>The diagnostic that detects when the Simulink software cannot infer the data type of a signal during data type propagation is set to <code>none</code> or <code>warning</code>. For safety-related applications, model developers must verify the data types of signals.</p>	<p>Set Underspecified data types (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>UnderSpecifiedDataTypeMsg</code> to <code>error</code>.</p>
<p>The diagnostic that detects whether the value of a signal is too large to be represented by the signal data type is set to <code>none</code> or <code>warning</code>. Undetected numeric overflows can result in unexpected application behavior.</p>	<p>Set Wrap on overflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>IntegerOverflowMsg</code> to <code>error</code>.</p>
<p>The diagnostic that detects whether the value of a signal is too large to be represented by the signal data type, resulting in a saturation, is set to <code>none</code> or <code>warning</code>. Undetected numeric overflows can result in unexpected application behavior.</p>	<p>Set Saturate on overflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>IntegerSaturationMsg</code> to <code>error</code>.</p>

Condition	Recommended Action
The diagnostic that detects when the value of a block output signal is Inf or NaN at the current time step is set to none or warning. When this type of block output signal condition occurs, numeric exceptions can result, and numeric exceptions are not acceptable in safety-related applications.	Set Inf or NaN block output (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter SignalInfNanChecking to error.
The diagnostic that detects Simulink object names that begin with rt is set to none or warning. This diagnostic prevents name clashes with generated signal names that have an rt prefix.	Set "rt" prefix for identifiers (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter RTPrefix to error.
The diagnostic that detects simulation range checking is set to none or warning. This diagnostic detects when signals exceed their specified ranges during simulation. Simulink compares the signal values that a block outputs with the specified range and the block data type.	Set Simulation range checking (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter SignalRangeChecking to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to signal data and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for compatibility

Check ID: `mathworks.do178.CompatibilityDiagnosticsSet`

Check model configuration for diagnostic settings that affect compatibility and that might impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to compatibility are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects when a block has not been upgraded to use features of the current release is set to <code>none</code> or <code>warning</code> . An S-function written for an earlier version might not be compatible with the current version and generated code could operate incorrectly.	Set S-function upgrades needed (Simulink) on the Diagnostics > Compatibility pane in the Configuration Parameters dialog box or set the parameter <code>SFcnCompatibilityMsg</code> to <code>error</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that affect compatibility and that might impact safety.

Capabilities and Limitations

- Does not run on library models.

- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for parameters

Check ID: `mathworks.do178.DataValidityParamDiagnosticsSet`

Check model configuration for diagnostic settings that apply to parameters and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to parameters are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects when a parameter downcast occurs is set to none or warning. A downcast to a lower signal range can result in numeric overflows of parameters, resulting in unexpected behavior.	Set Detect downcast (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter <code>ParameterDowncastMsg</code> to <code>error</code> .

Condition	Recommended Action
The diagnostic that detects when a parameter underflow occurs is set to none or warning. When the data type of a parameter does not have enough resolution, the parameter value is zero instead of the specified value. This can lead to incorrect operation of generated code.	Set Detect underflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter ParameterUnderflowMsg to error.
The diagnostic that detects when a parameter overflow occurs is set to none or warning. Numeric overflows can result in unexpected application behavior and should be detected and fixed in safety-related applications.	Set Detect overflow (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter ParameterOverflowMsg to error.
The diagnostic that detects when a parameter loses precision is set to none or warning. Not detecting such errors can result in a parameter being set to an incorrect value in the generated code.	Set Detect precision loss (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter ParameterPrecisionLossMsg to error.
The diagnostic that detects when an expression with tunable variables is reduced to its numerical equivalent is set to none or warning. This can result in a tunable parameter unexpectedly not being tunable in generated code.	Set Detect loss of tunability (Simulink) on the Diagnostics > Data Validity pane in the Configuration Parameters dialog box or set the parameter ParameterTunabilityLossMsg to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to parameters and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for model initialization

Check ID: `mathworks.do178.InitDiagnosticsSet`

In the model configuration, check diagnostic settings that affect model initialization and might impact safety.

Description

This check verifies that model diagnostic configuration parameters for initialization are optimally set to generate code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic, ensuring compatibility with previous releases of Simulink. The “Check undefined subsystem initial output” (Simulink) diagnostic is cleared. This diagnostic specifies whether Simulink displays a warning if the model contains a conditionally executed subsystem, in which a block with a specified initial condition drives an Output block with an undefined initial condition. A conditionally executed subsystem could have an output that is not initialized. If undetected, this condition can produce behavior that is nondeterministic.</p>	<p>Do one of the following:</p> <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Simplified. • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Classic and select Check undefined subsystem initial output (Simulink). • Set the parameter <code>CheckSSInitialOutputMsg</code> to on.
<p>In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic, ensuring compatibility with previous releases of Simulink. This diagnostic detects potential initial output differences from earlier releases. A conditionally executed subsystem could have an output that is not initialized. If undetected, this condition can produce behavior that is nondeterministic.</p>	<p>Do one of the following:</p> <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Simplified. • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Classic. • Set the parameter <code>CheckExecutionContextPreStartOutputMsg</code> to on.

Condition	Recommended Action
<p>In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic, ensuring compatibility with previous releases of Simulink. The “Check runtime output of execution context” (Simulink) diagnostic is cleared. This diagnostic detects potential output differences from earlier releases. A conditionally executed subsystem could have an output that is not initialized and feeds into a block with a tunable parameter. If undetected, this condition can cause the behavior of the downstream block to be nondeterministic.</p>	<p>Do one of the following:</p> <ul style="list-style-type: none"> • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Simplified. • In the Configuration Parameters dialog box, set Underspecified initialization detection (Simulink) to Classic and select Check runtime output of execution context (Simulink). • Set the parameter <code>CheckExecutionContextRuntimeOutputMsg</code> to on.

Action Results

To configure the diagnostic settings that affect model initialization and might impact safety, click **Modify Settings**.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for data used for debugging

Check ID: `mathworks.do178.DataValidityDebugDiagnosticsSet`

Check model configuration for diagnostic settings that apply to data used for debugging and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to debugging are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that enables model verification blocks is set to <code>Use local settings</code> or <code>Enable all</code> . Such blocks should be disabled because they are assertion blocks, which are for verification only. Model developers should not use assertions in embedded code.	In the Configuration Parameters dialog box, set Model Verification block enabling (Simulink) or set parameter <code>AssertControl</code> to <code>Disable All</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to data used for debugging and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for data store memory

Check ID: `mathworks.do178.DataStoreMemoryDiagnosticsSet`

Check model configuration for diagnostic settings that apply to data store memory and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to data store memory are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether the model attempts to read data from a data store in which it has not stored data in the current time step is set to a value other than <code>Enable all as errors</code> . Reading data before it is written can result in use of stale data or data that is not initialized.	Set Detect read before write (Simulink) in the Configuration Parameters dialog box or set the parameter <code>ReadBeforeWriteMsg</code> to <code>Enable all as errors</code> .
The diagnostic that detects whether the model attempts to store data in a data store, after previously reading data from it in the current time step, is set to a value other than <code>Enable all as errors</code> . Writing data after it is read can result in use of stale or incorrect data.	Set Detect write after read (Simulink) in the Configuration Parameters dialog box or set the parameter <code>WriteAfterReadMsg</code> to <code>Enable all as errors</code> .

Condition	Recommended Action
<p>The diagnostic that detects whether the model attempts to store data in a data store twice in succession in the current time step is set to a value other than Enable all as errors. Writing data twice in one time step can result in unpredictable data.</p>	<p>Set Detect write after write (Simulink) in the Configuration Parameters dialog box or set the parameter <code>WriteAfterWriteMsg</code> to Enable all as errors.</p>
<p>The diagnostic that detects when one task reads data from a Data Store Memory block to which another task writes data is set to none or warning. Reading or writing data in different tasks in multitask mode can result in corrupted or unpredictable data.</p>	<p>Set Multitask data store (Simulink) in the Configuration Parameters dialog box or set the parameter <code>MultiTaskDSMMsg</code> to error.</p>

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to data store memory and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for signal connectivity

Check ID: mathworks.do178.ConnectivitySignalsDiagnosticsSet

Check model configuration for diagnostic settings that apply to signal connectivity and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to signal connectivity are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects virtual signals that have a common source signal but different labels is set to none or warning. This diagnostic pertains to virtual signals only and has no effect on generated code. However, signal label mismatches can lead to confusion during model reviews.	Set Signal label mismatch (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>SignalLabelMismatchMsg</code> to error.
The diagnostic that detects when the model contains a block with an unconnected input signal is set to none or warning. This must be detected because code is not generated for unconnected block inputs.	Set Unconnected block input ports (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>UnconnectedInputMsg</code> to error.
The diagnostic that detects when the model contains a block with an unconnected output signal is set to none or warning. This must be detected because dead code can result from unconnected block output signals.	Set Unconnected block output ports (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>UnconnectedOutputMsg</code> to error.

Condition	Recommended Action
The diagnostic that detects unconnected signal lines and unmatched Goto or From blocks is set to none or warning. This error must be detected because code is not generated for unconnected lines.	Set Unconnected line (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter UnconnectedLineMsg to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to signal connectivity and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for bus connectivity

Check ID: mathworks.do178.ConnectivityBussesDiagnosticsSet

Check model configuration for diagnostic settings that apply to bus connectivity and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to bus connectivity are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a Model block's root Outport block is connected to a bus but does not specify a bus object is set to none or warning . For a bus signal to cross a model boundary, the signal must be defined as a bus object for compatibility with higher level models that use a model as a reference model.	Set Unspecified bus object at root Outport block (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>RootOutportRequireBusObject</code> to error.
The diagnostic that detects whether the name of a bus element matches the name specified by the corresponding bus object is set to none or warning . This diagnostic prevents the use of incompatible buses in a bus-capable block such that the output names are inconsistent.	Set Element name mismatch (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>BusObjectLabelMismatch</code> to error.
The diagnostic that detects when some blocks treat a signal as a mux/vector, while other blocks treat the signal as a bus, is set to none or warning . When the Simulink software automatically converts a muxed signal to a bus, it is possible for an unintended operation or unpredictable behavior to occur.	Set Bus signal treated as vector (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box to error, or the parameter <code>StrictBusMsg</code> to <code>ErrorOnBusTreatedAsVector</code> .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to bus connectivity and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings that apply to function-call connectivity

Check ID: `mathworks.do178.FcnCallDiagnosticsSet`

Check model configuration for diagnostic settings that apply to function-call connectivity and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to function-call connectivity are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects incorrect use of a function-call subsystem is set to <code>none</code> or <code>warning</code> . If this condition is undetected, incorrect code might be generated.	Set Invalid function-call connection (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter <code>InvalidFcnCallConnMsg</code> to <code>error</code> .

Condition	Recommended Action
The diagnostic that specifies whether the Simulink software has to compute inputs of a function-call subsystem directly or indirectly while executing the subsystem is set to Use local settings or Disable all. This diagnostic detects unpredictable data coupling between a function-call subsystem and the inputs of the subsystem in the generated code.	Set Context-dependent inputs (Simulink) on the Diagnostics > Connectivity pane in the Configuration Parameters dialog box or set the parameter FcnCallInpInsideContextMsg to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to function-call connectivity and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for type conversions

Check ID: mathworks.do178.TypeConversionDiagnosticsSet

Check model configuration for diagnostic settings that apply to type conversions and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to type conversions are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects Data Type Conversion blocks when the type conversion is set to none. The Simulink software might remove unnecessary Data Type Conversion blocks from generated code, which might result in requirements without corresponding code. The removal of these blocks needs to be identified so model developers can explicitly remove the unnecessary blocks .	Set the Unnecessary type conversions (Simulink) Configuration Parameter or <code>UnnecessaryDatatypeConvMsg</code> parameter to warning.
The diagnostic that detects vector-to-matrix or matrix-to-vector conversions at block inputs is set to none or warning. When the Simulink software automatically converts between vector and matrix dimensions, unintended operations or unpredictable behavior can occur.	Set the Vector/matrix block input conversion (Simulink) Configuration Parameter or <code>VectorMatrixConversionMsg</code> parameter to error
The diagnostic that detects when a 32-bit integer value is converted to a floating-point value is set to none. This type of conversion can result in a loss of precision due to truncation of the least significant bits for large integer values.	Set the 32-bit integer to single precision float conversion (Simulink) Configuration Parameter or <code>Int32ToFloatConvMsg</code> parameter to warning.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to type conversions and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for model referencing

Check ID: `mathworks.do178.MdlrefDiagnosticsSet`

Check model configuration for diagnostic settings that apply to model referencing and that can impact safety.

Description

This check verifies that model diagnostic configuration parameters pertaining to model referencing are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The diagnostic that detects a mismatch between the version of the model that creates or refreshes a Model block and the current version of the referenced model is set to error or warning. The detection occurs during load and update operations. When you get the latest version of the referenced model from the software configuration management system, rather than an older version that was used in a previous simulation, if this diagnostic is set to error, the simulation is aborted. If the diagnostic is set to warning, a warning message is issued. To resolve the issue, the user must resave the model being simulated, which may not be the desired action.</p>	<p>Set Model block version mismatch (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceVersionMismatchMessage</code> to none.</p>
<p>The diagnostic that detects port and parameter mismatches during model loading and updating is set to none or warning. If undetected, such mismatches can lead to incorrect simulation results because the parent and referenced models have different interfaces.</p>	<p>Set Port and parameter mismatch (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceIOMismatchMessage</code> to error.</p>
<p>The diagnostic that detects invalid internal connections to the current model's root-level Inport and Outport blocks is set to none or warning. When this condition is detected, the Simulink software might automatically insert hidden blocks into the model to fix the condition. The hidden blocks can result in generated code without traceable requirements. Setting the diagnostic to error forces model developers to fix the referenced models manually.</p>	<p>Set Invalid root Inport/Outport block connection (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceIOMessage</code> to error.</p>

Condition	Recommended Action
The diagnostic that detects whether To Workspace or Scope blocks are logging data in a referenced model is set to none or warning. Data logging is not supported for To Workspace and Scope blocks in referenced models.	Set Unsupported data logging (Simulink) on the Diagnostics > Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferenceDataLoggingMessage</code> to <code>error</code> . To log data, remove the blocks and log the referenced model signals. For more information, see “Logging Referenced Model Signals” (Simulink).

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to model referencing and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

Check safety-related model referencing settings

Check ID: `mathworks.do178.MdlrefOptSet`

Check model configuration for model referencing settings that can impact safety.

Description

This check verifies that model configuration parameters for model referencing are set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The referenced model is configured such that its target is rebuilt whenever you update, simulate, or generate code for the model, or if the Simulink software detects changes in known dependencies. These configuration settings can result in unnecessary regeneration of the code, resulting in changing only the date of the file and slowing down the build process when using model references.</p> <p>See: IEC 61508-3, Table A.3 (3) 'Language subset' IEC 61508-3, Table A.4 (3) 'Defensive programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1b) 'Use of language subsets' ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.4 (11) 'Language Subset' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>Set Rebuild (Simulink) on the Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>UpdateModelReferenceTargets</code> to <code>Never</code> or <code>If any changes detected</code>.</p>

Condition	Recommended Action
<p>The diagnostic that detects whether a target needs to be rebuilt is set to None or Warn if targets require rebuild. For safety-related applications, an error should alert model developers that the parent and referenced models are inconsistent. This diagnostic parameter is available only if Rebuild is set to Never.</p> <p>See: IEC 61508-3, Table A.3 (3) 'Language subset' IEC 61508-3, Table A.4 (3) 'Defensive programming' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1b) 'Use of language subsets' ISO 26262-6, Table 1 (1d) 'Use of defensive implementation techniques' EN 50128, Table A.4 (11) 'Language Subset' EN 50128, Table A.3 (1) 'Defensive Programming'</p>	<p>Set Never rebuild diagnostic (Simulink) on the Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>CheckModelReferenceTargetMessage</code> to <code>error</code>.</p>
<p>The ability to pass scalar root input by value is off. This capability should be off because scalar values can change during a time step and result in unpredictable data.</p> <p>See: IEC 61508-3, Table A.3 (3) 'Language subset' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1b) 'Use of language subsets' ' EN 50128, Table A.4 (11) 'Language Subset'</p>	<p>Set Pass fixed-size scalar root inputs by value for Real-Time Workshop (Simulink) on the Model Referencing pane in the Configuration Parameters dialog box or set the parameter <code>ModelReferencePassRootInputsByReference</code> to <code>off</code>.</p>

Condition	Recommended Action
<p>The model is configured to minimize algebraic loop occurrences. This configuration is incompatible with the recommended setting of Single output/update function for embedded systems code.</p> <p>See: IEC 61508-3, Table A.3 (3) 'Language subset' IEC 62304, 5.5.3 - Software Unit acceptance criteria ISO 26262-6, Table 1 (1b) 'Use of language subsets' ' EN 50128, Table A.4 (11) 'Language Subset'</p>	<p>In the Configuration Parameters dialog box, set Minimize algebraic loop occurrences (Simulink) or set parameter <code>ModelReferenceMinAlgLoopOccurrences</code> to off.</p>

Action Results

Clicking **Modify Settings** configures model referencing settings that can impact safety.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- “hisl_0037: Configuration Parameters > Model Referencing” (Simulink)
- “Analyze Model Dependencies” (Simulink)
- “Model Configuration Parameters: Model Referencing” (Simulink)

Check safety-related code generation settings

Check ID: `mathworks.do178.CodeSet`

Check model configuration for code generation settings that can impact safety.

Description

This check verifies that model configuration parameters for code generation are set optimally for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The option to include comments in the generated code is cleared. Comments provide good traceability between the code and the model.	Select Include comments (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>GenerateComments</code> to on.
The option to include comments that describe the code for blocks is cleared. Comments provide good traceability between the code and the model.	Select "Simulink block comments" (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>SimulinkBlockComments</code> to on.
The option to include comments that describe the code for blocks eliminated from a model is cleared. Comments provide good traceability between the code and the model.	Select Show eliminated blocks (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>ShowEliminatedStatement</code> to on.
The option to include the names of parameter variables and source blocks as comments in the model parameter structure declaration in <code>model_prm.h</code> is cleared. Comments provide good traceability between the code and the model.	Select Verbose comments for 'Model default' storage class (Simulink Coder) on the Code Generation > Comments pane in the Configuration Parameters dialog box or set the parameter <code>ForceParamTrailComments</code> to on.
The option to include requirement descriptions assigned to Simulink blocks as comments is cleared. Comments provide good traceability between the code and the model.	Select Requirements in block comments (Simulink Coder) on the Code Generation > Custom comments pane in the Configuration Parameters dialog box or set the parameter <code>ReqsInCode</code> to on.
The option to generate nonfinite data and operations is selected. Support for nonfinite numbers is inappropriate for real-time embedded systems.	Clear Support: non-finite numbers (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SupportNonFinite</code> to off.

Condition	Recommended Action
The option to generate and maintain integer counters for absolute and elapsed time is selected. Support for absolute time is inappropriate for real-time safety-related systems.	Clear Support: absolute time (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SupportAbsoluteTime</code> to off.
The option to generate code for blocks that use continuous time is selected. Support for continuous time is inappropriate for real-time safety-related systems.	Clear Support: continuous time (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SupportContinuousTime</code> to off.
The option to generate code for noninlined S-functions is selected. This option requires support of nonfinite numbers, which is inappropriate for real-time safety-related systems.	Clear Support: non-inlined S-functions (Simulink Coder) in the Configuration Parameters dialog box or set the parameter <code>SupportNonInlinedSFcns</code> to off.
The option to generate model function calls compatible with the main program module of the pre-R2012a GRT target is selected. This option is inappropriate for real-time safety-related systems.	Clear Classic call call interface (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>GRTInterface</code> to off.
The option to generate the <code>model_update</code> function is cleared. Having a single call to the output and update functions simplifies the interface to the real-time operating system (RTOS) and simplifies verification of the generated code.	Select Single output/update function (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>CombineOutputUpdateFcns</code> to on.
The option to generate the <code>model_terminate</code> function is selected. This function deallocates dynamic memory, which is unsuitable for real-time safety-related systems.	Clear Terminate function (Simulink Coder) on the Code Generation pane in the Configuration Parameters dialog box or set the parameter <code>IncludeMdlTerminateFcn</code> to off.
The option to log or monitor error status is cleared. If you do not select this option, the Simulink Coder product generates extra code that might not be reachable for testing.	Select Remove error status field in real-time model data structure (Simulink Coder) on the Code Generation > Interface pane in the Configuration Parameters dialog box or set the parameter <code>SuppressErrorStatus</code> to on.

Condition	Recommended Action
MAT-file logging is selected. This option adds extra code for logging test points to a MAT-file, which is not supported by embedded targets. Use this option only in test harnesses.	Clear MAT-file logging (Simulink Coder) in the Configuration Parameters dialog box or set the parameter <code>MatFileLogging</code> to off.
The option that specifies the style for parenthesis usage is set to Minimum (Rely on C/C++ operators precedence) or to Nominal (Optimize for readability) . For safety-related applications, explicitly specify precedence with parentheses.	Set parameter <code>ParenthesesLevel</code> to Maximum (Specify precedence with parentheses) .
The option that specifies whether to preserve operand order is cleared. This option increases the traceability of the generated code.	Set parameter <code>PreserveExpressionOrder</code> to on.
The option that specifies whether to preserve empty primary condition expressions in if statements is cleared. This option increases the traceability of the generated code.	Set parameter <code>PreserveIfCondition</code> to on.
The minimum number of characters specified for generating name mangling strings is less than four. You can use this option to minimize the likelihood that parameter and signal names will change during code generation when the model changes. Use of this option assists with minimizing code differences between file versions, decreasing the effort to perform code reviews.	Set Minimum mangle length (Simulink Coder) on the Code Generation > Symbols pane in the Configuration Parameters dialog box or the parameter <code>MangleLength</code> to a value of 4 or greater.

Action Results

Clicking **Modify Settings** configures model code generation settings that can impact safety.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check usage of shift operations for Stateflow data

Check ID: `mathworks.iec61508.hisf_0064`

Identify usage of shift operations for Stateflow data that might impact safety.

Description

This check inspects the shift operations that have shift operand values greater than the bit-width of the input or output type or a shift operand that has a negative value.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Right-shift operations are greater than the bit-width of the input type.	Explicitly modify the value of the bit-shift operations to be less than the shift operand.
Left-shift operations are greater than the bit-width of the output type.	Explicitly modify the value of the bit-shift operations to be less than the shift operand.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Does not support the shift operation that has the shift size defined as a Simulink signal or a variable.
- Does not support the shift operations that consist of shift size decided at run time.

Check assignment operations in Stateflow Charts

Check ID: `mathworks.iec61508.hisf_0065`

Identify assignment operations in Stateflow objects.

Description

This check identifies the assignment operations in Stateflow objects that implicitly cast integer and fixed-point arithmetic calculations to wider data types than the input data types.

This check identifies only the assignments with arithmetic operations.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow object consists of assignment operations that cast integer and fixed-point calculations to wider data types than the input data types.	Explicitly replace assignment operator (=) to := operator in Stateflow objects.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check Stateflow charts for unary operators

Check ID: `mathworks.iec61508.hisf_0211`

Identify unary operators in Stateflow charts.

Description

This check identifies the unary minus operators on unsigned data types in Stateflow charts.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The Stateflow chart consists of a unary minus operator on unsigned data types.	Explicitly modify the unary operator on unsigned data types. For more information, see “Unary Operations” (Stateflow).

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Does not flag expressions with bitwise and arithmetic operators. For example, `(u1/u2)` is not flagged.

Check safety-related optimization settings for Loop unrolling threshold

Check ID: `mathworks.iec61508.hisl_0051`

Check optimization settings in the model configuration that apply to Loop unrolling threshold and might impact safety.

Description

This check verifies that the model optimization configuration parameters pertaining to the minimum signal or parameter width for which a `for` loop is generated is set optimally for generating code for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The optimization setting to specify the minimum signal or parameter width for which a <code>for</code> loop is generated is set to a value less than 2.	In the Configuration Parameters dialog box, set Loop unrolling threshold or set the parameter <code>RollThreshold</code> to a value equal to or greater than 2.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes content in masked subsystems that have no workspace and no dialog boxes.

See Also

Check safety-related diagnostic settings for saving

Check ID: `mathworks.do178.SavingDiagnosticsSet`

Check model configuration for diagnostic settings that apply to saving model files

Description

This check verifies that model configuration parameters are set optimally for saving a model for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a model contains disabled library links before the model is saved is set to none or warning . If this condition is undetected, incorrect code might be generated.	Set Block diagram contains disabled library links (Simulink) in the Configuration Parameters dialog box or set parameter <code>SaveWithDisabledLinkMsg</code> to error .
The diagnostic that detects whether a model contains library links that are using parameters not in a mask before the model is saved is set to none or warning . If this condition is undetected, incorrect code might be generated.	Set Block diagram contains parameterized library links (Simulink) in the Configuration Parameters dialog box or set parameter <code>SaveWithParameterizedLinkMsg</code> to error .

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to saving a model file.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for Merge blocks

Check ID: `mathworks.iec61508.hisl_0303`

Check model configuration for diagnostic settings that apply to Merge blocks

Description

This check verifies that model configuration parameters are set optimally for Merge blocks for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a model contains Merge blocks with more than one driving block executing at the same time step is set to none or warning. In the Configuration Parameters dialog box, the “Underspecified initialization detection” (Simulink) diagnostic is set to Classic.	In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” (Simulink) or set the parameter MergeDetectMultiDrivingBlocksExec to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check safety-related diagnostic settings for Stateflow

Check ID: mathworks.iec61508.hisl_0311

Check safety-related diagnostic settings for Stateflow

Description

This check verifies that model configuration parameters are set optimally for Stateflow for a safety-related application.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The diagnostic that detects whether a chart configuration leads to unwanted backtracking during simulation is set to none or warning.	In the Configuration Parameters dialog box, set “Unexpected backtracking” (Simulink) or set the parameter SFUnexpectedBacktrackingDiag to error.
The diagnostic that detects whether a chart configuration has blocks that connect to chart input ports do not initialize their outputs during initialization is set to none or warning.	In the Configuration Parameters dialog box, set “Invalid input data access in chart initialization” (Simulink) or set the parameter SFInvalidInputDataAccessInChartInitDiag to error.
The diagnostic that detects whether a chart has an unconditional default transition to a state or a junction is set to none or warning.	In the Configuration Parameters dialog box, set “No unconditional default transitions” (Simulink) or set the parameter SFNoUnconditionalDefaultTransitionDiag to error.
The diagnostic that detects whether a chart contains a transition that loops outside of the parent state or junction is set to none or warning.	In the Configuration Parameters dialog box, set “Transition outside natural parent” (Simulink) or set the parameter SFTransitionOutsideNaturalParentDiag to error.
The diagnostic that detects whether a chart is constructed on a valid execution path is set to none or warning.	In the Configuration Parameters dialog box, set “Unreachable execution path” (Simulink) or set the parameter SFUnreachableExecutionPathDiag to error.

Action Results

Clicking **Modify Settings** configures model diagnostic settings that apply to solvers and that can impact safety.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

Check MATLAB Code Analyzer messages

Check ID: `mathworks.iec61508.himl_0004`

Check MATLAB Functions for `%#codegen` directive, MATLAB Code Analyzer messages, and justification message IDs.

Description

Verifies `%#codegen` directive, MATLAB Code Analyzer messages, and justification message IDs for:

- MATLAB code in MATLAB Function blocks
- MATLAB functions defined in Stateflow charts
- Called MATLAB functions

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>For MATLAB code in MATLAB Function blocks, either of the following:</p> <ul style="list-style-type: none"> • Code lines are not justified with a <code> %#ok</code> comment. • Codes lines justified with <code> %#ok</code> do not specify a message id. 	<ul style="list-style-type: none"> • Implement MATLAB Code Analyzer recommendations. • Justify not following MATLAB Code Analyzer recommendations with a <code> %#ok</code> comment. • Specify justified code lines with a message id. For example, <code> %#ok<NOPRT></code>.
<p>For MATLAB functions defined in Stateflow charts, either of the following:</p> <ul style="list-style-type: none"> • Code lines are not justified with a <code> %#ok</code> comment. • Codes lines justified with <code> %#ok</code> do not specify a message id. 	<ul style="list-style-type: none"> • Implement MATLAB Code Analyzer recommendations. • Justify not following MATLAB Code Analyzer recommendations with a <code> %#ok</code> comment. • Specify justified code lines with a message id. For example, <code> %#ok<NOPRT></code>.
<p>For called MATLAB functions:</p> <ul style="list-style-type: none"> • Code does not have the <code> %#codegen</code> directive. • Code lines are not justified with a <code> %#ok</code> comment. • Codes lines justified with <code> %#ok</code> do not specify a message id. 	<ul style="list-style-type: none"> • Insert <code> %#codegen</code> directive in the MATLAB code. • Implement MATLAB Code Analyzer recommendations. • Justify not following MATLAB Code Analyzer recommendations with a <code> %#ok</code> comment. • Specify justified code lines with a message id. For example, <code> %#ok<NOPRT></code>.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

Check MATLAB code for global variables

Check ID: mathworks.iec61508.himl_0005

Check for global variables in MATLAB code.

Description

Verifies that global variables are not used in any of the following:

- MATLAB code in MATLAB Function blocks
- MATLAB functions defined in Stateflow charts
- Called MATLAB functions

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Global variables are used in one or more of the following: <ul style="list-style-type: none"> • MATLAB code in MATLAB Function blocks • MATLAB functions defined in Stateflow charts • Called MATLAB functions 	Replace global variables with signal lines, function arguments, or persistent data.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

Check usage of Math Operations blocks

Check ID: `mathworks.iec61508.MathOperationsBlocksUsage`

Identify usage of Math Operation blocks that might impact safety.

Description

This check inspects the usage of the following blocks:

- Abs

- Assignment
- Gain

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>The model or subsystem contains an Absolute Value block that is operating on one of the following:</p> <ul style="list-style-type: none"> • A boolean or an unsigned input data type. This condition results in unreachable simulation pathways through the model and might result in unreachable code • A signed integer value with the Saturate on integer overflow check box not selected. For signed data types, the absolute value of the most negative value is problematic because it is not representable by the data type. This condition results in an overflow in the generated code. 	<p>If the identified Absolute Value block is operating on a boolean or unsigned data type, do one of the following:</p> <ul style="list-style-type: none"> • Change the input of the Absolute Value block to a signed input type. • Remove the Absolute Value block from the model. <p>If the identified Absolute Value block is operating on a signed data type, in the Block Parameters > Signal Attributes dialog box, select Saturate on integer overflow.</p>
<p>The model or subsystem contains Gain blocks with a of value 1 or an identity matrix.</p>	<p>If you are using Gain blocks as buffers, consider replacing them with Signal Conversion blocks.</p>
<p>The model or subsystem might contain Assignment blocks with incomplete array initialization that do not have block parameter Action if any output element is not assigned set to Error or Warning.</p>	<p>Set block parameter Action if any output element is not assigned to one of the recommended values:</p> <ul style="list-style-type: none"> • Error, if Assignment block is not in an Iterator subsystem. • Warning, if Assignment block is in an Iterator subsystem.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Signal Routing blocks

Check ID: `mathworks.iec61508.SignalRoutingBlockUsage`

Identify usage of Signal Routing blocks that might impact safety.

Description

This check identifies model or subsystem Switch blocks that might generate code with inequality operations (`~=`) in expressions that contain a floating-point variable or constant.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains a Switch block that might generate code with inequality operations ($\sim=$) in expressions where at least one side of the expression contains a floating-point variable or constant. The Switch block might cause floating-point inequality comparisons in the generated code.	For the identified block, do one of the following: <ul style="list-style-type: none"> For the control input block, change the Data type parameter setting. Change the Switch block Criteria for passing first input parameter setting. This might change the algorithm.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Logic and Bit Operations blocks

Check ID: `mathworks.iec61508.LogicBlockUsage`

Identify usage of Logical Operator and Bit Operations blocks that might impact safety.

Description

This check inspects the usage of:

- Blocks that compute relational operators, including Relational Operator, Compare To Constant, Compare To Zero, Detect Change, and If blocks
- Logical Operator blocks

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains a block computing a relational operator that is operating on different data types. The condition can lead to unpredictable results in the generated code.	For the identified blocks, use common data types as inputs. You can use Data Type Conversion blocks to change input data types.
The model or subsystem contains a block computing a relational operator that does not have Boolean output. The condition can lead to unpredictable results in the generated code.	For the specified blocks, on the Block Parameters > Signal Attributes pane, set the Output data type to boolean.
The model or subsystem contains a block computing a relational operator that uses the == or ~= operator to compare floating-point signals. The use of these operators on floating-point signals is unreliable and unpredictable because of floating-point precision issues. These operators can lead to unpredictable results in the generated code.	For the identified block, do one of the following: <ul style="list-style-type: none"> • Change the signal data type. • Rework the model to eliminate using == or ~= operators on floating-point signals.

Condition	Recommended Action
The model or subsystem contains a Logical Operator block that has inputs or outputs that are not Boolean inputs or outputs. The block might result in floating-point equality or inequality comparisons in the generated code.	<ul style="list-style-type: none"> • Modify the Logical Operator block so that all inputs and outputs are Boolean. On the Block Parameters > Signal Attributes pane, consider selecting Require all inputs to have the same data type and setting Output data type to boolean. • In the Configuration Parameters dialog box, consider selecting the Implement logic signals as boolean data (vs. double).

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Ports and Subsystems blocks

Check ID: `mathworks.iec61508.PortsSubsystemsUsage`

Identify usage of Ports and Subsystems blocks that might impact safety.

Description

This check inspects the usage of:

- For Iterator blocks
- While Iterator blocks
- If blocks
- Switch Case blocks

The check does not flag Switch Case blocks that do not use integer data types or enumeration values for inputs. To comply with “hisl_0011: Usage of Switch Case blocks and Action Subsystem blocks” (Simulink) - C, use an integer data type or an enumeration value for the inputs to Switch Case blocks.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains a For Iterator block that has variable iterations. This condition can lead to unpredictable execution times or infinite loops in the generated code.	For the identified For Iterator blocks, do one of the following: <ul style="list-style-type: none"> • Set the Iteration limit source parameter to <code>internal</code>. • If the Iteration limit source parameter must be <code>external</code>, use a Constant, Probe, or Width block as the source. • Clear the Set next i (iteration variable) externally check box. • Consider selecting the Show iteration variable check box and observe the iteration value during simulation.

Condition	Recommended Action
The model or subsystem contains a While Iterator block that has unlimited iterations. This condition can lead to infinite loops in the generated code. mo	For the identified While Iterator blocks: <ul style="list-style-type: none"> • Set the Maximum number of iterations (-1 for unlimited) parameter to a positive integer value. • Consider selecting the Show iteration number port check box and observe the iteration value during simulation.
The model or subsystem contains an If block with an If expression or Elseif expressions that might cause floating-point equality or inequality comparisons in generated code.	Modify the expressions in the If block to avoid floating-point equality or inequality comparisons in generated code.
The model or subsystem contains an If block using Elseif expressions without an Else condition.	In the If block Block Parameters dialog box, select Show else condition . Connect the resulting Else output port to an If Action Subsystem block.
The model or subsystem contains an If block with output ports that do not connect to If Action Subsystem blocks.	Verify that output ports of the If block connect to If Action Subsystem blocks.
The model or subsystem contains an Switch Case block without a default case.	In the Switch Case block Block Parameters dialog box, select Show default case . Connect the resulting default output port to a Switch Case Action Subsystem block.
The model or subsystem contains a Switch Case block with an output port that does not connect to a Switch Case Action Subsystem block.	Verify that output ports of the Switch Case blocks connect to Switch Case Action Subsystem blocks.

Condition	Recommended Action
<p>The model or subsystem contains one of the following time-dependent blocks in a For Iterator or While Iterator subsystem:</p> <ul style="list-style-type: none"> • Discrete Filter • Discrete FIR Filter • Discrete State-Space • Discrete Transfer Fcn • Discrete Zero-Pole • Transfer Fcn First Order • Transfer Fcn Lead or Lag • Transfer Fcn Real Zero • Discrete Derivative • Discrete Transfer Fcn (with initial outputs) • Discrete Transfer Fcn (with initial states) • Discrete Zero-Pole (with initial outputs) • Discrete Zero-Pole (with initial states) 	<p>In the model or subsystem, consider removing the time-dependent blocks.</p>

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Display configuration management data

Check ID: `mathworks.iec61508.MdlVersionInfo`

Display model configuration and checksum information.

Description

This informer check displays the following information for the current model:

- Model version number
- Model author
- Date
- Model checksum

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Could not retrieve model version and checksum information.	This summary is provided for your information. No action is required.

Capabilities and Limitations

- Does not run on library models.

- Does not allow exclusions of blocks or charts.

Check for blocks not recommended for MISRA C:2012

Check ID: `mathworks.misra.BlkSupport`

Identify blocks that are not supported or recommended for MISRA C:2012 compliant code generation.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Lookup Table blocks using cubic spline interpolation or extrapolation methods were found in the model or subsystem.	Consider other interpolation and extrapolation methods for the Lookup Table blocks.

Condition	Recommended Action
<p>Deprecated Lookup Table blocks were found in the model or subsystem.</p> <p>The deprecated Lookup Table blocks are Lookup and Lookup2D.</p>	<p>Consider replacing the deprecated Lookup Table blocks.</p>
<p>S-Function Builder blocks were found in the model or subsystem.</p>	<p>Consider replacing the S-Function Builder blocks with blocks recommended for production.</p>
<p>From Workspace blocks were found in the model or subsystem.</p>	<p>Consider replacing the From Workspace blocks with blocks recommended for production.</p>

Capabilities and Limitations

You can:

- Run this check on your library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “hisl_0020: Blocks not recommended for MISRA C:2012 compliance” (Simulink)

Check configuration parameters for MISRA C:2012

Check ID: `mathworks.misra.CodeGenSettings`

Identify configuration parameters that might impact MISRA C:2012 compliant code generation.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Use division for fixed-point net slope computation is not set to On or Use division for reciprocals of integers only.	Set configuration parameter Use division for fixed-point net slope computation to On or Use division for reciprocals of integers only.
Bitfield declarator type specifier is set to uchar_T when any these parameters are selected: <ul style="list-style-type: none"> • Pack Boolean data into bitfields • Use bitsets for storing state configuration • Use bitsets for storing Boolean data 	Set configuration parameter Bitfield declarator type specifier to uint_T.
Model Verification block enabling is set to Use local settings or Enable All.	Set configuration parameter Model Verification block enabling to Disable All.
Wrap on overflow is set to None	Set configuration parameter Wrap on overflow to warning or error.
Inf or NaN block output is set to None	Set configuration parameter Inf or NaN block output to warning or error.
Signed integer division rounds to is not set to Zero or Floor.	Set configuration parameter Signed integer division rounds to to Zero or Floor.
Dynamic memory allocation in MATLAB Function blocks is selected.	Clear configuration parameter Dynamic memory allocation in MATLAB Function blocks .
System target file is set to a GRT-based target.	Set configuration parameter System target file to an ERT-based target.

Condition	Recommended Action
Maximum identifier length	Set the configuration parameter value to the implementation dependent limit. The default is 31.
System-generated identifiers is set to Classic.	Set configuration parameter System-generated identifiers to Shortened.
Code replacement library is not set to None or AUTOSAR 4.0.	Set configuration parameter Code replacement library to None or AUTOSAR 4.0
Shared code placement is set to Auto.	Set configuration parameter Shared code placement to Shared location
Support: non-finite numbers is selected.	Clear configuration parameter Support: non-finite numbers
Support: complex numbers is selected.	Clear configuration parameter Support: complex numbers (ERT-based target only)
Support: continuous time is selected.	Clear configuration parameter Support: continuous time (ERT-based target only)
MAT-file logging is selected.	Clear configuration parameter MAT-file logging
Generate shared constants is selected.	Clear configuration parameter Generate shared constants .
Standard math library does not indicate the correct C programming language.	Set configuration parameter Standard math library to C89/C90 (ANSI) or C99 (ISO) depending on toolchain
Support non-inlined S-functions is selected.	Clear configuration parameter Support non-inlined S-functions (ERT-based target only)
Use dynamic memory allocation for model initialization is selected when Code Interface Packaging is set to Reusable Function.	Clear configuration parameter Use dynamic memory allocation for model initialization . Select only when configuration parameter Code Interface Packaging is set to Reusable Function.

Condition	Recommended Action
Parenthesis level is not set to Maximum (Specify precedence with parentheses).	Set configuration parameter Parentheses level to Maximum (Specify precedence with parentheses).
Replace multiplications by powers of two with signed bitwise shifts is selected.	Clear configuration parameter Replace multiplications by powers of two with signed bitwise shifts .
Casting Modes is not set to Standards Compliant.	Set configuration parameter Casting Modes to Standards Compliant.
Allow right shifts on signed integers is selected.	Clear configuration parameter Allow right shifts on signed integers .
Preserve static keyword in function declarations is cleared when File packaging format is set to Compact or CompactWithDataFile.	Select configuration parameter Preserve static keyword in function declarations (ERT-based target only).

Action Results

Clicking **Modify All** changes the parameter values to the recommended values.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

This check does not review referenced models.

Check font formatting

Check ID: `mathworks.maab.db_0043`

Check for difference in font and font sizes.

Description

With the exception of free text annotations within a model, text elements, such as block names, block annotations, and signal labels, must have the same font style and font size. Select a font style and font size that is legible and portable (convertible between platforms), such as Arial or Times New Roman 12 point. To specify font rules for a Simulink session, from the Simulink editor select **Diagram > Format > Font Styles for Model**.

Available with Simulink Check.

Input Parameters

Font Name

Apply the specified font to all text elements. When you specify **Common** (default), the check identifies different fonts used in your model. Although you can specify other fonts, the fonts available from the drop-down list are Arial, Courier New, Georgia, Times New Roman, Arial Black, and Verdana.

Font Size

Apply the specified font size to all text elements. When you specify **Common** (default), the check identifies different font sizes used in your model. Although you can specify other font sizes, the font sizes available from the drop-down list are 6, 8, 9, 10, 12, 14, 16.

Font Style

Apply the specified font style to all text elements. When you specify **Common** (default), the check identifies different font styles used in your model. The font styles available from the drop-down list are normal, bold, italic, and bold italic.

Results and Recommended Actions

Condition	Recommended Action
The fonts or font sizes for text elements in the model are not consistent or portable.	Specify values for the font parameters and in the right pane of the Model Advisor, click Modify all Fonts , or manually change the fonts and font sizes of text elements in the model so they are consistent and portable.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Action Results

In the right pane of the Model Advisor, clicking **Modify all Fonts** changes the font and font size of all text elements in the model according to the values you specify in the input parameters.

For the input parameters, if you specify **Common**, clicking **Modify all Fonts** changes the font and font sizes of all text elements in the model to the most commonly used fonts, font sizes, or font styles.

- JMAAB guideline, Version 4.0: db_0043: Simulink font and font size.

Check transition orientations in flow charts

Check ID: `mathworks.maab.db_0132`

Check transition orientations in flow charts.

Description

The following rules apply to transitions in flow charts:

- Draw transition conditions horizontally.
- Draw transitions with a condition action vertically.
- Junctions in flow charts should have a default exit transition.
- Transitions in flow charts should not combine condition and action.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The model includes a transition with a condition that is not drawn horizontally or a transition action that is not drawn vertically.	Modify the model.
Junction does not have a default exit transition	Add a default exit transition to the junction.
Transition has condition and action	Split up condition and action into separate transitions

Capabilities and Limitations

- MAAB guideline, Version 3.0 limitation: Although db_0132: Transitions in flow charts has an exception for loop constructs, the check does flag flow charts containing loop constructs if the transition violates the orientation rule.
- JMAAB guideline, Version 4.0 limitation: The check only flags flow charts containing loop constructs if the transition violates the orientation rule.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0132: Transitions in flow charts in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0132: Transitions in Flow Charts.

Check for nondefault block attributes

Check ID: `mathworks.maab.db_0140`

Identify blocks that use nondefault block parameter values that are not displayed in the model diagram.

Description

Model diagrams should display block parameters that have values other than default values. One way of displaying this information is by using the **Block Annotation** tab in the Block Properties dialog box. To automatically fix warnings associated with this check, see “Automatically Fix Display of Nondefault Block Parameters”.

To customize the list of nondefault block parameters that are flagged by the check, see “Customize Model Advisor Check for Nondefault Block Attributes”.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Block parameters that have values other than default values, and the values are not in the model display.	In the Block Properties dialog box, use the Block Annotation tab to add block parameter annotations.

Capabilities and Limitations

- Only customizable for block parameters in `IntrinsicDialogParameters`. See “Common Block Properties” (Simulink)
- JMAAB guideline, Version 4.0 limitation: The check flags masked blocks that display parameter information but do not use block annotations. JMAAB 4.0 guidelines allow masked blocks to display parameter information.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialog boxes.
- Allows exclusions of blocks and charts.

Tip

If you use the `add_block` function with `'built-in/blocktype'` as a source block path name for Simulink built-in blocks, some default parameter values of some blocks are different from the defaults that you get if you added those blocks interactively by using Simulink.

See Also

- MAAB guideline, Version 3.0: db_0140: Display of basic block parameters.
- JMAAB guideline, Version 4.0: db_0140: Display of block parameters.
- For a list of block parameter default values, see “Block-Specific Parameters” (Simulink).
- `add_block`.

Check usage of merge blocks

Check ID: `mathworks.maab.na_0032`

Check usage of Merge blocks.

Description

Identifies instances where buses are not identical in the Merge block, including number of elements, element names, element order, element data type, and element size.

Note These Merge block constraints are not covered by this check. They are flagged via compile-time errors.

- Signals and buses entering the Merge block cannot branch off to other blocks.
 - Buses must be either all virtual or all nonvirtual.
-

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Block parameter Allow unequal port widths is selected.	Clear block parameter Allow unequal port widths/

Condition	Recommended Action
Elements for bus input to a Merge block are different.	Bus input to a Merge block must be equivalent, including the same hierarchy with identical names and attributes for all elements. Consider updating the elements so that all buses are identical.
Data types for input signals to a Merge block are different.	The Merge block accepts real or complex signals of any data type that Simulink supports, including fixed-point and enumerated data types. Inputs must be of the same data type and numeric type. Consider updating the signals so data types are the same.
Dimensions of input signals to a Merge block are different.	The Merge block accepts only inputs of equal dimensions. Consider updating the signals inputs so they have the same dimensions.
Unequal number of inputs on the Merge block.	Connect a Merge block to at least two input signals and verify that input signals have the same sample time. Consider making the number of inputs signal and input ports the same.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0032: Use of merge blocks in the Simulink documentation.

Check signal line labels

Check ID: mathworks.maab.na_0008

Check the labeling on signal lines.

Description

Use a label to identify:

- Signals originating from the following blocks (the block icon exception noted below applies to all blocks listed, except Inport, Bus Selector, Demux, and Selector):
 - Bus Selector block (tool forces labeling)
 - Chart block (Stateflow)
 - Constant block
 - Data Store Read block
 - Demux block
 - From block
 - Inport block
 - Selector block
 - Subsystem block

Block Icon Exception If a signal label is visible in the display of the icon for the originating block, you do not have to display a label for the connected signal unless the signal label is required elsewhere due to a rule for signal destinations.

- Signals connected to one of the following destination blocks (directly or indirectly with a basic block that performs an operation that is not transformative):
 - Bus Selector block (tool forces labeling)
 - Chart block (Stateflow)
 - Data Store Write block
 - Goto block
 - Mux block
 - Outport block
 - Subsystem block
- Any signal of interest.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Signals coming from Bus Selector, Chart, Constant, Data Store Read, Demux, From, Inport, or Selector blocks are not labeled.	Label the signal.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: na_0008: Display of labels on signals in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0008: Display of labels on signals.
- “Signal Names and Labels” (Simulink).

Check for propagated signal labels

Check ID: `mathworks.maab.na_0009`

Check for propagated labels on signal lines.

Description

You should propagate a signal label from its source rather than enter the signal label explicitly (manually) if the signal originates from:

- An Inport block in a nested subsystem. However, if the nested subsystem is a library subsystem, you can explicitly label the signal coming from the Inport block to accommodate reuse of the library block.
- A basic block that performs a nontransformative operation.
- A Subsystem or Stateflow Chart block. However, if the connection originates from the output of an instance of the library block, you can explicitly label the signal to accommodate reuse of the library block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model includes signal labels that were entered explicitly, but should be propagated.	Use the open angle bracket (<) character to mark signal labels that should be propagated and remove the labels that were entered explicitly.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: na_0009: Entry versus propagation of signal labels in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0009: Entry versus propagation of signal labels.
- “Signal Names and Labels” (Simulink).

Check default transition placement in Stateflow charts

Check ID: `mathworks.maab.jc_0531`

Check default transition placement in Stateflow charts.

Description

In a Stateflow chart, you should connect the default transition at the top of the state and place the destination state of the default transition above other states in the hierarchy. There should be only one default transition.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
There is no default transition.	Add a default transition.
The default transition for a Stateflow chart is not connected at the top of the state.	Move the default transition to the top of the Stateflow chart.
The destination state of a Stateflow chart default transition is lower than other states in the same hierarchy.	Adjust the position of the default transition destination state so that the state is above other states in the same hierarchy.
There is more than one default transition.	Multiple default transitions should be combined into one default transition by using junctions and conditions.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0531: Placement of the default transition in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0531: Placement of the default transition.

Check return value assignments of graphical functions in Stateflow charts

Check ID: mathworks.maab.jc_0511

Identify graphical functions with multiple assignments of return values in Stateflow charts.

Description

The return value from a Stateflow graphical function must be set in only one place.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The return value from a Stateflow graphical function is assigned in multiple places.	Modify the specified graphical function so that its return value is set in one place.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0511: Setting the return value from a graphical function in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0511: Setting the return value from a graphical function.
- “When to Use Reusable Functions in Charts” (Stateflow).

Check entry formatting in State blocks in Stateflow charts

Check ID: `mathworks.maab.jc_0501`

Identify missing line breaks between entry action (en), during action (du), and exit action (ex) entries in states. Identify missing line breaks after semicolons (;) in statements.

Description

Start a new line after the entry, during, and exit entries, and after the completion of a statement “;”.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
An entry (en) is not on a new line.	Add a new line after the entry.
A during (du) is not on a new line.	Add a new line after the during.
An exit (ex) is not on a new line.	Add a new line after the exit.
Multiple statements found on one line.	Add a new line after each statement.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

MAAB guideline, Version 3.0: jc_0501: Format of entries in a State block in the Simulink documentation.

Check usage of return values from a graphical function in Stateflow charts

Check ID: mathworks.maab.jc_0521

Identify calls to graphical functions in conditional expressions.

Description

Do not use the return value of a graphical function in a comparison operation.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Conditional expressions contain calls to graphical functions.	Assign return values of graphical functions to intermediate variables. Use these intermediate variables in the specified conditional expressions.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0521: Use of the return value from graphical functions in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0521: Use of the return value from graphical functions.
- “When to Use Reusable Functions in Charts” (Stateflow).
- “Reuse Logic Patterns Using Graphical Functions” (Stateflow).

Check for pointers in Stateflow charts

Check ID: mathworks.maab.jm_0011

Identify pointer operations on custom code variables.

Description

Pointers to custom code variables are not allowed.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Custom code variables use pointer operations.	Modify the specified chart to remove the dependency on pointer operations.

Capabilities and Limitations

- Applies only to Stateflow charts that use C as the action language.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0011: Pointers in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: jm_0011: Pointers in Stateflow.

Check for event broadcasts in Stateflow charts

Check ID: `mathworks.maab.jm_0012`

Identify undirected event broadcasts that might cause recursion during simulation and generate inefficient code.

Description

Event broadcasts in Stateflow charts must be directed.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Event broadcasts are undirected.	Rearchitect the diagram to use directed event broadcasting. Use the send syntax or qualified event names to direct the event to a particular state. Use multiple send statements to direct an event to more than one state.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0012: Event broadcasts in the Simulink documentation.
- JMAAB guideline, Version 4.0: jm_0012: Event broadcasts.
- “Broadcast Events to Synchronize States” (Stateflow).

Check transition actions in Stateflow charts

Check ID: `mathworks.maab.db_0151`

Identify missing line breaks between transition actions.

Description

For readability, start each transition action on a new line.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Multiple transition actions are on a single line.	Verify that each transition action begins on a new line.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0151: State machine patterns for transition actions in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0151: State machine patterns for transition actions.
- “Syntax for States and Transitions” (Stateflow)

Check for MATLAB expressions in Stateflow charts

Check ID: `mathworks.maab.db_0127`

Identify Stateflow objects that use MATLAB expressions that are not suitable for code generation.

Description

Do not use MATLAB functions, instructions, and operators in Stateflow objects.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Stateflow objects use MATLAB expressions.	Replace MATLAB expressions in Stateflow objects.

Capabilities and Limitations

- Applies only to Stateflow charts that use C as the action language.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0127: MATLAB commands in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0127: MATLAB commands in Stateflow.
- “Access Built-In MATLAB Functions and Workspace Data” (Stateflow).

Check for indexing in blocks

Check ID: `mathworks.maab.db_0112`

Check that blocks use consistent vector indexing.

Description

Check that blocks use consistent vector indexing. When possible, use zero-based indexing to improve code efficiency.

Available with Simulink Check.

This check requires a Stateflow license.

The check verifies consistent indexing for the following objects:

Object	Indexing
<ul style="list-style-type: none"> • Assignment block • For Iterator block • Find block • Multiport Switch block • Selector block 	<ul style="list-style-type: none"> • Zero-based indexing ([0, 1, 2, ...]) • One-based indexing ([1, 2, 3,...])
<ul style="list-style-type: none"> • Stateflow charts with C action language 	Zero-based indexing ([0, 1, 2, ...])
<ul style="list-style-type: none"> • MATLAB Function block • Fcn block • MATLAB System blocks • Truth tables • State transition tables • Stateflow charts with MATLAB action language • MATLAB functions inside Stateflow charts 	One-based indexing ([1, 2, 3,...])

Results and Recommended Actions

Condition	Recommended Action
Objects in your model use one-based indexing, but can be configured for zero-based indexing.	Configure objects for zero-based indexing.
Objects in your model use inconsistent indexing.	If possible, configure objects for zero-based indexing. If your model contains objects that cannot be configured for zero-based indexing, configure objects for one-based indexing.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.

- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0112: Indexing in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0112: Indexing.

Check file names**Check ID:** `mathworks.maab.ar_0001`

Checks the names of all files residing in the same folder as the model

Description

A file name conforms to constraints.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The file name contains illegal characters.	Rename the file. Allowed characters are a-z, A-Z, 0-9, and underscore (_).
The file name starts with a number.	Rename the file.
The file name starts with an underscore ("_").	Rename the file.
The file name ends with an underscore ("_").	Rename the file.
The file extension contains one (or more) underscores.	Change the file extension.
The file name has consecutive underscores.	Rename the file.
The file name contains more than one dot (".").	Rename the file.

Capabilities and Limitations

- MAAB guideline, Version 3.0 limitation: The check does not flag conflicts with C++ keywords.
- Runs on library models.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: ar_0001: Filenames in the Simulink documentation.
- JMAAB guideline, Version 4.0: ar_0001: Usable characters for filenames.

Check folder names

Check ID: `mathworks.maab.ar_0002`

Checks model directory and subdirectory names for invalid characters.

Description

A directory name conforms to constraints.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The directory name contains illegal characters.	Rename the directory. Allowed characters are a-z, A-Z, 0-9. and underscore (_).
The directory name starts with a number.	Rename the directory.
The directory name starts with an underscore ("_").	Rename the directory.
The directory name ends with an underscore ("_").	Rename the directory.
The directory name has consecutive underscores.	Rename the directory.

Capabilities and Limitations

- Runs on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes the full path of the model.
- Analyzes subdirectories in the same directory as the model.

See Also

- MAAB guideline, Version 3.0: ar_0002: Directory names in the Simulink documentation.
- JMAAB guideline, Version 4.0: ar_0002: Usable characters for folder names.

Check for prohibited blocks in discrete controllers

Check ID: `mathworks.maab.jm_0001`

Check for prohibited blocks in discrete controllers.

Description

The check identifies continuous blocks in discrete controller models.

Available with Simulink Check.

Input Parameters

To change the list of blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check for prohibited blocks in discrete controllers**.
- 2 In the **Input Parameters** pane, to:
 - Prohibit the blocks as specified in MAAB 3.0, from **Standard**, select MAAB 3.0. The **Block type list** table provides the blocks that MAAB 3.0 prohibits inside controllers.
 - To specify blocks to either allow or prohibit, from **Standard**, select Custom. In **Treat blocktype list as**, select Allowed or Prohibited. In the **Block type list** table, you can add or remove blocks.

- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the specified input parameters.

Results and Recommended Actions

Condition	Recommended Action
Continuous blocks — Derivative, Integrator, State-Space, Transfer Fcn, Transfer Delay, Variable Time Delay, Variable Transport Delay, and Zero-Pole — are not permitted in models representing discrete controllers.	Replace continuous blocks with the equivalent blocks discretized in the s-domain. Use the Discretizing library, as described in “Discretize Blocks from the Simulink Model” (Simulink).

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0001: Prohibited Simulink standard blocks inside controllers in the Simulink documentation.
- JMAAB guideline, Version 4.0: jm_0001: Prohibited Simulink standard blocks inside controllers.
- “Overview of the Model Advisor Configuration Editor”

Check for prohibited sink blocks

Check ID: mathworks.maab.hd_0001

Check for prohibited Simulink sink blocks.

Description

You must design controller models from discrete blocks. Sink blocks, such as the Scope block, are not allowed in controller models.

Available with Simulink Check.

Input Parameters

To change the list of blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check for prohibited sink blocks**.
- 2 In the **Input Parameters** pane, to:
 - Prohibit the blocks as specified by MAAB 3.0, from **Standard**, select MAAB 3.0. The **Block type list** table provides the sink blocks that MAAB 3.0 prohibits.
 - To specify blocks to either allow or prohibit, from **Standard**, select Custom. In **Treat blocktype list as**, select Allowed or Prohibited. In the **Block type list** table, you can add or remove blocks.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the specified input parameters.

Results and Recommended Actions

Condition	Recommended Action
Sink blocks are not permitted in discrete controllers.	Remove sink blocks from the model.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: hd_0001: Prohibited Simulink sinks in the Simulink documentation.
- JMAAB guideline, Version 4.0: hd_0001: Prohibited Simulink sinks.

- “Overview of the Model Advisor Configuration Editor”

Check positioning and configuration of ports

Check ID: `mathworks.maab.db_0042`

Check whether the model contains ports with invalid position and configuration.

Description

In models, ports must comply with the following rules:

- Place Inport blocks on the left side of the diagram. It is acceptable to move the Inport block to the right only to prevent signal crossings.
- Place Outport blocks on the right side of the diagram. It is acceptable to move the Outport block to the left only to prevent signal crossings.
- Avoid using duplicate Inport blocks at the subsystem level if possible.
- Do not use duplicate Inport blocks at the root level.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Inport blocks are too far to the right and result in left-flowing signals.	Move the specified Inport blocks to the left.
Outport blocks are too far to the left and result in left-flowing signals.	Move the specified Output blocks to the right.
Ports do not have the default orientation.	Modify the model diagram such that signal lines for output ports enter the side of the block and signal lines for input ports exit the right side of the block.
Ports are duplicate Inport blocks.	<ul style="list-style-type: none"> • If the duplicate Inport blocks are in a subsystem, remove them where possible. • If the duplicate Inport blocks are at the root level, remove them.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Does not analyze signal crossings

See Also

- MAAB guideline, Version 3.0: db_0042: Port block in Simulink models in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0042: Port block in Simulink models.

Check for matching port and signal names

Check ID: `mathworks.maab.jm_0010`

Check for mismatches between names of ports and corresponding signals.

Description

Use matching names for ports and their corresponding signals.

Available with Simulink Check.

Prerequisite

Prerequisite MAAB guidelines, Version 3.0, for this check are:

- db_0042: Port block in Simulink models
- na_0005: Port block name visibility in Simulink models

Results and Recommended Actions

Condition	Recommended Action
Ports have names that differ from their corresponding signals.	Change the port name or the signal name to match the name for the signal.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0010: Port block names in Simulink models in the Simulink documentation.

Check whether block names appear below blocks

Check ID: `mathworks.maab.db_0142`

Check whether block names appear below blocks.

Description

If shown, the name of the block should appear below the block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Blocks have names that do not appear below the blocks.	Set the name of the block to appear below the blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0142: Position of block names in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0142: Position of block names.

Check for mixing basic blocks and subsystems

Check ID: `mathworks.maab.db_0143`

Check for systems that mix primitive blocks and subsystems.

Description

You must design each level of a model with building blocks of the same type, for example, only subsystems or only primitive (basic) blocks. If you mask your subsystem and set MaskType to a nonempty string, the Model Advisor treats the subsystem as a basic block.

Available with Simulink Check.

Input Parameters

To change the list of blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check for mixing basic blocks and subsystems**.
- 2 In the **Input Parameters** pane, to:
 - Allow the blocks specified by MAAB 3.0, from **Standard**, select MAAB 3.0. The **Block type list** table provides the blocks that MAAB 3.0 allows at any model level.
 - To specify blocks to either allow or prohibit, from **Standard**, select Custom. In **Treat blocktype list as**, select Allowed or Prohibited. In the **Block type list** table, you can add or remove blocks.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the specified input parameters.

Results and Recommended Actions

Condition	Recommended Action
A level in the model includes subsystem blocks and primitive blocks.	Move nonvirtual blocks into the subsystem.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0143: Similar block types on the model levels in the Simulink documentation.

Check for unconnected ports and signal lines

Check ID: `mathworks.maab.db_0081`

Check whether model has unconnected input ports, output ports, or signal lines.

Description

Unconnected inputs should be connected to ground blocks. Unconnected outputs should be connected to terminator blocks.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Blocks have unconnected inputs or outputs.	Connect unconnected lines to blocks specified by the design or to Ground or Terminator blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0081: Unconnected signals, block inputs and block outputs in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0081: Unconnected signals, block inputs and block outputs.

Check position of Trigger and Enable blocks

Check ID: `mathworks.maab.db_0146`

Check the position of Trigger and Enable blocks.

Description

Locate blocks that define subsystems as conditional or iterative at the top of the subsystem diagram.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Trigger, Enable, and Action Port blocks are not at the top of the subsystem diagram.	Move the Trigger, Enable, and Action Port blocks to the top of the subsystem diagram.

Condition	Recommended Action
For Each, For Iterator, and While Iterator blocks are not in the same location on the subsystem diagram.	Move the For Each, For Iterator, and While Iterator blocks so they are at a uniform location on the subsystem diagram.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: The check does not verify that For Each or For Iterator blocks are uniformly located.
- Runs on library models.
- Analyzes content of library linked blocks.
- Does not analyze content in masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0146: Triggered, enabled, conditional Subsystems in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0146: Triggered, enabled, conditional Subsystems.

Check usage of tunable parameters in blocks

Check ID: `mathworks.maab.db_0110`

Check whether tunable parameters specify expressions, data type conversions, or indexing operations.

Description

To make a parameter tunable, you must enter the basic block without the use of MATLAB calculations or scripting. For example, omit:

- Expressions
- Data type conversions
- Selections of rows or columns

Supported blocks include:

- Backlash
- Bias
- Combinatorial Logic
- Constant
- Dead Zone
- Derivative
- Discrete-Time Integrator
- Gain
- Hit Crossing
- Initial Condition (IC)
- Integrator
- n-D Lookup Table
- Magnitude-Angle to Complex
- Memory
- Permute Dimensions
- Quantizer
- Rate Limiter
- Rate Transition
- Real-Imag to Complex
- Relay
- Saturation
- Sine
- State-Space
- Switch
- Transport Delay
- Unit Delay
- Variable Transport Delay

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Blocks have a tunable parameter that specifies an expression, data type conversion, or indexing operation.	In each case, move the calculation outside of the block, for example, by performing the calculation with a series of Simulink blocks, or precompute the value as a new variable.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not evaluate mask parameters.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0110: Tunable parameters in basic blocks in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0110: Tunable parameters in basic blocks.

Check Stateflow data objects with local scope

Check ID: `mathworks.maab.db_0125`

Check whether Stateflow data objects with local scope are defined at the chart level or below.

Description

This check flags Stateflow data whose local scope is not defined at the Chart level or below, regardless of whether the data is used or not.

You must define local data of a Stateflow block on the chart level or below in the object hierarchy. You cannot define local variables on the machine level; however, parameters and constants are allowed at the machine level.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Local data is not defined in the Stateflow hierarchy at the chart level or below.	Define local data at the chart level or below.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: The check does not detect if local data has the same name within charts or states that have parent-child relationships.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: db_0125: Scope of internal signals and local auxiliary variables in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0125: Scope of internal signals and local auxiliary variables.

Check for Strong Data Typing with Simulink I/O

Check ID: `mathworks.maab.db_0122`

Check whether labeled Stateflow and Simulink input and output signals are strongly typed.

Description

Strong data typing between Stateflow and Simulink input and output signals is required.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
A Stateflow chart does not use strong data typing with Simulink.	Select the Use Strong Data Typing with Simulink I/O check box for the specified block.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks and charts.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0122: Stateflow and Simulink interface signals and parameters in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0122: Stateflow and Simulink interface signals and parameters.
- “Syntax for States and Transitions” (Stateflow)

Check usage of exclusive and default states in state machines

Check ID: mathworks.maab.db_0137

Check states in state machines.

Description

In state machines:

- There must be at least two exclusive states.
- A state cannot have only one substate.
- The initial state of a hierarchical level with exclusive states is clearly defined by a default transition.

Available with Simulink Check.

This check requires a Stateflow license.

Prerequisite

A prerequisite MAAB guideline, Version 3.0, for this check is db_0149: Flow chart patterns for condition actions.

Results and Recommended Actions

Condition	Recommended Action
Chart has only one exclusive (OR) state.	Make the state a parallel state, or add another exclusive (OR) state.
Chart does not have a default state defined.	Define a default state.
Chart has multiple default states defined.	Define only one default state. Make the others nondefault.
State has only one exclusive (OR) substate.	Make the state a parallel state, add another exclusive (OR) state, or replace the state with a flow chart.
State does not have a default substate defined.	Define a default substate.
State has multiple default substates defined.	Define only one default substate, make the others nondefault.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

MAAB guideline, Version 3.0: db_0137: States in state machines in the Simulink documentation.

Check Implement logic signals as Boolean data (vs. double)

Check ID: `mathworks.maab.jc_0011`

Check the optimization parameter for Boolean data types.

Description

Optimization for Boolean data types is required

Available with Simulink Check.

Prerequisite

A prerequisite MAAB guideline, Version 3.0, for this check is na_0002: Appropriate implementation of fundamental logical and numerical operations.

Results and Recommended Actions

Condition	Recommended Action
Configuration setting for Implement logic signals as boolean data (vs. double) is not set.	Select the Implement logic signals as boolean data (vs. double) check box in the Configuration Parameters dialog box.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: jc_0011: Optimization parameters for Boolean data types in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0011: Optimization parameters for Boolean data types.

Check model diagnostic parameters

Check ID: `mathworks.maab.jc_0021`

Check the model diagnostics configuration parameter settings.

Description

You should enable the following diagnostics:

Algebraic loop
Minimize algebraic loop
Inf or NaN block output
Duplicate data store names
Unconnected block input ports
Unconnected block output ports
Unconnected line
Unspecified bus object at root Output block
Element name mismatch
Invalid function-call connection

Diagnostics not listed in the Results and Recommended Actions section below can be set to any value.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Algebraic loop is set to none.	Set Algebraic loop on the Diagnostics > Solver pane in the Configuration Parameters dialog box to error or warning. Otherwise, Simulink might attempt to automatically break the algebraic loops, which can impact the execution order of the blocks.
Minimize algebraic loop is set to none.	Set Minimize algebraic loop on the Diagnostics > Solver pane in the Configuration Parameters dialog box to error or warning. Otherwise, Simulink might attempt to automatically break the algebraic loops for reference models and atomic subsystems, which can impact the execution order for those models or subsystems.
Inf or NaN block output is set to none, which can result in numerical exceptions in the generated code.	Set Inf or NaN block output on the Diagnostics > Data Validity > Signals pane in the Configuration Parameters dialog box to error or warning.

Condition	Recommended Action
Duplicate data store names is set to none, which can result in nonunique variable naming in the generated code.	Set Duplicate data store names on the Diagnostics > Data Validity > Signals pane in the Configuration Parameters dialog box to error or warning.
Unconnected block input ports is set to none, which prevents code generation.	Set Unconnected block input ports on the Diagnostics > Data Validity > Signals pane in the Configuration Parameters dialog box to error or warning.
Unconnected block output ports is set to none, which can lead to dead code.	Set Unconnected block output ports on the Diagnostics > Data Validity > Signals pane in the Configuration Parameters dialog box to error or warning.
Unconnected line is set to none, which prevents code generation.	Set Unconnected line on the Diagnostics > Connectivity > Signals pane in the Configuration Parameters dialog box to error or warning.
Unspecified bus object at root Output block is set to none, which can lead to an unspecified interface if the model is referenced from another model.	Set Unspecified bus object at root Output block on the Diagnostics > Connectivity > Buses pane in the Configuration Parameters dialog box to error or warning.
Element name mismatch is set to none, which can lead to an unintended interface in the generated code.	Set Element name mismatch on the Diagnostics > Connectivity > Buses pane in the Configuration Parameters dialog box to error or warning.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: jc_0021: Model diagnostic settings in the Simulink documentation.

Check the display attributes of block names

Check ID: `mathworks.maab.jc_0061`

Check the display attributes of subsystem and block names.

Description

When the subsystem and block names provide descriptive information, display the names. If the block function is known from its appearance, do not display the name. Blocks with names that are obvious from the block appearance:

- From
- Goto
- Ground
- Logic
- MinMax
- ModelReference
- MultiPortSwitch
- Product
- Relational Operator
- Saturate
- Switch
- Terminator
- Trigonometry
- Unit Delay
- Sum
- Compare To Constant
- Compare To Zero

Available with Simulink Check.

Input Parameters

To specify the custom blocks and masks to include in this check, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check the display attributes of block names**. In the **Input Parameters** pane, select Custom.
- 2 Use the **Block type list** table to include or exclude blocks and masks from the check.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
Name is displayed and obvious from the block appearance.	Hide name by clearing Diagram > Format > Show Block Name .
Name is not descriptive. Specifically, the block name is: <ul style="list-style-type: none"> • Not obvious from the block appearance. • The default name appended with an integer. 	Modify the name to be more descriptive or hide the name by clearing Diagram > Format > Show Block Name .
Name is descriptive and not displayed. Descriptive names are: <ul style="list-style-type: none"> • Provided for blocks that are not obvious from the block appearance. • Not a default name appended with an integer. 	Display the name by selecting Diagram > Format > Show Block Name
Check does not evaluate my custom blocks and masks.	Use the Model Configuration Editor to specify your custom checks and blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0061: Display of block names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0061: Display of block names.

Check display for port blocks

Check ID: `mathworks.maab.jc_0081`

Check the **Icon display** setting for Inport and Outport blocks.

Description

The **Icon display** setting is required.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The Icon display setting is not set.	Set the Icon display to Port number for the specified Inport and Outport blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

MAAB guideline, Version 3.0: jc_0081: Icon display for Port block in the Simulink documentation.

Check subsystem names

Check ID: `mathworks.maab.jc_0201`

Results and Recommended Actions

Condition	Recommended Action
The subsystem names do not comply with the naming standard specified in the input parameters.	Update the subsystem names to comply with your own guidelines or the MAAB guidelines.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Tips

Use underscores to separate parts of a subsystem name instead of spaces.

See Also

- MAAB guideline, Version 3.0: jc_0201: Usable characters for Subsystem names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0201: Usable characters for Subsystem names.

Check port block names

Check ID: `mathworks.maab.jc_0211`

Check whether Inport and Outport block names include invalid characters.

Description

The names of all Inport and Outport blocks are checked for invalid characters.

Available with Simulink Check.

Input Parameters

To control the naming convention for blocks that the check flags, you can use the Model Advisor Configuration Editor.

1 Open the Model Configuration Editor and navigate to **Check port block names**. In the **Input Parameter** pane:

- Use **Naming standard** to select MAAB 3.0 or Custom. When you select MAAB 3.0, the check uses the regular expression $([a-zA-Z_0-9])|(^d)|(^)|(^_)|(^_)$$ to verify that names:
 - Use these characters: a-z, A-Z, 0-9, and the underscore (_).
 - Do not start with a number.
 - Do not use underscores at the beginning or end of a string.
 - Do not use more than one consecutive underscore.

When you select Custom, you can enter your own **Regular expression for prohibited names**. For example, if you want to allow more than one consecutive underscore, enter $([a-zA-Z_0-9])|(^d)|(^)|(^_)|(^_)$$.

2 Click **Apply**.

3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The block names do not comply with the naming standard specified in the input parameters.	Update the block names to comply with your own guidelines or the MAAB guidelines.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Tips

Use underscores to separate parts of a block name instead of spaces.

See Also

- MAAB guideline, Version 3.0: jc_0211: Usable characters for Inport blocks and Output blocks in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0211: Usable characters for Inport block and Output block.

Check character usage in signal labels**Check ID:** `mathworks.maab.jc_0221`

Check whether signal line names include invalid characters.

Description

The names of all signal lines are checked for invalid characters.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The signal line name contains illegal characters.	Rename the signal line. Allowed characters include a-z, A-Z, 0-9, and underscore (_).
The signal line name starts with a number.	Rename the signal line.
The signal line name starts with an underscore ("_").	Rename the signal line.
The signal line name ends with an underscore ("_").	Rename the signal line.
The signal line name has consecutive underscores.	Rename the signal line.
The signal line name has blank spaces.	Rename the signal line.
The signal line name has control characters.	Rename the signal line.

Capabilities and Limitations

- Runs on library models.

- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

Tips

Use underscores to separate parts of a signal line name instead of spaces.

See Also

- MAAB guideline, Version 3.0: jc_0221: Usable characters for signal line names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0222: Usable characters for signal line and bus names.

Check Simulink bus signal names

Check ID: `mathworks.maab.na_0030`

Checks Simulink bus signal names.

Description

This check verifies that Simulink bus signal names comply with your own modeling guidelines or MAAB modeling guideline na_0030. MAAB naming guidelines are as follows.

Form

Simulink bus signal names:

- Should not start with a number
- Should not have blank spaces
- Carriage returns are not allowed

Allowed Characters

Simulink bus signal names can contain characters:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
0 1 2 3 4 5 6 7 8 9 _
```

Results and Recommended Actions

Condition	Recommended Action
The Simulink bus signal names do not comply with the naming standard specified in the input parameters.	Update the Simulink bus signal names to comply with your own or the MAAB guidelines.

Capabilities and Limitations

- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Allows syntax highlighting.

See Also

- MAAB guideline, Version 3.0: na_0030: Usable characters for Simulink Bus names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0222: Usable characters for signal line and bus names.

Check character usage in block names

Check ID: mathworks.maab.jc_0231

Check whether block names include invalid characters.

Description

The check reports invalid characters in all block names, except:

- Inports and Outports
- Unmasked subsystems

MAAB guideline, Version 3.0, jc_0231: Usable characters for block names does not apply to subsystem blocks.

Available with Simulink Check.

Prerequisite

A prerequisite MAAB guideline, Version 3.0, for this check is jc_0201: Usable characters for Subsystem names.

Input Parameters

To control the naming convention for blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check character usage in block names**. In the **Input Parameter** pane:
 - Use **Naming standard** to select MAAB 3.0 or Custom. When you select MAAB 3.0, the check uses the regular expression `([^a-zA-Z_0-9\n\r]) | (^\d) | (^)` to verify that names:
 - Use these characters: a-z, A-Z, 0-9, underscore (_), and blank space.
 - Do not start with a number or blank space.
 - Do not have double byte characters.

When you select Custom, you can enter your own **Regular expression for prohibited names**. For example, if you do not want to allow underscores (_) in a block name, enter `([^a-zA-Z0-9\r]) | (^\d) | (^)`.

- 2 Click **Apply**.
- 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The block names do not comply with the naming standard specified in the input parameters.	Update the block names to comply with your own guidelines or the MAAB guidelines.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.

- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Tips

Carriage returns are allowed in block names.

See Also

- MAAB guideline, Version 3.0: jc_0231: Usable characters for block names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0231: Usable characters for block names.

Check Trigger and Enable block names

Check ID: mathworks.maab.jc_0281

Check Trigger and Enable block port names.

Description

Block port names should match the name of the signal triggering the subsystem. The check does not flag Trigger or Enable block names if the associated signal does not have a label.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Trigger block does not match the name of the signal to which it is connected.	Match Trigger block names to the connecting signal.
Enable block does not match the name of the signal to which it is connected.	Match Enable block names to the connecting signal.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: This check only flags Trigger and Enable blocks names.

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0281: Naming of Trigger Port block and Enable Port block in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0281: Naming of Trigger Port block and Enable Port block.

Check for Simulink diagrams using nonstandard display attributes

Check ID: `mathworks.maab.na_0004`

Check model appearance setting attributes.

Description

Model appearance settings are required to conform to the guidelines when the model is released.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The toolbar is not visible.	Select View > Toolbar .
The status bar is not visible.	Select View > Status Bar .
Sample Time > Colors is selected.	Clear Sample Time > Colors .
Wide Nonscalar Lines is cleared.	Select Display > Signals & Ports > Wide Nonscalar Lines .
Viewer Indicators is cleared.	Select Display > Signals & Ports > Viewer Indicators .

Condition	Recommended Action
Testpoint Indicators is cleared.	Select Display > Signals & Ports > Testpoint & Logging Indicators .
Port Data Types is selected.	Clear Display > Signals & Ports > Port Data Types .
Storage Class is selected.	Clear Display > Signals & Ports > Storage Class .
Signal Dimensions is selected.	Clear Display > Signals & Ports > Signal Dimensions .
Execution Context Indicator is selected.	Clear Display > Signals & Ports > Execution Context Indicator .
Model Browser is selected.	Clear View > Model Browser > Show Model Browser .
Sorted Execution Order is selected.	Clear Display > Blocks > Sorted Execution Order .
Model Block Version is selected.	Clear Display > Blocks > Block Version for Referenced Models .
Model Block I/O Mismatch is selected.	Clear Display > Blocks > Block I/O Mismatch for Referenced Models .
Library Links is set Disabled, User Defined, or All.	Select Display > Library Links > None .
Linearization Indicators is cleared.	Select Display > Signals & Ports > Linearization Indicators .
Block backgrounds are not white.	Select Format > Background Color > White .
Block foregrounds are not black.	Select Format > Foreground Color > Black .
Diagrams do not have white backgrounds.	Select Diagram > Format > Canvas Color > White .
Diagrams do not have zoom factor set to 100%.	Select View > Zoom > Normal (100%) .

Action Results

Clicking **Modify** updates the display attributes to conform to the guideline.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: na_0004: Simulink model appearance in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0004: Simulink model appearance.

Check MATLAB code for global variables

Check ID: `mathworks.maab.na_0024`

Check for global variables in MATLAB code.

Description

Verifies that global variables are not used in any of the following:

- MATLAB code in MATLAB Function blocks
- MATLAB functions defined in Stateflow charts
- Called MATLAB functions

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Global variables are used in one or more of the following: <ul style="list-style-type: none"> • MATLAB code in MATLAB Function blocks • MATLAB functions defined in Stateflow charts • Called MATLAB functions 	Replace global variables with signal lines, function arguments, or persistent data.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

MAAB guideline, Version 3.0: na_0024: Global Variables in the Simulink documentation.

- MAAB guideline, Version 3.0: na_0024: Global Variables in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0024: Global variable.

Check visibility of block port names

Check ID: mathworks.maab.na_0005

Check the visibility of port block names.

Description

An organization applying the MAAB guideline, Version 3.0, must select one of the following alternatives to enforce:

- The names of port blocks are not hidden.

- The name of port blocks must be hidden.

Available with Simulink Check.

Input Parameters

All Port names should be shown (Format/Show Name)

Select this check box if all ports should show the name, including subsystems.

Results and Recommended Actions

Condition	Recommended Action
Blocks do not show their name and the All Port names should be shown (Format/Show Name) check box is selected.	Change the format of the specified blocks to show names according to the input requirement.
Blocks show their name and the All Port names should be shown (Format/Show Name) check box is cleared.	Change the format of the specified blocks to hide names according to the input requirement.
Subsystem blocks do not show their port names.	Set the subsystem parameter Show port labels to a value other than none.
Subsystem blocks show their port names.	Set the subsystem parameter Show port labels to none.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content in masked subsystems.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

MAAB guideline, Version 3.0: na_0005: Port block name visibility in Simulink models in the Simulink documentation.

Check orientation of Subsystem blocks

Check ID: mathworks.maab.jc_0111

Check the orientation of subsystem blocks.

Description

Subsystem inputs must be located on the left side of the block, and outputs must be located on the right side of the block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Subsystem blocks are not using the right orientation	Rotate the subsystem so that inputs are on the left side of block and outputs are on the right side of the block.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: The check does not flag the rotation of subsystems.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0111: Direction of Subsystem in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0111: Direction of Subsystem.

Check usage of Relational Operator blocks

Check ID: mathworks.maab.jc_0131

Check the position of Constant blocks used in Relational Operator blocks.

Description

When the relational operator is used to compare a signal to a constant value, the constant input should be the second, lower input.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Relational Operator blocks have a Constant block on the first, upper input.	Move the Constant block to the second, lower input.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0131: Use of Relational Operator block in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0131: Use of Relational Operator block.

Check usage of Switch blocks

Check ID: mathworks.maab.jc_0141

Check usage of Switch blocks.

Description

Verifies that the Switch block control input (the second input) is a Boolean value and that the block is configured to pass the first input when the control input is nonzero.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The Switch block control input (second input) is not a Boolean value.	Change the data type of the control input to Boolean.
The Switch block is not configured to pass the first input when the control input is nonzero.	Set the block parameter Criteria for passing first input to $u2 \sim= 0$.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0141: Use of the Switch block in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0141: Use of the Switch block.
- Switch block

Check usage of buses and Mux blocks

Check ID: mathworks.maab.na_0010

Check usage of buses and Mux blocks.

Description

This check verifies the usage of buses and Mux blocks.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The individual scalar input signals for a Mux block do not have common functionality, data types, dimensions, and units.	Modify the scalar input signals such that the specifications match.
The output of a Mux block is not a vector.	Change the output of the Mux block to a vector.
The input for a Bus Selector block is not a bus signal.	Make sure that the input for all Bus Selector blocks is a bus signal.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.
- Does not flag non-scalar inputs as described in MAAB guideline na_0010: Grouping data flows into signals.

See Also

- MAAB guideline, Version 3.0: na_0010: Grouping data flows into signals in the Simulink documentation.
- “Composite Signals” (Simulink)

Check for bitwise operations in Stateflow charts

Check ID: `mathworks.maab.na_0001`

Identify bitwise operators (&, |, and ^) in Stateflow charts. If you select **Enable C-bit operations** for a chart, only bitwise operators in expressions containing Boolean data types are reported. Otherwise, all bitwise operators are reported for the chart.

Description

Do not use bitwise operators in Stateflow charts, unless you enable bitwise operations.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Stateflow charts with Enable C-bit operations selected use bitwise operators (&, , and ^) in expressions containing Boolean data types.	Do not use Boolean data types in the specified expressions.
The Model Advisor could not determine the data types in expressions with bitwise operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.
Stateflow charts with Enable C-bit operations cleared use bitwise operators (&, , and ^).	To fix this issue, do either of the following: <ul style="list-style-type: none"> • Modify the expressions to replace bitwise operators. • If not using Boolean data types, consider enabling bitwise operations. In the Chart properties dialog box, select Enable C-bit operations.

Capabilities and Limitations

- Applies only to charts that use C as the action language.
- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- “Binary and Bitwise Operations” (Stateflow).
- MAAB guideline, Version 3.0: na_0001: Bitwise Stateflow operators in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0001: Bitwise Stateflow operators.
- “hisf_0003: Usage of bitwise operations” (Simulink).

Check fundamental logical and numerical operations

Check ID: `mathworks.maab.na_0002`

Checks data types in numerical and logic blocks.

Description

Checks the data types for logical and numerical blocks and identifies when the data type does is not appropriate for the operation.

The data type for logical blocks should be Boolean. Logic blocks include:

- Logical Operator (AND, OR, NOT)
- Enable (port)
- Trigger (port)

The data type for numerical blocks should be non-boolean. Numerical blocks include:

- Sum
- Complex to Real-Imag
- Product
- Dot Product
- Gain
- Sign
- Slider Gain

Note These blocks also accept numeric input but are not included as part of this check:

- Compare To Constant
- Compare To Zero
- Detect Fall Negative
- Detect Fall Nonpositive
- Detect Rise Positive
- Detect Rise Nonnegative
- Detect Change

- Detect Decrease
- Detect Increase
- Relational Operator

Available with Simulink Check.

Input Parameters

To specify the custom blocks and masks to include in this check, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check fundamental logical and numerical operations**. In the **Input Parameters** pane, select Custom.
- 2 Use the **Blocks for Numerical Operations** and **Blocks for Logical Operations** tables to include or exclude blocks and masks from the check.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
Data type for a numerical block is Boolean.	Consider changing the data type to a non-boolean.
Data type for a logical block is not Boolean.	Consider changing the data type to a Boolean.
Check does not evaluate my custom blocks and masks.	Enter your custom blocks and masks using the input parameters in the Model Configuration Editor.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0002: Appropriate implementation of fundamental logical and numerical operations in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0002: Appropriate implementation of fundamental logical and numerical operations.

Check logical expressions in If blocks

Check ID: `mathworks.maab.na_0003`

Check If blocks for inappropriate construct of primary expressions in a logical expression.

Description

Identifies instances in an If block where primary expressions are complex.

Primary expressions are defined as:

- An input
- A constant
- A constant parameter
- A parenthesized expression containing no operators other than zero or `<`, `>`, `>=`, `<=`, `==`, `~=`, `|`, `&`, and `~`

Examples of primary expressions include:

- `u1`
- `5`
- `K`
- `(u1 > 0)`
- `(u1 <= G)`
- `(u1 > U2)`
- `(~u1)`

Examples of acceptable logical expressions exceptions include:

- $u1 \mid u2$
- $((u1 > 0) \& (u1 < 20))$
- $(u1 > 0) \& (u2 < u3)$
- $(u1 > 0) \& (\sim u2)$

This table provides examples of unacceptable logical expressions.

Primary Expression	Reasoning
$u1 \& u2 \mid u3$	Too many primary expressions.
$u1 \& (u2 \mid u3)$	Unacceptable operator within primary expression.
$(u1 > 0) \& (u1 < 20) \& (u2 > 5)$	Too many primary expressions that are not inputs.
$(u1 > 0) \& ((2 * u2) > 6)$	Unacceptable operator within primary expression.

Exception

A logical expression can contain more than two primary expressions when both these conditions are met:

- The primary expressions are all inputs.
- Only one type of logical operator is present.

Examples of acceptable exceptions include:

- $u1 \mid u2 \mid u3 \mid u4 \mid u5$
- $u1 \& u2 \& u3 \& u4$

Simple "If" Expressions

In the literal interpretation of guideline na_0003, expression $u1 < u2$ is a violation. However, the expression follows the commonly used "If" expression template (<Primary Expression><Operator><Primary Expression>). So, when logical operators are not used and only one relational operator is present, the expression satisfies guideline na_0003 and $u1 < u2$ is NOT a violation.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
<p>Logical expression contains more than two primary expressions that consist of a constant, constant parameter, and input.</p>	<p>Consider one of the following:</p> <ul style="list-style-type: none"> • Make primary expressions an input and either: <ul style="list-style-type: none"> • Use parenthesized expressions with one relational operator type • Construct a simple "If" express using template <code><Primary Expression><Logical Operator><Primary Expression></code> • Reduce the number of primary expressions to two or less. • Construct the logical expression using logical blocks other than the If block.
<p>Logical expression contains more than two parenthesized expressions that use multiple relational operators</p>	<p>Consider one of the following:</p> <ul style="list-style-type: none"> • Use only one type of relational operator. Acceptable logical operators include <, >, >=, <=, ==, ~=, , &, and ~. The primary expression must consist of inputs only. • Reduce the number of parenthesized expressions to two or less. • Construct the logical expression using logical blocks other than the If block.
<p>Parenthesized expression includes a relational operator other than zero or <, >, >=, <=, ==, ~=, , &, or ~.</p>	<p>Consider one of the following:</p> <ul style="list-style-type: none"> • Use relational operator <, >, >=, <=, ==, ~=, , &, or ~ within the parenthesized expression. • Construct the logical expression using logical blocks other than the If block.

Capabilities and Limitations

- Does not flag logical expressions that use only one of these relative operators <, >, >=, <=, ==, ~=, |, &, and ~
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- MAAB guideline, Version 3.0: na_0003: Simple logical expressions in If Condition block in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0003: Simple logical expressions in If Condition block.

Check for comparison operations in Stateflow charts

Check ID: `mathworks.maab.na_0013`

Identify comparison operations with different data types in Stateflow objects.

Description

Comparisons should be made between variables of the same data types.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Comparison operations with different data types were found.	Revisit the specified operations to avoid comparison operations with different data types.
The Model Advisor could not determine the data types in expressions with comparison operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0013: Comparison operation in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0013: Comparison operation in Stateflow.

Check usage of restricted variable names

Check ID: mathworks.maab.na_0019

Check for use of reserved keywords in MATLAB Function block variable names.

Description

Identifies variable names in MATLAB Function blocks that conflict with reserved C and C++ keywords. For a complete list of reserved keywords, see “Reserved Keywords” (Simulink Coder).

Avoid using variable names that conflict with MATLAB Functions, such as `conv`.

This check is case insensitive. For example, the check flags keywords `true`, `True`, `TRUE`, and `tRue`.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Variable name conflicts with reserved keyword.	Consider using a different variable name that does not conflict with the reserved keywords.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- MAAB guideline, Version 3.0: na_0019: Restricted Variable Names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0251: Naming restrictions for signals and parameters.
- hisl_0032: Model object names

Check unused ports in Variant Subsystems

Check ID: mathworks.maab.na_0020

Checks variant subsystems for unused ports.

Description

Checks variant subsystems for unused ports and provides the action to terminate the unused inputs with a Terminator block.

Results and Recommended Actions

Condition	Recommended Action
Variant subsystem has unused ports	Consider connecting the unused ports to Terminator blocks.

Check action connects unused ports to Terminator blocks.

Available with Simulink Check.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.

- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Allows syntax highlighting.

See Also

- MAAB guideline, Version 3.0: na_0020: Number of inputs to variant subsystems in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0020: Number of inputs to variant subsystems.

Check usage of character vector inside MATLAB Function block

Check ID: `mathworks.maab.na_0021`

Check for use of character vectors in MATLAB Function blocks.

Description

Identifies character vectors that are used in MATLAB Function blocks.

MATLAB Functions store strings as character arrays. Due to lack of dynamic memory allocation, the arrays cannot be re-sized to accommodate a string value of different length. Strings are not a supported data type in Simulink, so MATLAB Function blocks cannot pass the string data outside the block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Function block contains a character vector.	Consider using enumerations instead of character vectors.

Capabilities and Limitations

- Does not flag strings in MATLAB
- Does not flag character vectors that are hard-coded into the class definition.
- Runs on library models.

- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- MAAB guideline, Version 3.0: na_0021: Strings in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0021: Strings.

Check usage of recommended patterns for Switch/Case statements

Check ID: `mathworks.maab.na_0022`

Check for use of non-constant variables in Switch/Case statements.

Description

In generated code, MATLAB Function block inputs are passed as functional arguments. This check evaluates the Switch/Case statements in the generated code to determine if non-constant values are being used in the Case argument.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Non-constant variables are used in the Switch/Case statement.	Consider defining the input variable as a constant.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- MAAB guideline, Version 3.0: na_0022: Recommended patterns for Switch/Case statements in the Simulink documentation.

- JMAAB guideline, Version 4.0: na_0022: Recommended patterns for Switch/Case statements.

Check use of default variants

Check ID: mathworks.maab.na_0036

Check use of default variants in a variant subsystem.

Description

Checks Variant Subsystem, Variant Source, Variant Sink, and variant Model blocks in a variant subsystem for a default variant.

Available with Simulink Check.

Input Parameters

To set the active variant as the default variant, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check use of default variants**. In the **Input Parameters** pane, select **Check use of 'Allow zero active variant controls' option**.

Note When using **Allow zero active variant controls** option, set the following on output ports of the variant subsystem:

- Set **Specify output when source is unconnected** to `true`
- Provide a valid value in **Constant value**
- Set **Output Data type** to `Inherit: auto`

-
- 2 Click **Apply**.
 - 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The subsystem does not contain a default variant.	Set block parameter Variant control to (default)
Block parameter Variant Control is set to Variant.	<p>To set the active variant as the default variant.</p> <ol style="list-style-type: none"> 1 Variant Control is set to Variant 2 Open the variant block and select block parameter Allow zero active variant controls. 3 For output ports of the variant subsystem: <ul style="list-style-type: none"> • Set Specify output when source is unconnected to true • Provide a valid value in Constant value • Set Output Data type to Inherit: auto

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts
- Allows syntax highlighting

See Also

- MAAB guideline, Version 3.0: na_0036: Default variant in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0036: Default variant.

Check use of single variable variant conditionals

Check ID: mathworks.maab.na_0037

Check use of single variables in conditional expressions

Description

Checks Variant Subsystem, Variant Source, Variant Sink, and variant Model blocks for conditional expressions that have more than one variable.

Note Guideline na_0037 states that default variants are an exception to the recommendation of writing variant conditional expressions using multiple variable with a single condition. You can define a default by:

- Selecting (default) in the block parameter **Variant control**.
- Specifying an exhaustive condition.

This check cannot differentiate between defaults that are defined using an exhaustive condition.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Conditional expression contains more than one condition variable.	Consider updating your model so that only one variant is used.
Conditional expression variable or Simulink.Variant object is not found in the workspace.	Consider defining a variant in your model.
Check does not execute on my variant subsystem.	Clear Override variant conditions and use following variant for the variant subsystem.

Capabilities and Limitations

- Does not check default variants.
- Does not run on the Variant subsystem when you select **Override variant conditions and use following variant**
- Runs on library models.

- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- MAAB guideline, Version 3.0: na_0037: Use of single variable variant conditionals in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0037: Use of single variable variant conditionals.

Check nested states in Stateflow charts

Check ID: `mathworks.maab.na_0038`

Checks the depth of nested states in Stateflow charts.

Description

Checks the depth of nested states in Stateflow charts and identifies states that exceed the defined nesting level threshold.

MAAB guideline na_0038 recommends three levels.

Available with Simulink Check.

Input Parameters

To specify the threshold for nesting levels of Stateflow states, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check nested states in Stateflow charts**.
- 2 In the **Input Parameters** pane, enter the nesting level threshold. The default value is 3.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
Level of nested Stateflow states exceeds the defined threshold.	Consider encapsulating Stateflow states in subcharts so level of nested states does not exceed the threshold.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Allows syntax highlighting.

See Also

- MAAB guideline, Version 3.0: na_0038: Levels in Stateflow charts in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0038: Levels in Stateflow charts.

Check use of Simulink in Stateflow charts

Check ID: `mathworks.maab.na_0039`

Checks for Stateflow charts that are nested in Simulink functions used in the root Stateflow chart.

Description

Checks Simulink functions in the root Stateflow chart and identifies Stateflow charts that are nested within these functions.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The Simulink function has a nested Stateflow chart.	Consider modifying your root Stateflow chart so the Simulink function does not contain a nested Stateflow chart.

Capabilities and Limitations

- Does not check Stateflow states.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Allows syntax highlighting.

See Also

- MAAB guideline, Version 3.0: na_0039: Use of Simulink in Stateflow charts in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0039: Use of Simulink in Stateflow charts.

Check number of Stateflow states per container

Check ID: mathworks.maab.na_0040

Checks the number of viewable states within a Stateflow container.

Description

Checks the number of viewable states in a Stateflow container and identifies containers that exceed the defined threshold. A state is considered visible if it is not within an atomic subchart, function, or subchart.

MAAB guideline na_0040 recommends six to 10 states per container.

Available with Simulink Check.

Input Parameters

To specify the threshold for the number of viewable states in a Stateflow container, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check number of Stateflow states per container**.
- 2 In the **Input Parameters** pane, enter the threshold for the number of viewable states per container. The default value is 10.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
Number of viewable states in the Stateflow container exceeds the defined threshold.	Consider encapsulating Stateflow states in subcharts so the number of states per container does not exceed the threshold.

Capabilities and Limitations

- Atomic subcharts are considered as states and included in the check.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Allows syntax highlighting.

See Also

- MAAB guideline, Version 3.0: na_0040: Number of states per container in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0040: Number of states per container.

Check for unary minus operations on unsigned integers in Stateflow charts

Check ID: mathworks.maab.jc_0451

Identify unary minus operations applied to unsigned integers in Stateflow objects.

Description

Do not perform unary minus operations on unsigned integers in Stateflow objects.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Unary minus operations are applied to unsigned integers in Stateflow objects.	Modify the specified objects to remove dependency on unary minus operations.
The Model Advisor could not determine the data types in expressions with unary minus operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0451: Use of unary minus on unsigned integers in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0451: Use of unary minus on unsigned integers in Stateflow.

Check for equality operations between floating-point expressions in Stateflow charts

Check ID: `mathworks.maab.jc_0481`

Identify equal to operations (==) in expressions where at least one side of the expression is a floating-point variable or constant.

Description

Do not use equal to operations with floating-point data types. You can use equal to operations with integer data types.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Expressions use equal to operations (==) where at least one side of the expression is a floating-point variable or constant.	Modify the specified expressions to avoid equal to operations between floating-point expressions. If an equal to operation is required, a margin of error should be defined and used in the operation.
The Model Advisor could not determine the data types in expressions with equality operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

MAAB guideline, Version 3.0: `jc_0481`: Use of hard equality comparisons for floating point numbers in Stateflow in the Simulink documentation.

Check input and output settings of MATLAB Functions

Check ID: mathworks.maab.na_0034

Identify MATLAB Functions that have inputs, outputs or parameters with inherited complexity or data type properties.

Description

The check identifies MATLAB Functions with inherited complexity or data type properties. A results table provides links to MATLAB Functions that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Functions have inherited interfaces.	<p>Explicitly define complexity and data type properties for inports, outports, and parameters of MATLAB Function identified in the results.</p> <p>If applicable, using the “MATLAB Function Block Editor” (Simulink), make the following modifications in the “Ports and Data Manager” (Simulink):</p> <ul style="list-style-type: none"> • Change Complexity from Inherited to On or Off. • Change Type from Inherit: Same as Simulink to an explicit type. • Change Size from -1 (Inherited) to an explicit size.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.

- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0034: MATLAB Function block input/output settings in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0034: MATLAB Function block input/output settings.

Check MATLAB Function metrics

Check ID: `mathworks.maab.himl_0003`

Display complexity and code metrics for MATLAB Functions. Report metric violations.

Description

This check provides complexity and code metrics for MATLAB Functions. The check additionally reports metric violations.

A results table provides links to MATLAB Functions that violate the complexity input parameters.

Available with Simulink Check.

Input Parameters

Maximum effective lines of code per function

Provide the maximum effective lines of code per function. Effective lines do not include empty lines, comment lines, or lines with a function end keyword.

Minimum density of comments

Provide minimum density of comments. Density is ratio of comment lines to total lines of code.

Maximum cyclomatic complexity per function

Provide maximum cyclomatic complexity per function. Cyclomatic complexity is the number of linearly independent paths through the source code.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Function violates the complexity input parameters.	For the MATLAB Function: <ul style="list-style-type: none"> • If effective lines of code is too high, further divide the MATLAB Function. • If comment density is too low, add comment lines. • If cyclomatic complexity per function is too high, further divide the MATLAB Function.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0016: Source lines of MATLAB Functions in the Simulink documentation.

Check for mismatches between names of Stateflow ports and associated signals

Check ID: mathworks.maab.db_0123

Check for mismatches between Stateflow ports and associated signal names.

Description

The name of Stateflow input and output should be the same as the corresponding signal. The check does not flag:

- Name mismatches for reusable Stateflow charts in libraries.
- Stateflow ports if the corresponding signal does not have a label.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Signals have names that differ from the corresponding Stateflow ports.	Change the names of either the signals or the Stateflow ports.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts. Exclusions will not work for library linked charts.

See Also

- MAAB guideline, Version 3.0: db_0123: Stateflow port names in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0123: Stateflow port names.

Check scope of From and Goto blocks

Check ID: `mathworks.maab.na_0011`

Check the scope of From and Goto blocks.

Description

You can use global scope for controlling flow. However, From and Goto blocks must use local scope for signal flows.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
From and Goto blocks are not configured with local scope.	<ul style="list-style-type: none">• Make sure that the ports are connected.• Change the scope of the specified blocks to local.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0011: Scope of Goto and From blocks in the Simulink documentation.

Japan MATLAB Automotive Advisory Board Checks

Japan MATLAB Automotive Advisory Board (JMAAB) checks facilitate designing and troubleshooting models from which code is generated for automotive applications.

The Model Advisor performs a checkout of the Simulink Check license when you run JMAAB checks.

See Also

- “MAAB Control Algorithm Modeling” (Simulink) guidelines
- The *Control Algorithm Modeling Guidelines Using MATLAB, Simulink, and Stateflow* JMAAB guidelines on the MathWorks website

Check file names

Check ID: mathworks.maab.ar_0001

Checks the names of all files residing in the same folder as the model

Description

A file name conforms to constraints.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The file name contains illegal characters.	Rename the file. Allowed characters are a-z, A-Z, 0-9. and underscore (_).
The file name starts with a number.	Rename the file.
The file name starts with an underscore ("_").	Rename the file.
The file name ends with an underscore ("_").	Rename the file.
The file extension contains one (or more) underscores.	Change the file extension.
The file name has consecutive underscores.	Rename the file.
The file name contains more than one dot (".").	Rename the file.

Capabilities and Limitations

- MAAB guideline, Version 3.0 limitation: The check does not flag conflicts with C++ keywords.
- Runs on library models.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: ar_0001: Filenames in the Simulink documentation.
- JMAAB guideline, Version 4.0: ar_0001: Usable characters for filenames.

Check folder names

Check ID: `mathworks.maab.ar_0002`

Checks model directory and subdirectory names for invalid characters.

Description

A directory name conforms to constraints.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The directory name contains illegal characters.	Rename the directory. Allowed characters are a-z, A-Z, 0-9. and underscore (_).
The directory name starts with a number.	Rename the directory.
The directory name starts with an underscore ("_").	Rename the directory.
The directory name ends with an underscore ("_").	Rename the directory.
The directory name has consecutive underscores.	Rename the directory.

Capabilities and Limitations

- Runs on library models.
- Does not allow exclusions of blocks or charts.
- Analyzes the full path of the model.
- Analyzes subdirectories in the same directory as the model.

See Also

- MAAB guideline, Version 3.0: ar_0002: Directory names in the Simulink documentation.
- JMAAB guideline, Version 4.0: ar_0002: Usable characters for folder names.

Check subsystem names

Check ID: `mathworks.maab.jc_0201`

Check whether subsystem block names include invalid characters.

Description

The names of all subsystem blocks that generate code are checked for invalid characters.

The check does not report invalid characters in subsystem names for:

- Virtual subsystems
- Atomic subsystems with **Function Packaging** set to `Inline`

Available with Simulink Check.

Input Parameters

To control the naming convention for blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check port block names**. In the **Input Parameter** pane:
 - Use **Naming standard** to select `MAAB 3.0` or `Custom`. When you select `MAAB 3.0`, the check uses the regular expression `([^\a-zA-Z_0-9])|(^d)|(^)|(^_|^_)|(^_|^_)$` to verify that names:

- Use these characters: a-z, A-Z, 0-9, and the underscore (_).
- Do not start with a number.
- Do not use underscores at the beginning or end of a string.
- Do not use more than one consecutive underscore.

When you select **Custom**, you can enter your own **Regular expression for prohibited names**. For example, if you want to allow more than one consecutive underscore, enter `([a-zA-Z_0-9])|(^\\d)|(^)|(^_)|(_$)`.

- 2 Click **Apply**.
- 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The subsystem names do not comply with the naming standard specified in the input parameters.	Update the subsystem names to comply with your own guidelines or the MAAB guidelines.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Tips

Use underscores to separate parts of a subsystem name instead of spaces.

See Also

- MAAB guideline, Version 3.0: jc_0201: Usable characters for Subsystem names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0201: Usable characters for Subsystem names.

Check port block names

Check ID: mathworks.maab.jc_0211

Check whether Inport and Outport block names include invalid characters.

Description

The names of all Inport and Outport blocks are checked for invalid characters.

Available with Simulink Check.

Input Parameters

To control the naming convention for blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check port block names**. In the **Input Parameter** pane:
 - Use **Naming standard** to select **MAAB 3.0** or **Custom**. When you select **MAAB 3.0**, the check uses the regular expression $([a-zA-Z_0-9])|(^d)|(^)|(^_)|(^_)$$ to verify that names:
 - Use these characters: a-z, A-Z, 0-9, and the underscore (_).
 - Do not start with a number.
 - Do not use underscores at the beginning or end of a string.
 - Do not use more than one consecutive underscore.

When you select **Custom**, you can enter your own **Regular expression for prohibited names**. For example, if you want to allow more than one consecutive underscore, enter $([a-zA-Z_0-9])|(^d)|(^)|(^_)|(^_)$$.

- 2 Click **Apply**.
- 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The block names do not comply with the naming standard specified in the input parameters.	Update the block names to comply with your own guidelines or the MAAB guidelines.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Tips

Use underscores to separate parts of a block name instead of spaces.

See Also

- MAAB guideline, Version 3.0: jc_0211: Usable characters for Inport blocks and Output blocks in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0211: Usable characters for Inport block and Output block.

Check character usage in signal labels

Check ID: `mathworks.maab.jc_0221`

Check whether signal line names include invalid characters.

Description

The names of all signal lines are checked for invalid characters.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The signal line name contains illegal characters.	Rename the signal line. Allowed characters include a-z, A-Z, 0-9, and underscore (_).
The signal line name starts with a number.	Rename the signal line.
The signal line name starts with an underscore ("_").	Rename the signal line.
The signal line name ends with an underscore ("_").	Rename the signal line.
The signal line name has consecutive underscores.	Rename the signal line.
The signal line name has blank spaces.	Rename the signal line.
The signal line name has control characters.	Rename the signal line.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

Tips

Use underscores to separate parts of a signal line name instead of spaces.

See Also

- MAAB guideline, Version 3.0: jc_0221: Usable characters for signal line names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0222: Usable characters for signal line and bus names.

Check character usage in block names

Check ID: `mathworks.maab.jc_0231`

Check whether block names include invalid characters.

Description

The check reports invalid characters in all block names, except:

- Inports and Outports
- Unmasked subsystems

MAAB guideline, Version 3.0, jc_0231: Usable characters for block names does not apply to subsystem blocks.

Available with Simulink Check.

Prerequisite

A prerequisite MAAB guideline, Version 3.0, for this check is jc_0201: Usable characters for Subsystem names.

Input Parameters

To control the naming convention for blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check character usage in block names**. In the **Input Parameter** pane:

- Use **Naming standard** to select MAAB 3.0 or Custom. When you select MAAB 3.0, the check uses the regular expression $([^a-zA-Z_0-9\n\r]) | (^\d) | (^)$ to verify that names:
 - Use these characters: a-z, A-Z, 0-9, underscore (_), and blank space.
 - Do not start with a number or blank space.
 - Do not have double byte characters.

When you select Custom, you can enter your own **Regular expression for prohibited names**. For example, if you do not want to allow underscores (_) in a block name, enter $([^a-zA-Z0-9\r]) | (^\d) | (^)$.

- 2 Click **Apply**.
- 3 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
The block names do not comply with the naming standard specified in the input parameters.	Update the block names to comply with your own guidelines or the MAAB guidelines.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Tips

Carriage returns are allowed in block names.

See Also

- MAAB guideline, Version 3.0: jc_0231: Usable characters for block names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0231: Usable characters for block names.

Check for mixing basic blocks and subsystems

Check ID: `mathworks.maab.db_0143`

Check for systems that mix primitive blocks and subsystems.

Description

You must design each level of a model with building blocks of the same type, for example, only subsystems or only primitive (basic) blocks. If you mask your subsystem and set `MaskType` to a nonempty string, the Model Advisor treats the subsystem as a basic block.

Available with Simulink Check.

Input Parameters

To change the list of blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check for mixing basic blocks and subsystems**.
- 2 In the **Input Parameters** pane, to:
 - Allow the blocks specified by MAAB 3.0, from **Standard**, select MAAB 3.0. The **Block type list** table provides the blocks that MAAB 3.0 allows at any model level.
 - To specify blocks to either allow or prohibit, from **Standard**, select Custom. In **Treat blocktype list as**, select Allowed or Prohibited. In the **Block type list** table, you can add or remove blocks.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the specified input parameters.

Results and Recommended Actions

Condition	Recommended Action
A level in the model includes subsystem blocks and primitive blocks.	Move nonvirtual blocks into the subsystem.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0143: Similar block types on the model levels in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0143: Similar block types on the model levels.

Check Implement logic signals as Boolean data (vs. double)

Check ID: `mathworks.maab.jc_0011`

Check the optimization parameter for Boolean data types.

Description

Optimization for Boolean data types is required

Available with Simulink Check.

Prerequisite

A prerequisite MAAB guideline, Version 3.0, for this check is `na_0002`: Appropriate implementation of fundamental logical and numerical operations.

Results and Recommended Actions

Condition	Recommended Action
Configuration setting for Implement logic signals as boolean data (vs. double) is not set.	Select the Implement logic signals as boolean data (vs. double) check box in the Configuration Parameters dialog box.

Capabilities and Limitations

- Does not run on library models.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: `jc_0011`: Optimization parameters for Boolean data types in the Simulink documentation.
- JMAAB guideline, Version 4.0: `jc_0011`: Optimization parameters for Boolean data types.

Check for Simulink diagrams using nonstandard display attributes

Check ID: `mathworks.maab.na_0004`

Check model appearance setting attributes.

Description

Model appearance settings are required to conform to the guidelines when the model is released.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The toolbar is not visible.	Select View > Toolbar .
The status bar is not visible.	Select View > Status Bar .
Sample Time > Colors is selected.	Clear Sample Time > Colors .
Wide Nonscalar Lines is cleared.	Select Display > Signals & Ports > Wide Nonscalar Lines .
Viewer Indicators is cleared.	Select Display > Signals & Ports > Viewer Indicators .
Testpoint Indicators is cleared.	Select Display > Signals & Ports > Testpoint & Logging Indicators .
Port Data Types is selected.	Clear Display > Signals & Ports > Port Data Types .
Storage Class is selected.	Clear Display > Signals & Ports > Storage Class .
Signal Dimensions is selected.	Clear Display > Signals & Ports > Signal Dimensions .
Execution Context Indicator is selected.	Clear Display > Signals & Ports > Execution Context Indicator .
Model Browser is selected.	Clear View > Model Browser > Show Model Browser .
Sorted Execution Order is selected.	Clear Display > Blocks > Sorted Execution Order .
Model Block Version is selected.	Clear Display > Blocks > Block Version for Referenced Models .

Condition	Recommended Action
Model Block I/O Mismatch is selected.	Clear Display > Blocks > Block I/O Mismatch for Referenced Models .
Library Links is set Disabled, User Defined, or All.	Select Display > Library Links > None .
Linearization Indicators is cleared.	Select Display > Signals & Ports > Linearization Indicators .
Block backgrounds are not white.	Select Format > Background Color > White .
Block foregrounds are not black.	Select Format > Foreground Color > Black .
Diagrams do not have white backgrounds.	Select Diagram > Format > Canvas Color > White .
Diagrams do not have zoom factor set to 100%.	Select View > Zoom > Normal (100%) .

Action Results

Clicking **Modify** updates the display attributes to conform to the guideline.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: na_0004: Simulink model appearance in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0004: Simulink model appearance.

Check font formatting

Check ID: mathworks.maab.db_0043

Check for difference in font and font sizes.

Description

With the exception of free text annotations within a model, text elements, such as block names, block annotations, and signal labels, must have the same font style and font size. Select a font style and font size that is legible and portable (convertible between platforms), such as Arial or Times New Roman 12 point. To specify font rules for a Simulink session, from the Simulink editor select **Diagram > Format > Font Styles for Model**.

Available with Simulink Check.

Input Parameters

Font Name

Apply the specified font to all text elements. When you specify **Common** (default), the check identifies different fonts used in your model. Although you can specify other fonts, the fonts available from the drop-down list are Arial, Courier New, Georgia, Times New Roman, Arial Black, and Verdana.

Font Size

Apply the specified font size to all text elements. When you specify **Common** (default), the check identifies different font sizes used in your model. Although you can specify other font sizes, the font sizes available from the drop-down list are 6, 8, 9, 10, 12, 14, 16.

Font Style

Apply the specified font style to all text elements. When you specify **Common** (default), the check identifies different font styles used in your model. The font styles available from the drop-down list are normal, bold, italic, and bold italic.

Results and Recommended Actions

Condition	Recommended Action
The fonts or font sizes for text elements in the model are not consistent or portable.	Specify values for the font parameters and in the right pane of the Model Advisor, click Modify all Fonts , or manually change the fonts and font sizes of text elements in the model so they are consistent and portable.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

Action Results

In the right pane of the Model Advisor, clicking **Modify all Fonts** changes the font and font size of all text elements in the model according to the values you specify in the input parameters.

For the input parameters, if you specify **Common**, clicking **Modify all Fonts** changes the font and font sizes of all text elements in the model to the most commonly used fonts, font sizes, or font styles.

See Also

- MAAB guideline, Version 3.0: db_0043: Simulink font and font size in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0043: Simulink font and font size.

Check positioning and configuration of ports

Check ID: `mathworks.maab.db_0042`

Check whether the model contains ports with invalid position and configuration.

Description

In models, ports must comply with the following rules:

- Place Inport blocks on the left side of the diagram. It is acceptable to move the Inport block to the right only to prevent signal crossings.
- Place Outport blocks on the right side of the diagram. It is acceptable to move the Outport block to the left only to prevent signal crossings.
- Avoid using duplicate Inport blocks at the subsystem level if possible.
- Do not use duplicate Inport blocks at the root level.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Inport blocks are too far to the right and result in left-flowing signals.	Move the specified Inport blocks to the left.
Outport blocks are too far to the left and result in left-flowing signals.	Move the specified Output blocks to the right.
Ports do not have the default orientation.	Modify the model diagram such that signal lines for output ports enter the side of the block and signal lines for input ports exit the right side of the block.
Ports are duplicate Inport blocks.	<ul style="list-style-type: none"> • If the duplicate Inport blocks are in a subsystem, remove them where possible. • If the duplicate Inport blocks are at the root level, remove them.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.
- Does not analyze signal crossings

See Also

- MAAB guideline, Version 3.0: db_0042: Port block in Simulink models in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0042: Port block in Simulink models.

Check whether block names appear below blocks

Check ID: mathworks.maab.db_0142

Check whether block names appear below blocks.

Description

If shown, the name of the block should appear below the block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Blocks have names that do not appear below the blocks.	Set the name of the block to appear below the blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0142: Position of block names in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0142: Position of block names.

Check the display attributes of block names

Check ID: `mathworks.maab.jc_0061`

Check the display attributes of subsystem and block names.

Description

When the subsystem and block names provide descriptive information, display the names. If the block function is known from its appearance, do not display the name. Blocks with names that are obvious from the block appearance:

- From
- Goto

- Ground
- Logic
- MinMax
- ModelReference
- MultiPortSwitch
- Product
- Relational Operator
- Saturate
- Switch
- Terminator
- Trigonometry
- Unit Delay
- Sum
- Compare To Constant
- Compare To Zero

Available with Simulink Check.

Input Parameters

To specify the custom blocks and masks to include in this check, use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check the display attributes of block names**. In the **Input Parameters** pane, select Custom.
- 2 Use the **Block type list** table to include or exclude blocks and masks from the check.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the input parameters that you specified.

Results and Recommended Actions

Condition	Recommended Action
Name is displayed and obvious from the block appearance.	Hide name by clearing Diagram > Format > Show Block Name .

Condition	Recommended Action
Name is not descriptive. Specifically, the block name is: <ul style="list-style-type: none"> • Not obvious from the block appearance. • The default name appended with an integer. 	Modify the name to be more descriptive or hide the name by clearing Diagram > Format > Show Block Name .
Name is descriptive and not displayed. Descriptive names are: <ul style="list-style-type: none"> • Provided for blocks that are not obvious from the block appearance. • Not a default name appended with an integer. 	Display the name by selecting Diagram > Format > Show Block Name
Check does not evaluate my custom blocks and masks.	Use the Model Configuration Editor to specify your custom checks and blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0061: Display of block names in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0061: Display of block names.

Check position of Trigger and Enable blocks

Check ID: `mathworks.maab.db_0146`

Check the position of Trigger and Enable blocks.

Description

Locate blocks that define subsystems as conditional or iterative at the top of the subsystem diagram.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Trigger, Enable, and Action Port blocks are not at the top of the subsystem diagram.	Move the Trigger, Enable, and Action Port blocks to the top of the subsystem diagram.
For Each, For Iterator, and While Iterator blocks are not in the same location on the subsystem diagram.	Move the For Each, For Iterator, and While Iterator blocks so they are at a uniform location on the subsystem diagram.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: The check does not verify that For Each or For Iterator blocks are uniformly located.
- Runs on library models.
- Analyzes content of library linked blocks.
- Does not analyze content in masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0146: Triggered, enabled, conditional Subsystems in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0146: Triggered, enabled, conditional Subsystems.

Check for nondefault block attributes

Check ID: `mathworks.maab.db_0140`

Identify blocks that use nondefault block parameter values that are not displayed in the model diagram.

Description

Model diagrams should display block parameters that have values other than default values. One way of displaying this information is by using the **Block Annotation** tab in the Block Properties dialog box. To automatically fix warnings associated with this check, see “Automatically Fix Display of Nondefault Block Parameters”.

To customize the list of nondefault block parameters that are flagged by the check, see “Customize Model Advisor Check for Nondefault Block Attributes”.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Block parameters that have values other than default values, and the values are not in the model display.	In the Block Properties dialog box, use the Block Annotation tab to add block parameter annotations.

Capabilities and Limitations

- Only customizable for block parameters in `IntrinsicDialogParameters`. See “Common Block Properties” (Simulink)
- JMAAB guideline, Version 4.0 limitation: The check flags masked blocks that display parameter information but do not use block annotations. JMAAB 4.0 guidelines allow masked blocks to display parameter information.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialog boxes.
- Allows exclusions of blocks and charts.

Tip

If you use the `add_block` function with `'built-in/blocktype'` as a source block path name for Simulink built-in blocks, some default parameter values of some blocks are different from the defaults that you get if you added those blocks interactively by using Simulink.

See Also

- MAAB guideline, Version 3.0: db_0140: Display of basic block parameters.
- JMAAB guideline, Version 4.0: db_0140: Display of block parameters.
- For a list of block parameter default values, see “Block-Specific Parameters” (Simulink).
- `add_block`.

Check Trigger and Enable block names**Check ID:** `mathworks.maab.jc_0281`

Check Trigger and Enable block port names.

Description

Block port names should match the name of the signal triggering the subsystem. The check does not flag Trigger or Enable block names if the associated signal does not have a label.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Trigger block does not match the name of the signal to which it is connected.	Match Trigger block names to the connecting signal.
Enable block does not match the name of the signal to which it is connected.	Match Enable block names to the connecting signal.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: This check only flags Trigger and Enable blocks names.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0281: Naming of Trigger Port block and Enable Port block in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0281: Naming of Trigger Port block and Enable Port block.

Check signal line labels

Check ID: mathworks.maab.na_0008

Check the labeling on signal lines.

Description

Use a label to identify:

- Signals originating from the following blocks (the block icon exception noted below applies to all blocks listed, except Inport, Bus Selector, Demux, and Selector):
 - Bus Selector block (tool forces labeling)
 - Chart block (Stateflow)
 - Constant block
 - Data Store Read block
 - Demux block
 - From block
 - Inport block
 - Selector block
 - Subsystem block

Block Icon Exception If a signal label is visible in the display of the icon for the originating block, you do not have to display a label for the connected signal unless the signal label is required elsewhere due to a rule for signal destinations.

- Signals connected to one of the following destination blocks (directly or indirectly with a basic block that performs an operation that is not transformative):
 - Bus Selector block (tool forces labeling)

- Chart block (Stateflow)
- Data Store Write block
- Goto block
- Mux block
- Outport block
- Subsystem block
- Any signal of interest.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Signals coming from Bus Selector, Chart, Constant, Data Store Read, Demux, From, Inport, or Selector blocks are not labeled.	Label the signal.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: na_0008: Display of labels on signals in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0008: Display of labels on signals.
- “Signal Names and Labels” (Simulink).

Check for propagated signal labels

Check ID: mathworks.maab.na_0009

Check for propagated labels on signal lines.

Description

You should propagate a signal label from its source rather than enter the signal label explicitly (manually) if the signal originates from:

- An Inport block in a nested subsystem. However, if the nested subsystem is a library subsystem, you can explicitly label the signal coming from the Inport block to accommodate reuse of the library block.
- A basic block that performs a nontransformative operation.
- A Subsystem or Stateflow Chart block. However, if the connection originates from the output of an instance of the library block, you can explicitly label the signal to accommodate reuse of the library block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model includes signal labels that were entered explicitly, but should be propagated.	Use the open angle bracket (<) character to mark signal labels that should be propagated and remove the labels that were entered explicitly.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: na_0009: Entry versus propagation of signal labels in the Simulink documentation.

Check for unconnected ports and signal lines

Check ID: `mathworks.maab.db_0081`

Check whether model has unconnected input ports, output ports, or signal lines.

Description

Unconnected inputs should be connected to ground blocks. Unconnected outputs should be connected to terminator blocks.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Blocks have unconnected inputs or outputs.	Connect unconnected lines to blocks specified by the design or to Ground or Terminator blocks.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: `db_0081`: Unconnected signals, block inputs and block outputs in the Simulink documentation.
- JMAAB guideline, Version 4.0: `db_0081`: Unconnected signals, block inputs and block outputs.

Check for prohibited blocks in discrete controllers

Check ID: `mathworks.maab.jm_0001`

Check for prohibited blocks in discrete controllers.

Description

The check identifies continuous blocks in discrete controller models.

Available with Simulink Check.

Input Parameters

To change the list of blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check for prohibited blocks in discrete controllers**.
- 2 In the **Input Parameters** pane, to:
 - Prohibit the blocks as specified in MAAB 3.0, from **Standard**, select MAAB 3.0. The **Block type list** table provides the blocks that MAAB 3.0 prohibits inside controllers.
 - To specify blocks to either allow or prohibit, from **Standard**, select Custom. In **Treat blocktype list as**, select Allowed or Prohibited. In the **Block type list** table, you can add or remove blocks.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the specified input parameters.

Results and Recommended Actions

Condition	Recommended Action
Continuous blocks — Derivative, Integrator, State-Space, Transfer Fcn, Transfer Delay, Variable Time Delay, Variable Transport Delay, and Zero-Pole — are not permitted in models representing discrete controllers.	Replace continuous blocks with the equivalent blocks discretized in the s-domain. Use the Discretizing library, as described in “Discretize Blocks from the Simulink Model” (Simulink).

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0001: Prohibited Simulink standard blocks inside controllers in the Simulink documentation.
- JMAAB guideline, Version 4.0: jm_0001: Prohibited Simulink standard blocks inside controllers.
- “Overview of the Model Advisor Configuration Editor”

Check for prohibited sink blocks

Check ID: mathworks.maab.hd_0001

Check for prohibited Simulink sink blocks.

Description

You must design controller models from discrete blocks. Sink blocks, such as the Scope block, are not allowed in controller models.

Available with Simulink Check.

Input Parameters

To change the list of blocks that the check flags, you can use the Model Advisor Configuration Editor.

- 1 Open the Model Configuration Editor and navigate to **Check for prohibited sink blocks**.
- 2 In the **Input Parameters** pane, to:
 - Prohibit the blocks as specified by MAAB 3.0, from **Standard**, select MAAB 3.0. The **Block type list** table provides the sink blocks that MAAB 3.0 prohibits.
 - To specify blocks to either allow or prohibit, from **Standard**, select Custom. In **Treat blocktype list as**, select Allowed or Prohibited. In the **Block type list** table, you can add or remove blocks.
- 3 Click **Apply**.
- 4 Save the configuration. When you run the check using this configuration, the check uses the specified input parameters.

Results and Recommended Actions

Condition	Recommended Action
Sink blocks are not permitted in discrete controllers.	Remove sink blocks from the model.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: hd_0001: Prohibited Simulink sinks in the Simulink documentation.
- JMAAB guideline, Version 4.0: hd_0001: Prohibited Simulink sinks.

Check usage of Switch blocks

Check ID: `mathworks.maab.jc_0141`

Check usage of Switch blocks.

Description

Verifies that the Switch block control input (the second input) is a Boolean value and that the block is configured to pass the first input when the control input is nonzero.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The Switch block control input (second input) is not a Boolean value.	Change the data type of the control input to Boolean.

Condition	Recommended Action
The Switch block is not configured to pass the first input when the control input is nonzero.	Set the block parameter Criteria for passing first input to <code>u2 ~= 0</code> .

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0141: Use of the Switch block in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0141: Use of the Switch block.
- Switch block

Check usage of Relational Operator blocks

Check ID: `mathworks.maab.jc_0131`

Check the position of Constant blocks used in Relational Operator blocks.

Description

When the relational operator is used to compare a signal to a constant value, the constant input should be the second, lower input.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Relational Operator blocks have a Constant block on the first, upper input.	Move the Constant block to the second, lower input.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0131: Use of Relational Operator block in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0131: Use of Relational Operator block.

Check for indexing in blocks

Check ID: `mathworks.maab.db_0112`

Check that blocks use consistent vector indexing.

Description

Check that blocks use consistent vector indexing. When possible, use zero-based indexing to improve code efficiency.

Available with Simulink Check.

This check requires a Stateflow license.

The check verifies consistent indexing for the following objects:

Object	Indexing
<ul style="list-style-type: none">• Assignment block• For Iterator block• Find block• Multiport Switch block• Selector block	<ul style="list-style-type: none">• Zero-based indexing ([0, 1, 2, ...])• One-based indexing ([1, 2, 3,...])

Object	Indexing
<ul style="list-style-type: none"> Stateflow charts with C action language 	Zero-based indexing ([0, 1, 2, ...])
<ul style="list-style-type: none"> MATLAB Function block Fcn block MATLAB System blocks Truth tables State transition tables Stateflow charts with MATLAB action language MATLAB functions inside Stateflow charts 	One-based indexing ([1, 2, 3,...])

Results and Recommended Actions

Condition	Recommended Action
Objects in your model use one-based indexing, but can be configured for zero-based indexing.	Configure objects for zero-based indexing.
Objects in your model use inconsistent indexing.	If possible, configure objects for zero-based indexing. If your model contains objects that cannot be configured for zero-based indexing, configure objects for one-based indexing.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0112: Indexing in the Simulink documentation.

- JMAAB guideline, Version 4.0: db_0112: Indexing.

Check usage of tunable parameters in blocks

Check ID: `mathworks.maab.db_0110`

Check whether tunable parameters specify expressions, data type conversions, or indexing operations.

Description

To make a parameter tunable, you must enter the basic block without the use of MATLAB calculations or scripting. For example, omit:

- Expressions
- Data type conversions
- Selections of rows or columns

Supported blocks include:

- Backlash
- Bias
- Combinatorial Logic
- Constant
- Dead Zone
- Derivative
- Discrete-Time Integrator
- Gain
- Hit Crossing
- Initial Condition (IC)
- Integrator
- n-D Lookup Table
- Magnitude-Angle to Complex
- Memory
- Permute Dimensions

- Quantizer
- Rate Limiter
- Rate Transition
- Real-Imag to Complex
- Relay
- Saturation
- Sine
- State-Space
- Switch
- Transport Delay
- Unit Delay
- Variable Transport Delay

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Blocks have a tunable parameter that specifies an expression, data type conversion, or indexing operation.	In each case, move the calculation outside of the block, for example, by performing the calculation with a series of Simulink blocks, or precompute the value as a new variable.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not evaluate mask parameters.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0110: Tunable parameters in basic blocks in the Simulink documentation.

- JMAAB guideline, Version 4.0: db_0110: Tunable parameters in basic blocks.

Check orientation of Subsystem blocks

Check ID: `mathworks.maab.jc_0111`

Check the orientation of subsystem blocks.

Description

Subsystem inputs must be located on the left side of the block, and outputs must be located on the right side of the block.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Subsystem blocks are not using the right orientation	Rotate the subsystem so that inputs are on the left side of block and outputs are on the right side of the block.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: The check does not flag the rotation of subsystems.
- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in masked subsystems that have no workspaces and no dialogs.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0111: Direction of Subsystem in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0111: Direction of Subsystem.

Check usage of Discrete-Time Integrator block

Check ID: mathworks.jmaab.jc_0627

Check usage of Discrete-Time Integrator block.

Description

For Discrete-Time Integrator blocks, check:

- Block parameter **Limit output** is selected.
- Saturation limits is defined using a Simulink.Parameter or MPT.Parameter object whose data type is auto.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Block parameter Limit output is cleared	Select the Discrete-Time Integrator block parameter Limit output .
Saturation limit is defined by a Parameter object whose data type is not auto	Change the data type for the Parameter object to auto.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- JMAAB guideline, Version 4.0: jc_0627: Guideline for using the Discrete-Time Integrator block

Check for blocks with a fixed-point data type whose bias is not zero

Check ID: mathworks.jmaab.jc_0643

Check blocks with whose output signal data type is fixed-point and bias is not zero.

Description

For blocks that have a fixed-point data type for their output signals, check that block parameter **Bias** is set to 0.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
In the Data Type Assistant, Mode is set to Fixed Point but the value for Bias is not 0.	Change block parameter Bias to 0.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- JMAAB guideline, Version 4.0: jc_0643: Fixed-point setting

Check input and output datatype for Switch blocks

Check ID: `mathworks.jmaab.jc_0650`

Check whether the input and output data types for data ports are the same for switching function blocks

Description

For Switch, Multiport Switch, and Index Vector blocks, check that the input and output data ports have the same data type.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Input and output data ports have different data types.	Change the input or output data port so the data type is the same for both.

Capabilities and Limitations

- Analyzes content in all masked subsystems.

See Also

- JMAAB guideline, Version 4.0: jc_0650: Block input/output data type with switching function.

Check input signal datatypes in product blocks that perform division

Check ID: mathworks.jmaab.jc_0611

Check the sign bit for the input signal data types in product blocks with division operators.

Description

For product blocks with division operators, check that the same sign bit is used for input signal data types. Sign bits are either **signed** or **unsigned**.

Results and Recommended Actions

Condition	Recommended Action
Input signal data types have different sign bits.	Update the production block so the sign bit for the input signal data types match.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.

See Also

- JMAAB guideline, Version 4.0: jc_0611: Input signal sign during product block division

Check transition orientations in flow charts

Check ID: mathworks.maab.db_0132

Check transition orientations in flow charts.

Description

The following rules apply to transitions in flow charts:

- Draw transition conditions horizontally.
- Draw transitions with a condition action vertically.
- Junctions in flow charts should have a default exit transition.
- Transitions in flow charts should not combine condition and action.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The model includes a transition with a condition that is not drawn horizontally or a transition action that is not drawn vertically.	Modify the model.
Junction does not have a default exit transition	Add a default exit transition to the junction.
Transition has condition and action	Split up condition and action into separate transitions

Capabilities and Limitations

- MAAB guideline, Version 3.0 limitation: Although db_0132: Transitions in flow charts has an exception for loop constructs, the check does flag flow charts containing loop constructs if the transition violates the orientation rule.

- JMAAB guideline, Version 4.0 limitation: The check only flags flow charts containing loop constructs if the transition violates the orientation rule.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0132: Transitions in flow charts in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0132: Transitions in Flow Charts.

Check return value assignments of graphical functions in Stateflow charts

Check ID: `mathworks.maab.jc_0511`

Identify graphical functions with multiple assignments of return values in Stateflow charts.

Description

The return value from a Stateflow graphical function must be set in only one place.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The return value from a Stateflow graphical function is assigned in multiple places.	Modify the specified graphical function so that its return value is set in one place.

Capabilities and Limitations

- Runs on library models.

- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0511: Setting the return value from a graphical function in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0511: Setting the return value from a graphical function.
- “When to Use Reusable Functions in Charts” (Stateflow).

Check default transition placement in Stateflow charts**Check ID:** `mathworks.maab.jc_0531`

Check default transition placement in Stateflow charts.

Description

In a Stateflow chart, you should connect the default transition at the top of the state and place the destination state of the default transition above other states in the hierarchy. There should be only one default transition.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
There is no default transition.	Add a default transition.
The default transition for a Stateflow chart is not connected at the top of the state.	Move the default transition to the top of the Stateflow chart.
The destination state of a Stateflow chart default transition is lower than other states in the same hierarchy.	Adjust the position of the default transition destination state so that the state is above other states in the same hierarchy.

Condition	Recommended Action
There is more than one default transition.	Multiple default transitions should be combined into one default transition by using junctions and conditions.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0531: Placement of the default transition in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0531: Placement of the default transition.

Check for Strong Data Typing with Simulink I/O

Check ID: mathworks.maab.db_0122

Check whether labeled Stateflow and Simulink input and output signals are strongly typed.

Description

Strong data typing between Stateflow and Simulink input and output signals is required.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
A Stateflow chart does not use strong data typing with Simulink.	Select the Use Strong Data Typing with Simulink I/O check box for the specified block.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks and charts.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0122: Stateflow and Simulink interface signals and parameters in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0122: Stateflow and Simulink interface signals and parameters.
- “Syntax for States and Transitions” (Stateflow)

Check Stateflow data objects with local scope

Check ID: `mathworks.maab.db_0125`

Check whether Stateflow data objects with local scope are defined at the chart level or below.

Description

This check flags Stateflow data whose local scope is not defined at the Chart level or below, regardless of whether the data is used or not.

You must define local data of a Stateflow block on the chart level or below in the object hierarchy. You cannot define local variables on the machine level; however, parameters and constants are allowed at the machine level.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Local data is not defined in the Stateflow hierarchy at the chart level or below.	Define local data at the chart level or below.

Capabilities and Limitations

- JMAAB guideline, Version 4.0 limitation: The check does not detect if local data has the same name within charts or states that have parent-child relationships.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

- MAAB guideline, Version 3.0: db_0125: Scope of internal signals and local auxiliary variables in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0125: Scope of internal signals and local auxiliary variables.

Check usage of return values from a graphical function in Stateflow charts

Check ID: `mathworks.maab.jc_0521`

Identify calls to graphical functions in conditional expressions.

Description

Do not use the return value of a graphical function in a comparison operation.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Conditional expressions contain calls to graphical functions.	Assign return values of graphical functions to intermediate variables. Use these intermediate variables in the specified conditional expressions.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0521: Use of the return value from graphical functions in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0521: Use of the return value from graphical functions.
- “When to Use Reusable Functions in Charts” (Stateflow).
- “Reuse Logic Patterns Using Graphical Functions” (Stateflow).

Check for MATLAB expressions in Stateflow charts

Check ID: `mathworks.maab.db_0127`

Identify Stateflow objects that use MATLAB expressions that are not suitable for code generation.

Description

Do not use MATLAB functions, instructions, and operators in Stateflow objects.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Stateflow objects use MATLAB expressions.	Replace MATLAB expressions in Stateflow objects.

Capabilities and Limitations

- Applies only to Stateflow charts that use C as the action language.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0127: MATLAB commands in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0127: MATLAB commands in Stateflow.
- “Access Built-In MATLAB Functions and Workspace Data” (Stateflow).

Check for pointers in Stateflow charts

Check ID: `mathworks.maab.jm_0011`

Identify pointer operations on custom code variables.

Description

Pointers to custom code variables are not allowed.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Custom code variables use pointer operations.	Modify the specified chart to remove the dependency on pointer operations.

Capabilities and Limitations

- Applies only to Stateflow charts that use C as the action language.
- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0011: Pointers in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: jm_0011: Pointers in Stateflow.

Check for event broadcasts in Stateflow charts

Check ID: `mathworks.maab.jm_0012`

Identify undirected event broadcasts that might cause recursion during simulation and generate inefficient code.

Description

Event broadcasts in Stateflow charts must be directed.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Event broadcasts are undirected.	Rearchitect the diagram to use directed event broadcasting. Use the send syntax or qualified event names to direct the event to a particular state. Use multiple send statements to direct an event to more than one state.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jm_0012: Event broadcasts in the Simulink documentation.
- JMAAB guideline, Version 4.0: jm_0012: Event broadcasts.
- “Broadcast Events to Synchronize States” (Stateflow).

Check transition actions in Stateflow charts

Check ID: mathworks.maab.db_0151

Identify missing line breaks between transition actions.

Description

For readability, start each transition action on a new line.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Multiple transition actions are on a single line.	Verify that each transition action begins on a new line.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: db_0151: State machine patterns for transition actions in the Simulink documentation.
- JMAAB guideline, Version 4.0: db_0151: State machine patterns for transition actions.
- “Syntax for States and Transitions” (Stateflow)

Check for bitwise operations in Stateflow charts

Check ID: `mathworks.maab.na_0001`

Identify bitwise operators (&, |, and ^) in Stateflow charts. If you select **Enable C-bit operations** for a chart, only bitwise operators in expressions containing Boolean data types are reported. Otherwise, all bitwise operators are reported for the chart.

Description

Do not use bitwise operators in Stateflow charts, unless you enable bitwise operations.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Stateflow charts with Enable C-bit operations selected use bitwise operators (&, , and ^) in expressions containing Boolean data types.	Do not use Boolean data types in the specified expressions.
The Model Advisor could not determine the data types in expressions with bitwise operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.
Stateflow charts with Enable C-bit operations cleared use bitwise operators (&, , and ^).	To fix this issue, do either of the following: <ul style="list-style-type: none"> • Modify the expressions to replace bitwise operators. • If not using Boolean data types, consider enabling bitwise operations. In the Chart properties dialog box, select Enable C-bit operations.

Capabilities and Limitations

- Applies only to charts that use C as the action language.
- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- “Binary and Bitwise Operations” (Stateflow).
- MAAB guideline, Version 3.0: na_0001: Bitwise Stateflow operators in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0001: Bitwise Stateflow operators.
- “hisf_0003: Usage of bitwise operations” (Simulink).

Check for unary minus operations on unsigned integers in Stateflow charts

Check ID: mathworks.maab.jc_0451

Identify unary minus operations applied to unsigned integers in Stateflow objects.

Description

Do not perform unary minus operations on unsigned integers in Stateflow objects.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Unary minus operations are applied to unsigned integers in Stateflow objects.	Modify the specified objects to remove dependency on unary minus operations.
The Model Advisor could not determine the data types in expressions with unary minus operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: jc_0451: Use of unary minus on unsigned integers in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: jc_0451: Use of unary minus on unsigned integers in Stateflow.

Check for comparison operations in Stateflow charts

Check ID: mathworks.maab.na_0013

Identify comparison operations with different data types in Stateflow objects.

Description

Comparisons should be made between variables of the same data types.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Comparison operations with different data types were found.	Revisit the specified operations to avoid comparison operations with different data types.
The Model Advisor could not determine the data types in expressions with comparison operations.	To allow Model Advisor to determine the data types, consider explicitly typecasting the specified expressions.

Capabilities and Limitations

- Does not run on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0013: Comparison operation in Stateflow in the Simulink documentation.
- JMAAB guideline, Version 4.0: na_0013: Comparison operation in Stateflow.

Check for mismatches between names of Stateflow ports and associated signals

Check ID: `mathworks.maab.db_0123`

Check for mismatches between Stateflow ports and associated signal names.

Description

The name of Stateflow input and output should be the same as the corresponding signal. The check does not flag:

- Name mismatches for reusable Stateflow charts in libraries.
- Stateflow ports if the corresponding signal does not have a label.

Available with Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
Signals have names that differ from the corresponding Stateflow ports.	Change the names of either the signals or the Stateflow ports.

Capabilities and Limitations

- Does not run on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts. Exclusions will not work for library linked charts.

See Also

- MAAB guideline, Version 3.0: `db_0123`: Stateflow port names in the Simulink documentation.
- JMAAB guideline, Version 4.0: `db_0123`: Stateflow port names.

Check input and output settings of MATLAB Functions

Check ID: mathworks.maab.na_0034

Identify MATLAB Functions that have inputs, outputs or parameters with inherited complexity or data type properties.

Description

The check identifies MATLAB Functions with inherited complexity or data type properties. A results table provides links to MATLAB Functions that do not pass the check, along with conditions triggering the warning.

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Functions have inherited interfaces.	<p>Explicitly define complexity and data type properties for inports, outports, and parameters of MATLAB Function identified in the results.</p> <p>If applicable, using the “MATLAB Function Block Editor” (Simulink), make the following modifications in the “Ports and Data Manager” (Simulink):</p> <ul style="list-style-type: none"> • Change Complexity from Inherited to On or Off. • Change Type from Inherit: Same as Simulink to an explicit type. • Change Size from -1 (Inherited) to an explicit size.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.

- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

See Also

- MAAB guideline, Version 3.0: na_0034: MATLAB Function block input/output settings in the Simulink documentation.

Check MATLAB code for global variables**Check ID:** `mathworks.maab.na_0024`

Check for global variables in MATLAB code.

Description

Verifies that global variables are not used in any of the following:

- MATLAB code in MATLAB Function blocks
- MATLAB functions defined in Stateflow charts
- Called MATLAB functions

Available with Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Global variables are used in one or more of the following: <ul style="list-style-type: none">• MATLAB code in MATLAB Function blocks• MATLAB functions defined in Stateflow charts• Called MATLAB functions	Replace global variables with signal lines, function arguments, or persistent data.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Does not allow exclusions of blocks or charts.

See Also

Check MATLAB Function metrics

Check ID: `mathworks.maab.himl_0003`

Display complexity and code metrics for MATLAB Functions. Report metric violations.

Description

This check provides complexity and code metrics for MATLAB Functions. The check additionally reports metric violations.

A results table provides links to MATLAB Functions that violate the complexity input parameters.

Available with Simulink Check.

Input Parameters

Maximum effective lines of code per function

Provide the maximum effective lines of code per function. Effective lines do not include empty lines, comment lines, or lines with a function end keyword.

Minimum density of comments

Provide minimum density of comments. Density is ratio of comment lines to total lines of code.

Maximum cyclomatic complexity per function

Provide maximum cyclomatic complexity per function. Cyclomatic complexity is the number of linearly independent paths through the source code.

Results and Recommended Actions

Condition	Recommended Action
MATLAB Function violates the complexity input parameters.	For the MATLAB Function: <ul style="list-style-type: none">• If effective lines of code is too high, further divide the MATLAB Function.• If comment density is too low, add comment lines.• If cyclomatic complexity per function is too high, further divide the MATLAB Function.

Capabilities and Limitations

- Runs on library models.
- Does not analyze content of library linked blocks.
- Analyzes content in all masked subsystems.
- Allows exclusions of blocks and charts.

Check usage of Assignment blocks

Check ID: `mathworks.misra.AssignmentBlocks`

Identify Assignment blocks that do not have block parameter **Action if any output element is not assigned** set to **Error** or **Warning**.

Description

This check applies to the Assignment block that is available in the Simulink block library under **Simulink > Math Operations**.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem might contain Assignment blocks with incomplete array initialization that do not have block parameter Action if any output element is not assigned set to Error or Warning .	Set block parameter Action if any output element is not assigned to one of the recommended values: <ul style="list-style-type: none"> • Error, if Assignment block is not in an Iterator subsystem. • Warning, if Assignment block is in an Iterator subsystem.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- If you have a Simulink Check license, allows exclusions of blocks and charts.

Check for blocks not recommended for MISRA C:2012

Check ID: `mathworks.misra.BlkSupport`

Identify blocks that are not supported or recommended for MISRA C:2012 compliant code generation.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Lookup Table blocks using cubic spline interpolation or extrapolation methods were found in the model or subsystem.	Consider other interpolation and extrapolation methods for the Lookup Table blocks.
Deprecated Lookup Table blocks were found in the model or subsystem. The deprecated Lookup Table blocks are Lookup and Lookup2D.	Consider replacing the deprecated Lookup Table blocks.
S-Function Builder blocks were found in the model or subsystem.	Consider replacing the S-Function Builder blocks with blocks recommended for production.
From Workspace blocks were found in the model or subsystem.	Consider replacing the From Workspace blocks with blocks recommended for production.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “hisl_0020: Blocks not recommended for MISRA C:2012 compliance” (Simulink)
- “MISRA C Guidelines” (Embedded Coder)

- “MISRA C:2012 Compliance Considerations” (Simulink)

Check for unsupported block names

Check ID: `mathworks.misra.BlockNames`

Identify block names containing `/`.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Block names containing <code>/</code> were found in the model or subsystem.	Remove <code>/</code> from the block name.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- If you have a Simulink Check license, allows exclusions of blocks and charts.

See Also

- MISRA C:2012, Rule 3.1

Check configuration parameters for MISRA C:2012

Check ID: `mathworks.misra.CodeGenSettings`

Identify configuration parameters that might impact MISRA C:2012 compliant code generation.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Use division for fixed-point net slope computation is not set to On or Use division for reciprocals of integers only.	Set configuration parameter Use division for fixed-point net slope computation to On or Use division for reciprocals of integers only.
Bitfield declarator type specifier is set to uchar_T when any these parameters are selected: <ul style="list-style-type: none"> • Pack Boolean data into bitfields • Use bitsets for storing state configuration • Use bitsets for storing Boolean data 	Set configuration parameter Bitfield declarator type specifier to uint_T.
Model Verification block enabling is set to Use local settings or Enable All.	Set configuration parameter Model Verification block enabling to Disable All.
Wrap on overflow is set to None	Set configuration parameter Wrap on overflow to warning or error.
Inf or NaN block output is set to None	Set configuration parameter Inf or NaN block output to warning or error.
Signed integer division rounds to is not set to Zero or Floor.	Set configuration parameter Signed integer division rounds to to Zero or Floor.

Condition	Recommended Action
Dynamic memory allocation in MATLAB Function blocks is selected.	Clear configuration parameter Dynamic memory allocation in MATLAB Function blocks .
System target file is set to a GRT-based target.	Set configuration parameter System target file to an ERT-based target.
Maximum identifier length	Set the configuration parameter value to the implementation dependent limit. The default is 31.
System-generated identifiers is set to Classic.	Set configuration parameter System-generated identifiers to Shortened.
Code replacement library is not set to None or AUTOSAR 4.0.	Set configuration parameter Code replacement library to None or AUTOSAR 4.0
Shared code placement is set to Auto.	Set configuration parameter Shared code placement to Shared location
Support: non-finite numbers is selected.	Clear configuration parameter Support: non-finite numbers
Support: complex numbers is selected.	Clear configuration parameter Support: complex numbers (ERT-based target only)
Support: continuous time is selected.	Clear configuration parameter Support: continuous time (ERT-based target only)
MAT-file logging is selected.	Clear configuration parameter MAT-file logging
Generate shared constants is selected.	Clear configuration parameter Generate shared constants .
Standard math library does not indicate the correct C programming language.	Set configuration parameter Standard math library to C89/C90 (ANSI) or C99 (ISO) depending on toolchain
Support non-inlined S-functions is selected.	Clear configuration parameter Support non-inlined S-functions (ERT-based target only)

Condition	Recommended Action
Use dynamic memory allocation for model initialization is selected when Code Interface Packaging is set to Reusable Function.	Clear configuration parameter Use dynamic memory allocation for model initialization . Select only when configuration parameter Code Interface Packaging is set to Reusable Function.
Parenthesis level is not set to Maximum (Specify precedence with parentheses).	Set configuration parameter Parentheses level to Maximum (Specify precedence with parentheses).
Replace multiplications by powers of two with signed bitwise shifts is selected.	Clear configuration parameter Replace multiplications by powers of two with signed bitwise shifts .
Casting Modes is not set to Standards Compliant.	Set configuration parameter Casting Modes to Standards Compliant.
Allow right shifts on signed integers is selected.	Clear configuration parameter Allow right shifts on signed integers .
Preserve static keyword in function declarations is cleared when File packaging format is set to Compact or CompactWithDataFile.	Select configuration parameter Preserve static keyword in function declarations (ERT-based target only).

Action Results

Clicking **Modify All** changes the parameter values to the recommended values.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

Capabilities and Limitations

This check does not review referenced models.

Check for equality and inequality operations on floating-point values

Check ID: `mathworks.misra.CompareFloatEquality`

Identify equality and inequality operations on floating-point values.

Description

The check flags sources causing equality or inequality operations on floating-point values.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

The check does not flag blocks with equality or inequality operations on floating-point values if they are justified with a Polyspace® annotation. When you run the check, the **Blocks with justification** table lists blocks with equality or inequality operations that have a justification.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model object has an equality or inequality operation on a floating-point value.	Consider using non-floating-point values for equality or inequality operations.

Capabilities and Limitations

You can:

- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

Check for bitwise operations on signed integers

Check ID: `mathworks.misra.CompliantCGIRConstructions`

Identify Simulink blocks that contain bitwise operations on signed integers. The check does not flag MATLAB Function or Stateflow blocks that use signed operands for bitwise operators.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

Available with Embedded Coder and Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The model has blocks that contain bitwise operations on signed integers.	Consider using unsigned integers for bitwise operations.

Capabilities and Limitations

You can:

- The check assumes that code is generated for the whole model. When code is generated by a subsystem build or export functions, the check can produce incorrect results.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

Check for recursive function calls**Check ID:** `mathworks.misra.RecursionCompliance`

Identify recursive function calls in Stateflow charts.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications. The check flags charts that have recursive function calls.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Chart has a recursive function call.	Remove recursive function call.

See Also

- MISRA C:2012, Dir 17.2
- “Guidelines for Avoiding Unwanted Recursion in a Chart” (Stateflow)

Check for switch case expressions without a default case**Check ID:** `mathworks.misra.SwitchDefault`

Identify switch case expressions that do not have a default case.

Description

The check flags model objects that have switch case expressions without a default case.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

The check does not flag blocks without default cases if they are justified with a Polyspace annotation. When you run the check, the **Blocks with justification** table lists blocks without default cases that have a justification.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model object has a switch case expression without a default case.	For Switch Case blocks, consider selecting block parameter Show default case to explicitly specify a default case.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

- “Secure Coding Standards” (Embedded Coder)

Check for blocks not recommended for C/C++ production code deployment

Check ID: `mathworks.codegen.PCGSupport`

Identify blocks not supported by code generation or not recommended for C/C++ production code deployment.

Description

This check partially identifies model constructs that are not recommended for C/C++ production code generation as identified in the Simulink Block Support (Simulink Coder) tables for Simulink Coder and Embedded Coder. If you are using blocks with support notes for code generation, review the information and follow the given advice.

Following the recommendations of this check increases the likelihood of generating code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains blocks that should not be used for production code deployment.	Consider replacing the blocks listed in the results. Click an element from the list of questionable items to locate condition.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “Blocks and Products Supported for C Code Generation” (Simulink Coder)

- “Secure Coding Standards” (Embedded Coder)

Check for missing error ports for AUTOSAR receiver interfaces

Check ID: `mathworks.misra.AutosarReceiverInterface`

Identify AUTOSAR receiver interface inports that do not have matching error ports.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications. The check flags AUTOSAR receiver interfaces inports that are missing error ports.

The check does not flag missing error ports if they are justified with a Polyspace annotation. When you run the check, the **Blocks with justification** table lists the missing error ports that have a justification.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
AUTOSAR receiver interface inport does not have a matching error port.	Add missing error port and map to the corresponding AUTOSAR receiver interface inport.

Capabilities and Limitations

You can:

- Analyzes top layer/root level models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- MISRA C: 2012, Directive 4.7

- “Annotate Code and Hide Known or Acceptable Results” (Polyspace Bug Finder)

Check for missing const qualifiers in model functions

Check ID: `mathworks.misra.ModelFunctionInterface`

Identify missing const qualifiers in input data pointers.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications. The check flags input data pointers that do not have a const qualifier.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
A const qualifier is not defined for the input data pointer.	Consider adding a const qualifier to the input data pointer.

See Also

- MISRA C:2012, Rule 8.13
- “MISRA C Guidelines” (Embedded Coder)

Check integer word length

Check ID: `mathworks.misra.IntegerWordLengths`

Identify integer word lengths that do not comply with hardware implementation settings

Description

The check flags integers whose word lengths exceed the number of bits permitted via the hardware implementation settings.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model object contains integer word lengths that are not compliant with hardware implementation settings.	Update the integer so its length does not exceed the permitted number of bits. You can view the permitted number of bits in the Configuration Parameters dialog box, on the Hardware Implementation > Device details pane.

Capabilities and Limitations

You can:

- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- MISRA C:2012, Rule 10.1
- CERT C, INT13-C
- CWE, CWE-682

Check bus object names that are used as element names

Check ID: `mathworks.misra.BusElementNames`

Identify bus object names that are used as bus element names.

Description

Using this check increases the likelihood of generating code for embedded applications that is compliant with MISRA C:2012. The check flags instances where a Simulink.Bus object name is used as the Simulink.Bus element name.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
A bus object name is being used as a bus element name.	Change either the flagged bus object name or the bus element name so that they are not identical.

These checks are used to validate that code generated by Embedded Coder complies with the CERT C, CWE, and ISO/IEC TS 17961 (Embedded Coder) secure coding standards.

Check configuration parameters for secure coding standards

Check ID: `mathworks.security.CodeGenSettings`

Identify configuration parameters that might impact compliance with secure coding standards.

Description

Following the recommendations of this check increases the likelihood of generating code that complies with CERT C, CWE, ISO/IEC TS 17961 secure coding standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model Verification block enabling is set to Use local settings or Enable All.	In the Configuration Parameters dialog box, set Model Verification block enabling to Disable All.
System target file is set to a GRT-based target.	In the Configuration Parameters dialog box, on the Code Generation > General pane, set System target file to an ERT-based target.
Code Generation > Interface parameters are not set to the recommended values.	<p>In the Configuration Parameters dialog box, on the Code Generation > Interface pane:</p> <ul style="list-style-type: none"> • Set Code replacement library to None or AUTOSAR 4.0 • Clear Support: non-finite numbers • Clear Support: continuous time (ERT-based target only) <p>In the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> • Clear Support non-inlined S-functions (ERT-based target only) • Clear MAT-file logging
Signed integer division rounds to is not set to Zero or Floor.	In the Configuration Parameters dialog box, on the Hardware Implementation pane, set Signed integer division rounds to to Zero or Floor.
Replace multiplications by powers of two with signed bitwise shifts is selected.	In the Configuration Parameters dialog box, on the Code Generation > Code Style pane, clear Replace multiplications by powers of two with signed bitwise shifts .

Condition	Recommended Action
Allow right shifts on signed integers is selected.	In the Configuration Parameters dialog box, on the Code Generation > Code Style pane, clear Allow right shifts on signed integers .
Use dynamic memory allocation for model initialization is selected.	In the Configuration Parameters dialog box, clear Use dynamic memory allocation for model initialization .
Wrap on overflow is set to None	In the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane, set Wrap on overflow to warning or error.
Inf or NaN block output is set to None	In the Configuration Parameters dialog box, on the Diagnostics > Data Validity pane, set Inf or NaN block output to warning or error.
Dynamic memory allocation in MATLAB Function blocks is selected.	In the Configuration Parameters dialog box, clear Dynamic memory allocation in MATLAB Function blocks .

Action Results

Clicking **Modify All** changes the parameter values to the recommended values.

Subchecks depend on the results of the subchecks noted with **D** in the results table in the Model Advisor window.

“Secure Coding Standards” (Embedded Coder)

Check for blocks not recommended for C/C++ production code deployment

Check ID: `mathworks.codegen.PCGSupport`

Identify blocks not supported by code generation or not recommended for C/C++ production code deployment.

Description

This check partially identifies model constructs that are not recommended for C/C++ production code generation as identified in the Simulink Block Support (Simulink Coder) tables for Simulink Coder and Embedded Coder. If you are using blocks with support notes for code generation, review the information and follow the given advice.

Following the recommendations of this check increases the likelihood of generating code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem contains blocks that should not be used for production code deployment.	Consider replacing the blocks listed in the results. Click an element from the list of questionable items to locate condition.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

Check for blocks not recommended for secure coding standards

Check ID: `mathworks.security.BlockSupport`

Identify blocks not recommended for compliance with secure coding standards.

Description

Following the recommendations of this check increases the likelihood of generating code that complies with CERT C, CWE, ISO/IEC TS 17961 secure coding standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Lookup Table blocks using cubic spline interpolation or extrapolation methods were found in the model or subsystem.	Consider other interpolation and extrapolation methods for the Lookup Table blocks.
Deprecated Lookup Table blocks were found in the model or subsystem.	Consider replacing the deprecated Lookup Table blocks.
S-Function Builder blocks were found in the model or subsystem.	Consider replacing the S-Function Builder blocks with blocks recommended for production.
From Workspace blocks were found in the model or subsystem	Consider replacing the From Workspace blocks with blocks recommended for production.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

See Also

- “What Is a Model Advisor Exclusion?”
- “Secure Coding Standards” (Embedded Coder)

Check usage of Assignment blocks

Check ID: `mathworks.misra.AssignmentBlocks`

Identify Assignment blocks that do not have block parameter **Action if any output element is not assigned** set to **Error** or **Warning**.

Description

This check applies to the Assignment block that is available in the Simulink block library under **Simulink > Math Operations**.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
The model or subsystem might contain Assignment blocks with incomplete array initialization that do not have block parameter Action if any output element is not assigned set to Error or Warning .	Set block parameter Action if any output element is not assigned to one of the recommended values: <ul style="list-style-type: none"> • Error, if Assignment block is not in an Iterator subsystem. • Warning, if Assignment block is in an Iterator subsystem.

Capabilities and Limitations

- Runs on library models.
- Analyzes content of library linked blocks.
- Analyzes content in all masked subsystems.
- If you have a Simulink Check license, allows exclusions of blocks and charts.

Check for switch case expressions without a default case

Check ID: `mathworks.misra.SwitchDefault`

Identify switch case expressions that do not have a default case.

Description

The check flags model objects that have switch case expressions without a default case.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

The check does not flag blocks without default cases if they are justified with a Polyspace annotation. When you run the check, the **Blocks with justification** table lists blocks without default cases that have a justification.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model object has a switch case expression without a default case.	For Switch Case blocks, consider selecting block parameter Show default case to explicitly specify a default case.

Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Check for bitwise operations on signed integers

Check ID: `mathworks.misra.CompliantCGIRConstructions`

Identify Simulink blocks that contain bitwise operations on signed integers. The check does not flag MATLAB Function or Stateflow blocks that use signed operands for bitwise operators.

Description

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

Available with Embedded Coder and Simulink Check.

This check requires a Stateflow license.

Results and Recommended Actions

Condition	Recommended Action
The model has blocks that contain bitwise operations on signed integers.	Consider using unsigned integers for bitwise operations.

Capabilities and Limitations

You can:

- The check assumes that code is generated for the whole model. When code is generated by a subsystem build or export functions, the check can product incorrect results.
- Exclude blocks and charts from this check if you have a Simulink Check license.

Check for equality and inequality operations on floating-point values**Check ID:** `mathworks.misra.CompareFloatEquality`

Identify equality and inequality operations on floating-point values.

Description

The check flags sources causing equality or inequality operations on floating-point values.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

The check does not flag blocks with equality or inequality operations on floating-point values if they are justified with a Polyspace annotation. When you run the check, the **Blocks with justification** table lists blocks with equality or inequality operations that have a justification.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model object has an equality or inequality operation on a floating-point value.	Consider using non-floating-point values for equality or inequality operations.

Capabilities and Limitations

You can:

- Exclude blocks and charts from this check if you have a Simulink Check license.

Check integer word length

Check ID: `mathworks.misra.IntegerWordLengths`

Identify integer word lengths that do not comply with hardware implementation settings

Description

The check flags integers whose word lengths exceed the number of bits permitted via the hardware implementation settings.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

Available with Embedded Coder and Simulink Check.

Results and Recommended Actions

Condition	Recommended Action
Model object contains integer word lengths that are not compliant with hardware implementation settings.	Update the integer so its length does not exceed the permitted number of bits. You can view the permitted number of bits in the Configuration Parameters dialog box, on the Hardware Implementation > Device details pane.

Capabilities and Limitations

You can:

- Exclude blocks and charts from this check if you have a Simulink Check license.

Detect Dead Logic

Check ID: `mathworks.sldv.deadlogic`

Identify logic that stays inactive during simulation.

Description

This check identifies portions of your model that stay inactive during simulation.

You can run a more detailed analysis that identifies both dead logic and active logic using Simulink Design Verifier™ design error detection. For more information, see “Detect Dead Logic Caused by an Incorrect Value” (Simulink Design Verifier).

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards

Results and Recommended Actions

Result	Recommended Action
Failed, model incompatible	<p>Resolve the model incompatibility. See:</p> <ul style="list-style-type: none">• “Supported and Unsupported Simulink Blocks in Simulink Design Verifier” (Simulink Design Verifier)• “Support Limitations for Model Blocks” (Simulink Design Verifier)• “Support Limitations for Simulink Software Features” (Simulink Design Verifier)• “Support Limitations for Stateflow Software Features” (Simulink Design Verifier)• “Support Limitations for MATLAB for Code Generation” (Simulink Design Verifier) <p>Also see “Handle Incompatibilities with Automatic Stubbing” (Simulink Design Verifier).</p>

Result	Recommended Action
Dead logic found in model	<p>Simulink Design Verifier proved that these decision and condition outcomes cannot occur and are dead logic in the model. Dead logic can also be a side effect of specified constraints on parameters or specified minimum and maximum constraints on input ports. In rare cases, dead logic can result from approximations performed by Simulink Design Verifier. It is possible that there are objectives that this analysis did not decide. To extend the results of this analysis, use Simulink Design Verifier design error detection to also identify active logic. From the Simulink Editor, select Analysis > Design Verifier > Options. In the Design Error Detection pane, select both Dead logic and Identify active logic.</p>
Dead logic not found in model	<p>Simulink Design Verifier did not find dead logic in the model. It is possible that there are objectives that this analysis did not decide. To extend the results of this analysis, use Simulink Design Verifier design error detection to also identify active logic. From the Simulink Editor, select Analysis > Design Verifier > Options. In the Design Error Detection pane, select both Dead logic and Identify active logic.</p>

Detect Integer Overflow

Check ID: `mathworks.sldv.integeroverflow`

Detects integer or fixed-point data overflow errors in your model

Description

This check identifies operations that exceed the data type range for integer or fixed-point operations.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Results and Recommended Actions

Result	Recommended Action
Failed, model incompatible	Resolve the model incompatibility. Detect Division by Zero

Check ID: `mathworks.sldv.divbyzero`

Detects division-by-zero errors in your model

Description

This check identifies operations in your model that cause division-by-zero errors.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Results and Recommended Actions

Result	Recommended Action

Detect Out Of Bound Array Access

Check ID: `mathworks.sldv.arraybounds`

Detects operations that access outside the bounds of an array index

Description

This check detects instances of out of bound array access in Simulink Design Verifier.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C, CWE, ISO/IEC TS 17961 standards.

Results and Recommended Actions

Detect Violation of Specified Minimum and Maximum Values

Check ID: `mathworks.sldv.minmax`

Detect signals which exceed specified minimum and maximum values

Description

This analysis checks the specified minimum and maximum values (the design ranges) on intermediate signals throughout the model and on the output ports. If the analysis detects that a signal exceeds the design range, the results identify where in the model the errors occurred.

Following the recommendations of this check increases the likelihood of generating MISRA C:2012 compliant code for embedded applications, as well as code that complies with the CERT C and CWE standards.

Results and Recommended Actions

Model Metrics

Model Metrics

Model metrics analyze your model and help you assess your model with regard to size, architecture, readability, and compliance to standards. Simulink Check provides the metrics for these metric types:

- “Size Metrics” on page 2-387
- “Architecture Metrics” on page 2-388
- “Compliance Metrics” on page 2-389
- “Readability Metrics” on page 2-390

Using the Metrics Dashboard, you can collect and view model metrics to get an assessment of your project quality status. For more information, see “Collect and Explore Metric Data by Using the Metrics Dashboard”.

You can use the model metric API to run the model metrics programmatically and export the results to a file. For more information, see “Collect Model Metrics Programmatically”.

For your company guidelines and standards, you can also use the model metric API to create your own model metrics, compute those metrics, and export the metric data. For more information, see “Create a Custom Model Metric”.

Size Metrics

To collect metric data on a model or subsystem, run these metrics.

Metric	Description
“Simulink block metric” on page 2-390	Calculates the number of blocks in the model.
“Subsystem metric” on page 2-392	Calculates the number of subsystems in the model.
“Library link metric” on page 2-393	Calculates the number of library-linked blocks in the model.

Metric	Description
“Effective lines of MATLAB code metric” on page 2-394	Calculates the number of effective lines of MATLAB code.
“Stateflow chart objects metric” on page 2-395	Calculates the number of Stateflow objects.
“Lines of code for Stateflow blocks metric” on page 2-397	Calculates the number of code lines for the following Stateflow blocks in the model: <ul style="list-style-type: none">• States• Transitions• Truth tables
“Subsystem depth metric” on page 2-398	Calculates the subsystem depth of the model.
“Input output metric” on page 2-400	Calculates the number of inports and outports in your model.
“Explicit input output metric” on page 2-402	Calculates the number of inports and outports in your model.
“File metric” on page 2-403	Calculates the number of model and library files.
“Matlab Function metric” on page 2-404	Calculates the number of Matlab Function blocks in your model.
“Model file count” on page 2-405	Calculates the number of model files.
“Parameter metric” on page 2-406	Calculates the number of data objects that parameterize the behavior of a model.
“Stateflow chart metric” on page 2-407	Calculates the number of Stateflow charts in your model.

For more information on model metrics, see “Collect Model Metrics”.

Architecture Metrics

To learn more about the architecture for a model or subsystem, run these metrics.

Metric	Description
“Cyclomatic complexity metric” on page 2-408	Calculates the cyclomatic complexity of the model.
“Clone content metric” on page 2-409	Calculates the number of components involved in a clone, excluding libraries.
“Clone detection metric” on page 2-410	Calculates the number of clones in components across the model hierarchy.
“Library content metric” on page 2-411	Calculates the number of components involved in a library, excluding clones.

For more information on model metrics, see “Collect Model Metrics”.

Compliance Metrics

To determine if your model or subsystem is compliant with standards and guidelines, run one or more of these metrics.

Metric	Description
“MATLAB code analyzer warnings” on page 2-415	Determines warnings for MATLAB code blocks in your model.
“Diagnostic warnings metric” on page 2-401	Calculates the number of diagnostic warnings reported.
“Model Advisor Check Compliance for High-Integrity Systems” on page 2-416	Returns the fraction of checks the model passes from Model Advisor DO-178C/DO-331 Standards.
“Model Advisor Check Compliance for Modeling Standards for MAAB” on page 2-417	Returns the fraction of checks the model passes from Model Advisor MAAB Standard.
“Model Advisor Check Issues for High-Integrity Systems” on page 2-418	Reports the number of issues from Model Advisor DO-178C/DO-331 Standards.

Metric	Description
“Model Advisor check issues for MAAB Standards” on page 2-419	Reports the number of issues from Model Advisor MAAB Standard.

For more information on model metrics, see “Collect Model Metrics”.

Readability Metrics

Run these metrics to determine readability for a model or subsystem.

Metric	Description
“Nondescriptive block name metric” on page 2-412	Determines nondescriptive Inport, Outport, and Subsystem block names.
“Data and structure layer separation metric” on page 2-414	Calculates the data and structure layer separation.

For more information on model metrics, see “Collect Model Metrics”.

Simulink block metric

Metric Type: Size

Metric ID: `mathworks.metrics.SimulinkBlockCount`

Model Advisor Check ID: `mathworks.metricchecks.SimulinkBlockCount`

Calculate the number of Simulink blocks in the model

Description

Use this metric to calculate the number of blocks in the model. The results provide the number of blocks at the model and subsystem level. This metric counts Simulink–based blocks, but does not include underlying blocks used to implement the block. This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Simulink block metric** in **By Task > Model Metrics > Count Metrics**.

- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.SimulinkBlockCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of blocks.
- **AggregatedValue:** Number of blocks for component and its subcomponents.
- **Measures:** Not applicable.

Note The results from metric analysis of **Simulink block metric** can differ from calling `sldiagnostics`. The result of the Simulink block metric:

- Includes referenced models.
 - Does not include any underlying blocks used to implement a MathWorks block that you used from the Simulink Library Browser.
 - Does not include links into MathWorks libraries, which means that MathWorks library blocks that are masked subsystems are counted as one block. The inner content of those blocks is not counted.
 - Does not include hidden content under Stateflow Charts or MATLAB Function blocks.
 - Does not include requirements blocks.
-

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Subsystem metric

Metric Type: Size

Metric ID: `mathworks.metrics.SubSystemCount`

Model Advisor Check ID: `mathworks.metricchecks.SubSystemCount`

Display number of subsystems in the model

Description

Use this metric to calculate the number of subsystems in the model. The results provide the number of subsystems at the model and subsystem level.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Subsystem metric** in **By Task > Model Metrics > Count Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.SubSystemCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of subsystems.
- **AggregatedValue:** Number of subsystems for a component and its subcomponent.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- Does not count subsystems linked to MathWorks libraries.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Library link metric

Metric Type: Size

Metric ID: `mathworks.metrics.LibraryLinkCount`

Model Advisor Check ID: `mathworks.metricchecks.LibraryLinkCount`

Display number of library links in the model

Description

Use this metric to calculate the number of library-linked blocks in the model. The results provide the number of library-linked blocks at the model and subsystem level.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Library link metric** in **By Task > Model Metrics > Count Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.LibraryLinkCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of library linked blocks.
- **AggregatedValue:** Number of library linked blocks for a component and its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- Does not count subsystems linked to MathWorks libraries.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Effective lines of MATLAB code metric

Metric Type: Size

Metric ID: `mathworks.metrics.MatlabLOCCount`

Model Advisor Check ID: `mathworks.metricchecks.MatlabLOCCount`

Display number of effective lines of MATLAB code

Description

Run this metric to calculate the number of effective lines of MATLAB code. Effective lines of MATLAB code are lines of executable code. Empty lines, lines that contain only comments, and lines that contain only an end statement are not considered effective lines of code. The results provide the number of effective lines of MATLAB code for each MATLAB Function block and for MATLAB functions in Stateflow charts.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Effective lines of MATLAB code metric** in **By Task > Model Metrics > Count Metrics**.

- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.MatlabLOCCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of effective lines of MATLAB code.
- **AggregatedValue:** Number of effective lines of MATLAB code for a component and its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- Does not analyze the content of MATLAB code in external files.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Stateflow chart objects metric

Metric Type: Size

Metric ID: `mathworks.metrics.StateflowChartObjectCount`

Model Advisor Check ID:

`mathworks.metricchecks.StateflowChartObjectCount`

Display the number of Stateflow objects in each chart

Description

Run this metric to calculate the number of Stateflow objects. For each chart in the model, the results provide the number of the following Stateflow objects:

- Atomic subcharts
- Boxes
- Data objects
- Events
- Graphical functions
- Junctions
- Linked charts
- MATLAB functions
- Notes
- Simulink functions
- States
- Transitions
- Truth tables

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Stateflow chart objects metric** in **By Task > Model Metrics > Count Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.StateflowChartObjectCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of Stateflow objects.
- **AggregatedValue:** Number of Stateflow objects for a component and its subcomponents.

- Measures: Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Lines of code for Stateflow blocks metric

Metric Type: Size

Metric ID: `mathworks.metrics.StateflowLOCCount`

Model Advisor Check ID: `mathworks.metricchecks.StateflowLOCCount`

Display the number of effective lines of code for Stateflow blocks

Description

Use this metric to calculate the number of effective lines of code in Stateflow. Effective lines of MATLAB code are lines of executable code. Empty lines, lines that contain only comments, and lines that contain only an end statement are not considered effective lines of code. This metric calculates the lines of code for the following Stateflow blocks in the model:

- Chart, counting the code on Transitions and inside States
- State Transition Table block
- Truth Table block

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Lines of code for Stateflow blocks metric** in **By Task > Model Metrics > Count Metrics**.

- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.StateflowLOCCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of Stateflow block code lines.
- **AggregatedValue:** Number of Stateflow block code lines for a component and its subcomponents.
- **Measures:** Vector with two entries: number of effective lines of code in MATLAB action language and number of effective lines of code in C action language.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Subsystem depth metric

Metric Type: Size

Metric ID: `mathworks.metrics.SubSystemDepth`

Model Advisor Check ID: `mathworks.metricchecks.SubSystemDepth`

Calculates the maximum depth of all hierarchical children of a subsystem or model

Description

Use this metric to count the maximum depth of all hierarchical children for a given subsystem or model starting from the given component, or root of analysis. The depth is the relative depth of the deepest branch. Depth traversal analysis stops when it reaches a referenced model or a library. Depth and level are restarted with 0 for each of these components.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Subsystem depth metric** in **By Task > Model Metrics > Count Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.SubSystemDepth`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: None`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** subsystem depth for each component in the hierarchy.
- **AggregatedValue:** Not applicable.
- **Measure:** level of component in the hierarchy.
- **AggregatedMeasure:** Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Input output metric

Metric Type: Size

Metric ID: `mathworks.metrics.IOCount`

Display number of inputs and outputs in the model

Description

Use this metric to calculate the number of inputs and outputs in the model, which include:

- Inputs: Inport blocks, Trigger ports, Enable ports, chart input data and events.
- Outputs: Outport blocks, chart output data and events.
- Implicit inputs: From block, where the matching Goto block is outside of the component.
- Implicit outputs: Goto block, where the matching From block is outside of the component.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Max`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** total interface size or sum of the elements of `Measures`.
- **AggregatedValue:** Number of inputs and outputs for a component and its subcomponents.
- **Measures:** Array consisting of number of inputs, number of outputs, number of implicit inputs, and number of implicit outputs, which are local to the component.
- **AggregatedMeasures:** Maximum number of inputs, outputs, implicit inputs, and implicit outputs for a component and subcomponents.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Diagnostic warnings metric

Metric Type: Size

Metric ID: `mathworks.metrics.DiagnosticWarningsCount`

Calculate the number of diagnostic warnings reported during a model update for simulation.

Description

Use this metric to calculate the number of Simulink diagnostic warnings reported during a model update for simulation. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.DiagnosticWarningsCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of diagnostic warnings reported.
- **AggregatedValue:** Number of diagnostic warnings reported for component and its subcomponents.
- **Measure:** Not applicable.

Capabilities and Limitations

- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Explicit input output metric

Metric Type: Size

Metric ID: `mathworks.metrics.ExplicitIOCount`

Display number of inputs and outputs in the model, excluding From and Goto blocks.

Description

Use this metric to calculate the number of inputs and outputs in the model, which include:

- Inputs: Inport blocks, Trigger ports, Enable ports, chart input data and events.
- Outputs: Outport blocks, chart output data and events.

This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.ExplicitIOCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Max`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Total interface size or sum of the elements of **Measures**.
- **AggregatedValue:** Number of inputs and outputs for a component and its subcomponents.
- **Measures:** Array consisting of number of inputs and number of outputs which are local to the component.

- **AggregatedMeasures:** Maximum number of inputs and outputs for a component and subcomponents.

Capabilities and Limitations

The metric:

- Excludes From and Goto blocks.
- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

File metric

Metric Type: Size

Metric ID: `mathworks.metrics.FileCount`

Calculates the number of model and library files used by a specific component and its subcomponents.

Description

Use this metric to count the number of model and library files used by a specific component and its subcomponents. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.FileCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: None`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of model and library files.
- **AggregatedValue:** Not applicable.
- **Measures:** Not applicable.

Capabilities and Limitations

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

For more information on model metrics, see “Collect Model Metrics”.

Matlab Function metric

Metric Type: Size

Metric ID: `mathworks.metrics.MatlabFunctionCount`

Calculates the number of Matlab Function blocks inside a component.

Description

Use this metric to count the number of Matlab Function blocks inside a component. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.MatlabFunctionCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode`: Sum
- `slmetric.metric.AggregateComponentDetails`: true

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of Matlab Function blocks.
- **AggregatedValue:** Number of Matlab Function blocks for component and its subcomponents.

- Measures: Not applicable.

Capabilities and Limitations

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Model file count

Metric Type: Size

Metric ID: `mathworks.metrics.ModelFileCount`

Calculate the number of model files.

Description

Use this metric to count the number of model files. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.ModelFileCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: None`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of files reference by a component and its subcomponents.
- **AggregatedValue:** Not applicable.
- **Measures:** Not applicable.

Capabilities and Limitations

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Parameter metric

Metric Type: Size

Metric ID: `mathworks.metrics.ParameterCount`

Calculate the number of parameters.

Description

Use this metric to calculate the amount of user-managed parameterization data inside a Simulink system. A parameter is a variable used by a Simulink block or object of a basic type (single, double, uint8, uint16, uint32, int8, int16, int32, boolean, logical, struct, char, cell), `Simulink.Parameter`, `Simulink.Variant`, or enum value. The parameter can be stored in either the base workspace, the model workspace, or a data dictionary.

This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.ParameterCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode`: Sum
- `slmetric.metric.AggregateComponentDetails`: true

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- Value: Number of parameters used inside a component.

- **AggregatedValue:** Number of parameters for a component and its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

This metric:

- Uses the `Simulink.findVars` function and inherits the limitations of this function.
- Counts the parameter instances in a component rather than unique parameters.
- Does not include parameters in masked workspaces.
- Does not include data type and signal objects.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Stateflow chart metric

Metric Type: Size

Metric ID: `mathworks.metrics.StateflowChartCount`

Calculate the number of Stateflow charts at any component level.

Description

Use this metric to count the number of Stateflow charts at any component level. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.StateflowChartCount`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of Stateflow charts at the model level.
- **AggregatedValue:** Number of charts for component and its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

For more information on model metrics, see “Collect Model Metrics”.

Cyclomatic complexity metric

Metric Type: Architecture

Metric ID: `mathworks.metrics.CyclomaticComplexity`

Model Advisor Check ID: `mathworks.metricchecks.CyclomaticComplexity`

Display the local and aggregated cyclomatic complexity of the model

Description

Use this metric to calculate the cyclomatic complexity of the model. The results provide the local and aggregated cyclomatic complexity for the:

- Model
- Subsystems
- Charts
- States in charts
- MATLAB functions

Local complexity is the cyclomatic complexity for objects at their hierarchical level. Aggregated cyclomatic complexity is the cyclomatic complexity of an object and its descendants.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Cyclomatic complexity metric** in **By Task > Model Metrics > Complexity Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.CyclomaticComplexity`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Local cyclomatic complexity.
- **AggregatedValue:** Aggregated cyclomatic complexity.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Does not run on library models.
- Analyzes content in masked subsystems.
- Does not analyze inactive variants.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

- “Collect Model Metrics”
- “Cyclomatic Complexity for Stateflow Charts” (Simulink Coverage)
- “Specify Coverage Options” (Simulink Coverage)

Clone content metric

Metric Type: Architecture

Check ID: `mathworks.metrics.CloneContent`

Calculate the number of components involved in a clone.

Description

Use this metric to calculate the number of components involved in an exact graphical subsystem clone, excluding libraries. Exact graphical subsystem clones must have identical block types, connections, and parameter values. If the software identifies a subsystem as a clone, the subsystem itself and all subcomponents are considered as being involved in a clone. Subcomponents linked to a library and its subcomponents are not considered to be involved in a clone. For more information on clone detection, see “Enable Component Reuse by Using Clone Detection”.

This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.CloneContent`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: None`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of components involved in a clone.
- **AggregatedValue:** Not applicable.
- **Measures:** Not applicable.

Capabilities and Limitations

- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Clone detection metric

Metric Type: Architecture

Check ID: `mathworks.metrics.CloneDetection`

Calculate the number of clones in a model.

Description

Use this metric to count the number of exact graphical subsystem clones in a model. Exact graphical subsystem clones must have identical block types, connections, and parameter values. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.CloneDetection`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode`: Sum
- `slmetric.metric.AggregateComponentDetails`: false

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- `Value`: Number of clones.
- `AggregatedValue`: Number of clones for component and its subcomponents.
- `Measures`: Not applicable.

Capabilities and Limitations

- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.
- This metric does not support Simscape models.

See Also

For more information on model metrics, see “Collect Model Metrics”.

Library content metric

Metric Type: Architecture

Check ID: `mathworks.metrics.LibraryContent`

Calculate the number of components involved in a library, excluding clones.

Description

Use this metric to calculate the number of components involved in a library, excluding clones. This metric is available with Simulink Check. To collect data for this metric, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.LibraryContent`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: None`
- `slmetric.metric.AggregateComponentDetails: false`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- `Value`: Number of components involved in a library, excluding clones.
- `AggregatedValue`: Not applicable.
- `Measures`: Not applicable.

Capabilities and Limitations

- If specified, analyzes the content of library-linked blocks or referenced models.
- This metric does not support Simscape models.

For more information on model metrics, see “Collect Model Metrics”.

Nondescriptive block name metric

Metric Type: Readability

Check ID: `mathworks.metrics.DescriptiveBlockNames`

Model Advisor Check ID: `mathworks.metricchecks.DescriptiveBlockNames`

Display nondescriptive Inport, Outport, and Subsystem block names

Description

Run this metric to determine nondescriptive Inport, Outport, and Subsystem block names. Default names appended with an integer are nondescriptive block names. The results provide the nondescriptive block names at the model and subsystem levels.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Nondescriptive block name metric** in **By Task > Model Metrics > Readability Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.DescriptiveBlockNames`.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of nondescriptive Inport, Outport, and Subsystem block names.
- **AggregatedValue:** Number of nondescriptive Inport, Outport, and Subsystem block names for a component and its subcomponents.
- **Measures:** 1-D vector containing:
 - Total number of Inport blocks
 - Number of Inport blocks with nondescriptive names
 - Total number of Outport blocks
 - Number of Outport blocks with nondescriptive names
 - Total number of Subsystem blocks
 - Number of Subsystem blocks with nondescriptive names
- **AggregatedMeasures:** 1-D vector containing sum of:
 - Total number of Inport blocks
 - Number of Inport blocks with nondescriptive names
 - Total number of Outport blocks

- Number of Outport blocks with nondescriptive names
- Total number of Subsystem blocks
- Number of Subsystem blocks with nondescriptive names

Capabilities and Limitations

The metric:

- Does not run on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

For more information on model metrics, see “Collect Model Metrics”

Data and structure layer separation metric

Metric Type: Readability

Metric ID: `mathworks.metrics.LayerSeparation`

Model Advisor Check ID: `mathworks.metricchecks.LayerSeparation`

Display data and structure layer separation

Description

Run this metric to calculate the data and structure layer separation. The results provide the separation at the model and subsystem level.

Run this metric to calculate the data and structure layer separation. The results provide the separation at the model and subsystem levels.

This metric is available with Simulink Check. To collect data for this metric:

- Using the Model Advisor, run the check, **Data and structure layer separation metric** in **By Task > Model Metrics > Readability Metrics**.
- Programmatically, use `slmetric.Engine.getMetrics` with the metric identifier, `mathworks.metrics.LayerSeparation`.

For guidelines about blocks on model levels, see the MAAB 3.0 guideline db_0143: Similar block types on the model levels.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of basic blocks on a structural level.
- **AggregatedValue:** Number of basic blocks on a structural level for a component and its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Does not run on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.

For more information on model metrics, see “Collect Model Metrics”

MATLAB code analyzer warnings

Metric Type: Compliance

Metric ID: `mathworks.metrics.MatlabCodeAnalyzerWarnings`

Use this metric to calculate the number of MATLAB code analyzer warnings from MATLAB code in the model

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of MATLAB code analyzer warnings
- **AggregatedValue:** Number of MATLAB code analyzer warnings aggregated for a component and subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Analyzes MATLAB code in MATLAB Function blocks
- Analyzes MATLAB functions in Stateflow charts
- Runs on library models
- Analyzes content in masked subsystems
- If specified, analyzes content of library-linked blocks and referenced models
- Does not analyze external MATLAB code files

Model Advisor Check Compliance for High-Integrity Systems

Metric Type: Compliance

Metric ID: `mathworks.metrics.ModelAdvisorCheckCompliance.hisl_do178`

Use this metric to calculate the fraction of Model Advisor checks that pass for the **High-Integrity Systems** subgroups.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Percentile`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Fraction of total number of checks passed in **High-Integrity Systems** subgroups.
- **AggregatedValue:** Fraction of total number of checks passed in **High-Integrity Systems** subgroups aggregated for a component and all of its subcomponents.
- **Measures:** Vector containing: number of checks passed in subgroups and number of checks in subgroups.
- **AggregatedMeasures:** Vector containing: number of checks passed in subgroups and number of checks in subgroup, for a component and all its subcomponents.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.
- Analyzes content in Stateflow objects.

Model Advisor Check Compliance for Modeling Standards for MAAB

Metric Type: Compliance

Metric ID: `mathworks.metrics.ModelAdvisorCheckCompliance.maab`

Use this metric to calculate the fraction of Model Advisor checks that pass for the group **Modeling Standards for MAAB**

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Percentile`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Fraction of total number of checks passed in MAAB.
- **AggregatedValue:** Fraction of total number of checks passed in MAAB aggregated for a component and all of its subcomponents.
- **Measures:** Vector containing: number of checks passed in group and number of checks in group.
- **AggregatedMeasures:** Vector containing: number of checks passed in group and number of checks in group, for a component and all its subcomponents.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.
- Analyzes content in Stateflow objects.

Model Advisor Check Issues for High-Integrity Systems

Metric Type: Compliance

Metric ID: `mathworks.metrics.ModelAdvisorCheckIssues.hisl_do178`

Use this metric to calculate number of issues reported by the subgroups of Model Advisor checks for **High-Integrity Systems**. An issue is a Simulink object that the Model Advisor

check flags. You see an issue in the check output as a hyperlink and in the Simulink Editor with Model Advisor highlighting. For configuration parameter checks, we add one issue to each model component that fails the check.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of issues reported by the **High-Integrity Systems** checks
- **AggregatedValue:** Number of issues reported by the **High-Integrity Systems** checks aggregated for a component and all of its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.
- Analyzes content in Stateflow objects.

- “Collect Model Metrics”
- “Model Checks for DO-178C/DO-331 Standard Compliance”

Model Advisor check issues for MAAB Standards

Metric Type: Compliance

Metric ID: `mathworks.metrics.ModelAdvisorCheckIssues.maab`

Use this metric to calculate number of issues reported by the group of Model Advisor checks for **Modeling Standards for MAAB**. An issue is a Simulink object that is flagged

by the Model Advisor check. You see an issue in the check output as a hyperlink and in the Simulink Editor with Model Advisor highlighting.

Aggregation properties for this metric are set to:

- `slmetric.metric.AggregationMode: Sum`
- `slmetric.metric.AggregateComponentDetails: true`

Results

For this metric, instances of `slmetric.metric.Result` provide the following results:

- **Value:** Number of issues reported by the Model Advisor for MAAB checks.
- **AggregatedValue:** Number of issues reported by the Model Advisor for MAAB checks aggregated for a component and all of its subcomponents.
- **Measures:** Not applicable.

Capabilities and Limitations

The metric:

- Runs on library models.
- Analyzes content in masked subsystems.
- If specified, analyzes the content of library-linked blocks or referenced models.
- Analyzes content in Stateflow objects.
- Adds check issues on the configuration set or issues with data objects to the issue count at the model root level.

Model Transformer Tasks

Model Transformer Tasks

In this section...
“Transformations” on page 3-2
“Transform the model to variant system” on page 3-2
“Eliminate Data Store Blocks” on page 3-3

Use the Model Transformer tool to refactor a model to implement variants and eliminate eligible data store blocks. You can perform the steps in the Model Transformer all at once or one step at a time.

Transformations

Use the Model Transformer tool to create models that contain these transformations:

- Replace qualifying modeling patterns with variant blocks.
- Replace data store blocks with blocks that make data dependency explicit.

If you want to perform both transformations at once, for each step, specify the input parameters. Then, click the **Run Selected Checks** button. After you run each check, create new models with the transformations by clicking the **Refactor Model** buttons.

If you want to perform one transformation at a time, you can individually select the checks.

See Also

- “Transform Model to Variant System”
- “Replace Data Store Blocks”

Transform the model to variant system

Click the **Run This Check** button to identify system constants for use in variant transformations and blocks that qualify for transformation into Variant Subsystem or Variant Source blocks. These transformations are possible:

- If an If block connects to one or more If Action Subsystems and each If Action Subsystem has one output, replace this modeling pattern with a subsystem and a Variant Source block.

- If an If block connects to an If Action Subsystem that has no output or two or more outputs, replace this modeling pattern with a Variant Subsystem block.
- If a Switch Case block connects to one or more Switch Case Action Subsystems and each Switch Case Action Subsystem has one output, replace this modeling pattern with a subsystem and a Variant Source block.
- If a Switch Case block connects to a Switch Case Action Subsystem that has no output or two or more outputs, replace this modeling pattern with a Variant Subsystem block.
- Replace a Switch block with a Variant Source block.
- Replace a Multiport Switch block that has two or more data ports with a Variant Source block.

A system constant is the control input or is part of an arithmetic expression that forms the control input to Multiport Switch or Switch blocks and the inputs to If or Switch Case blocks. The control input must be Constant blocks and some combination of blocks that form a supported MATLAB expression. In the Constant block parameters dialog box, the **Constant value** parameters are the system constants. In the transformed model, system constants are part of condition expressions in Variant Source or Variant Subsystem blocks.

Note For some model patterns and settings, the Model Transformer cannot perform every one of the preceding transformations.

In the **Result** table, each modeling pattern is a hyperlink to the corresponding location in the model. If you do not want the Model Transformer to perform a transformation, clear the check box next to the qualifying pattern.

Click the **Refactor Model** button to create a model that contains the transformations. The transformed model is in the folder that has the prefix m2m plus the original model name.

See Also

- “Transform Model to Variant System”

Eliminate Data Store Blocks

Click the **Run This Check** button to identify Data Store Memory, Data Store Read, and Data Store Write blocks that qualify for elimination. Click the **Refactor Model** button to

create a model that replaces these blocks with either a direct signal line, a Delay block, or a Merge block. The model is in the folder that has the prefix m2m plus the original model name.

Replacing these blocks improves model readability by making data dependency explicit. The Model Transformer can replace these data stores:

- For signals that are not buses, if a Data Store Read block executes before a Data Store Write block, the tool replaces these blocks with a Delay block.
- For signals that are not buses, if a Data Store Write block executes before a Data Store Read block, the tool replaces these blocks with a direct connection.
- For bus signals, if the write to bus elements executes before the read of the bus, the tool replaces the Data Store Read and Data Store Write blocks with a direct connection and a Bus Creator block.
- For bus signals, if the write to the bus executes before the read of bus elements, the tool replaces the Data Store Read and Data Store Write blocks with a direct connection and a Bus Selector block.
- For conditionally executed subsystems, the tool replaces the Data Store Read and Data Store Write blocks with a direct connection and a Merge block.

The Model Transformer tool only eliminates local data stores that Data Store Memory blocks define. The tool does not eliminate global data stores. For the Data Store Memory block, on the **Signal Attributes** tab of the block parameters dialog box, the **Data store name must resolve to Simulink signal object** parameter must be cleared.

The **Result** table contains hyperlinks to the corresponding Data Store Memory, Data Store Read, and Data Store Write blocks. If you do not want the Model Transformer to perform a transformation, before clicking the **Refactor Model** button, clear the check box next to the Data Store Memory block.

Clone Detection Tasks

Clone Detection Checks

Use the Identify Modeling Clones tool to refactor a model by identifying clones and creating models that replace clones with links to subsystem blocks in a library.

In this section...
“Replace clones with library block links” on page 4-2
“Replace clones of library blocks with library links” on page 4-3
“Replace graphical clones with library links” on page 4-3
“Replace functional clones with library links” on page 4-4
“Exclude subsystems and referenced models from clone detection” on page 4-4

Replace clones with library block links

This folder contains these checks:

- **Replace clones of library blocks with library links**
- **Replace graphical clones with library links**
- **^Replace functional clones with library links**

If you click **Run Selected Checks**, the tool executes these three checks. The tool identifies clones across referenced model boundaries including in commented-out regions and inactive variants. If you do not want to perform a check, clear the check box next to that check.

Before clicking **Run Selected Checks**, specify values for these parameters:

- For the **Replace clones of library blocks with library links** check, specify values for the **Library file name** and **Maximum number of different parameters** parameters.
- For the **Replace graphical clones with library links** and **Replace functional clones with library links** checks, specify values for the **New library file name** and **Maximum number of different parameters** parameters.

Exact clones have identical block types and connections, and parameter settings and values. To identify only exact clones, set the **Maximum number of different parameters** value to 0 (default value). If you want to identify clones with different block

parameter settings and values, increase the **Maximum number of different parameters** value.

When the Identify Modeling Clones tool runs checks, it generates an HTML report of check results. By default, the HTML report is in the `s\prj` folder.

See Also

- “Enable Component Reuse by Using Clone Detection”

Replace clones of library blocks with library links

When you click **Run This Check**, the tool lists modeling patterns that are clones of library subsystems. The tool checks for library clones across a model hierarchy including in inactive variants and commented-out regions. To identify only exact clones, set the **Maximum number of different parameters** value to 0 (default value). If you want to identify clones with different block parameter settings and values, increase the **Maximum number of different parameters** value.

In the **Library file name** field, specify a library in which to check a model for clones.

In the modeling patterns list, each subsystem clone is a hyperlink to the corresponding location in the model.

To create a model with linked library blocks, click **Refactor Model** .

Note This check identifies exact and similar clones of library blocks. The tool refactors a model to replace exact clones with links to library blocks. It does not refactor a model to replace similar clones with links to library blocks.

See Also

- “Enable Component Reuse by Using Clone Detection”

Replace graphical clones with library links

When you click **Run This Check**, the tool lists subsystems that are graphical clones. The tool checks for graphical clones across a model hierarchy including in inactive variants and commented-out regions. To identify only exact clones, set the **Maximum number of**

different parameters value to 0 (default value). If you want to identify clones with different block parameter settings and values, increase the **Maximum number of different parameters** value.

In the list, each subsystem clone is a hyperlink to the corresponding location in the model.

To create a model with linked library blocks, click **Refactor Model**.

See Also

- “Enable Component Reuse by Using Clone Detection”

Replace functional clones with library links

When you click **Run This Check**, the tool lists subsystems that are functional clones. The tool checks for functional clones in all regions except for inactive variants and commented-out regions. To identify only exact clones, set the **Maximum number of different parameters** value to 0 (default value). If you want to identify clones with different block parameter settings and values increase the **Maximum number of different parameters** value.

In the list, each subsystem clone is a hyperlink to the corresponding location in the model.

- “Enable Component Reuse by Using Clone Detection”

Exclude subsystems and referenced models from clone detection

To save time during model development, you can limit the scope of the clone detection analysis of your model. You can use the Clone Detection Exclusion Editor to exclude Subsystem and Model Reference blocks from clone detection. To exclude a subsystem or referenced model, right-click the subsystem or referenced model and select **Identify Modeling Clones > Subsystem and its contents > Add to exclusions**.

After you specify the Subsystem or Model Reference blocks to exclude, the Identify Modeling Clones tool uses the exclusion information to exclude blocks during analysis. By default, the exclusion information is stored in the model SLX file. Alternately, you can

store the information in an exclusion file. To use an exclusion file, in the Clone Detection Exclusion Editor dialog box, clear **Store exclusions in model file**. The **Exclusion File** field is enabled.

The **Exclusion File** contains the exclusion file name and location associated with the model. You can use an exclusion file with several models. However, a model can have only one exclusion file.

Unless you specify a different folder, the Clone Detection Exclusion Editor saves the exclusion files in the current folder. The default name for an exclusion file is `<model_name>_exclusions.xml`.

If you create an exclusion file and save your model, you attach the exclusion file to your model. Each time that you open the model, the blocks specified in the exclusion file are excluded from the analysis.

When you click **Run This Check**, the tool lists the excluded subsystems and referenced models in the Result table under List of excluded subsystems.

To view exclusion information for a model, right-click a subsystem or Model Reference block and select **Identify Modeling Clones > Open Clone Detection Exclusion Editor**. For each subsystem or referenced model that you exclude from detection, in the Rationale field, you can provide a reason for why you are excluding it.
